Selects the test bus configuration for the ADU. Used for hardware debug only

ADU_ADU_TEST_CTRL

Bits	Name	Description
4:0	TEST_BUS_SEL	Enabled different testbusses in the ADU. 0: none 1-3: functional signals 4:gas_testbus 5:dahb_gam_testbus 6:cahb_gam_testbus 7:gbi_testbus 8-b: functional signals c-d: reinit signals e: uma_tx f: uma_rx Reset State: 0x00000004

0x3000010 ADU_ADU_STATUS

Type: read-only
Reset State: 0x00000000

Provides status information about the ADU

ADU_ADU_STATUS

Bits	Name	Description
28:24	ENCODED_ADU_REINIT_FSM	The FSM status of adu reinit Reset State: 0x00000000
23	ADU_SM_STATE_MSB	The MSB of state machine state of the ADU controller Reset State: 0x00000000
22	BMU_UMA_TX_WQ_DA	The status of the bmu_uma_tx_wq_da Reset State: 0x00000000
21	ENCODED_GAS_INTERFACE_SM_STATE	The status of the gas interface. Reset State: 0x00000000
20	UMA_TX_STATUS	The status of the uma tx. 0 means uma tx is idle Reset State: 0x00000000
19:15	UMA_TX_SM_STATE	The state machine state of the uma tx Reset State: 0x00000000
13	ADU_MULTIPLE_RX_UPDATE_ONGOING	shows the status of adu_multiple_rx_update_ongoing Reset State: 0x00000000
12:8	ADU_SM_STATE	The 5LSB of state machine state of the ADU controller Reset State: 0x00000000
5	ADU_FIXED_WQ_PUSH_MODE_WOW_ENABLED	Shows the status of adu_fixed_wq_push_mode_wow_enabled signal. It's set to 1 when control[6] is set to 1, and clear to 0 when control[6] is cleaered or when dpu_wakuphost assert Reset State: 0x00000000
4	DPU_WAKEUPHOST	Shows the status of dpu_wakuphost Reset State: 0x00000000
3	ADU_STATUS	When set, the ADU controller is NOT in it's IDLE state Reset State: 0x00000000

ADU_ADU_STATUS (cont.)

Bits	Name	Description
2	ADU_MCU_ERR_INT	shows the status of the ADU error interrupt signal going to the mcu Reset State: 0x00000000
1	DATA_AVAIL	shows the data_available signal from the bmu Reset State: 0x00000000
0	BD_PDU_AVAIL	shows the bd_pdu_avail signal from the bmu Reset State: 0x00000000

0x3000014 ADU_ADU_DEBUG0

Type: read-only
Reset State: 0x00000000

Contains error debug info

ADU_ADU_DEBUG0

Bits	Name	Description
31:16	ORIGINAL_BD_INDEX	Index of the original BD that was popped Reset State: 0x00000000
9:5	UMA_TX_ERROR_SM_STATE	The state machine state the uma tx was in when it generated an error pulse Reset State: 0x00000000
4:0	ADU_ERROR_SM_STATE	The state machine state the ADU was in when it generated an error pulse Reset State: 0x00000000

0x3000018 ADU_ADU_DEBUG1

Type: read-only
Reset State: 0x00000000

provides access to the testbus

ADU_ADU_DEBUG1

Bits	Name	Description
31:0	ADU_TESTBUS_LOW	The lowest 32 bits of the ADU testbus Reset State: 0x00000000

0x300001C ADU_ADU_DEBUG2

Type: read-only
Reset State: 0x00000000

provides access to the testbus

ADU_ADU_DEBUG2

Bits	Name	Description
12:0	ADU_TESTBUS_HIGH	Bits [44:32] of the ADU testbus Reset State: 0x00000000

0x3000020 ADU_ADU_COUNTERS1

Type: read-only
Reset State: 0x00000000

gives information on the number of frames processed

ADU_ADU_COUNTERS1

Bits	Name	Description
23:16	NUMBER_OF_AMSDU_FRAMES_PROCESSED	Indicates the number of amsdu frames processed by the ADU Reset State: 0x00000000
7:0	NUMBER_OF_FRAMES_POPPED	Indicates the number of frames that were popped by the ADU Reset State: 0x00000000

0x3000024 ADU_ADU_COUNTERS2

Type: read-only
Reset State: 0x00000000

gives information on the number of frames processed

ADU_ADU_COUNTERS2

Bits	Name	Description
23:16	NUMBER_OF_NON_AMSDU_FRAMES_PROCESSED	Indicates the number of non amsdu frames processed by the ADU Reset State: 0x00000000
7:0	NUMBER_OF_BYPASS_FRAMES_PROCESSED	Indicates the number of frames for which the 'ADU bypass' bit in the BD was set Reset State: 0x00000000

0x3000028 ADU_ADU_COUNTERS3

Type: read-only
Reset State: 0x00000000

gives information on the number of frames processed

ADU_ADU_COUNTERS3

Bits	Name	Description
23:16	NR_OF_ERROR_FRAMES	Indicates the number of error frames which has been pushed to error wq. Reset State: 0x00000000
7:0	NR_OF_MISCONFIGURED_AMSDU_FRAMES	Indicates the number of amsdu frames processed that were not correctly configured Reset State: 0x00000000

0x300002C ADU_CONTROL2

Type: read-write
Reset State: 0x03FFF92A

Contains configuration information for the adu

ADU_CONTROL2

Bits	Name	Description
31:26	SPARE_BIT	Spare register bits for ECOs Reset State: 0x00000000
25:12	TIMEOUT_CNT	This field specify the timeout value in unit of 1 us when adu fsm doesn't return to IDLE. Reset State: 0x00003FFF
11:0	MAX_LENGTH	This field specify the max subframe length is allowed. Reset State: 0x0000092A

0x3000030 ADU_TIMEOUT_READ

Type: read-only
Reset State: 0x00000000

Contains timeout counter information for the adu

ADU_TIMEOUT_READ

Bits	Name	Description
19:0	TIMEOUT_CNT_REG	This field read the timeout counter value Reset State: 0x00000000

0x300003C ADU_UMA_CONFIG

Type: read-write
Reset State: 0xA0106000

This register is to config the UMA function

ADU_UMA_CONFIG

Bits	Name	Description
31	UMA_TX_MCUSEBC_EN	When set, mc address will use bc addr for da search. Reset State: 0x00000001
30:26	UMA_TX_QID_FOR_NONQOS	The Queueid to fill the BD when the packet is non QoS frame. Reset State: 0x00000008
25	UMA_TX_EATRACT_TID	When set, uma tx extract the tid from 802.1Q/IP header. Reset State: 0x00000000
24	UMA_RX_LLC_EN	When set and bit 21 is set, enables LLC removal. Reset State: 0x00000000
23	UMA_RX_CHECKSUM_EN	When set and bit 21 is set, enables the TCP checksum validation in RX direction Reset State: 0x00000000
22	UMA_RX_FT_EN	When set and bit 21 is set, enables the frame translation in RX direction Reset State: 0x00000000
21	UMA_RX_EN	When set, enables the data path enhancement in RX direction. When clear, UMA RX simply forward the frame to the specified WQ. Reset State: 0x00000000
20	UMA_TX_PUSH_WQ_SEL	When set, UMA will push the frame to the WQ specified in bit [19:12] When clear, UMA will push the frame to the WQ specified in the routing flag in BD Reset State: 0x00000001
19:12	UMA_TX_PUSH_WQ	Specify the WQ that UMA should push to in TX direction if bit 20 is set. Reset State: 0x00000006
11:4	TX_DEFAULT_STAID	The default descriptor index used for frame translation in TX direction when there's no DA match in the srch table.. Reset State: 0x00000000

ADU_UMA_CONFIG (cont.)

Bits	Name	Description
3	UMA_TX_LLC_EN	When set and bit 0 is set, enables LLC insertion in TX direction Reset State: 0x00000000
2	UMA_TX_CHECKSUM_EN	When set and bit 0 is set, enables TCO checksum computation in TX direction Reset State: 0x00000000
1	UMA_TX_FT_EN	When set and bit 0 is set, enables frame translation in TX direction. Reset State: 0x00000000
0	UMA_TX_EN	When set, enables data path enhancement in TX direction. When clear, UMA simply forward the incoming frame to the specified WQ. Reset State: 0x00000000

0x3000040 ADU_UMA_CTRL

Type: read-write
Reset State: 0x0000FF03

This register is to control the UMA function

ADU_UMA_CTRL

Bits	Name	Description
31:24	UMA_TX_AP_WQ	The WQ UMA will push when there's no match. Reset State: 0x00000000
23:16	UMA_RX_MC_WQ	The WQ UMA will push when DA is a mc/bc address. Reset State: 0x00000000
15:8	UMA_RX_ERROR_WQ	The Error WQ UMA will forward when exception occurs, such as payload size less than 8 bytes. Reset State: 0x000000FF
7	UMA_RX_MCWQ_EN	When set, enable UMA RX push the frame to uma_rx_mc_wq when DA is a mc/bc address Reset State: 0x00000000
6	UMA_TX_APWQ_EN	When set, enable UMA TX push the frame to uma_tx_ap_wq when there's no match Reset State: 0x00000000
5	UMA_DISABLE_MIN_PAYLOAD_CHECK	When set, disable the min payload check Reset State: 0x00000000
4	UMA_COUNTER_CLEAR	Write a '1' to clear the UMA TX Counters. Always read '0'. Reset State: 0x00000000

ADU_UMA_CTRL (cont.)

Bits	Name	Description
3	UMA_TX_QID_FROM_BD	When set, UMA won't update the queue id in BD. When clear, queue id will be a 1-1 mapping from tid(QoS) or register (non-QoS) Reset State: 0x00000000
2	UMA_TX_ERROR_EXIT	Write a '1' to clear the UMA TX interrupts and UMA TX FSM goes back to IDLE. Always read '0'. Reset State: 0x00000000
1	UMA_RX_ENABLE	When set, UMA RX is enabled. When clear, UMA RX is off. adu_ctrl will push the processed frame to the specified WQ. Reset State: 0x00000001
0	UMA_TX_ENABLE	When set, UMA TX is enabled. When clear, UMA TX is off. No frame will be popped from BMU. Reset State: 0x00000001

0x3000044 ADU_UMA_DESP_TABLE_ADDR

Type: read-write
Reset State: 0x00000000

This register contains the base address of uma's descriptor table

ADU_UMA_DESP_TABLE_ADDR

Bits	Name	Description
31:0	UMA_DESP_TABLE_BASE_ADDR	Base address of UMA's descriptor table Reset State: 0x00000000

0x3000048 ADU_UMA_TX_ETHERTYPE_TABLE1

Type: read-write
Reset State: 0x00000000

This register contains 2 entries of the ethertype table for uma tx

ADU_UMA_TX_ETHERTYPE_TABLE1

Bits	Name	Description
31:16	UMA_TX_ETHERTYPE_ENTRY2	One of the entries of uma tx ethertype table Reset State: 0x00000000
15:0	UMA_TX_ETHERTYPE_ENTRY1	One of the entries of uma tx ethertype table Reset State: 0x00000000

0x300004C ADU_UMA_TX_ETHERTYPE_TABLE2

Type: read-write
Reset State: 0x00000000

This register contains 2 entries of the ethertype table for uma tx

ADU_UMA_TX_ETHERTYPE_TABLE2

Bits	Name	Description
31:16	UMA_TX_ETHERTYPE_ENTRY4	One of the entries of uma tx ethertype table Reset State: 0x00000000
15:0	UMA_TX_ETHERTYPE_ENTRY3	One of the entries of uma tx ethertype table Reset State: 0x00000000

0x3000050 ADU_UMA_RX_ETHERTYPE_TABLE1

Type: read-write
Reset State: 0x00000000

This register contains 2 entries of the ethertype table for uma rx

ADU_UMA_RX_ETHERTYPE_TABLE1

Bits	Name	Description
31:16	UMA_RX_ETHERTYPE_ENTRY2	One of the entries of uma rx ethertype table Reset State: 0x00000000
15:0	UMA_RX_ETHERTYPE_ENTRY1	One of the entries of uma rx ethertype table Reset State: 0x00000000

0x3000054 ADU_UMA_RX_ETHERTYPE_TABLE2

Type: read-write
Reset State: 0x00000000

This register contains 2 entries of the ethertype table for uma rx

ADU_UMA_RX_ETHERTYPE_TABLE2

Bits	Name	Description
31:16	UMA_RX_ETHERTYPE_ENTRY4	One of the entries of uma rx ethertype table Reset State: 0x00000000
15:0	UMA_RX_ETHERTYPE_ENTRY3	One of the entries of uma rx ethertype table Reset State: 0x00000000

0x3000058 ADU_UMA_TX_COUNTERS1

Type: read-only
Reset State: 0x00000000

This register contains counters information of uma tx

ADU_UMA_TX_COUNTERS1

Bits	Name	Description
23:16	UMA_TX_PUSHED_COUNTER	Counters of the frame uma tx pushed Reset State: 0x00000000
7:0	UMA_TX_POPPED_COUNTER	Counters of the frame uma tx popped Reset State: 0x00000000

0x300005C ADU_UMA_TX_COUNTERS2

Type: read-only
Reset State: 0x00000000

This register contains counters information of uma tx

ADU_UMA_TX_COUNTERS2

Bits	Name	Description
23:16	UMA_TX_ERROR_COUNTER	Counters of the frames forwarded to error wq by UMA TX Reset State: 0x00000000
7:0	UMA_TX_FT_COUNTER	Counters of the frame translated by uma tx Reset State: 0x00000000

0x3000060 ADU_UMA_LLC_COUNTERS

Type: read-only
Reset State: 0x00000000

This register contains counters information of uma llc insertion/removal

ADU_UMA_LLC_COUNTERS

Bits	Name	Description
23:16	UMA_RX_LLC_COUNTER	Counters of the LLC removal done by uma rx Reset State: 0x00000000
7:0	UMA_TX_LLC_COUNTER	Counters of the LLC insertion done by uma tx Reset State: 0x00000000

0x3000064 ADU_UMA_INDEX_TABLE_WDATA_U

Type: read-write
Reset State: 0x00000000

This register contains the upper bits of the entry of index table

ADU_UMA_INDEX_TABLE_WDATA_U

Bits	Name	Description
23:16	UMA_SRCHTABLE_INDEX	index (in unit of 3 words) to the descriptor table Reset State: 0x00000000
15:0	UMA_SRCHTABLE_WDATA_U	Upper bits of the entry of index table Reset State: 0x00000000

0x3000068 ADU_UMA_INDEX_TABLE_WDATA_L

Type: read-write
Reset State: 0x00000000

This register contains the lower bits of the entry of index table

ADU_UMA_INDEX_TABLE_WDATA_L

Bits	Name	Description
31:0	UMA_SRCHTABLE_WDATA_L	Lower bits of the 1st entry of index table Reset State: 0x00000000

0x300006C ADU_UMA_INDEX_TABLE_ADDR_CTRL

Type: read-write
Reset State: 0x00000000

This register contains the address of index table the data to be written to/read from

ADU_UMA_INDEX_TABLE_ADDR_CTRL

Bits	Name	Description
8	UMA_SRCHTABLE_RW	Always read '0' Write '1' to write the data {uma_index_data_u, uma_index_data_l} to the address uma_index_addr Write '0' to load the contents of the index table addressed by uma_index_addr to uma_index_table_data_[l|u] registers. Reset State: 0x00000000

ADU_UMA_INDEX_TABLE_ADDR_CTRL (cont.)

Bits	Name	Description
7:0	UMA_SRCHTABLE_ADDR	address of the index table to be written to/read from Reset State: 0x00000000

0x3000070 ADU_UMA_INDEX_TABLE_RDATA_U

Type: read-only
Reset State: 0x00000000

This register contains the upper bits of the entry of index table for read

ADU_UMA_INDEX_TABLE_RDATA_U

Bits	Name	Description
23:16	UMA_SRCHTABLE_RDATA_INDEX	Index of the index table for read Reset State: 0x00000000
15:0	UMA_SRCHTABLE_RDATA_U	Upper bits of the entry of index table for read Reset State: 0x00000000

0x3000074 ADU_UMA_INDEX_TABLE_RDATA_L

Type: read-only
Reset State: 0x00000000

This register contains the lower bits of the entry of index table for read

ADU_UMA_INDEX_TABLE_RDATA_L

Bits	Name	Description
31:0	UMA_SRCHTABLE_RDATA_L	Lower bits of the 1st entry of index table for read Reset State: 0x00000000

0x3000078 ADU_UMA_TX_DEFAULT_WMACADDR_U

Type: read-write
Reset State: 0x00000000

This register contains the upper bits of the default wmac addr to be used when there's no DA match

ADU_UMA_TX_DEFAULT_WMACADDR_U

Bits	Name	Description
15:0	UMA_DEFAULT_WMACADDR_U	Upper bits of the default wmac addr Reset State: 0x00000000

0x300007C ADU_UMA_TX_DEFAULT_WMACADDR_L

Type: read-write
Reset State: 0x00000000

This register contains the lower bits of the default wmac addr to be used when there's no DA match

ADU_UMA_TX_DEFAULT_WMACADDR_L

Bits	Name	Description
31:0	UMA_DEFAULT_WMACADDR_L	Lower bits of the default wmac addr Reset State: 0x00000000

0x3000080 ADU_UMA_CTRL2

Type: read-write
Reset State: 0x000104FF

This register is to control the UMA function

ADU_UMA_CTRL2

Bits	Name	Description
17	WOW_WAKEUP_SEL	When set, adu will check the BD for wow wakeup indication. When clear, adu will check the sideband signal from dpu for wow wakeup. Reset State: 0x00000000
16	RX_PRIORITY_ROUTING_WQ_EN	When set, adu will push to the rx_priority_routing_wq when the rx dxe priority routing bit is set in BD Reset State: 0x00000001
15:8	RX_PRIORITY_ROUTING_WQ	The WQ adu will push to when the rx dxe priority routing bit is set in BD Reset State: 0x00000004
7:0	UMA_TX_ERROR_WQ	The WQ uma tx will push the frame when there's error Reset State: 0x000000FF

0x3000084 ADU_UMA_TX_COUNTERS3

Type: read-only
Reset State: 0x00000000

This register contains counters information of uma tx

ADU_UMA_TX_COUNTERS3

Bits	Name	Description
23:16	UMA_TX_SYNC_WQ_COUNTER	Counters of the uma tx push to sync wq Reset State: 0x00000000
7:0	UMA_TX_BYPASS_COUNTER	Counters of the uma tx bypass Reset State: 0x00000000

0x30000B8 ADU_UMA_TX_WQ_QID_CTRL

Type: read-write
Reset State: 0x00000000

This register contains the control signals to enable/disable whether or not checking the threshold value for mCPU/btqm wq push.

ADU_UMA_TX_WQ_QID_CTRL

Bits	Name	Description
24	UMA_TX_BD_FILL_EN	When set, UMA TX fill the extra fields in BD. Reset State: 0x00000000

0x30000C0 ADU_ADU_POLL_CMD_ERROR_ADDR

Type: read-only
Reset State: 0x00000000

This register contains the poll cmd address when it reaches retry timeout error

ADU_ADU_POLL_CMD_ERROR_ADDR

Bits	Name	Description
31:0	ADU_POLL_CMD_ERROR_ADDR	The poll cmd address when adu_poll_cmd_error is generated Reset State: 0x00000000

0x30000C4 ADU_ADU_SW_REG_REINIT_ADDR

Type: read-write
Reset State: 0x00000000

This register contains the software triggered reg reinit table address

ADU_ADU_SW_REG_REINIT_ADDR

Bits	Name	Description
31:2	SW_REG_REINIT_ADDR	The software triggered reg reinit table address. always word address Reset State: 0x00000000

0x30000C8 ADU_ADU_SW_REG_REINIT_TRIGGER

Type: read-only
Reset State: 0x00000000

This register to trigger the reg reinit

ADU_ADU_SW_REG_REINIT_TRIGGER

Bits	Name	Description
0	SW_REG_REINIT_P	Write '1' to trigger the reg reinit. Always read 0. Reset State: 0x00000000

16.2.36 bmu

0x3000000 BMU_CONTROL

Type: read-write
Reset State: 0x03FE03FE

Sets the valid range of BD and PDU indexes in the BMU.

BMU_CONTROL

Bits	Name	Description
31:16	MAX_PDU_INDEX_NR	Typically the MAX PDU index is greater then the MAC BD index. In that case BDs can not be used as PDUs and vice versa. When MAX_BD_Index and MAX_PDU_index are programmed to the same value, the BMU is set in a special mode: Mixed mode. Each PDU can be used as a BD or each BD used as a PDU. At initialization the PDU idle list does not need to be created, just the BD idle list. When PDUs are requested, they will be taken from the BD idle list. During operation BD and PDU idle lists will both be maintained, but all released PDUs will automatically get moved back to the BD idle list. In this mode, the MAX BD and PDU index number can not be greater then the MAX BD index number that the hardware allows. Note that before the WQs get enabled, this value must be programmed accordingly to the amount of packet memory available. This is similar to have to program the bd_pbu_base_address in the MCU. The default value here is just a place holder. In Volans, the BMU should be configured to only operate in Mixed Mode. Reset State: 0x000003FE
10:0	MAX_BD_INDEX_NR	Virgo can maximum support 2K BDs. The maximum value that can therefor be programmed is 2047. Where as Libra and Volans can support only 1023 BDs Note that before the WQs get enabled, this value must be programmed accordingly to the amount of packet memory available. This is similar to have to program the bd_pbu_base_address in the MCU. The default value here is just a place holder. Reset State: 0x000003FE

0x3000004 BMU_ERR_INTR_STATUS

Type: read-only
Reset State: 0x00000000

This register indicates the BMU Error Interrupt Status When one of these errors occur, the status will always reflect this. The Err_Intr_ENABLE register is used to indicate which error bits will cause an interrupt to be generated. Writing a 1'b1 to a particular bit will clear the error status bit. Most of these errors are generated when the BMU receives a command. In this case the command will be stored in the 'err_int_addr' and 'err_int_wdata' registers.

BMU_ERR_INTR_STATUS

Bits	Name	Description
31	BMU_ACCESS_DIRECTION	When one of the error indications below gets set, this bit will indicate if this happened on a read or write BMU access. 1'b1 indicates write access 1'b0 indicates read access On a write access, register err_int_wdata will contain the write data Reset State: 0x00000000

BMU_ERR_INTR_STATUS (cont.)

Bits	Name	Description
30	BMU_INTERRUPT_STATUS	Status of the BMU err interrupt status signal going to the mcu. This is the OR of all interrupts enabled in this registers and bmu_idle_bd_pdu_threshold_interrupt_status bit from register: bmu_idle_bd_pdu_status. Reset State: 0x00000000
28	BTQM_ERR	This is the OR of all the enabled bits from btqm_err_status register Set when the btqm detects an error or some other operational related interrupt in the btqm_err_status register. The details on which btqm error happened can be found in register 'btqm_err_int_status' Reset State: 0x00000000
27	DOUBLE_RELEASE_PDU_ERR	Error set when head or tail of a list of linked PDUs that is being released is equal to the head or tail pointer of the idle PDU list. Note that there can be a delay between the release command and the detection of this problem due to buffering Reset State: 0x00000000
26	DOUBLE_RELEASE_BD_ERR	Error set when head or tail of a list of linked BDs that is being released is equal to the head or tail pointer of the idle BD list. Note that there can be a delay between the release command and the detection of this problem due to buffering Reset State: 0x00000000
25	DOUBLE_PUSH_ERR	Error set when a push command contains a BD index equal to the head or tail pointer of the WQ it is pushed to. Reset State: 0x00000000
24	RELEASE_FRAG_BD_INDEX_ERR	When BMU starts releasing defragmentation BD, if a fragment contains invalid BD index this error will be set Reset State: 0x00000000
23	MULTIPLE_READY_ERR	Error set when multiple modules in the bmu indicate ready. That should not happen. Reset State: 0x00000000
22	RELEASE_INTEGRITY_CHECK_PDU_LINK_ERR	Error set when on a release command, the integrity check failed. The pdu links were incorrect Reset State: 0x00000000
21	PUSH_INTEGRITY_CHECK_PDU_LINK_ERR	Error set when on a push bd command, the integrity check failed. The pdu links were incorrect Reset State: 0x00000000
20	PUSH_INTEGRITY_CHECK_HEAD_TAIL_PDU_ERR	Error set when on a push bd command, the integrity check failed. The head/tail/entries part in the BD was incorrect Reset State: 0x00000000
19	PUSH_INTEGRITY_CHECK_PREV_PDU_ERR	Error set when on a push bd command, the integrity check failed. The prev. pdu pointer in the BD was incorrect Reset State: 0x00000000

BMU_ERR_INTR_STATUS (cont.)

Bits	Name	Description
18	PREV_PDU_INDEX_ERR	Error set when on a release of BD with linked PDUs, and the A-MSDU feature is enabled and the prev PDU pointer has an invalid index. Reset State: 0x00000000
17	NR_OF_PDU_OVERFLOW_ERR	Error set when on a release of PDUs, the number of dle PDUs would gone over the theoretical amount as determined by the MAX BD index and MAX PDU index from the BMU control register Reset State: 0x00000000
16	NR_OF_BD_OVERFLOW_ERR	Error set when on a release of BDs, the number of idle BDs would gone over the theoretical amount as determined by the MAX BD index from the BMU control register Reset State: 0x00000000
15	WRGAM_ERR	Set when the write GAM indicated an internal error Reset State: 0x00000000
14	RDGAM_ERR	Set when the read GAM indicated an internal error Reset State: 0x00000000
13	TIME_OUT_ERR	Set when the BMU internally detected is has been hanging There is a timeout counter in the BMU, which tracks the length of each transaction. The timeout count value can be programmed in register: bmu_watchdog_timout_time For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error. Reset State: 0x00000000
12	IDLE_PDU_LIST_TAIL_ERR	The pdu idle list is corrupted. In the PDU idle list the PDU prefetch unit has read the PDU pointer index from the one but last PDU in the PDU idle list. It was expected that this PDU index pointer points to the PDU indicated in the idle_pdu_tail register. This was however not the case. THis is a serious error as it indicates that the idle PDU list is corrupted. Reset State: 0x00000000
11	IDLE_PDU_LIST_CNT_ERR	The pdu idle list is corrupted. In the PDU idle list the PDU prefetch unit has found an PDU who was pointing to the PDU tail index, which would indicate that the end of the idle PDU list has been reached. But this does not correspond with the idle PDU count in the idle_pdu_count register. This error indicates that more PDUs were expected to be in the idle PDU list. THis is a serious error as it indicates that the idle PDU list is corrupted. Reset State: 0x00000000
10	PDU_INDEX_FROM_BD_ERR	When a BD with linked PDUs was released, the BMU detected that in the BD the number of linked PDUs was non zero, but the head or tail PDU pointer index in the BD was greater then the MAX PDU index range. This is an indication that the Idle PDU list is broken and is a serious error. Reset State: 0x00000000

BMU_ERR_INTR_STATUS (cont.)

Bits	Name	Description
9	RELEASE_FIFO_FULL_WARNING	Set when the BMU release fifo got full. This will not break BMU operation, but still should not occur as it can effect latency on the AHB bus. This however is minimized due to the split transaction generated by the BMU GAS if the release takes too long. Reset State: 0x00000000
8	BD_LINKED_LIST_ERR	Set when in the bd idle list a pointer to a bd index was found that is outside of the valid bd index ranges. This is a serious error and the only way to recover is to soft reset the BMU or generate a bmu module reset Reset State: 0x00000000
7	PDU_LINKED_LIST_ERR	Set when in the pdu idle list a pointer to a pdu index was found that is outside of the valid pdu index ranges. This is a serious error and the only way to recover is to soft reset the BMU or generate a bmu module reset Reset State: 0x00000000
6	OUT_OF_MODULE_RANGE_ERR	Set when a BMU command with module index that was out of allowed range was used The valid module index is less than or equal to BMU_HIGHEST_VALID_MASTER_INDEX For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error. Reset State: 0x00000000
5	OUT_OF_PDU_RANGE	Set when a BMU command with PDU index that was out of allowed range was used For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error. Reset State: 0x00000000
4	OUT_OF_BD_RANGE	Set when a BMU command with BD index that was out of allowed range was used For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error. Reset State: 0x00000000
3	UNDEFINED_CMD	Set when an undefined BMU command was given to the BMU For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error. Reset State: 0x00000000
2	WQ_INVALID	Set when an un-enabled or undefined WQ was used in a BMU command In Volans, the valid WQs are "2 to 16 and 23 to 26" For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error. Reset State: 0x00000000
1	WQ_FULL	This is set with push command when the WQ entries are greater/equal to highest_valid_bd_index value. This shouldn't happen in the system For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error. Reset State: 0x00000000

BMU_ERR_INTR_STATUS (cont.)

Bits	Name	Description
0	NOT_ENOUGH_BD_PDU_WARNING	Set when a request for BD_PDUs came in when they were not available. The modules should be able to handle this and resubmit their request at a later time. This is not an error, but is given for informational purposes Reset State: 0x00000000

0x3000008 BMU_ERR_INTR_ENABLE

Type: read-write
Reset State: 0x00000000

This register is used as BMU Interrupt enable Mask. By default all the interrupts are disabled For descriptions of each error interrupt, see register: Err_Intr_STATUS

BMU_ERR_INTR_ENABLE

Bits	Name	Description
28	BTQM_ERR_ENABLE	Reset State: 0x00000000
27	DOUBLE_RELEASE_PDU_ERR_ENABLE	Reset State: 0x00000000
26	DOUBLE_RELEASE_BD_ERR_ENABLE	Reset State: 0x00000000
25	DOUBLE_PUSH_ERR_ENABLE	Reset State: 0x00000000
24	RELEASE_FRAG_BD_INDEX_ERR_ENABLE	Reset State: 0x00000000
23	MULTIPLE_READY_ERR_ENABLE	Reset State: 0x00000000
22	RELEASE_INTEGRITY_CHECK_PDU_LINK_ERR_ENABLE	Reset State: 0x00000000
21	PUSH_INTEGRITY_CHECK_PDU_LINK_ERR_ENABLE	Reset State: 0x00000000
20	PUSH_INTEGRITY_CHECK_HEAD_TAIL_PDU_ERR_ENABLE	Reset State: 0x00000000
19	PUSH_INTEGRITY_CHECK_PREV_PDU_ERR_ENABLE	Reset State: 0x00000000
18	PREV_PDU_INDEX_ERR_ENABLE	Reset State: 0x00000000
17	NR_OF_PDU_OVERFLOW_ERR_ENABLE	Reset State: 0x00000000

BMU_ERR_INTR_ENABLE (cont.)

Bits	Name	Description
16	NR_OF_BD_OVERFLOW_ERR_ENABLE	Reset State: 0x00000000
15	WRGAM_ERR_ENABLE	Reset State: 0x00000000
14	RDGAM_ERR_ENABLE	Reset State: 0x00000000

3	UNDEFINED_CMD_ERR_ENABLE	Reset State: 0x00000000
2	WQ_INVALID_ERR_ENABLE	Reset State: 0x00000000
1	WQ_FULL_ERR_ENABLE	Reset State: 0x00000000
0	NOT_ENOUGH_BD_PDU_WARNING_ENABLE	Reset State: 0x00000000

0x300000C BMU_ERR_INT_ADDR

Type: read-only
Reset State: 0x00000000

This register contains the BMU access address that caused the last error interrupt is generated This information is for debug purpose only

BMU_ERR_INT_ADDR

Bits	Name	Description
31:0	BMU_ERR_ACCESS_ADDRESS	Reset State: 0x00000000

0x3000010 BMU_ERR_INT_WDATA

Type: read-only
Reset State: 0x00000000

This register contains the BMU access wdata that caused the last error interrupt is generated. This information is for debug purpose only The data in here is only valid when 'BMU_access_direction' in register Err_Intr_STATUS is set.

BMU_ERR_INT_WDATA

Bits	Name	Description
31:0	BMU_ERR_ACCESS_WDATA	Reset State: 0x00000000

0x3000014 BMU_BD_PDU_THRESHOLD0

Type: read-write
Reset State: 0x00000035

Controls the bd_pdu_available[0] signal to RXP. If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[0] signal to the RXP will not be set, causing that master to stall. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD0

Bits	Name	Description
31:16	PDU_THRESHOLD_0	Reset State: 0x00000000
10:0	BD_THRESHOLD_0	Reset State: 0x00000035

0x3000018 BMU_BD_PDU_THRESHOLD1

Type: read-write
Reset State: 0x00000001

Controls the bd_pdu_available[1] signal to DPU. If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[1] signal to the DPU will not be set,

causing that master to stall. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD1

Bits	Name	Description
31:16	PDU_THRESHOLD_1	Reset State: 0x00000000
10:0	BD_THRESHOLD_1	Reset State: 0x00000001

0x300001C BMU_BD_PDU_THRESHOLD2

Type: read-write
Reset State: 0x00000001

Controls the bd_pdu_available[2] signal to DPU. If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[2] signal to the DPU will not be set, causing that master to stall. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD2

Bits	Name	Description
31:16	PDU_THRESHOLD_2	Reset State: 0x00000000
10:0	BD_THRESHOLD_2	Reset State: 0x00000001

0x3000020 BMU_BD_PDU_THRESHOLD3

Type: read-write
Reset State: 0x00000001

Controls the bd_pdu_available[3]. The assignment/usage of this signal is programmable. It could be used by software or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[3] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD3

Bits	Name	Description
31:16	PDU_THRESHOLD_3	Reset State: 0x00000000
10:0	BD_THRESHOLD_3	Reset State: 0x00000001

0x3000024 BMU_BD_PDU_THRESHOLD4

Type: read-write
Reset State: 0x00000028

Controls the bd_pdu_available[4]. The assignment/usage of this signal is programmable. It could be used by software or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[4] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD4

Bits	Name	Description
31:16	PDU_THRESHOLD_4	Reset State: 0x00000000
10:0	BD_THRESHOLD_4	Reset State: 0x00000028

0x3000028 BMU_BD_PDU_THRESHOLD5

Type: read-write
Reset State: 0x00000028

Controls the bd_pdu_available[5]. The assignment/usage of this signal is programmable. It could be used by software or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[5] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD5

Bits	Name	Description
31:16	PDU_THRESHOLD_5	Reset State: 0x00000000
10:0	BD_THRESHOLD_5	Reset State: 0x00000028

0x300002C BMU_BD_PDU_THRESHOLD6

Type: read-write
Reset State: 0x00000001

Controls the bd_pdu_available[6]. The assignment/usage of this signal is programmable. It could be used by software or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[6] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD6

Bits	Name	Description
31:16	PDU_THRESHOLD_6	Reset State: 0x00000000
10:0	BD_THRESHOLD_6	Reset State: 0x00000001

0x3000030 BMU_BD_PDU_THRESHOLD7

Type: read-write
Reset State: 0x00000029

Controls the bd_pdu_available[7]. The assignment/usage of this signal is programmable. It could be used by software or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[7] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD7

Bits	Name	Description
31:16	PDU_THRESHOLD_7	Reset State: 0x00000000
10:0	BD_THRESHOLD_7	Reset State: 0x00000029

0x3000034 BMU_BD_PDU_THRESHOLD8

Type: read-write
Reset State: 0x00000029

Controls the bd_pdu_available[8]. The assignment/usage of this signal is programmable. It could be used by software or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[8] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD8

Bits	Name	Description
31:16	PDU_THRESHOLD_8	Reset State: 0x00000000
10:0	BD_THRESHOLD_8	Reset State: 0x00000029

0x3000038 BMU_BD_PDU_THRESHOLD9

Type: read-write
Reset State: 0x000003FF

Controls the bd_pdu_available[9]. The assignment/usage of this signal is programmable. It could be used by software or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[9] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD9

Bits	Name	Description
31:16	PDU_THRESHOLD_9	Reset State: 0x00000000
10:0	BD_THRESHOLD_9	Reset State: 0x000003FF

0x300003C BMU_BD_PDU_THRESHOLD10

Type: read-write
Reset State: 0x000003FF

Controls the bd_pdu_available[10]. The assignment/usage of this signal is programmable. It could be used by software or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_available[10] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The software programmers guide will have guidance on how to program these values.

BMU_BD_PDU_THRESHOLD10

Bits	Name	Description
31:16	PDU_THRESHOLD_10	Reset State: 0x00000000
10:0	BD_THRESHOLD_10	Reset State: 0x000003FF

0x3000040 BMU_BD_PDU_RESERVED0

Type: read-only
Reset State: 0x00000000

Indicates how many BDs or PDUs have been reserved by the RXP A module can use the BMU command Idle BD and PDU reservation request to have the BMU set aside a number of BDs and PDUs for that module. These BDs and PDUs will only be set aside if this does not violate the 'BD and PDU threshold values that were set aside for this master. This register gives inside into how many BDs and PDUs have been set aside to this master. This number will decrement each time the module gets a BD or PDU.

BMU_BD_PDU_RESERVED0

Bits	Name	Description
31:16	NUMBER_RESERVED_PDU	Reset State: 0x00000000
10:0	NUMBER_RESERVED_BD	Reset State: 0x00000000

0x3000044 BMU_BD_PDU_RESERVED1

Type: read-only
Reset State: 0x00000000

Indicates how many BDs or PDUs have been reserved by the DPU A module can use the BMU command Idle BD and PDU reservation request to have the BMU set aside a number of BDs and PDUs for that module. These BDs and PDUs will only be set aside if this does not violate the 'BD and PDU threshold values that were set aside for this master. This register gives inside into how many BDs and PDUs have been set aside to this master. This number will decrement each time the module gets a BD or PDU.

BMU_BD_PDU_RESERVED1

Bits	Name	Description
31:16	NUMBER_RESERVED_PDU	Reset State: 0x00000000
10:0	NUMBER_RESERVED_BD	Reset State: 0x00000000

0x3000048 BMU_BD_PDU_RESERVED2

Type: read-only
Reset State: 0x00000000

Indicates how many BDs or PDUs have been reserved by master 2 (software assignable) A module can use the BMU command Idle BD and PDU reservation request to have the BMU set aside a number of BDs and PDUs for that module. These BDs and PDUs will only be set aside if this does not violate the 'BD and PDU threshold values that were set aside for this master. This register gives inside into how many BDs and PDUs have been set aside to this master. This number will decrement each time the module gets a BD or PDU. Note that this can be used as a mechanism by software to set a number of PDUs and BDs aside for a particular DXE channel.

BMU_BD_PDU_RESERVED2

0x3000064 BMU_BD_PDU_RESERVED9

Type: read-only
Reset State: 0x00000000

Indicates how many BDs or PDUs have been reserved by master 9 (software assignable) A module can use the BMU command Idle BD and PDU reservation request to have the BMU set aside a number of BDs and PDUs for that module. These BDs and PDUs will only be set aside if this does not violate the 'BD and PDU threshold values that were set aside for this master. This register gives inside into how many BDs and PDUs have been set aside to this master. This number will decrement each time the module gets a BD or PDU. Note that this can be used as a mechanism by software to set a number of PDUs and BDs aside for a particular DXE channel.

BMU_BD_PDU_RESERVED9

Bits	Name	Description
31:16	NUMBER_RESERVED_PDU	Reset State: 0x00000000
10:0	NUMBER_RESERVED_BD	Reset State: 0x00000000

0x3000068 BMU_BD_PDU_RESERVED10

Type: read-only
Reset State: 0x00000000

Indicates how many BDs or PDUs have been reserved by master 10 (software assignable) A module can use the BMU command Idle BD and PDU reservation request to have the BMU set aside a number of BDs and PDUs for that module. These BDs and PDUs will only be set aside if this does not violate the 'BD and PDU threshold values that were set aside for this master. This register gives inside into how many BDs and PDUs have been set aside to this master. This number will decrement each time the module gets a BD or PDU. Note that this can be used as a mechanism by software to set a number of PDUs and BDs aside for a particular DXE channel.

BMU_BD_PDU_RESERVED10

Bits	Name	Description
31:16	NUMBER_RESERVED_PDU	Reset State: 0x00000000
10:0	NUMBER_RESERVED_BD	Reset State: 0x00000000

0x300006C BMU_WQ_ENABLE

Type: read-write
Reset State: 0x00000000

Controls which WQ will be enabled. These WQs should be enabled during initialization, after the BD and PDU idle lists have been created and all head an tail pointers for the to be enabled WQs have been configured. The number of WQs to be enabled need to be decided at that time. Once enabled, a WQ should never be disable again, as this can cause BD and PDU leaks. Bit 0 corresponds to WQ0, Bit 26 corresponds to WQ 26.

BMU_WQ_ENABLE

Bits	Name	Description
26:0	WQ_ENABLE	WQ0: Assigned for Idle BD. WQ1: Assigned for Idle PDU WQ2: Assigned for mCPU RX WQ WQ3: Can be assigned to DPU, DXE or mCPU WQ4: Can be assigned to DPU, DXE or mCPU WQ5: Can be assigned to DPU, DXE or mCPU WQ6: Can be assigned to DPU, DXE or mCPU WQ7: Can be assigned to DPU, DXE or mCPU WQ8: Can be assigned to DPU, DXE or mCPU WQ9: Can be assigned to DPU, DXE or mCPU WQ10: Can be assigned to DPU, DXE or mCPU WQ11: Can be assigned to DXE or mCPU WQ12: Can be assigned to DXE or mCPU WQ13: Can be assigned to DXE or mCPU WQ14: Can be assigned to DXE or mCPU WQ15: Can be assigned to DXE or mCPU WQ16: Can be assigned to DXE or mCPU WQ17: Not supported in Volans WQ18: Not supported in Volans WQ19: Not supported in Volans WQ20: Not supported in Volans WQ21: Not supported in Volans WQ22: Not supported in Volans WQ23: Can be assigned to mCPU WQ24: Can be assigned to mCPU, or ADU WQ25: High priority entrance WQ for the BTQM (BMU Transmit Queue Manager) WQ26: Low priority entrance WQ for the BTQM (BMU Transmit Queue Manager) Reset State: 0x00000000

0x3000070 BMU_DPU_WQ_ASSIGNMENT

Type: read-write
Reset State: 0x00000809

WQs 3 to 10 can be assigned to the DPU. This register controls if they are assigned to the DPU and if so, in which direction: TX or RX By default, WQ 3 is enabled and assigned to the TX side of the DPU By default, WQ 4 is enabled and assigned to the RX side of the DPU

BMU_DPU_WQ_ASSIGNMENT

Bits	Name	Description
15	WQ10_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 10 is assigned to the DPU. When set, WQ 10 is assigned to the TX side of the DPU When NOT set, WQ 10 is assigned to the RX side of the DPU Reset State: 0x00000000
14	WQ9_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 9 is assigned to the DPU. When set, and WQ 9 is assigned to the TX side of the DPU When NOT set, WQ 9 is assigned to the RX side of the DPU Reset State: 0x00000000
13	WQ8_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 8 is assigned to the DPU. When set, and WQ 8 is assigned to the TX side of the DPU When NOT set, WQ 8 is assigned to the RX side of the DPU Reset State: 0x00000000

BMU_DPU_WQ_ASSIGNMENT (cont.)

Bits	Name	Description
12	WQ7_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 7 is assigned to the DPU. When set, and WQ 7 is assigned to the TX side of the DPU When NOT set, WQ 7 is assigned to the RX side of the DPU Reset State: 0x00000000
11	WQ6_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 6 is assigned to the DPU. When set, and WQ 6 is assigned to the TX side of the DPU When NOT set, WQ 6 is assigned to the RX side of the DPU Reset State: 0x00000001
10	WQ5_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 5 is assigned to the DPU. When set, and WQ 5 is assigned to the TX side of the DPU When NOT set, WQ 5 is assigned to the RX side of the DPU Reset State: 0x00000000
9	WQ4_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 4 is assigned to the DPU. When set, and WQ 4 is assigned to the TX side of the DPU When NOT set, WQ 4 is assigned to the RX side of the DPU Reset State: 0x00000000
8	WQ3_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 3 is assigned to the DPU. When set, and WQ 3 is assigned to the TX side of the DPU When NOT set, WQ 3 is assigned to the RX side of the DPU Reset State: 0x00000000
7	WQ10_DPU_ASSIGNMENT_ENABLE	When set, WQ 10 is assigned to the DPU Reset State: 0x00000000
6	WQ9_DPU_ASSIGNMENT_ENABLE	When set, WQ 9 is assigned to the DPU Reset State: 0x00000000
5	WQ8_DPU_ASSIGNMENT_ENABLE	When set, WQ 8 is assigned to the DPU Reset State: 0x00000000
4	WQ7_DPU_ASSIGNMENT_ENABLE	When set, WQ 7 is assigned to the DPU Reset State: 0x00000000
3	WQ6_DPU_ASSIGNMENT_ENABLE	When set, WQ 6 is assigned to the DPU Reset State: 0x00000001
2	WQ5_DPU_ASSIGNMENT_ENABLE	When set, WQ 5 is assigned to the DPU Reset State: 0x00000000
1	WQ4_DPU_ASSIGNMENT_ENABLE	When set, WQ 4 is assigned to the DPU Reset State: 0x00000000
0	WQ3_DPU_ASSIGNMENT_ENABLE	When set, WQ 3 is assigned to the DPU Reset State: 0x00000001

0x3000074 BMU_TEST_CTRL

Type: read-write
Reset State: 0x00000000

Selects the test bus configuration from the BMU. Used for hardware debug only

BMU_TEST_CTRL

Bits	Name	Description
9:8	TESTBUS_BIT_SWAP_MODE	Controls how the 45 bmu testbus signals are mapped onto the output testbus signals Assignment TBD Reset State: 0x00000000
4:0	TEST_BUS_SEL	Enabled different testbusses in the BMU. Default assignment is gas other assignment TBD Reset State: 0x00000000

0x3000078 BMU_TEST_OUT_LOW

Type: read-only
Reset State: 0x00000000

This is read only register which contains the muxed out bmu_test bus. To select the test bus check the encoding in bmu test control register. test_bus_sel[2:0].

BMU_TEST_OUT_LOW

Bits	Name	Description
31:0	BMU_TEST_BUS	BMU test out bus bits [31:0] Reset State: 0x00000000

0x300007C BMU_TEST_OUT_HIGH

Type: read-only
Reset State: 0x00000000

This is read only register which contains the muxed out bmu_test bus. To select the test bus check the encoding in bmu test control register. test_bus_sel[2:0].

BMU_TEST_OUT_HIGH

Bits	Name	Description
31:0	BMU_TEST_BUS	BMU test out bus bits [43:32] Reset State: 0x00000000

0x3000080 BMU_GAS_CONFIGURATION

Type: read-write
Reset State: 0x000F7F0F

These are the configuration bits for the gas The default values should be OK This register is provided as a backup

BMU_GAS_CONFIGURATION

Bits	Name	Description
19:16	GAS_CFG_HREADY_LIMIT	Reset State: 0x0000000F
15:8	GAS_CFG_HSPLIT_RESP_LIMIT	Reset State: 0x0000007F
7:0	GAS_CFG_HSPLIT_MST_RESP_LIMIT	Reset State: 0x0000000F

0x3000084 BMU_AVAILABLE_BD_PDU_AFTER_RSV

Type: read-only
Reset State: 0x00000000

This register can be used to find out how many idle PDUs and BDs are actually available from the BD and PDU idle list when the number of reserved BDs and PDUs for all the different modules have been taken into account.

BMU_AVAILABLE_BD_PDU_AFTER_RSV

Bits	Name	Description
31:16	AVAILABLE_PDUS	Reset State: 0x00000000
15:0	AVAILABLE_BDS	Reset State: 0x00000000

0x3000088 BMU_CONTROL2

Type: read-write
Reset State: 0x00000001

This register can be used to control bmu A-MSDU support BD/PDU integrity checking by the BMU To enable rxp_bmu_dxe_datalength for DXE wq byte count To enable enhanced reserve all command To enable priority based BD/PDU reservation

BMU_CONTROL2

Bits	Name	Description
31	FREEZE_ONE_ERROR_LESS_STRICKED_ENABLE	When bit 'freeze_one_error' is set, and this bit is set, and an error is detected in the BMU, the BMU will freeze, but in a little less rigorous way then when this bit is not set. Get commands will still go through, and the BD/PDU available signals to the RXP and DPU will not be masked off. This will prevent DPU and RXP getting into some error state. Reset State: 0x00000000
7	BLOCK_RXP_PUSH_INTEGRITY_CHECK	When set, and 'push_data_integrity_check' is also set, the push integrity will be performed on all WQs except WQ 2. That is the WQ that RXP is pushing to. Reset State: 0x00000000
6	FREEZE_ONE_ERROR_ENABLE	When set, and an error is detected in the BMU, the BMU will freeze. That is, release commands are thrown away, get bd/dpu commands will not be successful anymore, and reservation request will return unsuccessful. All wq signals and bd/pdu available signals will be set to low. Reset State: 0x00000000
5	RELEASE_INTEGRITY_CHECK	When set, and a release command is received by the BMU, the BMU will check the integrity of the BD and linked PDUs. If a problem is found with the linked DPU pointers, an error is reported and the frame is not pushed into the WQ, so that the contents remains available for debugging Reset State: 0x00000000
4	PUSH_DATA_INTEGRITY_CHECK	When set, and a push command is received by the BMU, the BMU will check the integrity of the BD and linked PDUs. If a problem is found with the BD/DPU pointers, an error is reported and the frame is not pushed into the WQ, so that the contents remains available for debugging The index of the BD that caused the problem can be read in register: bmu_push_integrity_err_bd_index Reset State: 0x00000000
3	RXP_BMU_DXE_DATALEN_ENABLE	When set, any packet push from Rxp to Dxe, rxp_bmu_dxe_datalen is taken to calculate dxe data length Reset State: 0x00000000
2	ENHANCED_RESERVE_ALL_ENABLE	When set, reserve all command checks for TX memory threshold if tx_threshold is greater than BTQM memory size then it reserves min. of (tx_threshold - BTQM memory size, idle Packet memory size - requested module threshold) Reset State: 0x00000000
1	PRIORITY_BASED_RES_ENABLE	When set, enables priority based BD/PDU reservation command Reset State: 0x00000000

BMU_CONTROL2 (cont.)

Bits	Name	Description
0	AMSDU_RELEASE_SUPPORT_ENABLE	When set, the A-MSDU support for releasing PDUs from BDs is enabled. This means that the BMU will evaluate the setting of the PREV PDU index field in the BD. If this field is zero, the PDUs are release according to the head/tail and PDU count linked to the BD. When the PREV PDU index field is unequal to zero, the BMU will use this index as the 'tail' index of the list of PDUs to release. The amount of PDUs to release is set equal to PDU count minus 1. Reset State: 0x00000001

0x300008C BMU_DISABLE_WQ_DA

Type: read-write
Reset State: 0x00000000

This register can be used to disable the wq da available signals. In that case, modules will think that their WQ is empty.

BMU_DISABLE_WQ_DA

Bits	Name	Description
26:2	DISABLE_WQ_DA	Bit 2 corresponds with WQ 2, bit 3 with WQ 3 etc. When set, the wq da available signal to a WQ will always indicate that the WQ is empty. This overwrites any real amount of frames buffered in a WQ. Reset State: 0x00000000

0x3000090 BMU_DISABLE_BD_PDU_AVAIL

Type: read-write
Reset State: 0x00000000

This register can be used to disable the bd_pdu available signals. In that case, modules will think that no more BDs or PDUs are available, and will stall their operation

BMU_DISABLE_BD_PDU_AVAIL

Bits	Name	Description
10:0	DISABLE_BD_PDU_AVAIL	Bit 0 corresponds with master 0, bit 1 with master 1 etc. When set, the bd_pdu available signal to a master will always indicate that no BDs and PDUs are available. This overwrites any real amount of BDs or PDUs being available for that module. Reset State: 0x00000000

0x3000094 BMU_LAST_FOUR_POP_TRACE_CONTROL

Type: read-write
Reset State: 0x00000000

This register controls the enabling of the last 4 pop command tracing control. The POP command tracing can be enabled for one specific (programmable) WQ. It also provides insight into how many times a pop command was issues for the specified WQ

BMU_LAST_FOUR_POP_TRACE_CONTROL

Bits	Name	Description
31:16	POP_CMD_COUNT	The number of times a POP command was issued on the specified WQ. Reset State: 0x00000000
8	POP_TRACE_ENABLE	When set, the pop tracing functionality for the WQ as specified in field 'pop_trace_wq_index' is enabled. The BD indexes returned for the last 4 pop commands that were issued for the specified WQ, are captured in the registers: pop_cmd_trace_bd_index0, pop_cmd_trace_bd_index1, pop_cmd_trace_bd_index2 and pop_cmd_trace_bd_index3.The index in the pop_cmd_trace_bd_index0 is the BD index returned with the most recent pop command. Whenever the 'pop_trace_wq_index' field gets changed the pop trace functionality first needs to be disabled. That will clear the 4 stored indexes and the pop counter. Reset State: 0x00000000
4:0	POP_TRACE_WQ_INDEX	The WQ index for which the pop commands need to be traced Reset State: 0x00000000

0x3000098 BMU_POP_CMD_TRACE_BD_INDEX0

Type: read-only
Reset State: 0x00000000

This register contains a BD index returned as the result of a POP command on a specific WQ. See the description for the 'last_four_pop_trace_control' register for additional details.

BMU_POP_CMD_TRACE_BD_INDEX0

Bits	Name	Description
11:0	POP_BD_INDEX0	BD index Reset State: 0x00000000

0x300009C BMU_POP_CMD_TRACE_BD_INDEX1

Type: read-only
Reset State: 0x00000000

This register contains a BD index returned as the result of a POP command on a specific WQ. See the description for the 'last_four_pop_trace_control' register for additional details.

BMU_POP_CMD_TRACE_BD_INDEX1

Bits	Name	Description
11:0	POP_BD_INDEX1	BD index Reset State: 0x00000000

0x30000A0 BMU_POP_CMD_TRACE_BD_INDEX2

Type: read-only
Reset State: 0x00000000

This register contains a BD index returned as the result of a POP command on a specific WQ. See the description for the 'last_four_pop_trace_control' register for additional details.

BMU_POP_CMD_TRACE_BD_INDEX2

Bits	Name	Description
11:0	POP_BD_INDEX2	BD index Reset State: 0x00000000

0x30000A4 BMU_POP_CMD_TRACE_BD_INDEX3

Type: read-only
Reset State: 0x00000000

This register contains a BD index returned as the result of a POP command on a specific WQ. See the description for the 'last_four_pop_trace_control' register for additional details.

BMU_POP_CMD_TRACE_BD_INDEX3

Bits	Name	Description
11:0	POP_BD_INDEX3	BD index Reset State: 0x00000000

0x30000AC BMU_BMU_INTERNAL_MEM_TRACE_ADDR

Type: read-only
Reset State: 0x00000000

This register Indicates the head index pointer of where the last BMU command data was written to BMU internal memory

BMU_BMU_INTERNAL_MEM_TRACE_ADDR

Bits	Name	Description
10:0	BMU_INTERNAL_MEM_INDEX	internal BMU memory address that will be used next to store the internal BMU tracing BMU commands and data. In units of BD index. Reset State: 0x00000000

0x30000B0 BMU_RELEASE_ERROR_DETAILS

Type: read-only
Reset State: 0x00000000

When a release error is reported, this register contains PDU index values of current & previous PDUs that caused release error This is debug information

BMU_RELEASE_ERROR_DETAILS

Bits	Name	Description
31:0	RELEASE_ERROR_DETAILS	Bits 31:16 will indicate the previous PDU index Bits 15:0 will indicate the current PDU index Reset State: 0x00000000

0x30000B4 BMU_RELEASE_ERROR_DETAILS_LOW

Type: read-only
Reset State: 0x00000000

When a release error is reported, this register contains debug information

BMU_RELEASE_ERROR_DETAILS_LOW

Bits	Name	Description
23:0	RELEASE_ERROR_DETAILS_LOW	Bit 23: when set, indicates a release of PDU linked list is ongoing when NOT set, bit 22 indicates the ongoing command: Bit 22: when NOT set, indicates a release of BD-PDU command is ongoing when set, indicates a release is ongoing based on a push to the sink WQ: FF That means, this can be a BD-PDU release or a release based on a defrag BD. The BMU will first investigate what the BD type is and process is accordingly. Bits [15:0]: when bit 23 is set: PDU head index of the PDU linked list when bit 23 is NOT set: BD index Reset State: 0x00000000

0x30000B8 BMU_RELEASE_ERROR_DETAILS_HIGH

Type: read-only
Reset State: 0x00000000

When a release error is reported, this register contains debug information It only contains valid info when bit 23 of register release_error_details_low is set

BMU_RELEASE_ERROR_DETAILS_HIGH

Bits	Name	Description
23:0	RELEASE_ERROR_DETAILS_HIGH	Bits [23:16]: number of PDUs in the PDU linked list being released Bits [15:0]: PDU tail index of the PDU linked list Reset State: 0x00000000

0x30000BC BMU_RELEASE_FIFO_ENTRIES

Type: read-only
Reset State: 0x00000000

The register provides insight into how many entries in the release fifo have been used

BMU_RELEASE_FIFO_ENTRIES

Bits	Name	Description
15:8	NR_PDU_LINKS_CHECKED	When a release (integrity) check error is reported, this field can help debug the problem This field will indicate how many PDUs the integrity check has gone down the PDU linked list that is connected to the BD Reset State: 0x00000000
5:0	NR_USED_REL_FIFO_ENTRIES	Reset State: 0x00000000

0x30000C0 BMU_LAST_BD_PREFETCH_HEAD

Type: read-only
Reset State: 0x00000000

The register provides insight info what the last used bd prefetch head was. This information can be useful in case a linked BD list error is reported

BMU_LAST_BD_PREFETCH_HEAD

Bits	Name	Description
26:16	REMAINING_AVAILABLE_BD_FOR_PREFETCH_CNT	Reset State: 0x00000000
10:0	PREFETCH_HEAD_BD_INDEX	Reset State: 0x00000000

0x30000C4 BMU_BD_PREFETCH_HEAD_BD_LINK

Type: read-only
Reset State: 0x00000000

The register provides insight into which BD index was the bd prefetch head was pointing to This information can be useful in case a linked BD list error is reported

BMU_BD_PREFETCH_HEAD_BD_LINK

Bits	Name	Description
10:0	NEXT_PREFETCH_HEAD_BD_INDEX	Reset State: 0x00000000

0x30000C8 BMU_BMU_PUSH_INTEGRITY_ERR_BD_INDEX

Type: read-only
Reset State: 0x00000000

This register indicates the bd index of the BD that was pushed into a WQ, but the integrity check on the BD with linked PDUs failed

BMU_BMU_PUSH_INTEGRITY_ERR_BD_INDEX

Bits	Name	Description
10:0	INTEGRITY_ERR_BD_INDEX	BD index. Reset State: 0x00000000

0x30000CC BMU_BMU_WATCHDOG_TIMEOUT_TIME

Type: read-write
Reset State: 0x0000FFFF

This register indicates the timeout in nr of clock cycles when an ahb access has started but does not get finished

BMU_BMU_WATCHDOG_TIMEOUT_TIME

Bits	Name	Description
19:0	BMU_WATCHDOG_TIMEOUT_TIME	timeout time in nr of clk cycles. When set to zero, the watchdog functionality is disabled Reset State: 0x0000FFFF

0x30000D0 BMU_BMU_SM_STATES_ON_ERROR_LOW

Type: read-only
Reset State: 0x00000000

This register provides a snapshot of the bmu state machines when an error is reported.

BMU_BMU_SM_STATES_ON_ERROR_LOW

Bits	Name	Description
31:0	BMU_SM_STATES_ON_ERROR_LOW	[31:28] = encoded_release_pdu_ctrl_sm_state[3:0]; [27:25] = encoded_release_bd_ctrl_sm_state[2:0]; [24:22] = encoded_release_ctrl_sm_state[2:0]; [21:19] = encoded_pdu_prefetch_mgr_sm_state[2:0]; [18:15] = encoded_bd_prefetch_mgr_sm_state[3:0]; [14:12] = encoded_bd_pdu_mgr_sm_state[2:0]; [11:8] = encoded_integrity_check_state[3:0]; [7:4] = {1'b0, encoded_wq_mgr_state[2:0]}; [3:0] = encoded_gas_interface_sm_state; Reset State: 0x00000000

0x30000D4 BMU_BMU_SM_STATES_ON_ERROR_HIGH

Type: read-only
Reset State: 0x00000000

This register provides a snapshot of the bmu state machines when an error is reported.

BMU_BMU_SM_STATES_ON_ERROR_HIGH

Bits	Name	Description
31	ERROR_CAPTURED	when set, an error state has been captured Reset State: 0x00000000
12:0	BMU_SM_STATES_ON_ERROR_HIGH	[12] = bmu_mcu_err_int; [11] = freeze_bmu_state; [10:4] = test_bus_locally_prefetched_pdu_count[`BMU_HIGH_BIT_PREFETCH_MEM + 1:0]; [3:1] = encoded_prefetch_fifo_ctrl_sm_state[2:0]; [0] = encoded_release_pdu_ctrl_sm_state[4]; Reset State: 0x00000000

0x30000D8 BMU_BMU_PREFETCH_ERROR_DETAILS

Type: read-only
Reset State: 0x00000000

This register provides insight to the error that was reported on an reported prefetch error

BMU_BMU_PREFETCH_ERROR_DETAILS

Bits	Name	Description

31:0	BMU_PREFETCH_ERROR_DETAILS	rdgam_prefetch_pdu_rdata_valid [15:0] = used_pdu_head_index_reg [31:16] = rdgam_prefetch_pdu_rdata[15:0]
		tail_of_pdu_list_reached_based_on_tail_pointer [15:0] = used_pdu_head_index_reg; [23:16] = locally_prefetched_pdu_count_reg; [31:24] = pdu_count_available_for_prefetch[7:0];
		next_tail_of_pdu_list_reached_based_on_pdu_count [15:0] = used_pdu_head_index_reg; [31:16] = local_pdu_head_index_reg;
		Reset State: 0x00000000

0x30000DC BMU_CONTROL3

Type: read-write
Reset State: 0x00000000

This register can be used to control details for the bmu build in BD/PDU integrity checking. The enabling of the overall integrity check is controlled by bits in the control2 register. This register allows that check to tune in into specific WQs (for the push command check) or specific masters (for the release check).

BMU_CONTROL3

Bits	Name	Description
15	PUSH_INTEGRITY_FOR_SPECIF_MASTER_SELECTED	When set, the push WQ integrity check will only be performed on pushes to the WQ identified by "push_integrity_check_wq_nr". Reset State: 0x00000000
12:8	PUSH_INTEGRITY_CHECK_WQ_NR	This is the number of the WQ for which the BD/PDUs pushed into this WQ need to be checked for their integrity. Reset State: 0x00000000
7	RELEASE_INTEGRITY_FOR_SPECIF_MASTER_SELECTED	When set, the release BD/PDU integrity check will only be performed for the master identified by "release_integrity_check_master_id". Reset State: 0x00000000
5:0	RELEASE_INTEGRITY_CHECK_MASTER_ID	This is the id of the master from which the releases need to be checked for it's integrity. Reset State: 0x00000000

0x30000E0 BMU_CONTROL4

Type: read-write
Reset State: 0x00000F28

This register can be used to control the generation of the 'priority' signal to the DAHB arbiter who passes this on to the MIF. This priority setting will help BMU getting faster 'prioritized' access to the MIF memory over other (SYS, mCPU) interfaces to the MIF.

BMU_CONTROL4

Bits	Name	Description
31	PREFETCH_FIFO_ACCESS_PRIORITY_SET	When set, the prefetch fifo priority signal is set, resulting in the MIF giving priority to the DAHB accesses. Reset State: 0x00000000
30	RELEASE_FIFO_ACCESS_PRIORITY_SET	When set, the release fifo priority signal is set, resulting in the MIF giving priority to the DAHB accesses. Reset State: 0x00000000
29	PDU_PREFETCH_ACCESS_PRIORITY_SET	When set, the pdu based prefetch priority signal is set, resulting in the MIF giving priority to the DAHB accesses. Reset State: 0x00000000
28	BD_PREFETCH_ACCESS_PRIORITY_SET	When set, the bd based prefetch priority signal is set, resulting in the MIF giving priority to the DAHB accesses. Reset State: 0x00000000
22:16	NR_OF_PREFETCH_ENTRIES	The number of entries in the PDU prefetch fifo Reset State: 0x00000000

BMU_CONTROL4 (cont.)

Bits	Name	Description
11:8	PREFETCH_FIFO_ACCESS_PRIORITY_THRESHOLD	The 'priority' signal is set when the number of used PDU entries in the prefetch fifo gets below this threshold, and there are still PDUs left that can be prefetched When BMU is operating in the special mode where every 128 byte memory segment can be BD or PDU, the amount of the 'priority' signal is set when the prefetched BDs are below the threshold, and the PDU prefetch fifo has less then this threshold number of used entries. Reset State: 0x0000000F
6:0	RELEASE_FIFO_ACCESS_PRIORITY_THRESHOLD	The 'priority signal is set when the release fifo gets filled above this threshold Reset State: 0x00000028

0x30000E4 BMU_DPU_RSV_STATUS

Type: read-write
Reset State: 0x00000000

This register can be used to observe and clear pending reservation commands that were issued by the dpu to the BMU When a reservation command from the DPU is not granted, the nr of BDs and PDUs that were requested are remembered by the BMU. The BMU uses this number, together with the programmed BD/PDU threshold to control the generation of the bmu_pdu_bd_pdu_avail_for_rsv_req signals for the DPU.

BMU_DPU_RSV_STATUS

Bits	Name	Description
31	BMU_PDU_RX_BD_PDU_AVAIL_CLEAR	When set, will clear the pending DPU rx reservation Reset State: 0x00000000
30	BMU_PDU_RX_BD_PDU_AVAIL_FOR_RSV_REQ	Status of the bmu_pdu_rx_bd_pdu_avail_for_rsv_req signal to the dpu Reset State: 0x00000000
28:24	DPU_RX_PENDING_BD_RSV_REQ	The number of bds the dpu rx has requested Reset State: 0x00000000
23:16	DPU_RX_PENDING_PDU_RSV_REQ	The number of pdus the dpu rx has requested Reset State: 0x00000000
15	BMU_PDU_TX_BD_PDU_AVAIL_CLEAR	When set, will clear the pending DPU tx reservation Reset State: 0x00000000
14	BMU_PDU_TX_BD_PDU_AVAIL_FOR_RSV_REQ	Status of the bmu_pdu_tx_bd_pdu_avail_for_rsv_req signal to the dpu Reset State: 0x00000000
12:8	DPU_TX_PENDING_BD_RSV_REQ	The number of bds the dpu tx has requested Reset State: 0x00000000

BMU_DPU_RSV_STATUS (cont.)

Bits	Name	Description
7:0	DPU_TX_PENDING_PDU_RSV_REQ	The number of pdus the dpu tx has requested Reset State: 0x00000000

0x30000E8 BMU_RECEIVE_DEBUG_CONTROL

Type: read-write
Reset State: 0x00000000

These are debug control registers main for dropping incoming frames for the rxp when this is happening too fast

BMU_RECEIVE_DEBUG_CONTROL

Bits	Name	Description
31	DROP_STATUS	current status of the drop logic When set, frames for wq 2 will be dropped Reset State: 0x00000000
30:16	MIN_INTERVAL_BEFORE_DROP	See minimum_rx_interval_drop_enable Units is in clk cycles Reset State: 0x00000000
15:8	MAX_WQ_ENTRIES_BEFORE_DROP	See max_entries_drop_enable Reset State: 0x00000000
2	BD_WRITE_POINTER_CHECK_DISABLE	When set, the bd write command checks are disabled Reset State: 0x00000000
1	MAX_ENTRIES_DROP_ENABLE	When set, and a push command to the wq2 (RXP) is received which would bring the number of entries in the wq2 above the 'max_wq_entries_before_drop' threshold, the frame will be dropped. Reset State: 0x00000000
0	MINIMUM_RX_INTERVAL_DROP_ENABLE	When set, and 2 sequential push command to the wq2 (RXP) are received within the minimum interval as specified in 'min_interval_before_drop', the second frame will be dropped Reset State: 0x00000000

0x30000EC BMU_BMU_SPARE_REG

Type: read-write
Reset State: 0x00000000

These are reserved bits for future usage

BMU_BMU_SPARE_REG

Bits	Name	Description
15:0	BMU_SPARE_REG	Reset State: 0x00000000

0x30000F0 BMU_BTQM_CONTROL1

Type: read-write
Reset State: 0x00000000

controls BTQM (BMU Transmit Queue Manager) features

BMU_BTQM_CONTROL1

Bits	Name	Description
31	FAST_STAMEM_INIT_STATUS	When set, the fast sta-mem initialization is ongoing Reset State: 0x00000000
28	FAST_STA_MEM_INIT	Writing a 1 to this register bit, the BTQM will initialize the STA mem to all zeros, which means all staids are disabled. It is safest to immediately clear this bit after it was set. Reset State: 0x00000000
27	BTQM_COUNTERS_CLEAR	Writing a 1 to this register bit will clear the btqm related counters This register auto clears. Reset State: 0x00000000
26	CFG_MASK_OFF_APSD_SESSION_ENABLE	When set, the 'get_info_apsd_session_ongoing' signal will never be set. Reset State: 0x00000000
25	CFG_FIXED_BCN_QUEUE_DA_MAPPING	When set, the beacon queueid 0 will always be mapped to BO_DA0, beacon queueid 1 is mapped to BO_DA1, etc. When not set, the same mapping as for the NON beacon STAids is used. Reset State: 0x00000000
24	CFG_CORRECTED_ARBITRATION_ENABLED	When set, the arbitration logic treats the lowest STAid that has data among all STAids that have data for the same queueid, with the same priority as all the others STAids. When NOT set, the lowest STAid that has data among all STAids that have data for the same queueid, might get less opportunity to transmit Reset State: 0x00000000
23	TPE_STATS_BUSY_FLAG_SET_ON_FEEDBACK	When set, the ampdu stats busy signal will be set when a TPE feedback signal is received. It will only get cleared when a BA bitmap has been received and has been fully processed Reset State: 0x00000000
22	APSD_TRIGGER_PM_BIT_SETTING_ENABLE	When set, an incoming apsd frame that has an TID that is of the trigger category, is always considered to be setting the power save status of the STA, irrespective of the pm bit in the frame. Reset State: 0x00000000

BMU_BTQM_CONTROL1 (cont.)

Bits	Name	Description
21	PSPOLL_PM_BIT_SETTING_ENABLE	When set, an incoming pspoll frame is always considered to be setting the power save status of the STA, irrespective of the pm bit in the frame Reset State: 0x00000000
20	APSD_TRIGGER_PM_BIT_MASKING_ENABLE	When set, the PM bit from the received APSD trigger frame is masked off and not interpreted to (properly) indicate the power state of the transmitters STA Reset State: 0x00000000
19	PSPOLL_PM_BIT_MASKING_ENABLE	When set, the PM bit from the received PS-Poll frame is masked off and not interpreted to (properly) indicate the power state of the transmitters STA Reset State: 0x00000000
18	REGISTER_APSD_TRIGGER_WHEN_DA_AVAIL	When set, and QoS Null transmission is NOT enabled as response to an APSD trigger, the APSD trigger will only be registered when there is data in any of the delivery enabled queues Reset State: 0x00000000
17	REGISTER_PSPOLL_TRIGGER_WHEN_DA_AVAIL	When set, and Data Null transmission is NOT enabled as response to a PSPoll, the pspoll trigger will only be registered when there is data in a transmit queue Reset State: 0x00000000
16	ADVANCED_MORE_DATA_BIT_GENERATION_ENABLED	When set, data frames that are pushed into a transmit queue from which a transmission is happening, will be taken into account for the more data bit generation. Reset State: 0x00000000
15	COMBINED_SEARCH_ENABLED	When set, BEACON STA and NON BEACON sta search arbitration will happen in parallel as long as NO NON BEACON sta is in power save mode Reset State: 0x00000000
13	QOS_NULL_TID_SOURCE_IS_TRIGGER_TID	When set, and a qos null frame is transmitted, the TID inserted in the qos null frame is set to the tid field of the trigger frame received. When Not set, the TID inserted in the QoS Null frame will be based on the U-APSD queue with the highest queueid number. Reset State: 0x00000000
12	SW_PROCESSING_OF_PSPOLL_DATA_NULL_ENABLE	When set, and a valid PSPOLL is received, the reception will be registered in the STA descriptor, so that software can find out this trigger was received and the start the handling of it. Reset State: 0x00000000
11	SW_PROCESSING_OF_APSD_QOS_NULL_ENABLE	When set, and a valid APSD trigger is received, the trigger will be registered in the STA descriptor, so that software can find out this trigger was received and the start the handling of it. Reset State: 0x00000000
10	RANDOM_PSPOLL_APSD_TRIGGER_PRIORITY_SCHEDULE_ENABLE	When set, and a valid pspoll or APSD trigger is received, the STA has a 50% chance to be put close to the start of the transmit queue. Reset State: 0x00000000

BMU_BTQM_CONTROL1 (cont.)

Bits	Name	Description
9	PSPOLL_APSD_TRIGGER_PRIORITY_SCHEDULING_ENABLE	When set, and a valid pspoll or APSD trigger is received, the STA is put at close to the start of the transmit queue Reset State: 0x00000000
8	BD_PUSH_OWNERSHIP_CHECK_ENABLE	When set, the ownership check on all the push commands gets enabled Reset State: 0x00000000
7	BD_OWNERSHIP_ASSIGNMENT_DISABLE	When set, the BD_PDU manager module will stop updating the BD ownership assignment when a BD is taken out of the BD idle list and handed over to an other module. Disabling this feature reduces the overhead on the BD SRAM memory Reset State: 0x00000000
6	BD_OWNERSHIP_CHECK_ENABLE	When set, the will start assigning and tracking who owns a BD. There are 4 owners: 0: BD idle list 1: External module 2: WQ managed by the BMU 3: BTQM transmit WQ Reset State: 0x00000000
5	APSD_AMPDU_BA_SUPPORT_ENABLED	When set, the BTQM can handle BA policy transmissions while APSD is enabled. Frames can be aggregated in an AMPDU. Reset State: 0x00000000
4	BTQM_RXP_PWR_INTERFACE_ENABLE	When set, the BMU interface to the RXP related to the power state processing of a station processing is enabled Reset State: 0x00000000
3	BTQM_RXP_BA_INTERFACE_ENABLE	When set, the BMU interface to the RXP related to the Block Ack bitmap processing is enabled Reset State: 0x00000000
2	BTQM_TPE_INTERFACE_ENABLE	When set, the BMU interface to the TPE is enabled Reset State: 0x00000000
1	BTQM_QUEUEING_CTRL_LP_ENABLE	When set, the btqm will start popping frames out of the low priority BTQM entrance WQ 26 and pushing them into the Transmit WQs Reset State: 0x00000000
0	BTQM_QUEUEING_CTRL_HP_ENABLE	When set, the btqm will start popping frames out of the high priority BTQM entrance WQ 25 and pushing them into the Transmit WQs Reset State: 0x00000000

0x30000F4 BMU_BTQM_CONTROL2

Type: read-write
Reset State: 0x00000000

controls BTQM (BMU Transmit Queue Manager) features

BMU_BTQM_CONTROL2

Bits	Name	Description
31	CFG_BA_PARTIAL_BITMAP_UPDATE	When set, and an AMPDU session, if BA is received without sending BAR (Partial bitmap) and received BA SSN is greater than current SSN the frames are not dropped. Reset State: 0x00000000
30	CFG_SW_OWNERSHIP_HAS_PRIORITY	When set, the software access should be getting higher priority over the other ownership request accesses Reset State: 0x00000000
29	CFG_SENT_QOS_NULL_AFTER_EOSP_WITH_RETRY_DROP	When set, and an AMPDU session exchange with the TPE is ongoing for which the EOSP gets set, and any frame for which the EOSP was set gets dropped because the max retry count is reached, the BMU will set the internal' QoS data sent flag, so that when no BA is received in which frames get acknowledged, only one more QoS Null frame will be sent, and not any more data frames. Reset State: 0x00000000
28	CFG_DATA_NULL_SENT_HIGH_PRIORITY_ENABLE	When set, and a data null frame has been sent, but has not yet been acknowledged, the frame will be resent with high priority. Reset State: 0x00000000
27	CFG_QOS_NULL_SENT_HIGH_PRIORITY_ENABLE	When set, and a qos null frame has been sent, but has not yet been acknowledged, the frame will be resent with high priority. Reset State: 0x00000000
26	CFG_AMPDU_APSD_MISSING_EOSP_HANDLING_ENABLE	When set, more frames get acknowledged by an BA then the Remaining frame count and NO EOSP was sent (which should not have happened), the BTQM will force a QOS NULL to be sent next, with the EOSP bit set. Reset State: 0x00000000
25	CFG_END_APSD_AFTER_BA_APSD_EOSP_SENT	When set, and an APSD session with BA is ongoing and an EOSP was set, and the BA gets received, the APSD session will be ended independent of how many frames were acknowledged Reset State: 0x00000000
24	CFG_SEND_QOSNULL_AFTER_BA_APSD_EOSP_SENT	When set, and an APSD session with BA is ongoing and an EOSP was set, and the BA gets received, a QoS null will be sent if the BA is not confirming all frames to be ACKED. Reset State: 0x00000000
10:0	BTQM_QUEUEID_QUEUE_ENABLE	When set, the corresponding queueid transmission is enabled. Bit zero corresponds with queueid0 This register allows high level blocking of all the transmission of frames out of a particular queueid Reset State: 0x00000000

0x30000F8 BMU_BTQM_STATUS

Type: read-only
Reset State: 0x00000000

This register indicates the status of several BTQM features

BMU_BTQM_STATUS

Bits	Name	Description
3	BTQM_TPE_INT_STATUS	When set, the BTQM TPE interface is active providing the TPE queue related information. Reset State: 0x00000000
2	BTQM_ARBITER_STATUS	When set, the BTQM arbiter is active searching for the next STA to transmit a new frame from Reset State: 0x00000000
1	BTQM_BA_HANDLER_STATUS	When set, the BTQM Block Ack handler is processing a Block ACK bitmap Reset State: 0x00000000
0	BTQM_QUEUE_CTRL_STATUS	When set, the BTQM queue controller is active popping a frame out of one of the BTQM entrance WQs and pushing them into the transmit WQs Reset State: 0x00000000

0x30000FC BMU_BTQM_STA_ENABLE_DISABLE_CONTROL

Type: read-write
Reset State: 0x00000000

Controls the enabling or disabling of a STA Whenever a value is written into this register, the BTQM will process the STA settings that came with it. A status bit will indicate if the BTQM is still processing an 'update' command. The next update command should not be issued till the status bit has been cleared. Note that this can sometimes take quite a while. If for example just before a STA-disable command, a transmit exchange sequence with that STA had started, that transmit exchange sequence will be allowed to finish first. This is done to prevent abnormal abortion of sequences.

BMU_BTQM_STA_ENABLE_DISABLE_CONTROL

Bits	Name	Description
31	STA_UPDATE_STATUS	When set to one, BTQM is processing the last STAid configuration command written to this register. Reset State: 0x00000000

BMU_BTQM_STA_ENABLE_DISABLE_CONTROL (cont.)

Bits	Name	Description
10:8	STA_CONFIGURATION_COMMAND	0x0: Enable the transmit queues, but do NOT enable transmission 001: Enable the transmit queues, AND enable transmission 010: Disable the transmit queues AND disable transmission 011: Disable the transmit queues AND disable transmission AND cleanup any data left in the transmit queues 100: Clear the fileds related to control frames (ps-poll bit, apsd trigger bit, data null sent bit, qos null sent bit, remaining apsd frame count and eosp sent bit 101: Disable transmission, but leave transmit queues enabled AND clear the fields related to control frames ps-poll bit, apsd trigger bit, data null sent bit, qos null sent bit, remaining apsd frame count and eosp sent bit 110: Disable transmission, but leave transmit queues enabled) Reset State: 0x00000000
3:0	STAID	The STAid for which the STA operation is intended. Reset State: 0x00000000

0x3000100 BMU_TRANSMIT_QUEUE_ACCESS_CONTROL1

Type: read-write
Reset State: 0x00000000

Selects the queue to access

BMU_TRANSMIT_QUEUE_ACCESS_CONTROL1

Bits	Name	Description
11:8	QUEUEID	Reset State: 0x00000000
3:0	STAID	Reset State: 0x00000000

0x3000104 BMU_TRANSMIT_QUEUE_ACCESS_CONTROL2

Type: read-write
Reset State: 0x00000000

Part 1 of the queue information to write back to the bmu Note that this format corresponds to the first word of the TX queue info in MIF memory

BMU_TRANSMIT_QUEUE_ACCESS_CONTROL2

Bits	Name	Description
31	PREV_TX_DROP_SETTING	Reset State: 0x00000000
30	BAR_REQ_SETTING	Reset State: 0x00000000

BMU_TRANSMIT_QUEUE_ACCESS_CONTROL2 (cont.)

Bits	Name	Description
10:0	NR_OF_FRAMES_IN_QUEUE	Reset State: 0x00000000

0x3000108 BMU_TRANSMIT_QUEUE_ACCESS_CONTROL3

Type: read-write
Reset State: 0x00000000

Part 2 of the queue information to write back to the bmu Note that this format corresponds to the second word of the TX queue info in MIF memory

BMU_TRANSMIT_QUEUE_ACCESS_CONTROL3

Bits	Name	Description
26:16	QUEUE_HEAD_BD_INDEX	Reset State: 0x00000000
10:0	QUEUE_TAIL_BD_INDEX	Reset State: 0x00000000

0x300010C BMU_TRANSMIT_QUEUE_ACCESS_CONTROL4

Type: read-write
Reset State: 0x80000000

controls what kind of access will happen on the transmit queue

BMU_TRANSMIT_QUEUE_ACCESS_CONTROL4

Bits	Name	Description
31	ACCESS_DONE	When set, the queue access control action has finished. Reset State: 0x00000001
0	READ_WRITE_CONTROL	Only valid when 'set_frame_drop_indication' is NOT set When 'read_write_control' is set to 1, a transmit queue read access is initialized The read result will be available in registers 'transmit_queue_access_control5' and 6, after the 'access done' bit is set. When set to 0, a transmit queue write access is initialized. The data that is present in the registers 'transmit_queue_access_control1' and 2, is written back to the transmit queue maintained by the BTQM Reset State: 0x00000000

0x3000110 BMU_TRANSMIT_QUEUE_ACCESS_CONTROL5

Type: read-only
Reset State: 0x00000000

Part 1 of the queue information read from the bmu. Only valid after the 'access done' bit is set in 'transmit_queue_access_control4' Note that this format corresponds to the firxt word of the TX queue info in MIF memory

BMU_TRANSMIT_QUEUE_ACCESS_CONTROL5

Bits	Name	Description
31	PREV_TX_DROP_SETTING	Reset State: 0x00000000
30	BAR_REQ_SETTING	Reset State: 0x00000000
10:0	NR_OF_FRAMES_IN_QUEUE	Reset State: 0x00000000

0x3000114 BMU_TRANSMIT_QUEUE_ACCESS_CONTROL6

Type: read-only
Reset State: 0x00000000

Part 2 of the queue information read from the bmu. Only valid after the 'access done' bit is set in 'transmit_queue_access_control4' Note that this format corresponds to the second word of the TX queue info in MIF memory

BMU_TRANSMIT_QUEUE_ACCESS_CONTROL6

Bits	Name	Description
26:16	QUEUE_HEAD_BD_INDEX	Reset State: 0x00000000
10:0	QUEUE_TAIL_BD_INDEX	Reset State: 0x00000000

0x3000118 BMU_BD_INDEX_INFO_ACCESS_CONTROL1

Type: read-write
Reset State: 0x00000000

Selects the bd index to access

BMU_BD_INDEX_INFO_ACCESS_CONTROL1

Bits	Name	Description
31	BD_INDEX_INFO_ACCESS_STATUS	When set, the BD index memory access is ongoing. The read data will not be valid until this bit is cleared. No new bd index command should be given when this bit is set. Reset State: 0x00000000
16	BD_INDEX_UPDATE	When set, the BD index info in BMU memory will be updated with the data given in registers 'bd_index_info_access_control2 - 4' When NOT set, the BD index info will be read from the BMU memory and will be made available in registers: 'bd_index_info_access_control5 - 7' Reset State: 0x00000000
10:0	BD_INDEX	The bd index for which the BD index info needs to be read or written Reset State: 0x00000000

0x300011C BMU_BD_INDEX_INFO_ACCESS_CONTROL2

Type: read-write
Reset State: 0x00000000

Part 1 of the bd index information to write back to the bmu

BMU_BD_INDEX_INFO_ACCESS_CONTROL2

Bits	Name	Description
31:0	BD_INDEX_INFO_0	Reset State: 0x00000000

0x3000120 BMU_BD_INDEX_INFO_ACCESS_CONTROL3

Type: read-write
Reset State: 0x00000000

Part 2 of the bd index information to write back to the bmu

BMU_BD_INDEX_INFO_ACCESS_CONTROL3

Bits	Name	Description
31:0	BD_INDEX_INFO_1	Reset State: 0x00000000

0x3000124 BMU_BD_INDEX_INFO_ACCESS_CONTROL4

Type: read-write
Reset State: 0x00000000

Part 3 of the bd index information to write back to the bmu

BMU_BD_INDEX_INFO_ACCESS_CONTROL4

Bits	Name	Description
5:0	BD_INDEX_INFO_2	Reset State: 0x00000000

0x3000128 BMU_BD_INDEX_INFO_ACCESS_CONTROL5

Type: read-only
Reset State: 0x00000000

Part 1 of the bd index information read from the bmu. Only valid after the 'access done' bit is set in 'bd_index_info_access_control5'

BMU_BD_INDEX_INFO_ACCESS_CONTROL5

Bits	Name	Description
31:0	BD_INDEX_INFO_0	Reset State: 0x00000000

0x300012C BMU_BD_INDEX_INFO_ACCESS_CONTROL6

Type: read-only
Reset State: 0x00000000

Part 2 of the bd index information read from the bmu. Only valid after the 'access done' bit is set in 'bd_index_info_access_control5'

BMU_BD_INDEX_INFO_ACCESS_CONTROL6

Bits	Name	Description
31:0	BD_INDEX_INFO_1	Reset State: 0x00000000

0x3000130 BMU_BD_INDEX_INFO_ACCESS_CONTROL7

Type: read-only
Reset State: 0x00000000

Part 3 of the bd index information read from the bmu. Only valid after the 'access done' bit is set in 'bd_index_info_access_control5'

BMU_BD_INDEX_INFO_ACCESS_CONTROL7

Bits	Name	Description
5:0	BD_INDEX_INFO_2	Reset State: 0x00000000

0x3000134 BMU_BAR_AND_FRAME_DROP_CONTROL

Type: read-write
Reset State: 0x00000000

controls bar indication and frame drop indication This operation complete is indicated by setting bit-31 of transmit_queue_access_control4 register

BMU_BAR_AND_FRAME_DROP_CONTROL

Bits	Name	Description
2	SET_QUEUE_BAR_INDICATION	When set to 1, the BTQM will force the 'BAR request' setting in the indicated transmit queue to be set. This feature should be used when a Block ack session is to be initialized, and with the 'BAR request' setting set, the TPE will be forced to first transmit a BAR frame. Reset State: 0x00000000
1	SET_FRAME_DROP_INDICATION	When set to 1, the BTQM will force the 'drop frame' setting in the indicated transmit queue to be set. Reset State: 0x00000000

0x3000138 BMU_TX_QUEUE_STAID_QUEUEID_CONFIG

Type: read-write
Reset State: 0x00000000

controls the valid STAid and queueid ranges

BMU_TX_QUEUE_STAID_QUEUEID_CONFIG

Bits	Name	Description
19:16	MAX_VALID_QUEUEID	The maximum allowed queueid. When a frame is pushed to a transmit WQ for a queueid higher then the programmed value, an error indication will be generated. Reset State: 0x00000000

BMU_TX_QUEUE_STAID_QUEUEID_CONFIG (cont.)

Bits	Name	Description
11:8	MAX_VALID_STAID	The maximum allowed staid. When a frame is pushed to a transmit WQ for a STAid higher then the programmed value, an error indication will be generated. Reset State: 0x00000000
3:0	NR_OF_BEACON_STAIDS	The number of staids set aside for beacon handling The STAids reserved start from 0. A number of 5 programmed here, means STAids 0, 1, 2, 3, and 4 are set aside for beacon transmission Reset State: 0x00000000

0x300013C BMU_ENHANCED_TRACING_CONTROL1

Type: read-write
Reset State: 0x00000000

Control for the enhance gen5/6 hardware tracing capabilities

BMU_ENHANCED_TRACING_CONTROL1

Bits	Name	Description
31	SW_BMU_HWTRACE_ENABLE	Implemented: When set, tracing is enabled for software data Reset State: 0x00000000
30	BTQM_ARBITER_SEARCH_HWTRACE_ENABLE	Implemented: When set, tracing is enabled for btqm next STA/qid transmission selection Reset State: 0x00000000
29	BTQM_PWR_STATE_HWTRACE_ENABLE	Implemented: When set, tracing is enabled for receive frames pwr state handling Reset State: 0x00000000
28	TPE_BMU_HWTRACE_ENABLE	Implemented: When set, tracing is enabled for signals from the TPE module Reset State: 0x00000000
27	GET_BD_PDU_TRACE_FOR_PDU_ENABLE	Implemented: When set, get bd and pdu command tracing is enabled for GET commands that request at least one PDU Reset State: 0x00000000
26	NAV_UPDATE_TRACE_ENABLE	Implemented: When set, NAV updated (setting or clearing) are registered Reset State: 0x00000000
25	PHYTX_IDLE_TRACE_ENABLE	Implemented: When set, phytx idle level changes are registered Reset State: 0x00000000
24	RXP_PKDET_N_TRACE_ENABLE	Implemented: When set, pktdet_n level changes are registered Reset State: 0x00000000

BMU_ENHANCED_TRACING_CONTROL1 (cont.)

Bits	Name	Description
23	RXP_SECONDARY_CCA_TRACE_ENABLE	Implemented: When set, secondary cca level changes are registered Reset State: 0x00000000
22	RXP_PRIMARY_CCA_TRACE_ENABLE	Implemented: When set, primary cca level changes are registered Reset State: 0x00000000
21	RXP_RPE_BITMAP_UPDATE_TRACE_ENABLE	Implemented: When set, rxp - rpe bitmap update interaction is registered Reset State: 0x00000000
20	RXP_RPE_DUPL_DETECT_TRACE_ENABLE	Implemented: When set, rxp - rpe dupl detect interaction is registered Reset State: 0x00000000
19	BTQM_QUEUEING_CTRL	Implemented: When set, popping of frames by the BTQM transmit queue controller of frames pushed into the BTQM entrance WQs are registered Reset State: 0x00000000
18	TPE_FEEDBACK_CMD_TRACE_ENABLE	Implemented: When set, tpe feedback info is registered Reset State: 0x00000000
17	TPE_GET_BDIDX_CMD_TRACE_ENABLE	Implemented: When set, tpe bd index info command are registered Reset State: 0x00000000
16	TPE_GET_LENGTH_CMD_TRACE_ENABLE	Implemented: When set, tpe get length info command are registered Reset State: 0x00000000
15	TPE_GET_INFO_CMD_TRACE_ENABLE	Implemented: When set, tpe get info command are registered Reset State: 0x00000000
14	DETAILED_BD_IDLE_LIST_PUSH_HW_TRACE_ENABLE	Implemented: When set, every push to the bd idle list is registered Reset State: 0x00000000
13	BTQM_QUEUEING_DROP_FRAME_TRACE_ENABLE	Implemented: When set, frame drops by the BTQM queue controller tracing is enabled Reset State: 0x00000000
12	RELEASE_TPE_INT_FRAME_TRACE_ENABLE	Implemented: When set, release frames from tpe interface tracing is enabled Reset State: 0x00000000
11	RELEASE_DISABLED_STA_QUEUE_TRACE_ENABLE	Implemented: When set, release disabled_sta queue command tracing is enabled Reset State: 0x00000000
10	RELEASE_BA_DROP_TRACE_ENABLE	When set, release ba_drop command tracing is enabled Reset State: 0x00000000
9	RELEASE_SINK_CMD_TRACE_ENABLE	Implemented: When set, release sink command tracing is enabled Reset State: 0x00000000

BMU_ENHANCED_TRACING_CONTROL1 (cont.)

Bits	Name	Description
8	RELEASE_BD_PDU_CMD_TRACE_ENABLE	Implemented: When set, release bd_pdu command tracing is enabled Reset State: 0x00000000
7	RELEASE_PDU_CMD_TRACE_ENABLE	Implemented: When set, release pdu command tracing is enabled Reset State: 0x00000000
6	RELEASE_BD_CMD_TRACE_ENABLE	Implemented: When set, release bd command tracing is enabled Reset State: 0x00000000
5	BD_PDU_RESERVATION_TRACE_ENABLE	Implemented: When set, bd pdu reservation command tracing is enabled Reset State: 0x00000000
4	GET_BD_PDU_TRACE_FOR_BD_ENABLE	Implemented: When set, get bd and pdu command tracing is enabled for GET commands that request at least one BD Reset State: 0x00000000
3	PUSH_CMD_TRACE_ENABLE	Implemented: When set, push command tracing is enabled Reset State: 0x00000000
2	POP_CMD_TRACE_ENABLE	Implemented: When set, pop command tracing is enabled Reset State: 0x00000000
1	TRACE_FREEZE_ON_ERR	Implemented: When set, the tracing memory will freeze when the bmu detects an internal error for which an BMU error interrupt was enabled. Reset State: 0x00000000
0	ENHANCED_TRACING_ENABLE	Implemented: When set, all legacy (gen 4) modes of BMU HW-TRACING are disabled, and the new mode is enabled. In this mode all legacy tracing control bit settings are discarded Reset State: 0x00000000

0x3000140 BMU_BTQM_QUEUE_INFO_BASE_ADDR

Type: read-write
Reset State: 0x00000000

sets the memory address location where the BTQM is going to find the transmit queues

BMU_BTQM_QUEUE_INFO_BASE_ADDR

Bits	Name	Description
31:2	ADDRESS	The memory address where the BTQM is going to find the transmit queues Reset State: 0x00000000

0x3000144 BMU_QOS_QUEUEID_MAPPING1

Type: read-write
Reset State: 0x000000FF

indicates to the BMU which queueids contain QoS frames

BMU_QOS_QUEUEID_MAPPING1

Bits	Name	Description
10:0	QOS_SETTING	When a bit is set, the corresponding queueid will contain QoS frames Reset State: 0x000000FF

0x3000148 BMU_QOS_QUEUEID_MAPPING2

Type: read-write
Reset State: 0x76543210

indicates to the BMU what QoS TID frames are located in a queue. This setting is only valid for a queueid, if the corresponding 'qos_setting' bit for that queue is set.

BMU_QOS_QUEUEID_MAPPING2

Bits	Name	Description
31:28	TID_FOR_QUEUEID7	Reset State: 0x00000007
27:24	TID_FOR_QUEUEID6	Reset State: 0x00000006
23:20	TID_FOR_QUEUEID5	Reset State: 0x00000005
19:16	TID_FOR_QUEUEID4	Reset State: 0x00000004
15:12	TID_FOR_QUEUEID3	Reset State: 0x00000003
11:8	TID_FOR_QUEUEID2	Reset State: 0x00000002
7:4	TID_FOR_QUEUEID1	Reset State: 0x00000001
3:0	TID_FOR_QUEUEID0	Reset State: 0x00000000

0x300014C BMU_QOS_QUEUEID_MAPPING3

Type: read-write
Reset State: 0x00000000

indicates to the BMU what QoS TID frames are located in a queue. This setting is only valid for a queueid, if the corresponding 'qos_setting' bit for that queue is set.

BMU_QOS_QUEUEID_MAPPING3

Bits	Name	Description
11:8	TID_FOR_QUEUEID10	Reset State: 0x00000000
7:4	TID_FOR_QUEUEID9	Reset State: 0x00000000
3:0	TID_FOR_QUEUEID8	Reset State: 0x00000000

0x3000154 BMU_QUEUEID_BO_MAPPING1

Type: read-write
Reset State: 0x44557667

indicates to the BMU how queueid are mapped to BO engines

BMU_QUEUEID_BO_MAPPING1

Bits	Name	Description
30:28	BO_FOR_QUEUEID7	Reset State: 0x00000004
26:24	BO_FOR_QUEUEID6	Reset State: 0x00000004
22:20	BO_FOR_QUEUEID5	Reset State: 0x00000005
18:16	BO_FOR_QUEUEID4	Reset State: 0x00000005
14:12	BO_FOR_QUEUEID3	Reset State: 0x00000007
10:8	BO_FOR_QUEUEID2	Reset State: 0x00000006
6:4	BO_FOR_QUEUEID1	Reset State: 0x00000006
2:0	BO_FOR_QUEUEID0	Reset State: 0x00000007

0x3000158 BMU_QUEUEID_BO_MAPPING2

Type: read-write
Reset State: 0x00000032

indicates to the BMU how queueid are mapped to BO engines

BMU_QUEUEID_BO_MAPPING2

Bits	Name	Description
10:8	BO_FOR_QUEUEID10	Reset State: 0x00000000
6:4	BO_FOR_QUEUEID9	Reset State: 0x00000003
2:0	BO_FOR_QUEUEID8	Reset State: 0x00000002

0x3000160 BMU_FAST_TRACE_READING_CONTROL

Type: read-write
Reset State: 0x00000000

Indicates the start bd index address from which fast trace reading should start programming this field set the trace reading head ptr automatically back to this programmed index

BMU_FAST_TRACE_READING_CONTROL

Bits	Name	Description
26:16	CURRENT_FAST_TRACE_BD_INDEX_ADDRESS	The current bd index used for the next bd index read. This value gets automatically updated to the 'fast_trace_start_bd_index_address' field when that is reprogrammed. This value also gets automatically updated to point to the trace table entry when 'fast_trace_reading_data2' register is read. The hardware takes care of 'wrapping around', when the end of the trace memory has been reached. Reset State: 0x00000000
10:0	FAST_TRACE_START_BD_INDEX_ADDRESS	Reset State: 0x00000000

0x3000164 BMU_FAST_TRACE_READING_DATA0

Type: read-only
Reset State: 0x00000000

returns the lower 32 bits of the bd index data of the bd index indicated in field: current_fast_trace_bd_index_address

BMU_FAST_TRACE_READING_DATA0

Bits	Name	Description
31:0	TRACE_DATA0	The lower 32 bits of the trace data Reset State: 0x00000000

0x3000168 BMU_FAST_TRACE_READING_DATA1

Type: read-only
Reset State: 0x00000000

returns the middle 32 bits of the bd index data of the bd index indicated in field: current_fast_trace_bd_index_address.

BMU_FAST_TRACE_READING_DATA1

Bits	Name	Description
31:0	TRACE_DATA1	The upper X bits of the trace data Reset State: 0x00000000

0x300016C BMU_FAST_TRACE_READING_DATA2

Type: read-only
Reset State: 0x00000000

returns the upper X bits of the bd index data of the bd index indicated in field: current_fast_trace_bd_index_address. Reading from this register, automatically updates the 'current_fast_trace_bd_index_address' field to point to the next entry in the trace table (exact width of this field: TBD)

BMU_FAST_TRACE_READING_DATA2

Bits	Name	Description
31:0	TRACE_DATA2	The upper X bits of the trace data Reset State: 0x00000000

0x3000170 BMU_FAST_BD_LINK_SETUP_CONTROL

Type: read-write
Reset State: 0x00000000

Initiates fast automated linking of BDs

BMU_FAST_BD_LINK_SETUP_CONTROL

Bits	Name	Description
31	CREATE_BD_LINKED_LIST	When writing a 1 to this field, the BMU will start linking all the BDs indicated by the 'bd_start_index' and 'bd_end_index' fields. Reset State: 0x00000000
30	BD_LINK_LIST_CREATION_STATUS	When set, the BMU is still busy creating the BD linked list Reset State: 0x00000000
26:16	BD_END_INDEX	The index of the last BD in the BD linked list to be created by HW Reset State: 0x00000000
10:0	BD_START_INDEX	The index of the first BD in the BD linked list to be created by HW Reset State: 0x00000000

0x3000174 BMU_STA_CONFIG_STATUS1

Type: read-write
Reset State: 0x00000000

Selects the STAid for which the STA parameters need to be read Whenever this register is written, the hardware will start reading or writing the sta parameters related to this staid

BMU_STA_CONFIG_STATUS1

Bits	Name	Description
31	READ_WRITE_STATUS	When set, the hardware is busy retrieving the station information for the last time this register got programmed Reset State: 0x00000000
8	STA_CONFIG_UPDATE	When NOT set, the hardware will read the staid settings When set, the hardware will write back the staid settings as programmed in the 'sta_config_status2' and 'sta_config_status3' registers. Reset State: 0x00000000
3:0	STAID	The STAid for which the station parameters need to be read Reset State: 0x00000000

0x3000178 BMU_STA_CONFIG_STATUS2

Type: read-write
Reset State: 0x00000000

Provides the STA information corresponding to the 'staid' programmed in the 'sta_config_status1' register This register only has valid contents when the 'read_write_status' bit in the 'sta_config_status1' register is NOT set

BMU_STA_CONFIG_STATUS2

Bits	Name	Description
22	EOSP_SENT_STATUS	When set to one, the BTQM has sent a QoS frame for which the EOSP bit in the QoS field was set. This field is used by the BTQM to track the sending of this indicating in case APSD in combination with AMPDU aggregation is used Reset State: 0x00000000
21	QOS_NULL_SENT_ONCE_STATUS	When set to one, the BTQM has sent a QoS Null frame. This field is used to be able to indicate that the previous transmission was not successful, and the next time around the QoS Null will be resent one more time Reset State: 0x00000000

BMU_STA_CONFIG_STATUS2 (cont.)

Bits	Name	Description
20	DATA_NULL_SENT_ONCE_STATUS	When set to one, the BTQM has sent a Data Null frame. This field is used to be able to indicate that the previous transmission was not successful, and the next time around the Data Null will be resent one more time Reset State: 0x00000000
18:16	CURRENT_REMAINING_TX_FRAME_CNT	This value will be taken as the 'current remaining tx frame count'. Typically this value should be set to zero, and access here is only provided for backup or testing purposes When set to a non zero value, it will only be used when also 'current_apsd_trig_received_setting' has been set, and the 'sta_u_apsd_enable' has been set. Reset State: 0x00000000
14	CURRENT_APSD_TRIG_RECEIVED_SETTING	When set to one, the BTQM will assume that an apsd trigger frame has just been received Reset State: 0x00000000
13	CURRENT_PS_POLL_RECEIVED_SETTING	When set to one, the BTQM will assume that a ps_poll frame has just been received Reset State: 0x00000000
12	CURRENT_PWR_STATE_SETTING	When set to one, the BTQM will assume that the STA is in power save mode. Reset State: 0x00000000
10:8	INITIAL_REMAINING_TX_FRAME_CNT	After receiving an APSD trigger frame, the value in this register will represent the number of response frames that will be sent to the STA. A value of 7 indicates, to drain the complete transmit queue Reset State: 0x00000000
6	QOS_NULL_RESP_ENABLE	When set, and an apsd trigger is received and all APSD delivery enabled queues are empty, the BTQM will indicate to the TPE to transmit a QoS null frame Reset State: 0x00000000
5	U_DATA_NULL_RESP_ENABLE	When set, and a ps-poll apsd trigger is received and all the (non APSD deliver enabled) queues are empty, the BTQM will indicate to the TPE to transmit a Data null frame Reset State: 0x00000000
4	STA_U_APSD_TRACK_ENABLE	When set to one, the BTQM will the reception and handling of APSD trigger frames Reset State: 0x00000000
1	STA_TX_ENABLE	When set, transmission for this sta is enabled Reset State: 0x00000000
0	STA_ENABLE	When set, the STAid is enabled Reset State: 0x00000000

0x300017C BMU_STA_CONFIG_STATUS3

Type: read-write
Reset State: 0x00000000

Provides the STA information corresponding to the 'staid' programmed in the 'sta_config_status1' register This register only has valid contents when the 'read_write_status' bit in the 'sta_config_status1' register is NOT set

BMU_STA_CONFIG_STATUS3

Bits	Name	Description
31:16	DELIVERY_ENABLED_TCID_QUEUES	When set, the corresponding TCID is part of the delivery enabled queues. Bit 0 corresponds with TCID 0 Reset State: 0x00000000
15:0	TRIGGER_ENABLED_TCID	When set, and a QoS Data frame of the corresponding TCID is received, the frame will be interpreted as an APSD trigger frame Reset State: 0x00000000

0x3000180 BMU_STA_CONFIG_STATUS4

Type: read-write
Reset State: 0x00000000

Provides the STA information corresponding to the 'staid' programmed in the 'sta_config_status1' register This register only has valid contents when the 'read_write_status' bit in the 'sta_config_status1' register is NOT set

BMU_STA_CONFIG_STATUS4

Bits	Name	Description
10:0	DATA_AVAILABLE	When set, the corresponding queueid queue contains frames Bit 0, corresponds to queueid 0 Bit 1, corresponds to queueid 1 ... Reset State: 0x00000000

0x3000184 BMU_BTQM_ERR_STATUS

Type: read-only
Reset State: 0x00000000

Provides status information on BTQM internal errors

BMU_BTQM_ERR_STATUS

Bits	Name	Description
27	BTQM_POLL_STATUS_TIMER_INT_STATUS	Reset State: 0x00000000
26	STA_CONFIG_DONE_INT_STATUS	Reset State: 0x00000000
25	BTQM_SW_QUEUE_ACCESS_DONE_INT_STATUS	Reset State: 0x00000000
24	STA_CONTROL_UPDATE_DONE_INT_STATUS	Reset State: 0x00000000
23	RESERVED_ERR	Reset State: 0x00000000
22	BTQM_BA_SEQ_NR_GE_TX_SEQ_NR_ERR	Reset State: 0x00000000
21	BTQM_FRAME_DATA_AVAIL_ERR	Reset State: 0x00000000
20	BTQM_FRAME_TIMEOUT_ERR	Reset State: 0x00000000
19	RELEASE_BTQM_LINK_BD_INDEX_ERR	Reset State: 0x00000000
18	SET_PREV_LAST_FRAME_NULL_BD_INDEX_ERR	Reset State: 0x00000000
17	SET_SECOND_FRAME_NULL_BD_INDEX_ERR	Reset State: 0x00000000
16	RELEASE_BD_PDU_CMD_OWNERSHIP_ERR	Reset State: 0x00000000
15	RELEASE_FRAG_BD_CMD_OWNERSHIP_ERR	Reset State: 0x00000000
14	RELEASE_PDU_TO_BD_CMD_OWNERSHIP_ERR	Reset State: 0x00000000
13	BD_PDU_MGR_OWNERSHIP_ERR	Reset State: 0x00000000
12	BTQM_TPE_INT_OWNERSHIP_ERR	Reset State: 0x00000000
11	BTQM_QUEUE_CTRL_OWNERSHIP_ERR	Reset State: 0x00000000
10	BA_HANDLER_OWNERSHIP_ERR	Reset State: 0x00000000
9	RELEASE_BD_OWNERSHIP_ERR	Reset State: 0x00000000
8	PUSH_BD_OWNERSHIP_ERR	Reset State: 0x00000000

BMU_BTQM_ERR_STATUS (cont.)

Bits	Name	Description
7	EMPTY_TX_QUEUE_PREFETCHED_WARNING	Reset State: 0x00000000
6	CONTROL_FRAME_ERR	Reset State: 0x00000000
5	FRAME_FORMAT_ERR	Reset State: 0x00000000
4	INVALID_BD_PARAMETERS_ERR	Reset State: 0x00000000
3	UNEXPECTED_ARBITER_RESULT_WARNING	Reset State: 0x00000000
2	BROKEN_TRANSMIT_QUEUE_LINK_ERR	Reset State: 0x00000000
1	TPE_INTERACTION_ERR	Reset State: 0x00000000
0	LINKED_LIST_ERR	Reset State: 0x00000000

0x3000188 BMU_BTQM_ERR_ENABLE

Type: read-write
Reset State: 0x00DFFF7F

Enables for the BTQM error or warning interrupt generation

BMU_BTQM_ERR_ENABLE

Bits	Name	Description
27	BTQM_POLL_STATUS_TIMER_INT_ENABLE	Reset State: 0x00000000
26	STA_CONFIG_DONE_INT_ENABLE	Reset State: 0x00000000
25	BTQM_SW_QUEUE_ACCESS_DONE_INT_ENABLE	Reset State: 0x00000000
24	STA_CONTROL_UPDATE_DONE_INT_ENABLE	Reset State: 0x00000000
23	RESERVED_ERR_ENABLE	Reset State: 0x00000001
22	BTQM_BA_SEQ_NR_GE_TX_SEQ_NR_ERR_ENABLE	Reset State: 0x00000001
21	BTQM_FRAME_DATA_AVAIL_ERR_ENABLE	Reset State: 0x00000000
20	BTQM_FRAME_TIMEOUT_ERR_ENABLE	Reset State: 0x00000001
19	RELEASE_BTQM_LINK_BD_INDEX_ERR_ENABLE	Reset State: 0x00000001

BMU_BTQM_ERR_ENABLE (cont.)

Bits	Name	Description
18	SET_PREV_LAST_FRAME_NULL_BD_INDEX_ERR_ENABLE	Reset State: 0x00000001
17	SET_SECOND_FRAME_NULL_BD_INDEX_ERR_ENABLE	Reset State: 0x00000001
16	RELEASE_BD_PDU_CMD_OWNERSHIP_ERR_ENABLE	Reset State: 0x00000001
15	RELEASE_FRAG_BD_CMD_OWNERSHIP_ERR_ENABLE	Reset State: 0x00000001
14	RELEASE_PDU_TO_BD_CMD_OWNERSHIP_ERR_ENABLE	Reset State: 0x00000001
13	BD_PDU_MGR_OWNERSHIP_ERR_ENABLE	Reset State: 0x00000001
12	BTQM_TPE_INT_OWNERSHIP_ERR_ENABLE	Reset State: 0x00000001
11	BTQM_QUEUE_CTRL_OWNERSHIP_ERR_ENABLE	Reset State: 0x00000001
10	BA_HANDLER_OWNERSHIP_ERR_ENABLE	Reset State: 0x00000001
9	RELEASE_BD_OWNERSHIP_ERR_ENABLE	Reset State: 0x00000001
8	PUSH_BD_OWNERSHIP_ERR_ENABLE	Reset State: 0x00000001
7	EMPTY_TX_QUEUE_PREFETCHED_WARNING	Reset State: 0x00000000
6	CONTROL_FRAME_ERR_ENABLE	Reset State: 0x00000001
5	FRAME_FORMAT_ERR_ENABLE	Reset State: 0x00000001
4	INVALID_BD_PARAMETERS_ERR_ENABLE	Reset State: 0x00000001
3	UNEXPECTED_ARBITER_RESULT_WARNING	Reset State: 0x00000001
2	BROKEN_TRANSMIT_QUEUE_LINK_ERR_ENABLE	Reset State: 0x00000001
1	TPE_INTERACTION_ERR_ENABLE	Reset State: 0x00000001
0	LINKED_LIST_ERR_ENABLE	Reset State: 0x00000001

0x300018C BMU_BTQM_ERR_STATE

Type: read-only
Reset State: 0x00000000

Provides the BTQM state machine states when a BMU error interrupt is generated

BMU_BTQM_ERR_STATE

Bits	Name	Description
29:0	BTQM_STATES	Snapshot of the btqm state machines states when a BMU error interrupt is generated Reset State: 0x00000000

0x3000190 BMU_BTQM_ERR_STATE2

Type: read-only
Reset State: 0x00000000

Provides part 2 of the BTQM state machine states when a BMU error interrupt is generated

BMU_BTQM_ERR_STATE2

Bits	Name	Description
19:0	BTQM_STATES	Snapshot of the btqm state machines states when a BMU error interrupt is generated Reset State: 0x00000000

0x3000194 BMU_BTQM_TPE_INT_STATS

Type: read-only
Reset State: 0x00000000

Provides status information on the bmu_tpe interface

BMU_BTQM_TPE_INT_STATS

Bits	Name	Description
19	TPE_INTERACTION_ERROR_STATUS	When set, a TPE interface interaction error occurred Reset State: 0x00000000
18:16	TPE_INTERACTION_ERROR_CODE	indicates the first tpe interface interaction error that happened Reset State: 0x00000000
15:8	BO_DATA_AVAIL	status of the data available signals to the TPE Reset State: 0x00000000

BMU_BTQM_TPE_INT_STATS (cont.)

Bits	Name	Description
4:0	TPE_INT_SM_STATE	Represent the state machine state Reset State: 0x00000000

0x30001B0 BMU_BMU_VERSION

Type: read-only
Reset State: 0x00000000

Provides the BMU label version number

BMU_BMU_VERSION

Bits	Name	Description
9:0	BMU_VERSION	Reset State: 0x00000000

0x30001B4 BMU_RETRY_LIMIT_DROP_CNT

Type: read-only
Reset State: 0x00000000

Provides the number of frames that were dropped by the BTQM because the retry limit was reached.

BMU_RETRY_LIMIT_DROP_CNT

Bits	Name	Description
23:0	RETRY_LIMIT_DROP_CNT	Reset State: 0x00000000

0x30001B8 BMU_TPE_DROP_CNT

Type: read-only
Reset State: 0x00000000

Provides the number of frames that were dropped by the BTQM because the TPE gave a 'DROP feedback' command

BMU_TPE_DROP_CNT

Bits	Name	Description
23:0	TPE_DROP_CNT	Reset State: 0x00000000

0x30001BC BMU_BA_HANDLER_ACKED_DROP_CNT

Type: read-only
Reset State: 0x00000000

Provides the number of frames that were dropped by the BTQM BA handler because the frame reception got acknowledged by the BA bitmap

BMU_BA_HANDLER_ACKED_DROP_CNT

Bits	Name	Description
23:0	BA_HANDLER_ACKED_DROP_CNT	Reset State: 0x00000000

0x30001C0 BMU_BA_HANDLER_WINDOW_MOVED_DROP_CNT

Type: read-only
Reset State: 0x00000000

Provides the number of frames that were dropped by the BTQM BA handler because the BA bitmap SSN moved on beyond the frame Sequence number still in the queue

BMU_BA_HANDLER_WINDOW_MOVED_DROP_CNT

Bits	Name	Description
23:0	BA_HANDLER_WINDOW_MOVED_DROP_CNT	Reset State: 0x00000000

0x30001C4 BMU_GET_INFO_CNT

Type: read-only
Reset State: 0x00000000

Provides the number times the BTQM received a 'get_info' command from the TPE

BMU_GET_INFO_CNT

Bits	Name	Description
23:0	GET_INFO_CNT	Reset State: 0x00000000

0x30001C8 BMU_GET_BD_INDEX_CNT

Type: read-only
Reset State: 0x00000000

Provides the number times the BTQM received a 'get_bd_index' command from the TPE

BMU_GET_BD_INDEX_CNT

Bits	Name	Description
23:0	GET_BD_INDEX_CNT	Reset State: 0x00000000

0x30001CC BMU_PWR_SAVE_STA_CNT

Type: read-write
Reset State: 0x00000000

The number of STAs that are in power save mode & bit map for power save stations

BMU_PWR_SAVE_STA_CNT

Bits	Name	Description
31:16	POWER_SAVE_STAS_BIT_MAP	Reset State: 0x00000000
8:0	PWR_SAVE_STA_CNT	Reset State: 0x00000000

0x30001D0 BMU_BTQM_FRAME_CNT

Type: read-only
Reset State: 0x00000000

The number of frames currently managed by the btqm

BMU_BTQM_FRAME_CNT

Bits	Name	Description
10:0	BTQM_FRAME_CNT	Reset State: 0x00000000

0x30001D4 BMU_BTQM_TIMEOUT_CHECK_CTRL

Type: read-write
Reset State: 0x00000000

The number of clk cycles the BTQM is allowed to empty all btqm transmit queues measured from the point where the last frame got pushed into the BTQM When this number is exceeded, an BTQM timeout error interrupt is generated. A value of zero disables this check

BMU_BTQM_TIMEOUT_CHECK_CTRL

Bits	Name	Description
31:0	BTQM_TIMEOUT_CLK_CYCLE_CNT	Reset State: 0x00000000

0x30001D8 BMU_PWR_STATE_CHANGE_INT_CONTROL

Type: read-write
Reset State: 0x00000000

Provides interrupt control and status of STA power state changes

BMU_PWR_STATE_CHANGE_INT_CONTROL

Bits	Name	Description
31	PWR_STATE_CHANGE_INT_AUTO_CLEAR_ENABLE	Reset State: 0x00000000
30	PWR_STATE_CHANGE_INT_OVERFLOW	Reset State: 0x00000000
29	PWR_STATE_STATUS2	Reset State: 0x00000000
28	PWR_STATE_STATUS1	Reset State: 0x00000000
27	PWR_STATE_STATUS0	Reset State: 0x00000000
26	PWR_STATE_ENTRY2_VALID	Reset State: 0x00000000
25	PWR_STATE_ENTRY1_VALID	Reset State: 0x00000000
24	PWR_STATE_ENTRY0_VALID	Reset State: 0x00000000
23:16	STAID_PWR_INT2	Reset State: 0x00000000
15:8	STAID_PWR_INT1	Reset State: 0x00000000
7:0	STAID_PWR_INT0	Reset State: 0x00000000

0x30001DC BMU_BTQM_INTERRUPT_STATUS

Type: read-only
Reset State: 0x00000000

This register indicates the status of BTQM interrupts When one of the corresponding events occur, the status will reflect this. An interrupt is only generated if the interrupt is also enabled (see next register)

BMU_BTQM_INTERRUPT_STATUS

Bits	Name	Description
2	PWRSTATE_DROP_INTERRUPT	When set, the maximum number of frames in a queue for an STA in power save mode has been reached. Reset State: 0x00000000
1	BTQM_QUEUES_EMPTY_INTERRUPT	When set, the BTQM queues have become empty Reset State: 0x00000000
0	PWRSTATE_CHANGE_INTERRUPT	When set, an STA has indicated a power state change Reset State: 0x00000000

0x30001E0 BMU_BTQM_INTERRUPT_ENABLE

Type: read-write
Reset State: 0x00000000

This register controls the enables of BTQM interrupts

BMU_BTQM_INTERRUPT_ENABLE

Bits	Name	Description
2	PWRSTATE_DROP_INTERRUPT_ENABLE	When set, an interrupt will be generated when the maximum number of frames in a queue for an STA in power save mode has been reached. Reset State: 0x00000000
1	BTQM_QUEUES_EMPTY_INTERRUPT_ENABLE	When set, an interrupt will be generated when the BTQM queues have become empty Reset State: 0x00000000
0	PWRSTATE_CHANGE_INTERRUPT_ENABLE	When set, an interrupt will be generated when an STA has indicated a power state change Reset State: 0x00000000

0x30001E4 BMU_PWR_SAVE_DROP_CTRL

Type: read-write
Reset State: 0x00000000

This register controls dropping of frames for an STA in power save mode

BMU_PWR_SAVE_DROP_CTRL

Bits	Name	Description
8	PWR_SAVE_DROP_ENABLE	When set, and the number of frames in a queue for a STA is larger then this 'drop_threshold' number, the frame will be dropped. Reset State: 0x00000000
3:0	PWR_SAVE_DROP_THRESHOLD	When set, an interrupt will be generated when an STA has indicated a power state change Reset State: 0x00000000

0x30001E8 BMU_PWR_SAVE_DROP_INT_CONTROL

Type: read-write
Reset State: 0x00000000

Provides interrupt control and status for the power save frame DROP interrupt generations (For when BTQM starts dropping frames for an STA in power save mode because the max threshold of frames is reached.)

BMU_PWR_SAVE_DROP_INT_CONTROL

Bits	Name	Description
31	DROP_INT_AUTO_CLEAR_ENABLE	Reset State: 0x00000000
30	DROP_INT_OVERFLOW	Reset State: 0x00000000
29	DROP_ENTRY1_VALID	Reset State: 0x00000000
28	DROP_ENTRY0_VALID	Reset State: 0x00000000
25:21	DROP_QUEUEID_PWR_INT1	Reset State: 0x00000000
20:16	DROP_QUEUEID_PWR_INT0	Reset State: 0x00000000
15:8	DROP_STAID_PWR_INT1	Reset State: 0x00000000
7:0	DROP_STAID_PWR_INT0	Reset State: 0x00000000

0x30001EC BMU_BMU_BACKUP_CONTROL

Type: read-write
Reset State: 0x00000000

This register controls backup functionality build into the BMU

BMU_BMU_BACKUP_CONTROL

Bits	Name	Description
4	SW_TRIGGERED_REARBITRAION_ENABLE	When set, BTQM arbiter to force a re-arbitration for the STAs It removes the current selected STAs from all the prefetched queues, and then re-start the arbitration Once rearbitration is done this bit will be cleared Reset State: 0x00000000
3	CFG_CLEAR_DA_ON_FINDING_EMPTY_QUEUE_ENABLE	When set, and an empty queue is prefetched, the data available signal corresponding to that STA/queueid will be cleared Reset State: 0x00000000
2	STA_DA_AVAIL_BACKUP_MODE_ENABLED	When set, on every frame pushed into a queue, all sta da available settings will be set Reset State: 0x00000000
1	ARBITRATION_BACKUP_MODE_ENABLED	When set, on every frame pushed into a queue, all queue da available and min/max values will be set again Reset State: 0x00000000
0	RESERVED	Do NOT set Reset State: 0x00000000

0x30001F0 BMU_BMU_QUEUE_DELAY_ACCESS_CONTROL

Type: read-write
Reset State: 0x0A0A0000

This register to control the access of Queue/Transmit delay parameters

BMU_BMU_QUEUE_DELAY_ACCESS_CONTROL

Bits	Name	Description
28:24	QUEUE_DELAY_RANGE_FIELD_VALUE	Queue delay Bin 0 Range field value for first bin Reset State: 0x0000000A
20:16	TRANSMIT_DELAY_RANGE_FIELD_VALUE	Transmit delay Bin 0 Range field value for first bin Reset State: 0x0000000A
8	READ_MODIFY_WRITE_ZERO	Control to access Queue/Transmit Delay parameters0: Data read only1: After reading the value, data is initialized to zero Reset State: 0x00000000
7	QUEUE_TRANSMIT_DELAY	Control to access Queue/Transmit Delay parameters0: Queue Delay1: Transmit Delay Reset State: 0x00000000
6:3	TID_INDEX	TID access control Reset State: 0x00000000
2:0	BIN_INDEX	Bin access control 000 : Bin-0 001 : Bin-1 . . 101 : Bin-5 Reset State: 0x00000000

0x30001F4 BMU_QUEUE_TRANSMIT_DELAY_VALUE

Type: read-only
Reset State: 0x00000000

Queue/Transmit delay value, and this register access is controlled through "bmu_queue_delay_access_control" register

BMU_QUEUE_TRANSMIT_DELAY_VALUE

Bits	Name	Description
31:0	QUEUE_TRANSMIT_DELAY_VALUE	Reset State: 0x00000000

0x30001F8 BMU_DXE_RX_WQ_INDEX

Type: read-write
Reset State: 0x0000040B

DXE rx WQ index where the received packed are being pushed. BMU keeps track of byte cnt for this WQ for SIF-DXE interface

BMU_DXE_RX_WQ_INDEX

Bits	Name	Description
15:8	DXE_RX_PRIORITY_WQ_INDEX	DXE high WQ index for high priority traffic Reset State: 0x00000004
7:0	DXE_RX_WQ_INDEX	DXE WQ index for normal traffic Reset State: 0x0000000B

0x30001FC BMU_BMU_SIF_DATA_LENGTH

Type: read-only
Reset State: 0x00000000

Number bytes pushed to DXE Rx WQ

BMU_BMU_SIF_DATA_LENGTH

Bits	Name	Description
16	DXE_WQ_DATA_UNDER_FLOW	When this bit is set, SIF transfer byte count is more than DXE WQ data Reset State: 0x00000000

BMU_BMU_SIF_DATA_LENGTH (cont.)

Bits	Name	Description
15:0	BMU_SIF_DATA_LENGTH	Data accumulated in DXE WQ Reset State: 0x00000000

0x3000200 BMU_SW_BMU_DXE_DATA_LENGTH

Type: read-write
Reset State: 0x00000000

Number bytes pushed to DXE Rx WQ

BMU_SW_BMU_DXE_DATA_LENGTH

Bits	Name	Description
15:0	SW_BMU_DXE_DATA_LENGTH	Data length to be added to DXE Rx WQ count Reset State: 0x00000000

0x3000208 BMU_BTQM_PACKET_MEMORY_UNIT_SIZE

Type: read-write
Reset State: 0x00000001

BTQM reports consumed memory in btqm_packet_memory_unit_size*128-bytes

BMU_BTQM_PACKET_MEMORY_UNIT_SIZE

Bits	Name	Description
3:0	BTQM_PACKET_MEMORY_UNIT_SIZE	Reset State: 0x00000001

0x300020C BMU_SW_ACCESS_DEBUG_STATUS

Type: read-only
Reset State: 0x00000000

Software access debug bits

BMU_SW_ACCESS_DEBUG_STATUS

Bits	Name	Description
31	FINAL_BMU_BTQM_CTRL_CLK_ENABLE	Reset State: 0x00000000

BMU_SW_ACCESS_DEBUG_STATUS (cont.)

Bits	Name	Description
29	ARB_QUEUE_PREFETCH_REQUEST	Reset State: 0x00000000
28	QUEUE_RW_INFO_RETURN_REQUEST	Reset State: 0x00000000
27	QUEUE_RW_INFO_REQUEST	Reset State: 0x00000000
26	BTQM_CTRL_TO_ARB_OWNERSHIP_GRANT	Reset State: 0x00000000
25	ARBITER_QUEUE_OWNERSHIP_GRANT	Reset State: 0x00000000
24	QUEUE_CTRL_OWNERSHIP_GRANT	Reset State: 0x00000000
23	BA_HANDLER_QUEUE_OWNERSHIP_GRANT	Reset State: 0x00000000
22	SW_INT_QUEUE_OWNERSHIP_GRANT	Reset State: 0x00000000
21	FILTERED_ARB_QUEUE_PREFETCH_REQUEST	Reset State: 0x00000000
20	ARB_QUEUE_FLUSH_REQUEST	Reset State: 0x00000000
19	ARBITER_QUEUE_RETURN_QUEUE_OWNERSHIP_REQUEST	Reset State: 0x00000000
18	SW_INT_RETURN_QUEUE_OWNERSHIP_REQUEST	Reset State: 0x00000000
17	QUEUE_CTRL_RETURN_QUEUE_OWNERSHIP_REQUEST	Reset State: 0x00000000
16	BA_HANDLER_RETURN_QUEUE_OWNERSHIP_REQUEST	Reset State: 0x00000000
15	FILTERED_ARBITER_QUEUE_OWNERSHIP_REQUEST	Reset State: 0x00000000
14	FILTERED_SW_INT_QUEUE_OWNERSHIP_REQUEST	Reset State: 0x00000000
13	FILTERED_QUEUE_CTRL_OWNERSHIP_REQUEST	Reset State: 0x00000000
12	FILTERED_BA_HANDLER_QUEUE_OWNERSHIP_REQUEST	Reset State: 0x00000000
11	ARBITER_QUEUE_OWNERSHIP_REQUEST	Reset State: 0x00000000

BMU_SW_ACCESS_DEBUG_STATUS (cont.)

Bits	Name	Description
10	QUEUE_CTRL_OWNERSHIP_REQUEST	Reset State: 0x00000000
9	BA_HANDLER_QUEUE_OWNERSHIP_REQUEST	Reset State: 0x00000000
8	SW_INT_QUEUE_OWNERSHIP_REQUEST	Reset State: 0x00000000
6:4	ENCODED_BTQM_SW_INT_STATE	Reset State: 0x00000000
2:0	ENCODED_BTQM_CTRL_STATE	Reset State: 0x00000000

0x3000210 BMU_BTQM_TX_THRESHOLD

Type: read-write
Reset State: 0x00000080

Controls the memory resources for Tx traffic If the Tx memory usage is greater than equal to this value Any request for BD/PDUs from reserve all command is ignored

BMU_BTQM_TX_THRESHOLD

Bits	Name	Description
10:0	BTQM_MEM_THRESHOLD	Reset State: 0x00000080

0x3000214 BMU_BTQM_STAID_3_TO_0_MEM_STATUS

Type: read-only
Reset State: 0x00000000

BTQM memory status for STAid3 to STAid0. It is multiples of 128bytes. This needs to be multiplied by setting in "btqm_packet_memory_unit_size" register.

BMU_BTQM_STAID_3_TO_0_MEM_STATUS

Bits	Name	Description
31:24	STAID3	Reset State: 0x00000000
23:16	STAID2	Reset State: 0x00000000
15:8	STAID1	Reset State: 0x00000000
7:0	STAID0	Reset State: 0x00000000

0x3000218 BMU_BTQM_STAID_7_TO_4_MEM_STATUS

Type: read-only
Reset State: 0x00000000

BTQM memory status for STAid7 to STAid4. It is multiples of 128bytes. This needs to be multiplied by setting in "btqm_packet_memory_unit_size" register.

BMU_BTQM_STAID_7_TO_4_MEM_STATUS

Bits	Name	Description
31:24	STAID7	Reset State: 0x00000000
23:16	STAID6	Reset State: 0x00000000
15:8	STAID5	Reset State: 0x00000000
7:0	STAID4	Reset State: 0x00000000

0x300021C BMU_BTQM_PKT_MEMORY_STATUS

Type: read-only
Reset State: 0x00000000

BTQM combined memory status for all the stations.

BMU_BTQM_PKT_MEMORY_STATUS

Bits	Name	Description
10:0	BTQM_PKT_MEMORY_STATUS	Reset State: 0x00000000

0x3000220 BMU_HP_RX_MEMORY_UPPER_LIMIT

Type: read-write
Reset State: 0x000000E8

Controls the memory resources for Rx high priority RX traffic. If the Rx memory usage is greater than equal to this value Any request for BD/PDUs from Rx modules is ignored

BMU_HP_RX_MEMORY_UPPER_LIMIT

Bits	Name	Description
10:0	HP_RX_MEMORY_UPPER_LIMIT	Reset State: 0x000000E8

0x3000224 BMU_LP_RX_MEMORY_UPPER_LIMIT

Type: read-write
Reset State: 0x000000D1

Controls the memory resources for Rx high priority RX traffic. If the Rx memory usage is greater than equal to this value Any request for BD/PDUs from Rx modules is ignored

BMU_LP_RX_MEMORY_UPPER_LIMIT

Bits	Name	Description
10:0	LP_RX_MEMORY_UPPER_LIMIT	Reset State: 0x000000D1

0x3000228 BMU_BTQM_STAID_1_TO_0_MEM_THRESHOLD

Type: read-write
Reset State: 0x00000000

BTQM memory threshold for STAid1 to STAid0. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

BMU_BTQM_STAID_1_TO_0_MEM_THRESHOLD

Bits	Name	Description
25:16	STAID1	Reset State: 0x00000000
9:0	STAID0	Reset State: 0x00000000

0x300022C BMU_BTQM_STAID_3_TO_2_MEM_THRESHOLD

Type: read-write
Reset State: 0x00000000

BTQM memory threshold for STAid3 to STAid2. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

BMU_BTQM_STAID_3_TO_2_MEM_THRESHOLD

Bits	Name	Description
25:16	STAID3	Reset State: 0x00000000
9:0	STAID2	Reset State: 0x00000000

0x3000230 BMU_BTQM_STAID_5_TO_4_MEM_THRESHOLD

Type: read-write
Reset State: 0x00000000

BTQM memory threshold for STAid5 to STAid4. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

BMU_BTQM_STAID_5_TO_4_MEM_THRESHOLD

Bits	Name	Description
25:16	STAID5	Reset State: 0x00000000
9:0	STAID4	Reset State: 0x00000000

0x3000234 BMU_BTQM_STAID_7_TO_6_MEM_THRESHOLD

Type: read-write
Reset State: 0x00000000

BTQM memory threshold for STAid7 to STAid6. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

BMU_BTQM_STAID_7_TO_6_MEM_THRESHOLD

Bits	Name	Description
25:16	STAID7	Reset State: 0x00000000
9:0	STAID6	Reset State: 0x00000000

0x3000238 BMU_BTQM_STAID_15_TO_0_MEM_USAGE_STATUS

Type: read-write
Reset State: 0x00000000

BTQM memory status for STAid15 to STAid0. When the memory usage for STAidX is less than the threshold value the bit will be set

BMU_BTQM_STAID_15_TO_0_MEM_USAGE_STATUS

Bits	Name	Description
31	BMU_MCU_QUEUE_USAGE_THRESHOLD_INTERRUPT_STATUS	Writing one to this register bit will clear the interrupt Reset State: 0x00000000

BMU_BTQM_STAID_15_TO_0_MEM_USAGE_STATUS (cont.)

Bits	Name	Description
30	BMU_MCU_QUEUE_USAGE_THRESHOLD_INTERRUPT_ENABLE	When this bit is set, bmu_mcu_queue_usage_threshold_interrupt is enabled Reset State: 0x00000000
15:0	STAID	Reset State: 0x00000000

0x300023C BMU_POLL_STATUS_TIMER_THRESHOLD

Type: read-write
Reset State: 0x0000FFFF

BTQM poll status threshold, this value represents no.of clock cycles BTQM generates an interrupt when the delay exceeds this value

BMU_POLL_STATUS_TIMER_THRESHOLD

Bits	Name	Description
15:0	POLL_STATUS_TIMER_THRESHOLD	Reset State: 0x0000FFFF

0x3000240 BMU_BMU_IDLE_BD_PDU_STATUS

Type: read-write
Reset State: 0x00000000

BMU keeps track of no.of idle bd/pdus in the system. When this idle bd/pdu number reaches the programmed threshold value it generates an interrupt

BMU_BMU_IDLE_BD_PDU_STATUS

Bits	Name	Description
31	BMU_IDLE_BD_PDU_THRESHOLD_INTERRUPT_STATUS	Writing one to this register bit will clear the interrupt Reset State: 0x00000000
15	BMU_IDLE_BD_PDU_THRESHOLD_INTERRUPT_ENABLE	When this bit is set, bmu_idle_bd_pdu_threshold_interrupt is enabled Reset State: 0x00000000
10:0	BMU_IDLE_BD_PDU_THRESHOLD	Reset State: 0x00000000

0x3000244 BMU_BTQM_STAID_11_TO_8_MEM_STATUS

Type: read-only
Reset State: 0x00000000

BTQM memory status for STAid11 to STAid8. It is multiples of 128bytes. This needs to be multiplied by setting in "btqm_packet_memory_unit_size" register.

BMU_BTQM_STAID_11_TO_8_MEM_STATUS

Bits	Name	Description
31:24	STAID11	Reset State: 0x00000000
23:16	STAID10	Reset State: 0x00000000
15:8	STAID9	Reset State: 0x00000000
7:0	STAID8	Reset State: 0x00000000

0x3000248 BMU_BTQM_STAID_15_TO_12_MEM_STATUS

Type: read-only
Reset State: 0x00000000

BTQM memory status for STAid15 to STAid12. It is multiples of 128bytes. This needs to be multiplied by setting in "btqm_packet_memory_unit_size" register.

BMU_BTQM_STAID_15_TO_12_MEM_STATUS

Bits	Name	Description
31:24	STAID15	Reset State: 0x00000000
23:16	STAID14	Reset State: 0x00000000
15:8	STAID13	Reset State: 0x00000000
7:0	STAID12	Reset State: 0x00000000

0x300024C BMU_BTQM_STAID_9_TO_8_MEM_THRESHOLD

Type: read-write
Reset State: 0x00000000

BTQM memory threshold for STAid9 to STAid8. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

BMU_BTQM_STAID_9_TO_8_MEM_THRESHOLD

Bits	Name	Description
25:16	STAID9	Reset State: 0x00000000
9:0	STAID8	Reset State: 0x00000000

0x3000250 BMU_BTQM_STAID_11_TO_10_MEM_THRESHOLD

Type: read-write
Reset State: 0x00000000

BTQM memory threshold for STAid11 to STAid10. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

BMU_BTQM_STAID_11_TO_10_MEM_THRESHOLD

Bits	Name	Description
25:16	STAID11	Reset State: 0x00000000
9:0	STAID10	Reset State: 0x00000000

0x3000254 BMU_BTQM_STAID_13_TO_12_MEM_THRESHOLD

Type: read-write
Reset State: 0x00000000

BTQM memory threshold for STAid13 to STAid12. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

BMU_BTQM_STAID_13_TO_12_MEM_THRESHOLD

Bits	Name	Description
25:16	STAID13	Reset State: 0x00000000
9:0	STAID12	Reset State: 0x00000000

0x3000258 BMU_BTQM_STAID_15_TO_14_MEM_THRESHOLD

Type: read-write
Reset State: 0x00000000

BTQM memory threshold for STAid15 to STAid14. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

BMU_BTQM_STAID_15_TO_14_MEM_THRESHOLD

Bits	Name	Description
25:16	STAID15	Reset State: 0x00000000
9:0	STAID14	Reset State: 0x00000000

16.2.37 cahb

0x3000000 CAHB_CAHB_RXP_PL

Type: read-write
Reset State: 0x00000005

cahb Arbiter arbitration priority level for rxp master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CAHB_CAHB_RXP_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rxp master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000004 CAHB_CAHB_TPE_PL

Type: read-write
Reset State: 0x00000005

cahb Arbiter arbitration priority level for tpe master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CAHB_CAHB_TPE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for tpe master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000008 CAHB_CAHB_RPE_PL

Type: read-write
Reset State: 0x00000005

cahb Arbiter arbitration priority level for rpe master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CAHB_CAHB_RPE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rpe master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x300000C CAHB_CAHB_RPEM_PL

Type: read-write
Reset State: 0x00000005

cahb Arbiter arbitration priority level for rpem master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CAHB_CAHB_RPEM_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rpem master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000010 CAHB_CAHB_DPU_PL

Type: read-write
Reset State: 0x00000001

cahb Arbiter arbitration priority level for dpu master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CAHB_CAHB_DPU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dpu master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cahb arbiter will prevent a master from disabling itself. Reset State: 0x00000001

0x3000014 CAHB_CAHB_ADU_PL

Type: read-write
Reset State: 0x00000001

cahb Arbiter arbitration priority level for adu master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CAHB_CAHB_ADU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for adu master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cahb arbiter will prevent a master from disabling itself. Reset State: 0x00000001

0x3000018 CAHB_CAHB_CBR_PL

Type: read-write
Reset State: 0x00000004

cahb Arbiter arbitration priority level for cbr master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CAHB_CAHB_CBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for cbr master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cahb arbiter will prevent a master from disabling itself. Reset State: 0x00000004

0x3000048 CAHB_CAHB_DFLT_MST

Type: read-write
Reset State: 0x00000000

This register identifies the default master for the cahb

CAHB_CAHB_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY 0x1: RXP 0x2: TPE 0x3: RPE 0x4: RPEM 0x5: DPU 0x6: ADU 0x7: CBR Reset State: 0x00000000

0x3000090 CAHB_CAHB_VERSION

Type: read-only
Reset State: 0x3230382A

ASCII value for each number in the version, followed by '*'. For example 32_30_31_2A represents the version 2.01*.

CAHB_CAHB_VERSION

Bits	Name	Description
31:24	CAHB_COMP_VERSION_BYTE0	Reset State: 0x00000032
23:16	CAHB_COMP_VERSION_BYTE1	Reset State: 0x00000030
15:8	CAHB_COMP_VERSION_BYTE2	Reset State: 0x00000038
7:0	CAHB_COMP_VERSION_BYTE3	Reset State: 0x0000002A

16.2.38 cfg

0x3000000 CFG_CSI_TEMPLATE_DW0

Type: read-write
Reset State: 0x00000000

this register contains first dword of the CSI template

CFG_CSI_TEMPLATE_DW0

Bits	Name	Description
31:0	CFG_TEMPLATE_DW0	First dword of template in stored in register since memory is not big enough. SO this register contains first dword of the template, this is filled by SW. Refer CSI template in to bd_datastructure document for the contents of this dword Reset State: 0x00000000

0x3000004 CFG_CSI_TEMPLATE_MEM

Type: read-write
Reset State: 0x00000000

Registers 000-810 give access to 528 locations of the CSI template that is stored in the local memory refer to BD_Data_structure.doc for template format

CFG_CSI_TEMPLATE_MEM

Bits	Name	Description
31:0	CFG_TEMPLATE_DATA	Check bit 32 of the config register, if it is zero then YOu can either read from any of the locations or write to any of the locations. Reset State: 0x00000000

0x3000844 CFG_CFG_STALL_TIMEOUT

Type: read-write
Reset State: 0x00000A00

Stall timeout functionality - allows CFG to return to idle if PMI interface stalls.

CFG_CFG_STALL_TIMEOUT

Bits	Name	Description
16	STALL_TIMEOUT_EN	Enable stall timeout functionality on the MPI. Reset State: 0x00000000

CFG_CFG_STALL_TIMEOUT (cont.)

Bits	Name	Description
11:0	STALL_TIMEOUT_TIME	Number of cycles of no activity during PMI transaction before stall timeout occurs. Reset State: 0x00000A00

0x3000848 CFG_CFG_CONFIG

Type: read-write
Reset State: 0x00000000

gives some configurations for CFG

CFG_CFG_CONFIG

Bits	Name	Description
31	CSIPROC_REGACCESS_FAIL	when set indicates template is being updates internally hence read or write access failed this needs to be cleared by SW Reset State: 0x00000000
30	CSIPROC_BUSY	when set indicates template is being updates internally Reset State: 0x00000000
29	CSIPROC_TEMPLATE_READY	when set indicates template is ready Reset State: 0x00000000
11	CFG_PHYCLK_TESTBUS_SEL	selects different test buses for CFG in PHY clock domain 0x0: RXIF_BLOCK 0x1: FIFO_PHYCLK_TESTBUS Reset State: 0x00000000
10:8	CFG_TESTBUS_SEL	selects different test buses in CFG in mac clock domain 0x0: CSIPROC_TESTBUS1 0x1: CSIPROC_TESTBUS2 0x2: GAS_TESTBUS 0x3: FIFO_TESTBUS 0x4: MEMIF_TESTBUS 0x5: CONFIG_TESTBUS Reset State: 0x00000000
1	SOFT_PMI_ABORT_EN	Soft PMI abort enable. this is basically to create phy abort thru' software in this case need to make sure stall timeout is enabled Reset State: 0x00000000
0	CFG_CSI_EN	Enables the CSI functionality, by default it is disabled Reset State: 0x00000000

0x300084C CFG_STALL_TIMEOUT_PHY_ABORT_CNT

Type: read-only
Reset State: 0x00000000

Number of times stall timeout occurs with PHY interface. this register also has PHY abort cents

CFG_STALL_TIMEOUT_PHY_ABORT_CNT

Bits	Name	Description
27:24	FIFOFULL_CNT	counts number of times fifo full happened Reset State: 0x00000000
23:16	PHY_CLKSTART_CNT	counts number of clock starts Reset State: 0x00000000
11:8	PHY_ABORT_CNT	PHY Abort Packet Cnt. Reset State: 0x00000000
3:0	STALL_TIMEOUT_COUNT	Number of times the PMI interface encounters a stall timeout Reset State: 0x00000000

0x3000850 CFG_CFG_TESTBUS_LOWER

Type: read-only
Reset State: 0x00000000

This registers gives testbus for lower 32bits

CFG_CFG_TESTBUS_LOWER

Bits	Name	Description
31:0	CFG_TESTBUS_LOWER	lower 32bit of the testbus (31:0) Reset State: 0x00000000

0x3000854 CFG_CFG_TESTBUS_UPPER

Type: read-only
Reset State: 0x00000000

This registers gives bits 44:32 of testbus

CFG_CFG_TESTBUS_UPPER

Bits	Name	Description
12:0	CFG_TESTBUS_UPPER	upper 13bits bits 44:32 of testbus Reset State: 0x00000000

0x3000858 CFG_CFG_SM_STATE

Type: read-only
Reset State: 0x00010001

this register gives the state of the two CFG state machines

CFG_CFG_SM_STATE

Bits	Name	Description
21:16	RXIF_PHY_STATE	RX interface to phy state machine state Reset State: 0x00000001
7:0	CSIPROC_STATE	CSI processing state machine state Reset State: 0x00000001

16.2.39 dahb

0x3000000 DAHB_DAHB_DPUW_PL

Type: read-write
Reset State: 0x00000004

dahb Arbiter arbitration priority level for dpuw master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

DAHB_DAHB_DPUW_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dpuw master. 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the dahb arbiter will prevent a master from disabling itself. Reset State: 0x00000004

0x3000004 DAHB_DAHB_DPUR_PL

Type: read-write
Reset State: 0x00000004

dahb Arbiter arbitration priority level for dpur master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

DAHB_DAHB_DPUR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dpur master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the dahb arbiter will prevent a master from disabling itself. Reset State: 0x00000004

0x3000008 DAHB_DAHB_BMUW_PL

Type: read-write
Reset State: 0x00000005

dahb Arbiter arbitration priority level for bmuw master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

DAHB_DAHB_BMUW_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for bmuw master. 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the dahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x300000C DAHB_DAHB_BMUR_PL

Type: read-write
Reset State: 0x00000005

dahb Arbiter arbitration priority level for bmur master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

DAHB_DAHB_BMUR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for bmur master. 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the dahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000010 DAHB_DAHB_ADU_PL

Type: read-write
Reset State: 0x00000002

dahb Arbiter arbitration priority level for adu master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

DAHB_DAHB_ADU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for adu master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the dahb arbiter will prevent a master from disabling itself. Reset State: 0x00000002

0x3000014 DAHB_DAHB_DBR_PL

Type: read-write
Reset State: 0x00000005

dahb Arbiter arbitration priority level for dbr master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

DAHB_DAHB_DBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dbr master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the dahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000048 DAHB_DAHB_DFLT_MST

Type: read-write
Reset State: 0x00000000

This register identifies the default master for the dahb

DAHB_DAHB_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY 0x1: DPUW 0x2: DPUR 0x3: BMUW 0x4: BMUR 0x5: ADU 0x6: DBR Reset State: 0x00000000

0x3000090 DAHB_DAHB_VERSION

Type: read-only
Reset State: 0x3230382A

ASCII value for each number in the version, followed by '*'. For example 32_30_31_2A represents the version 2.01*.

DAHB_DAHB_VERSION

Bits	Name	Description
31:24	DAHB_COMP_VERSION_BYTE0	Reset State: 0x00000032
23:16	DAHB_COMP_VERSION_BYTE1	Reset State: 0x00000030
15:8	DAHB_COMP_VERSION_BYTE2	Reset State: 0x00000038
7:0	DAHB_COMP_VERSION_BYTE3	Reset State: 0x0000002A

16.2.40 dpu

0x3000000 DPU_DPU_TXPKTCOUNT

Type: read-write
Reset State: 0x00000000

Total TX packets handled by the PDU

DPU_DPU_TXPKTCOUNT

Bits	Name	Description
15:0	DD_TXPKTCOUNT	Total TX packets handled by the PDU Reset State: 0x00000000

0x3000004 DPU_DPU_RXPKTCOUNT

Type: read-write
Reset State: 0x00000000

Total RX packets handled by the PDU

DPU_DPU_RXPKTCOUNT

Bits	Name	Description
15:0	DD_RXPKTCOUNT	Total RX packets handled by the PDU Reset State: 0x00000000

0x300000C DPU_DPU_BASE_ADDR

Type: read-write
Reset State: 0x00010000

Base address of the DPU data structure

DPU_DPU_BASE_ADDR

Bits	Name	Description
31:0	DD_BASE	Base address of the DPU data structure Reset State: 0x00010000

0x3000010 DPU_DPU_KEYBASE_ADDR

Type: read-write
Reset State: 0x00011000

Base address of the Key data structure

DPU_DPU_KEYBASE_ADDR

Bits	Name	Description
31:0	DD_KEYBASE	Base address of the key data structure Reset State: 0x00011000

0x3000014 DPU_DPU_MICKEYBASE_ADDR

Type: read-write
Reset State: 0x00012000

Base address of the TKIP Mic Key data structure

DPU_DPU_MICKEYBASE_ADDR

Bits	Name	Description
31:0	DD_MICKEYBASE	Base address of the TKIP MIC key data structure Reset State: 0x00012000

0x3000018 DPU_DPU_RCBASE_ADDR

Type: read-write
Reset State: 0x00013000

Base address of the Reply_counter data structure

DPU_DPU_RCBASE_ADDR

Bits	Name	Description
31:0	DD_RCBASE	Base address of the reply-counter data structure Reset State: 0x00013000

0x300001C DPU_DPU_CONTROL

Type: read-write
Reset State: 0x00000006

Holds DPU based configuration fields

DPU_DPU_CONTROL

Bits	Name	Description
31	SP_CLKGATE_DISABLE	Disable clock gating for Security block 0: Clock gating is enabled 1: Clock gating is disabled Reset State: 0x00000000
30	WEP_CLKGATE_DISABLE	Disable clock gating for RC4 engine 0: Clock gating is enabled 1: Clock gating is disabled Reset State: 0x00000000
29	TKIP_CLKGATE_DISABLE	Disable clock gating for TKIP block 0: Clock gating is enabled 1: Clock gating is disabled Reset State: 0x00000000
28	AES_CLKGATE_DISABLE	Disable clock gating for AES engine 0: Clock gating is enabled 1: Clock gating is disabled Reset State: 0x00000000
27	FRAG_CLKGATE_DISABLE	Disable clock gating for fragmentation/defragmentation block 0: Clock gating is enabled 1: Clock gating is disabled Reset State: 0x00000000
26	PDUBD_STALL	DPU is stalled as no PDU/BD's are available and the DPU requires more. 0: DPU is not stalled 1: DPU is stalled Reset State: 0x00000000
25	IGR_BUSY	DPU Egress State-machine is Busy indication. 0: Ingress SM is IDLE. 1: Ingress SM is BUSY. Reset State: 0x00000000
24	EGR_BUSY	DPU Egress State-machine is Busy indication. 0: Egress SM is IDLE. 1: Egress SM is BUSY. Reset State: 0x00000000
23	SP_BUSY	Encryption/Decryption engine is Busy indication. 0: SP is IDLE. 1: SP is BUSY. Reset State: 0x00000000
18	WAPI_BUSY	WAPI Encryption/Decryption engine is Busy indication. 0: WAPI is IDLE. 1: WAPI is BUSY. Reset State: 0x00000000
17	SP_RC4_BUSY	RC4 Encryption/Decryption engine is Busy indication. 0: SP is IDLE. 1: SP is BUSY. Reset State: 0x00000000
16	SP_AES_BUSY	AES Encryption/Decryption engine is Busy indication. 0: SP is IDLE. 1: SP is BUSY. Reset State: 0x00000000
15	WAPI_CLKGATE_DISABLE	Disable clock gating for WAPI engine 0: Clock gating is enabled 1: Clock gating is disabled Reset State: 0x00000000
14	CSR_CLKGATE_DISABLE	Disable clock gating for config reg module 0: Clock gating is enabled 1: Clock gating is disabled Reset State: 0x00000000

DPU_DPU_CONTROL (cont.)

Bits	Name	Description
13	WAPI_REVERSE_IV_ENDIAN_RX	This bit reverses the endianess of WAPI replay counter in rx direction Reset State: 0x00000000
12	INCL_PN_IN_BD_EN	By enabling this bit, DPU writes the packet number in BD(0x38) when replay check is disabled Reset State: 0x00000000
11	WAPI_REVERSE_IV_ENDIAN_TX	This bit reverses the endianess of WAPI replay counter in tx direction Reset State: 0x00000000
10	WAPI_QOS_EN	This bit enables wapi QoS field to calculate MIC value Reset State: 0x00000000
9	RHS_WINCHK_EN	This bit enables right hand side window check Reset State: 0x00000000
8	WQ_TX_RSV_EN	This bit enables reservations on for TX WQ's Reset State: 0x00000000
7	WQ_RX_RSV_EN	This bit enables reservations on for RX WQ's Reset State: 0x00000000
6	DROP_EQ_LEN	Setting this bit drops all envelope only received packets 0: Removes the envelope and passes zero byte packet to Host 1: Drops all envelope only received packets Reset State: 0x00000000
5	ROUTING_FLAG_EN	Setting this bit overrides the BD routing flag 0: Packet will be routed to the value set in BD 1: Packet will be routed to the value set in routing flag register Reset State: 0x00000000
3	SEQUENCE_NO_INS_EN	Setting this bit enables inserting of DPU generated sequence no in frame control 0: Sequence no from Host is passed on 1: Inserts Sequence number generated by DPU Reset State: 0x00000000
2	RX_TAG_CHK_EN	Setting this bit enables BD TAG checking against the DPU TAG for RX packets 0: Don't check BD and DD tag on RX 1: Do check BD and DD tag on RX Reset State: 0x00000001
1	TX_TAG_CHK_EN	Setting this bit enables BD TAG checking against the DPU TAG for TX packets 0: Don't check BD and DD tag on TX 1: Do check BD and DD tag on TX Reset State: 0x00000001
0	WQ_ARB_MODE	Setting this bit selects the arbitration scheme of the Work Queues (WQ). 0: Arbitration priority is ordered RX0->RX7 followed by TX0->TX7, i.e., RX WQ's have higher priority than TX WQ's 1: Arbitration priority is ordered RX0,TX0,RX1,TX1,RX2,TX2,etc.,i.e., RX WQ 0 has higher priority than TX WQ 0, which has higher priority than RX WQ 1 and so on. Reset State: 0x00000000

0x3000020 DPU_DPU_INTERRUPT_MASK

Type: read-write
Reset State: 0x00000000

Enables/Disables the DPU interrupts

DPU_DPU_INTERRUPT_MASK

Bits	Name	Description
31	EGR_WR_ERROR	Setting this bit enables the EGR State Machine Error interrupt. The interrupt occurs when the DPU egress state-machine enters the error state. Such errors are triggered by errors on the Write AHB bus, which should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled Reset State: 0x00000000
30	EGR_GBI_ERROR	Setting this bit enables the EGR State Machine Error interrupt. The interrupt occurs when the DPU egress state-machine enters the error state. Such errors are triggered by errors on the Command AHB bus, which should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled Reset State: 0x00000000
29	IGR_ERROR	Setting this bit enables the IGR State Machine Error interrupt. The interrupt occurs when the DPU ingress state-machine enters the error state. Such errors are triggered by errors on the Read AHB bus, which should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled Reset State: 0x00000000
28	PDUBD_STALL	Setting this bit enables the PDU/BD Stalled interrupt. The interrupt occurs when the DPU requires BD/PDU's but none are available. 0: Disabled 1: Enabled Reset State: 0x00000000
27	WATCHDOG_TIMER	Setting this bit enables the Watchdog Timer interrupt. The interrupt occurs when the Watchdog timer reaches is programmable threshold. 0: Disabled 1: Enabled Reset State: 0x00000000
24	DPU_WAKEUPHOST_EN	Setting this bit enables the wake-up host interrupt In WoWL mode whenever it detects magic packet the interrupt bit is set 0: Disabled 1: Enabled Reset State: 0x00000000
23	MIC_ERR_EN	Setting this bit enables the MIC error interrupt. The interrupt occurs when a TKIP MIC is detected as errored. 0: Disabled 1: Enabled Reset State: 0x00000000
20:0	PKT_ERR_EN	The state of each bit enables/disables an interrupt for the corresponding Packet Error Code. The interrupt occurs when a packet Error is detected. 0: Disabled (per-bit) 1: Enabled (per-bit) Reset State: 0x00000000

0x3000024 DPU_DPU_INTERRUPT_STATUS

Type: read-only
Reset State: 0x00000000

Returns the status of the DPU interrupts

DPU_DPU_INTERRUPT_STATUS

Bits	Name	Description
31	EGR_WR_ERROR	This bit indicates the status of the EGR State Machine Error interrupt. The event occurs when the DPU egress state-machine enters the error state. Such errors are triggered by errors on the Write AHB bus which, should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled Reset State: 0x00000000
30	EGR_GBI_ERROR	This bit indicates the status of the EGR State Machine Error interrupt. The event occurs when the DPU egress state-machine enters the error state. Such errors are triggered by errors on the Command AHB bus which, should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled Reset State: 0x00000000
29	IGR_ERROR	This bit indicates the status of the IGR State Machine Error interrupt. The event occurs when the DPU ingress state-machine enters the error state. Such errors are triggered by errors on the Read AHB bus, which should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled Reset State: 0x00000000
28	PDUBD_STALL	This bit indicates the status of the PDU/BD Stalled interrupt. The event occurs when the DPU requires BD/PDU's but none are available. 0: Disabled 1: Enabled Reset State: 0x00000000
27	WATCHDOG_TIMER	This bit indicates the status of the Watchdog Timer event. The event occurs when the Watchdog timer reaches is programmable threshold. 0: Disabled 1: Enabled Reset State: 0x00000000
23	MIC_ERR	This bit indicates the status of the MIC error event. The event occurs when a TKIP MIC is detected as errored. 0: Disabled 1: Enabled Reset State: 0x00000000

DPU_DPU_INTERRUPT_STATUS (cont.)

Bits	Name	Description
20:0	PKT_ERR	The state of each bit enables/disables an interrupt for the corresponding Packet Error Code. The interrupt occurs when a packet Error is detected. 0: Disabled (per-bit) 1: Enabled (per-bit) 0x2: DPU_BAD_TAG_ERR 0x4: DPU_BAD_BD_ERR 0x20: DPU_FRAG_CNT_ERR 0x40: DPU_BAD_MIC_ERR 0x100: DPU_BAD_DECRYPT_ERR 0x200: DPU_ENV_ONLY_ERR 0x400: DPU_ENV_PART_ERR 0x800: DPU_ZERO_LEN_ERR 0x1000: DPU_BAD_EXTIV_ERR 0x2000: DPU_BAD_KID_ERR 0x4000: DPU_BAD_TSC1_ERR 0x8000: DPU_UNPROT_ERR 0x10000: DPU_PROT_ERR 0x20000: DPU_BAD_RC_ERR 0x40000: DPU_RC_WRAP_ERR 0x80000: DPU_STALL_FLUSH 0x100000: DPU_BD_CHNG_ERR Reset State: 0x00000000

0x3000028 DPU_DPU_BIP_MMIE

Type: read-write
Reset State: 0x00001000

This is the Management MIC Information Element This contains Element ID and Length

DPU_DPU_BIP_MMIE

Bits	Name	Description
15:8	LENGTH	Default this value is 16, This is Length Information Reset State: 0x00000010
7:0	ELEMENT_ID	Default this value is 0, This is MMIE Element ID Reset State: 0x00000000

0x3000048 DPU_DPU_WATCHDOG

Type: read-write
Reset State: 0xFFFF0000

This value represents the DPU watch dog timer and controls. The watchdog self resets to 0 when the DPU is idle and increments by 1 at 128 micro-second intervals when the DPU is not idle. NOTE: The Watchdog does not stop/change the operation of the DPU.

DPU_DPU_WATCHDOG

Bits	Name	Description
31:16	WATCHDOG_THRES	This is the value that if reached the DPU will issue a timeout interrupt. Writing to this register resets the watchdog timer Reset State: 0x0000FFFF
15:0	WATCHDOG_VALUE	This is the current value of the DPU watchdog timer. Reset State: 0x00000000

0x300004C DPU_DPU_BD_IN_COUNTS

Type: read-only
Reset State: 0x00000000

This register provides debug counts of BD's into the DPU

DPU_DPU_BD_IN_COUNTS

Bits	Name	Description
19:16	BD_REQUEST	This is the count of BD's requested by the DPU. Reset State: 0x00000000
3:0	BD_POP	This is the count of BD's poped by the DPU. Reset State: 0x00000000

0x3000050 DPU_DPU_BD_OUT_COUNTS

Type: read-only
Reset State: 0x00000000

This register provides debug counts of BD's out of the DPU

DPU_DPU_BD_OUT_COUNTS

Bits	Name	Description
19:16	BD_RELEASE	This is the count of BD's released by the DPU. Reset State: 0x00000000
3:0	BD_PUSH	This is the count of BD's pushed by the DPU. Reset State: 0x00000000

0x3000054 DPU_DPU_WQ_3_RESERVE

Type: read-write
Reset State: 0x00000110

This register is used to define the number of BD/PDU's the DPU reserves before processing a TX/RX 3 WQ. If the reservation fails the TX/RX 3 to 10 WQ's are disabled from selection until there enough BD/PDU's to satisfy the reservation request. The BD/PDU reservation values must be less than TX/RX 4 WQ reservation values.

DPU_DPU_WQ_3_RESERVE

Bits	Name	Description
12:8	BD_CNT	This the number of BD's the DPU will reserve before processing a WQ 3. Reset State: 0x00000001
6:0	PDU_CNT	This the number of PDU's the DPU will reserve before processing a WQ 3. Reset State: 0x00000010

0x300005C DPU_DPU_WQ_5_RESERVE

Type: read-write
Reset State: 0x00000110

This register is used to define the number of BD/PDU's the DPU reserves before processing a TX/RX 5 WQ. If the reservation fails the TX/RX 5 to 10 WQ's are disabled from selection until there enough BD/PDU's to satisfy the reservation request. The BD/PDU reservation values must be less than TX/RX 6 WQ reservation values.

DPU_DPU_WQ_5_RESERVE

Bits	Name	Description
12:8	BD_CNT	This the number of BD's the DPU will reserve before processing a WQ 5. Reset State: 0x00000001
6:0	PDU_CNT	This the number of PDU's the DPU will reserve before processing a WQ 5. Reset State: 0x00000010

0x3000060 DPU_DPU_WQ_6_RESERVE

Type: read-write
Reset State: 0x00000110

This register is used to define the number of BD/PDU's the DPU reserves before processing a TX/RX 6 WQ. If the reservation fails the TX/RX 6 to 10 WQ's are disabled from selection until there enough BD/PDU's to satisfy the reservation request. The BD/PDU reservation values must be less than TX/RX 7 WQ reservation values.

DPU_DPU_WQ_6_RESERVE

Bits	Name	Description
12:8	BD_CNT	This the number of BD's the DPU will reserve before processing a WQ 6. Reset State: 0x00000001
6:0	PDU_CNT	This the number of PDU's the DPU will reserve before processing a WQ 6. Reset State: 0x00000010

0x3000064 DPU_DPU_WQ_7_RESERVE

Type: read-write
Reset State: 0x00000110

This register is used to define the number of BD/PDU's the DPU reserves before processing a TX/RX 4 WQ. If the reservation fails the TX/RX 7 to 10 WQ's are disabled from selection until there enough BD/PDU's to satisfy the reservation request. The BD/PDU reservation values must be less than TX/RX 8 WQ reservation values.

DPU_DPU_WQ_7_RESERVE

Bits	Name	Description
12:8	BD_CNT	This the number of BD's the DPU will reserve before processing a WQ 7. Reset State: 0x00000001
6:0	PDU_CNT	This the number of PDU's the DPU will reserve before processing a WQ 7. Reset State: 0x00000010

0x3000074 DPU_DPU_ERROR_WQ

Type: read-write
Reset State: 0x0000FF08

This register is used to define two Work Queues to which error packets can be routed. By default, both of these error work queues are set to 0xFF, which is intended to be a 'junk' work queue where data is discarded.

DPU_DPU_ERROR_WQ

Bits	Name	Description
15:8	ERR_WQ_B	This indicates the work queue number for work queue B. Reset State: 0x000000FF
7:0	ERR_WQ_A	This indicates the work queue number for work queue A. Reset State: 0x00000008

0x3000078 DPU_DPU_ERROR_WQ_SELECT

Type: read-write
Reset State: 0x00000000

This register is used to select the work queue routing for error packet with particular error codes. Each error code is represented by a single bit in this register; for example bit 3 is used for selecting routing of packets with error code 3. A set bit will direct error packets with that error code to work queue B. A cleared bit will direct error packets with that error code to work queue A. By default all errors are routed to error work queue A.

DPU_DPU_ERROR_WQ_SELECT

Bits	Name	Description
18:1	ERR_WQ_SELECT	If bit n is set in this field then error packets with error code n are sent to error work queue B; if the bit is clear then they are sent to work queue A. All bit numbers other than valid error codes are reserved and should be left zero. Reset State: 0x00000000

0x300007C DPU_DPU_ERROR_WQ_COUNT

Type: read-write
Reset State: 0x00000000

This register contains counters for errors used to each error work queue. The counts are cleared when it is written.

DPU_DPU_ERROR_WQ_COUNT

Bits	Name	Description
19:16	ERR_WQ_B_CNT	Count of error packets that have been routed to error work queue B. Reset State: 0x00000000
3:0	ERR_WQ_A_CNT	Count of error packets that have been routed to error work queue A. Reset State: 0x00000000

0x3000080 DPU_DPU_FRAG_COUNT

Type: read-write
Reset State: 0x00000000

This register contains counters for fragments received and transmitted. The counts are cleared when it is written.

DPU_DPU_FRAG_COUNT

Bits	Name	Description
31:16	RX_FRAG_CNT	This is a count of fragments de-fragmented by the DPU. Packets that pass through the DPU without being de-fragmented do not increment this count. Reset State: 0x00000000
15:0	TX_FRAG_CNT	This is a count of fragments created by the DPU. Packets that pass through the DPU without being fragmented do not increment this count. Reset State: 0x00000000

0x3000084 DPU_DPU_DBG_TESTBUS_HI

Type: read-write
Reset State: 0x17000000

This register is a debug register and indicates the state of the Testbus high bits and selects the testbus to view

DPU_DPU_DBG_TESTBUS_HI

Bits	Name	Description
31:28	TEST_MODULE_SEL	Selects the different tests bus modules of the DPU. 0x0: NONE 0x1: GBI 0x2: FRAG 0x3: FLOW 0x4: MIC 0x5: SP 0x6: EGR 0x7: IGR 0x8: WDMA 0x9: RDMA 0xA: CSR 0xB: WOW 0xC: WAPI Reset State: 0x00000001

DPU_DPU_DBG_TESTBUS_HI (cont.)

Bits	Name	Description
27:24	TEST_BUS_SEL	Selects the different test buses of the selected module. Reset State: 0x00000007
12:0	TESTBUS_HI	Reset State: 0x00000000

0x3000088 DPU_DPU_DBG_TESTBUS_LO

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the state of the Testbus low bits

DPU_DPU_DBG_TESTBUS_LO

Bits	Name	Description
31:0	TESTBUS_LO	Reset State: 0x00000000

0x300008C DPU_DPU_DBG_WQ_AVAIL

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the state of the WQ available signals

DPU_DPU_DBG_WQ_AVAIL

Bits	Name	Description
31:24	RX_WQ_AVAIL	This indicates the state of the bmu_dpu_dvalid_rx signal Reset State: 0x00000000
17	RX_PDU_AVAIL	This indicates the state of the bmu_dpu_pdu_avail_tx signal Reset State: 0x00000000
16	RX_BD_RSV_AVAIL	This indicates the state of the bmu_dpu_rx_bd_pdu_avail_for_rsv_req signal Reset State: 0x00000000
15:8	TX_WQ_AVAIL	This indicates the state of the bmu_dpu_dvalid_tx Reset State: 0x00000000
1	TX_PDU_AVAIL	This indicates the state of the bmu_dpu_pdu_avail_tx signal Reset State: 0x00000000
0	TX_BD_RSV_AVAIL	This indicates the state of the bmu_dpu_tx_bd_pdu_avail_for_rsv_req signal Reset State: 0x00000000

0x3000090 DPU_DPU_DBG_WQ_ALLOW

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the state of the WQ blocking signals

DPU_DPU_DBG_WQ_ALLOW

Bits	Name	Description
24	WQ_SEL_DIR	This indicates the direction of the current/last selected WQ. Reset State: 0x00000000
23:16	WQ_SEL_IDX	This indicates the current/last selected WQ. Reset State: 0x00000000
15:8	RX_WQ_ALLOW	This indicates the state of allowed RX WQ's to be processed as determined by the reservation logic. Reset State: 0x00000000
7:0	TX_WQ_ALLOW	This indicates the state of allowed TX WQ's to be processed as determined by the reservation logic. Reset State: 0x00000000

0x3000094 DPU_DPU_DBG_SM_STATE

Type: read-only
Reset State: 0x00000000

This registers is a debug register and indicates the state of the DPU state-machines

DPU_DPU_DBG_SM_STATE

Bits	Name	Description
27:23	IGR_IGR_SM	Reset State: 0x00000000
12:8	EGR_EGR_SM	Reset State: 0x00000000
6:4	FRAG_SM_ENC	Reset State: 0x00000000
2:0	FLOW_SM_ENC	Reset State: 0x00000000

0x3000098 DPU_DPU_DBG_BUF_FILL

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the fill level of the internal buffers

DPU_DPU_DBG_BUF_FILL

Bits	Name	Description
17:9	OUTBUF_FILL	Reset State: 0x00000000
8:0	INPBUF_FILL	Reset State: 0x00000000

0x300009C DPU_DPU_DBG_BD_DPU_WORD0

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the BD Word 0 fields relevant to DPU. This also includes the BD Index of the last BD DPU processed.

DPU_DPU_DBG_BD_DPU_WORD0

Bits	Name	Description
31:24	IGR_BD_DPU_RF	Reset State: 0x00000000
23:21	IGR_BD_TAG	Reset State: 0x00000000
20:6	IGR_CUR_BDIDX	Reset State: 0x00000000
5:4	IGR_BD_RX_KID	Reset State: 0x00000000
3	IGR_BD_NE	Reset State: 0x00000000
1:0	IGR_BD_BDT	Reset State: 0x00000000

0x30000A0 DPU_DPU_DBG_BD_DPU_WORD2

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the BD Word 2 fields relevant to DPU.

DPU_DPU_DBG_BD_DPU_WORD2

Bits	Name	Description
31:16	IGR_BD_HDPTR	Reset State: 0x00000000
15:0	IGR_BD_TLPTR	Reset State: 0x00000000

0x30000A4 DPU_DPU_DBG_BD_DPU_WORD3

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the BD Word 3 fields relevant to DPU.

DPU_DPU_DBG_BD_DPU_WORD3

Bits	Name	Description
31:24	IGR_BD_HDRLEN	Reset State: 0x00000000
23:16	IGR_BD_HDRSTRT	Reset State: 0x00000000
15:7	IGR_BD_DTSTRT	Reset State: 0x00000000
6:0	IGR_BD_PDUCNT	Reset State: 0x00000000

0x30000A8 DPU_DPU_DBG_BD_DPU_WORD4

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the BD Word 4 fields relevant to DPU.

DPU_DPU_DBG_BD_DPU_WORD4

Bits	Name	Description
31:16	IGR_BD_MPDULEN	Reset State: 0x00000000
11:8	IGR_BD_TCID	Reset State: 0x00000000

0x30000AC DPU_DPU_DBG_BD_DPU_WORD5

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the BD Word 5 fields relevant to DPU.

DPU_DPU_DBG_BD_DPU_WORD5

Bits	Name	Description
31:24	IGR_BD_DDOFFSET	Reset State: 0x00000000

0x30000D0 DPU_DPU_DBG_DD_WORD_0

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the DD Word 0 fields relevant to DPU.

DPU_DPU_DBG_DD_WORD_0

Bits	Name	Description
27:16	IGR_DD_FRAGSIZE	Reset State: 0x00000000
8:6	IGR_DD_TAG	Reset State: 0x00000000

0x30000D4 DPU_DPU_DBG_DD_WORD_1

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the DD Word 1 fields relevant to DPU.

DPU_DPU_DBG_DD_WORD_1

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x30000D8 DPU_DPU_DBG_DD_WORD_2

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the DD Word 2 fields relevant to DPU.

DPU_DPU_DBG_DD_WORD_2

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x30000DC DPU_DPU_DBG_DD_WORD_3

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the DD Word 3 fields relevant to DPU.

DPU_DPU_DBG_DD_WORD_3

Bits	Name	Description
27:24	IGR_DD_RC_BASE_OFFSET	Reset State: 0x00000000
23:16	IGR_DD_MICKEY_OFFSET	Reset State: 0x00000000
15:8	IGR_DD_TX_SPKEY_OFFSET	Reset State: 0x00000000
7:6	IGR_DD_TX_KID	Reset State: 0x00000000
2:0	IGR_SP_MODE	Reset State: 0x00000000

0x30000E0 DPU_DPU_DBG_DD_WORD_4

Type: read-only
Reset State: 0x00000000

This register is a debug register and indicates the DD Word 4 fields relevant to DPU.

DPU_DPU_DBG_DD_WORD_4

Bits	Name	Description
7:0	IGR_DD_RC_OFFSET	Reset State: 0x00000000

0x30000E4 DPU_DPU_WAPIMICKEYBASE_ADDR

Type: read-write
Reset State: 0x00012000

Base address of the WAPI Mic Key data structure

DPU_DPU_WAPIMICKEYBASE_ADDR

Bits	Name	Description
31:0	DD_WAPIMICKEYBASE	Base address of the WAPI MIC key data structure Reset State: 0x00012000

0x30000E8 DPU_DPU_BUG_FIX

Type: read-write
Reset State: 0x00000000

This register holds bug fix controls.

DPU_DPU_BUG_FIX

Bits	Name	Description
2	TKIP_PRIORITY_SEL	Selects the method by which the PRIORITY field is generated for the TKIP MIC calculations. 0: from the BD TID field. PRIORITY = {4'h0,BD_TID} 1: from the QC field. PRIORITY = (QC_VALID) QC[7:0] : 8'h0 Reset State: 0x00000000

0x30000EC DPU_DPU_AES_MASK

Type: read-write
Reset State: 0x80000000

This register holds AES AAD Mask controls.

DPU_DPU_AES_MASK

Bits	Name	Description
31	FRAME_CONTROL_MASK_15	Selects the masking control for Frame Control bit 15 0: Frame Control bit 15 set to 0 1: Frame Control bit 15 set to value in MAC Header Reset State: 0x00000001
7	QOS_MASK_7	Selects the masking control for QOS bit 7 0: QOS bit 7 set to 0 1: QOS bit 7 set to value in MAC Header Reset State: 0x00000000

0x30000F0 DPU_DPU_TKIP_MASK

Type: read-write
Reset State: 0x00000000

This register holds TKIP MIC Mask controls.

DPU_DPU_TKIP_MASK

Bits	Name	Description
7	PRIORITY_MASK_7	Selects the masking control for PRORITY bit 7 0: PRIORITY bit 7 set to 0 1: PRIORITY bit 7 set to value in MAC Header Reset State: 0x00000000

0x30000F4 DPU_DPU_SEQUENCE_NO

Type: read-write
Reset State: 0x00000000

This register holds Sequence number.

DPU_DPU_SEQUENCE_NO

Bits	Name	Description
11:0	SEQUENCE_NO	DPU generated Sequence Number Reset State: 0x00000000

0x30000F8 DPU_DPU_ROUTING_FLAG

Type: read-write
Reset State: 0x0000FF18

This register holds the Routing Flag Value.

DPU_DPU_ROUTING_FLAG

Bits	Name	Description
15:8	WOW_ROUTING_FLAG	Routing flag to rout the packets in WOW mode (This is controlled by wow_routing_flag_en) Reset State: 0x000000FF
7:0	ROUTING_FLAG	Routing flag to rout the packets in WOW mode (This controlled by wow_en) Reset State: 0x00000018

0x30000FC DPU_DPU_HOST_WAKEUP_STATUS_MAGICBD

Type: read-only
Reset State: 0x00000000

This register holds host wakeup reason code and magic BD index Value

DPU_DPU_HOST_WAKEUP_STATUS_MAGICBD

Bits	Name	Description
31:16	MAGIC_PACKET_BD_INDEX	Bd index value for the Magic packet Reset State: 0x00000000
15	HOST_WAKEUP_STATUS	Host wake-up status Reset State: 0x00000000

DPU_DPU_HOST_WAKEUP_STATUS_MAGICBD (cont.)

Bits	Name	Description
6:0	HOST_WAKEUP_REASON_CODE	Host wake-up reason code Reset State: 0x00000000

0x3000100 DPU_DPU_WOW_CONFIG

Type: read-write
Reset State: 0x00000000

Holds WOW based configuration fields

DPU_DPU_WOW_CONFIG

Bits	Name	Description
7	WOW_ROUTING_FLAG_EN	When this bit is enabled 0: 1: Reset State: 0x00000000
6	WOW_PKTERR_EN	When this bit is enabled 0: 1: Reset State: 0x00000000
5	WOW_CHANSWITCH_EN	When this bit is set wow block will also wake up the host if channel switch frame is received 0: 1: When this bit is set wow block will also wake up the host if channel switch frame is received Reset State: 0x00000000
4	WOW_DEAUTH_EN	When this bit is set wow block will also wake up the host if de-authentication packet is received 0: 1: When this bit is set wow block will also wake up the host if de-authentication packet is received Reset State: 0x00000000
3	WOW_DISASS_EN	When this bit is set wow block will also wake up the host if disassociation packet is received 0: 1: When this bit is set wow block will also wake up the host if disassociation packet is received Reset State: 0x00000000
2:1	WOW_MODE	four wow modes from the register data that is programmed by software 00: Magic packet 01: Client only (reserved) 10: AP-Assist(reserved) 11: AP Reset State: 0x00000000
0	WOW_EN	Setting this bit enables/disables the wow mode. 0: WOW blockdisabled 1: WOW block enable Reset State: 0x00000000

0x3000104 DPU_DPU_WOW_TIMERS

Type: read-write
Reset State: 0x00000000

Link down Timer :The value programmed indicates the threshold for consecutive missed beacons. If the timer reaches this value host is woken up. Wake-up Timer : Time out timer if an wakeup even has not occurred and this timer expires we wakeup the host

DPU_DPU_WOW_TIMERS

Bits	Name	Description
31:8	WAKEUP	Reset State: 0x00000000
5:0	LINK_DOWN	Reset State: 0x00000000

0x3000108 DPU_DPU_WOW_MAGIC_PACKET_HI

Type: read-write
Reset State: 0x00000000

This is 48bit mac address that is written by software, this is the pattern that is used for magic packet. It can be any pattern also

DPU_DPU_WOW_MAGIC_PACKET_HI

Bits	Name	Description
15:0	MAGIC_PACKET_47_TO_32	This is 48bit mac address that is written by software Reset State: 0x00000000

0x300010C DPU_DPU_WOW_MAGIC_PACKET_LO

Type: read-write
Reset State: 0x00000000

This is 48bit mac address that is written by software, this is the pattern that is used for magic packet. It can be any pattern also

DPU_DPU_WOW_MAGIC_PACKET_LO

Bits	Name	Description
31:0	MAGIC_PACKET_31_TO_0	This is 48bit mac address that is written by software Reset State: 0x00000000

0x3000110 DPU_WOW_FOUND_MAGIC_COUNTER

Type: read-only
Reset State: 0x00000000

Number of packets received after magic packet has been detected Note That these packets will be pushed to DXE WQ including magic packet, which is something you can verify

DPU_WOW_FOUND_MAGIC_COUNTER

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x3000114 DPU_WOW_WAITING4MAGIC_COUNTER

Type: read-only
Reset State: 0x00000000

Number of packets received before we detect a magic packet These packets are pushed to drop WQ

DPU_WOW_WAITING4MAGIC_COUNTER

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x3000118 DPU_WAPI_STA_KEY_INDEX_VALUES

Type: read-only
Reset State: 0x00000000

Station key index values

DPU_WAPI_STA_KEY_INDEX_VALUES

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x3000120 DPU_WAPI_STA0_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA0_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000124 DPU_WAPI_STA1_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA1_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000128 DPU_WAPI_STA2_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA2_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x300012C DPU_WAPI_STA3_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA3_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000130 DPU_WAPI_STA4_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA4_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000134 DPU_WAPI_STA5_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA5_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000138 DPU_WAPI_STA6_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA6_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x300013C DPU_WAPI_STA7_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA7_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000140 DPU_WAPI_STA8_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA8_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000144 DPU_WAPI_STA9_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA9_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000148 DPU_WAPI_STA10_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA10_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x300014C DPU_WAPI_STA11_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA11_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000150 DPU_WAPI_STA12_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA12_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000154 DPU_WAPI_STA13_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA13_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x3000158 DPU_WAPI_STA14_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA14_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

0x300015C DPU_WAPI_STA15_KEY_INDEXES

Type: read-write
Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

DPU_WAPI_STA15_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Key index value to map keyid3 Reset State: 0x00000000
23:16	KEY_INDEX2	Key index value to map keyid2 Reset State: 0x00000000
15:8	KEY_INDEX1	Key index value to map keyid1 Reset State: 0x00000000
7:0	KEY_INDEX0	Key index value to map keyid0 Reset State: 0x00000000

16.2.41 fdahb

0x3000000 FDAHB_FDAHB_RXP_PL

Type: read-write
Reset State: 0x00000004

fdahb Arbiter arbitration priority level for rxp master. In the fdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

FDAHB_FDAHB_RXP_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rxp master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the fdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000004

0x3000004 FDAHB_FDAHB_TXP_PL

Type: read-write
Reset State: 0x00000004

fdahb Arbiter arbitration priority level for txp master. In the fdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

FDAHB_FDAHB_TXP_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for txp master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the fdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000004

0x3000008 FDAHB_FDAHB_TPE_PL

Type: read-write
Reset State: 0x00000004

fdahb Arbiter arbitration priority level for tpe master. In the fdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

FDAHB_FDAHB_TPE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for tpe master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the fdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000004

0x300000C FDAHB_FDAHB_FDBR_PL

Type: read-write
Reset State: 0x00000005

fdahb Arbiter arbitration priority level for fdbr master. In the fdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

FDAHB_FDAHB_FDBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for fdbr master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the fdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000010 FDAHB_FDAHB_RPE_PL

Type: read-write
Reset State: 0x00000004

fdahb Arbiter arbitration priority level for rpe master. In the fdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

FDAHB_FDAHB_RPE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rpe master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the fdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000004

0x3000048 FDAHB_FDAHB_DFLT_MST

Type: read-write
Reset State: 0x00000000

This register identifies the default master for the fdahb

FDAHB_FDAHB_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY 0x1: RXP 0x2: TXP 0x3: TPE 0x4: FDBR 0x5: RPE Reset State: 0x00000000

0x3000090 FDAHB_FDAHB_VERSION

Type: read-only
Reset State: 0x3230382A

ASCII value for each number in the version, followed by '*'. For example 32_30_31_2A represents the version 2.01*.

FDAHB_FDAHB_VERSION

Bits	Name	Description
31:24	FDAHB_COMP_VERSION_BYTE0	Reset State: 0x00000032
23:16	FDAHB_COMP_VERSION_BYTE1	Reset State: 0x00000030
15:8	FDAHB_COMP_VERSION_BYTE2	Reset State: 0x00000038
7:0	FDAHB_COMP_VERSION_BYTE3	Reset State: 0x0000002A

16.2.42 mcu

0x3000000 MCU_BD_PDU_BASE_ADDR

Type: read-write
Reset State: 0x00000000

Sets the memory base address of the BDs and PDUs.

MCU_BD_PDU_BASE_ADDR

Bits	Name	Description
31:7	BD_PDU_BASE_ADDRESS	Base address of the BDs and PDUs. Note that the lowest 8 bits can not be programmed as these bits will always have to be zero. BDs and PDUs are in units of 128 bytes. Reset State: 0x00000000

0x3000004 MCU_MLC_CONTROL

Type: read-write
Reset State: 0x00330000

MAC Loop back Control register

MCU_MLC_CONTROL

Bits	Name	Description
31	MLC_LOOPBACK_ENABLE	When set to 1'b1, the MLC loopback functionality is enabled Reset State: 0x00000000
30	MLC_SNOOPING_ENABLE	When set to 1'b1, the MLC snooping functionality is enabled Reset State: 0x00000000
29	MLC_ADDRESS_SWAP_ENABLE	When set to 1'b1, the MLC will swap address 1 and address2 of the frame received from the TXP Reset State: 0x00000000
23:16	BYTE_FORWARDING_INTERVAL	The number of 160MHz clock cycles in between each data byte requested from the TXP and forwarded to the RXP. A value of 8'd3 corresponds with 315 Mbps. A value of 8'd7 corresponds with 100 mbps. This setting is only used in MLC loopback functionality mode, not snooping mode. bits [17:16] are read only and are always tied to 2'b11 since this is the minimum value that you can program. It is tied to this value preventing user from programming it anything other Reset State: 0x00000033

0x300000C MCU_DBR_STATUS

Type: read-write
Reset State: 0x00000000

Status register of the DBR

MCU_DBR_STATUS

Bits	Name	Description
5	DBR_GAM_ERROR	When set to 1'b1, the gam inside the DBR reported an error to overcome some rtl issue, please write to this bit to clear DBR_incorrect_length_error Reset State: 0x00000000
4	DBR_INCORRECT_LENGTH_ERROR	When set to 1'b1, the DBR reported an error: a module tried an access that was larger then 1 word to overcome some rtl issue, please write to this bit to clear DBR_GAM_error Reset State: 0x00000000

0x3000010 MCU_MCPU_TO_HOST_MB_INT_STAT

Type: read-only
Reset State: 0x00000000

Register indicating for which mailboxes an interrupt to the host is pending.

MCU_MCPU_TO_HOST_MB_INT_STAT

Bits	Name	Description
15:0	MBX_INT_STATUS	Each bit stands for the corresponding mailbox. When set, an interrupt from that Mailbox is pending Reset State: 0x00000000

0x3000014 MCU_HOST_TO_MCPU_MB_INT_STAT

Type: read-only
Reset State: 0x00000000

Register indicating for which mailboxes an interrupt to the mCPU is pending.

MCU_HOST_TO_MCPU_MB_INT_STAT

Bits	Name	Description
15:0	MBX_INT_STATUS	Each bit stands for the corresponding mailbox. When set, an interrupt from that Mailbox is pending Reset State: 0x00000000

0x3000018 MCU_MB0_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the mCPU or to the host.

MCU_MB0_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: mCPU to host, When set to one: host to mCPU Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x300001C MCU_MB0_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt.

MCU_MB0_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb0_control register. This value gets cleared on a mb0 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset. Reset State: 0x00000000

0x3000020 MCU_MB1_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the mCPU or to the host.

MCU_MB1_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: mCPU to host, When set to one: host to mCPU Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x3000024 MCU_MB1_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

MCU_MB1_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb1_control register. This value gets cleared on a mb1 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset. Reset State: 0x00000000

0x3000028 MCU_MB2_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the mCPU or to the host.

MCU_MB2_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: mCPU to host, When set to one: host to mCPU Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x300002C MCU_MB2_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

MCU_MB2_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb2_control register. This value gets cleared on a mb2 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset. Reset State: 0x00000000

0x3000030 MCU_MB3_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the mCPU or to the host.

MCU_MB3_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver. Reset State: 0x00000000

MCU_MB3_CONTROL (cont.)

Bits	Name	Description
1	INT_DIRECTION	Interrupt direction: When set to zero: mCPU to host, When set to one: host to mCPU Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x3000034 MCU_MB3_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt.

MCU_MB3_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb3_control register. This value gets cleared on a mb3 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset. Reset State: 0x00000000

0x3000098 MCU_MUTEX0

Type: read-only
Reset State: 0x00000101

General purpose semaphore and/or mutex register.

MCU_MUTEX0

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	The Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001

MCU_MUTEX0 (cont.)

Bits	Name	Description
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount. Reset State: 0x00000001

0x300009C MCU_MUTEX1

Type: read-only
Reset State: 0x00000101

General purpose semaphore and/or mutex register.

MCU_MUTEX1

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	THe Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount. Reset State: 0x00000001

0x30000A0 MCU_MUTEX2

Type: read-only
Reset State: 0x00000101

General purpose semaphore and/or mutex register.

MCU_MUTEX2

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	THe Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount. Reset State: 0x00000001

0x30000A4 MCU_MUTEX3

Type: read-only
Reset State: 0x00000101

General purpose semaphore and/or mutex register.

MCU_MUTEX3

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	THe Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount. Reset State: 0x00000001

0x30000B8 MCU_SOFT_RESET

Type: read-write
Reset State: 0x00000000

Control to soft reset MAC modules. For mCPU reset control, refer to register: MCPU_reset_control.

MCU_SOFT_RESET

Bits	Name	Description
31	TXP_PHYTX_ABORT	When set, the abort signal to the PHYTX is raised. Reset State: 0x00000000
30	CAHB_SOFT_RESET_DOWNCNT_EN	When set, the cahb_soft_reset_downcount starts to count for 63 cycles then reset the mrcm_cahb Reset State: 0x00000000
19	FDAHB_SOFT_RESET	When set, the fdahb is held in soft reset Reset State: 0x00000000
18	FDBR_SOFT_RESET	When set, the fdbr is held in soft reset Reset State: 0x00000000
17	CBR_SOFT_RESET	When set, the cbr is held in soft reset Reset State: 0x00000000
16	QTA_SOFT_RESET	When set, the QTA is held in soft reset Reset State: 0x00000000
15	CFG_SOFT_RESET	When set, the CFG is held in soft reset Reset State: 0x00000000
14	PHY_SOFT_RESET	When set, the PHY is held in soft reset Reset State: 0x00000000
13	ADU_SOFT_RESET	When set, the ADU is held in soft reset Reset State: 0x00000000
12	RPE_SOFT_RESET	When set, the RPE is held in soft reset Reset State: 0x00000000
11	TPE_SOFT_RESET	When set, the TPE is held in soft reset Reset State: 0x00000000
10	DAHB_SOFT_RESET	When set, the DAHB is held in soft reset Reset State: 0x00000000
9	MCU_SOFT_RESET	When set, the MCU is held in soft reset Reset State: 0x00000000
8	PHY_AHB_2_APB_SOFT_RESET	When set, the PHY AHB to APB interface is held in soft reset Reset State: 0x00000000
7	DPU_SOFT_RESET	When set, the DPU is held in soft reset Reset State: 0x00000000
6	BMU_SOFT_RESET	When set, the BMU is held in soft reset Reset State: 0x00000000
5	MTU_SOFT_RESET	When set, the MTU (MAC Timing Unit) is held in soft reset When set, the RXP is held in soft reset Reset State: 0x00000000

MCU_SOFT_RESET (cont.)

Bits	Name	Description
3	TXP_SOFT_RESET	When set, the TXP is held in soft reset Reset State: 0x00000000
2	DBR_SOFT_RESET	Reserved Reset State: 0x00000000
0	MLC_SOFT_RESET	When set, the MLC (MAC Loopback Controller) is held in soft reset Reset State: 0x00000000

0x30000BC MCU_MAC_CLK_GATING_ENABLE

Type: read-write
Reset State: 0x03FF8DE9

Control to enable the dynamic clock gating functionality in the MAC modules.

MCU_MAC_CLK_GATING_ENABLE

Bits	Name	Description
25	MCU_FDAHB_CLK_GATING_ENABLE	When set, the fdahb dynamic clock gating function is enabled Reset State: 0x00000001
24	MCU_FDBR_CLK_GATING_ENABLE	When set, the fdbr dynamic clock gating function is enabled Reset State: 0x00000001
23	MCU_CBR_CLK_GATING_ENABLE	When set, the cbr dynamic clock gating function is enabled Reset State: 0x00000001
22	MCU_CFG_CLK_GATING_ENABLE	When set, the cfg dynamic clock gating function is enabled Reset State: 0x00000001
21	MCU_GAS_CLK_GATING_ENABLE	When set, the MCU gas dynamic clock gating function is enabled Reset State: 0x00000001
20	QTA_CLK_GATING_ENABLE	When set, the QTA dynamic clock gating function is enabled Reset State: 0x00000001
19	ARM_CLK_GATING_ENABLE	When set, the ARM dynamic clock gating function is enabled Reset State: 0x00000001
18	BTC_CLK_GATING_ENABLE	When set, the BTC dynamic clock gating function is enabled Reset State: 0x00000001
17	ADU_CLK_GATING_ENABLE	When set, the ADU dynamic clock gating function is enabled Reset State: 0x00000001
16	TPE_CLK_GATING_ENABLE	When set, the TPE dynamic clock gating function is enabled Reset State: 0x00000001
15	RPE_CLK_GATING_ENABLE	When set, the RPE dynamic clock gating function is enabled Reset State: 0x00000001

MCU_MAC_CLK_GATING_ENABLE (cont.)

Bits	Name	Description
14	DPU_HISTBUF_CLK_ENABLE	This bit is a little bit different since 0-> the clks to hist buff are enabled 1-> the clks are disabled write zero to enable the clock Reset State: 0x00000000
13	DAHB_CLK_GATING_ENABLE	When set, the DAHB bus module dynamic clock gating function is enabled Reset State: 0x00000000
12	CAHB_CLK_GATING_ENABLE	When set, the CAHB module dynamic clock gating function is enabled Reset State: 0x00000000
11	RESERVED1	RESERVED Reset State: 0x00000001
10	MIF_CLK_GATING_ENABLE	Reserved Reset State: 0x00000001
9	MCU_CLK_GATING_ENABLE	When set, the MCU dynamic clock gating function is enabled Reset State: 0x00000000
8	PHY_AHB_2_APB_CLK_GATING_ENABLE	When set, the PHY AHB to APB interface dynamic clock gating function is enabled Reset State: 0x00000001
7	DPU_CLK_GATING_ENABLE	When set, the DPU dynamic clock gating function is enabled Reset State: 0x00000001
6	BMU_CLK_GATING_ENABLE	When set, the BMU dynamic clock gating function is enabled Reset State: 0x00000001
5	MTU_CLK_GATING_ENABLE	When set, the MTU (MAC Timing Unit) dynamic clock gating function is enabled When set, the RXP dynamic clock gating function is enabled Reset State: 0x00000001
3	TXP_CLK_GATING_ENABLE	When set, the TXP dynamic clock gating function is enabled Reset State: 0x00000001
2	DBR_CLK_GATING_ENABLE	When set, the DBR dynamic clock gating function is enabled Reset State: 0x00000000
1	RESERVED2	RESERVED Reset State: 0x00000000
0	MLC_CLK_GATING_ENABLE	When set, the MLC (MAC Loopback Controller) dynamic clock gating function is enabled Reset State: 0x00000001

0x30000C0 MCU_MAC_TESTBUS_CONTROL

Type: read-write
Reset State: 0x3FC0001B

Control to enable the outputs of the MAC module testbusses that do not have programmable registers inside. Control to select which testbus from the MAC is selected to go to the chip top level mux. When set to zero, none of the testbusses are enabled, thus saving power.

MCU_MAC_TESTBUS_CONTROL

Bits	Name	Description
31	MACPHY_TEST_SEL	This bit selects if the vital test signals are from MAC or PHY 0x0: MAC 0x1: PHY Reset State: 0x00000000
30	TESTBUS_MUX_UPPER_LOWER	This bit selects lower 33 bits or upper 33 bits of the 44-bit testbus 1'b0 selects testbus[33:0] 1'b1 selects testbus[44:12] Reset State: 0x00000000
29:28	CBRM_TESTBUS_MODE	testmux select for cbr module 0x1: CBRM_MODE1_TEST 0x2: CBRM_MODE2_TEST 0x3: CBRM_MODE3_TEST Reset State: 0x00000003
27	CAHB_TESTBUS_ENABLE	When set, the CAHB testbus is enabled Reset State: 0x00000001
26	CAHB_VITALS_TESTBUS_ENABLE	When set, the CAHB vitals testbus is enabled Reset State: 0x00000001
25	DAHB_TESTBUS_ENABLE	When set, the DAHB testbus is enabled Reset State: 0x00000001
24	DAHB_VITALS_TESTBUS_ENABLE	When set, the DAHB vitals testbus is enabled Reset State: 0x00000001
23	FDAHB_TESTBUS_ENABLE	When set, the FDAHB testbus is enabled Reset State: 0x00000001
22	FDAHB_VITALS_TESTBUS_ENABLE	When set, the FDAHB vitals testbus is enabled Reset State: 0x00000001
20:16	TBS_PHY_TESTMODE	phy testmode select Reset State: 0x00000000
15:13	WMAC_120_160_TESTBUS_SELECT	These bits select WMAC test bus and the rxp and txp 160,120and160 domain test bus 0x0: WMAC_120 0x1: MTU_120_160 0x2: TXP_160 0x3: TXP_120_160 0x4: RXP_160 0x5: RXP_120_160 0x6: PMU_TESTBUS_CLK_ROSC 0x7: CFG_PHYCLK Reset State: 0x00000000

MCU_MAC_TESTBUS_CONTROL (cont.)

Bits	Name	Description
12:8	WMAC_TESTBUS_SELECT	These bits are used to select wmac testbus from different mac modules see the table for more info 0x0: MCU_TESTBUS 0x1: TXP_TESTBUS 0x2: ACPU_TESTBUS 0x3: RXP_TESTBUS 0x4: CBR_CAHB_TO_CCAHB_TTESTBUS 0x5: MLC_TESTBUS 0x7: DBR_TESTBUS 0x8: MTU_TESTBUS 0x9: BMU_TESTBUS 0xA: DPU_TESTBUS 0xB: AHB2APB_TESTBUS 0xC: CBR_CCAHB_TO_CAHB_TESTBUS 0xD: DBR_DAHB_TO_CDAHB_TESTBUS 0xE: CAHB_TESTBUS 0xF: DAHB_TESTBUS 0x10: DBR_CDAHB_TO_DAHB_TESTBUS 0x11: LRAM_TESTBUS 0x12: MMX_TESTBUS 0x13: MPP_TESTBUS 0x14: DAHB_VITAL_TESTBUS 0x15: PMU_TESTBUS 0x16: RPE_TESTBUS 0x17: ADU_TESTBUS 0x18: TPE_TESTBUS 0x19: BTC_TESTBUS 0x1A: CFG_TESTBUS 0x1B: QTA_TESTBUS 0x1C: FDAHB_VITAL_TESTBUS 0x1D: FDAHB_TESTBUS 0x1E: FDBR_FDAHB_TO_CDAHB_TESTBUS 0x1F: FDBR_CDAHB_TO_FDAHB_TESTBUS Reset State: 0x00000000
4	MCU_TESTBUS	When set, the MCU testbus is enabled Reset State: 0x00000001
3	PHY_AHB_2_APB_TESTBUS	When set, the PHY AHB to APB interface testbus is enabled Reset State: 0x00000001
2:1	DBR_TESTMODE_SELECT	Reserved 0x1: DBR_MODE1_TESTBUS 0x2: DBR_MODE2_TESTBUS Reset State: 0x00000001
0	MLC_TESTBUS_ENABLE	When set, the MLC (MAC Loopback Controller) testbus is enabled Reset State: 0x00000001

0x30000C4 MCU_MAC_FPGA_VERSION

Type: read-only
Reset State: 0x00D0001A

Indicates the version number of the WMAC for FPGA builds.

MCU_MAC_FPGA_VERSION

Bits	Name	Description
31:16	WMAC_TOP_VERSION	The label version number of the WMAC TOP module Reset State: 0x000000D0
15:0	MCU_VERSION	The label version number of the MCU module Reset State: 0x0000001A

0x30000D4 MCU_MAC_MODULES_ROOT_CLK_ENABLES

Type: read-write
Reset State: 0x0003FFED

Control to enable the root clocks for each of the MAC modules.

MCU_MAC_MODULES_ROOT_CLK_ENABLES

Bits	Name	Description
17	FDAHB_ROOT_CLK_ENABLE	When set, the fdahb root clock is enabled Reset State: 0x00000001
16	FDBR_ROOT_CLK_ENABLE	When set, the fdbr root clock is enabled Reset State: 0x00000001
15	CBR_ROOT_CLK_ENABLE	When set, the cbr root clock is enabled Reset State: 0x00000001
14	CFG_ROOT_CLK_ENABLE	When set, the CFG root clock is enabled Reset State: 0x00000001
13	RTCK_ROOT_CLK_ENABLE	Reserved. Reset State: 0x00000001
12	ADU_ROOT_CLK_ENABLE	When set, the ADU root clock is enabled Reset State: 0x00000001
11	RPE_ROOT_CLK_ENABLE	When set, the RPE root clock is enabled Reset State: 0x00000001
10	TPE_ROOT_CLK_ENABLE	When set, the TPE root clock is enabled Reset State: 0x00000001
9	MCPU_ROOT_CLK_ENABLE	When set, the MCPU root clock is enabled Reset State: 0x00000001

MCU_MAC_MODULES_ROOT_CLK_ENABLES (cont.)

Bits	Name	Description
8	PHY_AHB_2_APB_ROOT_CLK_ENABLE	When set, the PHY AHB to APB interface root clock is enabled Reset State: 0x00000001
7	DPU_ROOT_CLK_ENABLE	When set, the DPU root clock is enabled Reset State: 0x00000001
6	BMU_ROOT_CLK_ENABLE	When set, the BMU root clock is enabled Reset State: 0x00000001
5	MTU_ROOT_CLK_ENABLE	When set, the MTU (MAC Timing Unit) root clock is enabled When set, the RXP root clock is enabled Reset State: 0x00000001
3	TXP_ROOT_CLK_ENABLE	When set, the TXP root clock is enabled Reset State: 0x00000001
2	DBR_ROOT_CLK_ENABLE	When set, the DBR root clock is enabled Reset State: 0x00000001
0	MLC_ROOT_CLK_ENABLE	When set, the MLC (MAC Loopback Controller) root clock is enabled Reset State: 0x00000001

0x30000D8 MCU_MAC_MODULES_GOTO_IDLE_CONTROL

Type: read-write
Reset State: 0x00000000

The state machines in the MAC modules can be forced to go back to idle by setting these signals. This resembles somewhat the soft reset functionality, except that the configuration registers maintain their settings. It is therefore less intrusive then a soft reset, and might achieve restoring the modules into a known state.

MCU_MAC_MODULES_GOTO_IDLE_CONTROL

Bits	Name	Description
12	CFG_GOTO_IDLE	When set, the CFG hardware state machines will return to idle Reset State: 0x00000000
11	ADU_GOTO_IDLE	When set, the ADU hardware state machines will return to idle Reset State: 0x00000000
10	TPE_GOTO_IDLE	When set, the TPE hardware state machines will return to idle Reset State: 0x00000000
9	RPE_GOTO_IDLE	When set, the RPE hardware state machines will return to idle Reset State: 0x00000000

MCU_MAC_MODULES_GOTO_IDLE_CONTROL (cont.)

Bits	Name	Description
8	PHY_AHB_2_APB_GOTO_IDLE	When set, the PHY AHB to APB interface hardware state machines will return to idle Reset State: 0x00000000
7	DPU_GOTO_IDLE	When set, the DPU hardware state machines will return to idle Reset State: 0x00000000
6	BMU_GOTO_IDLE	When set, the BMU hardware state machines will return to idle Reset State: 0x00000000
5	MTU_GOTO_IDLE	When set, the MTU (MAC Timing Unit) hardware state machines will return to idle When set, the RXP hardware state machines will return to idle Reset State: 0x00000000
2	DBR_GOTO_IDLE	Reserved Reset State: 0x00000000
0	MLC_GOTO_IDLE	When set, the MLC (MAC Loopback Controller) hardware state machines will return to idle Reset State: 0x00000000

0x30000DC MCU_MAC_TESTBUS_LOW

Type: read-only
Reset State: 0x00000000

The register allows to read the values on the MAC testbus, lower 32 bits.

MCU_MAC_TESTBUS_LOW

Bits	Name	Description
31:0	MAC_TEST_BUS_LOW	Bits [31:0] of the MAC test bus Reset State: 0x00000000

0x30000E0 MCU_MAC_TESTBUS_HIGH

Type: read-only
Reset State: 0x00000000

The register allows to read the values on the MAC testbus, upper bits.

MCU_MAC_TESTBUS_HIGH

Bits	Name	Description
12:0	MAC_TEST_BUS_HIGH	Bits [44:32] of the MAC test bus Reset State: 0x00000000

0x30000E4 MCU_DBR_TRANSLATION_BASE_ADDR

Type: read-write
Reset State: 0x00000000

The DBR allows access to the DAHB from the CAHB. This address is the base address of the window onto the DAHB. It is comparable to the BAR1 base addresses from the PIF when set indicates watchdog 2 interrupt from MTU pending.

MCU_DBR_TRANSLATION_BASE_ADDR

Bits	Name	Description
31:10	DBR_ADDRESS_TRANSLATION_BASE_ADDR	Base address of the 1K window onto the DAHB Reset State: 0x00000000

0x30000EC MCU_APB2PHY_STATUS

Type: read-write
Reset State: 0x00000000

Status register of the apb interface to the PHY.

MCU_APB2PHY_STATUS

Bits	Name	Description
1	AHB2PHY_MCU_TIMOUT_ERROR1	When set to 1'b1, a timeout has happened in the apb2phy interface Reset State: 0x00000000
0	AHB2PHY_MCU_TIMOUT_ERROR2	When set to 1'b1, a timeout has happened in the apb2phy interface Reset State: 0x00000000

0x30000F0 MCU_MLC_STATUS

Type: read-only
Reset State: 0x00000000

Status register of the MLC.

MCU_MLC_STATUS

Bits	Name	Description
31:28	MLC_CONTROLLER_STATE	State that the MLC controller is in: 0x0: idle 0xf:0x1: MLC active Reset State: 0x00000000
27:24	NR_OF_RXP_STARTS	The number of txp_mlc_start pulses received Reset State: 0x00000000
23:22	NR_OF_TXP_MLC_ABORTS	The number of txp_mlc_aborts received. This number freezes on 2'b11. Reset State: 0x00000000
21:20	NR_OF_MLC_ENDS	The number of command bytes passed on to the RXP Reset State: 0x00000000
19:12	NR_OF_COMMAND_BYTES	The number of command bytes passed on to the RXP Reset State: 0x00000000
11:0	NR_OF_DATA_BYTES	The number of data bytes and statistics bytes passed on to the RXP Reset State: 0x00000000

0x30000F4 MCU_MCU_RESERVED

Type: read-write
Reset State: 0x00000000

These bits have been reserved for future use

MCU_MCU_RESERVED

Bits	Name	Description
15:1	MCU_RESERVED	Spare register bits read writable Reset State: 0x00000000
0	PMU_AGC_SLEEP	pmu_agc_sleep Reset State: 0x00000000

0x3000100 MCU_RF_WARMUP_CONTROL

Type: read-write
Reset State: 0x00000000

This register has controls for txp for rf warmup.

MCU_RF_WARMUP_CONTROL

Bits	Name	Description
2	TXP_MCU_RF_WARMUP	This is a read-only signal. It is basically the status of the of the warmup signal that is given by the TXP to the PHY Reset State: 0x00000000
1	MCU_TXP_RF_WARMUP	Reserved. Not used. Reset State: 0x00000000
0	MCU_TXP_RF_WARMUP_END	Reserved. Not used. Reset State: 0x00000000

0x3000104 MCU_BTC

Type: read-write
Reset State: 0x00000040

This register controls the operation of the BTC function. This register also masks the various conditions that this device will be reporting 'ACTIVE' to the Bluetooth device. Setting a bit to "1" enables the condition, while "0" masks (disables) the condition.

MCU_BTC

Bits	Name	Description
23	MTU_BTC_TX_RX_BUSY	Gives status of busy signal going to BTC after the override Reset State: 0x00000000
22	MTU_MCU_TX_RX_BUSY	Gives status of busy signal coming from MTU Reset State: 0x00000000
21	BTC_GPIO_INTEL_WLAN_ACTIVE	Reserved. 2-wire is not supported Reset State: 0x00000000
20	BTC_BSR_WLAN_ACTIVE	Gives status of wlan active signal going to the pad Reset State: 0x00000000
19	BTC_BLUETOOTH_ACTIVE	Gives status input bluetooth active signal Reset State: 0x00000000
18	BTC_WLAN_ACTIVE	Gives status of wlan active signal from logic (before override) Reset State: 0x00000000
17	BTC_INTEL_WLAN_ACTIVE	Reserved. 2-wire is not supported Reset State: 0x00000000
16	CHANNEL_DATA_DONE	Reserved. 2-wire is not supported Reset State: 0x00000000
12	BTC_WLAN_ACTIVE_SW_SEL	When '1', this bit selects override for the wlan active signal Reset State: 0x00000000

MCU_BTC (cont.)

Bits	Name	Description
11	BTC_WLAN_ACTIVE_OVERRIDE	When '1', this bit overrides the wlan active signal from logic Reset State: 0x00000000
10	BTC_INTEL_WLAN_ACTIVE_OVERRIDE	Reserved. 2-wire is not supported Reset State: 0x00000000
9	BTC_INTEL_WLAN_ACTIVE_SW_SEL	Reserved. 2-wire is not supported Reset State: 0x00000000
8	BTC_TX_RX_BUSY_SW_SEL	Reserved Reset State: 0x00000000
7	BTC_TX_RX_BUSY_OVERRIDE	Reserved Reset State: 0x00000000
6	BT_ACTIVE_EN	When '1', this bit enables the sensing of the Bluetooth devices activity on the shared transmission channel for both Dell and Intel modes of operation. Reset State: 0x00000001
5	BTC_MODE	Reserved. 2-wire is not supported Reset State: 0x00000000
4	CHANNEL_DATA_WR_EN	Reserved. 2-wire is not supported Reset State: 0x00000000
3:0	CHANNEL_DATA	Reserved. 2-wire is not supported Reset State: 0x00000000

0x3000108 MCU_RF_ON_OFF_CONTROL

Type: read-only
Reset State: 0x00000000

This register reflects the status of radio on/off hardware pin.

MCU_RF_ON_OFF_CONTROL

Bits	Name	Description
0	RD_ON_OFF_HWPIN_STAT	0x0: radio OFF 1'b1 : radio ON Reset State: 0x00000000

0x3000194 MCU_DEBUGC_CONTROL

Type: read-write
Reset State: 0x00000000

Debug testbus control.

MCU_DEBUGC_CONTROL

Bits	Name	Description
29:16	MIF_DEBUGC_ADDR	Gives the address where the above tracing is stored Reset State: 0x00000000
7:0	DBGC_CONTROL	0x8: Nothing selected 8'd1 : BMU tracing selected 8'd2 : DAHB tracing selected 8'd3 : CAHB tracing selected Reset State: 0x00000000

0x3000210 MCU_DABH_MIF_PRIORITY_GENERATION_CONTROL

Type: read-write
Reset State: 0x00000000

Controls the way the priority signal from the DAHB to the MIF is generated.

MCU_DABH_MIF_PRIORITY_GENERATION_CONTROL

Bits	Name	Description
1:0	DABH_MIF_PRIORITY_MODE	0x0: txp, rxp bus request based, BMU priority request based 01: txp, rxp and bmu bus request based (when BMU priority requested AND mif txp/rxp/bmu busy based 10: same as 01, but with extended bus request version 11: request starts on a rising edge of the busrequest from txp/rxp/bmuwhen bmu priority requested and ends at the falling edge of the txp/rxp/bmu mif busy indication) Reset State: 0x00000000

0x3000214 MCU_BTC_CTRL

Type: read-write
Reset State: 0x0006019F

This register controls the BTC function in 3/4 wire mode.

MCU_BTC_CTRL

Bits	Name	Description
29:27	SCO_RESERVE_SLOT	To setup the sco/esco reserve slot in terms of slot Reset State: 0x00000000
26	FORCE_SYNC_TO_SCO	A 0->1 transition will force pta to sync to the bt_active when the counter reaches 0 within the programmed boundary as sco start. software has to clear this bit. Reset State: 0x00000000
25	STATS_EN	When set, enable the states counters Reset State: 0x00000000

MCU_BTC_CTRL (cont.)

Bits	Name	Description
24	ESCO_WAIT_FOR_RETX_EN	When set, the wlan will not be allow to transmit until the esco retransmission slot is cleared Reset State: 0x00000000
23:21	ESCO_RETRANSMIT_SLOT	To setup the esco retransmission slot in terms of slot Reset State: 0x00000000
20:16	SCO_PERIOD	To setup the sco period in terms of slot Reset State: 0x00000006
15	PERIOD_INT_CLEAR	Reserved. Not required any more Reset State: 0x00000000
14	PRIORITY_INT_CLEAR	Reserved. Not required any more Reset State: 0x00000000
13	BT_SIMUL_TX_NONOVERLAP	Reserved. No simultaneous transmission Reset State: 0x00000000
12	BT_SIMUL_TX_ALL	Reserved. No simultaneous transmission Reset State: 0x00000000
11	PERIOD_INT_DISABLE	Reserved. Not required any more Reset State: 0x00000000
10	PRIORITY_INT_DISABLE	Reserved. Not required any more Reset State: 0x00000000
9:8	BT_3_4WIRE_MODE	Reserved. Only 3-wire is supported Reset State: 0x00000001
7	BT_DELL_PRIORITY	Reserved. 2-wire is not supported Reset State: 0x00000001
6	BT_SVO_MODE	Set this bit if BT is in SVO mode. 0x0: NOT_IN_SVO 0x1: IN_SVO Reset State: 0x00000000
5	BT_SCO_MODE	Set this bit if BT is in SCO mode. 0x0: NOT_IN_SCO 0x1: IN_SCO Reset State: 0x00000000
4	BT_STATUS_POLARITY	Set this bit if BT is operating in 3/4 wire protocol. 0x0: TX_LOW 0x1: TX_HIGH Reset State: 0x00000001
3	WLAN_ACTIVE_POLARITY	To configure the polarity of wlan_active signal from BT. 0x0: ACTIVE_LOW 0x1: ACTIVE_HIGH Reset State: 0x00000001

MCU_BTC_CTRL (cont.)

Bits	Name	Description
2	BT_FREQ_POLARITY	Reserved. 4-wire is not supported Reset State: 0x00000001
1	BT_PRIORITY_POLARITY	To configure the polarity of bt_priority signal from BT 0x0: ACTIVE_LOW 0x1: ACTIVE_HIGH Reset State: 0x00000001
0	BT_ACTIVE_POLARITY	To configure the polarity of bt_active signal from BT 0x0: ACTIVE_LOW 0x1: ACTIVE_HIGH Reset State: 0x00000001

0x3000218 MCU_BTC_CTRL2

Type: read-write
Reset State: 0x01003200

This register is to set up the counter value in 3/4 wire mode.

MCU_BTC_CTRL2

Bits	Name	Description
31:24	OFFSET_UNCERTANTY	To set up the allowed offset value for period validation Reset State: 0x00000001
23	BEFORE_LAG	Reserved 0x0: CNT_LAG 0x1: CNT_PRIORI Reset State: 0x00000000
15:8	EARLY_END_CNT	To set up the number of cycles for wlan to stop to transmit after bt_active assertion.(keep the name of the bit field in case any TB might use it for whatever purpose). Note this value should be larger than t2 to avoid wrong priority bt traffic request signal sent to TPE. Reset State: 0x00000032
7:0	LATE_START_CNT	To set up the number of cycles for wlan to start to transmit after bt_active de-assertion. Reset State: 0x00000000

0x300021C MCU_BTC_CTRL3

Type: read-write
Reset State: 0x00014196

This register is to set up the timing spec in 3/4 wire mode.

MCU_BTC_CTRL3

Bits	Name	Description
17:12	BTC_T3	To setup the T3 number (default to 20us). Reset State: 0x00000014
11:8	BTC_T2	To setup the T2 number (default to 1us). Reset State: 0x00000001
7:0	BTC_T1	To setup the T1 number (default to 150us). Reset State: 0x00000096

0x3000220 MCU_BTC_STATUS

Type: read-write
Reset State: 0x010EA500

This register contains the status of internal signals.

MCU_BTC_STATUS

Bits	Name	Description
31	WAIT_FOR_ESCO_DONE	The status of the esco_bt_is_done signal. If it's in esco mode, and the BTC_CTRL[24] is set, the signal will be asserted until the esco retransmission is done. Otherwise this signal will be 0. Reset State: 0x00000000
30	BTC_MODE	When '1', BT is in tx in current slot. When '0' and bt_active is high, BT is in rx in current slot Reset State: 0x00000000
29:24	SCO_SLOT_CNT	The sco slot counter value Reset State: 0x00000001
23	SCO_SYNC_FLAG	To indicate whether the sco period is locked(1) or not(0) Reset State: 0x00000000
22:8	BT_AVAIL_CNT	The sco period counter which software can write to change the value (The big field name is kept in case any mcs relies on it) Reset State: 0x00000EA5
7	MASTER_SLAVE_STATUS	To indicate whether it's master(1) or slave(0) This is only valid in sco/esco mode. Reset State: 0x00000000
6	BT_PERIOD_STATUS	The status of the bt_period_int signal which validates the bt mode and period (Always read 0 since the interrupt is removed) Reset State: 0x00000000

MCU_BTC_STATUS (cont.)

Bits	Name	Description
5	BT_PRIORITY_STATUS	The status of the bt_priority_int signal which validates the bt mode and priority (Always read 0 since the interrupt is removed) Reset State: 0x00000000
4	BT_PRIORITY_TO_TPE	The status of the bt_priority signal to TPE Reset State: 0x00000000
3	BT_TRAFFIC_REQUEST	The status of the bt_traffic_request signal to TPE Reset State: 0x00000000
2	BT_FREQ	The status of the incoming bt_freq signal (Always read 0 since we only use 3 wire protocol) Reset State: 0x00000000
1	BT_PRIORITY	The status of the incoming bt_priority signal Reset State: 0x00000000
0	BT_ACTIVE_S	The status of the sync-ed bt_active signal Reset State: 0x00000000

0x3000224 MCU_BTC_STATUS2

Type: read-only
Reset State: 0x00007FFF

This register contains the status of internal signals.

MCU_BTC_STATUS2

Bits	Name	Description
31:28	CNT_3750US	Reserved Reset State: 0x00000000
27:24	S_STATE	The encoded state machine status Reset State: 0x00000000
23:16	CNT_T2_T3	The status of the t2_t3 counter Reset State: 0x00000000
14:0	BT_AVAIL_CNT	The down counter to next bt-active assertion in sco/esco mode to TPE Reset State: 0x00007FFF

0x300022C MCU_BTC_FRAME1_STATUS

Type: read-only
Reset State: 0x00000000

This register is obsolete and no longer support.

MCU_BTC_FRAME1_STATUS

Bits	Name	Description
24:12	FRAME1_PERIOD	Reserve Reset State: 0x00000000
11:0	FRAME1_HIGH	Reserve Reset State: 0x00000000

0x3000230 MCU_BTC_FRAME2_STATUS

Type: read-only
Reset State: 0x00000000

This register is obsolete and no longer support.

MCU_BTC_FRAME2_STATUS

Bits	Name	Description
24:12	FRAME2_PERIOD	Reserve Reset State: 0x00000000
11:0	FRAME2_HIGH	Reserve Reset State: 0x00000000

0x3000238 MCU_FIQ_EN

Type: read-write
Reset State: 0x00000000

This register contains the acpu fiq enable signals

MCU_FIQ_EN

Bits	Name	Description
31	SW_1_FIQ_EN	When set, software 1 interrupt is enabled. Reset State: 0x00000000
30	RXP_ERR_FIQ_EN	When set, rxp error interrupt is enabled. Reset State: 0x00000000
29	QTA_FIQ_EN	When set, qta interrupt is enabled. Reset State: 0x00000000

MCU_FIQ_EN (cont.)

Bits	Name	Description
28	MTU_TIMER7_EN	When set, mtu timer7/tsf_timer7 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
27	MTU_TIMER6_EN	When set, mtu timer6/tsf_timer6 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
26	PHY_HIF_FIQ_EN	When set, phy hif interrupt is enabled. Reset State: 0x00000000
25	WQ_DATA_AVAIL_FIQ_EN	When set, wq data available interrupt is enabled. Reset State: 0x00000000
24	PHY_FIQ_IRQ_EN	When set, phy irq interrupt is enabled. Reset State: 0x00000000
23	PHY_FIQ_FIQ_EN	When set, phy fiq interrupt is enabled. Reset State: 0x00000000
22	TPE_FIQ_EN	When set, tpe_mcu_int interrupt is enabled. Reset State: 0x00000000
21	MIF_FIQ_EN	When set, mif interrupt is enabled. Reset State: 0x00000000
20	BT_INACTIVE_FIQ_EN	When set, the bt inactive interrupt is enabled. Reset State: 0x00000000
19	BT_ACTIVE_FIQ_EN	When set, the bt active interrupt is enabled. Reset State: 0x00000000
18	MTU_TIMER5_EN	When set, mtu timer5/tsf_timer5 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
17	ADU_FIQ_EN	When set, adu interrupt is enabled. Reset State: 0x00000000
16	MTU_TIMER4_EN	When set, mtu timer4/tsf_timer4 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
15	RPE_FIQ_EN	When set, rpe interrupt is enabled. Reset State: 0x00000000
13	COMBINED_FIQ_EN	When set, the combined txp/dpu/dbr/ahb2phy interrupt is enabled. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_FIQ_EN	When set, rxp beacon related interrupt is enabled. Reset State: 0x00000000
7	HOST_TO_ACPU_MB3_FIQ_EN	When set, host to acpu MB3 interrupt is enabled. Reset State: 0x00000000

MCU_FIQ_EN (cont.)

Bits	Name	Description
6	HOST_TO_ACPU_MB2_FIQ_EN	When set, host to acpu MB2 interrupt is enabled. Reset State: 0x00000000
5	HOST_TO_ACPU_MB1_FIQ_EN	When set, host to acpu MB1 interrupt is enabled. Reset State: 0x00000000
4	HOST_TO_ACPU_MB0_FIQ_EN	When set, host to acpu MB0 interrupt is enabled. Reset State: 0x00000000
3	MTU_FIQ_EN	When set, combined mtu interrupt is enabled. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_FIQ_EN	When set, software 0 interrupt is enabled. Reset State: 0x00000000
1	SCU_UART_FIQ_EN	When set, uart interrupt is enabled. Reset State: 0x00000000
0	MTU_WD_1_FIQ_EN	When set, mtu watchdog timer (warning) interrupt is enabled. Reset State: 0x00000000

0x300023C MCU_FIQ_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the acpu fiq raw status signals

MCU_FIQ_STATUS

Bits	Name	Description
31	SW_1_FIQ_STATUS	sw 1 interrupt status. Reset State: 0x00000000
30	RXP_ERR_FIQ_STATUS	rxp error interrupt status. Reset State: 0x00000000
29	QTA_FIQ_STATUS	qta interrupt status. Reset State: 0x00000000
28	MTU_TIMER7_STATUS	When set, mtu timer7/tsf_timer7 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
27	MTU_TIMER6_STATUS	When set, mtu timer6/tsf_timer6 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
26	PHY_HIF_FIQ_STATUS	phy hif interrupt status. Reset State: 0x00000000

MCU_FIQ_STATUS (cont.)

Bits	Name	Description
25	WQ_DATA_AVAIL_FIQ_STATUS	wq data available interrupt status. Reset State: 0x00000000
24	PHY_FIQ_IRQ_STATUS	phy irq interrupt status. Reset State: 0x00000000
23	PHY_FIQ_FIQ_STATUS	phy fiq interrupt status. Reset State: 0x00000000
22	TPE_FIQ_STATUS	tpe_mcu_int interrupt status. Reset State: 0x00000000
21	MIF_FIQ_STATUS	mif interrupt status. Reset State: 0x00000000
20	BT_INACTIVE_FIQ_STATUS	bt inactive interrupt status. Reset State: 0x00000000
19	BT_ACTIVE_FIQ_STATUS	bt active interrupt status. Reset State: 0x00000000
18	MTU_TIMER5_STATUS	When set, mtu timer5/tsf_timer5 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
17	ADU_FIQ_STATUS	adu interrupt status. Reset State: 0x00000000
16	MTU_TIMER4_STATUS	When set, mtu timer4/tsf_timer4 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
15	RPE_FIQ_STATUS	rpe interrupt status. Reset State: 0x00000000
13	COMBINED_FIQ_STATUS	the combined txp/dpu/dbr/ahb2phy interrupt status. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_FIQ_STATUS	rxp beacon related interrupt status. Reset State: 0x00000000
7	HOST_TO_ACPU_MB3_FIQ_STATUS	host to acpu MB3 interrupt status. Reset State: 0x00000000
6	HOST_TO_ACPU_MB2_FIQ_STATUS	host to acpu MB2 interrupt status. Reset State: 0x00000000
5	HOST_TO_ACPU_MB1_FIQ_STATUS	host to acpu MB1 interrupt status. Reset State: 0x00000000
4	HOST_TO_ACPU_MB0_FIQ_STATUS	host to acpu MB0 interrupt status. Reset State: 0x00000000

MCU_FIQ_STATUS (cont.)

Bits	Name	Description
3	MTU_FIQ_STATUS	combined mtu interrupt status. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_FIQ_STATUS	sw 0 interrupt status. Reset State: 0x00000000
1	SCU_UART_FIQ_STATUS	uart interrupt status. Reset State: 0x00000000
0	MTU_WD_1_FIQ_STATUS	mtu watchdog timer (warning) interrupt status. Reset State: 0x00000000

0x3000240 MCU_FIQ_MASKED_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the acpu fiq masked status

MCU_FIQ_MASKED_STATUS

Bits	Name	Description
31	SW_1_FIQ_MASKED_STATUS	sw 1 interrupt masked status. Reset State: 0x00000000
30	RXP_ERR_FIQ_MASKED_STATUS	rxp error interrupt masked status. Reset State: 0x00000000
29	QTA_FIQ_MASKED_STATUS	qta interrupt masked status. Reset State: 0x00000000
28	MTU_TIMER7_MASKED_STATUS	When set, mtu timer7/tsf_timer7 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
27	MTU_TIMER6_MASKED_STATUS	When set, mtu timer6/tsf_timer6 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
26	PHY_HIF_FIQ_MASKED_STATUS	phy hif interrupt masked status. Reset State: 0x00000000
25	WQ_DATA_AVAIL_FIQ_MASKED_STATUS	wq data available interrupt masked status. Reset State: 0x00000000
24	PHY_FIQ_IRQ_MASKED_STATUS	phy irq interrupt masked status. Reset State: 0x00000000
23	PHY_FIQ_FIQ_MASKED_STATUS	phy fiq interrupt masked status. Reset State: 0x00000000

MCU_FIQ_MASKED_STATUS (cont.)

Bits	Name	Description
22	TPE_FIQ_MASKED_STATUS	tpe_mcu_int interrupt masked status. Reset State: 0x00000000
21	MIF_FIQ_MASKED_STATUS	mif interrupt masked status. Reset State: 0x00000000
20	BT_INACTIVE_FIQ_MASKED_STATUS	bt inactive interrupt masked status. Reset State: 0x00000000
19	BT_ACTIVE_FIQ_MASKED_STATUS	bt active interrupt masked status. Reset State: 0x00000000
18	MTU_TIMER5_MASKED_STATUS	When set, mtu timer5/tsf_timer5 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
17	ADU_FIQ_MASKED_STATUS	adu interrupt masked status. Reset State: 0x00000000
16	MTU_TIMER4_MASKED_STATUS	When set, mtu timer4/tsf_timer4 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
15	RPE_FIQ_MASKED_STATUS	rpe interrupt masked status. Reset State: 0x00000000
13	COMBINED_FIQ_MASKED_STATUS	the combined txp/dpu/dbr/ahb2phy interrupt masked status. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_FIQ_MASKED_STATUS	rxp beacon related interrupt masked status. Reset State: 0x00000000
11	DXE_MXU_CHAIN_2_FIQ_MASKED_STATUS	dxe channel 2 interrupt masked status. Reset State: 0x00000000
10	DXE_MXU_CHAIN_1_FIQ_MASKED_STATUS	dxe channel 1 interrupt masked status. Reset State: 0x00000000
9	DXE_MXU_CHAIN_0_FIQ_MASKED_STATUS	dxe channel 0 interrupt masked status. Reset State: 0x00000000
8	PMU_PWR_UP_FIQ_MASKED_STATUS	pmu_pwr_up interrupt masked status. Reset State: 0x00000000
7	HOST_TO_ACPU_MB3_FIQ_MASKED_STATUS	host to acpu MB3 interrupt masked status. Reset State: 0x00000000
6	HOST_TO_ACPU_MB2_FIQ_MASKED_STATUS	host to acpu MB2 interrupt masked status. Reset State: 0x00000000
5	HOST_TO_ACPU_MB1_FIQ_MASKED_STATUS	host to acpu MB1 interrupt masked status. Reset State: 0x00000000
4	HOST_TO_ACPU_MB0_FIQ_MASKED_STATUS	host to acpu MB0 interrupt masked status. Reset State: 0x00000000

MCU_FIQ_MASKED_STATUS (cont.)

Bits	Name	Description
3	MTU_FIQ_MASKED_STATUS	combined mtu interrupt masked status. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_FIQ_MASKED_STATUS	sw 0 interrupt masked status. Reset State: 0x00000000
1	SCU_UART_FIQ_MASKED_STATUS	uart interrupt masked status. Reset State: 0x00000000
0	MTU_WD_1_FIQ_MASKED_STATUS	mtu watchdog timer (warning) interrupt masked status. Reset State: 0x00000000

0x3000244 MCU_FIQ_CLEAR

Type: write-only
Reset State: 0x00000000

This register contains the acpu fiq clear signals

MCU_FIQ_CLEAR

Bits	Name	Description
31	SW_1_FIQ_CLEAR	When set, software 1 interrupt is cleared. Reset State: 0x00000000
30	RXP_ERR_FIQ_CLEAR	When set, rxp error interrupt is cleared. Reset State: 0x00000000
29	QTA_FIQ_CLEAR	When set, qta interrupt is cleared. Reset State: 0x00000000
28	MTU_TIMER7_CLEAR	When set, mtu timer7/tsf_timer7 interrupt is cleared Reset State: 0x00000000
27	MTU_TIMER6_CLEAR	When set, mtu timer6/tsf_timer6 interrupt is cleared Reset State: 0x00000000
26	PHY_HIF_FIQ_CLEAR	When set, phy hif interrupt is cleared. Reset State: 0x00000000
25	WQ_DATA_AVAIL_FIQ_CLEAR	When set, wq data available interrupt is cleared. Reset State: 0x00000000
24	PHY_FIQ_IRQ_CLEAR	When set, phy irq interrupt is cleared. Reset State: 0x00000000
23	PHY_FIQ_FIQ_CLEAR	When set, phy fiq interrupt is cleared. Reset State: 0x00000000

MCU_FIQ_CLEAR (cont.)

Bits	Name	Description
22	TPE_FIQ_CLEAR	When set, tpe_mcu_int interrupt is cleared. Reset State: 0x00000000
21	MIF_FIQ_CLEAR	When set, mif interrupt is cleared. Reset State: 0x00000000
20	BT_INACTIVE_FIQ_CLEAR	When set, bt inactive interrupt is cleared. Reset State: 0x00000000
19	BT_ACTIVE_FIQ_CLEAR	When set, bt active interrupt is cleared. Reset State: 0x00000000
18	MTU_TIMER5_CLEAR	When set, mtu timer5/tsf_timer5 interrupt is cleared Reset State: 0x00000000
17	ADU_FIQ_CLEAR	When set, adu interrupt is cleared. Reset State: 0x00000000
16	MTU_TIMER4_CLEAR	When set, mtu timer4/tsf_timer4 interrupt is cleared Reset State: 0x00000000
15	RPE_FIQ_CLEAR	When set, rpe interrupt is cleared. Reset State: 0x00000000
13	COMBINED_FIQ_CLEAR	When set, the combined txp/dpu/dbr/ahb2phy interrupt is cleared. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_FIQ_CLEAR	When set, rxp beacon related interrupt is cleared. Reset State: 0x00000000
7	HOST_TO_ACPU_MB3_FIQ_CLEAR	When set, host to acpu MB3 interrupt is cleared. Reset State: 0x00000000
6	HOST_TO_ACPU_MB2_FIQ_CLEAR	When set, host to acpu MB2 interrupt is cleared. Reset State: 0x00000000
5	HOST_TO_ACPU_MB1_FIQ_CLEAR	When set, host to acpu MB1 interrupt is cleared. Reset State: 0x00000000
4	HOST_TO_ACPU_MB0_FIQ_CLEAR	When set, host to acpu MB0 interrupt is cleared. Reset State: 0x00000000
3	MTU_FIQ_CLEAR	When set, combined mtu interrupt is cleared. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_FIQ_CLEAR	When set, software 0 interrupt is cleared. Reset State: 0x00000000
1	SCU_UART_FIQ_CLEAR	When set, uart interrupt is cleared. Reset State: 0x00000000
0	MTU_WD_1_FIQ_CLEAR	When set, mtu watchdog timer (warning) interrupt is cleared. Reset State: 0x00000000

0x3000248 MCU_IRQ_EN

Type: read-write
Reset State: 0x00000000

This register contains the acpu irq enable signals

MCU_IRQ_EN

Bits	Name	Description
31	SW_1_IRQ_EN	When set, software 1 interrupt is enabled. Reset State: 0x00000000
30	RXP_ERR_IRQ_EN	When set, rxp error interrupt is enabled. Reset State: 0x00000000
29	QTA_IRQ_EN	When set, qta interrupt is enabled. Reset State: 0x00000000
28	MTU_TIMER7_EN	When set, mtu timer7/tsf_timer7 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
27	MTU_TIMER6_EN	When set, mtu timer6/tsf_timer6 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
26	PHY_HIF_IRQ_EN	When set, phy hif interrupt is enabled. Reset State: 0x00000000
25	WQ_DATA_AVAIL_IRQ_EN	When set, wq data available interrupt is enabled. Reset State: 0x00000000
24	PHY_IRQ_IRQ_EN	When set, phy irq interrupt is enabled. Reset State: 0x00000000
23	PHY_FIQ_IRQ_EN	When set, phy fiq interrupt is enabled. Reset State: 0x00000000
22	TPE_IRQ_EN	When set, tpe_mcu_int interrupt is enabled. Reset State: 0x00000000
21	MIF_IRQ_EN	When set, mif interrupt is enabled. Reset State: 0x00000000
20	BT_INACTIVE_IRQ_EN	When set, bt inactive interrupt is enabled. Reset State: 0x00000000
19	BT_ACTIVE_IRQ_EN	When set, bt active interrupt is enabled. Reset State: 0x00000000
18	MTU_TIMER5_EN	When set, mtu timer5/tsf_timer5 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
17	ADU_IRQ_EN	When set, adu interrupt is enabled. Reset State: 0x00000000

MCU_IRQ_EN (cont.)

Bits	Name	Description
16	MTU_TIMER4_EN	When set, mtu timer4/tsf_timer4 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
15	RPE_IRQ_EN	When set, rpe interrupt is enabled. Reset State: 0x00000000
13	COMBINED_IRQ_EN	When set, the combined txp/dpu/dbr/ahb2phy interrupt is enabled. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_IRQ_EN	When set, rxp beacon related interrupt is enabled. Reset State: 0x00000000
7	HOST_TO_ACPU_MB3_IRQ_EN	When set, host to acpu MB3 interrupt is enabled. Reset State: 0x00000000
6	HOST_TO_ACPU_MB2_IRQ_EN	When set, host to acpu MB2 interrupt is enabled. Reset State: 0x00000000
5	HOST_TO_ACPU_MB1_IRQ_EN	When set, host to acpu MB1 interrupt is enabled. Reset State: 0x00000000
4	HOST_TO_ACPU_MB0_IRQ_EN	When set, host to acpu MB0 interrupt is enabled. Reset State: 0x00000000
3	MTU_IRQ_EN	When set, combined mtu interrupt is enabled. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_IRQ_EN	When set, software 0 interrupt is enabled. Reset State: 0x00000000
1	SCU_UART_IRQ_EN	When set, uart interrupt is enabled. Reset State: 0x00000000
0	MTU_WD_1_IRQ_EN	When set, mtu watchdog timer (warning) interrupt is enabled. Reset State: 0x00000000

0x300024C MCU_IRQ_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the acpu irq raw status signals

MCU_IRQ_STATUS

Bits	Name	Description
31	SW_1_IRQ_STATUS	sw 1 interrupt status. Reset State: 0x00000000

MCU_IRQ_STATUS (cont.)

Bits	Name	Description
30	RXP_ERR_IRQ_STATUS	rxp error interrupt status. Reset State: 0x00000000
29	QTA_IRQ_STATUS	qta interrupt status. Reset State: 0x00000000
28	MTU_TIMER7_STATUS	When set, mtu timer7/tsf_timer7 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
27	MTU_TIMER6_STATUS	When set, mtu timer6/tsf_timer6 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
26	PHY_HIF_IRQ_STATUS	phy hif interrupt status. Reset State: 0x00000000
25	WQ_DATA_AVAIL_IRQ_STATUS	wq data available interrupt status. Reset State: 0x00000000
24	PHY_IRQ_IRQ_STATUS	phy irq interrupt status. Reset State: 0x00000000
23	PHY_FIQ_IRQ_STATUS	phy fiq interrupt status. Reset State: 0x00000000
22	TPE_IRQ_STATUS	tpe_mcu_int interrupt status. Reset State: 0x00000000
21	MIF_IRQ_STATUS	mif interrupt status. Reset State: 0x00000000
20	BT_INACTIVE_IRQ_STATUS	bt inactive interrupt status. Reset State: 0x00000000
19	BT_ACTIVE_IRQ_STATUS	bt_active interrupt status. Reset State: 0x00000000
18	MTU_TIMER5_STATUS	When set, mtu timer5/tsf_timer5 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
17	ADU_IRQ_STATUS	adu interrupt status. Reset State: 0x00000000
16	MTU_TIMER4_STATUS	When set, mtu timer4/tsf_timer4 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
15	RPE_IRQ_STATUS	rpe interrupt status. Reset State: 0x00000000
13	COMBINED_IRQ_STATUS	the combined txp/dpu/dbr/ahb2phy interrupt status. See combined_int related registers for detail Reset State: 0x00000000

MCU_IRQ_STATUS (cont.)

Bits	Name	Description
12	RXP_IRQ_STATUS	rxp beacon related interrupt status. Reset State: 0x00000000
7	HOST_TO_ACPU_MB3_IRQ_STATUS	host to acpu MB3 interrupt status. Reset State: 0x00000000
6	HOST_TO_ACPU_MB2_IRQ_STATUS	host to acpu MB2 interrupt status. Reset State: 0x00000000
5	HOST_TO_ACPU_MB1_IRQ_STATUS	host to acpu MB1 interrupt status. Reset State: 0x00000000
4	HOST_TO_ACPU_MB0_IRQ_STATUS	host to acpu MB0 interrupt status. Reset State: 0x00000000
3	MTU_IRQ_STATUS	combined mtu interrupt status. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_IRQ_STATUS	sw 0 interrupt status. Reset State: 0x00000000
1	SCU_UART_IRQ_STATUS	uart interrupt status. Reset State: 0x00000000
0	MTU_WD_1_IRQ_STATUS	mtu watchdog timer (warning) interrupt status. Reset State: 0x00000000

0x3000250 MCU_IRQ_MASKED_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the acpu irq masked status

MCU_IRQ_MASKED_STATUS

Bits	Name	Description
31	SW_1_IRQ_MASKED_STATUS	sw 1 interrupt masked status. Reset State: 0x00000000
30	RXP_ERR_IRQ_MASKED_STATUS	rxp error interrupt masked status. Reset State: 0x00000000
29	QTA_IRQ_MASKED_STATUS	qta interrupt masked status. Reset State: 0x00000000
28	MTU_TIMER7_MASKED_STATUS	When set, mtu timer7/tsf_timer7 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000

MCU_IRQ_MASKED_STATUS (cont.)

Bits	Name	Description
27	MTU_TIMER6_MASKED_STATUS	When set, mtu timer6/tsf_timer6 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
26	PHY_HIF_IRQ_MASKED_STATUS	phy hif interrupt masked status. Reset State: 0x00000000
25	WQ_DATA_AVAIL_IRQ_MASKED_STATUS	wq data available interrupt masked status. Reset State: 0x00000000
24	PHY_IRQ_IRQ_MASKED_STATUS	phy irq interrupt masked status. Reset State: 0x00000000
23	PHY_FIQ_IRQ_MASKED_STATUS	phy fiq interrupt masked status. Reset State: 0x00000000
22	TPE_IRQ_MASKED_STATUS	tpe_mcu_int interrupt masked status. Reset State: 0x00000000
21	MIF_IRQ_MASKED_STATUS	mif interrupt masked status. Reset State: 0x00000000
20	BT_INACTIVE_IRQ_MASKED_STATUS	bt inactive interrupt masked status. Reset State: 0x00000000
19	BT_ACTIVE_IRQ_MASKED_STATUS	bt_active interrupt masked status. Reset State: 0x00000000
18	MTU_TIMER5_MASKED_STATUS	When set, mtu timer5/tsf_timer5 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
17	ADU_IRQ_MASKED_STATUS	adu interrupt masked status. Reset State: 0x00000000
16	MTU_TIMER4_MASKED_STATUS	When set, mtu timer4/tsf_timer4 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
15	RPE_IRQ_MASKED_STATUS	rpe interrupt masked status. Reset State: 0x00000000
13	COMBINED_IRQ_MASKED_STATUS	the combined txp/dpu/dbr/ahb2phy interrupt masked status. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_IRQ_MASKED_STATUS	rxp beacon related interrupt masked status. Reset State: 0x00000000
7	HOST_TO_ACPU_MB3_IRQ_MASKED_STATUS	host to acpu MB3 interrupt masked status. Reset State: 0x00000000
6	HOST_TO_ACPU_MB2_IRQ_MASKED_STATUS	host to acpu MB2 interrupt masked status. Reset State: 0x00000000

MCU_IRQ_MASKED_STATUS (cont.)

Bits	Name	Description
5	HOST_TO_ACPU_MB1_IRQ_MASKED_STATUS	host to acpu MB1 interrupt masked status. Reset State: 0x00000000
4	HOST_TO_ACPU_MB0_IRQ_MASKED_STATUS	host to acpu MB0 interrupt masked status. Reset State: 0x00000000
3	MTU_IRQ_MASKED_STATUS	combined mtu interrupt masked status. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_IRQ_MASKED_STATUS	sw 0 interrupt masked status. Reset State: 0x00000000
1	SCU_UART_IRQ_MASKED_STATUS	uart interrupt masked status. Reset State: 0x00000000
0	MTU_WD_1_IRQ_MASKED_STATUS	mtu watchdog timer (warning) interrupt masked status. Reset State: 0x00000000

0x3000254 MCU_IRQ_CLEAR

Type: write-only
Reset State: 0x00000000

This register contains the acpu irq clear signals

MCU_IRQ_CLEAR

Bits	Name	Description
31	SW_1_IRQ_CLEAR	When set, software 1 interrupt is cleared. Reset State: 0x00000000
30	RXP_ERR_IRQ_CLEAR	When set, rxp error interrupt is cleared. Reset State: 0x00000000
29	QTA_IRQ_CLEAR	When set, qta interrupt is cleared. Reset State: 0x00000000
28	MTU_TIMER7_CLEAR	When set, mtu timer7/tsf_timer7 interrupt is cleared Reset State: 0x00000000
27	MTU_TIMER6_CLEAR	When set, mtu timer6/tsf_timer6 interrupt is cleared Reset State: 0x00000000
26	PHY_HIF_IRQ_CLEAR	When set, phy hif interrupt is cleared. Reset State: 0x00000000
25	WQ_DATA_AVAIL_IRQ_CLEAR	When set, wq data available interrupt is cleared. Reset State: 0x00000000

MCU_IRQ_CLEAR (cont.)

Bits	Name	Description
24	PHY_IRQ_IRQ_CLEAR	When set, phy irq interrupt is cleared. Reset State: 0x00000000
23	PHY_FIQ_IRQ_CLEAR	When set, phy fiq interrupt is cleared. Reset State: 0x00000000
22	TPE_IRQ_CLEAR	When set, tpe_mcu_int interrupt is cleared. Reset State: 0x00000000
21	MIF_IRQ_CLEAR	When set, mif interrupt is cleared. Reset State: 0x00000000
20	BT_INACTIVE_IRQ_CLEAR	When set, bt inactive interrupt is cleared. Reset State: 0x00000000
19	BT_ACTIVE_IRQ_CLEAR	When set, bt active interrupt is cleared. Reset State: 0x00000000
18	MTU_TIMER5_CLEAR	When set, mtu timer5/tsf_timer5 interrupt is cleared Reset State: 0x00000000
17	ADU_IRQ_CLEAR	When set, adu interrupt is cleared. Reset State: 0x00000000
16	MTU_TIMER4_CLEAR	When set, mtu timer4/tsf_timer4 interrupt is cleared Reset State: 0x00000000
15	RPE_IRQ_CLEAR	When set, rpe interrupt is cleared. Reset State: 0x00000000
13	COMBINED_IRQ_CLEAR	When set, the combined txp/dpu/dbr/ahb2phy interrupt is cleared. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_IRQ_CLEAR	When set, rxp beacon related interrupt is cleared. Reset State: 0x00000000
7	HOST_TO_ACPU_MB3_IRQ_CLEAR	When set, host to acpu MB3 interrupt is cleared. Reset State: 0x00000000
6	HOST_TO_ACPU_MB2_IRQ_CLEAR	When set, host to acpu MB2 interrupt is cleared. Reset State: 0x00000000
5	HOST_TO_ACPU_MB1_IRQ_CLEAR	When set, host to acpu MB1 interrupt is cleared. Reset State: 0x00000000
4	HOST_TO_ACPU_MB0_IRQ_CLEAR	When set, host to acpu MB0 interrupt is cleared. Reset State: 0x00000000
3	MTU_IRQ_CLEAR	When set, combined mtu interrupt is cleared. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_IRQ_CLEAR	When set, software 0 interrupt is cleared. Reset State: 0x00000000

MCU_IRQ_CLEAR (cont.)

Bits	Name	Description
1	SCU_UART_IRQ_CLEAR	When set, uart interrupt is cleared. Reset State: 0x00000000
0	MTU_WD_1_IRQ_CLEAR	When set, mtu watchdog timer (warning) interrupt is cleared. Reset State: 0x00000000

0x3000258 MCU_MTU_INT_EN

Type: read-write
Reset State: 0x00000000

This register contains the mtu interrupt enable signals

MCU_MTU_INT_EN

Bits	Name	Description
14	MTU_MCU_TX_BOUNDARY_INT_EN	When set, mtu-tpe transmit boundary interrupt is enabled Reset State: 0x00000000
13	MTU_ERR_EN	When set, mtu error interrupt is enabled Reset State: 0x00000000
12	WD_ENABLE_DISABLE_ERROR_EN	When set, mtu wd_enable_disable_error interrupt is enabled Reset State: 0x00000000
11	WD_PROTECTION_ERROR_EN	When set, mtu wd_protection_error interrupt is enabled Reset State: 0x00000000
10	RESP_TIMEOUT_MISSING_PKT_PUSH_EN	When set, mtu resp_timeout_missing_pkt_push interrupt is enabled Reset State: 0x00000000
9	RESP_TIMEOUT_MISSING_PKTDET_EN	When set, mtu resp_timeout_missing_pktdet interrupt is enabled Reset State: 0x00000000
8	RESP_TIMEOUT_MISSING_EARLY_PKTDET_EN	When set, mtu resp_timeout_missing_early_pktdet interrupt is enabled Reset State: 0x00000000
7	MTU_PIFS_TO_EN	When set, mtu pifs timeout interrupt is enabled Reset State: 0x00000000
6	MTU_SIFS_TO_EN	When set, mtu sifs timeout interrupt is enabled Reset State: 0x00000000
5	MTU_BKOF1_EN	When set, mtu bkof1 interrupt is enabled Reset State: 0x00000000
4	MTU_BKOF0_EN	When set, mtu bkof0 interrupt is enabled Reset State: 0x00000000

MCU_MTU_INT_EN (cont.)

Bits	Name	Description
3	MTU_TIMER3_EN	When set, mtu timer3/tsf_timer3 interrupt is enabled See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
2	MTU_TIMER2_EN	When set, mtu timer2/tsf_timer2 interrupt is enabled See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
1	MTU_TIMER1_EN	When set, mtu timer1/tsf_timer1 interrupt is enabled See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
0	MTU_TIMER0_EN	When set, mtu timer0/tsf_timer0 interrupt is enabled See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000

0x300025C MCU_MTU_INT_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the mtu interrupt raw status signals

MCU_MTU_INT_STATUS

Bits	Name	Description
14	MTU_MCU_TX_BOUNDARY_INT_STATUS	mtu-tpe transmit boundary interrupt status Reset State: 0x00000000
13	MTU_ERR_STATUS	mtu error interrupt status Reset State: 0x00000000
12	WD_ENABLE_DISABLE_ERROR_STATUS	mtu wd_enable_disable_error interrupt status Reset State: 0x00000000
11	WD_PROTECTION_ERROR_STATUS	mtu wd_protection_error interrupt status Reset State: 0x00000000
10	RESP_TIMEOUT_MISSING_PKT_PUSH_STATUS	mtu resp_timeout_missing_pkt_push interrupt status Reset State: 0x00000000
9	RESP_TIMEOUT_MISSING_PKTDET_STATUS	mtu resp_timeout_missing_pktdet interrupt status Reset State: 0x00000000
8	RESP_TIMEOUT_MISSING_EARLY_PKTDET_STATUS	mtu resp_timeout_missing_early_pktdet interrupt status Reset State: 0x00000000
7	MTU_PIFS_TO_STATUS	mtu pifs timeout interrupt status Reset State: 0x00000000

MCU_MTU_INT_STATUS (cont.)

Bits	Name	Description
6	MTU_SIFS_TO_STATUS	mtu sifs timeout interrupt status Reset State: 0x00000000
5	MTU_BKOF1_STATUS	mtu bkof1 interrupt status Reset State: 0x00000000
4	MTU_BKOF0_STATUS	mtu bkof0 interrupt status Reset State: 0x00000000
3	MTU_TIMER3_STATUS	mtu timer3/tsf timer3 interrupt status Reset State: 0x00000000
2	MTU_TIMER2_STATUS	mtu timer2/tsf timer2 interrupt status Reset State: 0x00000000
1	MTU_TIMER1_STATUS	mtu timer1/tsf timer1 interrupt status Reset State: 0x00000000
0	MTU_TIMER0_STATUS	mtu timer0/tsf timer0 interrupt status Reset State: 0x00000000

0x3000260 MCU_MTU_INT_MASKED_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the mtu interrupt masked status signals

MCU_MTU_INT_MASKED_STATUS

Bits	Name	Description
14	MTU_MCU_TX_BOUNDARY_INT_MASK_STATUS	mtu-tpe transmit boundary interrupt masked status Reset State: 0x00000000
13	MTU_ERR_MASK_STATUS	mtu error interrupt masked status Reset State: 0x00000000
12	WD_ENABLE_DISABLE_ERROR_MASK_STATUS	mtu wd_enable_disable_error interrupt masked status Reset State: 0x00000000

2	MTU_TIMER2_MASK_STATUS	mtu timer2/tsf timer2 interrupt masked status Reset State: 0x00000000
1	MTU_TIMER1_MASK_STATUS	mtu timer1/tsf timer1 interrupt masked status Reset State: 0x00000000
0	MTU_TIMER0_MASK_STATUS	mtu timer0/tsf timer0 interrupt masked status Reset State: 0x00000000

0x3000264 MCU_MTU_INT_CLEAR

Type: write-only
Reset State: 0x00000000

This register contains the mtu interrupt clear signals

MCU_MTU_INT_CLEAR

Bits	Name	Description
14	MTU_MCU_TX_BOUNDARY_INT_CLEAR	When set, mtu-tpe transmit boundary interrupt is cleared Reset State: 0x00000000
13	MTU_ERR_CLEAR	When set, mtu error interrupt is cleared Reset State: 0x00000000
12	WD_ENABLE_DISABLE_ERROR_CLEAR	When set, mtu wd_enable_disable_error interrupt is cleared Reset State: 0x00000000
11	WD_PROTECTION_ERROR_CLEAR	When set, mtu wd_protection_error interrupt is cleared Reset State: 0x00000000

MCU_MTU_INT_CLEAR (cont.)

Bits	Name	Description
10	RESP_TIMEOUT_MISSING_PKT_PUSH_CLEAR	When set, mtu resp_timeout_missing_pkt_push interrupt is cleared Reset State: 0x00000000
9	RESP_TIMEOUT_MISSING_PKTDET_CLEAR	When set, mtu resp_timeout_missing_pktdet interrupt is cleared Reset State: 0x00000000
8	RESP_TIMEOUT_MISSING_EARLY_PKTDET_CLEAR	When set, mtu resp_timeout_missing_early_pktdet interrupt is cleared Reset State: 0x00000000
7	MTU_PIFS_TO_CLEAR	When set, mtu pifs timeout interrupt is cleared Reset State: 0x00000000
6	MTU_SIFS_TO_CLEAR	When set, mtu sifs timeout interrupt is cleared Reset State: 0x00000000
5	MTU_BKOF1_CLEAR	When set, mtu bkof1 interrupt is cleared Reset State: 0x00000000
4	MTU_BKOF0_CLEAR	When set, mtu bkof0 interrupt is cleared Reset State: 0x00000000
3	MTU_TIMER3_CLEAR	When set, mtu timer3/tsf timer3 interrupt is cleared Reset State: 0x00000000
2	MTU_TIMER2_CLEAR	When set, mtu timer2/tsf timer2 interrupt is cleared Reset State: 0x00000000
1	MTU_TIMER1_CLEAR	When set, mtu timer1/tsf timer1 interrupt is cleared Reset State: 0x00000000
0	MTU_TIMER0_CLEAR	When set, mtu timer0/tsf timer0 interrupt is cleared Reset State: 0x00000000

0x3000268 MCU_COMBINED_INT_EN

Type: read-write
Reset State: 0x00000000

This register contains the combined interrupt enable signals

MCU_COMBINED_INT_EN

Bits	Name	Description
23	WLAN_BRIDGE_AHB_ERR_INT_EN	When set, the wlan bridge ahb error interrupt is enabled Reset State: 0x00000000
21	BTC_PATTERN_DET_INT_EN	When set, btc_pattern_det_int_p interrupt is enabled Reset State: 0x00000000

MCU_COMBINED_INT_EN (cont.)

Bits	Name	Description
20	BTC_SCO_INT_EN	When set, btc_sco_int_p interrupt is enabled Reset State: 0x00000000
19	TPE_MCU_WRONG_SSN_OR_TID_ERROR_P_EN	When set, tpe_mcu_wrong_ssn_or_tid_error_p interrupt is enabled Reset State: 0x00000000
18	TPE_MCU_BD_BASED_TX_INT_1_P_EN	When set, tpe_mcu_bd_based_tx_int_1_p interrupt is enabled Reset State: 0x00000000
17	TPE_MCU_BD_BASED_TX_INT_0_P_EN	When set, tpe_mcu_bd_based_tx_int_0_p interrupt is enabled Reset State: 0x00000000
16	TPE_MCU_ERROR_VAILD_P_EN	When set, tpe_mcu_error_vaild_p interrupt is enabled Reset State: 0x00000000
15	TPE_MCU_GOT_ACK_FOR_BACK_P_EN	When set, tpe_mcu_got_ack_for_back_p interrupt is enabled Reset State: 0x00000000
14	BMU_MCU_PWRSTATE_DROP_INT_EN	When set, bmu_mcu_pwrstate_drop_interrupt is enabled Reset State: 0x00000000
13	BMU_MCU_PWRSTATE_CHANGE_INT_EN	When set, bmu_mcu_pwrstate_change_interrupt is enabled Reset State: 0x00000000
12	BMU_MCU_BTQM_QUEUES_EMPTY_INTERRUPT_EN	When set, bmu_mcu_btqm_queues_empty_interrupt interrupt is enabled Reset State: 0x00000000
11	BMU_MCU_ERR_INT_EN	When set, bmu_mcu_err_int interrupt is enabled Reset State: 0x00000000
10	AHB2PHY_MCU_TIMOUT_ERROR2_EN	When set, ahb2phy_mcu_timout_error2 interrupt is enabled Reset State: 0x00000000
9	AHB2PHY_MCU_TIMOUT_ERROR1_EN	When set, ahb2phy_mcu_timout_error1 interrupt is enabled Reset State: 0x00000000
8	DBR_MCU_GAM_ERR_EN	When set, dbr_mcu_gam_err interrupt is enabled Reset State: 0x00000000
7	DBR_MCU_INCORRECT_LENGTH_ERR_EN	When set, dbr_mcu_incorrect_length_err interrupt is enabled Reset State: 0x00000000
6	DPU_MCU_MICERR_P_EN	When set, dpu_mcu_micerr_p interrupt is enabled Reset State: 0x00000000
5	DPU_MCU_ERRINTR_P_EN	When set, dpu_mcu_errintr_p interrupt is enabled Reset State: 0x00000000
4	BMU_MCU_QUEUE_USAGE_THRESHOLD_INTERRUPT_EN	When set, bmu_mcu_queue_usage_threshold_interrupt is enabled Reset State: 0x00000000
3	ACPU_MCU_MIF_TIMEOUT_INT_P_EN	When set, acpu_mcu_mif_timeout_int_p interrupt is enabled Reset State: 0x00000000

MCU_COMBINED_INT_EN (cont.)

Bits	Name	Description
2	ACPU_MCU_AHB_ERR_INT_P_EN	When set, acpu_mcu_ahb_err_int_p interrupt is enabled Reset State: 0x00000000
1	TXP_MCU_TXP_TIMEOUT_INT_P_EN	When set, txp_mcu_txp_timeout_int_p interrupt is enabled Reset State: 0x00000000
0	TXP_MCU_ERR_INT_EN	When set, txp_mcu_err_int interrupt is enabled Reset State: 0x00000000

0x300026C MCU_COMBINED_INT_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the combined interrupt raw status signals

MCU_COMBINED_INT_STATUS

Bits	Name	Description
23	WLAN_BRIDGE_AHB_ERR_INT_STATUS	wlan bridge ahb error interrupt status Reset State: 0x00000000

0x3000278 MCU_BMU_WQ_INT_EN

Type: read-write
Reset State: 0x00000000

This register contains the bmu wq data available interrupt enable signals

MCU_BMU_WQ_INT_EN

Bits	Name	Description
24:2	BMU_WQ_INT_EN	BMU WQ 2-24 data available Reset State: 0x00000000

0x300027C MCU_BMU_WQ_INT_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the bmu wq data available interrupt raw status signals

MCU_BMU_WQ_INT_STATUS

Bits	Name	Description
24:2	BMU_WQ_INT_STATUS	BMU WQ 2-24 data available Reset State: 0x00000000

0x3000280 MCU_BMU_WQ_INT_MASKED_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the bmu wq data available interrupt masked status signals

MCU_BMU_WQ_INT_MASKED_STATUS

Bits	Name	Description
24:2	BMU_WQ_INT_MASKED_STATUS	BMU WQ 2-24 data available Reset State: 0x00000000

0x3000284 MCU_BMU_WQ_INT_CLEAR

Type: write-only
Reset State: 0x00000000

This register contains the bmu wq data available interrupt clear signals

MCU_BMU_WQ_INT_CLEAR

Bits	Name	Description
24:2	BMU_WQ_INT_CLEAR	BMU WQ 2-24 data available Reset State: 0x00000000

0x3000298 MCU_SW_INT_0

Type: read-write
Reset State: 0x00000000

This register contains the software interrupt signals

MCU_SW_INT_0

Bits	Name	Description
0	COMBINED_INT_EN	SW generated interrupt Reset State: 0x00000000

0x300029C MCU_SW_INT_1

Type: read-write
Reset State: 0x00000000

This register contains the software interrupt signals

MCU_SW_INT_1

Bits	Name	Description
0	COMBINED_INT_EN	SW generated interrupt1 Reset State: 0x00000000

0x30002A0 MCU_MCU_HOST_INT_EN

Type: read-write
Reset State: 0x00000000

This register contains the mcu_host interrupt enable signals

MCU_MCU_HOST_INT_EN

Bits	Name	Description
11	RESERVE	This bit is reserved. Reset State: 0x00000000
10	ADU_ERR_WQ_DA_AVAIL_EN	When set, adu_err_wq_da_avail interrupt is enabled Reset State: 0x00000000
9	DPU_ERR_WQ_DA_AVAIL_EN	When set, dpu_err_wq_da_avail interrupt is enabled Reset State: 0x00000000
8	MTU_TIMER3_EN	When set, mtu timer3/tsf_timer3 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
7	MTU_TIMER2_EN	When set, mtu timer2/tsf_timer2 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
6	MB3_EN	When set, mb3 interrupt is enabled Reset State: 0x00000000
5	MB2_EN	When set, mb2 interrupt is enabled Reset State: 0x00000000
4	MB1_EN	When set, mb1 interrupt is enabled Reset State: 0x00000000
3	MB0_EN	When set, mb0 interrupt is enabled Reset State: 0x00000000
2	DPU_MIC_ERROR_EN	When set, dpu mic error interrupt is enabled Reset State: 0x00000000
1	MTU_WATCHDOG_EN	When set, mtu watchdog interrupt is enabled Reset State: 0x00000000

0x30002A4 MCU_MCU_HOST_INT_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the mcu_host interrupt raw status signals

MCU_MCU_HOST_INT_STATUS

Bits	Name	Description
11	RESERVE	This bit is reserve Reset State: 0x00000000
10	ADU_ERR_WQ_DA_AVAIL_STATUS	adu_err_wq_da_avail status Reset State: 0x00000000

MCU_MCU_HOST_INT_STATUS (cont.)

Bits	Name	Description
9	DPU_ERR_WQ_DA_AVAIL_STATUS	dpu_err_wq_da_avail status Reset State: 0x00000000
8	MTU_TIMER3_STATUS	mtu timer3/tsf_timer3 status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000

0x30002AC MCU_MCU_HOST_INT_CLEAR

Type: write-only
Reset State: 0x00000000

This register contains the mcu_host interrupt clear signals

MCU_MCU_HOST_INT_CLEAR

Bits	Name	Description
11	RESERVE	This bit is reserve for future usage Reset State: 0x00000000
10	ADU_ERR_WQ_DA_AVAIL_CLEAR	When set, clear adu_err_wq_da_avail interrupt Reset State: 0x00000000
9	DPU_ERR_WQ_DA_AVAIL_CLEAR	When set, clear dpu_err_wq_da_avail interrupt Reset State: 0x00000000
8	MTU_TIMER3_CLEAR	When set, clear mtu timer3/tsf_timer3 interrupt Reset State: 0x00000000
7	MTU_TIMER2_CLEAR	When set, clear mtu timer2/tsf_timer2 interrupt Reset State: 0x00000000
6	MB3_CLEAR	When set, clear mb3 interrupt Reset State: 0x00000000

MCU_MCU_HOST_INT_CLEAR (cont.)

Bits	Name	Description
5	MB2_CLEAR	When set, clear mb2 interrupt Reset State: 0x00000000
4	MB1_CLEAR	When set, clear mb1 interrupt Reset State: 0x00000000
3	MB0_CLEAR	When set, clear mb0 interrupt Reset State: 0x00000000
2	DPU_MIC_ERROR_CLEAR	When set, clear dpu mic error interrupt Reset State: 0x00000000
1	MTU_WATCHDOG_CLEAR	When set, clear mtu watchdog interrupt Reset State: 0x00000000

0x30002B0 MCU_MCU_PMU_INFO

Type: read-write
Reset State: 0x00000000

This register contains the RF register reinitialization is done information

MCU_MCU_PMU_INFO

Bits	Name	Description
0	MCU_PMU_RF_REINIT_DONE	SW writes to this register to tell pmu that RF reg reinit is done. Reset State: 0x00000000

0x30002B4 MCU_MCU_WMAC_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the wmac modules status

MCU_MCU_WMAC_STATUS

Bits	Name	Description
10	ACPU_MCU_STATUS	When set, acpu is busy. Reset State: 0x00000000
9	SIF_MCU_STATUS	When set, sif is busy. Reset State: 0x00000000
8	BTQM_MCU_STATUS	When set, btqm queue is not empty. Reset State: 0x00000000

MCU_MCU_WMAC_STATUS (cont.)

Bits	Name	Description
7	BMU_MCU_STATUS	When set, bmu wq is not empty. Reset State: 0x00000000
6	TPE_MCU_STATUS	When set, tpe is busy. Reset State: 0x00000000
5	TXP_MCU_STATUS	When set, txp is busy. Reset State: 0x00000000
4	DXE_MCU_STATUS	When set, dxe is busy. Reset State: 0x00000000
3	ADU_MCU_STATUS	When set, adu is busy. Reset State: 0x00000000
2	DPU_MCU_STATUS	When set, dpu is busy. Reset State: 0x00000000
1	RPE_MCU_STATUS	When set, rpe is busy. Reset State: 0x00000000
0	RXP_MCU_STATUS	When set, rxp is busy. Reset State: 0x00000000

0x30002B8 MCU_MAC_HOST_INT_EN

Type: read-write
Reset State: 0x00000000

This register contains the mac to host interrupt enable signals. The bit order is the same as those in the IRQ/FIQ register which are used by acpu, this is dedicated for host.

MCU_MAC_HOST_INT_EN

Bits	Name	Description
31	SW_1_INT_EN	When set, software 1 interrupt is enabled. Reset State: 0x00000000
30	RXP_ERR_INT_EN	When set, rxp error interrupt is enabled. Reset State: 0x00000000
29	QTA_INT_EN	When set, qta interrupt is enabled. Reset State: 0x00000000
28	MTU_TIMER7_EN	When set, mtu timer7/tsf_timer7 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
27	MTU_TIMER6_EN	When set, mtu timer6/tsf_timer6 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000

MCU_MAC_HOST_INT_EN (cont.)

Bits	Name	Description
26	PHY_HIF_INT_EN	When set, phy hif interrupt is enabled. Reset State: 0x00000000
25	WQ_DATA_AVAIL_INT_EN	When set, wq data available interrupt is enabled. Reset State: 0x00000000
24	PHY_IRQ_INT_EN	When set, phy irq interrupt is enabled. Reset State: 0x00000000
23	PHY_FIQ_INT_EN	When set, phy fiq interrupt is enabled. Reset State: 0x00000000
22	TPE_INT_EN	When set, tpe_mcu_int interrupt is enabled. Reset State: 0x00000000
21	MIF_INT_EN	When set, mif interrupt is enabled. Reset State: 0x00000000
20	BT_INACTIVE_INT_EN	When set, bt_inactive interrupt is enabled. Reset State: 0x00000000
19	BT_ACTIVE_INT_EN	When set, bt active interrupt is enabled. Reset State: 0x00000000
18	MTU_TIMER5_EN	When set, mtu timer5/tsf_timer5 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
17	ADU_INT_EN	When set, adu interrupt is enabled. Reset State: 0x00000000
16	MTU_TIMER4_EN	When set, mtu timer4/tsf_timer4 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
15	RPE_INT_EN	When set, rpe interrupt is enabled. Reset State: 0x00000000
13	COMBINED_INT_EN	When set, the combined txp/dpu/dbr/ahb2phy interrupt is enabled. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_INT_EN	When set, rxp beacon related interrupt is enabled. Reset State: 0x00000000
7	ACPU_TO_HOST_MB3_INT_EN	When set, acpu to host MB3 interrupt is enabled. Reset State: 0x00000000
6	ACPU_TO_HOST_MB2_INT_EN	When set, acpu to host MB2 interrupt is enabled. Reset State: 0x00000000
5	ACPU_TO_HOST_MB1_INT_EN	When set, acpu to host MB1 interrupt is enabled. Reset State: 0x00000000
4	ACPU_TO_HOST_MB0_INT_EN	When set, acpu to host MB0 interrupt is enabled. Reset State: 0x00000000

MCU_MAC_HOST_INT_EN (cont.)

Bits	Name	Description
3	MTU_INT_EN	When set, combined mtu interrupt is enabled. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_INT_EN	When set, software 0 interrupt is enabled. Reset State: 0x00000000
1	SCU_UART_INT_EN	When set, uart interrupt is enabled. Reset State: 0x00000000
0	MTU_WD_1_INT_EN	When set, mtu watchdog timer (warning) interrupt is enabled. Reset State: 0x00000000

0x30002BC MCU_MAC_HOST_INT_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the mac to host interrupt raw status signals. The bit order is the same as those in the IRQ/FIQ register which are used by acpu, this is dedicated for host.

MCU_MAC_HOST_INT_STATUS

Bits	Name	Description
31	SW_1_INT_STATUS	sw 1 interrupt status. Reset State: 0x00000000
30	RXP_ERR_INT_STATUS	rxp error interrupt status. Reset State: 0x00000000
29	QTA_INT_STATUS	qta interrupt status Reset State: 0x00000000
28	MTU_TIMER7_STATUS	When set, mtu timer7/tsf_timer7 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
27	MTU_TIMER6_STATUS	When set, mtu timer6/tsf_timer6 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
26	PHY_HIF_INT_STATUS	phy hif interrupt status. Reset State: 0x00000000
25	WQ_DATA_AVAIL_INT_STATUS	wq data available interrupt status. Reset State: 0x00000000
24	PHY_IRQ_INT_STATUS	phy irq interrupt status. Reset State: 0x00000000

MCU_MAC_HOST_INT_STATUS (cont.)

Bits	Name	Description
23	PHY_FIQ_INT_STATUS	phy fiq interrupt status. Reset State: 0x00000000
22	TPE_INT_STATUS	tpe_mcu_int interrupt status. Reset State: 0x00000000
21	MIF_INT_STATUS	mif interrupt status. Reset State: 0x00000000
20	BT_INACTIVE_INT_STATUS	bt inactive interrupt status. Reset State: 0x00000000
19	BT_ACTIVE_INT_STATUS	bt active interrupt status. Reset State: 0x00000000
18	MTU_TIMER5_STATUS	When set, mtu timer5/tsf_timer5 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
17	ADU_INT_STATUS	adu interrupt status. Reset State: 0x00000000
16	MTU_TIMER4_STATUS	When set, mtu timer4/tsf_timer4 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
15	RPE_INT_STATUS	rpe interrupt status. Reset State: 0x00000000
13	COMBINED_INT_STATUS	the combined txp/dpu/dbr/ahb2phy interrupt status. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_INT_STATUS	rxp beacon related interrupt status. Reset State: 0x00000000
7	ACPU_TO_HOST_MB3_INT_STATUS	acpu to host MB3 interrupt status. Reset State: 0x00000000
6	ACPU_TO_HOST_MB2_INT_STATUS	acpu to host MB2 interrupt status. Reset State: 0x00000000
5	ACPU_TO_HOST_MB1_INT_STATUS	acpu to host MB1 interrupt status. Reset State: 0x00000000
4	ACPU_TO_HOST_MB0_INT_STATUS	acpu to host MB0 interrupt status. Reset State: 0x00000000
3	MTU_INT_STATUS	combined mtu interrupt status. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_INT_STATUS	sw 0 interrupt status. Reset State: 0x00000000

MCU_MAC_HOST_INT_STATUS (cont.)

Bits	Name	Description
1	SCU_UART_INT_STATUS	uart interrupt status. Reset State: 0x00000000
0	MTU_WD_1_INT_STATUS	mtu watchdog timer (warning) interrupt status. Reset State: 0x00000000

0x30002C0 MCU_MAC_HOST_INT_MASKED_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the mac to host interrupt masked status. The bit order is the same as those in the IRQ/FIQ register which are used by acpu, this is dedicated for host.

MCU_MAC_HOST_INT_MASKED_STATUS

Bits	Name	Description
31	SW_1_INT_MASKED_STATUS	sw 1 interrupt masked status. Reset State: 0x00000000
30	RXP_ERR_INT_MASKED_STATUS	rxp error interrupt masked status. Reset State: 0x00000000
29	QTA_INT_MASKED_STATUS	qta interrupt masked status Reset State: 0x00000000
28	MTU_TIMER7_MASKED_STATUS	When set, mtu timer7/tsf_timer7 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
27	MTU_TIMER6_MASKED_STATUS	When set, mtu timer6/tsf_timer6 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
26	PHY_HIF_INT_MASKED_STATUS	phy hif interrupt masked status. Reset State: 0x00000000
25	WQ_DATA_AVAIL_INT_MASKED_STATUS	wq data available interrupt masked status. Reset State: 0x00000000
24	PHY_IRQ_INT_MASKED_STATUS	phy irq interrupt masked status. Reset State: 0x00000000
23	PHY_FIQ_INT_MASKED_STATUS	phy fiq interrupt masked status. Reset State: 0x00000000
22	TPE_INT_MASKED_STATUS	tpe_mcu_int interrupt masked status. Reset State: 0x00000000
21	MIF_INT_MASKED_STATUS	mif interrupt masked status. Reset State: 0x00000000

MCU_MAC_HOST_INT_MASKED_STATUS (cont.)

Bits	Name	Description
20	BT_INACTIVE_INT_MASKED_STATUS	bt inactive interrupt masked status. Reset State: 0x00000000
19	BT_ACTIVE_INT_MASKED_STATUS	bt active interrupt masked status. Reset State: 0x00000000
18	MTU_TIMER5_MASKED_STATUS	When set, mtu timer5/tsf_timer5 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
17	ADU_INT_MASKED_STATUS	adu interrupt masked status. Reset State: 0x00000000
16	MTU_TIMER4_MASKED_STATUS	When set, mtu timer4/tsf_timer4 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
15	RPE_INT_MASKED_STATUS	rpe interrupt masked status. Reset State: 0x00000000
13	COMBINED_INT_MASKED_STATUS	the combined txp/dpu/dbr/ahb2phy interrupt masked status. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_INT_MASKED_STATUS	rxp beacon related interrupt masked status. Reset State: 0x00000000
7	ACPU_TO_HOST_MB3_INT_MASKED_STATUS	acpu to host MB3 interrupt masked status. Reset State: 0x00000000
6	ACPU_TO_HOST_MB2_INT_MASKED_STATUS	acpu to host MB2 interrupt masked status. Reset State: 0x00000000
5	ACPU_TO_HOST_MB1_INT_MASKED_STATUS	acpu to host MB1 interrupt masked status. Reset State: 0x00000000
4	ACPU_TO_HOST_MB0_INT_MASKED_STATUS	acpu to host MB0 interrupt masked status. Reset State: 0x00000000
3	MTU_INT_MASKED_STATUS	combined mtu interrupt masked status. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_INT_MASKED_STATUS	sw 0 interrupt masked status. Reset State: 0x00000000
1	SCU_UART_INT_MASKED_STATUS	uart interrupt masked status. Reset State: 0x00000000
0	MTU_WD_1_INT_MASKED_STATUS	mtu watchdog timer (warning) interrupt masked status. Reset State: 0x00000000

0x30002C4 MCU_MAC_HOST_INT_CLEAR

Type: write-only
Reset State: 0x00000000

This register contains the mac to host interrupt clear signals. The bit order is the same as those in the IRQ/FIQ register which are used by acpu, this is dedicated for host.

MCU_MAC_HOST_INT_CLEAR

Bits	Name	Description
31	SW_1_INT_CLEAR	When set, software 1 interrupt is cleared. Reset State: 0x00000000
30	RXP_ERR_INT_CLEAR	When set, rxp error interrupt is cleared. Reset State: 0x00000000
29	QTA_INT_CLEAR	When set, qta interrupt is cleared. Reset State: 0x00000000
28	MTU_TIMER7_CLEAR	When set, mtu timer7/tsf_timer7 interrupt is cleared Reset State: 0x00000000
27	MTU_TIMER6_CLEAR	When set, mtu timer6/tsf_timer6 interrupt is cleared Reset State: 0x00000000
26	PHY_HIF_INT_CLEAR	When set, phy hif interrupt is cleared. Reset State: 0x00000000
25	WQ_DATA_AVAIL_INT_CLEAR	When set, wq data available interrupt is cleared. Reset State: 0x00000000
24	PHY_IRQ_INT_CLEAR	When set, phy irq interrupt is cleared. Reset State: 0x00000000
23	PHY_FIQ_INT_CLEAR	When set, phy fiq interrupt is cleared. Reset State: 0x00000000
22	TPE_INT_CLEAR	When set, tpe_mcu_int interrupt is cleared. Reset State: 0x00000000
21	MIF_INT_CLEAR	When set, mif interrupt is cleared. Reset State: 0x00000000
20	BT_INACTIVE_INT_CLEAR	When set, bt inactive interrupt is cleared. Reset State: 0x00000000
19	BT_ACTIVE_INT_CLEAR	When set, bt active interrupt is cleared. Reset State: 0x00000000
18	MTU_TIMER5_CLEAR	When set, mtu timer5/tsf_timer5 interrupt is cleared Reset State: 0x00000000
17	ADU_INT_CLEAR	When set, adu interrupt is cleared. Reset State: 0x00000000

MCU_MAC_HOST_INT_CLEAR (cont.)

Bits	Name	Description
16	MTU_TIMER4_CLEAR	When set, mtu timer4/tsf_timer4 interrupt is cleared Reset State: 0x00000000
15	RPE_INT_CLEAR	When set, rpe interrupt is cleared. Reset State: 0x00000000
13	COMBINED_INT_CLEAR	When set, the combined txp/dpu/dbr/ahb2phy interrupt is cleared. See combined_int related registers for detail Reset State: 0x00000000
12	RXP_INT_CLEAR	When set, rxp beacon related interrupt is cleared. Reset State: 0x00000000
7	ACPU_TO_HOST_MB3_INT_CLEAR	When set, acpu to host MB3 interrupt is cleared. Reset State: 0x00000000
6	ACPU_TO_HOST_MB2_INT_CLEAR	When set, acpu to host MB2 interrupt is cleared. Reset State: 0x00000000
5	ACPU_TO_HOST_MB1_INT_CLEAR	When set, acpu to host MB1 interrupt is cleared. Reset State: 0x00000000
4	ACPU_TO_HOST_MB0_INT_CLEAR	When set, acpu to host MB0 interrupt is cleared. Reset State: 0x00000000
3	MTU_INT_CLEAR	When set, combined mtu interrupt is cleared. See mtu_int related registers for detail Reset State: 0x00000000
2	SW_0_INT_CLEAR	When set, software 0 interrupt is cleared. Reset State: 0x00000000
1	SCU_UART_INT_CLEAR	When set, uart interrupt is cleared. Reset State: 0x00000000
0	MTU_WD_1_INT_CLEAR	When set, mtu watchdog timer (warning) interrupt is cleared. Reset State: 0x00000000

0x30002C8 MCU_MTU_HOST_INT_EN

Type: read-write
Reset State: 0x00000000

This register contains the mtu interrupt enable signals

MCU_MTU_HOST_INT_EN

Bits	Name	Description
14	MTU_MCU_TX_BOUNDARY_INT_HOSTINT_EN	When set, mtu_mcu_tx_boundary_int interrupt is enabled Reset State: 0x00000000

MCU_MTU_HOST_INT_EN (cont.)

Bits	Name	Description
13	MTU_ERR_HOSTINT_EN	When set, mtu error interrupt is enabled Reset State: 0x00000000
12	WD_ENABLE_DISABLE_ERROR_HOSTINT_EN	When set, mtu wd_enable_disable_error interrupt is enabled Reset State: 0x00000000
11	WD_PROTECTION_ERROR_HOSTINT_EN	When set, mtu wd_protection_error interrupt is enabled Reset State: 0x00000000
10	RESP_TIMEOUT_MISSING_PKT_PUSH_HOSTINT_EN	When set, mtu resp_timeout_missing_pkt_push interrupt is enabled Reset State: 0x00000000
9	RESP_TIMEOUT_MISSING_PKTDET_HOSTINT_EN	When set, mtu resp_timeout_missing_pktdet interrupt is enabled Reset State: 0x00000000
8	RESP_TIMEOUT_MISSING_EARLY_PKTDET_HOSTINT_EN	When set, mtu resp_timeout_missing_early_pktdet interrupt is enabled Reset State: 0x00000000
7	MTU_PIFS_TO_HOSTINT_EN	When set, mtu pifs timeout interrupt is enabled Reset State: 0x00000000
6	MTU_SIFS_TO_HOSTINT_EN	When set, mtu sifs timeout interrupt is enabled Reset State: 0x00000000
5	MTU_BKOF1_HOSTINT_EN	When set, mtu bkof1 interrupt is enabled Reset State: 0x00000000
4	MTU_BKOF0_HOSTINT_EN	When set, mtu bkof0 interrupt is enabled Reset State: 0x00000000
3	MTU_TIMER3_HOSTINT_EN	When set, mtu timer3/tsf_timer3 interrupt is enabled See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
2	MTU_TIMER2_HOSTINT_EN	When set, mtu timer2/tsf_timer2 interrupt is enabled See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
1	MTU_TIMER1_HOSTINT_EN	When set, mtu timer1/tsf_timer1 interrupt is enabled See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
0	MTU_TIMER0_HOSTINT_EN	When set, mtu timer0/tsf_timer0 interrupt is enabled See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000

0x30002CC MCU_MTU_HOST_INT_MASKED_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the mtu interrupt masked status signals

MCU_MTU_HOST_INT_MASKED_STATUS

Bits	Name	Description
14	MTU_MCU_TX_BOUNDARY_INT_HOSTINT_MASK_STATUS	tu_mcu_tx_boundary_int interrupt masked status Reset State: 0x00000000
13	MTU_ERR_HOSTINT_MASK_STATUS	mtu error interrupt masked status Reset State: 0x00000000
12	WD_ENABLE_DISABLE_ERROR_HOSTINT_MASK_STATUS	mtu wd_enable_disable_error interrupt masked status Reset State: 0x00000000
11	WD_PROTECTION_ERROR_HOSTINT_MASK_STATUS	mtu wd_protection_error interrupt masked status Reset State: 0x00000000
10	RESP_TIMEOUT_MISSING_PKT_PUSH_HOSTINT_MASK_STATUS	mtu resp_timeout_missing_pkt_push interrupt masked status Reset State: 0x00000000
9	RESP_TIMEOUT_MISSING_PKTDET_HOSTINT_MASK_STATUS	mtu resp_timeout_missing_pktdet interrupt masked status Reset State: 0x00000000
8	RESP_TIMEOUT_MISSING_EARLY_PKTDET_HOSTINT_MASK_STATUS	mtu resp_timeout_missing_early_pktdet interrupt masked status Reset State: 0x00000000
7	MTU_PIFS_TO_HOSTINT_MASK_STATUS	mtu pifs timeout interrupt masked status Reset State: 0x00000000
6	MTU_SIFS_TO_HOSTINT_MASK_STATUS	mtu sifs timeout interrupt masked status Reset State: 0x00000000
5	MTU_BKOF1_HOSTINT_MASK_STATUS	mtu bkof1 interrupt masked status Reset State: 0x00000000
4	MTU_BKOF0_HOSTINT_MASK_STATUS	mtu bkof0 interrupt masked status Reset State: 0x00000000
3	MTU_TIMER3_HOSTINT_MASK_STATUS	mtu timer3/tsf_timer3 interrupt masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
2	MTU_TIMER2_HOSTINT_MASK_STATUS	mtu timer2/tsf_timer2 interrupt masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
1	MTU_TIMER1_HOSTINT_MASK_STATUS	mtu timer1/tsf_timer1 interrupt masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000
0	MTU_TIMER0_HOSTINT_MASK_STATUS	mtu timer0/tsf_timer0 interrupt masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection Reset State: 0x00000000

0x30002D0 MCU_COMBINED_HOST_INT_EN

Type: read-write
Reset State: 0x00000000

This register contains the combined interrupt enable signals

MCU_COMBINED_HOST_INT_EN

Bits	Name	Description
23	WLAN_BRIDGE_AHB_ERR_INT_HOSTINT_EN	When set, wlan bridge ahb error interrupt is enabled Reset State: 0x00000000
21	BTC_PATTERN_DET_INT_HOSTINT_EN	When set, btc_pattern_det_int_p interrupt is enabled Reset State: 0x00000000
20	BTC_SCO_INT_HOSTINT_EN	When set, btc_sco_int_p interrupt is enabled Reset State: 0x00000000
19	TPE_MCU_WRONG_SSN_OR_TID_ERROR_P_HOSTINT_EN	When set, tpe_mcu_wrong_ssn_or_tid_error_p interrupt is enabled Reset State: 0x00000000
18	TPE_MCU_BD_BASED_TX_INT_1_P_HOSTINT_EN	When set, tpe_mcu_bd_based_tx_int_1_p interrupt is enabled Reset State: 0x00000000
17	TPE_MCU_BD_BASED_TX_INT_0_P_HOSTINT_EN	When set, tpe_mcu_bd_based_tx_int_0_p interrupt is enabled Reset State: 0x00000000
16	TPE_MCU_ERROR_VAILD_P_HOSTINT_EN	When set, tpe_mcu_error_vaild_p interrupt is enabled Reset State: 0x00000000
15	TPE_MCU_GOT_ACK_FOR_BACK_P_HOSTINT_EN	When set, tpe_mcu_got_ack_for_back_p interrupt is enabled Reset State: 0x00000000
14	BMU_MCU_PWRSTATE_DROP_INT_EN	When set, bmu_mcu_pwrstate_drop_interrupt interrupt is enabled Reset State: 0x00000000
13	BMU_MCU_PWRSTATE_CHANGE_INT_EN	When set, bmu_mcu_pwrstate_change_interrupt interrupt is enabled Reset State: 0x00000000
12	BMU_MCU_BTQM_QUEUES_EMPTY_INTERRUPT_HOSTINT_EN	When set, bmu_mcu_btqm_queues_empty_interrupt interrupt is enabled Reset State: 0x00000000
11	BMU_MCU_ERR_INT_HOSTINT_EN	When set, bmu_mcu_err_int interrupt is enabled Reset State: 0x00000000
10	AHB2PHY_MCU_TIMOUT_ERROR2_HOSTINT_EN	When set, ahb2phy_mcu_timout_error2 interrupt is enabled Reset State: 0x00000000
9	AHB2PHY_MCU_TIMOUT_ERROR1_HOSTINT_EN	When set, ahb2phy_mcu_timout_error1 interrupt is enabled Reset State: 0x00000000
8	DBR_MCU_GAM_ERR_HOSTINT_EN	When set, dbr_mcu_gam_err interrupt is enabled Reset State: 0x00000000

MCU_COMBINED_HOST_INT_EN (cont.)

Bits	Name	Description
7	DBR_MCU_INCORRECT_LENGTH_ERR_HOSTINT_EN	When set, dbr_mcu_incorrect_length_err interrupt is enabled Reset State: 0x00000000
6	DPU_MCU_MICERR_P_HOSTINT_EN	When set, dpu_mcu_micerr_p interrupt is enabled Reset State: 0x00000000
5	DPU_MCU_ERRINTR_P_HOSTINT_EN	When set, dpu_mcu_errintr_p interrupt is enabled Reset State: 0x00000000
4	BMU_MCU_QUEUE_USAGE_THRESHOLD_INTERRUPT_EN	When set, bmu_mcu_queue_usage_threshold_interrupt is enabled Reset State: 0x00000000
3	ACPU_MCU_MIF_TIMEOUT_INT_P_HOSTINT_EN	When set, acpu_mcu_mif_timeout_int_p interrupt is enabled Reset State: 0x00000000
2	ACPU_MCU_AHB_ERR_INT_P_HOSTINT_EN	When set, acpu_mcu_ahb_err_int_p interrupt is enabled Reset State: 0x00000000
1	TXP_MCU_TXP_TIMEOUT_INT_P_HOSTINT_EN	When set, txp_mcu_txp_timeout_int_p interrupt is enabled Reset State: 0x00000000
0	TXP_MCU_ERR_INT_HOSTINT_EN	When set, txp_mcu_err_int interrupt is enabled Reset State: 0x00000000

0x30002D4 MCU_COMBINED_HOST_INT_MASKED_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the combined interrupt masked status signals

MCU_COMBINED_HOST_INT_MASKED_STATUS

Bits	Name	Description
23	WLAN_BRIDGE_AHB_ERR_INT_HOSTINT_MASK_STATUS	wlan bridge ahb error interrupt masked status Reset State: 0x00000000
21	BTC_PATTERN_DET_INT_P_HOSTINT_MASK_STATUS	btc_pattern_det_int_p interrupt masked status Reset State: 0x00000000
20	BTC_SCO_INT_P_HOSTINT_MASK_STATUS	btc_sco_int_p interrupt masked status Reset State: 0x00000000
19	TPE_MCU_WRONG_SSN_OR_TID_ERROR_P_HOSTINT_MASK_STATUS	tpe_mcu_wrong_ssn_or_tid_error_p interrupt masked status Reset State: 0x00000000
18	TPE_MCU_BD_BASED_TX_INT_1_P_HOSTINT_MASK_STATUS	tpe_mcu_bd_based_tx_int_1_p interrupt masked status Reset State: 0x00000000

MCU_COMBINED_HOST_INT_MASKED_STATUS (cont.)

Bits	Name	Description
17	TPE_MCU_BD_BASED_TX_INT_0_P_HOSTINT_MASK_STATUS	tpe_mcu_bd_based_tx_int_0_p interrupt masked status Reset State: 0x00000000
16	TPE_MCU_ERROR_VAILD_P_HOSTINT_MASK_STATUS	tpe_mcu_error_vaild_p interrupt masked status Reset State: 0x00000000
15	TPE_MCU_GOT_ACK_FOR_BACK_P_HOSTINT_MASK_STATUS	tpe_mcu_got_ack_for_back_p interrupt masked status Reset State: 0x00000000
14	BMU_MCU_PWRSTATE_DROP_INT_STATUS	bmu_mcu_pwrstate_drop_interrupt masked status Reset State: 0x00000000
13	BMU_MCU_PWRSTATE_CHANGE_INT_STATUS	bmu_mcu_pwrstate_change_interrupt masked status Reset State: 0x00000000
12	BMU_MCU_BTQM_QUEUES_EMPTY_INTERRUPT_HOSTINT_MASK_STATUS	bmu_mcu_btqm_queues_empty_interrupt interrupt masked status Reset State: 0x00000000
11	BMU_MCU_ERR_INT_HOSTINT_MASK_STATUS	bmu_mcu_err_int interrupt masked status Reset State: 0x00000000
10	AHB2PHY_MCU_TIMOUT_ERROR2_HOSTINT_MASK_STATUS	ahb2phy_mcu_timout_error2 interrupt masked status Reset State: 0x00000000
9	AHB2PHY_MCU_TIMOUT_ERROR1_HOSTINT_MASK_STATUS	ahb2phy_mcu_timout_error1 interrupt masked status Reset State: 0x00000000
8	DBR_MCU_GAM_ERR_HOSTINT_MASK_STATUS	dbr_mcu_gam_err interrupt masked status Reset State: 0x00000000
7	DBR_MCU_INCORRECT_LENGTH_ERR_HOSTINT_MASK_STATUS	dbr_mcu_incorrect_length_err interrupt masked status Reset State: 0x00000000
6	DPU_MCU_MICERR_P_HOSTINT_MASK_STATUS	dpu_mcu_micerr_p interrupt masked status Reset State: 0x00000000
5	DPU_MCU_ERRINTR_P_HOSTINT_MASK_STATUS	dpu_mcu_errintr_p interrupt masked status Reset State: 0x00000000
4	BMU_MCU_QUEUE_USAGE_THRESHOLD_INTERRUPT_STATUS	bmu_mcu_queue_usage_threshold_interrupt interrupt status Reset State: 0x00000000
3	ACPU_MCU_MIF_TIMEOUT_INT_P_HOSTINT_MASK_STATUS	acpu_mcu_mif_timeout_int_p interrupt masked status Reset State: 0x00000000
2	ACPU_MCU_AHB_ERR_INT_P_HOSTINT_MASK_STATUS	acpu_mcu_ahb_err_int_p interrupt masked status Reset State: 0x00000000

MCU_COMBINED_HOST_INT_MASKED_STATUS (cont.)

Bits	Name	Description
1	TXP_MCU_TXP_TIMEOUT_INT_P_HOSTINT_MASK_STATUS	txp_mcu_txp_timeout_int_p interrupt masked status Reset State: 0x00000000
0	TXP_MCU_ERR_INT_HOSTINT_MASK_STATUS	txp_mcu_err_int interrupt masked status Reset State: 0x00000000

0x30002D8 MCU_BMU_WQ_HOST_INT_EN

Type: read-write
Reset State: 0x00000000

This register contains the bmu wq data available interrupt enable signals

MCU_BMU_WQ_HOST_INT_EN

Bits	Name	Description
24:2	BMU_WQ_HOST_INT_EN	BMU WQ 2-24 data available Reset State: 0x00000000

0x30002DC MCU_BMU_WQ_HOST_INT_MASKED_STATUS

Type: read-only
Reset State: 0x00000000

This register contains the bmu wq data available interrupt masked status signals

MCU_BMU_WQ_HOST_INT_MASKED_STATUS

Bits	Name	Description
24:2	BMU_WQ_HOST_INT_MASKED_STATUS	BMU WQ 2-24 data available Reset State: 0x00000000

0x30002E0 MCU_MTU_TIMER_INTERRUPT_SOURCE

Type: read-write
Reset State: 0x00000000

This register controls which interrupt, TSF based or timer based, interrupt from MTU is selected

MCU_MTU_TIMER_INTERRUPT_SOURCE

Bits	Name	Description
7	TSF_TIMER7_INT_SELECT	When set, in all interrupt related registers indicating mtu timer7/tsf_timer7 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 7 Reset State: 0x00000000
6	TSF_TIMER6_INT_SELECT	When set, in all interrupt related registers indicating mtu timer6/tsf_timer6 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 6 Reset State: 0x00000000
5	TSF_TIMER5_INT_SELECT	When set, in all interrupt related registers indicating mtu timer5/tsf_timer5 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 5 Reset State: 0x00000000
4	TSF_TIMER4_INT_SELECT	When set, in all interrupt related registers indicating mtu timer4/tsf_timer4 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 4 Reset State: 0x00000000
3	TSF_TIMER3_INT_SELECT	When set, in all interrupt related registers indicating mtu timer3/tsf_timer3 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 3 Reset State: 0x00000000
2	TSF_TIMER2_INT_SELECT	When set, in all interrupt related registers indicating mtu timer2/tsf_timer2 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 2 Reset State: 0x00000000
1	TSF_TIMER1_INT_SELECT	When set, in all interrupt related registers indicating mtu timer1/tsf_timer1 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 1 Reset State: 0x00000000
0	TSF_TIMER0_INT_SELECT	When set, in all interrupt related registers indicating mtu timer0/tsf_timer0 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 0 Reset State: 0x00000000

0x3000300 MCU_BTC_CTRL4

Type: read-write
Reset State: 0x00000000

This register is to set up the pta.

MCU_BTC_CTRL4

Bits	Name	Description
15:0	SCO_INTERRUPT_OFFSET	The btc_sco_int will be trigger when the sco period counter matches the value When MSB is '1', the interrupt is to be triggered the programmed time after the bt_active assertion When MSB is '0', the interrupt is to be triggered the programmed time before the bt_active assertion Reset State: 0x00000000

0x3000304 MCU_BTC_PATTERN_DET1

Type: read-write
Reset State: 0x00000000

This register contains the info for pattern detection

MCU_BTC_PATTERN_DET1

Bits	Name	Description
15:0	DATA	The mask bits for pattern detection. The LSB should be 1. Reset State: 0x00000000

0x3000308 MCU_BTC_PATTERN_DET2

Type: read-write
Reset State: 0x00000000

This register contains the set up for pattern detection

MCU_BTC_PATTERN_DET2

Bits	Name	Description
31:16	BT_PRIORITY_PATTERN_DET	The bt_priority pattern for pattern detection Reset State: 0x00000000
15:0	BT_ACTIVE_PATTERN_DET	The bt_active pattern for pattern detection Reset State: 0x00000000

0x300030C MCU_BTC_PATTERN_HISTORY

Type: read-only
Reset State: 0x00000000

This register contains the history of bt_active and bt_priority

MCU_BTC_PATTERN_HISTORY

Bits	Name	Description
31:16	BT_PRIORITY_HISTORY	The bt_prioroity history Reset State: 0x00000000
15:0	BT_ACTIVE_HISTORY	The bt_active history Reset State: 0x00000000

0x3000310 MCU_BTC_HI_GRANT

Type: read-write
Reset State: 0x00000000

This register counts the stats of bt high priority grant

MCU_BTC_HI_GRANT

Bits	Name	Description
31:20	BT_HI_PRI_GRANT_CNT	BT high priority grant counts Reset State: 0x00000000
19:0	BT_HI_PRI_GRANT_TIME	BT high priority grant time in microseconds. Reset State: 0x00000000

0x3000314 MCU_BTC_LOW_GRANT

Type: read-write
Reset State: 0x00000000

This register contains the stats of bt log priority grant

MCU_BTC_LOW_GRANT

Bits	Name	Description
31:20	BT_LOW_PRI_GRANT_CNT	BT low priority grant counts Reset State: 0x00000000
19:0	BT_LOW_PRI_GRANT_TIME	BT low priority grant time in microseconds. Reset State: 0x00000000

0x3000318 MCU_BTC_REQ_CNT

Type: read-write
Reset State: 0x00000000

This register is to set up the pta.

MCU_BTC_REQ_CNT

Bits	Name	Description
23:12	BT_LO_PRI_REQ_CNT	BT low priority requests. Reset State: 0x00000000
11:0	BT_HI_PRI_REQ_CNT	BT high priority requests. Reset State: 0x00000000

0x300031C MCU_MRCM_CLK_GATE_DISABLE

Type: read-write
Reset State: 0x00003883

This register controls the dynamic clock gating of the wmac modules in mrcm

MCU_MRCM_CLK_GATE_DISABLE

Bits	Name	Description
13	MCU_MRCM_FDAHB_GCU_CLK_GATE_DISABLE	When set, disable fdahb dynamic clock gating Reset State: 0x00000001
12	MCU_MRCM_FDBR_GCU_CLK_GATE_DISABLE	When set, disable fdbr dynamic clock gating Reset State: 0x00000001
11	MCU_MRCM_CBR_GCU_CLK_GATE_DISABLE	When set, disable cbr dynamic clock gating Reset State: 0x00000001
10	MCU_MRCM_TXP_GCU_CLK_GATE_DISABLE	When set, disable txp dynamic clock gating Reset State: 0x00000000
9	MCU_MRCM_CFG_GCU_CLK_GATE_DISABLE	When set, disable cfg dynamic clock gating Reset State: 0x00000000
8	MCU_MRCM_RXP_GCU_CLK_GATE_DISABLE	When set, disable rxp dynamic clock gating Reset State: 0x00000000
7	MCU_MRCM_DBR_GCU_CLK_GATE_DISABLE	When set, disable dbr dynamic clock gating Reset State: 0x00000001
6	MCU_MRCM_BMU_GCU_CLK_GATE_DISABLE	When set, disable bmu dynamic clock gating Reset State: 0x00000000
5	MCU_MRCM_DPU_GCU_CLK_GATE_DISABLE	When set, disable dpu dynamic clock gating Reset State: 0x00000000
4	MCU_MRCM_ADU_GCU_CLK_GATE_DISABLE	When set, disable adu dynamic clock gating Reset State: 0x00000000
3	MCU_MRCM_TPE_GCU_CLK_GATE_DISABLE	When set, disable tpe dynamic clock gating Reset State: 0x00000000

MCU_MRCM_CLK_GATE_DISABLE (cont.)

Bits	Name	Description
2	MCU_MRCM_RPE_GCU_CLK_GATE_DISABLE	When set, disable rpe dynamic clock gating Reset State: 0x00000000
1	MCU_MRCM_CAHB_GCU_CLK_GATE_DISABLE	When set, disable cahb dynamic clock gating Reset State: 0x00000001
0	MCU_MRCM_DAHB_GCU_CLK_GATE_DISABLE	When set, disable dahb dynamic clock gating Reset State: 0x00000001

0x3000320 MCU_TXP_BUSY_CNT

Type: read-write
Reset State: 0x00000000

This register controls the counter counting on the time when txp is busy

MCU_TXP_BUSY_CNT

Bits	Name	Description
23:0	TXP_BUSY_CNT	The time (in unit of us) when txp is busy Reset State: 0x00000000

0x3000324 MCU_WLAN_BRIDGE_CTRL

Type: read-write
Reset State: 0x00000000

This register contains the control signal to the wlan bridges

MCU_WLAN_BRIDGE_CTRL

Bits	Name	Description
23:20	MCU_FDBR_CDAHB2FDAHB_TBUS_SEL	The testbus control signal for fdbr cdahb2fdahb Reset State: 0x00000000
19:16	MCU_FDBR_FDAHB2CDAHB_TBUS_SEL	The testbus control signal for fdbr fdahb2cdahb Reset State: 0x00000000
15:12	MCU_DBR_CDAHB2DAHB_TBUS_SEL	The testbus control signal for dbr dahb2cdahb Reset State: 0x00000000
11:8	MCU_DBR_DAHB2CDAHB_TBUS_SEL	The testbus control signal for dbr dahb2cdahb Reset State: 0x00000000
7:4	MCU_CBR_CCAHB2CAHB_TBUS_SEL	The testbus control signal for cbr ccahb2cahb Reset State: 0x00000000

MCU_WLAN_BRIDGE_CTRL (cont.)

Bits	Name	Description
3:0	MCU_CBR_CAHB2CCAHB_TBUS_SEL	The testbus control signal for cbr cahb2ccahb Reset State: 0x00000000

0x3000328 MCU_WLAN_BRIDGE_AHB_ERR_ADDR

Type: read-only
Reset State: 0x00000000

This register controls the address for which the AHB bus error happened

MCU_WLAN_BRIDGE_AHB_ERR_ADDR

Bits	Name	Description
31:0	ERR_ADDR	The address of the AHB bus error Reset State: 0x00000000

0x300032C MCU_WLAN_BRIDGE_AHB_ERR_SRC

Type: read-only
Reset State: 0x00000000

This register controls the bridge which generate the ahb error

MCU_WLAN_BRIDGE_AHB_ERR_SRC

Bits	Name	Description
5	FDBR_MCU_FDAHB_ERR	The source of the ahb error is fdbr fdahb Reset State: 0x00000000
4	FDBR_MCU_CDAHB_ERR	The source of the ahb error is fdbr cdahb Reset State: 0x00000000
3	DBR_MCU_DAHB_ERR	The source of the ahb error is dbr cahb Reset State: 0x00000000
2	DBR_MCU_CDAHB_ERR	The source of the ahb error is dbr cdahb Reset State: 0x00000000
1	CBR_MCU_CAHB_ERR	The source of the ahb error is cbr cahb Reset State: 0x00000000
0	CBR_MCU_CCAHB_ERR	The source of the ahb error is cbr ccahb Reset State: 0x00000000

16.2.43 mtu

0x3000000 MTU_DIFS_LIMIT_0TO3

Type: read-write
Reset State: 0x1C1C2525

AIFS limit register for 0 to 3 back off engines. The value is in micro seconds Though the name is DIFS, it is used for both DIFS,AIFS. It is up to software to select the value

MTU_DIFS_LIMIT_0TO3

Bits	Name	Description
31:24	SW_MTU_DIFS_LIMIT_3	AIFS value in micro seconds for the back-off engine 3 Reset State: 0x0000001C
23:16	SW_MTU_DIFS_LIMIT_2	AIFS value in micro seconds for the back-off engine 2 Reset State: 0x0000001C
15:8	SW_MTU_DIFS_LIMIT_1	AIFS value in micro seconds for the back-off engine 1 Reset State: 0x00000025
7:0	SW_MTU_DIFS_LIMIT_0	AIFS value in micro seconds for the back-off engine 0 Reset State: 0x00000025

0x3000004 MTU_DIFS_LIMIT_4TO7

Type: read-write
Reset State: 0x1F431616

AIFS limit register for 4 to 7 back off engines. The value is in micro seconds Though the name is DIFS, it is used for both DIFS,AIFS. It is up to software to select the value

MTU_DIFS_LIMIT_4TO7

Bits	Name	Description
31:24	SW_MTU_DIFS_LIMIT_7	AIFS value in micro seconds for the back-off engine 7 Reset State: 0x0000001F
23:16	SW_MTU_DIFS_LIMIT_6	AIFS value in micro seconds for the back-off engine 6 Reset State: 0x00000043
15:8	SW_MTU_DIFS_LIMIT_5	AIFS value in micro seconds for the back-off engine 5 Reset State: 0x00000016
7:0	SW_MTU_DIFS_LIMIT_4	AIFS value in micro seconds for the back-off engine 4 Reset State: 0x00000016

0x3000008 MTU_EIFS_PIFS_SLOT_LIMIT

Type: read-write
Reset State: 0x005A1309

This register contains the limits for eifs, pifs and the slot_limit for data and bcn

MTU_EIFS_PIFS_SLOT_LIMIT

Bits	Name	Description
31:16	SW_MTU_EIFS_LIMIT	EIFS value in micro seconds Reset State: 0x0000005A
15:8	SW_PIFS_LIMIT	PIFS value in micro seconds Reset State: 0x00000013
7:0	SW_MTU_SLOT_LIMIT	slot limit value in micro seconds for all the back-off engines Reset State: 0x00000009

0x300000C MTU_SW_MTU_BCN_SLOT_USEC_SIFS_LIMIT

Type: read-write
Reset State: 0x20007714

This register contains the limits for beacon slot microseconds pulse generation sifs.

MTU_SW_MTU_BCN_SLOT_USEC_SIFS_LIMIT

Bits	Name	Description
31:24	SW_MTU_EARLY_PKT_DET_MISS_LIMIT	sw_mtu_early_pkt_det_miss_limit-- this is used in respons_to(ack_to) logic if the system is expecting a response and if the early pkt_det is HIGH for this limit, an interrupt is generated (old name is cca_miss_limit) Reset State: 0x00000020
15:8	SW_MTU_ONE_USEC_LIMIT	limit value to be programmed to get one microseconds pulse. Basically this is number of clk cycles. this value is loaded into a counter and keep getting decremented at every clk. Reset State: 0x00000077
7:0	SW_MTU_BCN_SLOT_LIMIT	slot limit value in micro seconds for all the back-off engines Reset State: 0x00000014

0x3000010 MTU_SW_MTU_MISC_LIMITS

Type: read-write
Reset State: 0x0C20091E

This register contains the limits for one microseconds puls and for programmable pulse generation the programmable pulse is sued by the timers in one of the modes and the software delay limits

MTU_SW_MTU_MISC_LIMITS

Bits	Name	Description
31:24	SW_MTU_PUSH_MISS_LIMIT	Limit to control the missing_push interrupt. If pkt_det goes high and we don't get a packet from the rxp before this limit, the interrupt will go. Reset State: 0x0000000C
21:16	SW_MTU_TXP_DELAY_LIMIT	TXP is indicated earlier indication of transmission of a pkt. The number in this register indicates the delay between the indication to software and the corresponding flag set that goes to txp The actual delay is the number programmed multiplied by the sw_mtu_txp_delay_pulse_limit multiplied by 8ns Reset State: 0x00000020
11:8	SW_MTU_TXP_DELAY_PULSE_LIMIT	this number dictates the resolution of the delay between the software interrupt and the corresponding txp flag Reset State: 0x00000009
7:0	TIMER_RESOLUTION_LIMIT	A pulse is generated at the end of 'this limit' number of 120mhz pulses. This pulse represents the resolution in timers. Reset State: 0x0000001E

0x3000014 MTU_NAV_CNT

Type: read-write
Reset State: 0x000000FF

This register contains the nav value. NAV is updated by hardware as well as by the software. Software has higher priority over the hardware updates

MTU_NAV_CNT

Bits	Name	Description
31:0	NAV_CNT	This register contains the nav value. The value is in micro seconds Reset State: 0x000000FF

0x3000018 MTU_TSF_TIMER_LO

Type: read-write
Reset State: 0x00000000

This register contains the lower 32 bits of the tsf timer

MTU_TSF_TIMER_LO

Bits	Name	Description
31:0	TSF_TIMER_LO	This register contains the lower 32 bits of tsf timer Reset State: 0x00000000

0x300001C MTU_TSF_TIMER_HI

Type: read-write
Reset State: 0x00000000

This register contains the upper 32 bits of the tsf timer

MTU_TSF_TIMER_HI

Bits	Name	Description
31:0	TSF_TIMER_HI	This register contains the upper 32 bits of tsf timer Reset State: 0x00000000

0x3000020 MTU_TIMER_0

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 0 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_0.

MTU_TIMER_0

Bits	Name	Description
23:0	TIMER_0	This register contains the timer 0 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x3000024 MTU_TIMER_1

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 1 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on

reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_1.

MTU_TIMER_1

Bits	Name	Description
23:0	TIMER_1	This register contains the timer 1 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x3000028 MTU_TIMER_2

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 2 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_2.

MTU_TIMER_2

Bits	Name	Description
23:0	TIMER_2	This register contains the timer 2 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x300002C MTU_TIMER_3

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 3 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_3.

MTU_TIMER_3

Bits	Name	Description
23:0	TIMER_3	This register contains the timer 3 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x3000030 MTU_TIMER_4

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 4 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_4.

MTU_TIMER_4

Bits	Name	Description
23:0	TIMER_4	This register contains the timer 4 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x3000034 MTU_TIMER_5

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 5 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_5.

MTU_TIMER_5

Bits	Name	Description
23:0	TIMER_5	This register contains the timer 5 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x3000038 MTU_TIMER_6

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 6 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_6.

MTU_TIMER_6

Bits	Name	Description
23:0	TIMER_6	This register contains the timer 6 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x300003C MTU_TIMER_7

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 7 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_7.

MTU_TIMER_7

Bits	Name	Description
23:0	TIMER_7	This register contains the timer 7 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x3000040 MTU_TIMER_CONTROL

Type: read-write
Reset State: 0x00000000

This register contains all the controls for the timers.

MTU_TIMER_CONTROL

Bits	Name	Description
31:16	SW_MTU_BASIC_UNIT_SELECT	2 bit for each timer is provided. bit [1:0] for timer 0, bit [3:2] for timer 1... To make these timers more flexible, 3 basic units are provided. if the control =0, the timer will be stopped (this is the only way to disable the counters if the control =01, timer is ++ at every clk if the control =10, timer is ++ at every one us if the control =11, timer is ++ at every programmable pulse. Basically in this mode, the period of the pulse is also controlled by software. Note that this programmable pulse is only one for all the timers Reset State: 0x00000000

MTU_TIMER_CONTROL (cont.)

Bits	Name	Description
11:0	SW_MTU_TIMER_UP_DOWN_CNTRL	1 bit for each timer is provided. bit 0 for timer 0, bit 1 for timer 1... This controls the up/down functionality of the timers. 1-> up, 0->down. Reset State: 0x00000000

0x3000044 MTU_BKOF_CNT_0

Type: read-write
Reset State: 0x00000003

This register contains the bkof_cnt of bkof 0. The units are slot number.In one of the modes, software can control this counter and run the back offs with this value. But this is normal way of operating In this mode, software needs to take care of the random number generation also

MTU_BKOF_CNT_0

Bits	Name	Description
15:0	BKOF_CNT_0	This register contains the bkof_counter value for the back-off 0 In the software controlled mode, (sw_mtu_use_sw_bkof_counter = 1), software will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hardware generates this value = (lfsr_data & sw_mtu_cw_reg) Reset State: 0x00000003

0x3000048 MTU_BKOF_CNT_1

Type: read-write
Reset State: 0x00000004

This register contains the bkof_cnt of bkof 1.In one of the modes, software can control this counter and run the back offs with this value. But this is normal way of operating In this mode, software needs to take care of the random number generation also

MTU_BKOF_CNT_1

Bits	Name	Description
15:0	BKOF_CNT_1	This register contains the bkof_counter value for the back-off 1 In the software controlled mode, (sw_mtu_use_sw_bkof_counter = 1), software will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hardware generates this value = (lfsr_data & sw_mtu_cw_reg) Reset State: 0x00000004

0x300004C MTU_BKOF_CNT_2

Type: read-write
Reset State: 0x00000007

This register contains the bkof_cnt of bkof 2.In one of the modes, software can control this counter and run the back offs with this value. But this is normal way of operating In this mode, software needs to take care of the random number generation also

MTU_BKOF_CNT_2

Bits	Name	Description
15:0	BKOF_CNT_2	This register contains the bkof_counter value for the back-off 2 In the software controlled mode, (sw_mtu_use_sw_bkof_counter = 1), software will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hardware generates this value = (lfsr_data & sw_mtu_cw_reg) Reset State: 0x00000007

0x3000050 MTU_BKOF_CNT_3

Type: read-write
Reset State: 0x00000001

This register contains the bkof_cnt of bkof 3.In one of the modes, software can control this counter and run the back offs with this value. But this is normal way of operating In this mode, software needs to take care of the random number generation also

MTU_BKOF_CNT_3

Bits	Name	Description
15:0	BKOF_CNT_3	This register contains the bkof_counter value for the back-off 4 In the software controlled mode, (sw_mtu_use_sw_bkof_counter = 1), software will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hardware generates this value = (lfsr_data & sw_mtu_cw_reg) Reset State: 0x00000001

0x3000054 MTU_BKOF_CNT_4

Type: read-write
Reset State: 0x00000002

This register contains the bkof_cnt of bkof 4.In one of the modes, software can control this counter and run the back offs with this value. But this is normal way of operating In this mode, software needs to take care of the random number generation also

MTU_BKOF_CNT_4

Bits	Name	Description
15:0	BKOF_CNT_4	This register contains the bkof_counter value for the back-off 4 In the software controlled mode, (sw_mtu_use_sw_bkof_counter = 1), software will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hardware generates this value = (lfsr_data & sw_mtu_cw_reg) Reset State: 0x00000002

0x3000058 MTU_BKOF_CNT_5

Type: read-write
Reset State: 0x00000005

This register contains the bkof_cnt of bkof 5.In one of the modes, software can control this counter and run the back offs with this value. But this is normal way of operating In this mode, software needs to take care of the random number generation also

MTU_BKOF_CNT_5

Bits	Name	Description
15:0	BKOF_CNT_5	This register contains the bkof_counter value for the back-off 5 In the software controlled mode, (sw_mtu_use_sw_bkof_counter = 1), software will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hardware generates this value = (lfsr_data & sw_mtu_cw_reg) Reset State: 0x00000005

0x300005C MTU_BKOF_CNT_6

Type: read-write
Reset State: 0x00000006

This register contains the bkof_cnt of bkof 6.In one of the modes, software can control this counter and run the back offs with this value. But this is normal way of operating In this mode, software needs to take care of the random number generation also

MTU_BKOF_CNT_6

Bits	Name	Description
15:0	BKOF_CNT_6	This register contains the bkof_counter value for the back-off 6 In the software controlled mode, (sw_mtu_use_sw_bkof_counter = 1), software will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hardware generates this value = (lfsr_data & sw_mtu_cw_reg) Reset State: 0x00000006

0x3000060 MTU_BKOF_CNT_7

Type: read-write
Reset State: 0x00000000

This register contains the bkof_cnt of bkof 7.In one of the modes, software can control this counter and run the back offs with this value. But this is normal way of operating In this mode, software needs to take care of the random number generation also

MTU_BKOF_CNT_7

Bits	Name	Description
15:0	BKOF_CNT_7	This register contains the bkof_counter value for the back-off 7 In the software controlled mode, (sw_mtu_use_sw_bkof_counter = 1), software will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hardware generates this value = (lfsr_data & sw_mtu_cw_reg) Reset State: 0x00000000

0x3000064 MTU_BKOF_CONTROL

Type: read-write
Reset State: 0xFF000000

This register contains all the controls for the back-off engines.

MTU_BKOF_CONTROL

Bits	Name	Description
31:24	SW_MTU_SUPPRESS_COLLISION_INT	1 bit for each back off is provided. bit 0 for back 0, bit 1 for back 1... this bit is set to 1, the back off will not send interrupt to software for collision case (int status = 2'b11) warm up also will not be generated Reset State: 0x000000FF
23:16	SW_MTU_QUEUE_DATA_AVAIL	1 bit for each back is provided. bit 0 for back 0, bit 1 for back 1... data avail bits from the software. Unless this bit is set, software won't get interrupt (irrespective of the status of back-off. Reset State: 0x00000000
15:8	SW_MTU_STALL_BKOF	1 bit for each back is provided. bit 0 for back 0, bit 1 for back 1... if this bit is set, the corresponding back-off will be stalled. Basically the back-off counter -- will be stopped. This is used to stall all the back-offs while beacon is supposed to be sent or for any other reasons. Reset State: 0x00000000
7:0	SW_MTU_USE_SW_BKOF_COUNTER	1 bit for each back is provided. bit 0 for back 0, bit 1 for back 1... if this bit is set, the back_off counter is set by sw. Otherwise, hardware will use the cw_reg &lfsdr Reset State: 0x00000000

0x3000068 MTU_CW_REG_CONTROL_FOR_BACKOFF_0

Type: read-write
Reset State: 0x00000007

This register contains the cw_reg value that needs to be used by hardware . For backoff engine_0 This register also has the control bit that initiates the back-off after the hardware issued an interrupt to software for its attention.

MTU_CW_REG_CONTROL_FOR_BACKOFF_0

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VALID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hardware update will take place Reset State: 0x00000000
18:17	SW_MTU_CW_ACTION_0	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hardware does the boundary checks and resets the cw if it reaches the cw_max automatically Reset State: 0x00000000
16	SW_MTU_WAIT_DONE_P_0	This bit is write only. The hardware will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine Reset State: 0x00000000
15:0	SW_MTU_CW_REG_0	This register contains the cw_reg value for the back-off 0 Reset State: 0x00000007

0x300006C MTU_CW_REG_CONTROL_FOR_BACKOFF_1

Type: read-write
Reset State: 0x00000007

This register contains the cw_reg value that needs to be used by hardware . For backoff engine_1 This register also has the control bit that initiates the back-off after the hardware issued an interrupt to software for its attention.

MTU_CW_REG_CONTROL_FOR_BACKOFF_1

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VALID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hardware update will take place Reset State: 0x00000000

MTU_CW_REG_CONTROL_FOR_BACKOFF_1 (cont.)

Bits	Name	Description
18:17	SW_MTU_CW_ACTION_1	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hardware does the boundary checks and resets the cw if it reaches the cw_max automatically Reset State: 0x00000000
16	SW_MTU_WAIT_DONE_P_1	This bit is write only. The hardware will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine Reset State: 0x00000000
15:0	SW_MTU_CW_REG_1	This register contains the cw_reg value for the back-off 1 Reset State: 0x00000007

0x3000070 MTU_CW_REG_CONTROL_FOR_BACKOFF_2

Type: read-write
Reset State: 0x00000007

This register contains the cw_reg value that needs to be used by hardware . For backoff engine_2 This register also has the control bit that initiates the back-off after the hardware issued an interrupt to software for its attention.

MTU_CW_REG_CONTROL_FOR_BACKOFF_2

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VALID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hardware update will take place Reset State: 0x00000000
18:17	SW_MTU_CW_ACTION_2	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hardware does the boundary checks and resets the cw if it reaches the cw_max automatically Reset State: 0x00000000
16	SW_MTU_WAIT_DONE_P_2	This bit is write only. The hardware will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine Reset State: 0x00000000
15:0	SW_MTU_CW_REG_2	This register contains the cw_reg value for the back-off 2 Reset State: 0x00000007

0x3000074 MTU_CW_REG_CONTROL_FOR_BACKOFF_3

Type: read-write
Reset State: 0x00000007

This register contains the cw_reg value that needs to be used by hardware . For backoff engine_3 This register also has the control bit that initiates the back-off after the hardware issued an interrupt to software for its attention.

MTU_CW_REG_CONTROL_FOR_BACKOFF_3

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VALID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hardware update will take place Reset State: 0x00000000
18:17	SW_MTU_CW_ACTION_3	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hardware does the boundary checks and resets the cw if it reaches the cw_max automatically Reset State: 0x00000000
16	SW_MTU_WAIT_DONE_P_3	This bit is write only. The hardware will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine Reset State: 0x00000000
15:0	SW_MTU_CW_REG_3	This register contains the cw_reg value for the back-off 3 Reset State: 0x00000007

0x3000078 MTU_CW_REG_CONTROL_FOR_BACKOFF_4

Type: read-write
Reset State: 0x00000007

This register contains the cw_reg value that needs to be used by hardware. For backoff engine_4 This register also has the control bit that initiates the back-off after the hardware issued an interrupt to software for its attention.

MTU_CW_REG_CONTROL_FOR_BACKOFF_4

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VALID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hardware update will take place Reset State: 0x00000000

MTU_CW_REG_CONTROL_FOR_BACKOFF_4 (cont.)

Bits	Name	Description
18:17	SW_MTU_CW_ACTION_4	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hardware does the boundary checks and resets the cw if it reaches the cw_max automatically Reset State: 0x00000000
16	SW_MTU_WAIT_DONE_P_4	This bit is write only. The hardware will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine Reset State: 0x00000000
15:0	SW_MTU_CW_REG_4	This register contains the cw_reg value for the back-off 4 Reset State: 0x00000007

0x300007C MTU_CW_REG_CONTROL_FOR_BACKOFF_5

Type: read-write
Reset State: 0x00000007

This register contains the cw_reg value that needs to be used by hardware . For backoff engine_5 This register also has the control bit that initiates the back-off after the hardware issued an interrupt to software for its attention.

MTU_CW_REG_CONTROL_FOR_BACKOFF_5

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VALID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hardware update will take place Reset State: 0x00000000
18:17	SW_MTU_CW_ACTION_5	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hardware does the boundary checks and resets the cw if it reaches the cw_max automatically Reset State: 0x00000000
16	SW_MTU_WAIT_DONE_P_5	This bit is write only. The hardware will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine Reset State: 0x00000000
15:0	SW_MTU_CW_REG_5	This register contains the cw_reg value for the back-off 5 Reset State: 0x00000007

0x3000080 MTU_CW_REG_CONTROL_FOR_BACKOFF_6

Type: read-write
Reset State: 0x00000007

This register contains the cw_reg value that needs to be used by hardware . For backoff engine_6 This register also has the control bit that initiates the back-off after the hardware issued an interrupt to software for its attention.

MTU_CW_REG_CONTROL_FOR_BACKOFF_6

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VALID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hardware update will take place Reset State: 0x00000000
18:17	SW_MTU_CW_ACTION_6	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hardware does the boundary checks and resets the cw if it reaches the cw_max automatically Reset State: 0x00000000
16	SW_MTU_WAIT_DONE_P_6	This bit is write only. The hardware will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine Reset State: 0x00000000
15:0	SW_MTU_CW_REG_6	This register contains the cw_reg value for the back-off 6 Reset State: 0x00000007

0x3000084 MTU_CW_REG_CONTROL_FOR_BACKOFF_7

Type: read-write
Reset State: 0x00000007

This register contains the cw_reg value that needs to be used by hardware . For backoff engine_7 This register also has the control bit that initiates the back-off after the hardware issued an interrupt to software for its attention.

MTU_CW_REG_CONTROL_FOR_BACKOFF_7

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VALID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hardware update will take place Reset State: 0x00000000

MTU_CW_REG_CONTROL_FOR_BACKOFF_7 (cont.)

Bits	Name	Description
18:17	SW_MTU_CW_ACTION_7	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hardware does the boundary checks and resets the cw if it reaches the cw_max automatically Reset State: 0x00000000
16	SW_MTU_WAIT_DONE_P_7	This bit is write only. The hardware will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine Reset State: 0x00000000
15:0	SW_MTU_CW_REG_7	This register contains the cw_reg value for the back-off 7 Reset State: 0x00000007

0x3000088 MTU_MTU_INTERRUPT_STATUS

Type: read-write
Reset State: 0x00000000

This register contains the status of all the interrupts that are generated by mtu. Basically every interrupt has a corresponding register bit which will be set on sending interrupt pulse to the interrupt module and this bit is reset by writing '1' to it. software has higher priority over hardware

MTU_MTU_INTERRUPT_STATUS

Bits	Name	Description
31	SECONDARY_CCA_TO	the secondary_cca_to is sampled and software can read its status through this register Reset State: 0x00000000
30	SIFS_TO	the sifs_to is sampled and software can read its status through this register Reset State: 0x00000000
29	PIFS_TO	the pifs_to is sampled and software can read its status through this register Reset State: 0x00000000
28	MTU_MCU_WATCH_DOG_ENABLE_DISABL_ERROR	if software tries to write wrong combinations to the watch dog enable disable bits this interrupt will be generated Reset State: 0x00000000
27	MTU_MCU_WATCH_DOG_PROTECTION_ERROR	if software tries to write to the watch dog register and if the protection vector matches, this interrupt will be generated. Reset State: 0x00000000
26:24	MTU_MCU_WATCH_DOG_TIMER_FLAG	watch dog interrupt flags. 24 is for thr0, bit 25 is for thr1, bit 26 is fr thr3 Reset State: 0x00000000

MTU_MTU_INTERRUPT_STATUS (cont.)

Bits	Name	Description
23:16	MTU_MCU_TSF_INT_FLAG	8 registers for 8 tsf based match register interrupts. bit 0 for match 0, 1 for match 1 ... Reset State: 0x00000000
15:8	MTU_MCU_BKOF_INT_FLAG	8 registers for 8 back off interrupts. bit 0 for timer 0, 1 for timer 1 ... Reset State: 0x00000000
7:0	MTU_MCU_TIMER_INT_FLAG	8 registers for 8 timer interrupts. bit 0 for timer 0, 1 for timer 1 ... Reset State: 0x00000000

0x300008C MTU_SW_MATCH_REGISTER_0

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 0 in up mode. Basically when the timer is operated in up mode, when the Timer 0 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_0

Bits	Name	Description
31:30	SW_TSF_SEL_0	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_0	This register contains the match value for tsf based counter interrupt 0, timer 0 (in up mode) Reset State: 0x00000EFF

0x3000090 MTU_SW_MATCH_REGISTER_1

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 1 in up mode. Basically when the timer is operated in up mode, when the Timer 1 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_1

Bits	Name	Description
31:30	SW_TSF_SEL_1	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_1	This register contains the match value for tsf based counter interrupt 1, timer 1 (in up mode) Reset State: 0x00000EFF

0x3000094 MTU_SW_MATCH_REGISTER_2

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 2 in up mode. Basically when the timer is operated in up mode, when the Timer 2 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_2

Bits	Name	Description
31:30	SW_TSF_SEL_2	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_2	This register contains the match value for tsf based counter interrupt 2, timer 2 (in up mode) Reset State: 0x00000EFF

0x3000098 MTU_SW_MATCH_REGISTER_3

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 3 in up mode. Basically when the timer is operated in up mode, when the Timer 3 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_3

Bits	Name	Description
31:30	SW_TSF_SEL_3	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_3	This register contains the match value for tsf based counter interrupt 3, timer 3 (in up mode) Reset State: 0x00000EFF

0x300009C MTU_SW_MATCH_REGISTER_4

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 4 in up mode. Basically when the timer is operated in up mode, when the Timer 4 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_4

Bits	Name	Description
31:30	SW_TSF_SEL_4	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_4	This register contains the match value for tsf based counter interrupt 4, timer 4 (in up mode) Reset State: 0x00000EFF

0x30000A0 MTU_SW_MATCH_REGISTER_5

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 5 in up mode. Basically when the timer is operated in up mode, when the Timer 5 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_5

Bits	Name	Description
31:30	SW_TSF_SEL_5	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_5	This register contains the match value for tsf based counter interrupt 5, timer 5 (in up mode) Reset State: 0x00000EFF

0x30000A4 MTU_SW_MATCH_REGISTER_6

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 6 in up mode. Basically when the timer is operated in up mode, when the Timer 6 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_6

Bits	Name	Description
31:30	SW_TSF_SEL_6	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_6	This register contains the match value for tsf based counter interrupt 6, timer 6 (in up mode) Reset State: 0x00000EFF

0x30000A8 MTU_SW_MATCH_REGISTER_7

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 7 in up mode. Basically when the timer is operated in up mode, when the Timer 7 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_7

Bits	Name	Description
31:30	SW_TSF_SEL_7	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_7	This register contains the match value for tsf based counter interrupt 7, timer 7 (in up mode) Reset State: 0x00000EFF

0x30000AC MTU_SW_CW_MIN_CW_MAX_0

Type: read-write
Reset State: 0x03FF000F

Contains the cw_min and cw_max for back-off 0

MTU_SW_CW_MIN_CW_MAX_0

Bits	Name	Description
31:16	SW_CW_MAX_0	This register contains the cw_max for back-off 0. The default is 7ff. Any suggested value is welcome Reset State: 0x000003FF
15:0	SW_CW_MIN_0	This register contains the cw_min for back-off 0. The default is 3f. Any suggested value is welcome Reset State: 0x0000000F

0x30000B0 MTU_SW_CW_MIN_CW_MAX_1

Type: read-write
Reset State: 0x03FF000F

Contains the cw_min and cw_max for back-off 1

MTU_SW_CW_MIN_CW_MAX_1

Bits	Name	Description
31:16	SW_CW_MAX_1	This register contains the cw_max for back-off 1. The default is 7ff. Any suggested value is welcome Reset State: 0x000003FF
15:0	SW_CW_MIN_1	This register contains the cw_min for back-off 1. The default is 3f. Any suggested value is welcome Reset State: 0x0000000F

0x30000B4 MTU_SW_CW_MIN_CW_MAX_2

Type: read-write
Reset State: 0x00070003

Contains the cw_min and cw_max for back-off 2

MTU_SW_CW_MIN_CW_MAX_2

Bits	Name	Description
31:16	SW_CW_MAX_2	This register contains the cw_max for back-off 2. The default is 7ff. Any suggested value is welcome Reset State: 0x00000007
15:0	SW_CW_MIN_2	This register contains the cw_min for back-off 2. The default is 3f. Any suggested value is welcome Reset State: 0x00000003

0x30000B8 MTU_SW_CW_MIN_CW_MAX_3

Type: read-write
Reset State: 0x00070003

Contains the cw_min and cw_max for back-off 3

MTU_SW_CW_MIN_CW_MAX_3

Bits	Name	Description
31:16	SW_CW_MAX_3	This register contains the cw_max for back-off 3. The default is 7ff. Any suggested value is welcome Reset State: 0x00000007
15:0	SW_CW_MIN_3	This register contains the cw_min for back-off 3. The default is 3f. Any suggested value is welcome Reset State: 0x00000003

0x30000BC MTU_SW_CW_MIN_CW_MAX_4

Type: read-write
Reset State: 0x00070003

Contains the cw_min and cw_max for back-off 4

MTU_SW_CW_MIN_CW_MAX_4

Bits	Name	Description
31:16	SW_CW_MAX_4	This register contains the cw_max for back-off 4. The default is 7ff. Any suggested value is welcome Reset State: 0x00000007
15:0	SW_CW_MIN_4	This register contains the cw_min for back-off 4. The default is 3f. Any suggested value is welcome Reset State: 0x00000003

0x30000C0 MTU_SW_CW_MIN_CW_MAX_5

Type: read-write
Reset State: 0x000F0007

Contains the cw_min and cw_max for back-off 5

MTU_SW_CW_MIN_CW_MAX_5

Bits	Name	Description
31:16	SW_CW_MAX_5	This register contains the cw_max for back-off 5. The default is 7ff. Any suggested value is welcome Reset State: 0x0000000F
15:0	SW_CW_MIN_5	This register contains the cw_min for back-off 5. The default is 3f. Any suggested value is welcome Reset State: 0x00000007

0x30000C4 MTU_SW_CW_MIN_CW_MAX_6

Type: read-write
Reset State: 0x03FF000F

Contains the cw_min and cw_max for back-off 6

MTU_SW_CW_MIN_CW_MAX_6

Bits	Name	Description
31:16	SW_CW_MAX_6	This register contains the cw_max for back-off 6. The default is 7ff. Any suggested value is welcome Reset State: 0x000003FF
15:0	SW_CW_MIN_6	This register contains the cw_min for back-off 6. The default is 3f. Any suggested value is welcome Reset State: 0x0000000F

0x30000C8 MTU_SW_CW_MIN_CW_MAX_7

Type: read-write
Reset State: 0x03FF000F

Contains the cw_min and cw_max for back-off 7

MTU_SW_CW_MIN_CW_MAX_7

Bits	Name	Description
31:16	SW_CW_MAX_7	This register contains the cw_max for back-off 7. The default is 7ff. Any suggested value is welcome Reset State: 0x000003FF
15:0	SW_CW_MIN_7	This register contains the cw_min for back-off 7. The default is 3f. Any suggested value is welcome Reset State: 0x0000000F

0x30000CC MTU_CCA_COUNTER0

Type: read-write
Reset State: 0x00000000

This register contains the primary cca count. The primary cca is sampled at every us and incremented if the cca is LOW.

MTU_CCA_COUNTER0

Bits	Name	Description
31:0	CCA_COUNTER0	contains the cca primary counter. Software write has higher priority over hardware update Reset State: 0x00000000

0x30000D0 MTU_CCA_COUNTER1

Type: read-write
Reset State: 0x00000000

This register contains the cca count. The selection to the cca used by this counter is programmable.

MTU_CCA_COUNTER1

Bits	Name	Description
31:0	CCA_COUNTER1	Depending on the cca_count1_sel-- a programmable bit, the enable to this counter is selected as shown below. Software write has higher priority over hardware update cca_term0 =

0x30000D4 MTU_CCA_COUNTER2

Type: read-write
Reset State: 0x00000000

This register contains the cca count. The selection to the cca used by this counter is programmable.

MTU_CCA_COUNTER2

Bits	Name	Description
31:0	CCA_COUNTER2	Depending on the cca_count2_sel-- a programmable bit, the enable to this counter is selected as shown below. Software write has higher priority over hardware update 3'b000: cca_count2_en_temp =

0x30000D8 MTU_WATCH_DOG_TIMER

Type: read-write
Reset State: 0x00000000

This is watch dog timer register. Basically, when the watch dog timer is enabled, this timer keeps ++ at every us. Once it reaches watch dog thr0, an interrupt is generated when it reaches thr1 another interrupt is generated (higher priority). On reaching thr3, another higher priority interrupt is generated. Typically this is used to reset the chip.

MTU_WATCH_DOG_TIMER

Bits	Name	Description
31:30	WATCH_DOG_TIMER_ENABLE_DISABLE	Watch dog timer and the corresponding interrupts are enabled only when these bits are 10. 01 is disable. Any other combination will not be accepted and if software writes 00 or 11, the status is maintained. We may have an interrupt to this condition as well as for any writes to the watch dog register without protection vector match. Reset State: 0x00000000
29:24	WATCH_DOG_TIMER_PROTECTION_VECTOR	This is write-only register. When it is read, ZEROs are returned. Writes to the watch dog register can happen (including the enable/disable) only when this field matches the watch_dog_thr0[25:24],thr1[25:24],thr2[25:24]. Reset State: 0x00000000
23:0	WATCH_DOG_TIMER	if it is enabled, it keeps ++ at every us. Software can write to it only when the protection vector matches the concat of the 2-bit protection bits from the watch dog threshold register. The protection vector cannot be 00 or 3f. Reset State: 0x00000000

0x30000DC MTU_WATCH_DOG_THR0

Type: read-write
Reset State: 0x00000000

This register contains thr0 for watch dog.

MTU_WATCH_DOG_THR0

Bits	Name	Description
27:26	THR0_PROTECTION_FIELD	This register is writable only when this field is 11. Reset State: 0x00000000
25:24	WATCH_DOG_PROTECTION_VECTOR0	2 bits of the protection vector of watch_dog_timer. Reset State: 0x00000000
23:0	WATCH_DOG_THR0	Contains the watch dog thr0. It is writable by software only when its protection field =11. Reset State: 0x00000000

0x30000E0 MTU_WATCH_DOG_THR1

Type: read-write
Reset State: 0x00000000

This register contains thr1 for watch dog.

MTU_WATCH_DOG_THR1

Bits	Name	Description
27:26	THR1_PROTECTION_FIELD	This register is writable only when this field is 10. Reset State: 0x00000000
25:24	WATCH_DOG_PROTECTION_VECTOR1	2 bits of the protection vector of watch_dog_timer. Reset State: 0x00000000
23:0	WATCH_DOG_THR1	Contains the watch dog thr1. It is writable by software only when its protection field =10. Reset State: 0x00000000

0x30000E4 MTU_WATCH_DOG_THR2

Type: read-write
Reset State: 0x00000000

This register contains thr2 for watch dog.

MTU_WATCH_DOG_THR2

Bits	Name	Description
27:26	THR2_PROTECTION_FIELD	This register is writable only when this field is 01 Reset State: 0x00000000
25:24	WATCH_DOG_PROTECTION_VECTOR2	2 bits of the protection vector of watch_dog_timer Reset State: 0x00000000
23:0	WATCH_DOG_THR2	Contains the watch dog thr2. It is writable by software only when its protection field =01 Reset State: 0x00000000

0x30000E8 MTU_BKOF_SW_INT_TYPE

Type: read-write
Reset State: 0x00000000

This register contains the status of the interrupt type for the back off engines.

MTU_BKOF_SW_INT_TYPE

Bits	Name	Description
15:0	BKOF_SW_INT_TYPE	Contains the type of the interrupt rom the back off engines. 1:0 is bkoff 0, 3:2 for bkoff 1 and so on. Value 2'b00: No interrupt pending, or cleared by software Value 2'b01: Backoff engine expired successfully (no collision with a higher priority backoff engine) Value 2'b10: There was in internal collision between this and a higher priority backoff engine. software needs to re-initialize the backoff engine. Value 2'b11: Data available got programmed after the backoff engine had already run and reached the BKOFF_DONE state. At the moment of programming Data available, the CCA was low. software needs to re-program the backoff engine. This is read-only register. But any write 1 to this register will clear the status for the corresponding back-off. For example, write of a 1 to bit 0 will clear 1:0, write of a 1 to bit 1 clears the 3:2 and so on. Only 11:0 are enabled for write operation, but will also automatically clear on a write. Corresponds to reset_bkof_sw_int_type_p in RTL Reset State: 0x00000000

0x30000EC MTU_CCA_CONTROL_REG

Type: read-write
Reset State: 0x00000000

This register contains the controls to select the cca that needs to be used for a particular back_off engine.

MTU_CCA_CONTROL_REG

Bits	Name	Description
31	SW_MTU_BKOF_GOTO_IDLE	If the back-offs are stuck for some reason, this bit will take the back-offs to idle We see a hang in the lab on a netlist that has no test buses, but it could not be reproduced. To be on safe side, this bit is added. Reset State: 0x00000000
30	SW_MTU_PIFS_RAW_CCA_SEL_NEW	Work with bit[25:24] to select the cca to be used for pifs. Reset State: 0x00000000
29	SW_MTU_CCA_FLAG	This is software controlled cca. If the sw_mtu_sel is 11, the corresponding back off engine uses this register bit as its cca. Reset State: 0x00000000
28:26	SW_MTU_PIFS_FINAL_CCA_SEL	We want to follow the same strategy we followed for back-off cca. Since the last_slot_time doesn't make sense for pifs, we kept the last_slot_time corresponds to back-off 0 000 -- raw CCA 001 -- (raw CCA && early_pktdet_n) 010 -- (raw CCA && pktdet_n) 011 -- early_pktdet_n 100 -- pktdet_n 101 -- (raw CCA && (early_pktdet_n ||
25:24	SW_MTU_PIFS_RAW_CCA_SEL	It was not clear which cca to be used for pifs. So a programmability is provided for this also. If bit[30] = 0, 00 selects primarcy cca, 01 selects secondary cca, 10 selects combined cca(basically and of both primary and secondary) 11 select the sw_mtu_cca_flag which is software config register bit. if bit[30] = 1, 00 selects tertiary cca, 01 selects quaternary cca, 10 selects all cca (basically and of primary, secondary, tertiary and quaternary) Final cca selection is done based on the next 3 bits-- sw_mtu_pifs_final_cca_sel Reset State: 0x00000000
23:16	SW_MTU_EIFS_CCA_SEL	1 bit for each back off. It was not clear which ccacto use for eifs. So a programmability is provided such that either the same cca that is used for difs is used for eifs also or just primary cca is selected. If this bit is 0, the primary cca is used for eifs (for the corresponding back off). Otherwise the cca that is used for the back off is used for eifs also. Reset State: 0x00000000
15:0	SW_MTU_RAW_CCA_SEL	2 bits for each back off. 1:0 for back off 0, 3:2 back off 1, and so on, if the corresponding mtu_cca_control.sw_mtu_raw_cca_sel=0, 00 selects primarcy cca, 01 selects secondary cca, 10 selects combined cca (basically and of both primary and secondary) 11 selects the sw_mtu_cca_flag, which is software config register bit, if the corresponding mtu_cca_control.sw_mtu_raw_cca_sel=1, 00 selects tertiary cca, 01 selects quaternary cca, 10 selects all cca(basically and of primary, secondary, tertiary and quaternary) Reset State: 0x00000000

0x30000F0 MTU_TIMER_8

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 8 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrup on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_8.

MTU_TIMER_8

Bits	Name	Description
23:0	TIMER_8	This register contains the timer 8 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x30000F4 MTU_TIMER_9

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 9 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrup on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_9.

MTU_TIMER_9

Bits	Name	Description
23:0	TIMER_9	This register contains the timer 9 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x30000F8 MTU_TIMER_10

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer c value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrup on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_10.

MTU_TIMER_10

Bits	Name	Description
23:0	TIMER_10	This register contains the timer 10 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x30000FC MTU_TIMER_11

Type: read-write
Reset State: 0x00EFFFFF

This register contains the timer 11 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrup on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_11.

MTU_TIMER_11

Bits	Name	Description
23:0	TIMER_11	This register contains the timer 11 value. This timer is rd/writable,up/down Reset State: 0x00EFFFFF

0x3000110 MTU_SW_MATCH_REGISTER_8

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 8 in up mode. Basically when the timer is operated in up mode, when the Timer 8 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_8

Bits	Name	Description
31:30	SW_TSF_SEL_8	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_8	This register contains the match value for tsf based counter interrupt 8, timer 8 (in up mode) Reset State: 0x00000EFF

0x3000114 MTU_SW_MATCH_REGISTER_9

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 9 in up mode. Basically when the timer is operated in up mode, when the Timer 9 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_9

Bits	Name	Description
31:30	SW_TSF_SEL_9	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_9	This register contains the match value for tsf based counter interrupt 9, timer 9 (in up mode) Reset State: 0x00000EFF

0x3000118 MTU_SW_MATCH_REGISTER_10

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 10 in up mode. Basically when the timer is operated in up mode, when the Timer 10 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_10

Bits	Name	Description
31:30	SW_TSF_SEL_10	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_10	This register contains the match value for tsf based counter interrupt 10, timer 10 (in up mode) Reset State: 0x00000EFF

0x300011C MTU_SW_MATCH_REGISTER_11

Type: read-write
Reset State: 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 11 in up mode. Basically when the timer is operated in up mode, when the Timer 11 reaches this value, an interrupt is generated

MTU_SW_MATCH_REGISTER_11

Bits	Name	Description
31:30	SW_TSF_SEL_11	To select the tsf will trigger the interrupt when the timer value reaches 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
23:0	SW_MATCH_REGISTER_11	This register contains the match value for tsf based counter interrupt 11, timer 11 (in up mode) Reset State: 0x00000EFF

0x3000134 MTU_BKOF_CONTROL2

Type: read-write
Reset State: 0x000E0000

This register contains all the controls for the back-off engines.

MTU_BKOF_CONTROL2

Bits	Name	Description
31	SW_MTU_CONSIDER_CSI_BKOF_EN	When set, csi bkof enable signal from MTU for hardware controlled sending CSI frame in calibration and delayed explicit beamform will be enabled Reset State: 0x00000000
30	SW_MTU_CONSIDER_QOSNULL_BKOF_EN	When set, qosnull bkof enable signal from MTU for hardware controlled sending qosnull frame in implicit beamform will be enabled Reset State: 0x00000000
19:16	SW_MTU_PKT_DET_TO_CNT_THR	pkt_det_to_cnt is compared with this register and generates a signal. This is used by tpe to start requesting BA. Basically allow tpe to get the bitmap updated. Reset State: 0x0000000E

0x3000138 MTU_CCA_CONTROL_REG2

Type: read-write
Reset State: 0x00000000

This register contains the controls to select the cca that needs to be used for a particular back_off engine.

MTU_CCA_CONTROL_REG2

Bits	Name	Description
19	CONSIDER_RX_CCA_ONLY	since the cca will be asserted even for the tx, we may want to ave count of only rx busy if this bit is set, the cca counters will be ++ only if txp_mtu_phytx_idle txp_mtu_phytx_idle =1 Reset State: 0x00000000
18:16	CCA_COUNT2_SEL	these bits select the count enable to the cca_count2 3'b000: cca_count2_en_temp = cca_term0; 3'b001: cca_count2_en_temp = cca_term1; 3'b010: cca_count2_en_temp = cca_term2; 3'b011: cca_count2_en_temp = cca_term3; 3'b100: cca_count2_en_temp = cca_term4; 3'b101: cca_count2_en_temp = cca_term5; 3'b110: cca_count2_en_temp = cca_term6; 3'b111: cca_count2_en_temp = cca_term7; cca_count2_en_final = consider_rx_cca_only ? (cca_count2_en_temp &
14:12	CCA_COUNT1_SEL	these bits select the count enable to the cca_count1 3'b000: cca_count1_en_temp = cca_term0; 3'b001: cca_count1_en_temp = cca_term1; 3'b010: cca_count1_en_temp = cca_term2; 3'b011: cca_count1_en_temp = cca_term3; 3'b100: cca_count1_en_temp = cca_term4; 3'b101: cca_count1_en_temp = cca_term5; 3'b110: cca_count1_en_temp = cca_term6; 3'b111: cca_count1_en_temp = cca_term7; cca_count1_en_final = consider_rx_cca_only ? (cca_count1_en_temp &

0x300014C MTU_TIMER_CONTROL11TO8

Type: read-write
Reset State: 0x00000000

This register contains all the controls for the timers 11 to 8.

MTU_TIMER_CONTROL11TO8

Bits	Name	Description
19:8	SW_MTU_CONTINUOUS_VALID	One bit for timer. if this bit is set, the timer will be loaded either with zero or the corresponding match register(depending on up/down). Basically if this bit is set the timer works as divided by N Reset State: 0x00000000

MTU_TIMER_CONTROL11TO8 (cont.)

Bits	Name	Description
7:0	SW_MTU_BASIC_UNIT_SELECT11TO8	2 bit for each timer is provided. bit [1:0] for timer 0, bit [3:2] for timer 1... To make these timers more flexible, 3 basic units are provided. if the control =0, the timer will be stopped (this is the only way to disable the counters if the control =01, timer is ++ at every clk if the control =10, timer is ++ at every one us if the control =11, timer is ++ at every programmable pulse. Basically in this mode, the period of the pulse is also controlled by software. Note that this programmable pulse is only one for all the timers Reset State: 0x00000000

0x3000150 MTU_MTU_GLOBAL_CONTROL

Type: read-write
Reset State: 0x19000000

Contains the global controls for mtu

MTU_MTU_GLOBAL_CONTROL

Bits	Name	Description
31:24	SW_MTU_SECONDARY_CCA_LIMIT	Whenever the secondary cca is hig for this limit (in us) time, mtu_mcu_secondary_cca_to will be generated. This functionality is exactly similar to pifs to except that the cca used is always secondary Reset State: 0x00000019
7:0	SW_MTU_SUPPRESS_RF_WARMUP	If this bit is set, mtu will not send rf_warmup to txp Any suggested value is welcome bit field [19:12] sw_mtu_suppress_rf_warmup_for_collision configuration 8'b0 bit fieldComment If this bit is set, mtu will not send rf_warmup to txp for the collision case Any suggested value is welcome Reset State: 0x00000000

0x3000154 MTU_MTU_INTERRUPT_STATUS11TO8

Type: read-write
Reset State: 0x00000000

This register contains the status of all the interrupts that are generated by mtu Basically every interrupt has a corresponding register bit which will be set on sending interrupt pulse to the interrupt module and this bit is reset by writing '1' to it. software has higher priority over hardware

MTU_MTU_INTERRUPT_STATUS11TO8

Bits	Name	Description
31:21	TXP_SIFS_DELAY_CNT_FORINNAV	The internal count is exposed. Basically this counter keeps ++ after the rising edge of pkt_det. The resolution is one clock (it is 25ns in 40Mhz mode, 12.5 if mac is selected of 80Mhz) Reset State: 0x00000000
11:8	MTU_MCU_TSF_INT_FLAG11TO8	4 registers for upper 4 tsf based match register interrupts. bit 0 for match 0, 1 for match 1 ... Reset State: 0x00000000
7:4	MTU_MCU_BKOF_INT_FLAG11TO8	4 registers for upper 4 back off interrupts. bit 0 for timer 0, 1 for timer 1 ... Reset State: 0x00000000
3:0	MTU_MCU_TIMER_INT_FLAG11TO8	4 registers for upper 4 timer interrupts. bit 0 for timer 0, 1 for timer 1 ... Reset State: 0x00000000

0x3000158 MTU_MTU_GLOBAL_CONTROL2

Type: read-write
Reset State: 0x000000EE

Contains the global controls for mtu

MTU_MTU_GLOBAL_CONTROL2

Bits	Name	Description
10	SW_MTU_CONSIDER_SKIP_DIFS	if this bit is set, the skip_difs from the rxp is used.. to take care of any bug in other module. Since this is not a main line function, better to have a protection Reset State: 0x00000000
9	SW_MTU_SELECT_LATE_PKT_DET_FOR_ACK_TO	if this bit is set, the late pkt_det is used for ack_to. By default the early_pkt-det should be used. This bit should never be set in the system. The configuration is provided for unknown flexibility.. Should be removed in the next spin at least Reset State: 0x00000000
8	SW_MTU_NAV_BASED_ON_RTS_VALID	The shadow_nav_cnt logic is enabled only when this bit is set. The nav update for RTS is done irrespective of this bit but the rts_nav_to logic is not enabled if this bit is set Reset State: 0x00000000

MTU_MTU_GLOBAL_CONTROL2 (cont.)

Bits	Name	Description
7:0	SW_MTU_RTS_NAV_TO_LIMIT	This register represents the timeout count in the following On receiving an RTS based NAV, a shadow NAV counter will keep running the previous NAV setting. The RTS NAV will be used to set the NAV. A (Programmable) timeout counter is started. If no pkdet_n is detected before the timeout count expires, the shadow NAV will be used again to set the NAV. If a pktdet_n is seen before the timeout expires, the RTS based NAV will continue. The 'shadow' NAV can now be discarded. The default is a randomly chosen.Any suggested value is welcome Reset State: 0x000000EE

0x300015C MTU_SW_MTU_SHADOW_NAV_CNT

Type: read-write
Reset State: 0x000000FF

This register contains the nav value in shadow register NAV is updated by hardware as well as by the software. Software has higher priority over the hardware updates

MTU_SW_MTU_SHADOW_NAV_CNT

Bits	Name	Description
31:0	SW_MTU_SHADOW_NAV_CNT	This register contains the nav value. The value is in micro seconds. This register just follows the nav_cnt but it will differ during the rts_nav update. When there is rts NAV update, the current NAV iscopied to this register and keeps updated. If there is rts_nav_to, this value is copied to the nav_cnt. Reset State: 0x000000FF

0x3000160 MTU_PRIMARY_CCA_HISTOGRAM_LO

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the lower 32 bits of primary_cca_histogram

MTU_PRIMARY_CCA_HISTOGRAM_LO

Bits	Name	Description
31:0	PRIMARY_CCA_HISTOGRAM31TO0	the primary cca is sampled at every slot time and shifted through a shift register software can read the shift register value through this address Reset State: 0xFFFFFFFF

0x3000164 MTU_PRIMARY_CCA_HISTOGRAM_HI

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the higher 32 bits of primary_cca_histogram

MTU_PRIMARY_CCA_HISTOGRAM_HI

Bits	Name	Description
31:0	PRIMARY_CCA_HISTOGRAM63TO32	the primary cca is sampled at every slot time and shifted through a shift register software can read the shift register value through this addressaddress Reset State: 0xFFFFFFFF

0x3000168 MTU_SECONDARY_CCA_HISTOGRAM_LO

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the lower 32 bits of secondary_cca_histogram

MTU_SECONDARY_CCA_HISTOGRAM_LO

Bits	Name	Description
31:0	SECONDARY_CCA_HISTOGRAM31TO0	the secondary cca is sampled at every slot time and shifted through a shift register software can read the shift register value through this address Reset State: 0xFFFFFFFF

0x300016C MTU_SECONDARY_CCA_HISTOGRAM_HI

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the higher 32 bits of secondary_cca_histogram

MTU_SECONDARY_CCA_HISTOGRAM_HI

Bits	Name	Description
31:0	SECONDARY_CCA_HISTOGRAM63TO32	the secondary cca is sampled at every slot time and shifted through a shift register software can read the shift register value through this address Reset State: 0xFFFFFFFF

0x3000170 MTU_TIMEOUT_LIMIT

Type: read-write
Reset State: 0x000640F5

This register contains the Timeouts for rsp_to and ..

MTU_TIMEOUT_LIMIT

Bits	Name	Description
20:10	SW_MTU_SIFS_LIMIT_FOR_WARMUP	This is the time within SIFS up to which we will mask out warmup (in clks) The default is 10 microseconds. This needs to be changed. Right now it is made same as what we have in Libra (10 microseconds) for 40Mhz clock (25ns*4000 = 10,000ns=10microseconds). If the clock is 80Mhz, this should be 2*400=800 Reset State: 0x00000190
9	SW_MTU_NOT_A_BUG_FIX	if the interrupts are back to back, though it should not be, there is a corner case the system could hang. So configurable fix.. Reset State: 0x00000000
8	SW_MTU_FORGET_PKT_DET_TO	Since this logic is to take care of fsm lock or misbehavior of early pkt det, we don't want this to be enabled by default Reset State: 0x00000000
7:0	SW_MTU_PKT_DET_TO_LIMIT	To make sure the fsm don't get in a loop while waiting for response time out, we use more reliable pkt_det from PHY and run a counter when the fsm is not in idle and the pkt_det is HIGH. When the counter reaches this limit, the fsm comes out and gives a time out interrupt to software. The default is f5. Basically a big value The limit is in micro seconds Reset State: 0x000000F5

0x3000174 MTU_CCA_FINAL_CONTROL_REG

Type: read-write
Reset State: 0x00000000

this register contains the controls to select the final cca that needs to be used for a particular back_off engine

MTU_CCA_FINAL_CONTROL_REG

Bits	Name	Description
23:0	SW_MTU_FINAL_CCA_SEL	3 bits for each back off. 2:0 for back off 0, 5:3 back off 1,... and so on 000 -- CCA 001 -- (CCA && early_pktdet_n) 010 -- (CCA && pktdet_n) 011 -- early_pktdet_n 100 -- pktdet_n 101 -- (CCA && (early_pktdet_n ||

0x300017C MTU_EARLY_INTERRUPT_LIMITS

Type: read-write
Reset State: 0x00050104

this register contains the time limits for early interrupt to s/w, txp back_off engine. The early interrupt to software is sw_mtu_early_sw_int_limit_us+sw_mtu_early_sw_int_limit_us_clks

MTU_EARLY_INTERRUPT_LIMITS

Bits	Name	Description
21:16	SW_MTU_TXP_SIFS_WIDTH_LIMIT	sw_mtu_txp_sifs_flag will be set as per the limit. After this limit the flag will just follow the pkt_det Reset State: 0x00000005
15:8	SW_MTU_EARLY_SW_INT_LIMIT_CLKS	This gives the delay in clks -- used by pifs and the back off interrupts See the comments in above field for mor info Reset State: 0x00000001
7:0	SW_MTU_EARLY_SW_INT_LIMIT_US	This gives the delay in microseconds -- used by back off interrupts basically an early slot pulse is generated whenever the slot count == this limit and one_microseconds count == sw_mtu_early_sw_int_limit_clks. The sw_mtu_early_sw_int_limit_clks is used to provide a resolution of one clk. Since the one_microseconds counter is a down counter the programming should be in terms of delay. Basically we want .25 microseconds early, we should program 1-.25 =.75=90 clks (approx) Reset State: 0x00000004

0x3000180 MTU_BTC_CONFIG_REGISTERS

Type: read-write
Reset State: 0x00000000

this register contains the Controls for btc

MTU_BTC_CONFIG_REGISTERS

Bits	Name	Description
25	SW_MTU_TX_GRANT_SEL	0x0: select bt_active, '1': select lte_tx_grant signal for sw_mtu_btc_cca_control Reset State: 0x00000000
24	SW_MTU_CONSIDER_QUATERNARY_CCA	If this is set rxp_mtu_quaternary_cca is considered in generation of mtu_btc_tx_rx_busy Reset State: 0x00000000
23	SW_MTU_CONSIDER_TERTIARY_CCA	If this is set rxp_mtu_tertiary_cca is considered in generation of mtu_btc_tx_rx_busy Reset State: 0x00000000

MTU_BTC_CONFIG_REGISTERS (cont.)

Bits	Name	Description
22	SW_MTU_BTC_PIFS_CONTROL	If this is set the final btc signals are considered in pifs. To consider both high and low prio sw_mtu_consider_low_pri_btc_active also need to be set Reset State: 0x00000000
21:6	SW_MTU_BTC_CCA_CONTROL	This controls the ANDING of BTC to CCA of the 8 back-offs 2 bits for each back-off (Only 8 nack-offs are considered) 21:6 00 --> don't consider btc from mcu/btc 01 --> Just simply aND with CCA 10 --> Don't consider till the slot count = 1 Reset State: 0x00000000
5	SW_MTU_CONSIDER_SECONDARYCCA	If this is set rxp_mtu_secondary_cca is considered in generation of mtu_btc_tx_rx_busy Reset State: 0x00000000
4	SW_MTU_CONSIDER_PRIMARYCCA	If this is set rxp_mtu_primary_cca is considered in generation of mtu_btc_tx_rx_busy Reset State: 0x00000000
3	SW_MTU_CONSIDER_EARLYPKTDETN	If this is set rxp_mtu_early_pktdet_n is considered in generation of mtu_btc_tx_rx_busy Reset State: 0x00000000
2	SW_MTU_CONSIDER_PKTDETN	If this is set rxp_mtu_pktdet_n is considered in generation of mtu_btc_tx_rx_busy Reset State: 0x00000000
1	SW_MTU_CONSIDER_PHYTXIDLE	If this is set txp_mtu_phytx_idle is considered in generation of mtu_btc_tx_rx_busy Reset State: 0x00000000
0	SW_MTU_CONSIDER_NAVACTIVE	If this is set nav_active is considered in generation of mtu_btc_tx_rx_busy Reset State: 0x00000000

0x3000184 MTU_MTU_TESTBUS_LOW

Type: read-only
Reset State: 0x00000000

This register contains the lower 32 bits of mtu testbus

MTU_MTU_TESTBUS_LOW

Bits	Name	Description
31:0	MTU_MCU_TESTBUS31TO0	This register contains the lower 32 bits of mtu testbus Reset State: 0x00000000

0x3000188 MTU_MTU_TESTBUS_HIGH

Type: read-write
Reset State: 0x00000000

This register contains the higher 13 bits of mtu testbus

MTU_MTU_TESTBUS_HIGH

Bits	Name	Description
20:16	SW_MTU_TEST_SEL	MTU test bus selection Reset State: 0x00000000
12:0	MTU_MCU_TESTBUS44TO32	This register contains the upper lower 13 bits of mtu testbus Reset State: 0x00000000

0x300018C MTU_MTU_FOR_HMAC_CONTROLS

Type: read-write
Reset State: 0xFF181003

This register contains the new registers that are added for hmac -- gen5/6

MTU_MTU_FOR_HMAC_CONTROLS

Bits	Name	Description
31:24	SW_MTU_HW_BACKOFF_VALID	if this bit is set the hardware back-offs will be enabled. By default this bit is enabled One per backoff. Reset State: 0x000000FF
20	SW_MTU_ALLOW_PMU_DISABLE	When cleared, the tsf timer will be always running When set, the tsf timer will be run when pmu_mtu_tsf_timer_en is asserted. Reset State: 0x00000001
19	SW_MTU_ALLOW_PMU_UPDATE	For UAPSD, we allowed PMU to be able to restore the tsf in MTU. This is made programmable to avoid any issues with this Reset State: 0x00000001
17	SW_MTU_BTAMP_MODE	When set, indicates it's in bt-amp mode. Reset State: 0x00000000
16	SW_MTU_SLR_LIMITS_ARE_VALID	SLR limits are valid only if this bit is set and the data rate is SLR Reset State: 0x00000000
15:8	SW_MTU_SLR_EARLY_PKT_DET_MISS_LIMIT	This is used in respons_to (ack_to) logic for SLR if the system is expecting a response and if the early pkt_det is HIGH for this limit, an interrupt is generated (old name is cca_miss_limit) Units are 4 microseconds Reset State: 0x00000010

MTU_MTU_FOR_HMAC_CONTROLS (cont.)

Bits	Name	Description
7	SW_MTU_CONSIDER_LSIG_CCA	only when this bit is set, the lsig from phy is considered in MTU Reset State: 0x00000000
6	SW_MTU_CONSIDER_LOW_PRI_BTC_ACTIVE	only when this bit is set, the mcu_mtu_bt_low_pri_active is considered in generation of final cca Reset State: 0x00000000
5	SW_MTU_IBSS_VALID	If this bit is set the back-off 0 is assigned for beacon... Reset State: 0x00000000
4	SW_MTU_DTIM_CNT_EN	Enables dtim counter. This bit needs to be set to enable dtim logic to be enabled Reset State: 0x00000000
2:0	SW_RSP_TO_CONSIDER_VECTOR	This register contains valid vector for ack_to. Basically bit 0 -- corresponds to mtu_mcu_timout_missing_early_pkt_det_p bit 1 -- corresponds to mtu_mcu_timout_missing_push_p bit 2 -- corresponds to mtu_mcu_timout_pkt_det_p Reset State: 0x00000003

0x3000190 MTU_MTU_DTIM_CNT_AND_PERIOD

Type: read-write
Reset State: 0x00000001

This register contains dtim_cnt dtim_period

MTU_MTU_DTIM_CNT_AND_PERIOD

Bits	Name	Description
31:16	DTIM_CNT	Basically this is the internal dtim counter. basically whenever this counter reaches, dtim_period -1 is loaded. this keeps ++ at every tbtt Reset State: 0x00000000
15:0	DTIM_PERIOD	This register contains the dtim period. The period is defined in number of beacons if this is 1, every beacon is DTIM. 2 means alternate beacons are dtim Reset State: 0x00000001

0x3000194 MTU_DTIM_THRSH_CNT_AND_LIMIT

Type: read-write
Reset State: 0x00000000

This register contains dtim_thrsh_limit and dtim_thrsh_limit

MTU_DTIM_THRSH_CNT_AND_LIMIT

Bits	Name	Description
31:16	DTIM_THRSH_CNT	Internal counter ++ at every microseconds to keep track of the dtim_thrsh_limit. This counter is effective only when sw_mtu_dtim_cnt_en is 1 Reset State: 0x00000000
15:0	DTIM_THRSH_LIMIT	This register contains the dtim_thrsh_limit. This number indicates the time in microseconds. Basically this number indicates up to what time during the DTIM beacon, MC and BC can be transmited Reset State: 0x00000000

0x3000198 MTU_TBTT_L

Type: read-write
Reset State: 0x7FFFFFFF

Lower 32 bits of tbtt register

MTU_TBTT_L

Bits	Name	Description
31:0	TBTT_L	Lower 32 bits of TBTT register. Reset State: 0x7FFFFFFF

0x300019C MTU_TBTT_H

Type: read-write
Reset State: 0x00000000

Upper 32 bits of tbtt rosewater

MTU_TBTT_H

Bits	Name	Description
31:0	TBTT_H	Upper 32 bits of TBTT register. Reset State: 0x00000000

0x30001A0 MTU_M_TBTT_L

Type: read-write
Reset State: 0x7FFFFFFF

Lower 32 bits of multiple bssid tbtt register

MTU_M_TBTT_L

Bits	Name	Description
31:0	M_TBTT_L	Lower 32 bits of TBTT register. Reset State: 0x7FFFFFFF

0x30001A4 MTU_M_TBTT_H

Type: read-write
Reset State: 0x00000000

Upper 32 bits of multiple bssid tbtt register.

MTU_M_TBTT_H

Bits	Name	Description
31:0	M_TBTT_H	Upper 32 bits of TBTT register. Reset State: 0x00000000

0x30001A8 MTU_BCN_BSSID_INTV

Type: read-write
Reset State: 0x00100064

Beacon Interval Register is programmed by software and it determined the period between two consecutive TBTT. This also contains the mbssid interval in microseconds

MTU_BCN_BSSID_INTV

Bits	Name	Description
29	SW_MTU_MBSSID_ENABLE	Multiple bssid are enabled only when this bit is set Reset State: 0x00000000
28	SW_MTU_TBTT_ENABLE	Beacons are enabled only when this bit is set Reset State: 0x00000000
27:24	SW_MTU_MAX_BSSIDS	Beacons are enabled only when this bit is set Reset State: 0x00000000
23:16	SW_MTU_BSSID_INTV	This bits determine the period between two consecutive beacons of different bssids. This value is in n 256 micro seconds. Each count is 256 microseconds Reset State: 0x00000010
15:0	SW_MTU_BEACON_INTV	This bits determine the period between two consecutive beacon. This value is in ms message. Reset State: 0x00000064

0x30001AC MTU_VALID_BSSID_BITMAP

Type: read-write
Reset State: 0x00070001

This register contains the valid bssids in the system

MTU_VALID_BSSID_BITMAP

Bits	Name	Description
31:16	IBSS_BCN_CW_LIMIT	This register contains the cw limit for ibss Reset State: 0x00000007
15:0	SW_MTU_VALID_BSSID_BITMAP	A 16 bit register indicates which bssid is enabled Bit 0 should be enabled for single bssid By default only one bssid is enabled message. Reset State: 0x00000001

0x30001B0 MTU_IBSS_BKOF_CNT

Type: read-write
Reset State: 0x00000000

This register contains the bkof_cnt of ibss. The units are slot number.

MTU_IBSS_BKOF_CNT

Bits	Name	Description
15:0	IBSS_BKOF_CNT	This register contains the bkof_counter value for the ibss_bkof_cnt this value = (lfsr_data & lfsr_value) Reset State: 0x00000000

0x30001B4 MTU_LFSR_DATA_1_0

Type: read-only
Reset State: 0x00000000

This register contains the lfsr_data of bkof 1 and 0.

MTU_LFSR_DATA_1_0

Bits	Name	Description
31:16	LFSR_DATA_1	This register contains the lfsr_data value for the bkof_1 Reset State: 0x00000000

MTU_LFSR_DATA_1_0 (cont.)

Bits	Name	Description
15:0	LFSR_DATA_0	This register contains the lfsr_data value for the bkof_0 Reset State: 0x00000000

0x30001B8 MTU_LFSR_DATA_3_2

Type: read-only
Reset State: 0x00000000

This register contains the lfsr_data of bkof 3 and 2.

MTU_LFSR_DATA_3_2

Bits	Name	Description
31:16	LFSR_DATA_3	This register contains the lfsr_data value for the bkof_3 Reset State: 0x00000000
15:0	LFSR_DATA_2	This register contains the lfsr_data value for the bkof_2 Reset State: 0x00000000

0x30001BC MTU_LFSR_DATA_5_4

Type: read-only
Reset State: 0x00000000

This register contains the lfsr_data of bkof 5 and 4.

MTU_LFSR_DATA_5_4

Bits	Name	Description
31:16	LFSR_DATA_5	This register contains the lfsr_data value for the bkof_5 Reset State: 0x00000000
15:0	LFSR_DATA_4	This register contains the lfsr_data value for the bkof_4 Reset State: 0x00000000

0x30001C0 MTU_LFSR_DATA_7_6

Type: read-only
Reset State: 0x00000000

This register contains the lfsr_data of bkof 7 and 6.

MTU_LFSR_DATA_7_6

Bits	Name	Description
31:16	LFSR_DATA_7	This register contains the lfsr_data value for the bkof_7 Reset State: 0x00000000
15:0	LFSR_DATA_6	This register contains the lfsr_data value for the bkof_6 Reset State: 0x00000000

0x30001C4 MTU_LONG_SHORT_XMIT_LIMIT_BKOF_3_TO_0

Type: read-only
Reset State: 0x47474747

This register contains the sort and long retry limits for backoff cw adjustment

MTU_LONG_SHORT_XMIT_LIMIT_BKOF_3_TO_0

Bits	Name	Description
31:0	SW_LONG_SHORT_XMIT_LIMIT_BKOF_3_TO_0	This register contains the short and long retry limts for bkof-3 to 0. 3:0 is short, 7:4 is long for back off 0. 11:8 is short, 15:12 is long for back off 1. 19:16 is short, 23:20 is long for back off 2. 27:24 is short, 31:28 is long for back off 3. Reset State: 0x47474747

0x30001C8 MTU_LONG_SHORT_XMIT_LIMIT_BKOF_7_TO_4

Type: read-only
Reset State: 0x47474747

This register contains the sort and long retry limts for backoff cw adjustment

MTU_LONG_SHORT_XMIT_LIMIT_BKOF_7_TO_4

Bits	Name	Description
31:0	SW_LONG_SHORT_XMIT_LIMIT_BKOF_7_TO_4	This register contains the short and long retry limits for bkof-7 to 4. 3:0 is short, 7:4 is long for back off 4. 11:8 is short, 15:12 is long for back off 5. 19:16 is short, 23:20 is long for back off 6. 27:24 is short, 31:28 is long for back off 7. Reset State: 0x47474747

0x30001CC MTU_WARMUP_LIMIT

Type: read-write
Reset State: 0x00000025

This register contains the threshold number for txp_mpi_rf_warmup.

MTU_WARMUP_LIMIT

Bits	Name	Description
11:8	TXP_MPI_RF_WARMUP_CNT	counter number of txp_mpi_rf_warmup high duration. Reset State: 0x00000000
7	TXP_MPI_RF_WARMUP_LOW_FLAG	When assert, indicates the duration of txp_mpi_rf_warmup is less than sw_mtu_warmup_thrd_low. Reset State: 0x00000000
6	TXP_MPI_RF_WARMUP_HIGH_FLAG	When assert, indicates the duration of txp_mpi_rf_warmup is longer than sw_mtu_warmup_thrd_high. Reset State: 0x00000000
5:4	SW_MTU_WARMUP_THRD_LOW	This register contains the lower limit value (in unit of microseconds) for txp_mpi_rf_warmup. Reset State: 0x00000002
3:0	SW_MTU_WARMUP_THRD_HIGH	This register contains the upper limit value (in unit of microseconds) for txp_mpi_rf_warmup. Reset State: 0x00000005

0x30001D0 MTU_ONE_SEC_LIMIT

Type: read-write
Reset State: 0x000F423F

This register contains the threshold number for one_sec pulse

MTU_ONE_SEC_LIMIT

Bits	Name	Description
19:0	SW_MTU_ONE_SEC_LIMIT	limit value to be programmed to get one sec pulse. Basically this is number of microseconds. this value is loaded into a counter and keep getting decremented at every one_microseconds_p. Reset State: 0x000F423F

0x30001D4 MTU_MTU_GLOBAL_TIMER

Type: read-write
Reset State: 0x00000000

This register contains a global timer to be used by all modules including software if it wants

MTU_MTU_GLOBAL_TIMER

Bits	Name	Description
31:0	MTU_GLOBAL_TIMER	This is a global timer increments at every one microseconds. This is different from tsf timer Reset State: 0x00000000

0x30001D8 MTU_TSF_TIMER_FOR_SIM_BSS_LO

Type: read-write
Reset State: 0x00000000

This register contains the lower 32 bits of the tsf timer used only during simultaneous bss and ibss mode This corresponds to BSS tsf during simultaneous mode. In none Simultaneous mode, this is not valid

MTU_TSF_TIMER_FOR_SIM_BSS_LO

Bits	Name	Description
31:0	TSF_TIMER_FOR_SIM_BSS_LO	This register contains the lower 32 bits of the tsf timer used only during simultaneous bss and ibss mode This corresponds to BSS tsf during simultaneous mode. In none Simultaneous mode, this is not valid Reset State: 0x00000000

0x30001DC MTU_TSF_TIMER_FOR_SIM_BSS_HI

Type: read-write
Reset State: 0x00000000

This register contains the upper 32 bits of the tsf timer used only during simultaneous bss and ibss mode This corresponds to BSS tsf during simultaneous mode. In none Simultaneous mode, this is not valid

MTU_TSF_TIMER_FOR_SIM_BSS_HI

Bits	Name	Description
31:0	TSF_TIMER_FOR_SIM_BSS_HI	This register contains the upper 32 bits of the tsf timer used only during simultaneous bss and ibss mode This corresponds to BSS tsf during simultaneous mode. In none Simultaneous mode, this is not valid Reset State: 0x00000000

0x30001E0 MTU_SW_MTU_SIFS_LIMIT_FORINNAV

Type: read-write
Reset State: 0x00000190

This is register that contains the SIFS Limit specified in number of clocks rather than in microseconds

MTU_SW_MTU_SIFS_LIMIT_FORINNAV

Bits	Name	Description
10:0	SW_MTU_SIFS_LIMIT_FORINNAV	This is register that contains the SIFS Limit specified in number of clocks rather than in microseconds The default is 15 microseconds. This needs to be changed. Right now it is made same as what we have in Libra (14 microseconds) for 40Mhz clock (25ns*560 = 14,000ns=14microseconds). If the clock is 80Mhz, this should be 2*560 = 1130 Reset State: 0x00000190

0x30001E4 MTU_SW_MTU_P2P_GO_TSF_TIMER_LO

Type: read-write
Reset State: 0x00000000

This is register that contains the lower 32 bits of the p2p group owner tsf timer

MTU_SW_MTU_P2P_GO_TSF_TIMER_LO

Bits	Name	Description
31:0	P2P_GO_TSF_TIMER_LO	The lower 32 bits of the p2p group owner tsf timer In unit of us. Reset State: 0x00000000

0x30001E8 MTU_SW_MTU_P2P_GO_TSF_TIMER_HI

Type: read-write
Reset State: 0x00000000

This is register that contains the upper 32 bits of the p2p group owner tsf timer

MTU_SW_MTU_P2P_GO_TSF_TIMER_HI

Bits	Name	Description
31:0	P2P_GO_TSF_TIMER_HI	The upper 32 bits of the p2p group owner tsf timer In unit of us. Reset State: 0x00000000

0x30001EC MTU_SW_MTU_P2P_CLIENT_TSF_TIMER_LO

Type: read-write
Reset State: 0x00000000

This is register that contains the lower 32 bits of the p2p client owner tsf timer

MTU_SW_MTU_P2P_CLIENT_TSF_TIMER_LO

Bits	Name	Description
31:0	P2P_CLIENT_TSF_TIMER_LO	The lower 32 bits of the p2p client owner tsf timer In unit of us. Reset State: 0x00000000

0x30001F0 MTU_SW_MTU_P2P_CLIENT_TSF_TIMER_HI

Type: read-write
Reset State: 0x00000000

This is register that contains the upper 32 bits of the p2p client owner tsf timer

MTU_SW_MTU_P2P_CLIENT_TSF_TIMER_HI

Bits	Name	Description
31:0	P2P_CLIENT_TSF_TIMER_HI	The upper 32 bits of the p2p client owner tsf timer In unit of us. Reset State: 0x00000000

0x30001F4 MTU_SW_MTU_P2P_CTRL

Type: read-write
Reset State: 0x00000040

This is register that contains the control bits for p2p feature

MTU_SW_MTU_P2P_CTRL

Bits	Name	Description
18:17	LTE_TSF_INSERTION_SEL	To select the TSF value to be provided to lte cxm 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
16	SW_BEACON_TRANSMIT_EN	Writing a '1' to trigger a beacon transmission. Always read zero Reset State: 0x00000000

MTU_SW_MTU_P2P_CTRL (cont.)

Bits	Name	Description
15:8	P2P_TX_BOUNDARY_THRESHOLD	The bcoff will be disabled after the transmit_boundary_timer reaches this value Reset State: 0x00000000
6:4	GLOBAL_TIMER_SRC_SEL	To select the source for the global timer 3'b000: BSS TSF; 3'b001: IBSS TSF; 3'b010: P2P group owner TSF; 3'b011: P2P client TSF 3'b100: internal timer Reset State: 0x00000004
3:2	P2P_TSF_INSERTION_SEL	To select the TSF value to be inserted in beacons in TPE 2'b00: BSS TSF; 2'b01: IBSS TSF; 2'b10: P2P group owner TSF; 2'b11: P2P client TSF Reset State: 0x00000000
1	P2P_CLIENT_TSF_TIMER_EN	Set to 1 to enable the p2p client timer Reset State: 0x00000000
0	P2P_GO_TSF_TIMER_EN	Set to 1 to enable the p2p group owner timer Reset State: 0x00000000

0x30001F8 MTU_SW_MTU_P2P_TRANSMIT_BOUNDARY

Type: read-write
Reset State: 0x00000000

This is register that contains the config bits of the transmit boundary timer

MTU_SW_MTU_P2P_TRANSMIT_BOUNDARY

Bits	Name	Description
31	P2P_TRANSMIT_BOUNDARY_EN	Set 1 to enable the transmit boundary feature. Reset State: 0x00000000
27:20	P2P_INT_BOUNDARY	When the counter reaches this value, an interrupt will be generated. In unit of us. Reset State: 0x00000000
18:0	P2P_TRANSMIT_BOUNDARY	A down counter that software can program so that no frame exchanges will go over this boundary. When value 0 is reached, no more transmissions happen, until a new none zero value is programmed or this feature is disabled. In unit of us. Reset State: 0x00000000

0x30001FC MTU_SW_MTU_P2P_WAIT_FOR_BEACON

Type: read-write
Reset State: 0x00020000

This is register that contains the config bits of the wait for beacon timer

MTU_SW_MTU_P2P_WAIT_FOR_BEACON

Bits	Name	Description
31	P2P_WAIT_FOR_BEACON_EN	Set 1 to enable the wait for beacon feature. Reset State: 0x00000000
17:16	P2P_WAIT_FOR_BEACON_SEL	To select which beacon to wait for. 2'b00: IBSS beacon, 2'b01: BSS beacon, 2'b10: p2p client beacon. Reset State: 0x00000002
15:0	P2P_MAX_WAIT_DURATION	max duration of waiting for the p2p beacon. Start at p2p tbtt. In unit of us. Reset State: 0x00000000

0x3000200 MTU_TERTIARY_CCA_HISTOGRAM_LO

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the lower 32 bits of tertiary_cca_histogram

MTU_TERTIARY_CCA_HISTOGRAM_LO

Bits	Name	Description
31:0	TERTIARY_CCA_HISTOGRAM31TO0	the tertiary cca is sampled at every slot time and shifted through a shift register software can read the shift register value through this address Reset State: 0xFFFFFFFF

0x3000204 MTU_TERTIARY_CCA_HISTOGRAM_HI

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the higher 32 bits of tertiary_cca_histogram

MTU_TERTIARY_CCA_HISTOGRAM_HI

Bits	Name	Description
31:0	TERTIARY_CCA_HISTOGRAM63TO32	the tertiary cca is sampled at every slot time and shifted through a shift register software can read the shift register value through this address Reset State: 0xFFFFFFFF

0x3000208 MTU_QUATERNARY_CCA_HISTOGRAM_LO

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the lower 32 bits of quaternary_cca_histogram

MTU_QUATERNARY_CCA_HISTOGRAM_LO

Bits	Name	Description
31:0	QUATERNARY_CCA_HISTOGRAM31TO0	the quaternary cca is sampled at every slot time and shifted through a shift register software can read the shift register value through this address Reset State: 0xFFFFFFFF

0x300020C MTU_QUATERNARY_CCA_HISTOGRAM_HI

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the higher 32 bits of quaternary_cca_histogram

MTU_QUATERNARY_CCA_HISTOGRAM_HI

Bits	Name	Description
31:0	QUATERNARY_CCA_HISTOGRAM63TO32	the quaternary cca is sampled at every slot time and shifted through a shift register software can read the shift register value through this address Reset State: 0xFFFFFFFF

0x3000210 MTU_MTU_CCA_CONTROL

Type: read-write
Reset State: 0x00001919

Contains the 3rd and 4th cca controls for mtu

MTU_MTU_CCA_CONTROL

Bits	Name	Description
23:16	SW_MTU_RAW_CCA_SEL_NEW	Work with cca_control_reg.sw_mtu_raw_cca_sel to select the cca for backoffs. bit16 for bkof0, bit17 for bkof1 ... Reset State: 0x00000000

MTU_MTU_CCA_CONTROL (cont.)

Bits	Name	Description
15:8	SW_MTU_QUATERNARY_CCA_LIMIT	Whenever the quaternary cca is high for this limit (in us) time, mtu_mcu_quaternary_cca_to will be generated. Reset State: 0x00000019
7:0	SW_MTU_TERTIARY_CCA_LIMIT	Whenever the tertiary cca is high for this limit (in us) time, mtu_mcu_tertiary_cca_to will be generated. Reset State: 0x00000019

0x3000214 MTU_MTU_CCA_STATUS

Type: read-only
Reset State: 0x00000000

Contains the 3rd and 4th cca status for mtu

MTU_MTU_CCA_STATUS

Bits	Name	Description
1	QUATERNARY_CCA_TO	the quaternary_cca_to is sampled and software can read its status through this register Reset State: 0x00000000
0	TERTIARY_CCA_TO	the tertiary_cca_to is sampled and software can read its status through this register Reset State: 0x00000000

0x3000218 MTU_ADD_TSF_TIMER_LO

Type: read-write
Reset State: 0x00000000

This register contains the lower 32 bits of the value to be added to the tsf timer

MTU_ADD_TSF_TIMER_LO

Bits	Name	Description
31:0	ADD_TSF_TIMER_LO	This register contains the lower 32 bits of the value to be added to the tsf timer Reset State: 0x00000000

0x300021C MTU_ADD_TSF_TIMER_HI

Type: read-write
Reset State: 0x00000000

This register contains the upper 32 bits of the value to be added to the tsf timer

MTU_ADD_TSF_TIMER_HI

Bits	Name	Description
31:0	ADD_TSF_TIMER_HI	This register contains the upper 32 bits of the value to be added to the tsf timer Reset State: 0x00000000

0x3000220 MTU_TSF_TIMER_CTRL

Type: read-only
Reset State: 0x00000000

This register control the add function to the tsf timer

MTU_TSF_TIMER_CTRL

Bits	Name	Description
0	ADD_TSF_TIMER	Write 1 to this bit so the sum of the add_tsf_timer_[hi|lo] value and the current tsf timer will be loaded to the tsf timer. Reset State: 0x00000000

0x3000224 MTU_MTU_LTE_CXM_TSF_LOW

Type: read-only
Reset State: 0x00000000

This register contains the lower 32-bits tsf value captured by the coex_frame_sync signal

MTU_MTU_LTE_CXM_TSF_LOW

Bits	Name	Description
31:0	MTU_LTE_CXM_TSF_LOW	The lower 32-bits tsf value captured by the capture_clk signal Reset State: 0x00000000

0x3000228 MTU_MTU_LTE_CXM_TSF_HIGH

Type: read-only
Reset State: 0x00000000

This register contains the upper 32-bits tsf value captured by the coex_frame_sync signal

MTU_MTU_LTE_CXM_TSF_HIGH

Bits	Name	Description
31:0	MTU_LTE_CXM_TSF_HIGH	The upper 32-bits tsf value captured by the capture_clk signal Reset State: 0x00000000

0x300022C MTU_SW_SECONDARY_CCA_HISTOGRAM_MASK

Type: read-write
Reset State: 0x0007F800

This register contains the mask bits of the secondary cca histogram for the bw signaling frame exchange

MTU_SW_SECONDARY_CCA_HISTOGRAM_MASK

Bits	Name	Description
31:0	SW_SECONDARY_CCA_HISTOGRAM_MASK	The mask bits for the secondary cca histogram for 6mbps rts data in unit of 3microseconds. Reset State: 0x0007F800

0x3000230 MTU_SW_TERTIARY_CCA_HISTOGRAM_MASK

Type: read-write
Reset State: 0x0007F800

This register contains the mask bits of the tertiary cca histogram for the bw signaling frame exchange

MTU_SW_TERTIARY_CCA_HISTOGRAM_MASK

Bits	Name	Description
31:0	SW_TERTIARY_CCA_HISTOGRAM_MASK	The mask bits for the tertiary cca histogram for 6mbps rts data in unit of 3 microseconds. Reset State: 0x0007F800

0x3000234 MTU_SW_QUATERNARY_CCA_HISTOGRAM_MASK

Type: read-write
Reset State: 0x0007F800

This register contains the mask bits of the quaternary cca histogram for the bw signaling frame exchange

MTU_SW_QUATERNARY_CCA_HISTOGRAM_MASK

Bits	Name	Description
31:0	SW_QUATERNARY_CCA_HISTOGRAM_MASK	The mask bits for the quaternary cca histogram for 6mbps rts data in unit of 3 microseconds. Reset State: 0x0007F800

0x3000238 MTU_SW_CCA_HISTOGRAM_MASK_MISC

Type: read-write
Reset State: 0x00000002

This register contains the shift value of the cca histogram for the bw signaling frame exchange

MTU_SW_CCA_HISTOGRAM_MASK_MISC

Bits	Name	Description
6	MTU_TPE_80MHZ_CCA_IS_IDLE_NON6MBPS	The 80mhz cca status (masked and shift) Reset State: 0x00000000
5	MTU_TPE_40MHZ_CCA_IS_IDLE_NON6MBPS	The 40mhz cca status (masked and shift) Reset State: 0x00000000
4	MTU_TPE_80MHZ_CCA_IS_IDLE_6MBPS	The 80mhz cca status (masked without shift) Reset State: 0x00000000
3	MTU_TPE_40MHZ_CCA_IS_IDLE_6MBPS	The 40mhz cca status (masked without shift) Reset State: 0x00000000
2:0	SW_CCA_HISTOGRAM_MASK_SHIFT	Right shift the mask bits of the cca histogram for non-6mbps rts data Reset State: 0x00000002

0x300023C MTU_CCA_SECONDARY_HISTOGRAM

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the secondary cca histogram

MTU_CCA_SECONDARY_HISTOGRAM

Bits	Name	Description
31:0	CCA_SECONDARY_HISTOGRAM	The secondary cca is sampled at every 2us time and shifted through a shift register Reset State: 0xFFFFFFFF

0x3000240 MTU_CCA_TERTIARY_HISTOGRAM

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the tertiary cca histogram

MTU_CCA_TERTIARY_HISTOGRAM

Bits	Name	Description
31:0	CCA_TERTIARY_HISTOGRAM	The tertiary cca is sampled at every 2us time and shifted through a shift register Reset State: 0xFFFFFFFF

0x3000244 MTU_CCA_QUATERNARY_HISTOGRAM

Type: read-only
Reset State: 0xFFFFFFFF

This register contains the quaternary cca histogram

MTU_CCA_QUATERNARY_HISTOGRAM

Bits	Name	Description
31:0	CCA_QUATERNARY_HISTOGRAM	The quaternary cca is sampled at every 2us time and shifted through a shift register Reset State: 0xFFFFFFFF

16.2.44 QTA

0x3000000 QTA_INTR

Type: read-write
Reset State: 0x00000000

Interrupt status register.

QTA_INTR

Bits	Name	Description
26	RX_FIFO_UFLOW_INTR	Receive FIFO Underflow interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000
25	RX_FIFO_OFLOW_INTR	Receive FIFO Overflow interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000
24	RX_FIFO_RDY_INTR	Receive FIFO Ready interrupt status bit: Indicates when the Receive FIFO is ready to be drained of software characters. This interrupt is set every clock cycle while the FIFO fill level is greater than the Receive FIFO Trigger Level (rx_trig_level). Software must write a 1 to this bit to clear it. Reset State: 0x00000000
17	TX_FIFO_OFLOW_INTR	Transmit FIFO Overflow interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000
16	TX_FIFO_RDY_INTR	Transmit FIFO Ready interrupt status bit: Indicates when the Transmit FIFO is ready to accept more software characters for transmission. This interrupt is set every clock cycle while the FIFO fill level is less than or equal to the Transmit FIFO Trigger Level (tx_trig_level). Software must write a 1 to this bit to clear it. Reset State: 0x00000000
8	RX_HW_CHAR_INTR	Received Hardware Character interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000
1	PARITY_ERR_INTR	UART Parity Error interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000
0	FRAME_ERR_INTR	UART Frame Error interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000

0x3000004 QTA_INTR_EN

Type: read-write
Reset State: 0x00000000

Interrupt enable register.

QTA_INTR_EN

Bits	Name	Description
26	RX_FIFO_UFLOW_INTR_EN	Interrupt enable for the Receive FIFO Underflow interrupt. Reset State: 0x00000000
25	RX_FIFO_OFLOW_INTR_EN	Interrupt enable for the Receive FIFO Overflow interrupt. Reset State: 0x00000000
24	RX_FIFO_RDY_INTR_EN	Interrupt enable for the Receive FIFO Ready interrupt. Reset State: 0x00000000
17	TX_FIFO_OFLOW_INTR_EN	Interrupt enable for the Transmit FIFO Overflow interrupt. Reset State: 0x00000000
16	TX_FIFO_RDY_INTR_EN	Interrupt enable for the Transmit FIFO Ready interrupt. Reset State: 0x00000000
8	RX_HW_CHAR_INTR_EN	Interrupt enable for the Received Hardware Character interrupt. Reset State: 0x00000000
1	PARITY_ERR_INTR_EN	Interrupt enable for the Parity Error interrupt. Reset State: 0x00000000
0	FRAME_ERR_INTR_EN	Interrupt enable for the Frame Error interrupt. Reset State: 0x00000000

0x3000008 QTA_UART_CTRL

Type: read-write
Reset State: 0x03280060

UART control register.

QTA_UART_CTRL

Bits	Name	Description
31:24	BAUD_RATE_NUMERATOR	Sets the numerator for the ratio of the system clock frequency to the baud rate. Reset State: 0x00000003
23:16	BAUD_RATE_DENOMINATOR	Sets the denominator for the ratio of the system clock frequency to the baud rate. Reset State: 0x00000028
6	TX_INV_EN	When set, enables the UART's serial TX output inverter. Reset State: 0x00000001
5	RX_INV_EN	When set, enables the UART's serial RX input inverter. Reset State: 0x00000001

QTA_UART_CTRL (cont.)

Bits	Name	Description
4	POWER_DOWN	When set, puts the UART into power-down mode. The UART transmitter will complete its current transmission and then disable all further transmissions. The UART receiver will discard the current character being received and then ignore all further receptions. Reset State: 0x00000000
3	PARITY_EN	Enables parity bit generation in the UART transmitter, and parity checking in the UART receiver. Reset State: 0x00000000
2	PARITY_ODD	When parity is enabled, this bit specifies whether the parity is odd or even. When 1, the parity is odd; when 0, it is even. Reset State: 0x00000000
1:0	NUM_STOPS	Specifies the number of stop bits (1-4) at the end of each character. The number of stop bits per character = num_stops + 1. Reset State: 0x00000000

0x300000C QTA_HW_CTRL

Type: command
Reset State: 0x00000014

Hardware layer control register.

QTA_HW_CTRL

Bits	Name	Description
31:24	LAST_RX_HW_CHAR	This field captures the last received hardware character that was passed on to the Signaling layer. Reset State: 0x00000000
15	TX_BUFFER_STATE	State of the 1-character-deep Hardware TX Buffer. When 1, the buffer is full; when 0, the buffer is empty. Reset State: 0x00000000
14:8	TX_BUFFER_CONTENTS	This field captures the hardware character presently stored in the TX Buffer. Resend bit excluded as only non-Resend-Requests are stored in this buffer. Reset State: 0x00000000
7	RESEND_REQ_FLAG	Indicates the present state of the Resend Request flag. When set, it indicates that a Resend Request is pending transmission. Reset State: 0x00000000
4	EXCLUSIVE_RESEND_EN	Exclusive Resend Enable: When set, the QTA module will treat Signal State bits within Resend Request characters as invalid. When clear, the Signal State bits are valid regardless of whether the character is a Resend Request. Reset State: 0x00000001

QTA_HW_CTRL (cont.)

Bits	Name	Description
3	RESEND_REQ_PASSTHRU_EN	Resend Request Pass-Through Enable: When set, the QTA module will pass received Resend Request characters through to the Signaling layer for processing. NB: This feature is unsupported for the WLAN version of the QTA module, because the Signaling interface for the WLAN version does not support Resend signaling. Reset State: 0x00000000
2	RESEND_RESP_EN	Resend Response Enable: When this bit is set, the QTA module will automatically respond to received Resend Requests by resending its last (non-Resend-Request) hardware character. Otherwise, the QTA module will not respond to Resend Requests received from the peer device. Reset State: 0x00000001
1	RETRANSMIT	Retransmit TX Buffer contents: Writing a 1 to this bit causes the last (non-Resend-Request) hardware character to be re-transmitted. This bit is self-clearing. Reset State: 0x00000000
0	RESEND_REQUEST	Send a Resend Request: Writing a 1 to this bit causes a Resend Request character to be queued for transmission. This bit is self-clearing. Reset State: 0x00000000

0x3000010 QTA_HW_TX_BUFFER_MODIFY

Type: write-only
Reset State: 0x00000000

TX Buffer modify register.

QTA_HW_TX_BUFFER_MODIFY

Bits	Name	Description
6:0	DATA	Data to be written to the TX Buffer. Writing to this register causes the contents of the TX Buffer to be modified to the value of the data field, and causes the TX buffer state to be set to full. Reset State: 0x00000000

0x3000014 QTA_SW_CTRL

Type: read-write
Reset State: 0x00000000

Software layer control register.

QTA_SW_CTRL

Bits	Name	Description
29:24	RX_FILL	Indicates the number of software characters presently queued in the Receive FIFO. Reset State: 0x00000000
21	RX_FLUSH	Receive FIFO Flush: Writing a 1 to this bit flushes the contents of the Receive FIFO. This bit is self-clearing. Reset State: 0x00000000
20:16	RX_TRIG_LEVEL	Receive FIFO Trigger Level. See the rx_fifo_rdy_int interrupt status register description. Reset State: 0x00000000
13:8	TX_FILL	Indicates the number of software characters presently queued in the Transmit FIFO. Reset State: 0x00000000
5	TX_FLUSH	Transmit FIFO Flush: Writing a 1 to this bit flushes the contents of the Transmit FIFO. This bit is self-clearing. Reset State: 0x00000000
4:0	TX_TRIG_LEVEL	Transmit FIFO Trigger Level. See the tx_fifo_rdy_int interrupt status register description. Reset State: 0x00000000

0x3000018 QTA_SW_TX_FIFO_IN

Type: write-only
Reset State: 0x00000000

Software Transmit FIFO write data register.

QTA_SW_TX_FIFO_IN

Bits	Name	Description
7:0	DATA	Software character to be transmitted. Reset State: 0x00000000

0x300001C QTA_SW_RX_FIFO_OUT

Type: read-only
Reset State: 0x00000000

Software Receive FIFO read data register.

QTA_SW_RX_FIFO_OUT

Bits	Name	Description
7:0	DATA	Software character received. Reset State: 0x00000000

0x3000020 QTA_TESTBUS

Type: read-write
Reset State: 0x00000000

Test bus control register.

QTA_TESTBUS

Bits	Name	Description
3:0	SEL	Select input for the test bus multiplexer. 0x0: QTA_TESTBUS_NONE 0x1: QTA_TESTBUS_UART_RX 0x2: QTA_TESTBUS_UART_TX 0x3: QTA_TESTBUS_SW_FIFOS 0x4: QTA_TESTBUS_SW_RX 0x5: QTA_TESTBUS_SW_TX 0x6: QTA_TESTBUS_HW_RX 0x7: QTA_TESTBUS_HW_TX 0x8: QTA_TESTBUS_CONV_RX 0x9: QTA_TESTBUS_CONV_TX 0xA: QTA_TESTBUS_RESERVED_10 0xB: QTA_TESTBUS_RESERVED_11 0xC: QTA_TESTBUS_RESERVED_12 0xD: QTA_TESTBUS_RESERVED_13 0xE: QTA_TESTBUS_RESERVED_14 0xF: QTA_TESTBUS_RESERVED_15 Reset State: 0x00000000

16.2.45 rpe

0x3000000 RPE_MEM_BASE_ADDR

Type: read-write
Reset State: 0x00000000

It gives the base address of the memory where all bitmaps and related flags are stored per station and per queue basis

RPE_MEM_BASE_ADDR

Bits	Name	Description
25:0	CFG_BASEADDR	Base address for the RPE data descriptor memory Reset State: 0x00000000

0x3000004 RPE_FULLSTATE_STATIONS_QUEUES

Type: read-write
Reset State: 0x00080006

This register indicates the max number of stations we are associated with and the max number of Queues per station

RPE_FULLSTATE_STATIONS_QUEUES

Bits	Name	Description
19:16	CFG_FULLSTATE_QUEUES	Max number of Queues per station default value 8 indicates 8 queues qids 0-7 Reset State: 0x00000008
4:0	CFG_FULLSTATE_STATIONS	The number here indicates the number of stations default value 6 indicates station ids 0- 5 Reset State: 0x00000006

0x3000008 RPE_SM_STUCK_CNT_VALUE

Type: read-write
Reset State: 0x00000600

The register has the time out value used by RPE when any state machine hangs

RPE_SM_STUCK_CNT_VALUE

Bits	Name	Description
11:0	SM_STUCK_CNT_VALUE	This value indicates the timeout value in terms of number of clock cycles for riva it is 40Mhz Reset State: 0x00000600

0x300000C RPE_RPE_CONFIG

Type: read-write
Reset State: 0x60000000

gives some configurations for RPE

RPE_RPE_CONFIG

Bits	Name	Description
31:29	CMDFIFO_FULL_THRESHOLD	Value here basically determines how many entries left will indicate fifo almost full, by default it is 3 entries when cmd fifo is almost full it is indicated to RXP, so that rxp can drop the incoming packets and indicate to TPE that no ack is sent on this packet Reset State: 0x00000003
28	SET_AVERAGE_TIMESTAMP	0x0: Record current timestamp for staid/qid whenever we forward packets 1'b1: Record current/average timestamp. If reorder bitmap after forward of packets all zero then Record current time stamp. else Record timestamp = stored_time stamp + current_time stamp / 2 This helps us store timestamp closer to the queued packets in the memory Reset State: 0x00000000
27	RPE_CLEAR_COUNTERS	writing 1 will clear all counters, hardware will make it zero Reset State: 0x00000000
19:16	RPE_TESTBUS_SEL	selects different test buses in RPE 0x0: ARBITER_BLOCK 0x1: BITMAP_BLOCK 0x2: DUPLICATE_BLOCK 0x3: REASSEMBLY_BLOCK 0x4: REORDER_BLOCK 0x5: DMA_BLOCK 0x6: GBI_TESTBUS 0x7: GAM_TESTBUS 0x8: GAS_TESTBUS 0x9: REORDER_PACKET_TESTBUS 0xA: REORDER_PACKET_TESTBUS2 0xB: REORDER_BUFFER_TESTBUS2 0xC: DMA_CONTROL_TESTBUS2 0xD: ARBITER_BLOCK_TESTBUS2 0xE: COMMAND_FIFO_TESTBUS2 Reset State: 0x00000000
15	TIMER_DIS	0x1: aging timer disabled 1'b0: aging timer enabled Reset State: 0x00000000
14:8	RSRC_ENTRY_DIS	This field controls the number of resources used for fragmentation. one resource is always used. (for only 2 resources are used only bit 0 is useful here) These seven bits can be used to turn of any resource table entry for fragment gathering. Each bit indicates the resource table entry number. bit 8 is for resource table 1, resource table 0 is always on. Resource entries should be on/off sequentially only, not randomly. for example 7'b0001111 is okay 7'b0101011 is not okay Reset State: 0x00000000

RPE_RPE_CONFIG (cont.)

Bits	Name	Description
7	OUOFORD_PKT_FWD	Whenever a window moves due to one of internal flushing events (internal events described in bit field 1) then the BA bitmap does not change but reorder bitmap changes if any packets that arrive in reorder for the holes then those packets need to be forwarded when this bit is set else they are dropped 0: Drop out of order packets arriving in reorder 1: Forward out of order packets arriving in reorder Reset State: 0x00000000
6	REORDER_PKT_IN_HW_DIS	When set the actual reordering (reorder buffer support the new feature in Volans) of the packets in hardware is disabled. Note that we have per STA based control in Station descriptor also. IF this feature is disabled, the STA descriptor setting is irrelevant Reset State: 0x00000000
5	NONFRAG_FLUSH_DIS	0x1: When set resource entries for frag pkts are not flushed when non-frag packets are received for a staid/qid which has valid entry 1'b0: When non-frag pkts are received for a staid/qid which has valid resource entry then that resource is flushed Reset State: 0x00000000
4	HOST_BAR_DROP_DIS	0x1: when set then the BAR packets which have same sequence number as next expected packet will be dropped by RPE and not host 1'b0: The BAR packet which has same sequence number as next expected packet will be sent to host with opcode DROP_CUR and host will drop the packet Reset State: 0x00000000
3	BDPDU_NOTAVAIL_DROP_DIS	THis is mostly relevant fragmented packets since we create frag BD. set to 1'b1: the packets will not be dropped when bmu indicates no bdpdu is avail, then we will wait for it to be available and will not drop the packet. 1'b0: default we will drop the packets when bdpdu is not available Reset State: 0x00000000
2	REORDER_DIS	when set the hardware buffer reordering support is disabled. Reset State: 0x00000000
1	FLUSH_EVENT_FWD_MODE_SEL	This bit selects between two modes of forwarding packets dpu due to internal flushing events. These events could be that 1.polling timer expired and we found a staid/qid which is aged 2. RPE memory threshold is reached and we can not hold packets 3. software requests these packets to be forwarded 1'b0: Mode1 flushing rule is selected For the selected staid/qid bitmap all the queues packets in all slots are forwarded to DPU New SSN = old SSN + slot of last queued packet 1b1: Mode2 flushing rule is selected For the selected staid/qid bitmap find the first queued packet and forward all the queued packets till next hole Reset State: 0x00000000
0	LRU_OR_RR	This register should always be set to Zero. Initially it was reserved for LRU which was not implemented. No one should touch this register. If it is set to 1-> RPE will not work Reset State: 0x00000000

0x3000010 RPE_ROUTING_FLAG

Type: read-write
Reset State: 0x00FF0003

This register will allow you to program routing table for RPE

RPE_ROUTING_FLAG

Bits	Name	Description
23:16	ROUTING_DROP_PACKET	All the BAD (error) packets will be pushed to this WQ default value gives the DROP wq == decimal 255 -- duplicate det packets during bit map updated -- duplicate or flushing fragments -- out of order etc --... Reset State: 0x000000FF
7:0	ROUTING_GOOD_PACKET	All good packets will be forwarded to WQ programmed in this field Default WQ is DPU Reset State: 0x00000003

0x3000014 RPE_SW_FLUSH_BITMAP_CACHE

Type: read-write
Reset State: 0x00000000

This register allows software to flush the caches for full state or partial state bitmaps

RPE_SW_FLUSH_BITMAP_CACHE

Bits	Name	Description
28:24	CFG_FWD_TO_DPU_STAID	This is basically used for software controlled forward packets to DPU This field has the STAID for which the software wants to forward the packets to DPU Write the staid whose packets all need to be forwarded to DPU by also enabling bit 21 in this register Reset State: 0x00000000
23	FWD_TO_DPU_FAIL_STATUS	Whenever this bit is set that means the forward to dpu is failed due to fifo full. Writing zero to this bit will clear it if this bit is set software need to reissue fwd to DPU Reset State: 0x00000000
22	FWD_TO_DPU_DONE_STATUS	This bit indicates status when software initiated fwd to dpu. Whenever this bit is set that means the forward to dpu is done Writing zero to this bit will clear it Reset State: 0x00000000
21	CFG_FWD_TO_DPU	Enabling this bit will allow RPE to forward all the packets queued in all the slots for the staid and qid written in this register bits 19:16= qid, 26:24 staid Reset State: 0x00000000

RPE_SW_FLUSH_BITMAP_CACHE (cont.)

Bits	Name	Description
19:16	CFG_FWD_TO_DPU_QID	This is basically used for software controlled forward packets to DPU This field has the QID for which the software wants to forward the packets to DPU Write the qid whose packets all need to be forwarded to DPU. The stationid is in bits 26:24 and the enable for this Reset State: 0x00000000
4	CFG_FLUSH_PARTIALSTATE_CACHE	Writing to this will flush the bitmap maintained in the cache set to 1'b1: fullstate bitmap in the cache is written to memory after the flush H/W will invalidate the cache Reset State: 0x00000000
0	CFG_FLUSH_FULLSTATE_CACHE	Writing to this will flush the fullstate bitmap maintained in the cache set to 1'b1: fullstate bitmap in the cache is written to memory after the flush H/W will invalidate the cache Reset State: 0x00000000

0x3000018 RPE_FULLSTATE_BITMAP_CACHE_DW1

Type: read-only
Reset State: 0x00000000

When read, it gives the lower 32 bits of fullstate bitmap that is in the cache. The staid/qid of this cache is in register stationid_qid_4_fullstate_bitmap

RPE_FULLSTATE_BITMAP_CACHE_DW1

Bits	Name	Description
31:0	BITMAP_CACHE_DW1	Indicates following fields ENTRY_VAL 0 RSVD 6:1 REORDR_BUF 7 RETRY_CHK 8 FLUSH_FRAG 9 ORDR_CHK 10 FRAG_CHK 11 IEEE_2K_CHK 12 WIN_SIZE 18:13 SSN_VAL 19 SSN 31:20 Reset State: 0x00000000

0x300001C RPE_FULLSTATE_BITMAP_CACHE_DW2

Type: read-only
Reset State: 0x00000000

When read, it gives the middle 32 bits 63:32 of fullstate bitmap that is in the cache. The staid/qid of this cache is in register stationid_qid_4_fullstate_bitmap

RPE_FULLSTATE_BITMAP_CACHE_DW2

Bits	Name	Description
31:0	BITMAP_CACHE_DW2	This is the actual bitmap which shows lower 32 bits 31:0 Reset State: 0x00000000

0x3000020 RPE_FULLSTATE_BITMAP_CACHE_DW3

Type: read-only
Reset State: 0x00000000

When read, it gives the upper 32 bits 95:64 of fullstate bitmap that is in the cache. The staid/qid of this cache is in register stationid_qid_4_fullstate_bitmap

RPE_FULLSTATE_BITMAP_CACHE_DW3

Bits	Name	Description
31:0	BITMAP_CACHE_DW3	This is bitmap which shows upper 32 bits Reset State: 0x00000000

0x3000024 RPE_STATIONID_QID_4_FULLSTATE_BITMAP

Type: read-only
Reset State: 0x00000000

When read, it gives you the station/qid the above bitmap belongs to.

RPE_STATIONID_QID_4_FULLSTATE_BITMAP

Bits	Name	Description
19:16	QID_4_FULLSTATE_BITMAP	Qid for the fullstate bitmap in cache Reset State: 0x00000000
4:0	STATIONID_4_FULLSTATE_BITMAP	Station id for the fullstate bitmap in cache Reset State: 0x00000000

0x3000028 RPE_PARTIALSTATE_BITMAP_CACHE_DW1

Type: read-only
Reset State: 0x00000000

When read, it gives the lower 32 bits 31:0 of partialstate bitmap that is in the cache. The staid/qid of this cache is in register stationid_qid_4_partialstate_bitmap.

RPE_PARTIALSTATE_BITMAP_CACHE_DW1

Bits	Name	Description
31:0	BITMAP_CACHE_DW1	Indicates following fields ENTRY_VAL 0 RSVD 6:1 REORDR_BUF 7 RETRY_CHK 8 FLUSH_FRAG 9 ORDR_CHK 10 FRAG_CHK 11 IEEE_2K_CHK 12 WIN_SIZE 18:13 SSN_VAL 19 SSN 31:20 Reset State: 0x00000000

0x300002C RPE_PARTIALSTATE_BITMAP_CACHE_DW2

Type: read-only
Reset State: 0x00000000

When read, it gives the middle 32 bits 63:32 of partialstate bitmap that is in the cache. The staid/qid of this cache is in register stationid_qid_4_partialstate_bitmap.

RPE_PARTIALSTATE_BITMAP_CACHE_DW2

Bits	Name	Description
31:0	BITMAP_CACHE_DW2	This is the actual bitmap which shows lower 32 bits Reset State: 0x00000000

0x3000030 RPE_PARTIALSTATE_BITMAP_CACHE_DW3

Type: read-only
Reset State: 0x00000000

When read, it gives you upper 32 bits of partialstate bitmap.

RPE_PARTIALSTATE_BITMAP_CACHE_DW3

Bits	Name	Description
31:0	BITMAP_CACHE_DW3	This is bitmap which shows upper 32 bits Reset State: 0x00000000

0x3000034 RPE_STATIONID_QID_4_PARTIALSTATE_BITMAP

Type: read-only
Reset State: 0x00000000

When read, it gives you which station/qid the above bitmap belongs to

RPE_STATIONID_QID_4_PARTIALSTATE_BITMAP

Bits	Name	Description
19:16	QID_4_PARTIALSTATE_BITMAP	Qid for the partialstate bitmap in cache Reset State: 0x00000000
4:0	STATIONID_4_PARTIALSTATE_BITMAP	Station id for the partialstate bitmap in cache Reset State: 0x00000000

0x3000038 RPE_FRAGMENT_RESRC_ENTRY1_DW1

Type: read-only
Reset State: 0x00000000

When read, it gives you lower 32 bits of 1st resource of the 8 MPDUs maintained in RPE.

RPE_FRAGMENT_RESRC_ENTRY1_DW1

Bits	Name	Description
31:0	RESRC1_DW1	Indicates following fields ENTRY_VAL 0 STAID 8:1 QID 13:9 SSN 25:14 FRAG_NUM 29:26 LRU_ORDR 30 RSRC_ENA 31 Reset State: 0x00000000

0x300003C RPE_FRAGMENT_RESRC_ENTRY1_DW2

Type: read-only
Reset State: 0x00000000

When read, it gives you upper 32 bits of 1st resource of the 8 MPDUs maintained in RPE.

RPE_FRAGMENT_RESRC_ENTRY1_DW2

Bits	Name	Description
31:0	RESRC1_DW2	Indicates following fields BD_INDX 19:0 RSVD 31:20 Reset State: 0x00000000

0x3000040 RPE_FRAGMENT_RESRC_ENTRY2_DW1

Type: read-only
Reset State: 0x00000000

When read, it gives you lower 32 bits of 2nd resource of the 8 MPDUs maintained in RPE.

RPE_FRAGMENT_RESRC_ENTRY2_DW1

Bits	Name	Description
31:0	RESRC2_DW1	Indicates following fields ENTRY_VAL 0 STAID 8:1 QID 13:9 SSN 25:14 FRAG_NUM 29:26 LRU_ORDR 30 RSRC_ENA 31 Reset State: 0x00000000

0x3000044 RPE_FRAGMENT_RESRC_ENTRY2_DW2

Type: read-only
Reset State: 0x00000000

When read, it gives you upper 32 bits of 2nd resource of the 8 MPDUs maintained in RPE.

RPE_FRAGMENT_RESRC_ENTRY2_DW2

Bits	Name	Description
31:0	RESRC2_DW2	Indicates following fields BD_INDX 19:0 RSVD 31:20 Reset State: 0x00000000

0x3000078 RPE_ERR_INT_ENABLE

Type: read-write
Reset State: 0x00000000

This register allows you to enable any error interrupt.

RPE_ERR_INT_ENABLE

Bits	Name	Description
10	RP_SM_STUCK_ERR_INT_EN	When a 1 is written to this bit, it will enable interrupt when reorder packet state machine is hung Reset State: 0x00000000
9	REORDER_CMD_FIFO_FULL_INT_EN	When a 1 is written to this bit, it will enable interrupt whenever reorder command fifo is full Reset State: 0x00000000
8	B_2K_JUMP_SN_IN_BASESSION_INT_EN	When a 1 is written to this bit, it will enable interrupt whenever AMPDU packet is received whose SN has 2k jump Reset State: 0x00000000
7	B_2K_JUMP_SSN_IN_BAR_INT_EN	When a 1 is written to this bit, it will enable interrupt whenever BAR frame whose SSN has 2k jump Reset State: 0x00000000

RPE_ERR_INT_ENABLE (cont.)

Bits	Name	Description
6	BAR_IN_NON_BASESSION_INT_EN	When a 1 is written to this bit, it will enable interrupt whenever BAR frames are received in BA session Reset State: 0x00000000
5	FRAGPKT_IN_BASESSION_INT_EN	When a 1 is written to this bit, it will enable interrupt whenever fragmented packets are received in BA session Reset State: 0x00000000
4	BU_SM_STUCK_ERR_INT_EN	When a 1 is written to this bit, it will enable interrupt when bitmap update state machine is hung Reset State: 0x00000000
3	DD_SM_STUCK_ERR_INT_EN	When a 1 is written to this bit, it will enable interrupt when duplicate detect state machine is hung Reset State: 0x00000000
2	BMU_BD_AVAIL_ERR_INT_ENABLE	When a 1 is written to this bit, it will enable interrupt due to no available Bd/PDU in BMU Reset State: 0x00000000
1	GBI_ERR_INT_EN	When a 1 is written to this bit, it will enable interrupt due to gbi error Reset State: 0x00000000
0	GAM_ERR_INT_EN	When a 1 is written to this bit, it will enable interrupt due to gam error Reset State: 0x00000000

0x300007C RPE_ERR_INT_STATUS

Type: read-write
Reset State: 0x00000000

This register gives the status of error interrupt.

RPE_ERR_INT_STATUS

Bits	Name	Description
31:28	REASON_CODE	Gives the reason for which the above 4 BA session related interrupts have occurred 4'b0000 : No error 4'b0001 : Fragmented packets received in BA session 4'b0010 : BAR frame received in NON BA session 4'b0100 : BAR frame received with a 2k jump in SSN 4'b1000 : AMPDU frame received with 2k jump in Seq Number Reset State: 0x00000000
24:21	INT_QID	Gives QID for which above interrupt occured, if two interrupts happen one after another, the later one will overwrite the old one. Reason code will indicate which one of the interrupt was caused by this qid. Reset State: 0x00000000

RPE_ERR_INT_STATUS (cont.)

Bits	Name	Description
20:16	INT_STAID	Gives STAID of for which above interrupt occurred, if two interrupts happen one after another, the later one will overwrite the old one. Reason code will indicate which interrupt was caused by this STAID Reset State: 0x00000000
10	RP_SM_STUCK_ERR_INT_STATUS	When this bit is 1 indicates reorder packet state machine is hung, writing a 1 to this bit will clear the interrupt Reset State: 0x00000000
9	REORDER_CMD_FIFO_FULL_INT_STATUS	When this bit is set it will indicate reorder command fifo is full. Writing a 1 will clear this interrupt Reset State: 0x00000000
8	B_2K_JUMP_SN_IN_BASESSION_INT_STATUS	When this bit is set it indicates that a AMPDU packet is received whose SN has 2k jump. Writing a 1 will clear this interrupt and the reason code. Reset State: 0x00000000
7	B_2K_JUMP_SSN_IN_BAR_INT_STATUS	When this bit is set it indicates that a BAR frame is received whose SSN has 2k jump. Writing a 1 will clear this interrupt and the reason code Reset State: 0x00000000
6	BAR_IN_NON_BASESSION_INT_STATUS	When this bit is set it indicates that a BAR frame is received in a non BA session. Writing a 1 will clear this interrupt and the reason code Reset State: 0x00000000
5	FRAGPKT_IN_BASESSION_INT_STATUS	When this bit is 1 it will indicate that fragmented packets are received in BA session. Writing a 1 will clear this interrupt and the reason code Reset State: 0x00000000
4	BU_SM_STUCK_ERR_INT_STATUS	When this bit is 1 indicates bitmap update state machine is hung, writing a 1 to this bit will clear the interrupt Reset State: 0x00000000
3	DD_SM_STUCK_ERR_INT_STATUS	When this bit is 1 indicates duplicate detect state machine is hung, writing a 1 to this bit will clear the interrupt Reset State: 0x00000000
2	BMU_BD_AVAIL_ERR_INT_STATUS	When this bit is 1 indicates BMU has rUn out of BDs, writing a 1 to this bit will clear the interrupt. Reset State: 0x00000000
1	GBI_ERR_INT_STATUS	When this bit is 1 indicates gbi error interrupt has occurred, writing a 1 to this bit will clear the interrupt. Reset State: 0x00000000
0	GAM_ERR_INT_STATUS	When this bit is 1 indicates gam error interrupt has occurred, writing a 1 to this bit will clear the interrupt. Reset State: 0x00000000

0x3000080 RPE_CUR_STATE_BU_DD

Type: read-only
Reset State: 0x00010001

Gives current state of state machine bitmap update and duplicate detect. This register can be used to check the state if bit 5 or 6 in err_int_status is set.

RPE_CUR_STATE_BU_DD

Bits	Name	Description
28:16	CUR_STATE_BU	current status of bitmap update state machine Reset State: 0x00000001
7:0	CUR_STATE_DD	current status of duplicate detect state machine Reset State: 0x00000001

0x3000084 RPE_CUR_STATE_RA_RR

Type: read-only
Reset State: 0x00010001

Gives current state of state machine reassembly and reorder. This register can be used to check the state if bit 3 or 4 in err_int_status is set.

RPE_CUR_STATE_RA_RR

Bits	Name	Description
27:16	CUR_STATE_RA	current status of reassembly state machine Reset State: 0x00000001
4:0	CUR_STATE_RR	current status of reorder state machine Reset State: 0x00000001

0x3000088 RPE_CUR_STATE_DMA

Type: read-only
Reset State: 0x00010001

Gives current state of state machine DMA control. This register can be used to check the state if bit 7 in err_int_status is set.

RPE_CUR_STATE_DMA

Bits	Name	Description
22:16	CUR_STATE_RP	current status of reorder packet control state machine Reset State: 0x00000001
15:0	CUR_STATE_DMA	current status of DMA control state machine Reset State: 0x00000001

0x300008C RPE_SEND_PKT_STATS

Type: read-write
Reset State: 0x00000000

This registers gives the count of all packets sent. It rolls over after reaching max count.

RPE_SEND_PKT_STATS

Bits	Name	Description
31:0	SEND_PKT_STATS	gives stats for sent packets Reset State: 0x00000000

0x3000090 RPE_DROP_PKT_STATS

Type: read-write
Reset State: 0x00000000

This register gives the count of all packets dropped by RPE. It rolls over after reaching max count.

RPE_DROP_PKT_STATS

Bits	Name	Description
31:0	DROP_PKT_STATS	gives stats for drop packets Reset State: 0x00000000

0x3000094 RPE_GET_BMU_FAIL_STATS

Type: read-only
Reset State: 0x00000000

This registers gives statistics for how many times get bmu failed. It rolls over after reaching max count.

RPE_GET_BMU_FAIL_STATS

Bits	Name	Description
15:0	GET_BMU_FAIL_STATS	Gives stats for get bmu failures Reset State: 0x00000000

0x3000098 RPE_RPE_TESTBUS_LOWER

Type: read-only
Reset State: 0x00000000

This registers gives testbus for lower 32bits.

RPE_RPE_TESTBUS_LOWER

Bits	Name	Description
31:0	RPE_TESTBUS_LOWER	lower 32bit of the testbus (31:0) Reset State: 0x00000000

0x300009C RPE_RPE_TESTBUS_UPPER

Type: read-only
Reset State: 0x00000000

This registers gives bits 44:32 of testbus.

RPE_RPE_TESTBUS_UPPER

Bits	Name	Description
12:0	RPE_TESTBUS_UPPER	upper 13bits bits 44:32 of testbus Reset State: 0x00000000

0x3000100 RPE_RPE_BITMAP_DUPLICATE_CNTR

Type: read-only
Reset State: 0x00000000

Gives the number of bitmap updates and duplicate detect received from RXP.

RPE_RPE_BITMAP_DUPLICATE_CNTR

Bits	Name	Description
28:16	BITMAP_UPDATE_CNTR	Counter value for bitmap update and it rolls over after reaching max cnt Reset State: 0x00000000
11:0	DUPLICATE_DETECT_CNTR	Counter value for duplicate detect and it rolls over after reaching max cnt Reset State: 0x00000000

0x3000104 RPE_RPE_SW_FLUSH_RSRC_ENTRY

Type: read-write
Reset State: 0x00000000

This register allows software flush any fragment resources software can program staid and qid for which if an resource entry for reassembly exists then it needs to be flushed.

RPE_RPE_SW_FLUSH_RSRC_ENTRY

Bits	Name	Description
19:16	SW_FLUSH_RSRC_ENTRY_QUEUE	This register gives queue id along with above station for which entry needs to be flushed Reset State: 0x00000000
12:8	SW_FLUSH_RSRC_STAID	This register indicates the station for which software wants to flush any resource held for this station Reset State: 0x00000000
1	SW_FLUSH_RSRC_ENTRY_STATUS	This gives status of flush if high that means it is still ongoing when it is zero it indicates we are ready for another flush Reset State: 0x00000000
0	SW_FLUSH_RSRC_ENTRY	Writing 1 to this bit and then writing staid and qid in this same register will allow H/w to flush any resource held for this station and queue this bit is automatically cleared when flush is done Reset State: 0x00000000

0x3000108 RPE_RPE_SW_BLOCK_PKTS

Type: read-write
Reset State: 0x00000000

This register gives staid and qid for which all packets needs to be blocked. blocking means all packets to that staid/qid will be dropped If there are any packets in reorder buffer before block software needs to forward them using fwd dpu feature by sw

RPE_RPE_SW_BLOCK_PKTS

Bits	Name	Description
19:16	SW_BLOCK_QID	This register gives queue id along with above station for which packets needs to be blocked Reset State: 0x00000000
12:8	SW_BLOCK_STAID	This register indicates the station for which software wants to block any packets coming in to this station and the qid given below Reset State: 0x00000000
0	SW_BLOCK_REQ	Writing 1 to this bit and then writing staid and qid in this same register will make RPE drop any packets coming to this particular staid and qid Reset State: 0x00000000

0x300010C RPE_REORDER_BITMAP_CACHE_DW1

Type: read-only
Reset State: 0x00000000

When read, it gives the lower 32 bits of reorder bitmap.

RPE_REORDER_BITMAP_CACHE_DW1

Bits	Name	Description
31:0	REORDER_CACHE_DW1	This is the actual reorder bitmap which shows lower 32 bits Reset State: 0x00000000

0x3000110 RPE_REORDER_BITMAP_CACHE_DW2

Type: read-only
Reset State: 0x00000000

When read, it gives the middle 32 bits of reorder bitmap.

RPE_REORDER_BITMAP_CACHE_DW2

Bits	Name	Description
31:0	REORDER_CACHE_DW2	This is the actual reorder bitmap which shows upper 32 bits Reset State: 0x00000000

0x3000114 RPE_REORDER_BITMAP_CACHE_DW3

Type: read-only
Reset State: 0x00000000

When read, it gives the upper 32 bits of reorder bitmap.

RPE_REORDER_BITMAP_CACHE_DW3

Bits	Name	Description
31:0	BITMAP_CACHE_DW3	[11:0] reorder SSN [12] reorder SSN val [18:13]reorder window size [31:19] reserved Reset State: 0x00000000

0x3000120 RPE_MEMORY_THRESHOLD_FOR_RPE

Type: read-write
Reset State: 0x000DFFFF

This register contains the memory threshold value up to which RPE can hold the packets. When threshold is reached, RPE will start forwarding packets to DPU until the memory threshold value goes down.

RPE_MEMORY_THRESHOLD_FOR_RPE

Bits	Name	Description
19:18	MEMORY_UNITS	The number of pdus that are stored per packet in memory. In terms of PDUS this number can be either multiple of 128/256/512/1024, depending on what is programmed in these registers 00 - 128bytes 01 - 256 10 - 512 11 - 1024 Reset State: 0x00000003
16:0	MEMORY_THRESHOLD	Program the memory threshold (in bytes) for RPE by default this value is high so that it does not get triggered Reset State: 0x0001FFFF

0x3000124 RPE_POLLING_THRESHOLD_FOR_RPE

Type: read-write
Reset State: 0x00FFFFFF

This register contains the polling timer threshold value. Once the threshold value is reached, RPE will in a round-robin way look at the timestamp of the particular staid/qid value and compare it to one of the four aging threshold (registers below). Then all the packets held for that staid/qid are forwarded to DPU.

RPE_POLLING_THRESHOLD_FOR_RPE

Bits	Name	Description
23:0	POLLING_THRESHOLD	Program the polling threshold for RPE, this is count of number of microseconds by default this value is high so that it does not get triggered Polling timeout value is calculated as follows = Aging timeout ---------- Aging timeout is programmed in the register, stations and queues registers already exist, C is some constant number which can vary depending on number of stations and Queues By default this value is 1ms Reset State: 0x00FFFFFF

0x3000128 RPE_AGING_THRESHOLD_FOR_AC0

Type: read-write
Reset State: 0x00000000

This register contains the aging threshold value for qids that are in ac0. This is the value that tells whether the staid/qid needs to be aged out; the units are in microseconds.

RPE_AGING_THRESHOLD_FOR_AC0

Bits	Name	Description
31:0	AGING_THRESHOLD_FOR_AC0	Program the aging threshold for RPE Reset State: 0x00000000

0x300012C RPE_AGING_THRESHOLD_FOR_AC1

Type: read-write
Reset State: 0x00000000

This register contains the aging threshold value for qids that are in ac1. This is the value that tells whether the staid/qid needs to be aged out; the units are in microseconds.

RPE_AGING_THRESHOLD_FOR_AC1

Bits	Name	Description
31:0	AGING_THRESHOLD_FOR_AC1	Program the aging threshold for RPE Reset State: 0x00000000

0x3000130 RPE_AGING_THRESHOLD_FOR_AC2

Type: read-write
Reset State: 0x00000000

This register contains the aging threshold value for qids that are in ac2. This is the value that tells whether the staid/qid needs to be aged out; the units are in microseconds.

RPE_AGING_THRESHOLD_FOR_AC2

Bits	Name	Description
31:0	AGING_THRESHOLD_FOR_AC2	Program the aging threshold for RPE Reset State: 0x00000000

0x3000134 RPE_AGING_THRESHOLD_FOR_AC3

Type: read-write
Reset State: 0x00000000

This register contains the aging threshold value qids for ac3. This is the value that tells whether the staid/qid needs to be aged out; the units are in microseconds.

RPE_AGING_THRESHOLD_FOR_AC3

Bits	Name	Description
31:0	AGING_THRESHOLD_FOR_AC3	Program the aging threshold for RPE Reset State: 0x00000000

0x3000138 RPE_QID_TO_AC0_MAPPING

Type: read-write
Reset State: 0x0F0F0F0F

This register contains qid to ac0 mapping.

RPE_QID_TO_AC0_MAPPING

Bits	Name	Description
27:24	QID3_AC0_MAPPING	Program in this field the third qid, which belongs to access category 0 Reset State: 0x0000000F
19:16	QID2_AC0_MAPPING	Program in this field the third qid, which belongs to access category 0 Reset State: 0x0000000F
11:8	QID1_AC0_MAPPING	Program in this field the second qid, which belongs to access category 0 Reset State: 0x0000000F

RPE_QID_TO_AC0_MAPPING (cont.)

Bits	Name	Description
3:0	QID0_AC0_MAPPING	Program in this field the first qid, which belongs to access category 0 Reset State: 0x0000000F

0x300013C RPE_QID_TO_AC1_MAPPING

Type: read-write
Reset State: 0x0F0F0F0F

This register contains qid to ac1 mapping.

RPE_QID_TO_AC1_MAPPING

Bits	Name	Description
27:24	QID3_AC1_MAPPING	Program in this field the third qid, which belongs to access category 1 Reset State: 0x0000000F
19:16	QID2_AC1_MAPPING	Program in this field the third qid, which belongs to access category 1 Reset State: 0x0000000F
11:8	QID1_AC1_MAPPING	Program in this field the second qid, which belongs to access category 1 Reset State: 0x0000000F
3:0	QID0_AC1_MAPPING	Program in this field the first qid, which belongs to access category 1 Reset State: 0x0000000F

0x3000140 RPE_QID_TO_AC2_MAPPING

Type: read-write
Reset State: 0x0F0F0F0F

This register contains qid to ac2 mapping

RPE_QID_TO_AC2_MAPPING

Bits	Name	Description
27:24	QID3_AC2_MAPPING	Program in this field the third qid, which belongs to access category 2 Reset State: 0x0000000F

RPE_QID_TO_AC2_MAPPING (cont.)

Bits	Name	Description
19:16	QID2_AC2_MAPPING	Program in this field the third qid, which belongs to access category 2 Reset State: 0x0000000F
11:8	QID1_AC2_MAPPING	Program in this field the second qid, which belongs to access category 2 Reset State: 0x0000000F
3:0	QID0_AC2_MAPPING	Program in this field the first qid which belongs to access category 2 Reset State: 0x0000000F

0x3000144 RPE_QID_TO_AC3_MAPPING

Type: read-write
Reset State: 0x0F0F0F0F

This register contains qid to ac3 mapping.

RPE_QID_TO_AC3_MAPPING

Bits	Name	Description
27:24	QID3_AC3_MAPPING	Program in this field the third qid, which belongs to access category 3 Reset State: 0x0000000F
19:16	QID2_AC3_MAPPING	Program in this field the third qid, which belongs to access category 3 Reset State: 0x0000000F
11:8	QID1_AC3_MAPPING	Program in this field the second qid, which belongs to access category 3 Reset State: 0x0000000F
3:0	QID0_AC3_MAPPING	Program in this field the first qid, which belongs to access category 3 Reset State: 0x0000000F

0x3000148 RPE_RPE_MEM_BYTES_USED

Type: read-only
Reset State: 0x00000000

This register will give the amount of memory used by RPE in bytes.

RPE_RPE_MEM_BYTES_USED

Bits	Name	Description
16:0	RPE_MEM_BYTES_USED	when RPE does reordering it may have to hold some packets in the memory this register gives the total memory used in bytes Reset State: 0x00000000

0x300014C RPE_FWD_TO_DPU_EVENT_PKT_STATS

Type: read-only
Reset State: 0x00000000

This register gives count of all packets forwarded by RPE due to internal events like aging, mem threshold reached and software request. It rolls over after reaching max count.

RPE_FWD_TO_DPU_EVENT_PKT_STATS

Bits	Name	Description
15:0	FWD_TO_DPU_EVENT_PKT_STATS	gives stats for packets forwarded to DPU due to internal events Reset State: 0x00000000

0x3000150 RPE_SPARE_AND_CLK_GATE_DISABLE

Type: read-write
Reset State: 0x00000000

This register has some spare bits and local clock gating disable bits

RPE_SPARE_AND_CLK_GATE_DISABLE

Bits	Name	Description
23:16	SPARE_BITS	read writable spare bits Reset State: 0x00000000
7:0	LOCAL_CLK_GATE_DISABLE	local clock gate disable bit0: config module bit1: duplicate_detect and arbiter module bit 2 : bitmap_update bit 3 : dma_control bit 4 : reassembly bit 5 : command_fifo bit 6 : reorder_packet bit 7 : reorder_buffer Reset State: 0x00000000

16.2.46 rxp

0x3000000 RXP_CONFIG

Type: read-write
Reset State: 0x00000100

It contains RXP Configuration registers. These configurations (with the exception of soft abort and mask_subsq_fcs_err_within_ampdu) can be changed at any time by software, but hardware will take effect only during the gap of packets so that software will not corrupt packets during configuration.

RXP_CONFIG

Bits	Name	Description
15	CFG_RESERVED	These are reserved for future configuration. Reset State: 0x00000000
14	CFG_MPR_DISABLE_WAIT_FOR_FILTER_IDLE	When set, this will disable the 'wait for filter to finish, when eop is received' function. This is a bug fix. This configuration bit will allow the bug fix to be disabled and the rxp logic to be reverted to the original implementation. This allows for backwards compatibility. Reset State: 0x00000000
13	RRI_CLEAR_ON_FCS_FAIL	If set, this will enable RRI regeneration when the first RRI got followed by and FCS err. Reset State: 0x00000000
12	MASK_SUBSQ_FCS_ERR_WITHIN_AMPDU	If set, this will mask out fcs error notification to the MTU after an MPDU within an AMPDU passes FCS check. This is to prevent doing EIFS in this case. Reset State: 0x00000000
11	SOFT_PMI_ABORT_EN	Soft PMI abort enable. Reset State: 0x00000000
10	CFG_HAS_FCS_EN	If set, RXP will enable writing 4-byte fcs into BD/PDU and RXP flag has_fcs flag will be set to 1. By default, the RXP DMA will NOT write fcs into BD/PDU and MPDU length does not include the 4-byte fcs. Reset State: 0x00000000
9	CFG_RSV_BMU_EN	If set, RXP will enable sending reservation command to BMU. By default, the RXP DMA will NOT send reservation command to BMU at start of packet. Reset State: 0x00000000
8	CFG_HAS_PHY_CMD	If set, RXP will write PHY Command into BD. By default, the PHY Command will not be put into BD so that software can adjust the "mpdu_header_start_offset" to save the BD space for MPDU data. Note that the TimeStamp will be in BD in any case. Reset State: 0x00000001

RXP_CONFIG (cont.)

Bits	Name	Description
7	CFG_HAS_DLM	This is not implemented! If set, the Delimiter of A-MPDU packet will be treated as part of MPDU and be written into BD starting at "MPDU header start offset". This is used to preserve and write Delimiter into BD after Delimiter processing. By default, the Delimiter is consumed by Delimiter Processing and will not be written into BD. Reset State: 0x00000000
6	CFG_DISABLE_DLM_PROC	If set to disable, the Delimiter Processing is disabled for A-MPDU packets and the whole A-MPDU packet will be sent to mCPU without MPDU Processing. The byp_dlm_proc and byp_mpdu_proc will be asserted for A-MPDU packets. By default, Delimiter Processing is enabled. Note: This cfg_disable_dlm_proc will affect only A-MPDU packets, but not MPDU packets. Reset State: 0x00000000
5	CFG_DISABLE_MPDU_PROC	If set to disable, the MPDU Processing is disabled for MPDU packets and the MPDU packets will be sent to mCPU without MPDU processing. This means NO FCS check, NO address filtering, and NO binary search. The packets are assumed passing MPDU processing. By default, MPDU Prcessing is enabled. Note: This cfg_disable_mpdu_proc will affect only MPDU packets, but not A-MPDU packets. This means MPDU within A-MPDU will be processed normally (without bypass) if cfg_disable_dlm_proc is not asserted for A-MPDU packets. Reset State: 0x00000000
4	CFG_DISABLE_FCS_CHECK	If set to disable, the FCS Check is disabled and all packets will be treated as passing FCS Check. By default, it is enabled and RXP will check FCS on MPDU packets. The counter associated with this config is fcs_err_cnt. If not disabled, this counter will increment if a packet has FCS error. Reset State: 0x00000000
3	CFG_MAX_PKTLEN_CHECK_EN	The max packet length check enable bit. By default, the max_pktlen check is disabled. If set, it will check MPDU packet length against max_pktlen register and check A-MPDU packet length against max_len_ampdu register. But it will not affect max_len_mpdu_in_ampdu which is checked in delimiter processing and can be disabled by asserting cfg_disable_dlm_proc. Reset State: 0x00000000
2	CFG_ADDR_FILTER_EN	If set, the Address Filter will be enabled. By default, it is disabled and all packets will be treated as passing Address Filtering. Reset State: 0x00000000
1	CFG_GEN_SHUTOFF_EN	If set, RXP will generate shutoff signal to PHY. By default, it will NOT generate shutoff signal. If shutoff is generated to PHY, PHY will stop receiving the current packet. This is used to save power. Reset State: 0x00000000

RXP_CONFIG (cont.)

Bits	Name	Description
0	CFG_RXP_EN	If enabled, RXP will receive packets from PHY. By default, the RXP is disabled and will not receive any packet from PHY. This bit can be changed at any time, but will only take effect when there is start pulse from PHY. Reset State: 0x00000000

0x3000008 RXP_MAX_PKTLEN

Type: read-write
Reset State: 0x00000040

The Max MPDU Packet Length in terms of the number bytes. It includes mac_header+payload+fcs, but does not include PHY data.

RXP_MAX_PKTLEN

Bits	Name	Description
6:0	MAX_PKTLEN	The Max MPDU Packet Length in terms of the number 128 bytes. Reset State: 0x00000040

0x300000C RXP_ROUTING_FLAG

Type: read-write
Reset State: 0x00000000

The Routing flag in BD.

RXP_ROUTING_FLAG

Bits	Name	Description
16:11	ROUTING_FLAG	This register is used to fill the reserved bits in the first Dword of the RxBD This location matches the reserved bits in first Dword, Software mainly uses this Reset State: 0x00000000

0x3000010 RXP_MPDU_HEADER_START_OFFSET

Type: read-write
Reset State: 0x00000040

The MPDU header start offset in BD, which is in the unit of data word (4-byte).

RXP_MPDU_HEADER_START_OFFSET

Bits	Name	Description
7:2	MPDU_HEADER_START_OFFSET	MPDU header start offset in BD. Note that the programmable bits are [7:2] and the lower [1:0] bits are always 2'b00 to guarantee the offset address is 4-byte aligned. If bit[7] is 0, the MPDU header starts at BD, but if bit[7] is 1, the MPDU header starts at PDU. Note that It is not valid to have the value of 6'h3f for bit[7:2] (or 8'hfc for bit[7:0]). The default value is 6'ha which means the offset address of 8'h28. In this case, the PHY Cmd bytes will not be written in BD so that the MPDU header can start right after TimeStamp field. However, for diagnostic purpose, the PHY Cmd can be written into BD by setting cfg_has_phy_cmd bit in config register so that this offset value will be adjusted to 6'h10 which means the offset address of 8'h40. Reset State: 0x00000010

0x300002C RXP_SEARCH_ADDR1_PTR

Type: read-write
Reset State: 0x00000000

SW can set the addr1 pointers of Binary Search.

RXP_SEARCH_ADDR1_PTR

Bits	Name	Description
16	ADDR1_POINTERS_VALID	When set, the pointers are valid. Reset State: 0x00000000
12:8	ADDR1_SEARCH_HI_PTR	Indicate the addr1 pointer of Binary Search upper bound. Reset State: 0x00000000
4:0	ADDR1_SEARCH_LO_PTR	Indicate the addr1 pointer of Binary Search lower bound. Reset State: 0x00000000

0x3000030 RXP_SEARCH_ADDR2_PTR

Type: read-write
Reset State: 0x00000000

SW can set the addr2 pointers of Binary Search.

RXP_SEARCH_ADDR2_PTR

Bits	Name	Description
16	ADDR2_POINTERS_VALID	When set, the pointers are valid. Reset State: 0x00000000
12:8	ADDR2_SEARCH_HI_PTR	Indicate the addr2 pointer of Binary Search upper bound. Reset State: 0x00000000
4:0	ADDR2_SEARCH_LO_PTR	Indicate the addr2 pointer of Binary Search lower bound. Reset State: 0x00000000

0x3000034 RXP_SEARCH_ADDR3_PTR

Type: read-write
Reset State: 0x00000000

SW can set the addr3 pointers of Binary Search.

RXP_SEARCH_ADDR3_PTR

Bits	Name	Description
16	ADDR3_POINTERS_VALID	When set, the pointers are valid. Reset State: 0x00000000
12:8	ADDR3_SEARCH_HI_PTR	Indicate the addr3 pointer of Binary Search upper bound. Reset State: 0x00000000
4:0	ADDR3_SEARCH_LO_PTR	Indicate the addr3 pointer of Binary Search lower bound. Reset State: 0x00000000

0x3000038 RXP_SEARCH_TABLE_CMD

Type: read-write
Reset State: 0x00000000

This is action register for indirect access to Binary Search Table. When software writes to this action register, it will trigger the interaction between Search_Table_Data[0-1] registers and Binary Search Table. For writing data into memory table, it is important for software to write into Search_Table_Data[0-1] registers before Search_Table_Cmd. For reading data from memory table, software only needs to write into Search_Table_Cmd and the read data will be available in Search_Table_Data[0-1] registers.

RXP_SEARCH_TABLE_CMD

Bits	Name	Description
9	STATUS	read only: If set to 1 a binary search table read or write is ongoing. Software should read and make sure this bit is 0 before issuing another cmd write into this register. Reset State: 0x00000000
8	WRITE	Indicate write/read. If 1, write. If 0, read. Reset State: 0x00000000
4:0	TABLE_PTR	Indicate the action should take effect on this entry number in Binary Search Table. Reset State: 0x00000000

0x300003C RXP_SEARCH_TABLE_DATA0

Type: read-write
Reset State: 0x00000000

This is data register 0 for indirect access to Binary Search Table. There are totally 3 Data registers for Binary Search address Table.

RXP_SEARCH_TABLE_DATA0

Bits	Name	Description
31:0	MAC_ADDR	MAC_Addr[31:0] portion of MAC_Addr[47:0]. Note: The order is Little Endian: MAC_Addr[31:0] = {Byte_3, Byte_2, Byte_1, Byte_0} Reset State: 0x00000000

0x3000040 RXP_SEARCH_TABLE_DATA1

Type: read-write
Reset State: 0x00000000

This is data register 1 for indirect access to Binary Search Table. There are totally 3 Data registers for Binary Search address Table.

RXP_SEARCH_TABLE_DATA1

Bits	Name	Description
31:29	DPU_MAN_MC_BC_SIG	This field is used to configure the DPU signature for Management mc/bc packets Reset State: 0x00000000
28	RSVD	reserved for future use Reset State: 0x00000000

RXP_SEARCH_TABLE_DATA1 (cont.)

Bits	Name	Description
27	VALID	Set when the sta address is valid Reset State: 0x00000000
26	RMF	Set when robust management frames require BIP or decryption Reset State: 0x00000000
25	FRAME_TRANSLATION	This bit is used to decide if a per station frame translation is required. When this bit is set and the bit in type/subtype is set then those packets for that station will require frame translation, so FT bit in BD will be set Reset State: 0x00000000
24	DROP	When set, on a address hit, the frame will be dropped. The setting of this bit is only valid when 'valid configuration' is set Reset State: 0x00000000
23:16	ADDR_ID	The addr_id[7:0]. Reset State: 0x00000000
15:0	MAC_ADDR	MAC_Addr[47:32] portion of MAC_Addr[47:0]. Note: The order is Little Endian: MAC_Addr[47:32] = {Byte_5, Byte_4} Reset State: 0x00000000

0x3000044 RXP_MAX_LEN_AMPDU

Type: read-write
Reset State: 0x0000FFFF

The Max Length for A-MPDU packet.

RXP_MAX_LEN_AMPDU

Bits	Name	Description
16:0	MAX_LEN	The Max Length for A-MPDU packet. Reset State: 0x0000FFFF

0x3000048 RXP_MAX_LEN_MPDU_IN_AMPDU

Type: read-write
Reset State: 0x00000FFF

The Max Length for MPDU in A-MPDU packet. This is used for delimiter processing to determine whether it finds a good delimiter.

RXP_MAX_LEN_MPDU_IN_AMPDU

Bits	Name	Description
13:0	MAX_LEN	The Max Length for MPDU in A-MPDU packet. Reset State: 0x00000FFF

0x300004C RXP_DMA_MAX_RSV_PDU

Type: read-write
Reset State: 0x00000008

The Max number of PDUs that RXP DMA can reserve at a time. The is to avoid the scenario that RXP drop big packet just because it fails to reserve a huge number of PDUs at the start of the packet.

RXP_DMA_MAX_RSV_PDU

Bits	Name	Description
3:0	MAX_RSV_PDU	The Max number of PDUs that RXP DMA can reserve at a time. Reset State: 0x00000008

0x3000050 RXP_DMA_BURST_THRESHOLD

Type: read-write
Reset State: 0x00000008

The data word threshold that RXP DMA control can start burst MPDU data to MIF. The data unit is 1 word (or 4 bytes). By default, the threshold is 8 words (or 32 bytes). RXP MPDU data is accumulated in DMA FIFO. The DMA control will not send data to MIF if the number of data word in DMA FIFO does not reach the threshold. This is to used to control the burstness of RXP data on AHB.

RXP_DMA_BURST_THRESHOLD

Bits	Name	Description
5:0	BURST_THRESHOLD	The data word threshold that DMA can start burst MPDU data to MIF. Reset State: 0x00000008

0x3000054 RXP_CLEAR_STATS

Type: read-write
Reset State: 0x00000000

This register is used to clear all stats.

RXP_CLEAR_STATS

Bits	Name	Description
0	CLEAR_STATS	When set, all statistics counters will be cleared When set, the hardware will automatically clear this bit. Reset State: 0x00000000

0x3000058 RXP_PHY_MPDU_CNT

Type: read-only
Reset State: 0x00000000

The number of MPDU packets that are received from PHY.

RXP_PHY_MPDU_CNT

Bits	Name	Description
31:0	PHY_MPDU_CNT	PHY MPDU Cnt. Reset State: 0x00000000

0x300005C RXP_PHY_AMPDU_CNT

Type: read-only
Reset State: 0x00000000

The number of A-MPDU packets that are received from PHY.

RXP_PHY_AMPDU_CNT

Bits	Name	Description
31:0	PHY_AMPDU_CNT	PHY A-MPDU Cnt. Reset State: 0x00000000

0x3000064 RXP_PHY_ABORT_CNT

Type: read-only
Reset State: 0x00000000

The number of aborted packets from PHY.

RXP_PHY_ABORT_CNT

Bits	Name	Description
7:0	PHY_ABORT_CNT	PHY Abort Packet Cnt. Reset State: 0x00000000

0x3000068 RXP_PHY_SHUTOFF_CNT

Type: read-only
Reset State: 0x00000000

The number of shutoff pulses that are generated by RXP to PHY.

RXP_PHY_SHUTOFF_CNT

Bits	Name	Description
7:0	PHY_SHUTOFF_CNT	PHY Shutoff Cnt. Reset State: 0x00000000

0x300006C RXP_DLM_FIFO_FULL_CNT

Type: read-only
Reset State: 0x00000000

The number of packets that have an error because DLM FIFO is full.

RXP_DLM_FIFO_FULL_CNT

Bits	Name	Description
7:0	DLM_FIFO_FULL_CNT	DLM FIFO Full Cnt. Reset State: 0x00000000

0x3000070 RXP_DLM_ERR_CNT

Type: read-only
Reset State: 0x00000000

The number of packets have error because Delimiter is bad. When a error is detected in the A-MPDU delimiter this count is incremented. But when RXP starts searching for the next A-MPDU delimiter, this count is NOT incremented. The implementation uses 'seen_dlm_err' flag. This flag is cleared for the first delimiter or after a good delimiter is found. It is set after a bad delimiter is found. If this flag is set, then don't increment the counter. This will increment whenever the next delimiter (using the previous good delimiter information) is not found in the expected location, or is bad.

RXP_DLM_ERR_CNT

Bits	Name	Description
7:0	DLM_ERR_CNT	DLM Error Cnt. Reset State: 0x00000000

0x3000074 RXP_FAIL_FILTER_CNT

Type: read-only
Reset State: 0x00000000

The number of packets that failed Address Filtering.

RXP_FAIL_FILTER_CNT

Bits	Name	Description
15:0	FAIL_FILTER_CNT	Fail Address Filter Cnt. Reset State: 0x00000000

0x3000078 RXP_FAIL_MAX_PKTLEN_CNT

Type: read-only
Reset State: 0x00000000

The number of packets that failed Max MPDU or AMPDU packet length check.

RXP_FAIL_MAX_PKTLEN_CNT

Bits	Name	Description
7:0	FAIL_MAX_PKTLEN_CNT	Fail Max MPDU or AMPDU Packet Length Check Cnt. Reset State: 0x00000000

0x300007C RXP_FCS_ERR_CNT

Type: read-only
Reset State: 0x00000000

The number of packets with FCS error.

RXP_FCS_ERR_CNT

Bits	Name	Description
31:0	FCS_ERR_CNT	FCS Error Cnt. Reset State: 0x00000000

0x3000080 RXP_DMA_SEND_CNT

Type: read-only
Reset State: 0x00000000

The number of packets sent to CPU by RXP Write DMA.

RXP_DMA_SEND_CNT

Bits	Name	Description
31:0	DMA_SEND_CNT	The number of packets are sent to CPU by RXP Write DMA. All packets in current system are all pushed by RXp refer to rpe dma send cnt for that. This counter increments only if RXP pushes packets directly to DXE Reset State: 0x00000000

0x3000084 RXP_DMA_DROP_CNT

Type: read-only
Reset State: 0x00000000

The number of packets are dropped by RXP Write DMA. This could increment due to: Failed filter PHY Abort AFTER the 9th command word BD/PDU errors If packet with command phase shorter or longer than actual command length specified is sent, the RXP will increment dma_drop_cnt instead of phy_err_drop_cnt (unless actual command phase < 9 words, in which case phy_err_drop_cnt will be incremented) Will NOT increment if end of psdu (as defined in psdu length by PHY command) occurs during search for next delimiter in AMPDU; this is because a new packet is not found, so there should not be a drop)

RXP_DMA_DROP_CNT

Bits	Name	Description
15:0	DMA_DROP_CNT	The number of packets are dropped by RXP Write DMA. Drop due to filter error, packet len error or Get bmu error any packet dropped at DMA due to any of above errors, these can be drop at DMA marked packets which may have filter fail errors Reset State: 0x00000000

0x3000088 RXP_DMA_GET_BMU_FAIL_CNT

Type: read-only
Reset State: 0x00000000

The number of packets dropped due to insufficient BD/PDUs BMU BD or PDU.

RXP_DMA_GET_BMU_FAIL_CNT

Bits	Name	Description
15:0	DMA_GET_BMU_FAIL_CNT	DMA No BMU BD/PDU Cnt. Reset State: 0x00000000

0x300008C RXP_PROTOCOL_VERSION_FILTER_CNT

Type: read-only
Reset State: 0x00000000

The number of packets dropped because of protocol version error.

RXP_PROTOCOL_VERSION_FILTER_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x3000090 RXP_TYPE_SUBTYPE_FILTER_CNT

Type: read-only
Reset State: 0x00000000

The number of packets dropped because of their type/subtype

RXP_TYPE_SUBTYPE_FILTER_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x3000094 RXP_INCORRECT_LENGTH_FILTER_CNT

Type: read-only
Reset State: 0x00000000

The length of the frame was not sufficient to do all the address filter checks. This may increment if dlm_fifo_full occurs.

RXP_INCORRECT_LENGTH_FILTER_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x3000098 RXP_ADDR1_BLOCK_FILTER_CNT

Type: read-only
Reset State: 0x00000000

Number of frames blocked based on the address one

RXP_ADDR1_BLOCK_FILTER_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x300009C RXP_ADDR1_HIT_NO_PASS_CNT

Type: read-only
Reset State: 0x00000000

Number of frames that got a hit in the binary search table but were instructed to be dropped because of the drop setting in the binary search table

RXP_ADDR1_HIT_NO_PASS_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x30000A0 RXP_ADDR1_DROP_CNT

Type: read-only
Reset State: 0x00000000

Number of frames that got dropped because there was no hit in the binary search table

RXP_ADDR1_DROP_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x30000A4 RXP_ADDR2_HIT_NO_PASS_CNT

Type: read-only
Reset State: 0x00000000

Number of frames that got a hit in the binary search table but were instructed to be dropped because of the drop setting in the binary search table

RXP_ADDR2_HIT_NO_PASS_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x30000A8 RXP_ADDR2_DROP_CNT

Type: read-only
Reset State: 0x00000000

Number of frames that got dropped because there was no hit in the binary search table

RXP_ADDR2_DROP_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x30000AC RXP_ADDR3_HIT_NO_PASS_CNT

Type: read-only
Reset State: 0x00000000

Number of frames that got a hit in the binary search table but were instructed to be dropped because of the drop setting in the binary search table

RXP_ADDR3_HIT_NO_PASS_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x30000B0 RXP_ADDR3_DROP_CNT

Type: read-only
Reset State: 0x00000000

Number of frames that got dropped because there was no hit in the binary search table

RXP_ADDR3_DROP_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x30000B4 RXP_MPDU_IN_AMPDU_CNT

Type: read-only
Reset State: 0x00000000

The number of MPDU packets are split from A-MPDU packets.

RXP_MPDU_IN_AMPDU_CNT

Bits	Name	Description
31:0	MPDU_IN_AMPDU_CNT	The number of MPDU packets are split from A-MPDU packets. Reset State: 0x00000000

0x30000B8 RXP_PHY_ERR_DROP_CNT

Type: read-only
Reset State: 0x00000000

The number of packets are dropped by RXP PHY Processing because of some apparent PHY protocol errors, such as: PHY Cmd Len is smaller than 9 bytes. PHY Cmd Len is larger than 28 bytes. PHY Stats Len is not equal to 8 bytes. Exception - if packet with command phase shorter longer than actual command length is sent, the RXP will increment dma_drop_cnt instead (however, if actual command length is < 9, this will be counted as a phy_err_drop) Note: The packets are dropped before reaching RXP Write DMA.

RXP_PHY_ERR_DROP_CNT

Bits	Name	Description
7:0	PHY_ERR_DROP_CNT	The number of packets are dropped by RXP PHY Processing. Reset State: 0x00000000

0x30000BC RXP_RADAR_DETECT_STATUS

Type: read-write
Reset State: 0x00000000

Radar detect status register. Pointers in radar detect circular buffer. Equal pointers means that the buffer is empty. There can be 0-63 entries in this circular buffer.

RXP_RADAR_DETECT_STATUS

Bits	Name	Description
24	RDR_DETECT_INT	status of the radar detect interrupt signal Reset State: 0x00000000
21:16	NR_ENTRIES	Number of entries filled in radar detect circular buffer. (0-63) Reset State: 0x00000000
13:8	TAIL_PTR	tail pointer of radar detect circular buffer Reset State: 0x00000000
5:0	HEAD_PTR	head pointer of radar detect circular buffer Reset State: 0x00000000

0x30000C0 RXP_RADAR_DETECT_CONTROL

Type: read-write
Reset State: 0x00000000

Radar detect control register.

RXP_RADAR_DETECT_CONTROL

Bits	Name	Description
8	RADAR_DETECT_ENABLE	Enable/disable storing of radar detect logs Reset State: 0x00000000
5:0	MIN_NR_LOGS_GEN_INT	Minimum number of stored logs to generate radar detect interrupt. 0 is a special case, which means to disable the interrupt. Reset State: 0x00000000

0x30000C4 RXP_RADAR_DETECT_LLOGS

Type: read-write
Reset State: 0x00000000

Radar detect lower word register.

RXP_RADAR_DETECT_LLOGS

Bits	Name	Description
31:0	RADAR_DETECT_LDATA	On read, the lower 4 bytes from the radar detect log as pointed by the tail pointer is returned. On write, the lower 4 bytes are written into the location pointed by the head pointer. Reset State: 0x00000000

0x30000C8 RXP_RADAR_DETECT_ULOGS

Type: read-write
Reset State: 0x00000000

Radar detect upper word register.

RXP_RADAR_DETECT_ULOGS

Bits	Name	Description
31:0	RADAR_DETECT_UDATA	On read, the lower 4 bytes from the radar detect log as pointed by the tail pointer is returned. After the read, the tail pointer is increased by one, except if that would cause it to become greater than the head pointer. On write, the lower 4 bytes are written into the location pointed by the head pointer. After the write, the head pointer is increased by one. If this would cause the head pointer to become equal to the tail pointer, the tail pointer would also be incremented. Reset State: 0x00000000

0x30000CC RXP_RADAR_DETECT_LOGS

Type: read-write
Reset State: 0x00000000

Radar detect logs counter register

RXP_RADAR_DETECT_LOGS

Bits	Name	Description
31	RADAR_DETECT_LOGS_CNT_CLEAR	When set, clears count of PHY written radar detect logs. This bit will automatically be cleared by HW. Reset State: 0x00000000
15:0	RADAR_DETECT_LOGS_CNT	Number of radar detect logs received from PHY. Reset State: 0x00000000

0x30000D0 RXP_SOFT_PMI_ABORT

Type: read-write
Reset State: 0x00000000

Soft PMI Abort register

RXP_SOFT_PMI_ABORT

Bits	Name	Description
0	SOFT_PMI_ABORT	Write only bit; when 1 is written to this bit, and soft_pmi_abort_en is 1, then a soft PHY abort will be generated. Error counters will be incremented as if an actual abort had occurred. Reset State: 0x00000000

0x30000D4 RXP_START_ERR_CNT

Type: read-only
Reset State: 0x00000000

The number of start errors on the PMI interface (pmi_rxp_starts received while still waiting for previous packet to complete).

RXP_START_ERR_CNT

Bits	Name	Description
7:0	PHY_START_ERR_CNT	PHY Start Error Cnt. Reset State: 0x00000000

0x30000D8 RXP_CCA_AND_EXT_TIMEOUT

Type: read-write
Reset State: 0x3C064090

Configuration bits for cca extensions and timeout functionality.

RXP_CCA_AND_EXT_TIMEOUT

Bits	Name	Description
31:21	CCA_PKTDET_6US_EXT_VALUE	THis is extension of packet detect, which is done only for 11b packets for 80Mhz clock : 11'd480 for 160Mhz clock : 11'd960 for 320Mhz clock : 11'd1920 Reset State: 0x000001E0
20:10	CCA_PKTDET_EXT_VALUE	THis is an additional extension of packet detect, if this is not needed it should be programmed to 1, otherwise hardware will use the default value of 11'd400 80Mhz clocks 80Hmz clock : 11'd400 160Mhz clock: 11'd800 320Mhz clock: 11'd1600. Reset State: 0x00000190
9	CCA_PKDET_EXTENTION_ALLOWED	when set it allows for 6us extension on ofdm packets Reset State: 0x00000000
8:4	FLT_TIMEOUT_TIME	This value represent that maximum time (in 256 OR 4096 120MHz clk cycle units) that the rxp filter will wait for two sequential MPDU header bytes to be received. If this time is not met, the rxp filter will drop the frame by indicating that the filter is done, but the frame does not pass the filter. The 'timeout_error_cnt' register contents will increase by 1. Reset State: 0x00000009
2	CCA_PKDET_EXTENTION_OLDLOGIC_DIS	when packet det gets de-asserted 5us extension is done, and at the end of 5us we look for command byte 6 for packet type whether it is ofdm and then do 6us additional extension. But PHY may not always give this info within 5us hence ofdm signal is used for this (which is the new logic). This logic is only enabled when you write 1 to this bit. Reset State: 0x00000000
1	FLT_TIMOUT_COUNT_UNIT	When clear, the timeout will count in 256 clk cycle units When set, the timeout counter will count in 4096 clk cycle units Reset State: 0x00000000
0	FLT_TIMEOUT_CHECK_DISABLED	When set, the rxp filter timeout check is disabled Reset State: 0x00000000

0x30000DC RXP_TIMEOUT_ERROR_CNT

Type: read-only
Reset State: 0x00000000

Number of times the rxp filter encounters a timeout As a result of this, the frame will be dropped

RXP_TIMEOUT_ERROR_CNT

Bits	Name	Description
7:0	TIMEOUT_COUNT	Number of times the rxp filter encounters a timeout Reset State: 0x00000000

0x30000E0 RXP_STALL_TIMEOUT_CNT

Type: read-only
Reset State: 0x00000000

Number of times stall timeout occurs. As a result of this, the frame will be dropped

RXP_STALL_TIMEOUT_CNT

Bits	Name	Description
7:0	STALL_TIMEOUT_COUNT	Number of times the PMI interface encounters a stall timeout Reset State: 0x00000000

0x30000EC RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ

Type: read-write
Reset State: 0x00000000

NAV control register and response requested register. The NAV PHY delay compensation can be programmed here. Also the control of how the NAV needs to be updated, or not at all, when the CCA was not asserted when a frame got received (and dropped) is configured here.

RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ

Bits	Name	Description
25	CFG_FLT_RESPONSE_REQ_WITH_HT_CONTROL	When set and the Response interrupt is generated, and the incoming frame has an HT control field (this is: incoming frame is QoS data frame and has the 'order' bit in the frame control field set), the response interrupt is only generated after the HT control field has been fully received and will be located in the reponse_header_info5 field. Setting this bit will also enable the generation of the 'HTC present' reporting in the enhanced_sequence_number_message_type Reset State: 0x00000000
24:21	CFG_FLT_NAV_RESERVED	reserved bits Reset State: 0x00000000
20	CFG_FLT_NAV_DELAY_COMPENSATION_VALUE_EN	When set, enables the NAV delay compensation functionality. This is, the NAV update value given to the MTU is compensated for the PHY delay. The compensation value is given in the bits: cfg_flt_nav_delay_compensation_value Reset State: 0x00000000
19:16	CFG_FLT_NAV_DELAY_COMPENSATION_VALUE	NAV compensation value in microseconds. Reset State: 0x00000000

RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ (cont.)

Bits	Name	Description
10	CFG_FLT_REGISTER_CCA_AT_START_OF_OBSERVE_TIME	When NOT set: no action When set: The RXP filter samples the setting of the primary cca signal at the start of the cca observe time. This sampled CCA is later used to determine if an NAV update is needed or NOT. The cca observe time is configured with other bits in this register. Reset State: 0x00000000
9	CFG_FLT_REGISTER_CCA_AT_END_OF_OBSERVE_TIME	When NOT set: no action When set: The RXP filter samples the setting of the primary cca signal at the end of the cca observe time. This sampled CCA is later used to determine if an NAV update is needed or NOT. The cca observe time is configured with other bits in this register. Reset State: 0x00000000
8	CFG_FLT_REGISTER_CCA_DURING_OBSERVE_TIME	When NOT set: no action When set: The RXP filter samples the setting of the primary cca signal during the entire duration of the cca observe time. If the cca goes low anywhere during this time, this is recorded and fixed. In that case, even if the CCA went high a little later, the sampled CCA value that is later used to determine if an NAV update is needed or NOT, will have a low value. The cca observe time is configured with other bits in this register. Reset State: 0x00000000
7	CFG_FLT_REGISTER_CCA_LEVEL_DURING_DATA_TIME	When NOT set: no action When set: The 'data reception time' as indicated by pktdet_n being low, is part of the cca observe time. Reset State: 0x00000000
6	CFG_FLT_REGISTER_CCA_LEVEL_DURING_PREAMBLE_TIME	When NOT set: no action When set: The 'data reception time as determined by early_pktdet_n being low, is part of the cca observe time. Reset State: 0x00000000
5	CFG_FLT_SKIP_DIFS_WHEN_NAV_UPDATE_MASKED	When NOT set: no action When set: When the RXP filter drops a frame and the NAV update is masked (due to enabling the NAV update masking features in this register), the 'skip_difs' signal to the MTU will be set. Reset State: 0x00000000
4	CFG_FLT_NO_NAV_UPDATE_ON_DROP_AND_BELOW_CCA	When NOT set: no action When set: When the RXP filter drops a frame due to any reason, AND the cca at the sample point was high, the RXP will NOT generate a NAV update based on the dropped frame. Reset State: 0x00000000
3	CFG_FLT_NO_NAV_UPDATE_ON_EXPLICIT_DROP_AND_BELOW_CCA	When NOT set: no action When set: When the RXP filter drops a frame due to an explicit drop configuration in the address table, AND the cca at the sample point was high, the RXP will NOT generate a NAV update based on the dropped frame. Reset State: 0x00000000
2	CFG_FLT_NO_NAV_UPDATE_ON_EXPLICIT_DROP	When NOT set: no action When set: When the RXP filter drops a frame due to an explicit drop configuration in the address table, the RXP will not generate a NAV update based on the dropped frame. The setting of the CCA is NOT taken into account Reset State: 0x00000000

RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ (cont.)

Bits	Name	Description
1	CFG_FLT_CLEAR_SKIP_NEXT_DIFS_ON_EARLY_PKTDET	When NOT set: no action When set: The RXP filter can generate a signal to the MTU to skip DIFS. See other register bits to enable this. This 'skip' signal will be cleared when early_pktdet_n gets asserted. Reset State: 0x00000000
0	CFG_FLT_CLEAR_SKIP_NEXT_DIFS_ON_CCA	When NOT set: no action When set: The RXP filter can generate a signal to the MTU to skip DIFS. See other register bits to enable this. This 'skip' signal will be cleared when primary cca gets asserted. Reset State: 0x00000000

0x30000F0 RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE0

Type: read-write
Reset State: 0x00000000

Control overwrite functionality for what was programmed in type/subtype config table (upper 32 bits)

RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE0

Bits	Name	Description
31:0	CFG_FLT_TYPE_SUBTYPE_RX_DISABLE0	Control some overwrite functionality for whatever was programmed in the Type/subtype configuration table. When set, a frame of the corresponding type should be dropped. Reset State: 0x00000000

0x30000F4 RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE1

Type: read-write
Reset State: 0x00000000

Control overwrite functionality for what was programmed in type/subtype config table (lower 32 bits)

RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE1

Bits	Name	Description
31:0	CFG_FLT_TYPE_SUBTYPE_RX_DISABLE1	Control some overwrite functionality for whatever was programmed in the Type/subtype configuration table. When set, a frame of the corresponding type should be dropped. Reset State: 0x00000000

0x30000F8 RXP_DIAG_STATUS

Type: read-only
Reset State: 0x00000000

The RXP diagnostic status.

RXP_DIAG_STATUS

Bits	Name	Description
31:0	DIAG_STATUS	The RXP diagnostic status. If status[5:0] is 6'h0, all the RXP state machines are IDLE. If status[10:6] is 5'h0, all the RXP FIFOs are empty. The following list the meaning of each status bit: status[28:25]: enc_cur_phy_st[3:0], status[24:21]: enc_cur_dlm_st[3:0], status[20:16]: enc_cur_mpdu_st[4:0], status[15:11]: enc_cur_dma_st[4:0], status[10]: !dma_ctl_st_idle, status[9]: !mpdu_proc_st_idle, status[8]: !dlm_proc_st_idle, status[7]: !phy_proc_st_idle, status[6]: !phy_rxi_ctl_st_idle, status[5]: !dma_tfifo_empty, status[4]: !dma_dfifo_empty, status[3]: !dma_hfifo_empty, status[2]: !dlm_tfifo_empty, status[1]: !dlm_dfifo_empty, status[0]: !dlm_hfifo_empty Reset State: 0x00000000

0x30000FC RXP_DIAG_TESTBUS_SEL

Type: read-write
Reset State: 0x00000000

The diagnostic testbus selection signal.

RXP_DIAG_TESTBUS_SEL

Bits	Name	Description
23:16	TESTBUS120AND160_SEL	The diagnostic testbus selection signal for 120/160 signals. 8'h0 is disabled. Valid values are from 0-1. testbus[44:19] will be from testbus120, pktdet_n, primary_cca, secondary_cca, early_pktdet_n, [13:9] will be rxi_testbus[36:32], [8:0] will be rxi_testbus[8:0]. Reset State: 0x00000000
15:8	TESTBUS160_SEL	The diagnostic testbus selection signal for 160 signals. 8'h0 is diabled. Valid values are from 0-2. rxi_testbus - 2, rdp_testbus - 1. Reset State: 0x00000000

RXP_DIAG_TESTBUS_SEL (cont.)

Bits	Name	Description
7:0	TESTBUS120_SEL	The diagnostic testbus selection signal for 120 signals. 8'h0 is diabled. Valid values are from 0-22 {13'h1fff, rxp_diag_status}, mpdu_proc_testbus2, // 21 dlm_proc_testbus4, dlm_proc_testbus3, dlm_proc_testbus2, rxp_drop_testbus2, // 17 rxp_dlm_fifo_full_testbus, dma_gam_testbus, dma_gbi_testbus, rxp_drop_testbus, phy_proc_testbus, dlm_proc_testbus, mpdu_proc_testbus, filter_testbus, binary_search_testbus, dma_ctl_testbus, {9'h0, gas_testbus}, {9'h0, gam_testbus}, {9'h0, gbi_testbus}, cfg_testbus, apm_testbus, rdm_testbus // 1 Reset State: 0x00000000

0x3000100 RXP_FRAME_FILTER_CONFIG

Type: read-write
Reset State: 0x00000000

This is a register set of 64 sequential word addresses: Each of these 64 words represent the filter configuration for a incoming frame type/subtype The register programming address per type/subtype is created as follows: ("This registers address" + {Type [b3, b2], Subtype [b7,b6,b5,b4], 2'b00}) where 'Type [b3,b2]' and 'Subtype [b7,b6,b5,b4]' are the IEEE standard encodings for the frames. A detailed description of the RXP filter specification can be found in the NOVA MAC architecture document. A summary of the bit functions is as follows:

RXP_FRAME_FILTER_CONFIG

Bits	Name	Description
21	G5_DROP_AT_DMA	When set, the RXP will drop the incoming frame (even when the CRC and filter function passes) at the RXP DMA engine. This feature is useful to prevent that control frames like the TRS, ACK etc, get unnecessarily written into memory Reset State: 0x00000000
20	NONHT_BW_INDICATION_ENABLE	when set then the this particular type/subtype will need to be checked for bw information. If bit 0 of TA is checked to see if BW information is valid. Reset State: 0x00000000
19	ROUTING_FLAG_SEL	when set : rxp will use dpu routing flag that is programmed in config3 bits 29:24 when not set : rxp will use dpu routing flag that is programmed in config3 bits 21:16 Reset State: 0x00000000
18	FRAME_TRANSLATION_REQ_EN	When set Frame translation by UMA is enabled Reset State: 0x00000000
17	PM_BIT_EVAL_REQUIRED_ENABLE	when this bit is set the pm bit is evaluated for this type/subtype packet Reset State: 0x00000000

RXP_FRAME_FILTER_CONFIG (cont.)

Bits	Name	Description
16	RESERVED3	It is reserved for future use, it is read writable Reset State: 0x00000000
15	ADDR3_ACCEPT_REMAINING_ENABLE	when enabled, and no hit was found for the Addr3 binary search, the incoming frame for this type/subtype will pass the Addr3 filter. The ADDR3 index code returned is 255 for multicast/broadcast and 254 for unicast. Reset State: 0x00000000
14	ADDR3_BINARY_SEARCH_FILTER_ENABLE	When enabled, Addr3 is submitted to the RXP Addr3 binary search filter. When not enabled, Addr3 filtering is NOT done, The returned ADDR3 index code is 253 and the 'Addr3_index_invalid' bit in the RXP status flags in the BD will be set Reset State: 0x00000000
13	ADDR2_ACCEPT_REMAINING_ENABLE	when enabled, and no hit was found for the Addr2 binary search, the incoming frame for this type/subtype will pass the Addr2 filter. The ADDR2 index code returned is 255 for multicast/broadcast and 254 for unicast. Reset State: 0x00000000
12	ADDR2_BINARY_SEARCH_FILTER_ENABLE	When enabled, Addr2 is submitted to the RXP Addr2 binary search filter. When not enabled, Addr2 filtering is NOT done, The returned ADDR2 index code is 253 and the 'Addr2_index_invalid' bit in the RXP status flags in the BD will be set Reset State: 0x00000000
11	ADDR1_ACCEPT_REMAINING_UNICAST_ENABLE	when enabled, and no hit was found for the unicast address in the Addr1 binary search, the incoming unicast frame for this type/subtype will pass the Addr1 filter. The index code returned is: 254 Reset State: 0x00000000
10	ADDR1_ACCEPT_REMAINING_MULTICAST_ENABLE	when enabled, and no hit was found for the multicast/broadcast address in the Addr1 binary search, the incoming multicast/broadcast frame for this type/subtype will pass the Addr1 filter. The index code returned is: 255. Reset State: 0x00000000
9	ADDR1_BINARY_SEARCH_FILTER_ENABLE	When enabled, Addr1 is submitted to the RXP Addr1 binary search filter. When not enabled, Addr1 filtering is NOT done, The returned ADDR1 index code is 253 and the 'Addr1_index_invalid' bit in the RXP status flags in the BD will be set Reset State: 0x00000000
8	ADDR1_BLOCK_UNICAST_ENABLE	when enabled, a unicast frame for this type/subtype will not pass the filter. Reset State: 0x00000000
7	ADDR1_BLOCK_MULTICAST_ENABLE	when enabled, a multicast frame for this type/subtype will not pass the filter. Reset State: 0x00000000

RXP_FRAME_FILTER_CONFIG (cont.)

Bits	Name	Description
6	ADDR1_BLOCK_BROADCAST_ENABLE	when enabled, a broadcast frame for this type/subtype will not pass the filter. Reset State: 0x00000000
5	RESERVED4	It is reserved for future use, it is read writable Reset State: 0x00000000
4	RESERVED5	It is reserved for future use, it is read writable Reset State: 0x00000000
3	RESERVED6	It is reserved for future use, it is read writable Reset State: 0x00000000
2	RESERVED7	It is reserved for future use, it is read writable Reset State: 0x00000000
1	BLOCK_RECEPTION_ENABLE	When enabled, all frames of this type/subtype will be blocked and will NOT pass the type/subtype/address filter check. Reset State: 0x00000000
0	RESERVED8	It is reserved for future use, it is read writable Reset State: 0x00000000

0x3000204 RXP_STALL_TIMEOUT

Type: read-write
Reset State: 0x00012000

Stall timeout functionality - allows RXP to return to idle if PMI interface stalls.

RXP_STALL_TIMEOUT

Bits	Name	Description
16	STALL_TIMEOUT_EN	Enable stall timeout functionality on the MPI. Reset State: 0x00000001
15:0	STALL_TIMEOUT_TIME	Number of cycles of no activity during PMI transaction before stall timeout occurs. Reset State: 0x00002000

0x3000250 RXP_CONFIG2

Type: read-write
Reset State: 0x010381DF

It contains RXP Configuration registers, related to gen5_6 functionality added

RXP_CONFIG2

Bits	Name	Description
31:29	CFG_CONFIG2_RESERVED	reserved for future use Reset State: 0x00000000
28	NAV_UPDATE_DOES_NOT_EXCLUDE_SELF	When set, the NAV will also be set for frames destined to this STA When NOT set, the NAV is only set for unicast frames received that are destined for other STAs For both settings the NAV will be set for all BC/MC frames. Reset State: 0x00000000
27	MASK_OUT_AMSDU_FRAMES_IN_AMPDU_ENABLE	When set, and amsdu frames embedded in AMPDU frames are received, the amsdu frames will be dropped Reset State: 0x00000000
26	ADDR2_AUTH_EXTRACT_ENABLE	When set, the RXP will extract the 'authentication setting from the addr 2 binary search entry (bit 2 of the 3 bit wide DPU tag entry), and insert in the BE. In this mode, the DPU tag when based on the ADDR 2 DPU TAG entry will only be 2 bits wide in stead of the regular 3 bits. Reset State: 0x00000000
25	PASS_LSIG_PROT_INFO_TO_TPE_ENABLE	When set, the RXP will pass the setting of the LSIG protection signal to the TPE together with the other response required info. Reset State: 0x00000000
24	DEFAULT_PUSH_WQ_OVERWRITE_ENABLE	When set, the RXP will by default push frames to WQ indicated in "default_push_wq". When NOT set, the RXP will by default push frames to WQ 2. Reset State: 0x00000001
23:16	DEFAULT_PUSH_WQ	Field is only used when Reset State: 0x00000003
15	BD_CLEAR_ENABLE_ENABLE	When set, the RXP will clear (set to zero) the bytes located in the BD between the PMI command bytes and the MPDU header bytes. Reset State: 0x00000001
14	FILTER_RPE_TRACE_ENABLE	When set, the RXP filter interaction result with the RPE will be passed on to the BMU. That can result in the BMU pushing this info into the BMU hardware tracing list Reset State: 0x00000000
13	DMA_RPE_TRACE_ENABLE	When set, the RXP DMA interaction result with the RPE will be passed on to the BMU. That can result in the BMU pushing this info into the BMU hardware tracing list Reset State: 0x00000000
12	CFG_FLT_DEFAULT_ROUTING_DIS	By default rxp uses the cfg_flt_dpu_man_rtg_flg,cfg_flu_dpu_data_rtg_flag to fill in dpu routing flags. If this bit is set then RXP will use the per type/subtype routing selection Reset State: 0x00000000

RXP_CONFIG2 (cont.)

Bits	Name	Description
11	CFG_FLT_PHY_ABORT_DIS	by default phy abort is enabled when this bit is set it is disabled By default PHY RX will be aborted (shutdown) when the frame does not pass the type/subtype/address filter. This will save extra power Reset State: 0x00000000
10	CFG_FLT_NAV_SET_ENABLE_ON_ABORT	When enabled and the incoming frame does not pass the type/subtype/address filter and is aborted before the FCS is calculated, update the NAV, Reset State: 0x00000000
9	CFG_FLT_NAV_CLEAR_ENABLE_ON_ABORT	When enabled, and the incoming frame does not pass the type/subtype/address filter and is aborted before the FCS is calculated, the NAV will be cleared. Reset State: 0x00000000
8	CFG_FLT_HW_SW_BASED_RESPONSE_SELECTION_ENABLE	when set, the response generation path: Software based or hardware based is controlled based on programming in the type/subtype configuration table, done through register "frame_filter_config". Note that if this control is required, the 'cfg_flt_generate_hw_response_enabled' should be cleared, otherwise this programming is overruled. When 'cfg_flt_hw_sw_based_response_selection_enable' is set, 'cfg_flt_generate_hw_response_enabled' is clear and 'G5_generate_HW_Response' for an incoming frame is set, the RXP will generate a pulse to the TPE to generate a response frame if also the following conditions are met: addr1 is a unicast address, caused a hit in the addr. lookup table AND incoming frame is a: Management frame OR data frame OR QoS data frame with ack policy set to normal OR RTS frame OR PSPOLL frame OR BAR_frame When 'cfg_flt_hw_sw_based_response_selection_enable' is set, 'cfg_flt_generate_hw_response_enabled' is clear and 'G5_generate_SW_RRI' for an incoming frame is set, the RXP will generate the RRI interrupt, so that software can start generating the response frame, if also the following conditions are met: addr1 is a unicast address, caused a hit in the addr. lookup table AND incoming frame is a: Management frame OR data frame OR QoS data frame with ack policy set to normal OR RTS frame OR PSPOLL frame OR BAR_frame Reset State: 0x00000001
7	CFG_FLT_FILTER_GO_TO_IDLE_ON_CLEAR_ENABLED	Gen 4 workaround: When set, and the MPDU PROC state machine signals 'clear' to the filter, the filter will return to its idle state, forcing it to break of all interaction with other modules Reset State: 0x00000001
6	CFG_MPR_BMU_BA_UPDATE_ENABLED	When set, enables the rxp interface with the BMU for Block Ack update Reset State: 0x00000001
5	CFG_MPDU_PROC_WAIT_FOR_IDLE_FILTER_ENABLED	When set, enables bug fix from gen 4. This forces the MPDU PROC state machine to wait for the rxp filter to get into an idle state before aborting a frame. Reset State: 0x00000000

RXP_CONFIG2 (cont.)

Bits	Name	Description
4	CFG_MPR_TPE_INTERFACE_ENABLED	When set to 1 the interface to the TPE is enabled Reset State: 0x00000001
3	CFG_FLT_GENERATE_HW_RESPONSE_ENABLED	When set to 1 the global hardware response generation logic within the RXP filter is enabled for the following conditions: addr1 is a unicast address, caused a hit in the addr. lookup table AND incoming frame is a: Management frame OR data frame OR QoS data frame with ack policy set to normal OR RTS frame OR PSPOLL frame OR BAR_frame Reset State: 0x00000001
2	BMU_PWR_UPDATE_ENABLED	When set, enables the rxp interface with the BMU for power management updates related to PWR Mgt bit in frame control field, PS POLL reception and APSD trigger frame reception Reset State: 0x00000001
1	CFG_BD_DPU_SOFTMACFIELDS_UPDATE_ENABLE	when you write a 1 the DPU related fields that softmac updates is enabled Reset State: 0x00000001
0	CFG_RPE_INTERFACE_ENABLE	when you write a 1 rpe interface is enabled That means duplicate detect interface function from the rxp filter is enabled as well as the bitmap update function from the rxp dma controller Reset State: 0x00000001

0x3000254 RXP_CONFIG3

Type: read-write
Reset State: 0x07180200

It contains RXP Configuration registers, related to gen5_6 functionality added

RXP_CONFIG3

Bits	Name	Description
29:24	CFG_FLT_DPU_MAN_RTG_FLG	This is the routing flag to which DPU will push management packets to, this is the value that is in the dpu_routing field in RXBD for management packets Reset State: 0x00000007
21:16	CFG_FLT_DPU_DATA_RTG_FLG	This is the routing flag to which DPU will push data packets to, this is the value that is in the dpu_routing field in RXBD for data packets Reset State: 0x00000018
14	CFG_RSSI_MODE_SEL	This bit selects the two modes of rssi data collection when this bit is 1'b0 : select Mode 0, the byte2(RxFIR0) and Byte3(RxFIR1) of PHY STATS are selected to be stored when this bit is 1'b1 : select Mode 1, the greater of Byte2 and Byte3 and Byte4(SNR) of PHY stats are selected to be stored Reset State: 0x00000000

RXP_CONFIG3 (cont.)

Bits	Name	Description
11:0	CFG_FLT_RPE_HANDSHAKE_TIMEOUT_VALUE	The RXP filter interacts with the RPE. At the start of this interaction a timeout counter is initialized. This register provides the timeout value for this interaction in number of clk cycles Reset State: 0x00000200

0x3000258 RXP_SEARCH_TABLE_DATA2

Type: read-write
Reset State: 0x00000000

This is data register 2 for indirect access to Binary Search Table. It contains all the DPU related configurations that the RXP will insert into the BD There are totally 3 Data registers for Binary Search address Table.

RXP_SEARCH_TABLE_DATA2

Bits	Name	Description
31:29	DPU_MC_BC_TAG	THe DPU routing flag that will be inserted in the BD Reset State: 0x00000000
28:21	DPU_MAN_MC_BC_DESCRIPTOR_INDEX	THe DPU descriptor index that will be inserted in the BD for mc/bc management packets Reset State: 0x00000000
20	DPU_NE	When set, the RXP will set the 'ne' field in the bd to 1'b1 Reset State: 0x00000000
19	WEP_KEY_ID_EXTRACT_ENABLE	When set, the RXP filter will extract the Key id from encrypted frames (assuming that the encryption is wep) Reset State: 0x00000000
18:16	DPU_TAG	THe DPU routing flag that will be inserted in the BD Reset State: 0x00000000
15:8	DPU_MC_BC_DPU_DESC	This field contains dpu descriptor index for BC/MC QoS/NonQoS frames RXP will insert this field in the DPU descriptor field in the BD. Reset State: 0x00000000
7:0	DPU_DESCRIPTOR_INDEX	THe DPU descriptor index that will be inserted in the BD for unicast data or unicast robust management frames (RMF) Reset State: 0x00000000

0x300025C RXP_BEACON_TSF_TIM_EXTRACT_CTRL

Type: read-write
Reset State: 0x00000003

This is controls what information needs to be extracted from the beacon and under what condition

RXP_BEACON_TSF_TIM_EXTRACT_CTRL

Bits	Name	Description
30	EARLY_TIM_PROCESS	when this bit is set then the tim not set interrupt is generated immediately after TIM bit is received and will not wait for the FCS complete Reset State: 0x00000000
29	P2P_BEACON_PARS_EN	when this bit is set then the system is indicating that we can receive p2p beacons so the beacon parsing checks whether received beacon is for P2P or BSS mode and accordingly TSF comparison and update is done 1'b0: no P2P beacons allowed, only BSS beacons allowed 1'b1: P2P/BSS beacons allowed Reset State: 0x00000000
28	SIM_IBSS_BSS_BEACON_PARS_EN	when this bit is set then the system is indicating that there is IBSS/BSS co-existence so the beacon parsing checks whether received beacon is for IBSS or BSS mode and accordingly TSF comparison and update is done 1'b1: IBSS/BSS beacons allowed 1'b0: no IBSS beacons allowed only BSS beacons allowed NOTE: when bit[29:28] = 2'b11 P2P/IBSS/BSS beacons allowed Reset State: 0x00000000
27	BEACON_CFP_AWARENESS_ENABLE	When set, and beacon processing is enabled, the beacon will also be evaluated for the presence of the CF parameter set. If present, the CFP remaining duration period is extracted and the NAV is set to that value. Reset State: 0x00000000
26:16	ASSOCIATION_ID	The association id of the station. This field is used to know which tim bit from the TIM element is related to this station Reset State: 0x00000000
15:8	CFG_MPR_SSID_LENGTH	When 'enable_beacon_ssid_check' is set and 'enable_beacon_partial_ssid_check_ok' is NOT set, RXP will check the SSID length field of the received beacon. That length field will need to have the same value as this register, otherwise the beacon filter will indicate a mismatch. When 'enable_beacon_ssid_check' is set and 'enable_beacon_partial_ssid_check_ok' is set as well, this length field indicates how many sequential bytes in a row of the beacon SSID field, starting from the first byte of the SSID field received, will have to match the programmed SSID bytes, in order for the beacon to pass the filter. Note that in this case, the SSID length field itself does not necessarily need to match, except that the length field in the beacon needs to be larger then the value programmed here. Reset State: 0x00000000
5	ENABLE_BEACON_SSID_CHECK	When set, the tsf update (based on IBSS of BSS rules) or tim field extraction will only happen if the incoming beacon has an SSID 3 field which matches the contents of the 'SSID_field' register, and 'SSID_length' field in this register Reset State: 0x00000000

RXP_BEACON_TSF_TIM_EXTRACT_CTRL (cont.)

Bits	Name	Description
1	ENABLE_BEACON_TIM_PARSING	When set, beacon tim field extraction and TIM field interrupt pulse generation is enabled Reset State: 0x00000001
0	ENABLE_BEACON_TSF_PARSING	When set, beacon timestamp extraction and TSF update are enabled Reset State: 0x00000001

0x3000260 RXP_TSF_COMPENSATION1_VALUE

Type: read-write
Reset State: 0x00000000

This register contains offset values to add the received TSF value to compensate for the delay in the PHY receive chain

RXP_TSF_COMPENSATION1_VALUE

Bits	Name	Description
31:24	TSF_11B_11MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 11Mbps Reset State: 0x00000000
23:16	TSF_11B_5_5MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 5.5Mbps Reset State: 0x00000000
15:8	TSF_11B_2MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 2Mbps Reset State: 0x00000000
7:0	TSF_11B_1MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 1Mbps Reset State: 0x00000000

0x3000264 RXP_TSF_COMPENSATION2_VALUE

Type: read-write
Reset State: 0x00000000

This register contains offset values to add the received TSF value to compensate for the delay in the PHY receive chain

RXP_TSF_COMPENSATION2_VALUE

Bits	Name	Description
23:16	TSF_11AG_OTHER_RATE_COMP_VALUE	THe TSF compensation value when the beacon is received at any other 11a or 11g rate Reset State: 0x00000000
15:8	TSF_11AG_54MBPS_COMP_VALUE	THe TSF compensation value when the beacon is received at an 11a or 11g rate of 54Mbps Reset State: 0x00000000
7:0	TSF_11AG_6MBPS_COMP_VALUE	THe TSF compensation value when the beacon is received at an 11a or 11g rate of 6Mbps Reset State: 0x00000000

0x3000268 RXP_SSID_VALUES_B0_B3

Type: read-write
Reset State: 0x00000000

This register contains SSID bytes 0 - 3

RXP_SSID_VALUES_B0_B3

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B0_B3	The SSID bytes, in LE format Reset State: 0x00000000

0x300026C RXP_SSID_VALUES_B4_B7

Type: read-write
Reset State: 0x00000000

This register contains SSID bytes 4 - 7

RXP_SSID_VALUES_B4_B7

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B4_B7	The SSID bytes, in LE format Reset State: 0x00000000

0x3000270 RXP_SSID_VALUES_B8_B11

Type: read-write
Reset State: 0x00000000

This register contains SSID bytes 8 - 11

RXP_SSID_VALUES_B8_B11

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B8_11	The SSID bytes, in LE format Reset State: 0x00000000

0x3000274 RXP_SSID_VALUES_B12_B15

Type: read-write
Reset State: 0x00000000

This register contains SSID bytes 12 - 15

RXP_SSID_VALUES_B12_B15

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B12_15	The SSID bytes, in LE format Reset State: 0x00000000

0x3000278 RXP_SSID_VALUES_B16_B19

Type: read-write
Reset State: 0x00000000

This register contains SSID bytes 16 - 19

RXP_SSID_VALUES_B16_B19

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B16_19	The SSID bytes, in LE format Reset State: 0x00000000

0x300027C RXP_SSID_VALUES_B20_B23

Type: read-write
Reset State: 0x00000000

This register contains SSID bytes 20 - 23

RXP_SSID_VALUES_B20_B23

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B20_23	The SSID bytes, in LE format Reset State: 0x00000000

0x3000280 RXP_SSID_VALUES_B24_B27

Type: read-write
Reset State: 0x00000000

This register contains SSID bytes 24 - 27

RXP_SSID_VALUES_B24_B27

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B24_27	The SSID bytes, in LE format Reset State: 0x00000000

0x3000284 RXP_SSID_VALUES_B28_B31

Type: read-write
Reset State: 0x00000000

This register contains SSID bytes 28 - 31

RXP_SSID_VALUES_B28_B31

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B28_31	The SSID bytes, in LE format Reset State: 0x00000000

0x3000288 RXP_BEACON_ADDR2_LOW_FIELD

Type: read-write
Reset State: 0x00000000

This register contains the lowest 4 bytes of the address 2 field of the beacon, in case a match function is enabled

RXP_BEACON_ADDR2_LOW_FIELD

Bits	Name	Description
31:0	BEACON_ADDR2_LSB_BYTES	The 4 LS Bytes of the addr2, LE format Reset State: 0x00000000

0x300028C RXP_BEACON_ADDR2_HIGH_FIELD

Type: read-write
Reset State: 0x00000000

This register contains the highest 2 bytes of the address 2 field of the beacon, in case a match function is enabled

RXP_BEACON_ADDR2_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_ADDR2_MSB_BYTES	The 2 MS Bytes of the addr2, LE format Reset State: 0x00000000

0x3000290 RXP_BEACON_ADDR3_LOW_FIELD

Type: read-write
Reset State: 0x00000000

This register contains the lowest 4 bytes of the address 3 field of the beacon, in case a match function is enabled

RXP_BEACON_ADDR3_LOW_FIELD

Bits	Name	Description
31:0	BEACON_ADDR3_LSB_BYTES	The 4 LS Bytes of the addr3, LE format Reset State: 0x00000000

0x3000294 RXP_BEACON_ADDR3_HIGH_FIELD

Type: read-write
Reset State: 0x00000000

This register contains the highest 2 bytes of the address 3 field of the beacon, in case a match function is enabled

RXP_BEACON_ADDR3_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_ADDR3_MSB_BYTES	The 2 MS Bytes of the addr3, LE format Reset State: 0x00000000

0x3000298 RXP_FLT_DUPL_CNT

Type: read-only
Reset State: 0x00000000

Number of frames that got dropped at the rxp filter because the RPE indicated to the RXP filter that the frame was a duplicate

RXP_FLT_DUPL_CNT

Bits	Name	Description
7:0	FLT_DUPL_DROPPED_COUNT	number of frames dropped Reset State: 0x00000000

0x300029C RXP_FLT_RPE_HANDSHAKE_TIMEOUT_CNT

Type: read-only
Reset State: 0x00000000

Number of times that the handshake between the rxp filter and the RPE timed out.

RXP_FLT_RPE_HANDSHAKE_TIMEOUT_CNT

Bits	Name	Description
19:16	DMA_RPE_TIMEOUT_COUNT	number of timeouts that occurred on the RXP DMA <-> RPE interface Reset State: 0x00000000
3:0	FLT_RPE_TIMEOUT_COUNT	number of timeouts that occurred on the RXP Filter <-> RPE interface Reset State: 0x00000000

0x3000300 RXP_QID_MAPPING0

Type: read-write
Reset State: 0x00000008

Controls how incoming data flows get mapped to a qid

RXP_QID_MAPPING0

Bits	Name	Description
4:0	MAN_AND_DATA_QID	When the incoming frame is a management frame or plain (NON QoS) data frame, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000008

0x3000304 RXP_QID_MAPPING1

Type: read-write
Reset State: 0x03020100

Controls how incoming data flows get mapped to a qid

RXP_QID_MAPPING1

Bits	Name	Description
28:24	QOS_TID3_QID	When the incoming frame is a QoS data frame with TID set to 3, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000003
20:16	QOS_TID2_QID	When the incoming frame is a QoS data frame with TID set to 2, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000002
12:8	QOS_TID1_QID	When the incoming frame is a QoS data frame with TID set to 1, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000001
4:0	QOS_TID0_QID	When the incoming frame is a QoS data frame with TID set to 0, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000000

0x3000308 RXP_QID_MAPPING2

Type: read-write
Reset State: 0x07060504

Controls how incoming data flows get mapped to a qid

RXP_QID_MAPPING2

Bits	Name	Description
28:24	QOS_TID7_QID	When the incoming frame is a QoS data frame with TID set to 7, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000007
20:16	QOS_TID6_QID	When the incoming frame is a QoS data frame with TID set to 6, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000006
12:8	QOS_TID5_QID	When the incoming frame is a QoS data frame with TID set to 5, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000005
4:0	QOS_TID4_QID	When the incoming frame is a QoS data frame with TID set to 4, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000004

0x300030C RXP_QID_MAPPING3

Type: read-write
Reset State: 0x00000000

Controls how incoming data flows get mapped to a qid

RXP_QID_MAPPING3

Bits	Name	Description
28:24	QOS_TID11_QID	When the incoming frame is a QoS data frame with TID set to 11, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000000
20:16	QOS_TID10_QID	When the incoming frame is a QoS data frame with TID set to 10, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000000
12:8	QOS_TID9_QID	When the incoming frame is a QoS data frame with TID set to 9, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000000
4:0	QOS_TID8_QID	When the incoming frame is a QoS data frame with TID set to 8, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000000

0x3000310 RXP_QID_MAPPING4

Type: read-write
Reset State: 0x00000000

Controls how incoming data flows get mapped to a qid

RXP_QID_MAPPING4

Bits	Name	Description
28:24	QOS_TID15_QID	When the incoming frame is a QoS data frame with TID set to 15, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000000
20:16	QOS_TID14_QID	When the incoming frame is a QoS data frame with TID set to 14, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000000
12:8	QOS_TID13_QID	When the incoming frame is a QoS data frame with TID set to 13, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000000
4:0	QOS_TID12_QID	When the incoming frame is a QoS data frame with TID set to 12, the contents of this register represents the qid assigned to this type of frames Reset State: 0x00000000

0x3000314 RXP_PUSH_WQ_CTRL

Type: read-write
Reset State: 0x02020202

Controls how frames that fall in the unicast other of multicast 'other categories' get routed through the system

RXP_PUSH_WQ_CTRL

Bits	Name	Description
31:24	ADDR2_255_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 255 for addr 2, the frame will be routed to this WQ. Reset State: 0x00000002
23:16	ADDR2_254_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 254 for addr 2, the frame will be routed to this WQ. Reset State: 0x00000002

RXP_PUSH_WQ_CTRL (cont.)

Bits	Name	Description
15:8	ADDR1_255_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 255 for addr 1 (multicast other), the frame will be routed to this WQ. Reset State: 0x00000002
7:0	ADDR1_254_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 254 for addr 1(unicast other), the frame will be routed to this WQ. Reset State: 0x00000002

0x3000318 RXP_PUSH_WQ_CTRL2

Type: read-write
Reset State: 0x00020202

Controls how frames that fall in the unicast other of multicast 'other categories' get routed through the system

RXP_PUSH_WQ_CTRL2

Bits	Name	Description
23:16	UNFILTERED_FRAME_PUSH_WQ_INDEX	When the incoming frame will does not get processed in any address filtering, all three staid indexes are invalid and set to 253, the frame will be routed to this WQ Reset State: 0x00000002
15:8	ADDR3_255_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 255 for addr 3, the frame will be routed to this WQ. Reset State: 0x00000002
7:0	ADDR3_254_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 254 for addr 3, the frame will be routed to this WQ. Reset State: 0x00000002

0x300031C RXP_EXTRA_FRAME_FILTER_CONTROL

Type: read-write
Reset State: 0x000001DD

additional control for how frames are filtered

RXP_EXTRA_FRAME_FILTER_CONTROL

Bits	Name	Description
15:9	RESERVED	Reserved for future filter functions Reset State: 0x00000000

RXP_EXTRA_FRAME_FILTER_CONTROL (cont.)

Bits	Name	Description
8	BLOCK_FRAMES_WITH_HT_CONTROL_FIELD	When set, frames that have a HT-control field present as specified in 11n are blocked from being received Reset State: 0x00000001
7	BLOCK_MULTI_TID_BLOCK_ACK_REQ	When set, the multi TID block ACK Request variant as specified in 11n is blocked from being received Reset State: 0x00000001
6	BLOCK_RESERVED_BLOCK_ACK_REQ	When set, the reserved block ACK Request variant as specified in 11n is blocked from being received Reset State: 0x00000001
5	BLOCK_COMPRESSED_BLOCK_ACK_REQ	When set, the compressed block ACK Request variant as specified in 11n is blocked from being received Reset State: 0x00000000
4	BLOCK_BASIC_BLOCK_ACK_REQ	When set, the basic block ACK Request variant as specified in 11n is blocked from being received Reset State: 0x00000001
3	BLOCK_MULTI_TID_BLOCK_ACK	When set, the multi TID block ACK variant as specified in 11n is blocked from being received Reset State: 0x00000001
2	BLOCK_RESERVED_BLOCK_ACK	When set, the reserved block ACK variant as specified in 11n is blocked from being received Reset State: 0x00000001
1	BLOCK_COMPRESSED_BLOCK_ACK	When set, the compressed block ACK variant as specified in 11n is blocked from being received Reset State: 0x00000000
0	BLOCK_BASIC_BLOCK_ACK	When set, the basic block ACK variant as specified in 11n is blocked from being received Reset State: 0x00000001

0x3000320 RXP_RXP_GROUPED_INTERRUPT_ENABLE

Type: read-write
Reset State: 0x00000000

interrupt Enables for RXP errors

RXP_RXP_GROUPED_INTERRUPT_ENABLE

Bits	Name	Description
26	RXP_SYSTEM_OUT_OF_MEMORY_FIRMWARE	Write 1 to enable this interrupt, so that whenever system runs out of memory this interrupt will be set. this is duplicate the one in bit 13 goes to host and this interrupt goes to firmware only Reset State: 0x00000000

RXP_RXP_GROUPED_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
25	P2P_BEACON_CTWIN_CHNG_DETECT_INT	when set enables this interrupt The NOA CTWin value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
24	P2P_BEACON_OPPPS_CHNG_DETECT_INT_EN	when set enables this interrupt The NOA OppPS value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated this interrupt goes to firmware only Reset State: 0x00000000
23	P2P_TIM_BIT_CLEAR_INT	When set, p2p beacon has tim bit clear this interrupt goes to firmware only Reset State: 0x00000000
22	P2P_TIM_BIT_SET_INT	When set, tim bit set in p2p beacon this interrupt goes to firmware only Reset State: 0x00000000
21	P2P_TIM_BEACON_CRC_ERR_INT	When set, p2p beacon has CRC error this interrupt goes to firmware only Reset State: 0x00000000
20	P2P_TIM_BASED_BROADCAST_FRAMES_PENDING_INT	When set, indicates tim bit indicates broadcast frames are pending from a p2p beacon this interrupt goes to firmware only Reset State: 0x00000000
19	P2P_BEACON_NOA_ABSENT_INT_EN	When set, P2P beacon which has no NOA element interrupt will be enabled this interrupt goes to firmware only Reset State: 0x00000000
18	P2P_BEACON_NOA_INDX_EQ_ONE_DETECT_INT_EN	when set, P2P beacon NOA index value equal to one interrupt will be enabled this interrupt goes to firmware only Reset State: 0x00000000
17	P2P_BEACON_NOA_INDX_CHNG_DETECT_INT_EN	The NOA, index field is compared with the index value programmed in p2p_parsing_control register if there is any change the this interrupt is generated When set, P2p Beacon NOA index value change detect interrupt is enabled this interrupt goes to firmware only Reset State: 0x00000000
16	RXP_RADAR_INTERRUPT	When set, radar detect interrupt will be generated Reset State: 0x00000000
15	RXP_MORE_DATA_SET_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is SET an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. this interrupt goes to host only Reset State: 0x00000000

RXP_RXP_GROUPED_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
14	RXP_RMF_FRAME_LEN_ERR	Write 1 to enable this interrupt, whenever we receive a RMF BC/MC frame with frame less than 48bytes(which is minimum) then this interrupt is generated. this interrupt goes to host only Reset State: 0x00000000
13	RXP_SYSTEM_OUT_OF_MEMORY	Write 1 to enable this interrupt, so that whenever system runs out of memory this interrupt will be set. this interrupt goes to host only Reset State: 0x00000000
12	RXP_MORE_DATA_CLEAR_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is NOT set an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. this interrupt goes to host only Reset State: 0x00000000
11	RXP_ADDR2_MISS_INTERRUPT	When set, and a frame is received that has an addr2 miss (and addr 1 is a hit), an 'addr2 miss interrupt will be generated. this interrupt goes to host only Reset State: 0x00000000
10	RXP_MISSED_EOSP_INT	When set, interrupt is generated when at least one other frame with EOSP got received while the first EOSP frame reception got reported this interrupt goes to firmware only Reset State: 0x00000000
9	RXP_EOSP_INT	When set, the EOSP interrupt will get generated if eosp frame is received this interrupt goes to firmware only Reset State: 0x00000000
8	TIM_BIT_CLEAR_INT	When set, beacon has tim bit clear this interrupt goes to firmware only Reset State: 0x00000000
7	TIM_BIT_SET_INT	When set, tim bit set in beacon this interrupt goes to firmware only Reset State: 0x00000000
6	TIM_BEACON_CRC_ERR_INT	When set, beacon has CRC error this interrupt goes to firmware only Reset State: 0x00000000
5	TIM_BASED_BROADCAST_FRAMES_PENDING_INT	When set, indicates tim bit indicates broadcast frames are pending this interrupt goes to host only Reset State: 0x00000000
4	ASYNC_FIFO_FULL_ERR_INT_ENABLE	When set, and the async fifo gets full, an interrupt will be generated this interrupt goes to host only Reset State: 0x00000000
3	GET_BMU_ERR_INT_ENABLE	When set, and the interaction with the bmu causes an error, an interrupt will be generated this interrupt goes to host only Reset State: 0x00000000

RXP_RXP_GROUPED_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
2	INVALID_RATE_INDEX_INT_ENABLE	When set, and an invalid rate index is generated based on information from the PHY, an interrupt will be generated this interrupt goes to host only Reset State: 0x00000000
1	RPE_DUPL_INTERFACE_TIMEOUT_INT_ENABLE	When set, the rpe duplicate detect interface handshake timeout error interrupt generation is enabled this interrupt goes to host only Reset State: 0x00000000
0	RPE_BITMAP_INTERFACE_TIMEOUT_INT_ENABLE	When set, the rpe bitmap interface handshake timeout error interrupt generation is enabled this interrupt goes to host only Reset State: 0x00000000

0x3000324 RXP_RXP_GROUPED_INTERRUPT_STATUS

Type: read-write
Reset State: 0x00000000

RXP combined interrupt status, writing 1 to any bit will clear the corresponding interrupt

RXP_RXP_GROUPED_INTERRUPT_STATUS

Bits	Name	Description
31	DROP_RPE_FIFO_FULL	whenever a frame is dropped due to system out of memory this bit will indicate if there was a rpe fifo full that caused this packet drop 1: if syste_out_of memory is set and this bit is one packet dropped due RPE fifo full 0: if syste_out_of memory is set and this bit is zero then there may BMU BD/PDU issue Writing 1 to this bit will clear this status Reset State: 0x00000000
30	PACKET_PRIORITY	whenever a frame is dropped due to system out of memory this bt will indicate what was the priority of the frame that was dropped 1: high priority frame dropped 0: Low priority frame dropped Writing 1 to this bit will clear this status Reset State: 0x00000000
26	RXP_SYSTEM_OUT_OF_MEMORY_FIRMWARE_INT	when set it indicates system is running out of memory, which allows software to indicate to AP to back off on sending frames by sending frames with PM bit set Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
25	P2P_BEACON_CTWIN_CHNG_DETECT_INT	The NOA CTWin value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000

RXP_RXP_GROUPED_INTERRUPT_STATUS (cont.)

Bits	Name	Description
24	P2P_BEACON_OPPPS_CHNG_DETECT_INT	The NOA OppPS value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated this interrupt goes to firmware only Reset State: 0x00000000
23	P2P_TIM_BIT_CLEAR_INT	When set, p2p beacon has tim bit clear Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
22	P2P_TIM_BIT_SET_INT	When set, tim bit set in p2p beacon Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
21	P2P_TIM_BEACON_CRC_ERR_INT	When set, p2p beacon has CRC error Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
20	P2P_TIM_BASED_BROADCAST_FRAMES_PENDING_INT	When set, indicates tim bit in p2p beacon indicates broadcast frames are pending Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
19	P2P_BEACON_NOA_ABSENT_INT	When set, P2P beacon which has no NOA element interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
18	P2P_BEACON_NOA_INDX_EQ_ONE_DETECT_INT	when set, indicates P2P beacon NOA index value equal to one interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
17	P2P_BEACON_NOA_INDX_CHNG_DETECT_INT	The NOA, index field is compared with the index value programmed in p2p_parsing_control register if there is any change the this interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
16	RXP_RADAR_INTERRUPT	When set, radar detect interrupt will be generated Writing 1 to this bit will clear this interrupt Reset State: 0x00000000
15	RXP_MORE_DATA_SET_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is SET an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. Writing 1 to this bit will clear this interrupt this interrupt goes to host only Reset State: 0x00000000
14	RXP_RMF_FRAME_LEN_ERR_INT	When set it indicates that we have received a RMF BC/MC frame with frame less than 48bytes(which is minimum) then this interrupt is generated. Writing 1 to this bit will clear this interrupt this interrupt goes to host only Reset State: 0x00000000

RXP_RXP_GROUPED_INTERRUPT_STATUS (cont.)

Bits	Name	Description
13	RXP_SYSTEM_OUT_OF_MEMORY_INT	when set it indicates system is running out of memory, which allows software to indicate to AP to back off on sending frames by sending frames with PM bit set Writing 1 to this bit will clear this interrupt this interrupt goes to host only Reset State: 0x00000000
12	RXP_MORE_DATA_CLEAR_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is NOT set an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. Writing 1 to this bit will clear this interrupt this interrupt goes to host only Reset State: 0x00000000
11	RXP_ADDR2_MISS_INTERRUPT	When set, and a frame is received that has an addr2 miss (and addr 1 is a hit), an 'addr2 miss interrupt will be generated. Writing 1 to this bit will clear this interrupt this interrupt goes to host only Reset State: 0x00000000
10	RXP_MISSED_EOSP_INT	When set, interrupt is generated when at least one other frame with EOSP got received while the first EOSP frame reception got reported Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
9	RXP_EOSP_INT	When set, the EOSP interrupt will get generated if eosp frame is received Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
8	TIM_BIT_CLEAR_INT	When set, beacon has tim bit clear Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
7	TIM_BIT_SET_INT	When set, tim bit set in beacon Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
6	TIM_BEACON_CRC_ERR_INT	When set, beacon has CRC error Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
5	TIM_BASED_BROADCAST_FRAMES_PENDING_INT	When set, indicates tim bit indicates broadcast frames are pending Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only Reset State: 0x00000000
4	ASYNC_FIFO_FULL_ERR_INT	When set, and the async fifo got full Writing 1 to this bit will clear this interrupt this interrupt goes to host only Reset State: 0x00000000
3	GET_BMU_ERR_INT	When set, the interaction with the bmu caused an error Writing 1 to this bit will clear this interrupt this interrupt goes to host only Reset State: 0x00000000

RXP_RXP_GROUPED_INTERRUPT_STATUS (cont.)

Bits	Name	Description
2	INVALID_RATE_INDEX_INT	When set, an invalid rate index is generated based on information from the PHY Writing 1 to this bit will clear this interrupt this interrupt goes to host only Reset State: 0x00000000
1	RPE_DUPL_INTERFACE_TIMEOUT_INT	When set, the rpe duplicate detect interface handshake timeout error has been detected Writing 1 to this bit will clear this interrupt this interrupt goes to host only Reset State: 0x00000000
0	RPE_BITMAP_INTERFACE_TIMEOUT_INT	When set, the rpe bitmap interface handshake timeout error has been detected Writing 1 to this bit will clear this interrupt this interrupt goes to host only Reset State: 0x00000000

0x3000328 RXP_DEFAULT_HW_INSERT_DPU_PARAM

Type: read-write
Reset State: 0x00000000

DPU related parameters to be put in the BD when the "bd_dpu_softmacfields_update_enable" is set and the frame that is received does not cause a hit in the filter, but falls in the unicast/multicast others category, and is still allowed to come in.

RXP_DEFAULT_HW_INSERT_DPU_PARAM

Bits	Name	Description
14:7	DPU_ROUTING_FLAG	The setting for the DPU_routing_flag bits in the BD Reset State: 0x00000000
6:4	DPU_TAG	The setting for the DPU TAG bits in the BD Reset State: 0x00000000
3:1	RX_KEY_ID_BITS	The setting for the RX KEY ID bits in the BD Reset State: 0x00000000
0	NE_BIT	The setting for the NE bit in the BD Reset State: 0x00000000

0x3000344 RXP_PSPOLL_NAV_VALUE

Type: read-write
Reset State: 0x00000000

indicates the NAV value that will be passed on to the MTU when a PSPOLL frame is received

RXP_PSPOLL_NAV_VALUE

Bits	Name	Description
7:0	PSPOLL_NAV_VALUE	The NAV value that will be passed on to the MTU when a PSPOLL frame is received Reset State: 0x00000000

0x3000348 RXP_PMU_INTERFACE_CONTROL

Type: read-write
Reset State: 0x00000000

Controls the PMU interfacing for Beacon Mode Power Save.

RXP_PMU_INTERFACE_CONTROL

Bits	Name	Description
10	PMU_SLEEP_PULSE_GENERATED	When set, a sleep pulse has been generated to the PMU Write 0 to clear this bit Reset State: 0x00000000
9	WAKEUP_ON_BC_TIM_SET_PULSE_GENERATED	When set, a wakeup pulse has been generated to the PMU indicating a beacon is received with the broadcast tim bit set Write 0 to clear this bit Reset State: 0x00000000
8	WAKEUP_ON_STA_TIM_SET_PULSE_GENERATED	When set, a wakeup pulse has been generated to the PMU indicating a beacon is received with the STA tim bit set Write 0 to clear this bit Reset State: 0x00000000
3	SLEEP_ON_BC_TIM_CLEAR	When set, a sleep pulse will be generated to the PMU when a beacon is received with the broadcast tim bit clear NOTE: when both 'pmu_sleep_on_sta_tim_clear' and 'sleep_on_bc_tim_clear' are set, both requirements need to be met in order to generate the sleep pulse Reset State: 0x00000000
2	PMU_SLEEP_ON_STA_TIM_CLEAR	When set, a sleep pulse will be generated to the PMU when a beacon is received with the sta tim bit clear Reset State: 0x00000000
1	WAKEUP_ON_SBC_TIM_SET	When set, a wakeup pulse will be generated to the PMU when a beacon is received with the broadcast tim bit set Reset State: 0x00000000
0	WAKEUP_ON_STA_TIM_SET	When set, a wakeup pulse will be generated to the PMU when a beacon is received with the STA tim bit set Reset State: 0x00000000

0x3000350 RXP_RATE_INDEX_HISTORY

Type: read-only
Reset State: 0x00000000

Gives an overview of the rate indexes of the last 2 frames received

RXP_RATE_INDEX_HISTORY

Bits	Name	Description
24:16	PREVIOUS_RECEIVED_RATE_INDEX	The rate index of the previous frame received Reset State: 0x00000000
8:0	LAST_RECEIVED_RATE_INDEX	The rate index of the last frame received Reset State: 0x00000000

0x3000358 RXP_ADDR2_MISS_INFO

Type: read-only
Reset State: 0x00000000

The lowest 32 bits of the addr 2 received that caused an addr 2 miss interrupt

RXP_ADDR2_MISS_INFO

Bits	Name	Description
31:0	ADDR2_BIT31_0	The lowest 32 bits of the addr 2 received Reset State: 0x00000000

0x300035C RXP_ADDR2_MISS_CTRL

Type: read-only
Reset State: 0x00000000

Addr 2 miss interrupt control and status

RXP_ADDR2_MISS_CTRL

Bits	Name	Description
23:16	ADDR1_INDEX	The corresponding addr 1 index of the frame received Reset State: 0x00000000
15:0	ADDR2_BIT47_32	The upper 16 bits of the addr 2 received Reset State: 0x00000000

0x3000360 RXP_EOSP_INT_CONTROL

Type: read-write
Reset State: 0x00000000

EOSP interrupt control and status

RXP_EOSP_INT_CONTROL

Bits	Name	Description
31	EOSP_INT_ENABLE	When set, and a frame is received that passes the filter and the EOSP bit in the QoS control field is set, an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields in this register. Reset State: 0x00000000
30	EOSP_INT_STATUS	When set, the EOSP interrupt got generated Reset State: 0x00000000
29	EOSP_INT_MISSED	When set, at least one other frame with EOSP set got received while the first EOSP frame reception got reported Reset State: 0x00000000
27:24	TID	The tid of the qos control field Reset State: 0x00000000
23:16	ADDR3_INDEX	The Addr 3 index of the frame received Reset State: 0x00000000
15:8	ADDR2_INDEX	The Addr 2 index of the frame received Reset State: 0x00000000
7:0	ADDR1_INDEX	The Addr 1 index of the frame received Reset State: 0x00000000

0x3000364 RXP_MORE_DATA_CLEAR_INT_CONTROL

Type: read-write
Reset State: 0x00000000

More data bit clear interrupt control and status

RXP_MORE_DATA_CLEAR_INT_CONTROL

Bits	Name	Description
31	MORE_DATA_CLEAR_INT_ENABLE	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is NOT set an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields in this register. Reset State: 0x00000000

RXP_MORE_DATA_CLEAR_INT_CONTROL (cont.)

Bits	Name	Description
30	MORE_DATA_CLEAR_INT_STATUS	When set, the more data bit clear interrupt got generated Reset State: 0x00000000
29	MORE_DATA_INT_MISSED	When set, at least one other frame with more data bit clear got received before software got to process the interrupt. while the first EOSP frame reception got reported Reset State: 0x00000000
28	QOS_FRAME	when set indicates it is a qos frame Reset State: 0x00000000
27:24	TID	tid of qos control field Reset State: 0x00000000
23:16	ADDR3_INDEX	The Addr 3 index of the frame received Reset State: 0x00000000
15:8	ADDR2_INDEX	The Addr 2 index of the frame received Reset State: 0x00000000
7:0	ADDR1_INDEX	The Addr 1 index of the frame received Reset State: 0x00000000

0x300036C RXP_CONFIG4

Type: read-write
Reset State: 0x00000000

It contains RXP Configuration registers.

RXP_CONFIG4

Bits	Name	Description
28	WLAN_RX_GRANT	This bit gives status of wlan_rx_grant. Write 1 to this bit to clear it 0: No rx grant generated 1: rx grant is generated Reset State: 0x00000000
27	WLAN_RX_GRANT_ENABLE	This bit is used to enable the wlan_rx grant feature 0: disable the WLAN_RX_Grants control of WLAN RX 1: enable the WLAN_RX_Grants control of WLAN RX Reset State: 0x00000000
26:11	TID_PRIORITY	This bit gives priority for frames on a tid basis this is used in support for Better Qos By default TID 6 and 7 have high priority 1: High priority 0: Low priority Reset State: 0x00000000
10	MANAGEMENT_PRIORITY	This bit gives priority for management frames this is used in support for Better Qos 1: High priority 0: Low priority Reset State: 0x00000000

RXP_CONFIG4 (cont.)

Bits	Name	Description
9	NONQOS_PRIORITY	This bit gives priority for non qos frames this is used in support for Better Qos 1: High priority 0: Low priority Reset State: 0x00000000
8:1	UNKNOWN_MC_STAID	when bit 0 is set then that means we are continuing address2 look up for an unknown multicast so the staid assigned for these types of packet should be set here Reset State: 0x00000000
0	CFG_FLT_ADDR1_BC_ENTRY_PRESENT	When this bit is set it indicates that a broadcast entry is present in address 1 when it is set it allows RXP to accept unknown multicast packets and continue address2 lookup Reset State: 0x00000000

0x3000374 RXP_BEACON_P2P_CLIENT_ADDR_LOW_FIELD

Type: read-write
Reset State: 0x00000000

This register contains the lowest 4 bytes of the address 2 field of the p2p beacon, in case a match function is enabled

RXP_BEACON_P2P_CLIENT_ADDR_LOW_FIELD

Bits	Name	Description
31:0	BEACON_P2P_CLIENT_ADDR_LSB_BYTES	The 4 LS Bytes of the addr2, LE format Reset State: 0x00000000

0x3000378 RXP_BEACON_P2P_CLIENT_ADDR_HIGH_FIELD

Type: read-write
Reset State: 0x00000000

This register contains the highest 2 bytes of the address 3 field of the beacon, in case a match function is enabled

RXP_BEACON_P2P_CLIENT_ADDR_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_P2P_CLIENT_ADDR_MSB_BYTES	The 2 MS Bytes of the addr2, LE format Reset State: 0x00000000

0x300037C RXP_P2P_BEACON_PARSE_CONTROL

Type: read-write
Reset State: 0x09000000

This register contains all the configurations necessary for handling p2p beacon

RXP_P2P_BEACON_PARSE_CONTROL

Bits	Name	Description
31:24	OUI_TYPE_VALUE	This is the OUI type value in P2P IE in the beacon. By default it is 09 indicating it is P2P version 1.0 Reset State: 0x00000009
23:16	NOA_INDEX_VALUE	The Index field value of NOA sub-element in P2P element in beacon RXP will parse the beacon for this index field and if there is any change in value an interrupt is generated. Reset State: 0x00000000
15:5	P2P_ASSOCIATION_ID	The association id of the station for p2p beacons. This field is used to know which tim bit from the TIM element is related to this station Reset State: 0x00000000
2	P2P_BEACON_NOA_PARSING_DIS	as long as riva is configured to receive p2p beacons, no parsing will be done. NOA parsing can be disabled by writing 1 to this bit Reset State: 0x00000000

0x3000380 RXP_MORE_DATA_SET_INT_CONTROL

Type: read-write
Reset State: 0x00000000

More data bit set interrupt related status

RXP_MORE_DATA_SET_INT_CONTROL

Bits	Name	Description
29	MORE_DATA_INT_MISSED	When set, at least one other frame with more data bit set got received before software got to process the interrupt. Reset State: 0x00000000
28	QOS_FRAME	when set indicates it is a qos frame Reset State: 0x00000000
27:24	TID	tid of qos control field Reset State: 0x00000000
23:16	ADDR3_INDEX	The Addr 3 index of the frame received Reset State: 0x00000000

RXP_MORE_DATA_SET_INT_CONTROL (cont.)

Bits	Name	Description
15:8	ADDR2_INDEX	The Addr 2 index of the frame received Reset State: 0x00000000
7:0	ADDR1_INDEX	The Addr 1 index of the frame received Reset State: 0x00000000

0x3000384 RXP_RULE1_CNTR_CTRL

Type: read-write
Reset State: 0x00000000

Has all controls to generate rule1 counter

RXP_RULE1_CNTR_CTRL

Bits	Name	Description
31:28	RULE1_QID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule1_qid_en is valid Reset State: 0x00000000
27:24	RULE1_QID_EN	Only the bit that are set here are considered for counting Program all the qid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule1_qid_mask are set to 0 are ignored. Reset State: 0x00000000
23:20	RULE1_STAID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule1_staid_en is valid Reset State: 0x00000000
19:16	RULE1_STAID_EN	Program all the staid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule1_staid_mask are set to 0 are ignored Reset State: 0x00000000
15:10	RULE1_TYPESUBTYPE_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule1_typesubtype_en is valid bits[15:14] = FC type bits[13:10] = FC subtype Reset State: 0x00000000
9:4	RULE1_TYPESUBTYPE_EN	Program all the type/subtype bit values that needs to be considered for counting.The setting of the bits whose corresponding bits in the rule1_typesubtype_mask are set to 0 are ignored. bits[9:8] = FC type bits[7:4] = FC subtype Reset State: 0x00000000
3	RULE1_HT_PRESENT_MASK	When set, ht present/or not present check is enabled Reset State: 0x00000000

RXP_RULE1_CNTR_CTRL (cont.)

Bits	Name	Description
2	RULE1_HT_PRESENT_EN	program the requirement of HT being present or not. This field is ignored if bit rule1_ht_present_mask is not set. Reset State: 0x00000000
0	RULE1_CNTR_EN	when set enables the counter Reset State: 0x00000000

0x3000388 RXP_RULE2_CNTR_CTRL

Type: read-write
Reset State: 0x00000000

Has all controls to generate rule1 counter

RXP_RULE2_CNTR_CTRL

Bits	Name	Description
31:28	RULE2_QID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule2_qid_en is valid Reset State: 0x00000000
27:24	RULE2_QID_EN	Only the bit that are set here are considered for counting Program all the qid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule2_qid_mask are set to 0 are ignored. Reset State: 0x00000000
23:20	RULE2_STAID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule2_staid_en is valid Reset State: 0x00000000
19:16	RULE2_STAID_EN	Program all the staid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule2_staid_mask are set to 0 are ignored Reset State: 0x00000000
15:10	RULE2_TYPESUBTYPE_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule2_typesubtype_en is valid bits[15:14] = FC type bits[13:10] = FC subtype Reset State: 0x00000000
9:4	RULE2_TYPESUBTYPE_EN	Program all the type/subtype bit values that needs to be considered for counting.The setting of the bits whose corresponding bits in the rule2_typesubtype_mask are set to 0 are ignored. bits[9:8] = FC type bits[7:4] = FC subtype Reset State: 0x00000000

RXP_RULE2_CNTR_CTRL (cont.)

Bits	Name	Description
3	RULE2_HT_PRESENT_MASK	When set, ht present/or not present check is enabled Reset State: 0x00000000
2	RULE2_HT_PRESENT_EN	program the requirement of HT being present or not. This field is ignored if bit rule2_ht_present_mask is not set. Reset State: 0x00000000
0	RULE2_CNTR_EN	when set enables the counter Reset State: 0x00000000

0x300038C RXP_RULE1_CNTR

Type: read-only
Reset State: 0x00000000

Rule 1 counter, if all conditions in rule1_ctrl pass then this counter gets incremented

RXP_RULE1_CNTR

Bits	Name	Description
7:0	RULE1_CNTR	This counter indicates number of packets received which passes rule 1 control conditions Reset State: 0x00000000

0x3000390 RXP_RULE2_CNTR

Type: read-only
Reset State: 0x00000000

Rule 2 counter, if all conditions in rule2_ctrl pass then this counter gets incremented

RXP_RULE2_CNTR

Bits	Name	Description
7:0	RULE2_CNTR	This counter indicates number of packets received which passes rule 2 control conditions Reset State: 0x00000000

0x3000394 RXP_DROP_DUE_TO_DROP_AT_DMA_CNT

Type: read-only
Reset State: 0x00000000

The number of packets are dropped by RXP due to drop at DMA bit set in type/subtype filter (these are mostly control packets)

RXP_DROP_DUE_TO_DROP_AT_DMA_CNT

Bits	Name	Description
15:0	DROP_DUE_TO_DROP_DMA_CMD_CNT	The number of packets are dropped by RXP due to drop at DMA bit being set these are usually all control packets. Reset State: 0x00000000

0x3000398 RXP_RX_TIME_CNTR

Type: read-only
Reset State: 0x00000000

The number of early pkt detect at every microseconds

RXP_RX_TIME_CNTR

Bits	Name	Description
23:0	RX_TIME_CNT	The number of microseconds that have early pkt detect high Reset State: 0x00000000

0x300039C RXP_SPARE_AND_CLKGATE_DIS

Type: read-write
Reset State: 0x00000000

this register has spare bits and local clock gate disable

RXP_SPARE_AND_CLKGATE_DIS

Bits	Name	Description
23:16	SPARE_BIT	read writable spare bits Reset State: 0x00000000
7:0	BLOCK_CLKGATE_DIS	when set to 1 the block level clock gating is disabled bit0 - phy_proc bit1 - dlm_proc,dlm_fifo bit2 - mpdu_proc,mpdu_hdr,crc32 bit3 - dma_fifo,dma_ctrl bit4 - config bit5 - filter,param_to_mem,binarysearch bit6 - rxi_ctrl,async_fifo Reset State: 0x00000000

0x30003A0 RXP_NDP_PKT_CNTR

Type: read-only
Reset State: 0x00000000

The number of NDP pkts received

RXP_NDP_PKT_CNTR

Bits	Name	Description
15:0	NDP_PKT_CNT	Number of NDP packets received Reset State: 0x00000000

0x30003A4 RXP_P2P_BEACON_PARSE_CONTROL2

Type: read-write
Reset State: 0x00000000

This register contains some more configurations necessary for handling p2p beacon

RXP_P2P_BEACON_PARSE_CONTROL2

Bits	Name	Description
7	NOA_OPPPS_VALUE	This value is set by SW, set 1 indicates group owner is using opportunistic power save, set to 0 indicates that it is disabled This value is compared to that in the beacon any change in this will generate a interrupt Reset State: 0x00000000
6:0	NOA_CTWIN_VALUE	Client Traffic window of value 0-6 is programmed in this register RXP will parse the beacon for this n CTWin of NOA element and if there is any change in value an interrupt is generated. This value is a period of time in TU after TBTT during which P2P group owner is present Reset State: 0x00000000

16.2.47 tpe

0x3000000 TPE_EDCF_TXOP_0_1

Type: read-write
Reset State: 0x06000600

edcf txop corresponds to back-offs 0 and 1

TPE_EDCF_TXOP_0_1

Bits	Name	Description
31:16	EDCF_TXOP_1	TXOP that is used while transmitting mpdus from the q corresponds to back-off 1 This values is in micro seconds. Reset State: 0x00000600
15:0	EDCF_TXOP_0	TXOP that is used while transmitting mpdus from the q corresponds to back-off 0 This values is in micro seconds. Reset State: 0x00000600

0x3000004 TPE_EDCF_TXOP_2_3

Type: read-write
Reset State: 0x06000600

edcf txop corresponds to back-offs 1 and 2

TPE_EDCF_TXOP_2_3

Bits	Name	Description
31:16	EDCF_TXOP_3	TXOP that is used while transmitting mpdus from the q corresponds to back-off 3 This value is in micro seconds. Reset State: 0x00000600
15:0	EDCF_TXOP_2	TXOP that is used while transmitting mpdus from the q corresponds to back-off 2 This value is in micro seconds. Reset State: 0x00000600

0x3000008 TPE_EDCF_TXOP_4_5

Type: read-write
Reset State: 0x06000600

edcf txop corresponds to back-offs 4 and 5

TPE_EDCF_TXOP_4_5

Bits	Name	Description
31:16	EDCF_TXOP_5	TXOP that is used while transmitting mpdus from the q corresponds to back-off 5 This value is in micro seconds. Reset State: 0x00000600
15:0	EDCF_TXOP_4	TXOP that is used while transmitting mpdus from the q corresponds to back-off 4 This value is in micro seconds. Reset State: 0x00000600

0x300000C TPE_EDCF_TXOP_6_7

Type: read-write
Reset State: 0x06000600

edcf txop corresponds to back-offs 6 and 7

TPE_EDCF_TXOP_6_7

Bits	Name	Description
31:16	EDCF_TXOP_7	TXOP that is used while transmitting mpdus from the q corresponds to back-off 7 This value is in micro seconds. Reset State: 0x00000600
15:0	EDCF_TXOP_6	TXOP that is used while transmitting mpdus from the q corresponds to back-off 6 This value is in micro seconds. Reset State: 0x00000600

0x3000010 TPE_SW_TEMPLATE_BASE_ADDR

Type: read-write
Reset State: 0x00005000

This register contains the implicit beamform bkof qosnull template address.

TPE_SW_TEMPLATE_BASE_ADDR

Bits	Name	Description
31:0	SW_BKOF_QOSNULL_TEMPLATE_ADDR	This address is used to specify the implicit beamform bkof qosnull template address. (Was used for hardware template which is removed in Riva). Reset State: 0x00005000

0x3000014 TPE_SW_TPE_HW_CONTROL_REG

Type: read-write
Reset State: 0x01840A01

This register contains all the hardware control config registers. software needs to set them as per hardware requirements. These may be either config for bug fixes or for future feature expansion.

TPE_SW_TPE_HW_CONTROL_REG

Bits	Name	Description
31	IGNORE_TXP_ERROR_INT_ECO	Set '1' to ignore the txp_mim_internal_error_int_p, so tpe won't issue soft reset because of the assertion of the interrupt Reset State: 0x00000000
30:25	RESERVED	Reserved spare register bit Reset State: 0x00000000
24:16	SW_11G_DUPLICATE_CTRL_INDEX_OFFSET	This is same as sw_11g_ctrl_index_offset but is used only for (40Mhz) pkts If 11b stations are in, in 11g protection This sw_11g_duplicate_ctrl_index_offset + 11G Rate index of the ctrl pkt from rate table is used to derive the actual ctrl rate index -- used for RTS,CTS,BAR there is no separate valid bit for duplicate rate. sw_11g_ctrl_index_offset_valid is used Reset State: 0x00000184
11	SW_DTIM_TERMINATE_VALID	when set, dtim will be terminated when p2p/bt/lte termination happened. When cleared, same behavior as in Volans. Reset State: 0x00000001
10	SW_P2P_TX_BOUNDARY_TERMINATE_VALID	when set, TPE will terminate the current transmission when p2p tx boundary txop reaches 0. Reset State: 0x00000000
9	SW_GEN6_3WIRE_VALID	when set, the gen6 bt functionality is enabled to generate wlan_Active Reset State: 0x00000001
8	SW_11G_OFDM_VALID	If this bit is set, the compensation reg is added to duration Also the sifs value in duration calculation is made 10 Reset State: 0x00000000
7:4	SW_11G_OFDM_COMPENSATION	In the case of 11G OFDM, we add 6microseconds to duration. The value is given in Register for flexibility Reset State: 0x00000000
1:0	SW_COMP_DIV_DELAY_REG	The div function delay is specified in this register. Actual MCP is = sw_comp_div_delay_reg+2. By default 1+2=3 cycles Reset State: 0x00000001

0x3000018 TPE_SW_SOFTWARE_TX_CONTROL_REG1

Type: read-write
Reset State: 0x00300000

This register contains the controls needed for software triggered transmission

TPE_SW_SOFTWARE_TX_CONTROL_REG1

Bits	Name	Description
29:24	SW_WAIT_COMMAND2	This register contains the wait command2. This command is used by TXP while sending pkt in the case of TXOP burst, it is used only first time and later onwards follows the station parameters Reset State: 0x00000000
21:16	SW_WAIT_COMMAND1	This register contains the wait command1. The tpe main waits as per this wait command before the request is considered for arbitration. The definition is as per TXP wait command. Any value beyond 21Hex is treated as no wait. by default it is no wait Reset State: 0x00000030
9:7	SW_TX_SESSION_CONTROL	This register contains the type of transmission software wants 000 --> nothing 001 --> data and use back-off index provided by software 010 --> data and use the staid, Qid given by software 011 --> template transmission, addr given by template addr Reset State: 0x00000000
5	SW_TX_RAW_PKT_VALID	if this bit is set the transmission is done in raw pkt mode Reset State: 0x00000000
4	SW_TX_TERMINATE_VALID	during software controlled tx, if this bit is set, the on going transmission will be terminated as if the txop is not available. The current transmission is ended gracefully. Reset State: 0x00000000
3:1	TPE_TX_TIMING_FEEDBACK	the feedback bits from h/w. They will be made zero on start_valid 000 --> Nothing is going on 001 --> waiting in commad1 010 --> command1 is done and command2 is going on 011 --> tx done 111 --> ack to 100 --> aging Reset State: 0x00000000
0	SW_TX_START_VALID	by writing 1 to this bit software indicates to hardware that the software tx controls are valid and hardware should start working on the software request software needs to toggle this by writing 0 and then 1 Reset State: 0x00000000

0x300001C TPE_SW_SOFTWARE_TX_ADDRESS

Type: read-write
Reset State: 0x00005000

This register contains the template address.

TPE_SW_SOFTWARE_TX_ADDRESS

Bits	Name	Description
31:0	SW_SOFTWARE_TX_ADDRESS	S/W programs this register during the software initiated transmission in the case of template transmission, this is templated address session control 001 --> [3:0] = backoff index, other bits are not used [31:16] = txop for this transmission 010 --> [3:0] = QID of the stream [11:4] = STAID [31:16] = txop for this transmission 011 --> [31:0] = template memory address --> template transmission is always txop=0 Reset State: 0x00005000

0x3000020 TPE_SW_MAX_BYTES_AND_TX_TIME_IN_AMPDU

Type: read-write
Reset State: 0x02000200

This register contains the max_tx (in micro sec) time that needs to be considered to terminate the AMPDU

TPE_SW_MAX_BYTES_AND_TX_TIME_IN_AMPDU

Bits	Name	Description
28:16	SW_MAX_AMPDU_TX_TIME	This is the max tx_time that an AMPDU can take. This is another AMPDU termination condition Reset State: 0x00000200
12:0	SW_MAX_AMPDU_TX_TIME_FOR_MIXED_MODE	During the mixed mode, we should not exceed this limit. This is considered in mixed mode only Reset State: 0x00000200

0x3000024 TPE_SW_MAX_MPDUS_IN_AMPDU_AND_MISC

Type: read-write
Reset State: 0x7F000010

This register contains the max no. of mpdus that can be packed in one AMPDU

TPE_SW_MAX_MPDUS_IN_AMPDU_AND_MISC

Bits	Name	Description
31:16	SW_PROTECTION_THR	The threshold that needs to be used for protection... RTS/CTS to self etc Reset State: 0x00007F00

TPE_SW_MAX_MPDUS_IN_AMPDU_AND_MISC (cont.)

Bits	Name	Description
15	SW_TX_AMPDU_TERMINATE_AT_RATE_CHANGE	if this bit is set, Wnever there is a rate change, ampdu will be terminated Reset State: 0x00000000
14	SW_TX_AMPDU_WINDOW_CHECK_VALID	the AMPDU window shcek is done in TX only when this bit is set Once the sata structure init is done in lab also, we can take out this bit. Reset State: 0x00000000
9	SW_CONSIDER_80_MHZ	80MHZ rates are considered only when this bit is set Reset State: 0x00000000
8	SW_GLOBAL_SB_MODE	indicates the side band mode. MAC simply copies this bit in the phy commands This bit is meaningful only when the CB is valid. Reset State: 0x00000000
7	SW_GLOBAL_CB_VALID	40MHZ rates are considered only when this bit is set Reset State: 0x00000000
6:0	SW_MAX_MPDUS_IN_AMPDU	This field indicates the number of MPDUs that can be packed in one AMPDU Reset State: 0x00000010

0x3000028 TPE_SW_STA_DESCR_ADDR

Type: read-write
Reset State: 0x00005000

This register contains the sta descriptor start address

TPE_SW_STA_DESCR_ADDR

Bits	Name	Description
31:0	SW_STA_DESCR_ADDR	the actual start address of descr is sw_sta_descr_addr + staid * (sw_global_no_of_qids * 16*4) Basically 64 bytes are reserved for each sta Reset State: 0x00005000

0x3000030 TPE_SW_TPE_TEST_AND_MISC

Type: read-write
Reset State: 0x00000000

This register contains the test bus select and upper test bus

TPE_SW_TPE_TEST_AND_MISC

Bits	Name	Description
29:21	SW_TPE_TRACE_SELECT_VECTOR	bmu trace controls used internally to control the tracing functionality Reset State: 0x00000000
20:8	SW_TPE_TEST_BUS_UPPER	this contains the upper 13 bits of tpe test bus Reset State: 0x00000000
4:0	SW_TPE_TEST_SEL	this controls the test bus mux selection in tpe 0-> test_bus_0 1-> test_bus_1 ... test_bus_... 0x13 internal_tpe_bus_1 [29:26] - tpe_main_cs_enc (0 is IDLE), [38:33] - tpe_mproc_cs_enc (0 is IDLE) Reset State: 0x00000000

0x3000034 TPE_SW_PM

Type: read-write
Reset State: 0xF096280A

S/W-configurable PM bit

TPE_SW_PM

Bits	Name	Description
31:24	SW_TX_SIFS_A_MODE_CYCLES	The SIFS cycles that needs to be programmed in tXP commands for A and G (non B) mode pkts This number is multiplied by 8 and used internally. F0 corresponds to hex 780 corresponds 1920(decimal) which is 16microseconds. Reset State: 0x000000F0
23:16	SW_TX_SIFS_B_MODE_CYCLES	The SIFS cycles that needs to be programmed in tXP commands for B mode pkts This number is multiplied by 8 and used internally. 96 corresponds to hex x4b0 corresponds 1200(decimal) which is 10microseconds. Reset State: 0x00000096
15	SW_PROMOTE_BT_LOW_PRI	if this bit is set, the lower priority BT is treated as Higher priority This should not be set in normal conditions. I don't think we ever set this bit Provided so that if we get in to any system issues, this can be turned on Reset State: 0x00000000
14	SW_CONSIDER_TXP_ERROR_IN_TPE_ERROR	If this bit is set the tpe_mcu_error includes the TXP Error too Reset State: 0x00000000
13	SW_CONSIDER_RESPONSE_WHILE_WAITING	if this bit is set, response pkt will be sent even tpe is busy Reset State: 0x00000001
12	SW_IGNORE_DMA_INDEX	The dma index from rxp is ignored Reset State: 0x00000000

TPE_SW_PM (cont.)

Bits	Name	Description
11	SW_IGNORE_DMA_CONFIRM	The dma_confirm from RXP is ignored -- to eliminate any potential Hangs in the rxp-tpe interface Reset State: 0x00000001
10	SW_LSIG_PROTECTION_TYPE	If this bit is set the entire TXOP is used for LSIG protection. Otherwise what ever duration is seen in pkt is used for lsig Reset State: 0x00000000
9	SW_LSIG_PROTECTION_VALID	If this bit is set the lsig protection is considered. Entire TXOP or only the next_pkt is done based on lsig_protection_type Reset State: 0x00000000
8	SW_CONSIDER_SECOND_PKT_READ	If this bit is set the next_pkt read and the duration computation for non zero TXOP and frags is done as per spec. Otherwise we don't include next pkt for the computation. This will be removed once the verification is done Reset State: 0x00000000
7	SW_CONSIDER_TX_BOUNDARY_TXOP	if this bit is set, the tx_boundary_txop is considered in TPE Reset State: 0x00000000
6	SW_BT_TERMINATE_VALID	if this bit is set, mproc will terminate if the btc_is_active (after validating it with configs) btc_active_final & sw_bt_terminate_valid = terminate mproc Reset State: 0x00000000
5	SW_CONSIDER_BT_AVAIL_TIME_CNT	if this bit is set, the btc_tpe_avail_time_cnt is considered in tPE Reset State: 0x00000000
4	SW_CONSIDER_BT_LOW_PRI	if this bit is set, the btc low priority request is considered Reset State: 0x00000000
3	SW_CONSIDER_BT_HIGH_PRI	if this bit is set, the btc high priority request is considered Reset State: 0x00000001
2	SW_CONSIDER_WARMUP_DELAY_FOR_SIFS_CMD	If this bit is set, all the sifs_ommand instructions will wait warm_upenable signal from mtu. This is to reduce the warmup pulse width for the cases in which PHY has less delay. Setting this bit to 0 is Taurus com[atible Reset State: 0x00000000
1	SW_BCN_TERMINATE_VALID	if this bit is set, the current transmission will be terminated if it is TBTT time Reset State: 0x00000001
0	SW_PM	Reserved. The pm bit for data is in sta decriptor now. Reset State: 0x00000000

0x3000038 TPE_SW_TPE_TEST_BUS_LOWER

Type: read-only
Reset State: 0x00000000

This register contains the test bus lower 31:0

TPE_SW_TPE_TEST_BUS_LOWER

Bits	Name	Description
31:0	SW_TPE_TEST_BUS_LOWER	this contains the lower 32 bits of tpe test bus Reset State: 0x00000000

0x300003C TPE_SW_11G_CTRL_INDEX_OFFSET

Type: read-write
Reset State: 0x0003FC00

offset for 11g protection rates

TPE_SW_11G_CTRL_INDEX_OFFSET

Bits	Name	Description
31:24	SW_AMPDU_EXTRA_DURATION	This value is added to AMPDU duration if the current one is not last one in the TXOP. Since we don't know the exact duration of the next AMPDU, we just add a constant value. By default it is ZERO Reset State: 0x00000000
18:10	SW_CF_END_TXOP_THR	CF-END Will be sent only if the remaining TXOP is more than this value Default is 255 microseconds Reset State: 0x000000FF
9	SW_11G_CTRL_INDEX_OFFSET_VALID	if this bit is set, sw_11g_ctrl_index_offset is used basically this is nothing but use_11b_protection_mode. Reset State: 0x00000000
8:0	SW_11G_CTRL_INDEX_OFFSET	If 11b stations are in, in 11g protection This sw_11g_index_offset + 11G Rate index of the ctrl pkt from rate table is used to derive the actual ctrl rate index -- used for RTS,CTS,BAR Reset State: 0x00000000

0x3000040 TPE_RATE_TABLE_SRAM_CONTROL

Type: read-write
Reset State: 0x80000000

controls software operations on TPE rate table. To start a read transaction, check first if bit 31 is 1. If 1, then proceed, writing 0 to bit 31, address to [29:21], 0 to bit 1, and 1 to bit 0. When bit 31 turns 1, then read the data bits. To start a write operation, check first if bit 31 is 1. If 1, then proceed, write 0 to bit 31, address to [29:21], data to [20:4], 1 to bit 1, and 1 to bit 0. When bit 31 turns 1, then write is done.

TPE_RATE_TABLE_SRAM_CONTROL

Bits	Name	Description
31	RATE_SRAM_XACT_DONE	1 indicates transaction complete - write to 0 at start of operation Reset State: 0x00000001
29:21	RATE_SRAM_XACT_ADDR	address for software rate table sram read/write Reset State: 0x00000000
20:3	RATE_SRAM_XACT_DATA	rate table sram data [3] - ctrl resp lpe bit ([26] in rate table) [7:4] - ctrl rate index ([17:14] in rate table) [12:8] - cntrl rep tx power ([31:27] in rate table) [16:13] - resp rate index ([35:32] in rate table) [20:17] - 11g cntrl rate index minus 11b base offset ([61:58] in rate table) Reset State: 0x00000000
1	RATE_SRAM_XACT_WRITE_READZ	1 indicates write operation, 0 indicates read operation Reset State: 0x00000000
0	RATE_SRAM_XACT_START	Write only bit that initiates software rate sram transaction Reset State: 0x00000000

0x3000044 TPE_RATE_TABLE_SRAM_CONTROL2

Type: read-write
Reset State: 0x00000000

controls software operations on TPE rate table.

TPE_RATE_TABLE_SRAM_CONTROL2

Bits	Name	Description
9:0	RATE_SRAM_XACT_DATA	rate table sram data [4:0] - upper bits of ctrl rate index ([22:18] in rate table) [9:5] - upper bits of resp rate index ([40:36] in rate table) Reset State: 0x00000000

0x3000050 TPE_SW_BEACON_BASE_ADDR

Type: read-write
Reset State: 0x00005000

This register contains the beacon base address. THIS REGISTER CAN BE REMOVED -- SIMPLY USE THE OFFSET FROM THE TEMPLATE

TPE_SW_BEACON_BASE_ADDR

Bits	Name	Description
31:0	SW_BEACON_BASE_ADDR	S/w needs to program this register based on the chip configuration hardware uses this base address and depending on the sw_beacon_max_size, it derives the beacon addresses for all the bssids accordingly Reset State: 0x00005000

0x3000054 TPE_SW_BEACON_MAX_SIZE_MISC

Type: read-write
Reset State: 0x00000800

This register contains the max size of the beacon. Make sure the size is in bytes but always word boundary, i.e., the lsb 2 bits are always expected to be Zeros

TPE_SW_BEACON_MAX_SIZE_MISC

Bits	Name	Description
22	SW_BCN_UN_LOCK_BY_SW	s/w unlocks the beacon ownership by writing 1 to this register. Typically after updating the beacon, software writes to this register It is write only register Reset State: 0x00000000
21:18	SW_UPDATE_BCN_INDEX	the beacon index that software wants to update Reset State: 0x00000000
17	MAIN_SW_UPDATE_BCN_GNT_BY_HW	h/w grant to the software request to update beacon. Basically after requesting to update a beacon software will poll this register. Once this bit is set software can go ahead and update the beacon template. Once the software changes the beacon it needs to unlock by writing 1 to sw_bcn_un_lock_by_sw Reset State: 0x00000000
16	SW_UPDATE_BCN_REQ	by writing this bit software requests hardware to grant to update beacon. when it is read, main_sw_bcn_update_pending_valid is reflected this bit will be set when software is written but reset by writing to sw_bcn_un_lock_by_sw Reset State: 0x00000000
15:0	SW_BEACON_MAX_SIZE	This register is used to derive the start address of the beacons. This is used in multiple bssid base_address of beacon [index] = sw_beacon_base_addr + index * sw_beacon_max_size Reset State: 0x00000800

0x3000058 TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE

Type: read-write
Reset State: 0x00000000

TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE

Bits	Name	Description
30	FEC_MODE	Reset State: 0x00000000
29	LPE_BIT	Reset State: 0x00000000
27:26	SW_CONSIDER_WLAN_RX_FOR_BT_ECO_VECTOR	basically this is config register to enable the ECO in Libra 2.0. While giving channel to BT Low priority request, the RX path (the packet det from PHY) is used. Two bits are provide for pkt_det and rxp filter pass Bit 0 of the vector i.e., bit 26 of this register enables consideration of rxp_tpe_flt_pass in the logic, Bit 1 of the vector i.e., bit 27 of this register enables consideration of rxp_mtu_pktdet_n in the logic, Reset State: 0x00000000
25	AMPDU_VALID	Reset State: 0x00000000
24:20	TX_POWER	Reset State: 0x00000000
18:16	TX_ANTENNA_EN	Reset State: 0x00000000
15:14	STBC_VALID	Reset State: 0x00000000
13	SGI_VALID	Reset State: 0x00000000
12:11	NSS_11B_MODE	Reset State: 0x00000000
8:3	STA_RATE	Reset State: 0x00000000
2:0	STA_MODE	Reset State: 0x00000000

0x3000080 TPE_TPE_BMU_INTERFACE_CNTS

Type: read-only
Reset State: 0x00000000

TPE<->BMU interface counters

TPE_TPE_BMU_INTERFACE_CNTS

Bits	Name	Description
31:24	TPE_BMU_FEEDBACK_CNT	Increments when tpe_bmu_feedback_p is sent. Reset State: 0x00000000
23:16	BMU_TPE_FEEDBACK_DONE_CNT	Increments when bmu_tpe_feedback_done_p is sent. Reset State: 0x00000000
15:8	TPE_BMU_GET_INFO_CNT	Increments when tpe_bmu_get_info_p is sent. Reset State: 0x00000000

TPE_TPE_BMU_INTERFACE_CNTS (cont.)

Bits	Name	Description
7:0	BMU_TPE_GET_INFO_VALID_CNT	Increments when bmu_tpe_get_info_valid_p is sent. Reset State: 0x00000000

0x3000084 TPE_RXP_TPE_INTERFACE_CNTS

Type: read-only
Reset State: 0x00000000

RXP<->TPE interface counters

TPE_RXP_TPE_INTERFACE_CNTS

Bits	Name	Description
31:24	RXP_TPE_FRAME_INFO_CNT	Increments when rxp_tpe_frame_info_p is sent. Reset State: 0x00000000
23:16	RXP_TPE_AMPDU_END_CNT	Increments when rxp_tpe_ampdu_end_p is sent. Reset State: 0x00000000
15:8	RXP_TPE_DMA_CONFIRM_CNT	Increments when rxp_tpe_dma_confirm_p is sent. Reset State: 0x00000000
7:0	RXP_TPE_BAR_INFO_CNT	Increments when rxp_tpe_bar_info_p is sent. Reset State: 0x00000000

0x3000088 TPE_MTU_TPE_INTERFACE_CNTS

Type: read-only
Reset State: 0x00000000

MTU<->TPE interface counters

TPE_MTU_TPE_INTERFACE_CNTS

Bits	Name	Description
23:16	MTU_TPE_BCN_REQ_VALID_CNT	Increments when mtu_tpe_bcn_req_valid_p is sent. Reset State: 0x00000000
15:8	MTU_TPE_REQ_VALID_CNT	Increments when mtu_tpe_req_valid_p is sent. Reset State: 0x00000000
7:0	TPE_MTU_FEEDBACK_VALID_CNT	Increments when tpe_mtu_feedback_valid_p is sent. Reset State: 0x00000000

0x300008C TPE_RPE_TPE_INTERFACE_CNTS

Type: read-only
Reset State: 0x00000000

RPE<->TPE interface counters

TPE_RPE_TPE_INTERFACE_CNTS

Bits	Name	Description
15:8	TPE_RPE_BITMAP_REQ_CNT	Increments when tpe_rpe_bitmap_req_p is sent. Reset State: 0x00000000
7:0	RPE_TPE_BITMAP_VLD_CNT	Increments when rpe_tpe_bitmap_vld_p is sent. Reset State: 0x00000000

0x3000090 TPE_ERROR_INT_CNTS

Type: read-only
Reset State: 0x00000000

Error counters

TPE_ERROR_INT_CNTS

Bits	Name	Description
23:16	MPROC_ERROR2_CNT	Reset State: 0x00000000
15:8	MPROC_ERROR1_CNT	Reset State: 0x00000000
7:0	TXP_ERROR_INT_CNT	Increments when txp signals error interrupt Reset State: 0x00000000

0x30000C0 TPE_UNICAST_BYTES_LOWER

Type: read-only
Reset State: 0x00000000

lower unicast bytes

TPE_UNICAST_BYTES_LOWER

Bits	Name	Description
31:0	TX_UNICAST_BYTES_LOWER	Reset State: 0x00000000

0x30000C4 TPE_UNICAST_BYTES_UPPER

Type: read-only
Reset State: 0x00000000

upper unicast bytes

TPE_UNICAST_BYTES_UPPER

Bits	Name	Description
31:0	TX_UNICAST_BYTES_UPPER	Reset State: 0x00000000

0x30000C8 TPE_MULTICAST_BYTES_LOWER

Type: read-only
Reset State: 0x00000000

lower multicast bytes

TPE_MULTICAST_BYTES_LOWER

Bits	Name	Description
31:0	TX_MULTICAST_BYTES_LOWER	Reset State: 0x00000000

0x30000CC TPE_MULTICAST_BYTES_UPPER

Type: read-only
Reset State: 0x00000000

upper multicast bytes

TPE_MULTICAST_BYTES_UPPER

Bits	Name	Description
31:0	TX_MULTICAST_BYTES_UPPER	Reset State: 0x00000000

0x30000D0 TPE_BROADCAST_BYTES_LOWER

Type: read-only
Reset State: 0x00000000

lower broadcast bytes

TPE_BROADCAST_BYTES_LOWER

Bits	Name	Description
31:0	TX_BROADCAST_BYTES_LOWER	Reset State: 0x00000000

0x30000D4 TPE_BROADCAST_BYTES_UPPER

Type: read-only
Reset State: 0x00000000

upper broadcast bytes

TPE_BROADCAST_BYTES_UPPER

Bits	Name	Description
31:0	TX_BROADCAST_BYTES_UPPER	Reset State: 0x00000000

0x3000100 TPE_STATISTIC_COUNTERS_CNTL

Type: read-write
Reset State: 0x00000004

statistic counters control

TPE_STATISTIC_COUNTERS_CNTL

Bits	Name	Description
2	COPY_VISTA_COUNTERS	copy 64 vista counters over into stats registers Reset State: 0x00000001
1	CLEAR_VISTA_COUNTERS	clear vista counters Reset State: 0x00000000
0	CLEAR_GLOBAL_COUNTERS	clear global counters Reset State: 0x00000000

0x3000104 TPE_TPE_STATUS_REG_LOWER

Type: read-only
Reset State: 0x00000000

tpe status - should be all 0 when idle and da are all 0

TPE_TPE_STATUS_REG_LOWER

Bits	Name	Description
31:0	TPE_STATUS	uspu_testbus[4:0], // 32:28 uspm_testbus[5:0], // 27:22 wpg_testbus[4:0], // 21:17 twr_testbus[5:0], // 16:11 tpe_mproc_test[5:0], // 10:5 tpe_main_test[22:18] // 4:0 Reset State: 0x00000000

0x3000108 TPE_TPE_STATUS_REG_UPPER

Type: read-only
Reset State: 0x00000000

tpe status upper - should be all 0 when idle and da are all 0 mtu_tpe_response_to, // 44 bmu_tpe_bo_data_avail[5:0], // 43:38 usps_testbus[4:0], // 37:33

TPE_TPE_STATUS_REG_UPPER

Bits	Name	Description
12:0	TPE_STATUS	Reset State: 0x00000000

0x3000110 TPE_GOT_ACK_FOR_BACK_INFO_REG

Type: read-only
Reset State: 0x00000000

staid, qid for got_ack_for_back_info interrupt got ack for back staid got ack for back qid

TPE_GOT_ACK_FOR_BACK_INFO_REG

Bits	Name	Description
12:5	GOT_ACK_FOR_BACK_STAID	Reset State: 0x00000000
4:0	GOT_ACK_FOR_BACK_QID	Reset State: 0x00000000

0x3000118 TPE_SW_DELAY_WAIT_CMD_CNT_REG

Type: read-write
Reset State: 0xFF1E801E

This is used to delay the wait command (so that the warmup pulse can be sent ahead in time This is in terms of 8 clk cycles, so a value of 'd30 would mean 240 clk cycles, or 2us For beacons,

Template tx, the transmission will happen immediately This is a problem for Warm up. We can't use pifs because the trigger to TPE already after pifs_to. send warmup later when we send wait_cycles (e.g. after cts-to-self) instead of right at the beginning of sifs. this "later" is determined by sw_wait_cycles_threshold (in terms of 8 cycles). This value is number of clocks before we send warmup. we will be delaying the wait command, sending warmup, and then sending the wait command with sw_wait_cycles_threshold to the txp. The default value is 240 cycles, which is 2 us (in terms of 16 us). The sw_template request if not sent after this threshold time will be dropped

TPE_SW_DELAY_WAIT_CMD_CNT_REG

Bits	Name	Description
31:24	SW_AGING_CNT_THRSHLD	Reset State: 0x000000FF
23:16	SW_WAIT_CYCLES_THRESHOLD	Reset State: 0x0000001E
15	SW_SEND_WARMUP_LATER_EN	Reset State: 0x00000001
13:8	SW_DELAY_CYCLE_FOR_NO_WAIT_TX	Reset State: 0x00000000
5:0	SW_DELAY_WAIT_CMD_CNT	Reset State: 0x0000001E

0x300011C TPE_SW_MEDIUM_TIME_USED_AC0

Type: read-write
Reset State: 0x00000000

This register contains the medium time used for AC0 This is internal to h/w. software can write to these register at its risk. Basically the corresponding AC should not be enabled for Admission control while updating this register (update should be only only in debug mode). To make sure that there are no side effects, software needs to disable the hardware control over the backoffs by writing appropriate value to sw_mtu_bckof_disable_valid_vector Medium time used for AC0. Each count corresponds to 32microseconds

TPE_SW_MEDIUM_TIME_USED_AC0

Bits	Name	Description
15:0	SW_MEDIUM_TIME_USED_AC0	Reset State: 0x00000000

0x3000120 TPE_SW_MEDIUM_TIME_USED_AC1

Type: read-write
Reset State: 0x00000000

This register contains the medium time used for AC1 This is internal to h/w. software can write to these register at its risk. Basically the corresponding AC should not be enabled for Admission control while updating this register (update should be only in debug mode.) To make sure that there are no side effects, software needs to disable the hardware control over the backoffs by writing appropriate value to sw_mtu_bckof_disable_valid_vector Medium time used for AC1. Each count corresponds to 32microseconds

TPE_SW_MEDIUM_TIME_USED_AC1

Bits	Name	Description
15:0	SW_MEDIUM_TIME_USED_AC1	Reset State: 0x00000000

0x3000124 TPE_SW_MEDIUM_TIME_USED_AC2

Type: read-write
Reset State: 0x00000000

This register contains the medium time used for AC2 This is internal to h/w. software can write to these register at its risk. Basically the corresponding AC should not be enabled for Admission control while updating this register (update should be only in debug mode.) To make sure that there are no side effects, software needs to disable the hardware control over the backoffs by writing appropriate value to sw_mtu_bckof_disable_valid_vector Medium time used for AC2. Each count corresponds to 32microseconds

TPE_SW_MEDIUM_TIME_USED_AC2

Bits	Name	Description
15:0	SW_MEDIUM_TIME_USED_AC2	Reset State: 0x00000000

0x3000128 TPE_SW_MEDIUM_TIME_USED_AC3

Type: read-write
Reset State: 0x00000000

This register contains the medium time used for AC3 This is internal to h/w. software can write to these register at its risk. BasicallyBasically the corresponding AC should not be enabled for Admission control while updating this register(update should be only only in debug mode.) To make sure that there are no side effects, software needs to disable the hardware control over the backoffs by writing appropriate value to sw_mtu_bckof_disable_valid_vector Medium time used for AC3. Each count corresponds to 32microseconds

TPE_SW_MEDIUM_TIME_USED_AC3

Bits	Name	Description
15:0	SW_MEDIUM_TIME_USED_AC3	Reset State: 0x00000000

0x300012C TPE_SW_MEDIUM_TIME_THR_AC0_AC1

Type: read-write
Reset State: 0xEFFFEFFF

This register contains the medium time threshold used for AC0 and AC1 Though the register will be written immediately, the internal logic will take this value at next one second pulse or or when a pkt has been transmitted from the correponding AC Medium time threshold for AC0. Each count corresponds to 32microseconds Medium time threshold for AC1. Each count corresponds to 32microseconds

TPE_SW_MEDIUM_TIME_THR_AC0_AC1

Bits	Name	Description
31:16	SW_MEDIUM_TIME_THR_AC1	Reset State: 0x0000EFFF
15:0	SW_MEDIUM_TIME_THR_AC0	Reset State: 0x0000EFFF

0x3000130 TPE_SW_MEDIUM_TIME_THR_AC2_AC3

Type: read-write
Reset State: 0xEFFFEFFF

This register contains the medium time threshold used for AC2 and AC3 Though the register will be written immediately, the internal logic will take this value at next one second pulse or or when a pkt has been transmitted from the correponding AC Medium time threshold for AC2. Each count corresponds to 32microseconds Medium time threshold for AC3. Each count corresponds to 32microseconds

TPE_SW_MEDIUM_TIME_THR_AC2_AC3

Bits	Name	Description
31:16	SW_MEDIUM_TIME_THR_AC3	Reset State: 0x0000EFFF
15:0	SW_MEDIUM_TIME_THR_AC2	Reset State: 0x0000EFFF

0x3000134 TPE_SW_ADMISSION_CONTROL_CONTROL_REG

Type: read-write
Reset State: 0x0000E4E4

This register contains the control for Admission Control feature. Basically it contains the back-off to AC mapping and enables to Admission control The AC that needs to be used for back-off 0, 1, 2, ...7 [1:0] -> bkof0, [3:2] ->bakof1,..[15:14]--> bkof7 Enable bits for Admission control. [16] --> bkof0, [17]-> bkof 1, [23] -> bkof 7 Only the traffic that corresponds to the back-off for which the enable is set is considered for admission control Enable bits for backoff disable control. [24] --> bkof0, [25]-> bkof 1, [26] -> bkof 27 This is override to disable back-off. Bug protection + also used if software wants to update the sw_medium_time_used_acs.

TPE_SW_ADMISSION_CONTROL_CONTROL_REG

Bits	Name	Description
31:24	SW_MTU_BCKOF_DISABLE_VALID_VECTOR	Reset State: 0x00000000
23:16	SW_AC_VALID_FOR_BKOF_VECTOR	Reset State: 0x00000000
15:0	SW_AC_TO_BKOF_LOOKUP_VECTOR	Reset State: 0x0000E4E4

0x300013C TPE_SW_LIFE_TIME_DROP_CNT

Type: read-write
Reset State: 0x00000000

Counter that counts the dropped pkts due to life time enforcement Whenever a pkt is dropped due to life time enforce ment, this count will be incremented. Writining to this register clears the counter. software is given higher priority over h/w

TPE_SW_LIFE_TIME_DROP_CNT

Bits	Name	Description
31:0	SW_LIFE_TIME_DROP_CNT	Reset State: 0x00000000

0x3000140 TPE_TPE_MCU_BD_BASED_TX_INT_FEEDBACK

Type: read-only
Reset State: 0x00000000

Contains the feedback info for the bd based tx interrupt [0] is ack_to_valid [2:0] feedback taht is sent to bmu -- Definition is as follows. S/w Doesn't need this. Kept this for any debug purpose and if software comes up with new requirement in future, these can be used TPE_BMU_FB_RESET

3'b000 TPE_BMU_FB_DROP 3'b001 TPE_BMU_FB_DROP_AND_REARB 3'b010 TPE_BMU_FB_RESET_AND_REARB 3'b011 TPE_BMU_FB_RESET_AND_CHK_RETRY 3'b100 TPE_BMU_FB_RESET_CHK_RTRY_AND_REARB 3'b101 TPE_BMU_FB_RESET_AND_REARB_UPDATE_RETRY 3'b110

TPE_TPE_MCU_BD_BASED_TX_INT_FEEDBACK

Bits	Name	Description
3:0	TPE_MCU_BD_BASED_TX_INT_FEEDBACK	Reset State: 0x00000000

0x3000144 TPE_TPE_MCU_BD_BASED_TX_INT_FEEDBACK_1

Type: read-only
Reset State: 0x00000000

Contains the feedback info for the bd based tx interrupt [0] is ack_to_valid [2:0] feedback taht is sent to bmu -- Definition is as follows. S/w Doesn't need this. Kept this for any debug purpose and if software comes up with new requirement in future, these can be used TPE_BMU_FB_RESET 3'b000 TPE_BMU_FB_DROP 3'b001 TPE_BMU_FB_DROP_AND_REARB 3'b010 TPE_BMU_FB_RESET_AND_REARB 3'b011 TPE_BMU_FB_RESET_AND_CHK_RETRY 3'b100 TPE_BMU_FB_RESET_CHK_RTRY_AND_REARB 3'b101 TPE_BMU_FB_RESET_AND_REARB_UPDATE_RETRY 3'b110

TPE_TPE_MCU_BD_BASED_TX_INT_FEEDBACK_1

Bits	Name	Description
3:0	TPE_MCU_BD_BASED_TX_INT_FEEDBACK_1	Reset State: 0x00000000

0x3000148 TPE_WRONG_BA_SSN_TID_FEEDBACK

Type: read-only
Reset State: 0x00000000

Contains the feedback info for the wrong BA interrupt. For the BAR sent, it a BA is received with different SSN or TID, an interrupt is set This register contains the Staid and tid of the corresponding flow This contains the station id of the flow for which a wrong BA is received This contains the tid of the flow for which a wrong BA is received

TPE_WRONG_BA_SSN_TID_FEEDBACK

Bits	Name	Description
11:8	WRONG_BA_TID_FEEDBACK	Reset State: 0x00000000

TPE_WRONG_BA_SSN_TID_FEEDBACK (cont.)

Bits	Name	Description
7:0	WRONG_BA_STAID_FEEDBACK	Reset State: 0x00000000

0x300014C TPE_SW_CAPPED_POWER_CONTROL

Type: read-write
Reset State: 0x00000000

This register contains the capped power controls -- bit vector and the capped power Station bit vector for capped power. If the corresponding bit is set, only then the capped power is used for the data and ack The capped power. The power that needs to be used for data and ack. Note the minimum of this and the one specified in R2P is used The capped power is used only if the corresponding bit is set Bit 0 is for All response pkts -- ack, ba, cts in respnse to RTS Bit 1 is for RTS,CTS to self Bit 2 is for the rest of types

TPE_SW_CAPPED_POWER_CONTROL

Bits	Name	Description
26:24	SW_PKT_BASED_POWER_BITMAP	Reset State: 0x00000000
20:16	SW_CAPPED_POWER_VALUE	Reset State: 0x00000000
15:0	SW_CAPPED_POWER_BIT_MAP	Reset State: 0x00000000

0x3000150 TPE_SW_ACK_TO_DUE_TO_BTC_COUNT

Type: read-write
Reset State: 0x00000000

A counter which increments every time when there is ack_to due to BTC Whenever there is ack_to due to BTC, this counter is ++

TPE_SW_ACK_TO_DUE_TO_BTC_COUNT

Bits	Name	Description
15:0	SW_ACK_TO_DUE_TO_BTC_COUNT	Reset State: 0x00000000

0x3000154 TPE_SW_LOW_PRIORITY_BT_REJECTED_COUNT

Type: read-write
Reset State: 0x00000000

A counter which ++ whenever the low priority BT is rejected due to the wlan is busy Whenever there is no grant to BT due to the wlan is busy (for low priority BT) this counter increments

TPE_SW_LOW_PRIORITY_BT_REJECTED_COUNT

Bits	Name	Description
15:0	SW_LOW_PRIORITY_BT_REJECTED_COUNT	Reset State: 0x00000000

0x3000158 TPE_SW_TERMINATE_CURRENT_TX_VALID

Type: read-write
Reset State: 0x00000000

To support terminate at TBTT in STA mode

TPE_SW_TERMINATE_CURRENT_TX_VALID

Bits	Name	Description
0	SW_TERMINATE_CURRENT_TX_VALID	If this bit is set, tpe will terminate the current transmisson. Basically this needs to be used by software when the chip is in station mode. Though we lived with this in earlier chips, it is realized that we might occupy the channel such that the AP might delay the beacons which is not good for the power save of other stations. Basically software simply have tsf based timers to trigger TBTT and enable this bit. This is not a sticky bit. This bit is reset if the tpe is in idle Reset State: 0x00000000

0x300015C TPE_RTT_REGISTER

Type: read-write
Reset State: 0x00000000

RTT registers for InNav Positioning

TPE_RTT_REGISTER

Bits	Name	Description
31	RTT_INFO_VALID	When set to 1, this RTT register contains new valid information. The software can clear this bit by writing '0'. Reset State: 0x00000000
30:24	FIR0_RSSI	The measured RSSI value from FIR-0 Reset State: 0x00000000
23:16	SNR	The measured SBR value Reset State: 0x00000000
15:10	TX_STAID	The TX STAID corresponding to this measurement Reset State: 0x00000000
9:0	RTT	The measured RTT value in 40MHz clk cycles Reset State: 0x00000000

0x3000160 TPE_BEAMFORM_CTRL

Type: read-write
Reset State: 0x00000000

Contains the control signals for calibration and beamform

TPE_BEAMFORM_CTRL

Bits	Name	Description
31:26	RESERVED	Move to ndp_beamform_ctrl.sounding_frame_response_rate_index due to bit-width increased because of new rate. Reset State: 0x00000000
25	CLEAR_WAITING_FOR_SENDING_QOSNULL	In software controlled implicit beamform, software has to write this bit so new qosnull request will be accepted software can also use this to clear the waiting if anything goes wrong Reset State: 0x00000000
24	ENABLE_MPI_CSI_EN	The mcfg_phycsxi_xfercsi_nonndp will be always on (as a backup if anything goes wrong). Reset State: 0x00000000
23	CLEAR_WAITING_FOR_SENDING_CSI	In software controlled calibration/explicit beamform, software has to write this bit so new csi request will be accepted software can also use this to clear the waiting if anything goes wrong Reset State: 0x00000000
22	EXPLICIT_IMMIDIATE_CTS_RSP_EN	When set, the 'cts response' explicit beamform will be acked with immediate cts and later ack+csi feedback, regardless of the setting in bit19. This is not currently implemented. It's here as a place holder. When cleared, delayed feedback will be used if bit19 is set. Reset State: 0x00000000

TPE_BEAMFORM_CTRL (cont.)

Bits	Name	Description
21	EXPLICIT_IMMIDIATE_ACK_RSP_EN	When set, the ack 'response ' explicit beamform will be acked with immediate ack/ba+csi feedback, regardless the setting in bit19. When cleared, delayed feedback will be used if bit19 is set. Reset State: 0x00000000
20	EXPLICIT_IMMIDIATE_NO_RSP_EN	When set, the 'no response' explicit beamform will be acked with immediate csi feedback, regardless the setting in bit19. When cleared, delayed feedback will be used if bit19 is set. Reset State: 0x00000000
19	HW_EXPLICIT_BEAMFORM_DELAY_FEEDBACK	Set to '1' to enable the hardware control csi delayed feedback for explicit beamform (when the support is enabled, and not ruled by the immediate feedback bits). Reset State: 0x00000000
18	EXPLICIT_BEAMFORM_EN	Set to '1' to enable the CSI explicit beamform support. Reset State: 0x00000000
17:14	SENDING_BKOF_QOSNULL_RETRY_THRSHLD	To setup the retry threshold when sending the bkof qosnull in hardware-controlled implicit beamform mode. Reset State: 0x00000000
13:10	SENDING_BKOF_CSI_RETRY_THRSHLD	To setup the retry threshold when sending the bkof csi in hardware-controlled calibration and explicit beamform mode. Reset State: 0x00000000
7	SW_NONCOMPRESSED_EXPLICIT_BEAMFORM_EN	When set, software control noncompressed explicit beamform is enabled. Note no hardware support for this mode. Reset State: 0x00000000
6	SW_COMPRESSED_EXPLICIT_BEAMFORM_EN	When set, software control compressed explicit beamform is enabled. Note no hardware support for this mode. Reset State: 0x00000000
5	HW_CONTROLLED_IMPLICIT_BEAMFORM_EN	When set, implicit is under hardware control. If a qosnull is waiting to be sent and bakoff 6 expires. The qosnull will be sent. Reset State: 0x00000000
4	HW_CONTROLLED_CALIBRATION_EN	When set, calibration is under hardware control. If a csi is waiting to be sent and bakoff 7 expires. The csi will be sent. Reset State: 0x00000000
3	IGNORE_CSI_FIELD_FOR_CAL_START_NDP	Set to '1' to ignore the csi field for ndp based calibration cal start frame Reset State: 0x00000000
2	SW_SEND_NDP2_VALID	Set to '1' to force the hardware to send the ndp frame to respond to the ndp frame in the ndp based calibration. The first response for this frame exchange will be a normal ack/cts. Clear to '0' so no ndp is sent. The first response for the ndp based calibration will be a sounding frame. Reset State: 0x00000000
1	IMPLICIT_BEAMFORM_EN	Set to '1' to enable implicit beamform support Reset State: 0x00000000

TPE_BEAMFORM_CTRL (cont.)

Bits	Name	Description
0	SW_CALIBRATION_FRAME_EXCHANGE_ENABLED	Set to '1' to enable calibration support Reset State: 0x00000000

0x3000164 TPE_CFG_CSI_ADDR

Type: read-write
Reset State: 0x00000000

Contains the address of the CSI template

TPE_CFG_CSI_ADDR

Bits	Name	Description
31:0	CFG_CSI_ADDR	Contains the address of the CSI frame template Reset State: 0x00000000

0x3000168 TPE_INTERRUPT_ENABLE

Type: read-write
Reset State: 0x00000000

Contains the enable bits for which interrupt has to be generated

TPE_INTERRUPT_ENABLE

Bits	Name	Description
10	SW_TEMPLATE_WRONG_CMD_INT_EN	Set to '1' to enable the invalid software command interrupt Reset State: 0x00000000
9	EXPLICITBF_QOSNULL_INT_EN	Set to '1' to enable the explicit beamform qosnull+ndp interrupt when the ndp is received followed by the qosnull request frame. Reset State: 0x00000000
8	SW_TEMPLATE_SENT_INT_EN	Set to '1' to enable interrupt after software template is sent Reset State: 0x00000000
7	GOT_ACK_FOR_BACK_INT_EN	Set to '1' to enable got_ack_for_back interrupt when expecting ba but received ack Reset State: 0x00000000
6	ERROR_VALID_INT_EN	Set to '1' to enable error interrupt. It can be either the mproc enters error state (pkt length is '0' for non qosnull/datanull pkt), or when enabled by sw, the txp timeout or internal error interrupts Reset State: 0x00000000

TPE_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
5	WRONG_SSN_OR_TID_ERROR_INT_EN	Set to '1' to enable wrong_ssn_or_tid interrupt when bar is sent and the tid/ssn of the received ba are not matched Reset State: 0x00000000
4	NONCOMPRESSED_EXPLICIT_BEAMFORM_INT_EN	Set to '1' to enable noncompressed explicit beamform interrupt for sw-controlled non compressed explicit beamform transmission Reset State: 0x00000000
3	COMPRESSED_EXPLICIT_BEAMFORM_INT_EN	Set to '1' to enable compressed explicit beamform interrupt for sw-controlled compressed explicit beamform transmission Reset State: 0x00000000
2	CSI_EXPLICIT_BEAMFORM_INT_EN	Set to '1' to enable csi explicit beamform interrupt for software controlled delayed csi explicit beamform transmission Reset State: 0x00000000
1	IMPLICIT_BEAMFORM_INT_EN	Set to '1' to enable implicit beamform interrupt for software controlled non-SIFS sounding frame transmission Reset State: 0x00000000
0	CALIBRATION_INT_EN	Set to '1' to enable calibration interrupt for software controlled calibration CSI frame transmission Reset State: 0x00000000

0x300016C TPE_INTERRUPT_STATUS

Type: read-write
Reset State: 0x00000000

Contains the interrupt status, writing 1 to any bit will clear the corresponding interrupt

TPE_INTERRUPT_STATUS

Bits	Name	Description
10	SW_TEMPLATE_WRONG_CMD_INT_STATUS	When set, indicates that there's an invalid software template command Write '1' to clear the interrupt. Reset State: 0x00000000
9	EXPLICITBF_QOSNULL_INT_STATUS	When set, indicates that explicit bf qosdata+ndp frame exchange is received Write '1' to clear the interrupt. Reset State: 0x00000000
8	SW_TEMPLATE_SENT_INT_STATUS	When set, indicates that software template transmit is completed Write '1' to clear the interrupt. Reset State: 0x00000000
7	GOT_ACK_FOR_BACK_INT_STATUS	When set, indicates that when expecting ba but received ack Write '1' to clear the interrupt. Reset State: 0x00000000

TPE_INTERRUPT_STATUS (cont.)

Bits	Name	Description
6	ERROR_VALID_INT_STATUS	When set, indicates the mproc error state, or when enabled by sw, the txp timeout or internal error interrupts Write '1' to clear the interrupt. Reset State: 0x00000000
5	WRONG_SSN_OR_TID_ERROR_INT_STATUS	When set, indicates that bar is sent and the tid/ssn of the received ba are not matched Write '1' to clear the interrupt. Reset State: 0x00000000
4	NONCOMPRESSED_EXPLICIT_BEAMFORM_INT_STATUS	When set, indicates the noncompressed explicit beamform frame request is received. software has to control the non compressed explicit beamform transmission Write '1' to clear the interrupt. Reset State: 0x00000000
3	COMPRESSED_EXPLICIT_BEAMFORM_INT_STATUS	When set, indicate the compressed explicit beamform frame req is received. software has to control the compressed explicit beamform transmission Write '1' to clear the interrupt. Reset State: 0x00000000
2	CSI_EXPLICIT_BEAMFORM_INT_STATUS	When set, indicates the explicit beamform frame is received. software has to control the delayed csi explicit beamform transmission Write '1' to clear the interrupt. Reset State: 0x00000000
1	IMPLICIT_BEAMFORM_INT_STATUS	When set, indicates the implicit beamform frame is received. software has to send the non-SIFS sounding frame transmission at bkof Write '1' to clear the interrupt. Reset State: 0x00000000
0	CALIBRATION_INT_STATUS	When set, indicates the calibration frame exchange step1 is done. software has to control the CSI frame transmission Write '1' to clear the interrupt. Reset State: 0x00000000

0x3000170 TPE_BEAMFORM_STATUS

Type: read-only
Reset State: 0x00000000

Contains the status for calibration and beamform.

TPE_BEAMFORM_STATUS

Bits	Name	Description
25	WAITING_FOR_SEND_QOSNULL	A qosnull is waiting to be sent. Hardware won't accept any new qosnull request until the signal is cleared by 1. qosnull is sent. 2. dropped due to retry limit 3. software write to the clear register bit Reset State: 0x00000000

TPE_BEAMFORM_STATUS (cont.)

Bits	Name	Description
24	WAITING_FOR_SEND_CSI	A CSI is waiting to be sent. Hardware won't accept any new csi request until the signal is cleared by 1. csi is sent. 2. csi is dropped due to retry limit 3. software write to the clear register bit Reset State: 0x00000000
23:20	SENDING_QOSNULL_CSI_RETRY_CNT	Retry counter for the bkof qosnull Reset State: 0x00000000
19:16	SENDING_BKOF_CSI_RETRY_CNT	Retry counter for the bkof csi Reset State: 0x00000000
15:8	ADDR2_STAID	The addr2_staid for software to send the bkof qosnull in software controlled implicit beamform Reset State: 0x00000000
7:0	ADDR1_STAID	The addr1_staid for software to send the bkof qosnull in software controlled implicit beamform Reset State: 0x00000000

0x3000174 TPE_CALIBRATION_CNT

Type: read-only
Reset State: 0x00000000

Contains the debug counter for calibration

TPE_CALIBRATION_CNT

Bits	Name	Description
23:16	CALIBRATION_SENT_CNT	Calibration sent count, increase when the bkof csi is sent or dropped. Reset State: 0x00000000
15:8	CALIBRATION_ABORT_CNT	Calibration abort count, increase when calibration complete frame is not received Reset State: 0x00000000
7:0	CALIBRATION_REQ_CNT	Calibration request count Reset State: 0x00000000

0x3000178 TPE_BEAMFORM_CNT

Type: read-only
Reset State: 0x00000000

Contains the debug counter for implicit/explicit beamform`

TPE_BEAMFORM_CNT

Bits	Name	Description
31:24	EXPLICIT_BEAMFORM_CSI_SENT_CNT	Explicit Beamform sent count, increase when the bkof csi is sent or dropped Reset State: 0x00000000
23:16	EXPLICIT_BEAMFORM_REQ_CNT	Explicit beamform request count Reset State: 0x00000000
15:8	IMPLICIT_BEAMFORM_QOSNULL_SENT_CNT	Implicit Beamform sent count, increase when the bkof qosnull is sent or dropped Reset State: 0x00000000
7:0	IMPLICIT_BEAMFORM_REQ_CNT	Implicit Beamform request count Reset State: 0x00000000

0x300017C TPE_SW_PM_2

Type: read-write
Reset State: 0x00000000

sw controlled pm bit

TPE_SW_PM_2

Bits	Name	Description
7:0	SW_PM	SW configurable PM bit for control/response frame which were sent by hardware template before. bit0 - ACK. bit1 - RTS. bit2 - CTS. bit3 - BAR. bit4 - BA. bit5 - CF_END bit6 - ACK CTRL WRAPPER. bit7 - CTS CTRL WRAPPER. Reset State: 0x00000000

0x3000198 TPE_SW_11AC_PADDING

Type: read-write
Reset State: 0x00000000

The SMDA version of A-MPDU delimiters to fill in the last ofdm symbol for 11ac

TPE_SW_11AC_PADDING

Bits	Name	Description
31:0	SW_11AC_PADDING_CONTENTS	The SMDA version of A-MPDU delimiters to fill in the last ofdm symbol for 11ac Reset State: 0x00000000

0x30001B0 TPE_NDP_BEAMFORM_CTRL

Type: read-write
Reset State: 0x00000000

Contains the control signals for beamform qosnull + ndp

TPE_NDP_BEAMFORM_CTRL

Bits	Name	Description
12:4	SOUNDING_FRAME_RESPONSE_RATE_INDEX	To be used in a sounding frame response when the response rate from the rate table is 11b or 11g rate. Reset State: 0x00000000
3	ENABLE_MPI_NDP_EN	The mcfg_phycsxi_xfercsi_ndp will be always on (as a backup if anything goes wrong). Reset State: 0x00000000
2	SW_EXPLICITBF_QOSNULL_HW_CTRL_EN	Set to '1' to enable the hardware controlled delay feedback of beamform qosnull+ndp Reset State: 0x00000000
1	SW_EXPLICITBF_QOSNULL_IMME_EN	Set to '1' to enable the immediate feedback of beamform qosnull+ndp Reset State: 0x00000000
0	SW_EXPLICITBF_QOSNULL_NDP_EN	Set to '1' to enable the explicit beamform qosnull + ndp Reset State: 0x00000000

0x30001B4 TPE_BEAMFORM_QOSNULL_NDP_CNT

Type: read-only
Reset State: 0x00000000

Contains the debug counter for beamform qosnull+ndp

TPE_BEAMFORM_QOSNULL_NDP_CNT

Bits	Name	Description
23:16	EXPLICITBF_QOSNULL_SENT_CNT	explicit beamform feedback sent count Reset State: 0x00000000
15:8	EXPLICITBF_QOSNULL_NDP_CNT	explicit beamform ndp receive count Reset State: 0x00000000
7:0	EXPLICITBF_QOSNULL_REQ_CNT	explicit beamform qosnull request count Reset State: 0x00000000

0x30001B8 TPE_CXM_CTRL

Type: read-write
Reset State: 0x00000000

Contains the control and status of cxm logic

TPE_CXM_CTRL

Bits	Name	Description
4	BTC_ACTIVE_FINAL	btc_active_final status Reset State: 0x00000000
3	LTE_CXM_WLAN_TX_GRANT	lte_cxm_wlan_tx_grant status Reset State: 0x00000000
2	WLAN_TX_GRANT	wlan_tx_grant status Reset State: 0x00000000
1	SW_WLAN_TX_GRANT_SEL	When enabled(bit[0]), 0: btc_active from pta controls tx, 1:lte_cxm_wlan_tx_grant from timer controls tx Reset State: 0x00000000
0	SW_WLAN_TX_GRANT_CTRL_EN	Set 1 to enable the wlan_tx_grant control logic. Clear 0 to always allow transmission Reset State: 0x00000000

0x30001BC TPE_SW_11AC_CTRL

Type: read-write
Reset State: 0x00000200

Contains the control signals 11ac related

TPE_SW_11AC_CTRL

Bits	Name	Description
15:0	SW_MAX_AMPDU_TX_TIME_11AC	The maximum ampdu tx time in 11ac mode Reset State: 0x00000200

0x30001C0 TPE_SW_AID_01

Type: read-write
Reset State: 0x00000000

Contains the AID for staid0, 1

TPE_SW_AID_01

Bits	Name	Description
21:11	SW_AID_01_1	The AID for staid1 Reset State: 0x00000000
10:0	SW_AID_01_0	The AID for staid0 Reset State: 0x00000000

0x30001C4 TPE_SW_AID_23

Type: read-write
Reset State: 0x00000000

Contains the AID for staid2, 3

TPE_SW_AID_23

Bits	Name	Description
21:11	SW_AID_23_3	The AID for staid3 Reset State: 0x00000000
10:0	SW_AID_23_2	The AID for staid2 Reset State: 0x00000000

0x30001C8 TPE_SW_AID_45

Type: read-write
Reset State: 0x00000000

Contains the AID for staid4, 5

TPE_SW_AID_45

Bits	Name	Description
21:11	SW_AID_45_5	The AID for staid5 Reset State: 0x00000000
10:0	SW_AID_45_4	The AID for staid4 Reset State: 0x00000000

0x30001CC TPE_SW_AID_67

Type: read-write
Reset State: 0x00000000

Contains the AID for staid6, 7

TPE_SW_AID_67

Bits	Name	Description
21:11	SW_AID_67_7	The AID for staid7 Reset State: 0x00000000
10:0	SW_AID_67_6	The AID for staid6 Reset State: 0x00000000

0x30001D0 TPE_SW_AID_89

Type: read-write
Reset State: 0x00000000

Contains the AID for staid8, 9

TPE_SW_AID_89

Bits	Name	Description
21:11	SW_AID_89_9	The AID for staid9 Reset State: 0x00000000
10:0	SW_AID_89_8	The AID for staid8 Reset State: 0x00000000

0x30001D4 TPE_SW_AID_AB

Type: read-write
Reset State: 0x00000000

Contains the AID for staid10, 11

TPE_SW_AID_AB

Bits	Name	Description
21:11	SW_AID_AB_11	The AID for staid11 Reset State: 0x00000000
10:0	SW_AID_AB_10	The AID for staid10 Reset State: 0x00000000

0x30001D8 TPE_SW_AID_CD

Type: read-write
Reset State: 0x00000000

Contains the AID for staid12, 13

TPE_SW_AID_CD

Bits	Name	Description
21:11	SW_AID_CD_13	The AID for staid13 Reset State: 0x00000000
10:0	SW_AID_CD_12	The AID for staid12 Reset State: 0x00000000

0x30001DC TPE_SW_AID_EF

Type: read-write
Reset State: 0x00000000

Contains the AID for staid14, 15

TPE_SW_AID_EF

Bits	Name	Description
21:11	SW_AID_EF_15	The AID for staid15 Reset State: 0x00000000
10:0	SW_AID_EF_14	The AID for staid14 Reset State: 0x00000000

0x30001E0 TPE_SW_GID_SEL

Type: read-write
Reset State: 0x00000000

Contains the GID selection for all stations

TPE_SW_GID_SEL

Bits	Name	Description
31:30	SW_GID_SEL_15	The gid selection for sta15 Reset State: 0x00000000
29:28	SW_GID_SEL_14	The gid selection for sta14 Reset State: 0x00000000

TPE_SW_GID_SEL (cont.)

Bits	Name	Description
27:26	SW_GID_SEL_13	The gid selection for sta13 Reset State: 0x00000000
25:24	SW_GID_SEL_12	The gid selection for sta12 Reset State: 0x00000000
23:22	SW_GID_SEL_11	The gid selection for sta11 Reset State: 0x00000000
21:20	SW_GID_SEL_10	The gid selection for sta10 Reset State: 0x00000000
19:18	SW_GID_SEL_9	The gid selection for sta9 Reset State: 0x00000000
17:16	SW_GID_SEL_8	The gid selection for sta8 Reset State: 0x00000000
15:14	SW_GID_SEL_7	The gid selection for sta7 Reset State: 0x00000000
13:12	SW_GID_SEL_6	The gid selection for sta6 Reset State: 0x00000000
11:10	SW_GID_SEL_5	The gid selection for sta5 Reset State: 0x00000000
9:8	SW_GID_SEL_4	The gid selection for sta4 Reset State: 0x00000000
7:6	SW_GID_SEL_3	The gid selection for sta3 Reset State: 0x00000000
5:4	SW_GID_SEL_2	The gid selection for sta2 Reset State: 0x00000000
3:2	SW_GID_SEL_1	The gid selection for sta1 Reset State: 0x00000000
1:0	SW_GID_SEL_0	The gid selection for sta0 Reset State: 0x00000000

0x30001E4 TPE_SW_NONHT_BW_CTRL

Type: read-write
Reset State: 0x00000000

Contains the BW indication configuration

TPE_SW_NONHT_BW_CTRL

Bits	Name	Description
6	SW_NAV_CHECK_FOR_RTS_EN	When set, always check if nav is zero before sending cts. Otherwise it will only be checked for BW signaling. Reset State: 0x00000000
5:0	SW_RTS_BW_RETRY_THRESHOLD	In static mode, when rts retry counters is larger than the threshold, data will be sent out at 20Mhz rate. Reset State: 0x00000000

0x30001E8 TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE_40MHZ

Type: read-write
Reset State: 0x00000000

TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE_40MHZ

Bits	Name	Description
30	FEC_MODE	Reset State: 0x00000000
29	LPE_BIT	Reset State: 0x00000000
25	AMPDU_VALID	Reset State: 0x00000000
24:20	TX_POWER	Reset State: 0x00000000
19	RESERVED	Reset State: 0x00000000
18:16	TX_ANTENNA_EN	Reset State: 0x00000000
15:14	STBC_VALID	Reset State: 0x00000000
13	SGI_VALID	Reset State: 0x00000000
12:11	NSS_11B_MODE	Reset State: 0x00000000
8:3	STA_RATE	Reset State: 0x00000000
2:0	STA_MODE	Reset State: 0x00000000

0x30001EC TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE_80MHZ

Type: read-write
Reset State: 0x00000000

TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE_80MHZ

Bits	Name	Description
30	FEC_MODE	Reset State: 0x00000000
29	LPE_BIT	Reset State: 0x00000000

TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE_80MHZ (cont.)

Bits	Name	Description
25	AMPDU_VALID	Reset State: 0x00000000
24:20	TX_POWER	Reset State: 0x00000000
19	RESERVED	Reset State: 0x00000000
18:16	TX_ANTENNA_EN	Reset State: 0x00000000
15:14	STBC_VALID	Reset State: 0x00000000
13	SGI_VALID	Reset State: 0x00000000
12:11	NSS_11B_MODE	Reset State: 0x00000000
8:3	STA_RATE	Reset State: 0x00000000
2:0	STA_MODE	Reset State: 0x00000000

0x30001F0 TPE_SW_WARMUP_DELAY

Type: read-write
Reset State: 0x00000000

This register contains the control signals for warmup

TPE_SW_WARMUP_DELAY

Bits	Name	Description
11	SW_FIX_WARMUP_DELAY_EN	Set this bit to 1 to enable the fix warmup delay Reset State: 0x00000000
10:0	SW_WARMUP_TIME	The wait time to be programmed in txp commands. This is the time between tpe asserts the warmup and the time when txp sends the first phy cmd. Reset State: 0x00000000

0x30001F4 TPE_MAIN_MPROC_REQ_CNT

Type: read-only
Reset State: 0x00000000

This register contains the main_mproc request counter per session

TPE_MAIN_MPROC_REQ_CNT

Bits	Name	Description
27:24	SESSION_IS_BACKOFF_CSI_QOSNULL_CNT	Reset State: 0x00000000

TPE_MAIN_MPROC_REQ_CNT (cont.)

Bits	Name	Description
23:20	SESSION_IS_BACKOFF_CNT	Reset State: 0x00000000
19:16	SESSION_IS_BEACON_CN	Reset State: 0x00000000
15:12	SESSION_IS_SW_TEMPLATE_CNT	Reset State: 0x00000000
11:8	SESSION_IS_SW_STA_QID_CNT	Reset State: 0x00000000
7:4	SESSION_IS_SW_BACK_OFF_INDEX_CNT	Reset State: 0x00000000
3:0	SESSION_IS_RXP_CNT	Reset State: 0x00000000

16.2.48 txp

0x3000000 TXP_TXP_CMDF_DIN

Type: read-write
Reset State: 0x00000000

Command write port of TXP FIFO.

TXP_TXP_CMDF_DIN

Bits	Name	Description
31:0	TXP_CMDF_WDATA	Write-only, 32-bit field for commands from the software to the TXP. Reset State: 0x00000000

0x3000004 TXP_TXP_CMDF_CONTROL

Type: read-write
Reset State: 0x00010024

TXP command FIFO control register.

TXP_TXP_CMDF_CONTROL

Bits	Name	Description
16	TPE_CAHBZ	This bit controls where the TXP commands will come from. 1 for TPE, 0 for CAHB (i.e., from SW). Reset State: 0x00000001

TXP_TXP_CMDF_CONTROL (cont.)

Bits	Name	Description
7:0	FREE_ENTRIES	Read-only field that shows free entries remaining in TXP command FIFO Reset State: 0x00000024

0x3000008 TXP_TXP_TIMEOUT_TIMER

Type: read-write
Reset State: 0x00000000

TXP Timeout Timer - will interrupt cpu if TXP state machines do not return to idle within pre-specified time.

TXP_TXP_TIMEOUT_TIMER

Bits	Name	Description
31	TIMER_EN	Timeout timer enable bit. Reset State: 0x00000000
23:0	TIMEOUT_TIMER_VAL	Timeout timer value - in microseconds. Reset State: 0x00000000

0x300000C TXP_TXP_STATUS

Type: read-only
Reset State: 0x00000000

Shows status of TXP.

TXP_TXP_STATUS

Bits	Name	Description
18:17	GAS_STATUS	Status of GAS in TXP. Reset State: 0x00000000
16	GAM_BUSY	Shows whether GAM in TXP is busy. Reset State: 0x00000000

TXP_TXP_STATUS (cont.)

Bits	Name	Description
15:8	ERROR_CODE	Read-only field that shows TXP error code (0 if no error). Command FIFO - Over flow: 8'b0001_0000; GAM control - AHB error returned from GAM: 8'b0010_0000; Invalid BD header: 8'b0010_0001; tx_size with 0 bytes: 8'b0010_0010; MPDU Header longer than 1st pdu: 8'b0010_0011; Data starts outside 1st pdu: 8'b0010_0100; MPDU header longer than MPDU: 8'b0010_0101; MPDU data_offset < MPDU hdr_off: 8'b0010_0110; PINF - PHY sends abort/BTC Active: 8'b0011_0000; - FIFO underrun: 8'b0011_0001; - New transmission with no PHY clkstart: 8'b0011_0010; - New transmission, but PHY not idle: 8'b0011_0011; - PHY goes idle prematurely: 8'b0011_0100; FCS - Two consecutive FCS Starts received: 8'b0100_0000; - Two consecutive FCS Stops received (last was FCS32): 8'b0100_0001; - FCS8 Start followed by FCS8 Start: 8'b0100_0010; - Two consecutive FCS Stops received (last was FCS8): 8'b0100_0011; - FCS32 Start followed by FCS8 Start: 8'b0100_0100; - FCS32 Start followed by FCS8 Stop: 8'b0100_0101; - FCS8 Start followed by FCS32 Start: 8'b0100_0110; - FCS8 Start followed by FCS32 Stop: 8'b0100_0111; Main FSM - Invalid command type: 8'b0101_0000; - PHY command with 0 bytes: 8'b0101_0001; - tx_sw with 0 bytes: 8'b0101_0010; Reset State: 0x00000000
7:0	LAST_CMD_NR	Read-only field that shows last command number successfully completed by TXP. TXP extracts the last 8 bits of the command and blindly copies it to this register This is the CMD index nr field supplied by software. Reset State: 0x00000000

0x3000010 TXP_TXP_BTC_ACTIVE_ABORT_ENABLE

Type: read-write
Reset State: 0x00000000

Controls if BTC active will cause TXP to be abort. software would then have to soft reset the TXP.

TXP_TXP_BTC_ACTIVE_ABORT_ENABLE

Bits	Name	Description
0	BTC_ACTIVE	Allows BTC active to cause TXP abort. Reset State: 0x00000000

0x3000014 TXP_TXP_TESTBUS

Type: read-write
Reset State: 0x00000008

testbus register.

TXP_TXP_TESTBUS

Bits	Name	Description
31	ENABLE_WAIT_GAM_IDLE_ECO	Set '1' to enable the eco, so the txp_tpe_main_error_hang won't be asserted until gam is idle Reset State: 0x00000000
11:8	MAC_PHY_TESTBUS_SEL	MAC/PHY testbus select. Reset State: 0x00000000
7:4	PHY_TESTBUS_SEL	PHY testbus select. Reset State: 0x00000000
3:0	MAC_TESTBUS_SEL	MAC testbus select. Reset State: 0x00000008

0x3000018 TXP_TXP_WARMUP_CNTL

Type: read-write
Reset State: 0x00000030

TXP warmup control register - added for Virgo

TXP_TXP_WARMUP_CNTL

Bits	Name	Description
5	TPE_TXP_RF_WARMUP_END_P_EN	allow tpe_txp_rf_warmup_end_p to affect txp_mpi_warmup Reset State: 0x00000001
4	TPE_TXP_RF_WARMUP_P_EN	allow tpe_txp_rf_warmup_p to affect txp_mpi_warmup Reset State: 0x00000001

0x3000080 TXP_TXP_DEBUG_CLEAR

Type: write-only
Reset State: 0x00000000

Write-only register; clears all debug registers.

TXP_TXP_DEBUG_CLEAR

Bits	Name	Description
0	CLR_DEBUG_REGS	Write only-bit; write 1 to clear all debug registers. Reset State: 0x00000000

0x3000084 TXP_TXP_NR_FRAMES_XMIT

Type: read-write
Reset State: 0x00000000

Number of frames (PPDU) transmitted

TXP_TXP_NR_FRAMES_XMIT

Bits	Name	Description
15:0	NR_FRAMES_XMIT	Number of frames transmitted; stuck at 0xffff Reset State: 0x00000000

0x3000088 TXP_TXP_PHY_ABORTS

Type: read-write
Reset State: 0x00000000

Number of times that txp_mpi_abort or mpi_txp_abort is asserted (counter is located before the loopback mux). The counters increment once for every low to high transition in the signal.

TXP_TXP_PHY_ABORTS

Bits	Name	Description
31:16	NR_PHY_ABORT_RCVD	Number of times mpi_txp_abort (or fphy_txp_abort) is asserted. Reset State: 0x00000000
15:0	NR_PHY_ABORT_GEN	Number of times txp_mpi_abort (or txp_fphy_abort) is asserted Reset State: 0x00000000

0x300008C TXP_TXP_NR_END_INTERRUPTS

Type: read-write
Reset State: 0x00000000

Number of end interrupts sent by TXP.

TXP_TXP_NR_END_INTERRUPTS

Bits	Name	Description
15:0	TXP_NR_END_INTERRUPTS	Number of end interrupts sent to software. Once it is reached max(0xFFFF), hardware stops updating software needs to reset to restart this counter again Reset State: 0x00000000

0x3000090 TXP_TXP_NR_CMDS

Type: read-write
Reset State: 0x00000000

Number of TXP commands processed.

TXP_TXP_NR_CMDS

Bits	Name	Description
15:0	TXP_NR_CMDS	Number of commands processed Reset State: 0x00000000

16.2.49 dpi

0x30003E0 DPI_LMAP_SYM

Type: read-write
Reset State: 0x00000000

NOT PHYSICALLY IN ASIC, used for RTL simulator debug. Shows only a particular OFDM symbol. val==0xffff shows all symbols. val==0 turns off debug messages. Assumes C++ is compiled with debugging turned on too.

DPI_LMAP_SYM

Bits	Name	Description
15:0	VAL	0x0: OFF 0xFFFF: ALL Reset State: 0x00000000

0x30003E4 DPI_LMAP_TONE_MIN

Type: read-write
Reset State: 0x00000000

NOT PHYSICALLY IN ASIC, used for RTL simulator debug. Shows debug values tone_min <= tone <= tone_max.

DPI_LMAP_TONE_MIN

Bits	Name	Description
15:0	VAL	Reset State: 0x00000000

0x30003E8 DPI_LMAP_TONE_MAX

Type: read-write
Reset State: 0x00000000

NOT PHYSICALLY IN ASIC, used for RTL simulator debug. Shows debug values tone_min <= tone <= tone_max.

DPI_LMAP_TONE_MAX

Bits	Name	Description
15:0	VAL	Reset State: 0x00000000

0x30003EC DPI_LMAP_ROT

Type: read-write
Reset State: 0x00000000

NOT PHYSICALLY IN ASIC, used for RTL simulator debug. Shows only a particular QR rotation.

DPI_LMAP_ROT

Bits	Name	Description
15:0	VAL	Reset State: 0x00000000

0x30003F0 DPI_LMAP_CONSTEL

Type: read-write
Reset State: 0x00000000

NOT PHYSICALLY IN ASIC, used for RTL simulator debug. On some calculations shows only a particular constellation point.

DPI_LMAP_CONSTEL

Bits	Name	Description
15:0	VAL	Reset State: 0x00000000

16.2.50 riva_bt_link_ctrl

0x3000000 BT_INT_0_INTERRUPT_CONTROL

Type: read-write
Reset State: 0x00000000

BT_INTR

Bits	Name	Description
26	RX_FIFO_UFLOW_INTR	Receive FIFO Underflow interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000
25	RX_FIFO_OFLOW_INTR	Receive FIFO Overflow interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000
24	RX_FIFO_RDY_INTR	Receive FIFO Ready interrupt status bit: Indicates when the Receive FIFO is ready to be drained of software characters. This interrupt is set every clock cycle while the FIFO fill level is greater than the Receive FIFO Trigger Level (rx_trig_level). Software must write a 1 to this bit to clear it. Reset State: 0x00000000
17	TX_FIFO_OFLOW_INTR	Transmit FIFO Overflow interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000
16	TX_FIFO_RDY_INTR	Transmit FIFO Ready interrupt status bit: Indicates when the Transmit FIFO is ready to accept more software characters for transmission. This interrupt is set every clock cycle while the FIFO fill level is less than or equal to the Transmit FIFO Trigger Level (tx_trig_level). Software must write a 1 to this bit to clear it. Reset State: 0x00000000
8	RX_HW_CHAR_INTR	Received Hardware Character interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000
1	PARITY_ERR_INTR	UART Parity Error interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000
0	FRAME_ERR_INTR	UART Frame Error interrupt status bit. Software must write a 1 to this bit to clear it. Reset State: 0x00000000

BT_UART_CTRL

Bits	Name	Description
31:24	BAUD_RATE_NUMERATOR	Sets the numerator for the ratio of the system clock frequency to the baud rate. Reset State: 0x00000003
23:16	BAUD_RATE_DENOMINATOR	Sets the denominator for the ratio of the system clock frequency to the baud rate. Reset State: 0x00000028
6	TX_INV_EN	When set, enables the UART's serial TX output inverter. Reset State: 0x00000001
5	RX_INV_EN	When set, enables the UART's serial RX input inverter. Reset State: 0x00000001

BT_UART_CTRL (cont.)

Bits	Name	Description
4	POWER_DOWN	When set, puts the UART into power-down mode. The UART transmitter will complete its current transmission and then disable all further transmissions. The UART receiver will discard the current character being received and then ignore all further receptions. Reset State: 0x00000000
3	PARITY_EN	Enables parity bit generation in the UART transmitter, and parity checking in the UART receiver. Reset State: 0x00000000
2	PARITY_ODD	When parity is enabled, this bit specifies whether the parity is odd or even. When 1, the parity is odd; when 0, it is even. Reset State: 0x00000000
1:0	NUM_STOPS	Specifies the number of stop bits (1-4) at the end of each character. The number of stop bits per character = num_stops + 1. Reset State: 0x00000000

0x300000C BT_HW_CTRL

Type: command
Reset State: 0x00000014

BT_HW_CTRL

Bits	Name	Description
31:24	LAST_RX_HW_CHAR	This field captures the last received hardware character that was passed on to the Signaling layer. Reset State: 0x00000000
15	TX_BUFFER_STATE	State of the 1-character-deep Hardware TX Buffer. When 1, the buffer is full; when 0, the buffer is empty. Reset State: 0x00000000
14:8	TX_BUFFER_CONTENTS	This field captures the hardware character presently stored in the TX Buffer. Resend bit excluded as only non-Resend-Requests are stored in this buffer. Reset State: 0x00000000
7	RESEND_REQ_FLAG	Indicates the present state of the Resend Request flag. When set, it indicates that a Resend Request is pending transmission. Reset State: 0x00000000
4	EXCLUSIVE_RESEND_EN	Exclusive Resend Enable: When set, the QTA module will treat Signal State bits within Resend Request characters as invalid. When clear, the Signal State bits are valid regardless of whether the character is a Resend Request. Reset State: 0x00000001

BT_HW_CTRL (cont.)

Bits	Name	Description
3	RESEND_REQ_PASSTHRU_EN	Resend Request Pass-Through Enable: When set, the QTA module will pass received Resend Request characters through to the Signaling layer for processing. NB: This feature is unsupported for the WLAN version of the QTA module, because the Signaling interface for the WLAN version does not support Resend signaling. Reset State: 0x00000000
2	RESEND_RESP_EN	Resend Response Enable: When this bit is set, the QTA module will automatically respond to received Resend Requests by resending its last (non-Resend-Request) hardware character. Otherwise, the QTA module will not respond to Resend Requests received from the peer device. Reset State: 0x00000001
1	RETRANSMIT	Retransmit TX Buffer contents: Writing a 1 to this bit causes the last (non-Resend-Request) hardware character to be re-transmitted. This bit is self-clearing. Reset State: 0x00000000
0	RESEND_REQUEST	Send a Resend Request: Writing a 1 to this bit causes a Resend Request character to be queued for transmission. This bit is self-clearing. Reset State: 0x00000000

0x3000010 BT_HW_TX_BUFFER_MODIFY

Type: write-only
Reset State: 0x00000000

BT_HW_TX_BUFFER_MODIFY

Bits	Name	Description
6:0	DATA	Data to be written to the TX Buffer. Writing to this register causes the contents of the TX Buffer to be modified to the value of the data field, and causes the TX buffer state to be set to full. Reset State: 0x00000000

0x3000014 BT_SW_CTRL

Type: read-write
Reset State: 0x00000000

BT_SW_CTRL

Bits	Name	Description
29:24	RX_FILL	Indicates the number of software characters presently queued in the Receive FIFO. Reset State: 0x00000000
21	RX_FLUSH	Receive FIFO Flush: Writing a 1 to this bit flushes the contents of the Receive FIFO. This bit is self-clearing. Reset State: 0x00000000
20:16	RX_TRIG_LEVEL	Receive FIFO Trigger Level. See the rx_fifo_rdy_int interrupt status register description. Reset State: 0x00000000
13:8	TX_FILL	Indicates the number of software characters presently queued in the Transmit FIFO. Reset State: 0x00000000
5	TX_FLUSH	Transmit FIFO Flush: Writing a 1 to this bit flushes the contents of the Transmit FIFO. This bit is self-clearing. Reset State: 0x00000000
4:0	TX_TRIG_LEVEL	Transmit FIFO Trigger Level. See the tx_fifo_rdy_int interrupt status register description. Reset State: 0x00000000

0x3000018 BT_SW_TX_FIFO_IN

Type: write-only
Reset State: 0x00000000

BT_SW_TX_FIFO_IN

Bits	Name	Description
7:0	DATA	Software character to be transmitted. Reset State: 0x00000000

0x300001C BT_SW_RX_FIFO_OUT

Type: read-only
Reset State: 0x00000000

BT_SW_RX_FIFO_OUT

Bits	Name	Description
7:0	DATA	Software character received. Reset State: 0x00000000

0x3000020 BT_TESTBUS

Type: read-write
Reset State: 0x00000000

BT_TESTBUS

Bits	Name	Description
3:0	SEL	Select input for the test bus multiplexer. 0x0: QTA_TESTBUS_NONE 0x1: QTA_TESTBUS_UART_RX 0x2: QTA_TESTBUS_UART_TX 0x3: QTA_TESTBUS_SW_FIFOS 0x4: QTA_TESTBUS_SW_RX 0x5: QTA_TESTBUS_SW_TX 0x6: QTA_TESTBUS_HW_RX 0x7: QTA_TESTBUS_HW_TX 0x8: QTA_TESTBUS_CONV_RX 0x9: QTA_TESTBUS_CONV_TX 0xA: QTA_TESTBUS_RESERVED_10 0xB: QTA_TESTBUS_RESERVED_11 0xC: QTA_TESTBUS_RESERVED_12 0xD: QTA_TESTBUS_RESERVED_13 0xE: QTA_TESTBUS_RESERVED_14 0xF: QTA_TESTBUS_RESERVED_15 Reset State: 0x00000000

0x3000000+4*RIVA_APU_RGn_RACR, n=[0..0]
n

Type: read-write
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type APU. These registers include a single bit per VMID granting read access.

RIVA_APU_RGn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x3000400+4*RIVA_APU_RGn_WACR, n=[0..0]
n

Type: read-write
Reset State: 0x00000000

These registers exist only for the case when APU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs.read-only access permission type APU.

RIVA_APU_RGn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x3000F80 RIVA_APU_CR

Type: read-write
Reset State: 0x00000000

APU Configuration Register: This register includes fields governing various APU behaviors.

RIVA_APU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved

RIVA_APU_CR (cont.)

Bits	Name	Description
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresse) are recorded as such. 0xDCDEE: V_0_DO_NOT_RECORD_DECODE_ERRORS_DO_NOT_SET_APU_ESR_APU_EAR_AND_APU_ESYNR0_NOT_UPDATED 0xDCDEE: V_1_RECORD_DECODE_ERRORS_SET_APU_ESR_APU_EAR_AND_APU_ESYNR0_UPDATED_WITH_ADDRESS_AND_SYNDROME_OF_ERROR
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x3000F84 RIVA_APU_EAR

Type: read-write
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

RIVA_APU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x3000F88 RIVA_APU_ESR

Type: read-write
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port. This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the APU_ESYNRn registers, which are merely the "syndrome" of an error indicated by APU_ESR.

RIVA_APU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x3000F8C RIVA_APU_ESRRESTORE

Type: read-write
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

RIVA_APU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.

RIVA_APU_ESRRESTORE (cont.)

Bits	Name	Description
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x3000F90 RIVA_APU_ESYNR0

Type: read-write
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

RIVA_APU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x3000F94 RIVA_APU_ESYNR1

Type: read-write
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

RIVA_APU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.

RIVA_APU_ESYNR1 (cont.)

Bits	Name	Description
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x3000FF4 RIVA_APU_REV

Type: read-only
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

RIVA_APU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x3000FF8 RIVA_APU_IDR

Type: read-only
Reset State: 0x00001C05

APU ID Register: Read-only register that defines various configuration attributes of the APU instance.

RIVA_APU_IDR

Bits	Name	Description
31:29	RESERVED31_21	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: RESERVED
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.
9	RESERVED9	Reserved
8:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x3000FFC RIVA_APU_ACR

Type: read-write
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

RIVA_APU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APUs (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

16.2.57 riva_m2vmt

0x3000000+0x4*n RIVA_M2VMT_M2VMRn, n=[0..1]

Type: read-write
Reset State: 0xxxxxxxxx

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID. Where n = NUM_M2VMT_ENTRIES from the design generics and we map NUM_M2VMT_ENTRIES to NUM_MASTERS.

RIVA_M2VMT_M2VMRn

Bits	Name	Description
31:5	RESERVED	
4:0	VMID	Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRn address associations. n = NUM_M2VMT_ENTRIES from the design generic/parameter.

0x3000F80 RIVA_M2VMT_CR

Type: read-write
Reset State: 0xxxxxxxxx

Global configuration register.

Note: When REMOVE_M2VMT_RPU = ‘1’, this register is not available. Also, bit [2], is not valid or has no effect when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT =‘1’.

RIVA_M2VMT_CR

Bits	Name	Description
31:4	RESERVED	
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., in valid addresses) are recorded as such. Decode error is asserted when config access to un-implemented and/or unmapped register/address are done. Also, note that decode error is never asserted for client port accesses. When value is set to '0' i.e., "do not record", decode errors do not set the M2VMT_ESR[CFG], and M2VMT_EAR & M2VMT_SYNRn is not updated. When value is set to '1', i.e., "record", decode errors set M2VMT_ESR[CFG] and M2VMT_EAR & M2VMT_SYNRn is updated with the address and the syndrome of the error. Reset State: 0xxxxxxxxx
2	RPUEIE	RPU error interrupt Enable: When set, configuration port errors are reported directly to the interrupt controller via the M2VMT_intr, interrupt output signal. Interrupt output is asserted if M2VMT_CR[RPUIE_EN] is '1' and ANY bit is set in the M2VMT_ESR register. Special Note: Not valid or has no effect on the interrupt when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT='1'. Reset State: 0xxxxxxxxx
1	RPUERE	RPU error report enable: When set, M2VMT reports configuration port errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via CRIF port will use a decode error, rather than a slave error. Regardless of the value of this field, both configuration port errors are terminated by the M2VMT as RAZ/WI, and are recorded in M2VMT_ESR register. Reset State: 0xxxxxxxxx
0	RPUE	RPU Enable: Governs whether M2VMT_RPU_ACR is enabled to check the VMID of the configuration request. When set, all configuration port accesses are checked against M2VMT_RPU_ACR register for access permissions. It's cleared by reset. Set once SROT configures MID->VMID mapping tables Reset State: 0x00000000

0x3000F84 RIVA_M2VMT_EAR

Type: read-only
Reset State: 0xxxxxxxxx

When there is an error, this register holds the physical address of the errant transaction.

RIVA_M2VMT_EAR

Bits	Name	Description
31:0	PA	M2VMT Error Address Register: Physical address[31:0]. Contains the physical address of the errant request. Based on implementation, it may not contain the full 32 bits of the address. Captures the address on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. Special Note: When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT = '1', this register is not available and therefore access to this register are treated as RAZ/WI.

0x3000F88 RIVA_M2VMT_ESR

Type: read-write
Reset State: 0xxxxxxxxx

M2VMT Error Status Register: Captures the status upon M2VMT configuration errors, as determined by the M2VMT_RPU_ACR. This register has read/write-clear access, meaning that reads simply provide a value in the register, while writes are performed by clearing those bits corresponding to '1's in the value written data, and leaving unchanged those bits corresponding to 0s n the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old error. A write with a '1' set in a bit field will result in clearing that bit. Writes with a 0 have no effect. The presence of an asserted value on any bit in this register is what prompts the assertion when enabled by M2VMT_CR[RPUEIE] of the M2MVT's interrupt output. Therefore these bits must be cleared by the interrupt handler. This is contrasted with the fields in the M2VMT_ESYNRn register, which are merely the "syndrome" of an error indicated by the M2VMT_ESR. For M2VMT, there is only one defined error status bit in the M2VMT_SER (actually two, if you count multi-error).

RIVA_M2VMT_ESR

Bits	Name	Description
31	MULTI	Multi-Error: When set to '1', indicates that an additional error occurred while M2VMT_ESR is non-zero. The M2VMT_EAR,M2VMT_ESYNRn and M2VMT_ESR registers (with the exception of this bit) lock on the first error, and must be cleared to unlock. Therefore, the status and the syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost. i.e., syndrome register and status register only stores details of the first error.
30:1	RESERVED	
0	CFG	Configuration Port Error: When set to '1', indicates an error associated with a configuration port request. Special Note: When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this register is treated as RAZ/WI.

0x3000F8C RIVA_M2VMT_ESRRESTORE

Type: read-write
Reset State: 0xxxxxxxxx

RIVA_M2VMT_ESRRESTORE

Bits	Name	Description
31:0	M2VMT_ESRRTORE	M2VMT Error Status Register Restore This is just an aliased address for M2VMT_ESR, which provides direct write access (rather than write-clear) for restoration purpose Special Note: When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this register is treated as RAZ/WI.

0x3000F90 RIVA_M2VMT_ESYNR0

Type: read-only
Reset State: 0xxxxxxxxx

Error Syndrome Register 0: Captures the syndrome on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) "lock" upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., the syndrome register and the status register stores only details of the first error.

RIVA_M2VMT_ESYNR0

Bits	Name	Description
31:24	ATID	ATID[7:0] field of errant request.
23:21	RESERVED	
20:16	AVMID	AVMID[4:0] field of errant request.
15:0	AMID	AMID[15:0] field of errant request. Special Note: When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT="1", this register is not available and therefore access to this register is treated as RAZ/WI.

0x3000F94 RIVA_M2VMT_ESYNR1

Type: read-only
Reset State: 0xxxxxxxxx

Error Syndrome Register 1: Captures syndrome upon M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for

the MULTI bit) “lock” upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is ‘1’ are lost, i.e., the syndrome register and the status register only stores details of the first error.

RIVA_M2VMT_ESYNR1

Bits	Name	Description
31	DCD	Decode: Indicates configuration port error due to invalid/ unrecognized/ unmapped/ un-implemented address (e.g., a reserved register address). Includes decode errors within the global address space. Also, note that decode error is never asserted for client port accesses.
30	AC	Access control: Indicates configuration port error due to lack of permission, as specified by the access control registers
29:25	RESERVED_1	
24	AFULL	AFULL field of the errant request
23	AOOOWR	AOOOWR field of the errant request
22	AOOORD	AOOORD field of the errant request.
21:20	ALOCK	ALOCK[1:0] (ALOCK field of the errant request).
19	RESERVED_2	
18:16	ASIZE	ASIZE[2:0] field of the errant request).
15:12	ALEN	ALEN[3:0] field of the errant request.
11:10	ABURST	ABURST[1:0] field of the errant request.
9	RESERVED	
8	AWRITE	AWRITE field of the errant request.
7	AINST	AINST field of the errant request.
6	APROTNS	APROTNS field of the errant request.
5	APRIV	APRIV field of the errant request.
4	AINNERSHARED	AINNERSHARED field of the errant request.
3	ASHARED	ASHARED field of the errant request.
2:0	AMEMTYPE	AMEMTYPE[2:0] field of the errant request.

0x3000FF4 RIVA_M2VMT_REV

Type: read-only
Reset State: 0xxxxxxxxx

Reports the revision information for the M2VMT core and wrapper.

RIVA_M2VMT_REV

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field.

0x3000FF8 RIVA_M2VMT_IDR

Type: read-only
Reset State: 0xxxxxxxxx

Reports the size of the M2VMT table. It is a read-only register.

RIVA_M2VMT_IDR

Bits	Name	Description
31:9	RESERVED	
8:0	M2VMTSIZE	M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping. M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.

0x3000FFC RIVA_M2VMT_RPU_ACR

Type: read-write
Reset State: 0xxxxxxxxx

Using the incoming VMID, this register controls access to the global register space.

RIVA_M2VMT_RPU_ACR

Bits	Name	Description
31:0	RWE	M2VMT local RPU Access control Register. Each bit position corresponds to a VMID. When set to ‘1’, that VMID is granted VMID read/write access to the entire block of registers within the M2VMT’s 4KB global address space, including this register itself. In practice, this register designates the VMID(s) that can act as SROT (e.g., scorpion-secure) or pseudo SROT (e.g. RPM ARM11). Special Note: When REMOVE_M2VMT_RPU=’1’, this register is not available and therefore access to this register is treated as RAZ/WI.

17.2 RPM GIC D Registers (0x00000000 RPM_BASE)

This section contains the RPM GIC D registers.

The Generic Interrupt Controller (GIC) is a reusable configurable soft core. This generic interrupt controller specification conforms to ARM's Generic Interrupt Controller architecture specification. Where differences exist, either additional features were added or this document must change to conform to ARM's specified architecture. Where additional features were added, they will be clearly marked. The generic interrupt controller design supports ARM's TrustZone architecture, with two security zones: secure and non-secure.

The generic interrupt controller is made of two parts: the Distributor and CPU Interfaces (up to eight). Each of these interfaces contains a CRIF slave interface. There must be at least one CPU Interface in the design.

Only word and byte accesses are supported on these registers. Half-word accesses are not supported. Byte access is supported by a subset of the registers.

Security treatment of registers in the generic interrupt controller is divided into four types of registers. These are:

- 'Common' indicates that both secure and non-secure software have full access to the register.
- 'NS-int Dependent' indicates that state belonging to both secure and non-secure interrupts may be present in the register, depending on the value set in the Interrupt Security Register. Secure accesses to such a register are able to access all of the register's state, regardless of the Interrupt Security Register setting. Non-secure accesses may only access state belonging to non-secure interrupts. For non-secure accesses to state belonging to secure interrupts, writes are ignored and reads return zero.
- 'Banked', indicates that the register exhibits different functionality according to whether it is accessed with a secure or non-secure request.
- 'Restricted' indicates that only secure requests may access this register. If non-secure accesses are attempted, writes are ignored and reads return zero.

The type of register is specified for each register individual. Table 17-2 explains security treatment for register bits.

Table 17-2 Register security treatment

bus NS bit	SECURITY BIT	ALLOW Access
0	0	1
0	1	1
1	0	0
1	1	1

Glossary:

CPU Interface: That part of the GIC2 responsible for receiving the next interrupt from the Distributor and, if the interrupt has sufficient priority, asserting an interrupt indication to the CPU.

CPU MID: The Master ID of a CPU interface (as in AXI's AMID). The CPU MID reaching the Distributor must match the CPU Interface connected to that master.

Distributor: That part of the GIC2 responsible for detecting, disabling, prioritizing, and directing interrupts to CPU(s). The Distributor also accepts requests from and signals software interrupts to the CPU(s).

FABRIC: Flexible Advanced Buses & Reusable Interconnect Cores

NS-int: Security status of a particular interrupt ID. The value 0x0 is "secure", 0x1 is "non-secure".

NS-prot: Security status of the a bus transaction (read or write) according to the NS bit.

PPI: Private Peripheral Interrupt, interrupt from a peripheral whose interrupt line is destined to a particular CPU and can't be physically connected/directed to any other.

SGI: Software Generated Interrupt, interrupt from one CPU (or thread) to another.

SPI: Shared Peripheral Interrupt, interrupt from a peripheral whose interrupt line's CPU target is programmable to one or more CPU interface by the Distributor.

17.2.1 Generic Interrupt Controller Distributor

Table 17-3 GIC Distributor Register Summary*

Address	Name	Type	Reset	Security Treatment	Description

17.2.2 Generic Interrupt Controller distributor registers

0x00060000 RPM_GICD_CTLR

Type: Read/write
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICD_CTLR register controls if the Distributor responds to external interrupt stimulus changes.

Non-secure access: Distributor provides access to the enable_ns register in bit 0.

Secure access: Distributor provides access to the enable_s register in bit 0, and the enable_ns register in bit 1.

RPM_GICD_CTLR

Bits	Name	Description
31:2	RESERVED	
1	ENABLE_NS	This bit is an alias of the enable_ns bit. This bit is only usable by Secure software. 0x0: CLR 0x1: SET
0	ENABLE	This bit is the enable bit for both Secure and Non-secure software. Secure software accesses enbale_s at this location. Non-secure software accesses enable_ns. 0x0: CLR 0x1: SET

0x00060004 RPM_GICD_TYPER

Type: Read
Clock: AHB_CLK
Reset State: Unknown

Security Treatment: Common

The GICD_TYPER register provides information about the configuration of the GIC.

RPM_GICD_TYPER

Bits	Name	Description
31:16	RESERVED	
15:11	LSPI	Returns the number of Lockable Shared Peripheral Interrupts (LSPIs) that the generic interrupt controller contains. The generic interrupt controller does not support lockable SPIs, always reads back 0x0.
10	TZ	TrustZone support. The generic interrupt controller supports TrustZone, always reads back 0x1.
9:8	RESERVED_BITS9_TO_8	

RPM_GICD_TYPER (cont.)

Bits	Name	Description
7:5	CPU_NUM	Returns the number of CPU interfaces that the generic interrupt controller provides. The generic interrupt controller provides either: 0b 000 = one CPU interface 0b 001 = two CPU interfaces 0b 010 = three CPU interfaces 0b 011 = four CPU interfaces 0b 100 = five CPU interfaces 0b 101 = six CPU interfaces 0b 110 = seven CPU interfaces 0b 111 = eight CPU interfaces.
4:0	IT_LINES	Returns the number of INTIDs, to the nearest 32, that the Distributor provides. Read as: 0b 00000 = the Distributor is configured for up to 32 INTIDs 0b 00001 = the Distributor is configured for up to 64 INTIDs 0b 00010 = the Distributor is configured for up to 96 INTIDs 0b 00011 = the Distributor is configured for up to 128 INTIDs . . . 0b 11110 = the Distributor is configured for up to 992 INTIDs 0b 11111 = the Distributor is configured for up to 1020 INTIDs.

0x00060008 RPM_GICD_IIDR

Type: Read
Clock: AHB_CLK
Reset State: 0x00000070

Security Treatment: Common

The GICD_IIDR register provides information the implementer of the Distributor and the revision of the Distributor.

RPM_GICD_IIDR

Bits	Name	Description
31:24	RESERVED	
15:12	REVISION	Returns the revision number of the Distributor, 0x0
11:0	IMPLEMENTOR	Returns JEP106 ID number, 0b 01110000

0x00060020 RPM_GICD_ANSACR

Type: Read/write
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: Restricted

The auxiliary non-secure access control register (GICD_ANSACR) is used to control non-secure access to GICD_CGCR.

RPM_GICD_ANSACR

Bits	Name	Description
31:1	RESERVED	
0	GICD_CGCR	0x0: SEC (Dis-allows non-secure access.) 0x1: NS (Allows non-secure access.)

0x00060024 RPM_GICD_CGCR

Type: Read/write
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: Restricted

The clock gate control register (GICD_CGCR) is used to control localized clock gating over-ride logic. Setting bits in GICD_CGCR disables the corresponding local clock gating logic. The local clock gating logic normally turns off a local (small subset) clock tree automatically if there is no need for the clock. If any error is found in the gating logic, these bits can be used to over-ride it.

RPM_GICD_CGCR

Bits	Name	Description
31:17	RESERVED_31_TO_17	
16	TOP	Controls the top level clock gate (which gates entire GIC). 0x1: DISABLE 0x0: ENABLE
15:4	RESERVED_15_TO_4	
3	DI_SGI_STATE	Controls the clock gate for Distributer interrupt state data base registers for SGI interrupts. 0x1: DISABLE 0x0: ENABLE
2	DI_PPI_SPI_STATE	Controls the clock gate for Distributer interrupt state data base registers for PPI and SPI interrupts. 0x1: DISABLE 0x0: ENABLE

RPM_GICD_CGCR (cont.)

Bits	Name	Description
1	DI_DEMET	Controls the clock gate for Distributer interrupt input demet registers. 0x1: DISABLE 0x0: ENABLE
0	DI_RD	Controls the clock gate for Distributer CRIF Read Data. 0x1: DISABLE 0x0: ENABLE

0x00060080+4*n RPM_GICD_ISRn, n=[0..8]

Type: Read/write
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: Restricted

Each bit in an GICD_ISR register controls the security state of an interrupt, to be either secure or non-secure. You can only access these registers with secure read or secure write accesses.

NOTE The GICD_ISR register at address offset 0x0080 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

RPM_GICD_ISRn

Bits	Name	Description
31:0	INT_NS	0x0: SEC (Assigns INTID N to the Secure state.) 0x1: NS (Assigns INTID N to the Non-secure state.)

0x00060100+4*n RPM_GICD_ISENABLERn, n=[0..8]

Type: Write (command - readable)
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ISENABLER register controls the enabling of an interrupt.

Reading this register returns the currently enabled interrupts subject to NS-int dependent access rules.

NOTE The GICD_ISENABLER register at address offset 0x0100 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

RPM_GICD_ISENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ICENABLER register.) 0x1: SET (Enables INTID N.)

0x00060180+4*n RPM_GICD_ICENABLERn, n=[0..8]

Type: Write (command - readable)
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ICENABLER register controls the disabling of an interrupt.

Reading this register returns the currently enabled interrupts subject to NS-int dependent access rules.

NOTE The GICD_ICENABLER register at address offset 0x0180 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

RPM_GICD_ICENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ISENABLER register.) 0x1: CLR (Enables INTID N.)

0x00060200+4*n RPM_GICD_ISPENDRn, n=[0..8]

Type: Write (command - readable)
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ISPENDR register controls the enabling of an interrupt.

Reading this register returns the currently pending interrupts subject to NS-int dependent access rules.

NOTE The GICD_ISPENDR register at address offset 0x0200 is repeated once per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

RPM_GICD_ISPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ICPENDR register.) 0x1: SET (Sets INTID N to the Pending state.)

0x00060280+4*n RPM_GICD_ICPENDRn, n=[0..8]

Type: Write (command - readable)
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ICPENDR register controls the disabling of an interrupt.

Reading this register returns the currently pending interrupts subject to NS-int dependent access rules.

NOTE The GICD_ICPENDR register at address offset 0x0280 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

RPM_GICD_ICPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ISPENDR register.) 0x1: CLR (Clears INTID N. from the pending state.)

0x00060300+4*n RPM_GICD_IACTIVERn, n=[0..8]

Type: Read
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in the GICD_IACTIVER register provides the active status of an interrupt.

NOTE The GICD_IACTIVER register at address offset 0x0300 is repeated once per CPU Interface. It is only accessible from the designated CPU and provides information for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

RPM_GICD_IACTIVERn

Bits	Name	Description
31:0	INT	0x0: CLR 0x1: SET

0x00060400+4*n RPM_GICD_IPRIORITYRn, n=[0..71]

Type: Read/write
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each field in the GICD_IPRIORITYR registers controls the priority level of an interrupt.

NOTE The GICD_IPRIORITYR registers at address offsets 0x0400 to 0x41C are repeated once per CPU Interface. These are only accessible from the designated CPU and control the priority levels for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupt priority levels.

NOTE This register is byte addressable.

The GICD_IPRIORITYR register behaves differently depending on the security setting of interrupt associated with the address written (NS-int) and the security of the bus transaction (NS-prot). Figure 26-1 shows how these differences affect different types of access.

Figure 26-1 Summary of the secure and non-secure views of interrupt priority

RPM_GICD_IPRIORITYRn

Bits	Name	Description
31:24	INT3	
23:16	INT2	
15:8	INT1	

RPM_GICD_IPRIORITYRn (cont.)

Bits	Name	Description
7:0	INT0	All bits cleared (0x0) is the highest priority. All bits set (0xFF) is the lowest priority. For non-secure write access, the MSB is always set (0x1). For non-secure read access, the MSB is always clear (0x0). Non-secure entities can't use the highest priorities without secure software setting such a priority. The highest priorities are typically reserved for secure software. On the other hand, secure software can, if needed, write and read the MSB. Secure entities have access to all priorities. Secure interrupts can use priority numbers 0x80-0xFF (the lower half of the priority spectrum) if needed. Due to strict 'less than' comparisons used in the CPU interface, setting an interrupt's priority to 0xFF effectively disables that interrupt. The number of priorities actually supported is determined by NUM_PRI generic. Software can determine this number by writing 0xFF and reading back the result.

0x00060800+4*n RPM_GICD_ITARGETSRn, n=[0..71]

Type: Read/write
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each field in the GICD_ITARGETSR registers controls the destination CPU(s) of an interrupt.

NOTE The GICD_ITARGETSR registers at address offsets 0x0800 to 0x81C are not actually implemented. These are place holders PPI and SGI interrupts. PPI interrupts, being private, only have one destination CPU. SGI interrupts are generated by the QGIC_DI_SOFT_INT register only. The remaining registers control the SPI interrupt destinations.

NOTE This register is byte addressable.

RPM_GICD_ITARGETSRn

Bits	Name	Description
31:24	INT3	
23:16	INT2	
15:8	INT1	

RPM_GICD_ITARGETSRn (cont.)

Bits	Name	Description
7:0	INT0	Each bit represents one of 8 CPUs. Bit 0 represents the zeroth CPU, bit 7 represents the seventh CPU. Setting this field to 0 will disable the interrupt as no CPU will see it set. For INTIDs < 32 (the SGI and PPI) the CPU ID (of the master) is returned on reads. Writes are ignored. The number of CPUs actually supported is determined by NUM_CPU generic. Software can determine this number by writing 0xFF and reading back the result.

0x00060C00+4*n RPM_GICD_ICFGRn, n=[0..17]

Type: Read/write
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each field in the GICD_ICFGR registers allows:

- control of type of an SPI:
- level-sensitive
- edge-sensitive
- reading the type of PPIs and sgis

NOTE The GICD_ICFGR registers at address offsets 0x0C00 to 0xC04 are repeated once per CPU Interface. These are only accessible from the designated CPU and allow read access for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

NOTE This register is not byte addressable, interrupts should be disabled before configuring their type.

RPM_GICD_ICFGRn

Bits	Name	Description
31:30	INT15	
29:28	INT14	
27:26	INT13	
25:24	INT12	
23:22	INT11	

RPM_GICD_ICFGRn (cont.)

Bits	Name	Description
21:20	INT10	
19:18	INT9	
17:16	INT8	
15:14	INT7	
13:12	INT6	
11:10	INT5	
9:8	INT4	
7:6	INT3	
5:4	INT2	
3:2	INT1	
1:0	INT0	These bits behave differently for each of the three interrupt types as follows: 0x0: LVL N to N 0x1: LVL 1 to N 0x2: EDGE N to N 0x3: EDGE 1 to N 0x0: For SGI, read back as 0b10 - SGI interrupts are edge-sensitive and use the N-N model. 0x0: For PPI/SPI, read/writable as 0b01 or 0b11 - PPI/SPI interrupts can be edge or level sensitive and use the 1-N model.

0x00060F00 RPM_GICD_SGIR

Type: Write (command)
Clock: AHB_CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICD_SGIR register provides the method by which software may cause interrupts to become pending for designated target CPU(s). The generic interrupt controller maintains an internal database of all outstanding software interrupt requests pended to each CPU Interface and rotates through them in Round Robin fashion. Signaling the same interrupt a second time before it is serviced will result in only one interrupt from the source CPU to the target CPU(s).

Table 17-4 Security status of the write event

Security status of the write event to the GICD_SGIR register (the state of the NS bit)	SATT Value	Interrupt's security status as set by GICD_ISR	Requested Interrupt set as pending on the target CPU
Secure	0	Secure	YES
Secure	0	Non-secure	NO
Secure	1	Secure	NO
Secure	1	Non-secure	YES
Non-secure	X	Secure	NO
Non-secure	X	Non-secure	YES

RPM_GICD_SGIR

Bits	Name	Description
31:26	RESERVED_BITS31_TO_26	
25:24	T_FILTER	Target Filter 0x0: LIST (Use the T_LIST as is) 0x1: OTHERS (Send to all CPUs except the CPU MID making the request, ignoring T_LIST) 0x2: MID (Send to only the CPU MID making the request, ignoring T_LIST) 0x3: NA (Reserved)
23:16	T_LIST	Target List. Each bit set represents a CPU target for the INT_ID, subject to the T_FILTER field. 0x1: CPU0 0x2: CPU1 0x4: CPU2 0x8: CPU3 0x10: CPU4 0x20: CPU5 0x40: CPU6 0x80: CPU7
15	SATT	Security ATTribute. This bit is only programmable by secure Software. See 0x0: SECURE (Secure interrupt is issued) 0x1: NONSECURE (Non-secure interrupt is issued.)
14:4	RESERVED_BITS14_TO_4	
3:0	INT_ID	The INT ID number (0-15) of the SGI to be set as pending. See the See Table 10-4 Security Status SGI pending truth table for security status Table 17-4 (SATT vs. NS-prot) for information on the conditions that allow an SGI to be set pending.

0x00060FD0 RPM_GICD_PIDR0

Type: Read
Clock: AHB_CLK
Reset State: 0x00000090

Security Treatment: Common

The GICD_PIDR0 provides access to generic interrupt controller peripheral identification.

RPM_GICD_PIDR0

Bits	Name	Description
31:8	RESERVED	
7:0	PART_NUM	Returns lower byte of the generic interrupt controller part number 0xB390, 0x90

17.3 RPM GIC GICC Registers (0x00000000 RPM_BASE)

This section contains the RPM GIC C registers.

The Generic Interrupt Controller (GIC) is a reusable configurable soft core. This GIC specification conforms to ARM's Generic Interrupt Controller architecture specification. Where differences exist, either additional features were added or this document must change to conform to ARM's specified architecture. Where additional features are added they will be clearly marked. The generic interrupt controller design supports ARM's TrustZone architecture with two security zones: secure and non-secure.

The generic interrupt controller is made of two parts: the Distributor and CPU Interfaces (up to eight). Each of these interfaces contains a CRIF slave interface. There must be at least one CPU Interface in the design.

Only word and byte accesses are supported on these registers. Half-word accesses are not supported. Byte access is supported by a subset of the registers.

Security treatment of registers in the generic interrupt controller is divided into four types of registers. These are:

- 'Common' indicates that both secure and non-secure software have full access to the register.
- 'NS-int Dependent' indicates that state belonging to both secure and non-secure interrupts may be present in the register, depending on the value set in the Interrupt Security Register. Secure accesses to such a register are able to access all of the register's state, regardless of the Interrupt Security Register setting. Non-secure accesses may only access state belonging to non-secure interrupts. For non-secure accesses to state belonging to secure interrupts, writes are ignored and reads return zero.
- 'Banked', indicates that the register exhibits different functionality according to whether it is accessed with a secure or non-secure request.
- 'Restricted' indicates that only secure requests may access this register. If non-secure accesses are attempted, writes are ignored and reads return zero.

The type of register is specified for each register individual. Table 17-5 explains security treatment for register bits.

Table 17-5 Register security treatment

bus NS bit	SECURITY BIT	ALLOW Access
0	0	1
0	1	1
1	0	0
1	1	1

Glossary:

CPU Interface: That part of the GIC2 responsible for receiving the next interrupt from the Distributor and, if the interrupt has sufficient priority, asserting an interrupt indication to the CPU.

CPU MID: The Master ID of a CPU interface (as in AXI's AMID). The CPU MID reaching the Distributor must match the CPU Interface connected to that master.

Distributor: That part of the GIC2 responsible for detecting, disabling, prioritizing, and directing interrupts to CPU(s). The Distributor also accepts requests from and signals software interrupts to the CPU(s).

FABRIC: Flexible Advanced Buses & Reusable Interconnect Cores

NS-int: Security status of a particular interrupt ID. The value 0x0 is "secure", 0x1 is "non-secure".

NS-prot: Security status of the a bus transaction (read or write) according to the NS bit.

PPI: Private Peripheral Interrupt, interrupt from a peripheral whose interrupt line is destined to a particular CPU and can't be physically connected/directed to any other.

SGI: Software Generated Interrupt, interrupt from one CPU (or thread) to another.

SPI: Shared Peripheral Interrupt, interrupt from a peripheral whose interrupt line's CPU target is programmable to one or more CPU interface by the Distributor.

17.3.1 Generic Interrupt Controller CPU Interface

Table 17-6 GIC CPU Interface Register Summary

Address	Name	Type	Reset	Security Treatment	Description
0x1000	GICC_CTLR	RW	0x0000_0000	Banked	CPU interface control register
0x1004	GICC_PMR	RW	0x0000_0000	Banked	CPU interface priority mask
0x1008	GICC_BPR	RW	0x0000_0000	Banked	CPU interface binary point
0x100C	GICC_IAR	R (CMD)	0x0000_0000	Banked	CPU interface interrupt acknowledge

0x1014	GICC_RPR	R	0x0000_0000	Banked	CPU interface running priority
0x1018	GICC_HPPIR	R	0x0000_0000	Banked	CPU interface highest priority pending

Table 17-6 GIC CPU Interface Register Summary

Address	Name	Type	Reset	Security Treatment	Description
0x101C	GICC_ABPR	RW	0x0000_0000	Restricted	CPU interface aliased binary point
0x10FC	GICC_IIDR	R	0x0001_0070	Common	CPU interface ID register

17.3.1.1 GIC CPU interface registers

0x00061000 RPM_GICC_CTLR

Type: Read/write
Clock: ACC_AHB_CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_CTLR configures the generic interrupt controller CPU interface.

Non-secure access: Access is granted only to bit 0, the enable register bit for non-secure interrupts.

Secure access: Access is granted to all register bits. Note that enable is aliased as bit 1, enable_ns. It is modifiable in that position and any such modifications will be seen by non secure accesses as changes to the enable bit (bit 0).

RPM_GICC_CTLR

Bits	Name	Description
31:5	RESERVED	
4	SBPR	Controls which binary point register is used to calculate preemption. 0x0: BANKED (secure interrupts use the secure Binary Point Register, non-secure interrupts use the non-secure Binary Point Register) 0x1: RESTRICTED (all interrupts use the secure Binary Point Register)
3	S_DEST	Controls destination of secure interrupts. 0x0: IRQ 0x1: FIQ

RPM_GICC_CTLR (cont.)

Bits	Name	Description
2	S_ACK	Controls the side effect behavior of a secure read request to the Interrupt Acknowledge Register in the case where the highest priority pending interrupt is non-secure. If AckCtl is set to 0, a secure read request to the Interrupt Acknowledge Register returns an Interrupt ID value of 1022, and the read request does not cause the interrupt to be acknowledged (that is the Pending status of the interrupt remains unchanged). If AckCtl is set to 1, a secure read request to the Interrupt Acknowledge Register returns the Interrupt ID value of the non-secure interrupt, and causes the interrupt to be acknowledged (that is the interrupt becomes Active, or Active and Pending). 0x0: DISABLE ACK OF NS PENDING 0x1: ENABLE ACK OF NS PENDING
1	ENABLE_NS	For secure software, a read/writable alias of non secure software's enable bit (bit 0 of this same register in non secure space). 0x0: CLR 0x1: SET
0	ENABLE	For non-secure software, this bit enables/disables non secure interrupts. For secure software, this bit enables/disables secure interrupts. 0x0: CLR 0x1: SET

0x00061004 RPM_GICC_PMR

Type: Read/write
Clock: ACC_AHB_CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_PMR register configures the generic interrupt controller CPU interface Priority Mask. The Priority Mask can be used to limit the interrupts that can cause an interrupt request to the CPU based on priority levels.

- Non-secure access: Write access is granted only if bit 7 is 0x1, writes are ignored otherwise. Reads are always granted, however, bit 7 is always set in the data returned. Bit 0 is always zero.
- Secure access: Access is granted to all register bits.

RPM_GICC_PMR

Bits	Name	Description
31:8	RESERVED	
7:0	LEVEL	Set the Priority Mask Level. The CPU interface asserts an interrupt request to CPU if the priority of the highest Pending interrupt sent by the interrupt Distributor is strictly higher than at least the mask set in Priority Mask Register.

0x00061008 RPM_GICC_BPR

Type: Read/write
Clock: ACC_AHB_CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_BPR register configures the generic interrupt controller CPU interface Binary Point. The Binary Point is used to limit interrupts that can cause an interrupt request to the CPU based on the interrupt's priority and the interrupt priority that currently being serviced by the CPU (if there is one). If the CPU is not servicing an interrupt, the Binary Point register is not used.

- Non-secure access: Provides access to the non-secure Binary Point register.
- Secure access: Provides access to the secure Binary Point register. Secure software may access the non secure Binary Point register at offset 0x001C

Table 17-7 Interpretation of Binary Point Register value

register value	Priority bits used to determine preemption for secure interrupts.	Priority bits used to determine preemption for non-secure interrupts. (Bit 7 is always 0x1)
0	7:1	7:0
1	7:2	7:1
2	7:3	7:2
3	7:4	7:3
4	7:5	7:4
5	7:6	7:5
6	7	7:6
7	No preemption	No preemption

RPM_GICC_BPR

Bits	Name	Description
31:3	RESERVED	

RPM_GICC_BPR (cont.)

Bits	Name	Description
2:0	VAL	The VAL setting is used according to determine the priority bits used for preemption according to Table 17-7 Interpretation of Binary Point Register value.

0x0006100C RPM_GICC_IAR

Type: Read (Command)
Clock: ACC_AHB_CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_IAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn.

Performing this read has the side effect of causing the Distributor to change the interrupt from the Pending state to the Active or Active and Pending state.

- Non-secure access: See Table 17-8.
- Secure access: See Table 17-8.

Table 17-8 Access

Highest Pending interrupt security status (NS-int)	Security status of the read request (NS-prot)	GICC_CTLR register S_ACK bit	Security Match	Interrupt ID returned
Non-secure	Non-secure	x	Yes	Non-secure Interrupt ID
Secure	Secure	x	Yes	Secure Interrupt ID
Non-secure	Secure	1	Yes	Non-secure Interrupt ID
Non-secure	Secure	0	No	Highest outstanding interrupt is non-secure (1022)
Secure	Non-secure	x	No	No outstanding interrupts (1023)
No pending interrupts	x	x	No	No outstanding interrupts (1023)

RPM_GICC_IAR

Bits	Name	Description
31:13	RESERVED	

RPM_GICC_IAR (cont.)

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, and the security state of any outstanding interrupts, as described in Table 17-7 Interpretation of Binary Point Register value.

0x00061010 RPM_GICC_EOIR

Type: Write (Command)
Clock: ACC_AHB_CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_EOIR (End Of Interrupt) register is written to indicate when software has finished handling an interrupt. Writing to this register will set the interrupt to Inactive or Pending (if prior to writing to this register, the interrupt was both Active and Pending) in the Distributor. The value written must be the interrupt ID, and the CPU Source ID for SGIs, of the interrupt that is being completed. The security status of the write to this register (NS-prot) must match the security status (NS-int) of the interrupt ID, according to Table 17-9 for the interrupt to be successfully cleared.

- Non-secure access: See Table 17-9**.**
- Secure access: See Table 17-9.

Currently Active interrupt

Table 17-9 GICC_EIOR security (and source CPU) match definition

security status (NS-int)	Security status of the write request (NS-prot)	GICC_CTLR register S_ACK bit	Written values of CPU Source ID and Interrupt ID match an Active interrupt' (sgis only)	Interrupt successfully returned to being Inactive or Pending'
Non-secure	Non-secure	x	Yes	Yes
Secure	Secure	x	Yes	Yes
Non-secure	Secure	1	Yes	Yes
Non-secure	Secure	0	Yes	No
Secure	Non-secure	x	Yes	No
No pending interrupts	x	x	No	No

RPM_GICC_EOIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. As described in Table 17-9, the CPU Source ID must match an active interrupt in order for the GICC_EOIR to take effect. The CPU_ID is written must match that delivered to software when GICC_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICC_IAR register. If the security settings match (see Table 17-9) the Active state in the Distributor for the corresponding interrupt will be cleared.

0x00061014 RPM_GICC_RPR

Type: Read
Clock: ACC_AHB_CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_RPR (Running Priority) register provides access to the highest priority of all the Active interrupts on this CPU. The priority value returned is sensitive to the security status (NS-int) of the interrupt currently running and the NS-prot

Non-secure access: If the currently interrupt is secure (NS-int = 0), and a non-secure read of the Running Priority register is attempted (NS-prot = 1), then the value 0 (maximum priority) is returned.

Secure access: Returns the true value in the register.

RPM_GICC_RPR

Bits	Name	Description
31:8	RESERVED	
7:0	VAL	Running Priority

0x00061018 RPM_GICC_HPPIR

Type: Read
Clock: ACC_AHB_CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_HPPIR register provides access to the highest priority pending interrupt to the CPU Interface.

NOTE Interrupts that are Active and Pending in the Distributor are not considered candidates to be come the highest priority pending interrupt.

- Non-secure access: Same as for GICC_IAR register. See Table 17-7.
- Secure access: Same as for GICC_IAR register. See Table 17-7, Interpretation of Binary Point Register value.

RPM_GICC_HPPIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, and the security state of any outstanding interrupts, as described in Table 17-7

0x0006101C RPM_GICC_ABPR

Type: Read/write
Clock: ACC_AHB_CLK
Reset State: 0x00000000

Security Treatment: Restricted

The GICC_ABPR register provides a copy of the non-secure binary point register for use by secure software. See the definition of the GICC_BPR register for details on the use of this register.

- Non-secure access: No access.
- Secure access: Access granted, updates are reflected to non-secure software at the GICC_BPR register at address offset 0x08.

RPM_GICC_ABPR

Bits	Name	Description
31:3	RESERVED	
2:0	VAL	Same as the GICC_BPR register - affects only non-secure interrupts.

0x000610FC RPM_GICC_IIDR

Type: Read
Clock: ACC_AHB_CLK
Reset State: 0x00010070

Security Treatment: Common

The GICC_IIDR register provides information about the generic interrupt controller CPU Interface version and device implementer information.

RPM_GICC_IIDR

Bits	Name	Description
31:20	PART_NUM	Part Number: 0x390
19:16	ARCH_VERSION	Architecture Version : 0x1
15:12	REVISION	Revision number: 0x0
11:0	IMPLEMENTOR	Bits[11:8] contain the implementer's JEP106 continuation code, 0x0 Bit[7] is always 0 Bits[6:0] contain bits [6:0] of the implementer's JEP106 code,

17.4 RPM Timer Registers (0x00000000 RPM_BASE)

This section contains RPM timer registers.

17.4.1 RPM timers

RPM timers block consists of three timers. Tmr0 is an XO time, i.e., its clock source is either PXO or CXO. TMR1 is a slow clock timer i.e., it is supposed to run on sleep clock. RPM also has a wdog timer. The clock source for this again is sleep clock.

17.4.1.1 RPM timers registers

0x00062000 RPM_RPM_TMR0_MTCH

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0000_0000

RPM TMR0 will signal interrupt when its counter value has reached the value stored in the RPM_TMR0_MTCH register.

RPM_RPM_TMR0_MTCH

Bits	Name	Description
31:0	MTCH	The value of RPM_TMR0_CNT at which an interrupt will be generated.

0x00062004 RPM_RPM_TMR0_CNT

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0000_0000

The RPM_TMR0_CNT register contains the current value of RPM TMR0. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the RPM_TMR0_MTCH register at the same time due to HW re-use. The procedure for writing the RPM_TMR0_CNT is as follows:

- Disable the timer by clearing the EN bit in RPM_TMR0_EN.
- Write RPM_TMR0_CNT.
- Write RPM_TMR0_MTCH, to restore match value.
- Enable the timer by setting the EN bit in RPM_TMR0_EN.

RPM_RPM_TMR0_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer count

0x00062008 RPM_RPM_TMR0_EN

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_TMR0_EN register is used to enable the RPM TMR0.

RPM_RPM_TMR0_EN

Bits	Name	Description
1	CLR_ON_MTCH_EN	When reset (0), the timer will not clear when it reaches the match value. When set (1), the timer will clear when it reaches the match value. 0x0: Don't clear timer 0x1: Clear timer
0	EN	When reset (0), the timer is disabled. When set (1), the timer is enabled and counts with frequency of timerO clock. 0x0: Disable timer 0x1: Enable timer

0x0006200C RPM_RPM_TMR0_CLR

Type: Write (Command)
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_TMR0_CLR register is a one-shot command register that, when written with any value, resets RPM TMR0 to a value of 0. This occurs regardless of the state of the RPM_TMR0_EN register.

RPM_RPM_TMR0_CLR

Bits	Name	Description
0	CLR	Data written is not used.

0x00062010 RPM_RPM_TMR0_CLK_CTL

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x3

The RPM_TMR0_CLK_CTL controls the clock divider inside RPM TMR0.

NOTE Due to the particular synchronization logic that the timer circuit uses, the timer clock should always run at least 4x slower than the AHB clock. So if both the AHB bus and XO are running at the same frequency, the RPM_TMR0_CLK_CTL register can be programmed to 3 to get the 4 to 1 divide ratio between bus clock and timer clock.

RPM_RPM_TMR0_CLK_CTL

Bits	Name	Description
1:0	DIV	0x3: 4 0x2: 3 0x1: 2 0x0: 1

0x00062040 RPM_RPM_TMR1_MTCH

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0000_0000

RPM TMR1 will signal interrupt when its counter value has reached the value stored in the RPM_TMR1_MTCH register.

RPM_RPM_TMR1_MTCH

Bits	Name	Description
31:0	MTCH	The value of RPM_TMR1_CNT at which an interrupt will be generated.

0x00062044 RPM_RPM_TMR1_CNT

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0000_0000

The RPM_TMR1_CNT register contains the current value of RPM TMR1. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the RPM_TMR1_MTCH register at the same time due to HW re-use. The procedure for writing the RPM_TMR1_CNT is as follows:

- Disable the timer by clearing the EN bit in RPM_TMR1_EN.
- Write RPM_TMR1_CNT.
- Write RPM_TMR1_MTCH, to restore match value.
- Enable the timer by setting the EN bit in RPM_TMR1_EN.

RPM_RPM_TMR1_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer count

0x00062048 RPM_RPM_TMR1_EN

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_TMR1_EN register is used to enable the RPM TMR1.

RPM_RPM_TMR1_EN

Bits	Name	Description
1	CLR_ON_MTCH_EN	When reset (0), the timer will not clear when it reaches the match value. When set (1), the timer will clear when it reaches the match value. 0x0: Don't clear timer 0x1: Clear timer
0	EN	When reset (0), the timer is disabled. When set (1), the timer is enabled and counts with frequency of sleep clock. 0x0: Disable timer 0x1: Enable timer

0x0006204C RPM_RPM_TMR1_CLR

Type: Write (Command)
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_TMR1_CLR register is a one-shot command register that, when written with any value, resets RPM TMR1 to a value of 0. This occurs regardless of the state of the RPM_TMR1_EN register.

NOTE Since RPM TMR1 runs on sleep clock, the 4-to-1 minimum ratio between bus clock and timer clock is implicitly met and the RPM_TMR1_CLK_CTL register is not needed.

RPM_RPM_TMR1_CLR

Bits	Name	Description
0	CLR	Data written is not used.

0x00062060 RPM_RPM_WDOG_RESET

Type: Write
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_WDOG_RESET register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset watch dog. This command register also disables the watchdog freeze.

RPM_RPM_WDOG_RESET

Bits	Name	Description
0	WDOG_RESET	This bit generates the WDOG_STB during the non-sleep mode. A pulse is generated on WDOG_STB when this bit is written with a ’1’.

0x00062064 RPM_RPM_WDOG_FREEZE

Type: Write/Command
Clock: RPM_BUS_CLK
Reset State: 0x0

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

The RPM_WDOG_FREEZE register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the RPM_WDOG_RESET register.

RPM_RPM_WDOG_FREEZE

Bits	Name	Description
0	WDOG_FREEZE	This bit is used to freeze the watchdog timer at count 0. To enable the watchdog timer auto-kicker, write a '1'.

0x00062068 RPM_RPM_WDOG_UNMASKED_INT_EN

Type: Write/Command
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_WDOG_UNMASKED_INT_EN register enables unmasked IRQs and FIQs to enable the watch dog.

RPM_RPM_WDOG_UNMASKED_INT_EN

Bits	Name	Description
1	ENABLE	Enable wdog timer Do not enable wdog timer 0x1: enable 0x0: don't enable
0	UNMASKED_INT_ENABLE	Unmasked IRQ or FIQ will enable wdog timer Unmasked IRQ or FIQ will not enable wdog timer 0x1: enable 0x0: don't enable

0x0006206C RPM_RPM_WDOG_STATUS

Type: Read
Clock: RPM_BUS_CLK
Reset State: 0x4

The RPM_WDOG_STATUS register is the watchdog status register.

RPM_RPM_WDOG_STATUS

Bits	Name	Description
16:3	WDOG_COUNT	Counter value [13:0] of watch dog counter. Note: the sleep counter value is sampled using the rpm bus clk. Multiple reads are required to determine the value (assuming rpm bus clk is much faster than sleep clock)
2	WDOG_CNT_RESET_STATUS	Show the status of wdog_res signal (for test).

RPM_RPM_WDOG_STATUS (cont.)

Bits	Name	Description
1	WDOG_FROZEN	This bit indicates whether or not wdog is frozen at count '0'. 0x1: frozen 0x0: not frozen
0	WDOG_EXPIRED_STATUS	Watchdog timer has expired. Wdog timer has not expired. 0x1: expired 0x0: not expired

0x00062070 RPM_RPM_WDOG_EXPIRED_WIDTH

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0xC7C

The RPM_WDOG_EXPIRED_WIDTH register defines the width of the wdog_expired pulse in the number of sleep_clk cycles. The default value is 0x0C7C = 3196.

RPM_RPM_WDOG_EXPIRED_WIDTH

Bits	Name	Description
14	SYNC_STATUS	When set (1), the wdog expired width data is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STATUS bit is clear (0). This bit is read only.
13:0	DATA	Wdog counter value to de-assert the wdog_expired pulse. The wdog counter is14 bits.

0x00062074 RPM_RPM_WDOG_BARK_TIME

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x3FFF

The RPM_WDOG_BARK_TIME register defines the time in sleep_clk when to assert the watchdog ('bark') interrupts. The value can be between 1and 12787 (the time when the watchdog times out). The default value is 0x3FFF, which is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog ('bark') interrupt.

NOTE A bark time of 0x0 is not allowed.

RPM_RPM_WDOG_BARK_TIME

Bits	Name	Description
14	SYNC_STATUS	When set (1), the wdog bark time is synchronizing to the SLEEP_CLK. The data value is not guaranteed until the SYNC_STATUS bit is clear (0). This bit is read only.
13:0	DATA	The wdog counter value on which to trigger the bark interrupt

0x00062078 RPM_RPM_WDOG_TEST_LOAD_STATUS

Type: Read
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_WDOG_TEST_LOAD_STATUS register indicates when the watchdog test load is synchronizing to sleep_clk.

RPM_RPM_WDOG_TEST_LOAD_STATUS

Bits	Name	Description
0	SYNC_STATUS	When set (1) wdog test load is synchronizing to SLEEP_XTAL_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x0006207C RPM_RPM_WDOG_TEST_LOAD

Type: Write (Command)
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_WDOG_TEST_LOAD register loads the RPM_WDOG_TEST register value into the watchdog counter. Any write to this register, irrespective of the value written, will create a load pulse.

RPM_RPM_WDOG_TEST_LOAD

Bits	Name	Description
0	LOAD	

0x00062080 RPM_RPM_WDOG_TEST

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_WDOG_TEST register indicates that the watchdog test is synchronizing to sleep_clk and contains the watchdog counter test load value.

RPM_RPM_WDOG_TEST

Bits	Name	Description
14	SYNC_STATUS	When set (1), the watchdog test is synchronizing to SLEEP_ XTAL_CLK. The data value is not guaranteed until the SYNC_STATUS bit is clear (0).
13:0	LOAD_VALUE	The watchdog counter test load value [13:0]. The watchdog counter is 14 bits.

0x00062100 RPM_RPM_TMR_STS

Type: Read
Clock: RPM_BUS_CLK
Reset State: 0x0000_0000

The RPM_TMR_STS can be used to determine the status of each of the RPM timers in the timer's resident clock domain. Since the timer clock domain may be much slower than the AHB clock, AHB transactions may be delayed in taking effect. This information can be used to qualify other actions or used simply for debug purposes. For example, software can determine when a write to RPM_TMR0_CLR has taken effect by examining the TMR0_CLR_PEND bit.

RPM_RPM_TMR_STS

Bits	Name	Description
17	WDOG_EN	Wdog enable
16	WDOG_UNMASKED_INT_E N	An unmasked interrupt will enable the timer (1) or not (0)
15:12	RESERVED_BITS15_12	
11	TMR1_WR_PEND	Timer has a write pending (1) or not (0)
10	TMR1_CLR_PEND	Timer has a clear pending (1) or not (0)
9	TMR1_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
8	TMR1_EN	Timer is enabled (1) or not (0)
7:4	RESERVED_BITS7_4	
3	TMR0_WR_PEND	Timer has a write pending (1) or not (0)

RPM_RPM_TMR_STS (cont.)

Bits	Name	Description
2	TMR0_CLR_PEND	Timer has a clear pending (1) or not (0)
1	TMR0_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
0	TMR0_EN	Timer is enabled (1) or not (0)

17.5 RPM General Purpose Registers (0x00000000 RPM_BASE)

This section contains RPM general purpose control and status registers.

17.5.1 RPM general purpose control and status registers

The RPM GP CSR block, as the name implies, houses general purpose control and status registers. These include registers related to enabling power saving as well as registers to set RPM general purpose outputs. Test mux control as well as RPM code RAM FS CGC control registers also reside in this block.

Only word accesses are supported to these registers.

17.5.1.1 RPM GP CS registers

0x00063000 RPM_RPM_BUS_CLK_FORCE_ON

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_BUS_CLK_FORCE_ON register provides a way to force the RPM bus_clk on irrespective of a write to RPM_PROC_BUS_CLK_OFF_CTL.

NOTE A write to RPM_BUS_CLK_FORCE_ON cannot be immediately followed by a write to RPM_PROC_BUS_CLK_OFF_CTL in the very next cycle, otherwise bus clock will not stay ON.

RPM_RPM_BUS_CLK_FORCE_ON

Bits	Name	Description
0	BUS_CLK_FORCE_ON	Programming this bit to 0 has no affect on bus clk Programming this bit to 1 will force bus clock ON irrespective of a write to RPM_PROC_BUS_CLK_OFF_CTL register. 0x0: No Affect 0x1: Clock ON

0x00063004 RPM_RPM_PROC_BUS_CLK_OFF_CTL

Type: Write (Command)
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_PROC_BUS_CLK_OFF_CTL register provides a way to turn off RPM processor, and bus clocks and clock to the RPM sFPB master interface, when these clocks are not needed.

The CLK_OFF bits are inverted to create CLKON request signals to the clock control block.

NOTE Any write to this register, irrespective of the value written, will turn off rpm processor clock and clock to the RPM sFPB master interface. The bus clock will also be turned off by a write to this register, if RPM_BUS_CLK_FORCE_ON register hasn't already been programmed to force the bus clk ON.

RPM_RPM_PROC_BUS_CLK_OFF_CTL

Bits	Name	Description
0	PROC_BUS_CLK_OFF	Turn OFF RPM processor/bus/sFPB interface clocks.

0x00063008 RPM_RPM_TIMERS_CLK_OFF_CTL

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x3

The RPM_TIMERS_CLK_OFF_CTL register provides a way to turn off clock to RPM gp and wdog timers when they are not needed.

The CLK_OFF bits are inverted to create CLKON request signals to the clock control block.

NOTE Both TIMER1 and WDOG timer have sleep clock as their clock source. TIMER1_CLK_OFF and WDOG_TIMER_CLK_OFF provide a means to locally gate off sleep clock to TIMER1 and WDOG timer respectively.

NOTE Please refer to the clock control block SWI for details on how to enable/disable RPM timer0 as well as rpm sleep clock.

RPM_RPM_TIMERS_CLK_OFF_CTL

Bits	Name	Description
1	WDOG_TIMER_CLK_OFF	RPM wdog timer clock should keep running. Turn OFF RPM wdog timer clock. 0x0: Clock ON 0x1: Clock OFF
0	TIMER1_CLK_OFF	RPM timer1 clock should keep running. Turn OFF RPM timer1 clock. 0x0: Clock ON 0x1: Clock OFF

0x0006300C RPM_RPM_SW_DONE

Type: Write (Command)
Clock: RPM_BUS_CLK
Reset State: 0x0

THe RPM_SW_DONE register provides a means to signal to MPM that it is safe to initiate sleep mode.

NOTE Writing to RPM_SW_DONE, in addition to creating the sw_done pulse, will also turn off rpm_proc_clk, rpm_bus_clk, and rpm_sfpb_clk. SW needs to make sure that clocks to RPM timers have been turned off (by writing to RPM_TIMERS_CLK_OFF) prior to writing to the SW_DONE register.

RPM_RPM_SW_DONE

Bits	Name	Description
0	SW_DONE	

0x00063020+ 0x4*n RPM_RPM_GPO_WDATAn, n=[0..1]

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x00000000

The RPM_GPO_WDATA register is used to set the corresponding RPM GPO outputs high or low, based on the value written to it.

RPM_RPM_GPO_WDATAn

Bits	Name	Description
31:0	WDATA	Load or read the Write Data register.

0x00063040+ 0x4*n RPM_RPM_GPO_WDSETn, n=[0..1]

Type: Write
Clock: RPM_BUS_CLK
Reset State: NA

The RPM_GPO_WDSET register provides a way to individually set RPM_ GPO_WDATA bits.

RPM_RPM_GPO_WDSETn

Bits	Name	Description
31:0	WDSET	Set bits in the Write Data register. For each bit in the GPO bus, (Don't set corresponding bit in RPM_GPO_WDATA) (Set corresponding bit in RPM_GPO_WDATA) 0x0: Don't set 0x1: Set

0x00063060+ 0x4*n RPM_RPM_GPO_WDCLRn, n=[0..1]

Type: Write
Clock: RPM_BUS_CLK
Reset State: NA

The RPM_GPO_WDCLR register provides a way to individually clear RPM_GPO_WDATA bits.

RPM_RPM_GPO_WDCLRn

Bits	Name	Description
31:0	WDCLR	Clear bits in the Write Data register. For each bit in the GPO bus, (Don't clear corresponding bit in RPM_GPO_WDATA) (Clear corresponding bit in RPM_GPO_WDATA) 0x0: Don't clear 0x1: Clear

0x00063080 RPM_RPM_TEST_BUS_SEL

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_TEST_BUS_SEL register selects RPM test bus contents.

NOTE For RPM AHB test bus, SFPB_CTRL_STATUS needs to be configured in addition to RPM_TEST_BUS_SEL.

RPM_RPM_TEST_BUS_SEL

Bits	Name	Description
31	B_0X00000000	0x55555555
30	B_1	
29	B_1	

RPM_RPM_TEST_BUS_SEL (cont.)

0	B_1	

0x0006308C RPM_RPM_CODE_RAM_FS_CTL

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0xF

The RPM_CODE_RAM_FS_CTL register provides software override of RPM code RAM core/periphery foot switch controls.

NOTE Memory core/periphery foot switches are forced ON by default. This register needs to be programmed appropriately to get the full benefits of memory power down.

RPM_RPM_CODE_RAM_FS_CTL

Bits	Name	Description
3	GRP1_FORCE_CORE_ON	This bit provides software override of core FS control (slp_nret_n) for code RAM 64KB- 128KB. 0x1: RAM core forced ON 0x0: RAM core not forced ON
2	GRP1_FORCE_PERPH_ON	This bit provides software override of periphery FS control (slp_ret_n) for code RAM 64KB- 128KB. 0x1: RAM periphery forced ON 0x0: RAM periphery not forced ON

RPM_RPM_CODE_RAM_FS_CTL (cont.)

Bits	Name	Description
1	GRP0_FORCE_CORE_ON	This bit provides software override of core FS control (slp_nret_n) for code RAM 0KB - 64KB. 0x1: RAM core forced ON 0x0: RAM core not forced ON
0	GRP0_FORCE_PERPH_ON	This bit provides software override of periphery FS control (slp_ret_n) for code RAM 0KB - 64KB. 0x1: RAM periphery forced ON 0x0: RAM periphery not forced ON

0x00063090 RPM_RPM_CODE_RAM_FS_AHALT_CTL

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_CODE_RAM_FS_AHALT_CTL register provides software a means to halt clock to RPM code RAM FS CGCs.

This register also provides a means to put the memory core/periphery in sleep mode, if they are not forced ON via bits in RPM_CODE_RAM_FS_CTL register.

RPM_RPM_CODE_RAM_FS_AHALT_CTL

Bits	Name	Description
1	GRP1_ASYNC_HALT	This bit asserts/de-asserts asynchronous clock halt signal to the FS CGC for code RAM 64KB - 128KB. 0x1: Halt clock 0x0: Enable clock
0	GRP0_ASYNC_HALT	This bit asserts/de-asserts asynchronous clock halt signal to FS CGC for code RAM 0KB - 64KB. 0x1: Halt clock 0x0: Enable clock

0x00063094 RPM_RPM_CODE_RAM_FS_WS_CTL

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0xF

The RPM_CODE_RAM_FS_WS_CTL register controls the number of cycles before the code RAM goes to sleep or wakes-up.

For sleep, the output clock is gated off immediately while the sleep signals are asserted low only after s clock cycles.

For wake-up, the sleep signals are de-asserted immediately while the clock starts toggling only after w wake-up clock cycles.

RPM_RPM_CODE_RAM_FS_WS_CTL

Bits	Name	Description
3:0	GRP_W_S_VAL	These bits control the number of clock cycles for the RAM to go to sleep or wake-up from sleep. 0x0: Clocks - 0 0x1: Clocks - 1 0x2: Clocks - 2 0x3: Clocks - 3 0x4: Clocks - 4 0x5: Clocks - 5 0x6: Clocks - 6 0x7: Clocks - 7 0x8: Clocks - 8 0x9: Clocks - 9 0xA: Clocks - 10 0xB: Clocks - 11 0xC: Clocks - 12 0xD: Clocks - 13 0xE: Clocks - 14 0xF: Clocks - 15

0x00063098 RPM_RPM_CODE_RAM_FS_CLK_STATUS

Type: Read
Clock: RPM_BUS_CLK
Reset State: 0x0

The RPM_CODE_RAM_FS_CLK_STATUS register provides status information about the clock at the output of RPM code RAM FS CGCs.

RPM_RPM_CODE_RAM_FS_CLK_STATUS

Bits	Name	Description
1	GRP1_CLOCK_STATUS	0x1: Clock OFF 0x0: Clock ON
0	GRP0_CLK_STATUS	0x1: Clock OFF 0x0: Clock ON

17.6 RPM XPU Registers (0x00000000 RPM_BASE)

This section contains the RPM XPU registers.

17.6.1 RPM AHB SS

RPM AHB SS is a wrapper around system_fpb. It consists of a 2x3 SFPB_v2 bus and a 2x6 SFPB based RPM local AHB bus.The sections below list the software interface for the two SFPBs in RPM AHB SS, the XPU in the 2x6 bus and the M2VMT in the 2x3 bus.

17.6.1.1 RPM XPU registers

The RPM local AHB(2x6) bus has an XPU configured as an APU that protects slaves 0,1,2 & 3. Slaves 4 & 5 are protected via ACR registers.

NOTE An RPM_ prefix is expected in the ARM_ADDRESS_FILE.flat for these registers, so they do not collide with other APUs used in the system.

0x00064000+ 4*n RPM_APU_RGn_RACR, n=[0..3]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type APU. These registers include a single bit per VMID granting read access.

RPM_APU_RGn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x00064400+ 4*n RPM_APU_RGn_WACR, n=[0..3]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when APU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type APU.

RPM_APU_RGn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x00064F80 RPM_APU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

APU Configuration Register: This register includes fields governing various APU behaviors.

RPM_APU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set APU_ESR. APU_EAR and APU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set APU_ESR. APU_EAR and APU_ESYNR0 updated with address and syndrome of error.
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x00064F84 RPM_APU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

RPM_APU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x00064F88 RPM_APU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the APU_ESYNRn registers, which are merely the 'syndrome' of an error indicated by APU_ESR.

RPM_APU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) 'lock' upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x00064F8C RPM_APU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

RPM_APU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) 'lock' upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x00064F90 RPM_APU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

RPM_APU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x00064F94 RPM_APU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

RPM_APU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x00064FF4 RPM_APU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

RPM_APU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x00064FF8 RPM_APU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x00001C03

APU ID Register: Read-only register that defines various configuration attributes of the APU instance.

RPM_APU_IDR

Bits	Name	Description
31:29	RESERVED31_21	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved

RPM_APU_IDR (cont.)

Bits	Name	Description
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only 'owner' VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit 'owner' VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.
9	RESERVED9	Reserved
8:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x00064FFC RPM_APU_APU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

RPM_APU_APU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APUs (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

17.7 RPM 2x3 System FPB Registers (0x00000000 RPM_BASE)

This section contains RPM 2x3 System FPB registers.

17.7.1 RPM AHB SS

RPM AHB SS is a wrapper around system_fpb. It consists of a 2x3 SFPB_v2 bus and a 2x6 SFPB based RPM local AHB bus.The sections below list the software interface for the two SFPBs in RPM AHB SS, the XPU in the 2x6 bus and the M2VMT in the 2x3 bus.

17.7.1.1 RPM AHB 2x6 registers

Table 1-11 lists the differences between the standard system FPB SW interface and system FPB SW interface as it corresponds to RPM local AHB bus. The changes in the SW interface are due to RPM customization of system FPB (via generics) for use as its local AHB bus.

Table 17-10 System FPB SWI changes for RPM

Register	Change for RPM
SFPB_CTRL_STATUS	No change.
SFPB_AHB2AHB_CFG_Ma, a=[0..15]	Removed. Since RPM local AHB does not instantiate an AHB2AHB bridge on any of its master interfaces, this register will not be generated.
SFPB_PORT_EN	Size reduced from 16 bits to 2 bits, since RPM local AHB has only 2 masters.
SFPB_AHB2AHB_CFG_Sa, a=[0..1]	Removed. Sa_Ma interfaces are used as slave interfaces on RPM local AHB without any AHB2AHB bridge, so these registers will not be generated.
SFPB_ERROR_STAT	No change.
SFPB_ERROR_ADDR	No change.
SFPB_GPREG	Size changed from 16 bits to 1 bit. RPM local AHB does not need this register, so it sets the generic that controls the size of this register to 1, which is the minimum allowed size.
SFPB_XPU_ACR	No change.
SFPB_HW_CLK_GATING_CFG	Removed. RPM sets the ENABLE_HW_CLK_GATING generic to 0, so this register is not generated.

NOTE An RPM_2x3 prefix is expected in the ARM_ADDRESS_FILE.flat for these registers, so they do not collide with other system FPBs used in the system.

0x00068000 RPM_SFPB_CTRL_STATUS

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0000

The SFPB_CTRL_STATUS register is a general configuration register.

RPM_SFPB_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables NOTE Power up value is clear (0)
11	RPM_ARM7_IRQ_EN	SW: RW, HW: R ARM7InterruptEnable When set, the ARM7 receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	SC_IRQ_EN	SW: RW, HW: R Scorpion Interrupt Enable When set, the Scorpion receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

RPM_SFPB_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x5: Select the S0_M0 ahb2ahb bridge test bus. 0x6: Select the S1_M1 ahb2ahb bridge test bus. 0x7: Select the M0 ahb2ahb bridge test bus. 0x8: Select the M1 ahb2ahb bridge test bus. 0x9: Select the M2 ahb2ahb bridge test bus. 0xA: Select the M3 ahb2ahb bridge test bus. 0xB: Select the M4 ahb2ahb bridge test bus. 0xC: Select the M5 ahb2ahb bridge test bus. 0xD: Select the M6 ahb2ahb bridge test bus. 0xE: Select the M7 ahb2ahb bridge test bus. 0xF: Select the M8 ahb2ahb bridge test bus. 0x10: Select the M9 ahb2ahb bridge test bus. 0x11: Select the M10 ahb2ahb bridge test bus. 0x12: Select the M11 ahb2ahb bridge test bus. 0x13: Select the M12 ahb2ahb bridge test bus. 0x14: Select the M13 ahb2ahb bridge test bus. 0x15: Select the M14 ahb2ahb bridge test bus. 0x16: Select the M15 ahb2ahb bridge test bus.

0x00068044 RPM_SFPB_PORT_EN

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x3

The SFPB_PORT_EN register is a SFPB master port enable register.

RPM_SFPB_PORT_EN

Bits	Name	Description
31:2	RESERVED_BIT31_2	

RPM_SFPB_PORT_EN (cont.)

Bits	Name	Description
1	M1_PORT_EN	SW: RW, HW: R M1PortEnable When cleared (0), M1 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

0x00068050 RPM_SFPB_ERROR_STAT

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000000

The SFPB_ERROR_STAT register is the bus error status register.

RPM_SFPB_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the DM channel ID that caused the detected error when the DM is the master of the access. If the DM is not the master of the access, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Applications DM 0x1: MDP 0x2: ARM9 0x3: ARM11 0x4: ADSP

RPM_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted based on PBUS_IRQ_EN settings. Clearing (0) this bit clears any interrupts asserted as well as enables the PBUS_ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x00068054 RPM_SFPB_ERROR_ADDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x00000000

The SFPB_ERROR_ADDR register contains the bus error address.

RPM_SFPB_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when PBUS_ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x00068058 RPM_SFPB_GPREG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0

The SFPB_GPREG register is a configurable general purpose register.

RPM_SFPB_GPREG

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	GPREG_CONTENT	SW: RW, HW: W GpregContent User defines the content of this register. The size of this register is defined by the generic-SFPB_GPREG_SIZE (1 - 32 bits). Power up value is clear (0)

0x0006805C RPM_SFPB_XPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFFFFFF

The SFPB_XPU_ACR register is a SFPB Access Control Register for configure register protection.

RPM_SFPB_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R M15PortEnable SFPB XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the SFPB configure space, including this register itself. Power up value is set (1)

17.7.1.2 RPM AHB 2x3 registers

This table lists the differences between the standard systemFPB SW interface and system FPB SW interface as it corresponds to RPM 2x3 splitter. The changes in the SW interface are due to RPM customization of system FPB (via generics) for use as a 2x3 arbiter to direct traffic from ARM7/TIC/JTAG2AHB or COresight DAP to either the local AHB bus, chip systemFPB, or chip FABRIC.

Table 17-11 System FPB SWI changes for RPM

Register	Change for RPM
SFPB_CTRL_STATUS	No change.
SFPB_AHB2AHB_CFG_Ma, a=[0..15]	Removed. Since RPM 2x3 arbiter does not instantiate an AHB2AHB bridge on its single master interface, this register will not be generated.
SFPB_PORT_EN	Size reduced from 16 bits to 2 bits, since the RPM 2x3 arbiter has only 2 masters.
SFPB_AHB2AHB_CFG_Sa, a=[0..1]	Removed. The Sa_Ma interfaces in RPM 2x3 arbiter do not instantiate any AHB2AHB bridges, so this register will not be generated.
SFPB_ERROR_STAT	No change.
SFPB_ERROR_ADDR	No change.
SFPB_GPREG	Size changed from 16 bits to 1 bit. RPM 2x3 arbiter does not need this register, so it sets the GENERIC that controls the size of this register to 1, which is the minimum allowed size.
SFPB_XPU_ACR	No change.
SFPB_HW_CLK_GATING_CFG	Removed. RPM sets the ENABLE_HW_CLK_GATING generic to 0, so this register will not be generated.

NOTE An RPM_2x3 prefix is expected in the ARM_ADDRESS_FILE.flat for these registers, so they do not collide with other system FPBs used in the chip.

.

0x00068000 RPM_SFPB_CTRL_STATUS

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0000

The SFPB_CTRL_STATUS register is a general configuration register.

NOTE The XPU_EN bit should never be set for RPM. Security needs to be set external to RPM (example systemFPB level). RPM should only receive secure accesses.

RPM_SFPB_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0) NOTE This bit should never be set for RPM. Setting to 1 will result in unpredictable behavior.
11	RPM_ARM7_IRQ_EN	SW: RW, HW: R ARM7InterruptEnable When set, the ARM7 receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	SC_IRQ_EN	SW: RW, HW: R Scorpion Interrupt Enable When set, the Scorpion receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

RPM_SFPB_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x5: Select the S0_M0 ahb2ahb bridge test bus. 0x6: Select the S1_M1 ahb2ahb bridge test bus. 0x7: Select the M0 ahb2ahb bridge test bus. 0x8: Select the M1 ahb2ahb bridge test bus. 0x9: Select the M2 ahb2ahb bridge test bus. 0xA: Select the M3 ahb2ahb bridge test bus. 0xB: Select the M4 ahb2ahb bridge test bus. 0xC: Select the M5 ahb2ahb bridge test bus. 0xD: Select the M6 ahb2ahb bridge test bus. 0xE: Select the M7 ahb2ahb bridge test bus. 0xF: Select the M8 ahb2ahb bridge test bus. 0x10: Select the M9 ahb2ahb bridge test bus. 0x11: Select the M10 ahb2ahb bridge test bus. 0x12: Select the M11 ahb2ahb bridge test bus. 0x13: Select the M12 ahb2ahb bridge test bus. 0x14: Select the M13 ahb2ahb bridge test bus. 0x15: Select the M14 ahb2ahb bridge test bus. 0x16: Select the M15 ahb2ahb bridge test bus.

0x00068044 RPM_SFPB_PORT_EN

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x3

The SFPB_PORT_EN register is a SFPB master port enable register.

RPM_SFPB_PORT_EN

Bits	Name	Description
31:2	RESERVED_BIT31_2	

RPM_SFPB_PORT_EN (cont.)

Bits	Name	Description
1	M1_PORT_EN	SW: RW, HW: R M1PortEnable When cleared (0), M1 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

0x00068050 RPM_SFPB_ERROR_STAT

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000000

The SFPB_ERROR_STAT register is the bus error status register.

RPM_SFPB_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the DM channel ID that caused the detected error when the DM is the master of the access. If the DM is not the master of the access, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Applications DM 0x1: MDP 0x2: ARM9 0x3: ARM11 0x4: ADSP

RPM_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted based on PBUS_IRQ_EN settings. Clearing (0) this bit clears any interrupts asserted as well as enables the PBUS_ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x00068054 RPM_SFPB_ERROR_ADDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x00000000

The SFPB_ERROR_ADDR register contains the bus error address.

RPM_SFPB_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when PBUS_ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x00068058 RPM_SFPB_GPREG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0

The SFPB_GPREG register is a configurable general purpose register.

RPM_SFPB_GPREG

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	GPREG_CONTENT	SW: RW, HW: W GpregContent User defines the content of this register. The size of this register is defined by the generic-SFPB_GPREG_SIZE (1 - 32 bits). Power up value is clear (0)

0x0006805C RPM_SFPB_XPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFFFFFF

The SFPB_XPU_ACR register is a SFPB Access Control Register for configure register protection.

NOTE The XPU_EN bit in SFPB_CTRL_STATUS register should never be set for RPM. This register, therefore, will never be needed since it is used only when the XPU_EN bit is set.

RPM_SFPB_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R M15PortEnable SFPB XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the SFPB configure space, including this register itself. Power up value is set (1)

17.7.1.2.1 M2VMT (hmaster index) registers

The M2VMT block is part of the system_fpb_v2 2 x3 bus. The mapper is a 2 entry mapper, but only one entry of the mapper is used for VMID generation - this is port M0 on which ARM7/TIC/JTAG2AHB can be masters (mutually exclusive). Port M1 of the 2x3 is configured as a link master, so the incoming VMID is passed through and the port ID is NOT used to index into the M2VMT to generate a VMID.

0x00069000+ 0x4*n RPM_SFPB_M2VMT_M2VMRn, n=[0..1]

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where n = NUM_M2VMT_ENTRIES from the design generics and we map NUM_M2VMT_ENTRIES to NUM_MASTERS.

NOTE Although the M2VMT hardware is configured for 2 VMID mapper entries, only one of the register's(SFPB_M2VMT_M2VMR0) VMID entry is actually used. This is for the M0 port on which either ARM7/TIC/JTAG2AHB can be masters.

RPM_SFPB_M2VMT_M2VMRn

Bits	Name	Description
31:5	RESERVED	
4:0	VMID	Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRn address associations. n = NUM_M2VMT_ENTRIES from the design generic/parameter.

0x00069F80 RPM_SFPB_M2VMT_CR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: xxx0

Global configuration register.

Special Note: When REMOVE_M2VMT_RPU = ’1’, this register is not available. Also, bit [2], is not valid or has no effect when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT =‘1’.

RPM_SFPB_M2VMT_CR

Bits	Name	Description
31:4	RESERVED	
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., in valid addresses) are recorded as such. Decode error is asserted when config access to un-implemented and/or unmapped register/address are done. Also, note that decode error is never asserted for client port accesses. When value is set to ’0’ i.e., ’do not record’, decode errors do not set the M2VMT_ESR[CFG], and M2VMT_EAR & M2VMT_SYNRn is not updated. When value is set to ’1’, i.e., ’record’, decode errors set M2VMT_ESR[CFG] and M2VMT_EAR & M2VMT_SYNRn is updated with the address and the syndrome of the error. Reset State: x
2	RPUEIE	RPU error interrupt Enable: When set, configuration port errors are reported directly to the interrupt controller via the M2VMT_intr, interrupt output signal. Interrupt output is asserted if M2VMT_CR[RPUIE_EN] is ’1’ and ANY bit is set in the M2VMT_ESR register. Special Note: Not valid or has no effect on the interrupt when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=’1’. Reset State: x
1	RPUERE	RPU error report enable: When set, M2VMT reports configuration port errors to the requesting bus master, according to the respective port’s bus protocol. All error types reported via CRIF port will use a decode error, rather than a slave error. Regardless of the value of this field, both configuration port errors are terminated by the M2VMT as RAZ/WI, and are recorded in M2VMT_ESR register. Reset State: X

RPM_SFPB_M2VMT_CR (cont.)

Bits	Name	Description
0	RPUE	RPU Enable: Governs whether M2VMT_RPU_ACR is enabled to check the VMID of the configuration request. When set, all configuration port accesses are checked against M2VMT_RPU_ACR register for access permissions. It's cleared by reset. Set once SROT configures MID->VMID mapping tables Reset State: 0

0x00069F84 RPM_SFPB_M2VMT_EAR

Type: Read
Clock: CC_SFPB_CLK
Reset State: unknown

When there is an error, this register holds the physical address of the errant transaction.

RPM_SFPB_M2VMT_EAR

Bits	Name	Description
31:0	PA	M2VMT Error Address Register: Physical address[31:0]. Contains the physical address of the errant request. Based on implementation, it may not contain the full 32 bits of the address. Captures the address on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. Special Note: When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT = '1', this register is not available and therefore access to this register are treated as RAZ/WI.

0x00069F88 RPM_SFPB_M2VMT_ESR

Type: Read/Write to clear
Clock: CC_SFPB_CLK
Reset State: Undefined

M2VMT Error Status Register:

Captures the status upon M2VMT configuration errors, as determined by the M2VMT_RPU_ACR.

This register has read/write-clear access, meaning that reads simply provide a value in the register, while writes are performed by clearing those bits corresponding to '1's in the value written data, and leaving unchanged those bits corresponding to 0s n the written data. This prevents inadvertent

clearing of new errors when writing the register to clear an old error. A write with a ’1’ set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

The presence of an asserted value on any bit in this register is what prompts the assertion when enabled by M2VMT_CR[RPUEIE] of the M2MVT’s interrupt output. Therefore these bits must be cleared by the interrupt handler. This is contrasted with the fields in the M2VMT_ESYNRn register, which are merely the ’syndrome’ of an error indicated by the M2VMT_ESR.

For M2VMT, there is only one defined error status bit in the M2VMT_SER (actually two, if you count multi-error).

RPM_SFPB_M2VMT_ESR

Bits	Name	Description
31	MULTI	Multi-Error: When set to ’1’, indicates that an additional error occurred while M2VMT_ESR is non-zero. The M2VMT_EAR,M2VMT_ESYNRn and M2VMT_ESR registers (with the exception of this bit) lock on the first error, and must be cleared to unlock. Therefore, the status and the syndrome of errors that occurred while M2VMT_ESR[CFG] is ’1’ are lost, i.e., syndrome register and status register stores only details of the first error.
30:1	RESERVED	
0	CFG	Configuration Port Error: When set to ’1’, indicates an error associated with a configuration port request. **NOTE** When REMOVE_M2VMT_RPU=’1’ OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT=’1’, this register is not available and therefore access to this register is treated as RAZ/WI.

0x00069F8C RPM_SFPB_M2VMT_ESRRESTORE

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: unknown

RPM_SFPB_M2VMT_ESRRESTORE

Bits	Name	Description
31:0	M2VMT_ESRRTORE	M2VMT Error Status Register Restore This is just an aliased address for M2VMT_ESR, which provides direct write access (rather than write-clear) for restoration purpose Special Note: When REMOVE_M2VMT_RPU=’1’ OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=’1’, this register is not available and therefore access to this register is treated as RAZ/WI.

0x00069F90 RPM_SFPB_M2VMT_ESYNR0

Type: Read
Clock: CC_SFPB_CLK
Reset State: undefined

Error Syndrome Register 0:

Captures the syndrome on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) 'lock' upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., the syndrome register and the status register stores only details of the first error.

RPM_SFPB_M2VMT_ESYNR0

Bits	Name	Description
31:24	ATID	ATID[7:0] field of errant request.
23:21	RESERVED	
20:16	AVMID	AVMID[4:0] field of errant request.
15:0	AMID	AMID[15:0] field of errant request. Special Note: When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT="1", this register is not available and therefore access to this register is treated as RAZ/WI.

0x00069F94 RPM_SFPB_M2VMT_ESYNR1

Type: Read
Clock: CC_SFPB_CLK
Reset State: Undefined

Error Syndrome Register 1:

Captures syndrome upon M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) 'lock' upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost. That is, the syndrome register and the status register only stores details of the first error.

RPM_SFPB_M2VMT_ESYNR1

Bits	Name	Description
31	DCD	Decode: Indicates configuration port error due to invalid/ unrecognized/ unmapped/ un-implemented address (e.g., a reserved register address). Includes decode errors within the global address space. Also, note that decode error is never asserted for client port accesses.
30	AC	Access control: Indicates configuration port error due to lack of permission, as specified by the access control registers
29:25	RESERVED_1	
24	AFULL	AFULL field of the errant request
23	AOOOWR	AOOOWR field of the errant request
22	AOOORD	AOOORD field of the errant request.
21:20	ALOCK	ALOCK[1:0] (ALOCK field of the errant request).
19	RESERVED_2	
18:16	ASIZE	ASIZE[2:0] field of the errant request).
15:12	ALEN	ALEN[3:0] field of the errant request.
11:10	ABURST	ABURST[1:0] field of the errant request.
9	RESERVED	
8	AWRITE	AWRITE field of the errant request.
7	AINST	AINST field of the errant request.
6	APROTNS	APROTNS field of the errant request.
5	APRIV	APRIV field of the errant request.
4	AINNERSHARED	AINNERSHARED field of the errant request.
3	ASHARED	ASHARED field of the errant request.
2:0	AMEMTYPE	AMEMTYPE[2:0] field of the errant request. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this registers is treated as RAZ/WI.

0x00069FF4 RPM_SFPB_M2VMT_REV

Type: Read
Clock: CC_SFPB_CLK
Reset State: ’10000000’b

Reports the revision information for the M2VMT core and wrapper.

RPM_SFPB_M2VMT_REV

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	Major variant field APQ8064: MAJOR = 0001
3:0	MINOR	Minor variant field. MINOR = 0000

0x00069FF8 RPM_SFPB_M2VMT_IDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x2

Reports the size of the M2VMT table. It is a read-only register.

RPM_SFPB_M2VMT_IDR

Bits	Name	Description
31:9	RESERVED	
8:0	M2VMTSIZE	.M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping. M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.

0x00069FFC RPM_SFPB_M2VMT_RPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: Undefined

Using the incoming VMID, this register controls access to the global register space.

RPM_SFPB_M2VMT_RPU_ACR

Bits	Name	Description
31:0	RWE	M2VMT local RPU Access control Register. Each bit position corresponds to a VMID. When set to ’1’, that VMID is granted VMID read/write access to the entire block of registers within the M2VMT’s 4KB global address space, including this register itself. In practice, this register designates the VMID(s) that can act as SROT (e.g., scorpion-secure) or pseudo SROT (e.g. RPM ARM11). Special Note: When REMOVE_M2VMT_RPU=’1’, this register is not available and therefore access to this register is treated as RAZ/WI.

17.8 RPM System FPB Registers (0x00000000 RPM_BASE)

This section contains RPM System FPB registers.

17.8.1 RPM AHB SS

RPM AHB SS is a wrapper around system_fpb. It consists of a 2x3 SFPB_v2 bus and a 2x6 SFPB based RPM local AHB bus.The sections below list the registers for the two SFPBs in RPM AHB SS, the XPU in the 2x6 bus and the M2VMT in the 2x3 bus.

17.8.1.1 RPM AHB 2x6 registers

Table 1-11 lists the differences between the standard system FPB SW interface and system FPB SW interface as it corresponds to RPM local AHB bus. The changes in the SW interface are due to RPM customization of system FPB (via generics) for use as its local AHB bus.

Table 17-12 System FPB SWI changes for RPM

Register	Change for RPM
SFPB_CTRL_STATUS	No change.
SFPB_AHB2AHB_CFG_Ma, a=[0..15]	Removed. Since RPM local AHB does not instantiate an AHB2AHB bridge on any of its master interfaces, this register will not be generated.
SFPB_PORT_EN	Size reduced from 16 bits to 2 bits, since RPM local AHB has only 2 masters.
SFPB_AHB2AHB_CFG_Sa, a=[0..1]	Removed. Sa_Ma interfaces are used as slave interfaces on RPM local AHB without any AHB2AHB bridge, so these registers will not be generated.
SFPB_ERROR_STAT	No change.
SFPB_ERROR_ADDR	No change.
SFPB_GPREG	Size changed from 16 bits to 1 bit. RPM local AHB does not need this register, so it sets the generic that controls the size of this register to 1, which is the minimum allowed size.
SFPB_XPU_ACR	No change.
SFPB_HW_CLK_GATING_CFG	Removed. RPM sets the ENABLE_HW_CLK_GATING generic to 0, so this register is not generated.

NOTE An RPM_2x3 prefix is expected in the ARM_ADDRESS_FILE.flat for these registers, so they do not collide with other system FPBs used in the system.

0x0006C000 RPM_SFPB_CTRL_STATUS

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0000

The SFPB_CTRL_STATUS register is a general configuration register.

RPM_SFPB_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables NOTE Power up value is clear (0)
11	RPM_ARM7_IRQ_EN	SW: RW, HW: R ARM7InterruptEnable When set, the ARM7 receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	SC_IRQ_EN	SW: RW, HW: R Scorpion Interrupt Enable When set, the Scorpion receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

RPM_SFPB_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x5: Select the S0_M0 ahb2ahb bridge test bus. 0x6: Select the S1_M1 ahb2ahb bridge test bus. 0x7: Select the M0 ahb2ahb bridge test bus. 0x8: Select the M1 ahb2ahb bridge test bus. 0x9: Select the M2 ahb2ahb bridge test bus. 0xA: Select the M3 ahb2ahb bridge test bus. 0xB: Select the M4 ahb2ahb bridge test bus. 0xC: Select the M5 ahb2ahb bridge test bus. 0xD: Select the M6 ahb2ahb bridge test bus. 0xE: Select the M7 ahb2ahb bridge test bus. 0xF: Select the M8 ahb2ahb bridge test bus. 0x10: Select the M9 ahb2ahb bridge test bus. 0x11: Select the M10 ahb2ahb bridge test bus. 0x12: Select the M11 ahb2ahb bridge test bus. 0x13: Select the M12 ahb2ahb bridge test bus. 0x14: Select the M13 ahb2ahb bridge test bus. 0x15: Select the M14 ahb2ahb bridge test bus. 0x16: Select the M15 ahb2ahb bridge test bus.

0x0006C044 RPM_SFPB_PORT_EN

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x3

The SFPB_PORT_EN register is a SFPB master port enable register.

RPM_SFPB_PORT_EN

Bits	Name	Description
31:2	RESERVED_BIT31_2	

RPM_SFPB_PORT_EN (cont.)

Bits	Name	Description
1	M1_PORT_EN	SW: RW, HW: R M1PortEnable When cleared (0), M1 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

0x0006C050 RPM_SFPB_ERROR_STAT

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000000

The SFPB_ERROR_STAT register is the bus error status register.

RPM_SFPB_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the DM channel ID that caused the detected error when the DM is the master of the access. If the DM is not the master of the access, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Applications DM 0x1: MDP 0x2: ARM9 0x3: ARM11 0x4: ADSP

RPM_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted based on PBUS_IRQ_EN settings. Clearing (0) this bit clears any interrupts asserted as well as enables the PBUS_ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x0006C054 RPM_SFPB_ERROR_ADDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x00000000

The SFPB_ERROR_ADDR register contains the bus error address.

RPM_SFPB_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when PBUS_ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x0006C058 RPM_SFPB_GPREG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0

The SFPB_GPREG register is a configurable general purpose register.

RPM_SFPB_GPREG

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	GPREG_CONTENT	SW: RW, HW: W GpregContent User defines the content of this register. The size of this register is defined by the generic-SFPB_GPREG_SIZE (1 - 32 bits). Power up value is clear (0)

0x0006C05C RPM_SFPB_XPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFFFFFF

The SFPB_XPU_ACR register is a SFPB Access Control Register for configure register protection.

RPM_SFPB_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R M15PortEnable SFPB XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the SFPB configure space, including this register itself. Power up value is set (1)

17.8.1.2 RPM AHB 2x3 registers

Table 1-12 lists the differences between the standard systemFPB SW interface and system FPB SW interface as it corresponds to RPM 2x3 splitter. The changes in the SW interface are due to RPM customization of system FPB (via generics) for use as a 2x3 arbiter to direct traffic from ARM7/TIC/JTAG2AHB or COresight DAP to either the local AHB bus, chip systemFPB, or chip FABRIC.

Table 17-13 System FPB SWI changes for RPM

Register	Change for RPM
SFPB_CTRL_STATUS	No change.
SFPB_AHB2AHB_CFG_Ma, a=[0..15]	Removed. Since RPM 2x3 arbiter does not instantiate an AHB2AHB bridge on its single master interface, this register will not be generated.
SFPB_PORT_EN	Size reduced from 16 bits to 2 bits, since the RPM 2x3 arbiter has only 2 masters.
SFPB_AHB2AHB_CFG_Sa, a=[0..1]	Removed. The Sa_Ma interfaces in RPM 2x3 arbiter do not instantiate any AHB2AHB bridges, so this register will not be generated.
SFPB_ERROR_STAT	No change.
SFPB_ERROR_ADDR	No change.
SFPB_GPREG	Size changed from 16 bits to 1 bit. RPM 2x3 arbiter does not need this register, so it sets the GENERIC that controls the size of this register to 1, which is the minimum allowed size.
SFPB_XPU_ACR	No change.
SFPB_HW_CLK_GATING_CFG	Removed. RPM sets the ENABLE_HW_CLK_GATING generic to 0, so this register will not be generated.

NOTE An RPM_2x3 prefix is expected in the ARM_ADDRESS_FILE.flat for these registers, so they do not collide with other system FPBs used in the chip

.

0x0006C000 RPM_SFPB_CTRL_STATUS

Type: Read/Write
Clock: RPM_BUS_CLK
Reset State: 0x0000

The SFPB_CTRL_STATUS register is a general configuration register.

NOTE The XPU_EN bit should never be set for RPM. Security needs to be set external to RPM (example system FPB level). RPM should only receive secure accesses.

RPM_SFPB_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0) NOTE This bit should never be set for RPM. Setting to 1 will result in unpredictable behavior.
11	RPM_ARM7_IRQ_EN	SW: RW, HW: R ARM7InterruptEnable When set, the ARM7 receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	SC_IRQ_EN	SW: RW, HW: R Scorpion Interrupt Enable When set, the Scorpion receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

RPM_SFPB_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x5: Select the S0_M0 ahb2ahb bridge test bus. 0x6: Select the S1_M1 ahb2ahb bridge test bus. 0x7: Select the M0 ahb2ahb bridge test bus. 0x8: Select the M1 ahb2ahb bridge test bus. 0x9: Select the M2 ahb2ahb bridge test bus. 0xA: Select the M3 ahb2ahb bridge test bus. 0xB: Select the M4 ahb2ahb bridge test bus. 0xC: Select the M5 ahb2ahb bridge test bus. 0xD: Select the M6 ahb2ahb bridge test bus. 0xE: Select the M7 ahb2ahb bridge test bus. 0xF: Select the M8 ahb2ahb bridge test bus. 0x10: Select the M9 ahb2ahb bridge test bus. 0x11: Select the M10 ahb2ahb bridge test bus. 0x12: Select the M11 ahb2ahb bridge test bus. 0x13: Select the M12 ahb2ahb bridge test bus. 0x14: Select the M13 ahb2ahb bridge test bus. 0x15: Select the M14 ahb2ahb bridge test bus. 0x16: Select the M15 ahb2ahb bridge test bus.

0x0006C044 RPM_SFPB_PORT_EN

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x3

The SFPB_PORT_EN register is a SFPB master port enable register.

RPM_SFPB_PORT_EN

Bits	Name	Description
31:2	RESERVED_BIT31_2	

RPM_SFPB_PORT_EN (cont.)

Bits	Name	Description
1	M1_PORT_EN	SW: RW, HW: R M1PortEnable When cleared (0), M1 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

0x0006C050 RPM_SFPB_ERROR_STAT

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000000

The SFPB_ERROR_STAT register is the bus error status register.

RPM_SFPB_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the DM channel ID that caused the detected error when the DM is the master of the access. If the DM is not the master of the access, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Applications DM 0x1: MDP 0x2: ARM9 0x3: ARM11 0x4: ADSP

RPM_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted based on PBUS_IRQ_EN settings. Clearing (0) this bit clears any interrupts asserted as well as enables the PBUS_ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x0006C054 RPM_SFPB_ERROR_ADDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x00000000

The SFPB_ERROR_ADDR register contains the bus error address.

RPM_SFPB_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when PBUS_ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x0006C058 RPM_SFPB_GPREG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0

The SFPB_GPREG register is a configurable general purpose register.

RPM_SFPB_GPREG

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	GPREG_CONTENT	SW: RW, HW: W GpregContent User defines the content of this register. The size of this register is defined by the generic-SFPB_GPREG_SIZE (1 - 32 bits). Power up value is clear (0)

0x0006C05C RPM_SFPB_XPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFFFFFF

The SFPB_XPU_ACR register is a SFPB Access Control Register for configure register protection.

NOTE The XPU_EN bit in SFPB_CTRL_STATUS register should never be set for RPM. This register, therefore, will never be needed since it is used only when the XPU_EN bit is set.

RPM_SFPB_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R M15PortEnable SFPB XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the SFPB configure space, including this register itself. Power up value is set (1)

17.9 MSG RAM XPU Registers (0x00100000 RPM_MSG_RAM_XPU_BASE)

This section contains MSG RAM XPU registers.

17.9.1 XPU Registers

0x00100000+4*n MSG_RAM_RPU_RGn_ACR, n=[0..47]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when RPU_IDR[MV, PT] = 01, i.e., a single VMID, read/write access vs. read-only access permission type RPU. These registers include two separate 5-bit "owner" VMID fields.

MSG_RAM_RPU_RGn_ACR

Bits	Name	Description
31:26	RESERVED31_26	Reserved.
25	ROGE	Read-only global enable: Opens up read-only access for this resource group to all VMIDs if: ROGE | (ROE & (VMID = ROVMID)) | RPU_RPU_ACR[VMID] = 1
24	ROE	Read-only enable. This is a "valid" bit for the ROVMID field.
23:21	RESERVED23_21	Reserved
20:16	ROVMID	Read-only VMID. Specifies "owner" VMID with read-only access to the registers in the associated resource group.
15:10	RESERVED15_10	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | RPU_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a "valid" bit for the RWVMID field
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies "owner" VMID with full read/write access to the registers in the associated resource group.

0x00100F80 MSG_RAM_RPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

RPU Configuration Register: This register includes fields governing various RPU behaviors.

MSG_RAM_RPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set RPU_ESR. RPU_EAR and RPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set RPU_ESR. RPU_EAR and RPU_ESYNR0 updated with address and syndrome of error.
2	RPUEIE	RPU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the RPU. Interrupt output is asserted if RPU_CR[RPUEIE] = 1 and any bit is set in RPU_ESR
1	RPUERE	RPU Error Report Enable. RPUERE = 0 causes the RPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master RPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective RPU port. Errors from either port are terminated by the RPU as RAZ/WI Both client and configuration port errors are recorded in RPU_ESR, independent of the value of RPU_CR[RPUERE]
0	RPUE	RPU Enable. Governs whether RPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures RPU and the MID to VMID mapping tables.

0x00100F84 MSG_RAM_RPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the RPU, for both the client port and the configuration port.

MSG_RAM_RPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x00100F88 MSG_RAM_RPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the RPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the RPU's interrupt output (when enabled by RPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the RPU_ESYNRn registers, which are merely the "syndrome" of an error indicated by RPU_ESR.

MSG_RAM_RPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while RPU_ESR[CFG, CLIENT] still non-zero. RPU_EAR and RPU_ESYNRn registers (and RPU_ESR itself, except for the MULTI bit) "lock" upon first error, RPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while RPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x00100F8C MSG_RAM_RPU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for RPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

MSG_RAM_RPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while RPU_ESR[CFG, CLIENT] still non-zero. RPU_EAR and RPU_ESYNRn registers (and RPU_ESR itself, except for the MULTI bit) "lock" upon first error, RPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while RPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x00100F90 MSG_RAM_RPU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the RPU, for both the client port and the configuration port.

MSG_RAM_RPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x00100F94 MSG_RAM_RPU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the RPU, for both the client port and the configuration port.

MSG_RAM_RPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x00100FF4 MSG_RAM_RPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

MSG_RAM_RPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved

MSG_RAM_RPU_REV (cont.)

Bits	Name	Description
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x00100FF8 MSG_RAM_RPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x0009082F

RPU ID Register: Read-only register that defines various configuration attributes of the RPU instance.

MSG_RAM_RPU_IDR

Bits	Name	Description
31:21	RESERVED31_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only RPU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate RPU_RGn_RACR and RPU_RGn_WACR registers govern read vs. write access. For single VMID, RPU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. RPU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMD type access control. RPU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.
9:8	RESERVED9_8	Reserved

MSG_RAM_RPU_IDR (cont.)

Bits	Name	Description
7:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the RPU. Value can range between 0 and 255 (1-256 resource groups).

0x00100FFC MSG_RAM_RPU_RPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

RPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the RPU (including the RPU_RPU_ACR itself).

MSG_RAM_RPU_RPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the RPU's 4KB address region (including the RPU_RPU_ACR itself). For single VMID type RPUs (RPU_IDR[MV] = 0) the RPU_RPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

17.10 MPM PMIC Registers (0x00200000 MPM_BASE)

This section contains MPM PMIC registers.

17.10.1 SBI registers

MPM can issue up to four SSBI transactions when entering and exiting sleep modes. The number of transactions issued is configurable.

The following registers provide the configuration and content of these SSBI transactions.

0x00200000 MPM_PMIC_VDD_CFG

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register programs the SSBI SEQ for the first SSBI command during shutdown, and the last SSBI command when wake-up. It can turn on/off voltage of any voltage rail (memory or logic). In a split-rail memory system, this register is usually used to set the PMIC regulator setting for VDDCX power rail when entering sleep mode (SLAVE_DATA_OFF) and when exiting sleep mode (SLAVE_DATA_ON). The OFF setting would be customized for either power collapse or VDDCX_MIN (retention). The ON setting would reflect the voltage level to restore upon wake-up from power collapse or VDDCX_MIN.

NOTE VDDCX is the nomenclature for the parent/main logic power rail for APQ chip.

MPM_PMIC_VDD_CFG

Bits	Name	Description
25:24	SLAVE_ADDR_PREFIX	The 2-bit address prefix for slave used in SSBI 2.0.
23:16	SLAVE_ADDR	PMIC VDDCX voltage regulator SSBI register address.
15:8	SLAVE_DATA_OFF	Data to turn off/lower VDDCX power domain.
7:0	SLAVE_DATA_ON	Data to turn on/increase VDDCX power domain.

0x00200004 MPM_PMIC_VDD_CFG_1

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register programs the SSBI SEQ for the second SSBI command shutdown, and the next to last SSBI command upon wake-up. It can turn on/off voltage of any voltage rail (memory or logic). In a split-rail memory system, this register is usually used to set the PMIC regulator setting for

VDDMX power rail when entering sleep mode (SLAVE_DATA_OFF) and when exiting sleep mode (SLAVE_DATA_ON). The OFF setting would be customized for either power collapse or VDDMX_MIN (retention). The ON setting would reflect the voltage level to restore upon wake-up from power collapse or VDDMX_MIN.

NOTE VDDMX is the nomenclature for the memory power rail for APQ chip. If SSBI_CNT_MAX = 0 this is not used. If SSBI_CNT_MAX = 1, 2 or 3, it will be used.

MPM_PMIC_VDD_CFG_1

Bits	Name	Description
25:24	SLAVE_ADDR_PREFIX_1	The 2-bit address prefix for slave used in SSBI 2.0.
23:16	SLAVE_ADDR_1	PMIC VDDMX voltage regulator SSBI register address.
15:8	SLAVE_DATA_OFF_1	Data to turn off/lower VDDMX power domain.
7:0	SLAVE_DATA_ON_1	Data to turn on/increase VDDMX power domain.

0x00200008 MPM_PMIC_VDD_CFG_2

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register supports the SSBI SEQ by sending up to four SSBI commands. It programs the SSBI SEQ for the third SSBI command shutdown, and the next to next to last SSBI command upon wake-up. If SSBI_CNT_MAX = 0 or 1, it will not be used. If SSBI_CNT_MAX = 2 or 3, it will be used.

MPM_PMIC_VDD_CFG_2

Bits	Name	Description
25:24	SLAVE_ADDR_PREFIX_2	The 2-bit address prefix for slave used in SSBI 2.0.
23:16	SLAVE_ADDR_2	PMIC VDD voltage regulator SSBI register address.
15:8	SLAVE_DATA_OFF_2	Data to turn off/lower VDD power domain.
7:0	SLAVE_DATA_ON_2	Data to turn on/increase VDD power domain.

0x0020000C MPM_PMIC_VDD_CFG_3

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register supports the SSBI SEQ by sending up to four SSBI commands. When SSBI_CNT_MAX = 3, it programs the SSBI SEQ for the fourth SSBI command shutdown, and the first SSBI command upon wake-up. The values in the register will not be used if SSBI sequencer is programmed to send up to three SSBI commands only.

MPM_PMIC_VDD_CFG_3

Bits	Name	Description
25:24	SLAVE_ADDR_PREFIX_3	The 2-bit address prefix for slave used in SSBI 2.0.
23:16	SLAVE_ADDR_3	PMIC VDD voltage regulator SSBI register address.
15:8	SLAVE_DATA_OFF_3	Data to turn off/lower VDD power domain.
7:0	SLAVE_DATA_ON_3	Data to turn on/increase VDD power domain.

0x00200010 MPM_PMIC_SSBI_SEL_CFG

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0x003

This register is used to select SSBI controls among the two SSBI output lines from MPM. It also selects SSBI 2.0 versus SSBI 1.0 and SSBI_CLKs, etc.

MPM_PMIC_SSBI_SEL_CFG

Bits	Name	Description
10:9	MPM_SSBICLK_DIV	Specifies the clock divider for SSBI_FCLK. When 00: div1 (default) When 01: div2 When 10: div3 When 11: div4
8	MPM_SSBICLK_SEL	When 0: CXO (default) When 1: PXO
7	SSBI_FCLK_MODE	Which clock to be used as forwarding clock and transmit ssbi command is determined by bit 8. When 0: Legacy tcxo mode (default) When 1: Enable forwarding clock mode
6	MPM_NS_BIT	Security bit setting for MPM used in the SSBI 2.0 protocol. Default is 0 (secured). No current use on the PM8058 side for this bit.
5:4	SSBI_VERSION	When 00: SSBI 1.0 (default) When 01: SSBI 2.0 When 10 or 11: Reserved

MPM_PMIC_SSBI_SEL_CFG (cont.)

Bits	Name	Description
3	MPM_SSBI2_ENABLE	Enable MPM to send SSBI command through SSBI2 port. This SSBI2 port is not related to the SSBI 2.0 protocol. When MPM does not drive SSBI, MPM allows the SSBI from the core to pass through regardless of this setting. When 0: Disable (default) When 1: Enable default = 0
2	MPM_SSBI1_ENABLE	Enable MPM to send SSBI command through SSBI1 port. When MPM does not drive SSBI, MPM lets the SSBI from the core pass through regardless of this setting. When 0: Disable (default) When 1: Enable
1	SSBI2_FORCE_LOW	This bit becomes SSBI2_FORCE_LOW. It forces the secondary SSBI outputs low when asserted. Write '0' enables normal SSBI signals drive pads. Default value after POR is '1'. Software must must reset this bit to enable normal SSBI function. When analog_test_mode pin is asserted, then this bit has no effect on SSBI outputs.
0	SSBI1_FORCE_LOW	This bit becomes SSBI1_FORCE_LOW. It forces the primary SSBI outputs low when asserted. Write '0' enables normal SSBI signals drive pads. Default value after POR is '1'. Software must reset this bit to enable normal SSBI function. When analog_test_mode pin is asserted, then this bit has no effect on SSBI outputs.

17.10.2 MPM CXO and PXO CONTROL registers

0x00200014 MPM_CXO_CTRL

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register controls turning on/off of CXO, as well as CXOPAD_EN, which is the clock-gating at the CXO_PAD to gate the CXO output to the core.

MPM_CXO_CTRL

Bits	Name	Description
2	ALT_FUNC_SEL	When 0: Not enabled; CXO_EN chip-level IO is controlled by bit 0 in this register (default) When 1: CXO_EN chip-level IO is not controlled by the bit 0 in this register. Instead, it is controlled by the MPM input port (core_cxo_po) directly
1	CXOPAD_DIS	When 0: CXOPAD clock to the core passes through ungated (default) When 1: Gate the CXOPAD clock to the core off

MPM_CXO_CTRL (cont.)

Bits	Name	Description
0	CXO_DIS	When 0: CXO_EN = 1 (default) When 1: Disabled, CXO is shut-off (when alt_func_sel = 0)

0x00200018 MPM_PXO_OSC_CTRL

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register controls the on-chip PXO OSC. To enable the low-power sleep mode of PXO, we use the following setting. PXO_OSC_RF_BYPASS = 1; PXOPAD_CORE_DIS = PXOPAD_HV_DIS = 1; PXO_OSC_SLEEP = 1.

MPM_PXO_OSC_CTRL

Bits	Name	Description
6:4	PXO_OSC_GAIN	When 000: Default When 111: Highest gain (8 levels)
3	PXOPAD_CORE_DIS	When 0: Enabled (default). Be sure to gate the clock to core before vddcx collapse. When 1: Disabled (clock-gated). This is for PXOPAD clock gating to the chip core.This will gate the main PXO source to the chip's clock controllers.
2	PXO_OSC_SLEEP	When 0: On (default) When 1: Enable sleep mode of the PXO oscillator.
1	PXOPAD_HV_DIS	When 0: Normal operation (default) When 1: Disabled. This is the PXOPAD clock gating to the HV branch of the output clock. The MPM uses this as a refclk source.
0	PXO_OSC_RF_BYPASS	When 0: Normal operation When 1: Enable by-pass mode and use chip input directly.

17.10.3 Sleep timer registers

0x0020001C MPM_SLEEP_TIMETICK_WAKEUP_TIME

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register specifies the MPM sleep crystal timetick counter value at which to generate a wake-up interrupt to initiate the warm-up process.

MPM_SLEEP_TIMETICK_WAKEUP_TIME

Bits	Name	Description
31:0	DATA	When wake-up time is reached, the counter will continue instead of resetting.

0x00200020 MPM_SLEEP_TIMETICK_WAKEUP_TIME_LATCH

Type: Read
Clock: REFCLK_DIV2
Reset State: 0

This register is used for synchronizing the MPM_SLEEP_TIMETICK_WAKEUP_TIME data to sleep_clk.

MPM_SLEEP_TIMETICK_WAKEUP_TIME_LATCH

Bits	Name	Description
0	LATCHING	When this bit is set (1), MPM_SLEEP_TIMETICK_WAKEUP_TIME data is synchronizing to sleep_clk. The microprocessor cannot re-write to MPM_SLEEP_TIMETICK_WAKEUP_TIME register until this bit is cleared (0).

0x00200024 MPM_SLEEP_TIMETICK_COUNT_VAL

Type: Read (async)
Clock: REFCLK_DIV2
Reset State: 0

This register returns the current value of the sleep crystal timetick counter.

MPM_SLEEP_TIMETICK_COUNT_VAL

Bits	Name	Description
31:0	DATA	This counter is reset at power-on (true power-on, not resume from power collapse) and is free-running afterwards, rolling over at 2^32-1. The coarse sleep counter value is sampled using the REFCLK_DIV2. Repeat reads until 2 consecutive values match.

17.10.4 Power controller registers

0x00200028 MPM_LOW_POWER_CFG

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register is used to configure MPM to go to one of the SLEEP states, such as XOs_SD, (XOs_SHUTDOWN), VDDCX_PC_VDDMX_PC (both logic and memory rails collapsed), VDDCX_PC_VDDMX_MIN (logic collapse with memory in retention), and VDDCX_MIN_VDDMX_MIN (both logic and memory in retention). It is an asynchronous reset register. In blackbird/phantom MPM, support for split-rail memory and support of individual shutdown of either or both crystals (PXO and CXO) was added. Many bits in this register are enable/disable bits for clamp_* and freeze_* signals. These clamp_* and freeze_* signals are for isolating different power domains and interfaces during sleep. It is beneficial to understand these freeze* and clamp* MPM outputs and their function during sleep.

MPM_LOW_POWER_CFG

Bits	Name	Description
24	ENABLE_PXOPAD_HV_GATING	When at '1', enables MPM HW to gate the PXOPAD HV clock source during sleep and wake-up. When at '0', no gating can be applied by MPM HW. Note: CXO clock to the core is always un-gated, and only set by SW
23	SSBICLK2_DIS	Disables SSBI logic/symbol clock to save power when not used. When 0: Enable (default) When 1: Disable
22	SELECT_CLAMP_SSBI	Selects the de-assertion timing (early or normal) of the MPM's input clamp on the core's SSBI control inputs during warm boot. When 0: clamp_io (default) When 1: preclamp_io to give SSBI line early access during RPM BOOT
21:20	SSBI_CNT_MAX	Configures how many SSBI commands the MPM HW will send out. When 00: Send 1 SSBI command (default) When 01: Send 2 SSBI commands When 10: Sends 3 SSBI commands When 11: Sends 4 SSBI commands For split-rail memory system, normally, set it at '01'. For non-split-rail memory system, set it at '00'.
19	SMEM_EN	This bit is to enable split-rail memory support. If the chip is not split-rail memory chip, assert it at '0'. If it is a split-rail memory design, set it at '1'.

MPM_LOW_POWER_CFG (cont.)

Bits	Name	Description
18	DISABLE_FREEZE_IO_M	Only applies to freeze_io_m/freeze_io_jtag_dbg_m signals, not other freeze_io* signals. When 0: Freeze_io_m is asserted (default) When 1: Freeze_io_m is disabled
17	DISABLE_CLAMP_MEM	This enable bit applies only to clamp_mem signal, not other clamp_io* signals. When 0: Enable CLAMP_MEM (default) When 1: Disable CLAMP_MEM
16	DISABLE_HW_RESTORED	When disabled, MPM FSM will not wait for hw_restored to be asserted before exiting wake-up. When 0: Enable (default) When 1: Disable hw_restored signal
15	ENABLE_PXOPAD_CORE_GATING	When 0: Disabled. No gating can be applied by MPM HW. In this mode, only SW can control via MPM_PXO_OSC_CTRL[PXOPAD_CORE_DIS] When 1: Enables MPM HW gate the PXOPAD clock source to the chips during sleep and wake-up
14	ENABLE_CXOPAD_GATING	When 0: CXO clock input to the chip is ungated and free running When 1: Enables MPM HW to apply CXOPAD gating during sleep and wake-up.
13	ENABLE_RPM_GROUPED_INT	No longer used in this version. The grouped interrupt from RPM is a dedicated interrupt to MPM INTC, bit 3. See MPM INT MAP for details.
12	DISABLE_TRST_N	Disables mpm_trst_n assertion at warm boot and allows SW to disable the trst_n and preserve breakpoints and debug information while the core is being reset.
11	DISABLE_CORE_RESET	Disables mpm_core_reset assertion at warm boot and allows pending MPM interrupts to the core to be seen at the end of PWR_UP state. For example, a chip reset by MPM is not needed for VDD_MIN sleep mode when chip state is retained.
10	DISABLE_CLAMPS	Disables all clamp_io signals including clamp_jtag, clamp_io, preclamp_io, clamp_ssbi, (except for clamp_mem).
9	DISABLE_FREEZE	Disables all freeze_io_* signals except for freeze_io_*_m signals.
8	DEBUG_ON	Enables debugging power collapse using JTAG. When asserted (1), the processor will be stopped when emerging from the next power collapse cycle via the MPM assertion of dbg_req to the processor tap controller.
7	SW_EBI1_CTL_ENABLE	Enable software control of Freeze_io_ebi1.
6	SW_EBI1_CTL_VALUE	SW value for freeze_io_ebi1.
5	VDDMX_MIN_EN	To enable VDDMX rail minimization (memory retention).
4	VDDMX_PC_EN	To enable VDDMX rail power collapse (off). It is only valid to assert this when also asserting VDDCX_PC_EN.

MPM_LOW_POWER_CFG (cont.)

Bits	Name	Description
3	VDDCX_MIN_EN	To enable VDDCX rail minimization (retention).
2	VDDCX_PC_EN	To enable VDDCX rail power collapse (off).
1	PXO_SD_EN	When 0: MPM HW is not controlling PXO. PXO control will be configured as defined by the MPM_PXO_OSC_CTRL register settings When 1: Enable MPM HW control PXO shutdown and wake-up
0	CXO_SD_EN	When 0: MPM HW is not controlling CXO. CXO control will be configured as defined by the MPM _CXO_CTRL register settings When 1: Enable MPM HW control CXO shutdown and wake-up

0x0020002C MPM_LOW_POWER_STATUS

Type: Read (async)
Clock: REFCLK_DIV2
Reset State: 0

This is an asynchronous reset register, which provides power collapse/VDD_MIN/XOs_SD status information. It is recommended that SW check this register first to make sure MPM FSM is in IDLE state before issuing any MPM-function-related actions/commands.

MPM_LOW_POWER_STATUS

Bits	Name	Description
13:12	SSBI_SEQ_FSM	The state value for SSBI_SEQ_FSM inside MPM (for debugging purpose). When 00: Idle When 01: Tx When 11: Delay When 10: Done
11:9	SMEM_FSM_STATE	The state value for SMEM_FSM inside MPM (for debugging purpose). When 000: SMEM_IDLE When 110: SMEM_CLAMP When 111: SMEM_MEMCLK_DIS When 101: SMEM_UNCLAMP
8	VDDMX_DOWN	This bit can be checked by software as part of the warm boot process prior to writing HW_RESTORED to determine which type of boot to take: full boot if this bit is set (1) meaning the sleep event did involve VDDMX power collapse; partial boot if this bit is clear (0), meaning the sleep event did not involve VDDMX power collapse. When set (1), indicates that the chip is up from VDDMX power collapse. This bit is reset upon exiting the sleep mode (software writing to the HW_RESTORED register).

MPM_LOW_POWER_STATUS (cont.)

Bits	Name	Description
7	VDDCX_DOWN	This bit can be checked by software as part of the warm boot process prior to writing HW_RESTORED to determine which type of boot to take: full boot if this bit is set (1) meaning the sleep event did involve VDDCX power collapse, or partial boot if this bit is clear (0), meaning the sleep event did not involve VDDCX power collapse. When set (1), indicates that the chip is up from VDDCX power collapse. This bit is reset upon exiting the sleep mode (software writing to the HW_RESTORED register).
6	PXO_DOWN	When set (1), indicates that the PXO is off.
5	CXO_DOWN	When set (1), indicates that the external TCXO crystal is off.
4	POWER_DOWN	This bit has been superseded with VDDMX_DOWN and VDDCX_DOWN bits, which provide more granularity in the power down.
3:0	FSM_STATE	Power collapse FSM current state, changed to output coding. The FSM state value is sampled using the REFCLK_DIV2. Repeat reads until 2 consecutive values match. The output coding is used in FSM. This is the encoded version. When 0000: IDLE When 0001: FREEZE When 0011: PWR_OFF When 0111: CLK_OFF When 1111: CLK_ON When 1110: CLK_WU When 1100: PWR_ON When 1000: PWR_UP When 1001: BOOT When 1101: UNCLAMP When 0101: UNFREEZE

0x00200030 MPM_CXO_POWER_RAMPUP_TIME

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register specifies the required CXO warm-up and power ramp-up times in unit of 32 KHz. This power ramp-up time (Tpwr_up) is the TOTAL power ramp-up time, which includes the warm-up time for both memory and logic rails, and the SSBI TX time. For example, it takes two SSBI commands to ramp up memory rail first and logic rail second, each takes Tssbi_tx time. The memory warm up time is specified in MPM_SPLIT_MEM_DELAY_TIME as Tmem_wu, The logic warm-up time is Tlogic_wu.

SW must program Tpwr_up as: Tpwr_up >= 2 * Tssbi_tx + (2 -1) *Tmem_wu + Tlogic_wu.

MPM_CXO_POWER_RAMPUP_TIME

Bits	Name	Description
31:16	CXO_WARMUP_TIME	Specifies time needed to tcxo to warm up in sleep clock periods. Can specify up to 8192 ms ramp-up time.
15:0	POWER_RAMPUP_TIME	Specifies time needed to power to ramp up in sleep clock periods. Can specify up to 8192 ms warm-up time.

0x00200034 MPM_PXO_WARMUP_TIME

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register specifies the required PXO warm-up. It is in unit of 32 KHz clock.

MPM_PXO_WARMUP_TIME

Bits	Name	Description
15:0	PXO_WARMUP_TIME	Specifies time needed to power to ramp/warm-up in sleep clock periods. Can specify up to 8192 ms warm-up time.

0x00200038 MPM_SPLIT_MEM_DELAY_TIME

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register specifies the required PXO warm-up. It is in unit of SSBI symbol clock period (ssbiclk_div2).

MPM_SPLIT_MEM_DELAY_TIME

Bits	Name	Description
31:16	RAMP_UP_DELAY_TIME	Specifies the delay time needed between the two SSBI commands during ramping up, first one for powering up memory rail (VDDMX), and the second for powering up logic rail. It is in ssbi_clk_div2 periods. For 20 MHz ssbi clk, It can specify up to 6.5 ms warm-up time
15:0	RAMP_DOWN_DELAY_TIME	Specifies the delay time needed between the two SSBI commands during ramping down, first one for shutting down/lower logic rail (VDDCX) and the second for shutting down/lower memory rail (VDDMX). It is given in ssbi_clk_div2 periods. For 20 MHz ssbi clk, it can specify up to 6.5 ms warm-up time.

0x0020003C MPM_HARDWARE_RESTORED

Type: Write
Clock: REFCLK_DIV2
Reset State: Undefined

If the disable_hardware_restored bit in the MPM_POWER_COLLAPSE_CONFIG register is set at ’1’, this command will be bypassed by MPM FSM and it will not wait for this SW command to complete the power-up process.

MPM_HARDWARE_RESTORED

Bits	Name	Description
0	DATA	Set (1) when resumed power-up (state restoration for warm boot) is complete.

17.10.5 Interrupt controller registers

Each chip has its own MPM power up interrupt source mapping. However the bottom four interrupts are treated differently since they have fixed and known uses common to all chips, as described in Table 2-2.

Table 17-14 MPM_INT mapping

Bits	MPM INT source	MPM INT source comments
63:4	<chip dependent>	
3	grouped_int	From RPM INTC grouped IRQ (i.e., clk_on_req), and level-shifted to the always-on domain.
2	spare_int	A spared interrupt source, used to be codec_hssd_irq_n.
1	penirq_n_debounced	From penirq_n input, after debounced.
0	mpm_wakeup_int	Internal MPM timetick interrupt. See MPM_SLEEP_TIMETICK_WAKEUP_TIME.

0x00200040 MPM_INT_CLEAR_1

Type: Write
Clock: REFCLK_DIV2
Reset State: Undefined

This register is used to clear the status bits of the various interrupts. In previous MPM, it was necessary to have only up to 32 bit interrupts. But now we have both MPM_INT_CLEAR_1 and MPM_INT_CLEAR_2, supporting up to 64 interrupts.

MPM_INT_CLEAR_1

Bits	Name	Description
31:0	INT_CLEAR_1	Set (1) to clear status of interrupt.

0x00200044 MPM_INT_CLEAR_2

Type: Write
Clock: REFCLK_DIV2
Reset State: Undefined

The expanded second set to support up to 64 interrupts.

MPM_INT_CLEAR_2

Bits	Name	Description
31:0	INT_CLEAR_2	Set (1) to clear status of interrupt.

0x00200048 MPM_INT_EN_1

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register is used to enable the various interrupts (first set).

MPM_INT_EN_1

Bits	Name	Description
31:0	INT_EN_1	Set (1) to enable interrupt.

0x0020004C MPM_INT_EN_2

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register is used to enable the various interrupts (second set).

MPM_INT_EN_2

Bits	Name	Description
31:0	INT_EN_2	Set (1) to enable interrupt.

0x00200050 MPM_INT_POLARITY_1

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register is to set the polarity of the interrupts.

MPM_INT_POLARITY_1

Bits	Name	Description
31:0	INT_POLARITY_1	Sets the polarity value of interrupt. When 0: Low When 1: High

0x00200054 MPM_INT_POLARITY_2

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register sets the polarity of the interrupts (second set).

MPM_INT_POLARITY_2

Bits	Name	Description
31:0	INT_POLARITY_2	Sets the polarity value of interrupt. When 0: Low When 1: High

0x00200058 MPM_DETECT_CTL_1

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register controls the interrupt triggering mechanism and must be initialized before an interrupt is enabled. Clear (0) for level trigger and set (1) for edge trigger.

MPM_DETECT_CTL_1

Bits	Name	Description
31:0	DETECT_CTL_1	Controls the interrupt triggering mechanism. Clear (0) for level trigger and set (1) for edge trigger.

0x0020005C MPM_DETECT_CTL_2

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register controls the interrupt triggering mechanism and must be initialized before an interrupt is enabled. Clear (0) for level trigger and set (1) for edge trigger.

MPM_DETECT_CTL_2

Bits	Name	Description
31:0	DETECT_CTL_2	Controls the interrupt triggering mechanism. Clear (0) for level trigger and set (1) for edge trigger.

0x00200060 MPM_INT_STATUS_1

Type: Read
Clock: REFCLK_DIV2
Reset State: Undefined

This register provides the status bits for the interrupts. This bit is sticky. This means that once a bit is set here, the source of the interrupt request must be reset, and the corresponding bit in the clear register must be set in order to reset the status bit (in the said order).

MPM_INT_STATUS_1

Bits	Name	Description
31:0	INT_STATUS_1	Status bit value for interrupt.

0x00200064 MPM_INT_STATUS_2

Type: Read
Clock: REFCLK_DIV2
Reset State: Undefined

This register provides the status bits for the interrupts. This bit is sticky. This means that once a bit is set here, the source of the interrupt request must be reset, and the corresponding bit in the clear register must be set in order to reset the status bit (in the said order).

MPM_INT_STATUS_2

Bits	Name	Description
31:0	INT_STATUS_2	Status bit value for interrupt.

0x00200068 MPM_INT_WKUP_CLK_SEL_1

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register specifies if any additional clock source (other than RPM/MPM reference clock (REFCLK)) must bring up for that specific triggered interrupt. (0) means no additional clock must be brought up for that particular interrupt. (1) means the other clock than REFCLK must be brought up in parallel with REFCLK. Therefore, it is possible to warm-up two clocks in parallel to save system overhead.

MPM_INT_WKUP_CLK_SEL_1

Bits	Name	Description
31:0	MPM_INT_WKUP_CLK_SEL_1	Specify the wake-up clock associated with each interrupt.

0x0020006C MPM_INT_WKUP_CLK_SEL_2

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register specifies if any additional clock source (other than RPM/MPM reference clock (REFCLK)) must bring up for that specific triggered interrupt. (0) means no additional clock must be brought up for that particular interrupt. (1) means the other clock than REFCLK must be brought up in parallel with REFCLK. Therefore, it is possible to warm-up two clocks in parallel to save system overhead. This is the second set.

MPM_INT_WKUP_CLK_SEL_2

Bits	Name	Description
31:0	MPM_INT_WKUP_CLK_SEL_2	Specify the wake-up clock associated with each interrupt.

0x00200070 MPM_CLOCK_SEL

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This is to select MPM REFCLK source, either CXO or PXO. Default is CXO. The divided-2 of refclk is used to clock the crif interface to access the MPM registers. MPM_REFCLK uses the same clock source.

MPM_CLOCK_SEL

Bits	Name	Description
0	MPM_REFCLK_SEL	MPM_REFCLK should be using the same clock source, either PXO or CXO. The crif interface inside MPM uses this REFCLK divided by 2. When 0: CXO (default) When 1: PXO

17.10.6 Debug registers

0x00200074 MPM_DEBUG_BUS_EN

Type: Read/Write
Clock: REFCLK_DIV2
Both bits cannot be set to (1) at the same time. The default is (0) for both bits.

MPM_DEBUG_BUS_EN

Bits	Name	Description
1	DEBUG_EN_1	dbg_rd_bus_1 <= altclk_needs_on & -- [31] pwr_up_expire & -- [30] timer_expire & -- [29] clamp_ssbi_loc & -- [28] switch_off & -- [27] pen_irq_n_debounced & -- [26] warm_boot_ebi2_en_local & -- [25] warm_boot_ebi1_en_local & -- [24] refclk_en & -- [23] any_int_sync & -- [22] refclk_div2_halt & -- [21] timetick_int & --[20] '0' & --[19] refclk_div2_dbg & --[18] cxopad_en_hw & -- [17] cxopad_en_pipe_1 & --[16] pxopad_core_en_comb & --[15] ssbiclk_div2_halt & -- [14] mpm_drives_ssbi & -- [13] ssbiclk_div2_dbg & -- [12] all_ssbi_done_sync & -- [11] mpm_ssbi_fclk_po & -- [10] mpm_ssbi_fclk_oe & -- [9] ssbi1_oe_mux_ana & -- [8] ssbi1_po_mux_ana & -- [7] ssbi2_oe_mux_ana & -- [6] ssbi2_po_mux_ana & -- [5] sw_done & -- [4] pxo_osc_rf_bypass_loc & -- [3] grouped_int & -- [2] pxopad_hv_en_comb & -- [1] pxo_osc_sleep_loc -- [0]

MPM_DEBUG_BUS_EN (cont.)

Bits	Name	Description
0	DEBUG_EN	dbg_rd_bus <= mpm_core_reset & -- [31] wdog_expired_async_hv & -- [30] mpm_sw_reset_async_hv & -- [29] msm_req_hv & -- [28] mpm_msm_ack & -- [27] mpm_dbg_req & -- [26] dbg_ack_hv & -- [25] mpm_marm_trst_n &--[24] mpm_int_hv & -- [23] preclamp_io_raw & -- [22] freeze_io_t & -- [21] freeze_io_ebi1_t & -- [20] freeze_io_jtag_dbg_t & -- [19] clamp_io_n & -- [18] clamp_mem_t & -- [17] '0' & -- [16] freeze_io_m_t & -- [15] show_int_dbg & -- [14] low_power_status_dbg [13:0]

17.10.7 JTAG state registers

0x00200078 MPM_JTAG_STATE

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register is used to store the JTAG efuse shadow register state after a full (cold) boot, and used to restore the shadow registered state after a partial (warm) boot.

MPM_JTAG_STATE

Bits	Name	Description
31:0	STATE	This register is one-time writable after a resin_n reset or a wdog_expired reset.

0x0020007C MPM_ENABLE_JTAG

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This is a write-once-only register used to enable JTAG debugging immediately after resin.

MPM_ENABLE_JTAG

Bits	Name	Description
0	ENABLE	This is a write-once-only register. Writing a '1' will enable the ARM JTAG.

17.10.8 Touch screen debounce registers

0x00200080 MPM_PEN_DEBOUNCE_CTL

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register is used to control the pen debounce logic.

MPM_PEN_DEBOUNCE_CTL

Bits	Name	Description
3	ENABLE	Controls the pen down debounce logic (logic is bypassed when disabled). This bit should be set (1) before going to the power-down mode. This bit should be cleared (0) upon a wake-up interrupt due to pen-touch or before enabling the TSSC in the master mode. When 0: Disabled When 1: Enabled
2:0	TIME	Determines the debounce time used by the debounce pen-down interrupt. When 000: 400 ms When 001: 800 ms When 010: 1.2 ms When 011: 1.6 ms When 100: 2.0 ms When 101: 3.0 ms When 110: 4.0 ms When 111: 6.0 ms

17.10.9 Control for EBI bus freeze during warm boot

0x00200084 MPM_WARM_BOOT_CFG

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register controls either freezing or not freezing EBI1/2 buses during warm boot, so that warm boot can have access to the unfrozen EBI buses.

NOTE This register is only implemented in DOrA65; it is not available for Phoenix2 because Phoenix2 is hardwired to enable EBI1 and disable EBI2 during warm boot.

MPM_WARM_BOOT_CFG

Bits	Name	Description
1	ENABLE_EBI2	When 0: Freeze EBI2 bus during warm boot When 1: Unfreeze EBI2 bus during warm boot
0	ENABLE_EBI1	When 0: Freeze EBI1 bus during warm boot When 1: Unfreeze EBI1 bus during warm boot

17.10.10 Regfile registers

0x00200088+4*n MPM_REGn_FILE, n=[0..8]

Type: Read/Write
Clock: REFCLK_DIV2
Reset State: 0

This register provides software configuration data that is needed for a warm boot-up.

MPM_REGn_FILE

Bits	Name	Description
31:0	DATA	Software configuration data needed for warm boot-up.

17.11 PA1 SSBI2 Registers (0x00300000 PA1_SSBI2_CFG_BASE)

This section contains SSBI2 configuration registers.

0x00300000 PA1_SSBI2_CTL

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0x83005

Specifies various generic SSBI2 control information. Bits 19:13 comprising of fields SSBI2_DATA_PDEN, FCLK_MODE, FCLK_SW_OVERRIDE and NUM_FCLK are either asynchronously reset or set. This is because they control the signals going directly to a pad. Remaining bits 12:0 are synchronously reset or set.

The delay between the master and the slave, by design, should be budgeted according to the ssbi2 timing specification. The reset default setting on the SEL_RD_DATA and SSBI2_DATA_DEL fields is expected to typically work out of the box for most PMIC to APQ, SURF, FFA routing in normal and forward clocking mode, provided the master and slave close timing based on the ssbi2 timing specification.

PA1_SSBI2_CTL

Bits	Name	Description
19:16	NUM_FCLK	Indicates a programmable number of active forwarding clock cycles following a SSBI2 'transaction done' for a corresponding SSBI2 request. Unless there is a new SSBI2 transaction request, the forwarding clock is shut off after toggling NUM_FCLK cycles at the PMIC SSBI2 clock frequency. The suggested setting (default value) for APQ8064 is 8 clock cycles.
15	FCLK_SW_OVERRIDE	This is a software override bit to control the CGC for forwarding clock. Set this bit to 1 to allow the SSBI2 clock to continue as a forwarding clock through the CGC (provided FLCK_MODE = 1). This override bit is provided to allow continuous toggling clock to SSBI2 slave irrespective of how the HW logic controls the CGC. Set this bit to 0 to enable pure HW control on the forwarding clock CGC.
14	FCLK_MODE	Set this bit to 1 to activate forwarding clock mode. When this bit is 0, the FCLK_SW_OVERRIDE field has no meaning. Out of reset, the mode is set to 0 indicating that the SSBI2 slave does not work off the forwarding clock. When FCLK_MODE = 0; no forwarding clock. When FCLK_MODE = 1; FCLK_SW_OVERRIDE = 1; forwarding clock always toggles. When FCLK_MODE = 1; FCLK_SW_OVERRIDE = 0; forwarding clock is controlled by HW logic.
13	SSBI2_DATA_PDEN	Pulldown enable for SSBI2_DATA pad.

PA1_SSBI2_CTL (cont.)

Bits	Name	Description
12	PA_CGC_CTRL	This is to control the SSBI2 clock going to this PMIC arbiter. Set this bit to 1 when you want to allow the clock to flow through the CGC. Set this bit to 0 to shut off clock to PMIC arbiter. Out of reset, this bit is set to 1.
11	RESERVED_1	Reserved bit.
10:8	SSBI2_ADDR_WIDTH	Specifies what is the addressing mode in SSBI2 mode. This field is only applicable in SSBI2 mode. 0x0: 8-bit addressing mode 0x1: 9-bit addressing mode 0x2: 10-bit addressing mode and so on
7	SSBI2_MODE	Set this bit to 1 when SW wants to switch to new SSBI2 mode. Set this is 0 when in old SSBI mode. 0x0: SSBI 1.0 Mode 0x1: SSBI 2.0 Mode
6	RESERVED_2	Reserved bit.
5:4	SEL_RD_DATA	Specifies which RD_DATA value to select out of four possible combinations. This signal allows the returned data from the slave to be captured inside the master, 1, 2, or 3 symbols late in order to accommodate a large range of routing delay. Based on this field, the entire read transaction length will increase by SEL_RD_DATA number of symbols.
3:2	SSBI2_DATA_DEL	Specifies the number of 1/2 clock periods, SSBI2_DATA will be delayed before sampling inside.
1:0	IDLE_SYMS	The master will ensure there are at least this number of idle symbol periods in between the accesses. The idle time is inserted at the end of the read or write transaction. This supported values are always between 1 - 3.

0x00300004 PA1_SSBI2_INT_ENABLE

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0

Provides control on whether the TRANSACTION-DONE interrupts can be generated or not (per SW master).

PA1_SSBI2_INT_ENABLE

Bits	Name	Description
9:0	ENABLE_SSBI2_INT	SSBI2 transaction done interrupts for each SW master are generated only when the corresponding bits are set. The following list provides the interrupt mapping information. 0x9: Unused: SW to set to 0_1 0x8: Riva A9 0x7: Unused: SW to set to 0_2 0x6: KPSS CPU1 non-secure 0x5: KPSS CPU1 secure 0x4: GSS A5 0x3: LPASS Q6 0x2: KPSS CPU0 non-secure 0x1: KPSS CPU0 secure 0x0: RPM

0x00300008 PA1_SSBI2_PRIORITIES

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0

Specifies the priorities for SSBI2 arbiter ports. The SSBI2 block supports up to maximum of 8 ports for arbitration. Each port has 3 bits to denote its priority. The bits are synchronously reset.

CAUTION Since the reset state value of SSBI2_PRIORITIES is 0, only SW requests (hard-coded to port # 0) can get through. SW has to program this register to allow hardware requests through the SSBI2 arbiter.

NOTE For APQ8064, 6 arbiter ports are used (5 ports for hardware PVC requests and 1 port for software command request). This register will scale based on the number of PVC ports. The port mapping for the HW PVC ports in mentioned in the SSBI2_PVC_CTL register.

PA1_SSBI2_PRIORITIES

Bits	Name	Description
17:15	PRIORITY5	Specifies the port number of host, with a priority that is 1 less then PRIORITY4.
14:12	PRIORITY4	Specifies the port number of host, with a priority that is 1 less then PRIORITY3.
11:9	PRIORITY3	Specifies the port number of host, with a priority that is 1 less then PRIORITY2.

PA1_SSBI2_PRIORITIES (cont.)

Bits	Name	Description
8:6	PRIORITY2	Specifies the port number of host, with a priority that is 1 less then PRIORITY1.
5:3	PRIORITY1	Specifies the port number of host, with a priority that is 1 less then PRIORITY0.
2:0	PRIORITY0	Specifies the port number of the highest priority host.

0x0030000C PA1_SSBI2_BANKS_2_3_CTL

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0xFFFFFFFF

This register specifies whether an access is allowed to banks (pages) 2 and 3 of PM8921. The access control to the banks (pages) 2 and 3 of PM8921 is set per VMID. Bit 0 corresponds to access control for VMID 0 and bit 31 corresponds to access control for VMID 31.

NOTE This register has no meaning when used in conjunction with control for other PMICs such as PM8018.

PA1_SSBI2_BANKS_2_3_CTL

Bits	Name	Description
31:0	ACCESS_CONTROL	Set each of the 32 bits to 1 if the master corresponding to that VMID wishes to initiate SW requests to banks (pages) 2 and 3 of PM8921. For other PMICs, this value has no meaning and is ignored.

0x00300010 PA1_SSBI2_ILLEGAL_STATUS

Type: Read
Clock: AHB_BUS_CLOCK
Reset State: 0

Returns status information of the software master that tried to access a SSBI2 command micro register, and failed security through the VIT table.

PA1_SSBI2_ILLEGAL_STATUS

Bits	Name	Description
5:1	ILLEGAL_VMID_4_0	Indicates the VMID of the master that performed the most recent illegal access. The value in this field is only meaningful when the ILLEGAL_ACCESS bit is set. On software reads, the value is retained unless another illegal access with a different VMID happens. In that case, this field will have the VMID corresponding to the most recent illegal master.
0	ILLEGAL_ACCESS	When set (1) indicates an illegal access. An illegal access is defined as an access that does not find a matching VMID in the SSBI2_VITn registers. This bit is cleared on a software read provided there is no other illegal access in the same clock cycle that a software read happens.

0x00300014 PA1_SSBI2_TEST_BUS_CTL

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0x0

This register is used for test bus (32 bits) control. The following is the bit mapping for the 32 bits. Bits 15:0 correspond to PMIC arbiter # 1 signals and bits 31:16 are the same as 15:0, but for PMIC arbiter # 2.

In the current form, only enabling/disabling the test bus is supported. In the future, this register will be expanded to include several test modes.

Table 17-15 PMIC arbiter signals

15	ssbi2_master_req	Request from SSBI arbiter to master.
14	ssbi2_master_read	Access type information from SSBI2 arbiter to master.
13	ssbi2_master_ack	Ack from SSBI2 master to arbiter.
12	ssbi2_sw_cmd_done	SW cmd done flag from SSBI2 arbiter to SMD micro.
11	ssbi2_sw_cmd_ack	SW cmd ack from SSBI2 arbiter to CMD micro.
10:8	winner	Arbitration winner.
7	pvc_intf_busy	Indicates that PVC interface is busy.
6	xpu_slave_summary_sel	Indicates xPU security permission for client access.
5	client_valid	xPU signal indicating that access to client region is valid.
4	client_wr	xPU signal indicating the access type to client region.
3	ssbi2_fclk_en_loc	Local signal that controls the CGC for FCLK.
2	fclk_en_hw	Hardware enable to logic that controls the CGC for FCLK.
1	ssbi2_cmd_micro_crif_error	CRIF error from SSBI2 CMD micro.
0	ssbi2_cfg_micro_crif_error	CRIF error from SSBI2 CFG micro.

PA1_SSBI2_TEST_BUS_CTL

Bits	Name	Description
0	TEST_BUS_EN	Set this bit to enable the 32-bit test bus. When reset, the test bus drives all zeros.

0x00300020+4*n PA1_SSBI2_VITn, n=[0..9]

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0

This is the VMID index table used for enabling concurrent SSBI2 SW requests among multiple SW masters. Secure entities are expected to assign a VMID for the SW master corresponding to an index. The SSBI2_VIT0 has the VMID associated with index 0, SSBI2_VIT1 has the VMID associated with index 1 and so on.

CAUTION By default, only the SW master with a VMID of '0' has access to registers in SSBI2 command micro space. SROT/RPM has to populate this table before valid SW masters can initiate SSBI2 SW transactions.

NOTE APQ8064 will have 10 SW masters. The maximum range of n will be 0-31 corresponding to a maximum of 32 VMID masters. Also, the indices n(0-9) should match the interrupt index mapping to processor given in SSBI2_INT_ENABLE.

PA1_SSBI2_VITn

Bits	Name	Description
4:0	VMID	VMID corresponding to index n.

0x003000A0 PA1_SSBI2_PVC_CTL

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0

This register provides the global enable/disable for the PVC interface module, per PVC port enable/disable as well as captures PVC interface busy status.

NOTE In APQ8064, there are 5 PVC ports (to connect to KPSS SAW CPU0 & CPU1,LPASS SAW, Q6SW & Q6FW). This register will scale in size based on the number of PVC ports (set as a RTL GENERIC).

WARNING In a PMIC arbiter wrapper system having more than 1 PMIC arbiter module; if a PVC port(x) is enabled in one of the PMIC arbiters, the corresponding PVC_port(x) in all

the other PMIC arbiters shall be disabled. If multiple PVC_port(x)'s enabled simultaneously, the hardware does not guarantee correct operation.

PA1_SSBI2_PVC_CTL

Bits	Name	Description
8	PVC_INTF_BUSY	This is a status bit. When set (1) indicates that the PVC interface module is busy (meaning there is at least one PVC transaction being serviced). Busy line goes high when PVC interface detects a new request on one of the PVC ports and stays high until it samples a done from SSBI2 arbiter. Writes to this bit will not have any effect and will be ignored.
7:6	RESERVED	Reserved bits.
5	PVC_PORT5_EN	Set this bit to 1 to enable PVC port 5. PVC port 5 maps to Q6FW
4	PVC_PORT4_EN	Set this bit to 1 to enable PVC port 4. PVC port 4 maps to Q6SW
3	PVC_PORT3_EN	Set this bit to 1 to enable PVC port 3. PVC port 3 maps to SMPSS CPU1 SAW.
2	PVC_PORT2_EN	Set this bit to 1 to enable PVC port 2. PVC port 2 maps to SMPSS CPU 0 SAW.
1	PVC_PORT1_EN	Set this bit to 1 to enable PVC port 1. PVC port 1 maps to LPASS Q6 SAW.
0	PVC_INTF_EN	Set this bit to 1 to enable PVC interface module.

0x003000A4+4*n PA1_SSBI2_PVC_TABLEn, n=[0..19]

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0

This set of registers indicates the full PVC table corresponding to all the PVC ports. There are 4 entries per PVC port and there are 5 PVC ports in APQ8064; hence the 20 entries. Each entry is 15-bit address to the SSBI2 slave registers. This indirect addressing from the PVC ports to the SSBI2 slave registers provides a way to enforce security on hardware SSBI2 requests.

NOTE Though this current document shows 20 entries, the number of entries should scale based on the GENERIC settings for the number of PVC ports and the address index width. Also though 15-bit addresses are supported, 10-bit addressing is all that is expected for current PMICs.

PA1_SSBI2_PVC_TABLEn

Bits	Name	Description
14:0	ADDR	15-bit address of the SSBI2 slave registers.

17.12 PA1 XPU Registers (0x00400000 PA1_XPU_BASE)

This section contains PMIC Arbiter 1 XPU registers.

Treatment of invalid accesses

XPU registers occupy the first 8 Kb of the total 1 MB XPU configuration space. Any accesses outside the 8 Kb space will be aliased on 8-Kb boundaries over the complete 1 MB decode region.

0x00400F80 PA1_RPU_CR

Type: Read/write
Clock: XPU_CLK
Reset State: 0x00000000

RPU configuration register. This register includes fields governing various RPU behaviors.

PA1_RPU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved.
3	DCDEE	Decode error enable. Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0x0: Do not record. Decode errors do not set RPU_ESR. RPU_EAR and RPU_ESYNR0 not updated. 0x1: Record. Decode errors set RPU_ESR. RPU_EAR and RPU_ESYNR0 updated with address and syndrome of error.
2	RPUEIE	RPU error interrupt enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the RPU. Interrupt output is asserted if RPU_CR[RPUEIE] = 1 and any bit is set in RPU_ESR.
1	RPUERE	RPU error report enable. Both client and configuration port errors are recorded in RPU_ESR, independent of the value of RPU_CR[RPUERE]. 0x0: Causes the RPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. 0x1: Enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective RPU port. Errors from either port are terminated by the RPU as RAZ/WI.
0	RPUE	RPU enable. Governs whether RPU checking occurs for both the client port and the configuration port. 0x0: Reset 0x1: Set once SROT configures RPU and the MID to VMID mapping tables

0x00400F84 PA1_RPU_EAR

Type: Read/write
Clock: XPU_CLK
Reset State: 0x00000000

Error address register. This register captures the address upon errors detected by the RPU, for both the client port and the configuration port.

PA1_RPU_EAR

Bits	Name	Description
31:0	PA	Physical address of the errant request.

0x00400F88 PA1_RPU_ESR

Type: Read/write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error status register. This register captures the status upon errors detected by the RPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old. The presence of an asserted value on any bit in this register is what prompts the assertion of the RPU's interrupt output (when enabled by RPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the RPU_ESYNRn registers, which are merely the 'syndrome' of an error indicated by RPU_ESR.

PA1_RPU_ESR

Bits	Name	Description
31	MULTI	Multi-error. Indicates additional error occurred while RPU_ESR[CFG, CLIENT] still non-zero. RPU_EAR and RPU_ESYNRn registers (and RPU_ESR itself, except for the MULTI bit) "lock" upon first error, RPU_ESR must be cleared to unlock. Status, address and syndrome of errors that occur while RPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved.
1	CLIENT	Client port error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration port error. Indicates error (access control or decode) associated with a configuration port request.

0x00400F8C PA1_RPU_ESRRESTORE

Type: Read/write
Clock: XPU_CLK
Reset State: 0x00000000

Error restore register. This is simply an aliased address for RPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

PA1_RPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error. Indicates additional error occurred while RPU_ESR[CFG, CLIENT] still non-zero. RPU_EAR and RPU_ESYNRn registers (and RPU_ESR itself, except for the MULTI bit) "lock" upon first error, RPU_ESR must be cleared to unlock. Status, address and syndrome of errors that occur while RPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved.
1	CLIENT	Client port error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration port error. Indicates error (access control or decode) associated with a configuration port request.

0x00400F90 PA1_RPU_ESYNR0

Type: Read/write
Clock: XPU_CLK
Reset State: 0x00000000

Error syndrome register. Captures the syndrome upon errors detected by the RPU, for both the client port and the configuration port.

PA1_RPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved.
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x00400F94 PA1_RPU_ESYNR1

Type: Read/write
Clock: XPU_CLK
Reset State: 0x00000000

Error syndrome register. Captures the syndrome upon errors detected by the RPU, for both the client port and the configuration port.

PA1_RPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved.
24	AFULL	AFULL field of errant request.
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request.
21:20	ALOCK	ALOCK field of errant request.
19	RESERVED19	Reserved.
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x00400FF4 PA1_RPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision register. This register provides major/minor revision codes for the implementation.

PA1_RPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved.
7:4	MAJOR	Major variant field.
3:0	MINOR	Minor variant field.

0x00400FF8 PA1_RPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x000009FF

RPU ID register. Read-only register that defines various configuration attributes of the RPU instance.

PA1_RPU_IDR

Bits	Name	Description
31:21	RESERVED31_21	Reserved.
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved.
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU) 0x0: RPU 0x1: APU 0x2: MPU 0x3: Reserved
11	PT	Permission type. 0x0: Indicates full access vs. no access type. Only RPU_RGn_ACR registers needed, and they specify which VMID (s have full access other VMIDs have no access.) 0x1: Indicates read/write access type vs. read-only access type. For multi-VMID, separate RPU_RGn_RACR and RPU_RGn_WACR registers govern read vs. write access. For single VMID, RPU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields.

PA1_RPU_IDR (cont.)

Bits	Name	Description
10	MV	Multi-VMID. 0x0: Indicates single VMID type access control. RPU_RGn_ACR registers indicate single 5-bit "owner" VMID field for governing access. 0x1: Indicates multi-VMD type access control. RPU_RGn_xACR registers include separate bit per VMID (32 bits for governing access.)
9:8	RESERVED9_8	Reserved.
7:0	NRG	Number of resource groups. Indicates number of resource groups (minus 1) supported by the RPU. Value can range between 0 and 255 (1-256 resource groups).

0x00400FFC PA1_RPU_RPU_ACR

Type: Read/write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

RPU access control register. This register includes a bit per VMID governing configuration port access to the registers of the RPU (including the RPU_RPU_ACR itself).

PA1_RPU_RPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the RPU's 4-Kb address region (including the RPU_RPU_ACR itself). For single VMID type RPUs (RPU_IDR[MV] = 0) the RPU_RPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

0x00401000+4*n PA1_RPU_RGn_RACR, n=[0..511]

Type: Read/write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) access control registers. This description is for the case when RPU_IDR[MV, PT] = 01, i.e., a single VMID, read/write access vs. read-only access permission type RPU. These registers include 2 separate 5 bit 'owner' VMID fields.

PA1_RPU_RGn_RACR

Bits	Name	Description
31:26	RESERVED31_26	Reserved.
25	ROGE	Read-only global enable. Opens up read-only access for this resource group to all VMIDs if: ROGE | (ROE & (VMID = ROVMID)) | RPU_RPU_ACR[VMID] = 1
24	ROE	Read-only enable. This is a valid bit for the ROVMID field.
23:21	RESERVED23_21	Reserved.
20:16	ROVMID	Read-only VMID. Specifies "owner" VMID with read-only access to the registers in the associated resource group.
15:10	RESERVED15_10	Reserved.
9	RWGE	Read/write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | RPU_RPU_ACR[VMID] = 1
8	RWE	Read/write enable. This is a valid bit for the RWVMID field.
7:5	RESERVED7_5	Reserved.
4:0	RWVMID	Read/write VMID. Specifies owner VMID with full read/write access to the registers in the associated resource group.

17.13 PA1 SSBI2 Registers (0x00500000 PA1_SSBI2_CMD_BASE)

This section lists the ARM registers associated with the SSBI2 command micro space.

Following are all the SSBI2 command micro software registers. These registers are open to access by all bus masters that have access to the slave port.

Table 17-16 lists all the SSBI2 command registers along with the type of software access.

Table 17-16 Summary of SW registers

Address offset	Register	SW access type
0x0	SSBI2_CMD	Command write
0x4	SSBI2_RD_STATUS	Read

Treatment of invalid accesses

An invalid access is any read or write access to addresses that do not have a valid SSBI2 command SW register associated with that particular address in the aliased 32-KB regions within the 1-MB space. Invalid write accesses are ignored and invalid read accesses return all zeroes. An invalid access also triggers a CRIF error which is captured in the test bus.

0x00500000 PA1_SSBI2_CMD

Type: Write (cmd)
Clock: AHB_BUS_CLOCK
Reset State: 0

The SW masters write to this register to initiate either a read or a write SSBI2 transaction. Through this register, the SW can address up to 32 Kb of SSBI2 slave register space. However, the PMICs only house a maximum of 1024 registers and hence the values on the most significant 5-bits of the REG_ADDR_14_8 field are ignored. The REG_DATA field is only applicable for write transaction and is ignored for reads. The read data returned back from the SSBI2 slave is directed to the SSBI2_RD_STATUS register. Bit 23 is left as a reserved bit to enable slave address to grow to 16-bits in the future.

PA1_SSBI2_CMD

Bits	Name	Description
24	RDWRN	Denotes whether the command to perform is a register write (0) or read (1).
23	RESERVED	Reserved bit.
22:16	REG_ADDR_14_8	Specifies the upper 7 bits, 14:8, of SSBI slave register address.
15:8	REG_ADDR_7_0	Lower 8 bits, 7:0, of SSBI slave register address.
7:0	REG_DATA	Write data for a slave register.

0x00500004 PA1_SSBI2_RD_STATUS

Type: Read
Clock: AHB_BUS_CLOCK
Reset State: 0

This register provides the read data as well as the status of the transaction. This register also returns back information associated with the transaction such as the SSBI2 slave register address and the transaction access type. SW is expected to poll TRANS_DONE and TRANS_DENIED until either of these bits are set to 1.

- TRANS_DONE = 0, TRANS_DENIED = 1; indicates to SW that the current transaction was rejected because the master did not have permissions to access the corresponding SSBI2 slave register.
- TRANS_DONE = 1, TRANS_DENIED = 0; indicates to SW that the current transaction was completed successfully. For writes, it means that the write data was sent out on the SSBI wire and for reads, it means that the read data is returned back and is now in SSBI2_RD_STATUS[REG_DATA]. At this point, the SW is said to have completed one transaction.
- Both TRANS_DONE and TRANS_DENIED is either 0 or 1; does not happen and is not a valid combination.

PA1_SSBI2_RD_STATUS

Bits	Name	Description
27	TRANS_DONE	When set (1), indicates that the SSBI2 has completed the transaction. If this was a write request, the write has completed. If this was a read request, the read data has returned back. This bit is not set for security violations via xPU or PM8921 banks (pages) 2 & 3 access control. NOTE This bit is cleared on read.
26	TRANS_DENIED	When set (1), indicates that a SSBI2 transaction was denied because the master did not have access to the particular SSBI2 slave SW register to where the access was intended. For PM88921 banks (pages) 0 and 1, this bit is set based on xPU blocking the transaction. For PM8921 banks (pages) 2 and 3, this bit is set based on the settings in SSBI2_BANKS_2_3_CTL register that blocked the transaction. NOTE This bit is cleared on read.
25	TRANS_PROG	When set (1), indicates that a SSBI2 transaction is in progress. This signal will be set for the duration from REQ assertion until DONE assertion.
24	RDWRN	Returns the access type of transaction. A value of 1 implies a read transaction and a value of 0 implies a write transaction.
23	RESERVED	Reserved bit.
22:8	REG_ADDR	Returns the address to which the SSBI2 transaction was performed.

PA1_SSBI2_RD_STATUS (cont.)

Bits	Name	Description
7:0	REG_DATA	Returned read register data. NOTE: The read data is not cleared on reads, however will return all zeros for a SW master whose transaction was denied or was an illegal SW master.

17.14 PA2 SSBI2 Registers (0x00600000 PA2_SSBI2_CFG_BASE)

This section lists the ARM registers associated with the SSBI2 configuration micro space.

Following are all the SSBI2 configuration micro software registers. These registers shall be accessed only by a secure-entity (RPM/sROT).

Table 17-17 lists all the SSBI2 configuration registers, along with the type of software access.

Table 17-17 Summary of SW registers

Address offset	Register	SW access type
0x0	SSBI2_CTL	Pseudo-static R/W
0x4	SSBI2_INT_ENABLE	Pseudo-static R/W
0x8	SSBI2_PRIORITIES	Pseudo-static R/W
0xC	SSBI2_BANKS_2_3_CTL	Pseudo-static R/W
0x10	SSBI2_ILLEGAL_STATUS	Read
0x14	SSBI2_TEST_BUS_CTL	R/W
0x20+4n	SSBI2_VITn, n=[0... 9]	Pseudo-static R/W
0xA0	SSBI2_PVC_CTL	Pseudo-static R/W
0xA4+4n	SSBI2_PVC_TABLEn, n=[0...11]	Pseudo-static R/W

Treatment of invalid accesses

An invalid access is any read or write access to addresses that do not have a valid SSBI2 configuration SW register associated with that particular address in the aliased 256 KB regions within the 1 MB space. Invalid write accesses are ignored and invalid read accesses return all zeros. An invalid access also triggers a CRIF error which is captured in the test bus.

Chip-specific configurations

Depending on which chipset the PMIC arbiter wrapper is used in, certain SW registers may scale in size and width. Table 17-18 lists the SW registers and the APQ8064 specific settings.

Table 17-18 SW register configurations in APQ8064

Register	APQ8064
SSBI2_INT_ENABLE	10 enables
SSBI2_PRIORITIES	6 priority settings
SSBI2_VITn	n=[0... 9]
SSBI2_PVC_CTRL	Provides enables for 5 PVC ports
SSBI2_PVC_TABLEn	n=[0... 19]

0x00600000 PA2_SSBI2_CTL

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0x83005

Specifies various generic SSBI2 control information. Bits 19:13 comprising of fields SSBI2_DATA_PDEN, FCLK_MODE, FCLK_SW_OVERRIDE and NUM_FCLK are either asynchronously reset or set. This is because they control the signals going directly to a pad. Remaining bits 12:0 are synchronously reset or set.

The delay between the master and the slave, by design, should be budgeted according to the ssbi2 timing specification. The reset default setting on the SEL_RD_DATA and SSBI2_DATA_DEL fields is expected to typically work out of the box for most PMIC to APQ, SURF, FFA routing in normal and forward clocking mode provided the master and slave close timing based on the ssbi2 timing specification.

PA2_SSBI2_CTL

Bits	Name	Description
19:16	NUM_FCLK	Indicates a programmable number of active forwarding clock cycles following a SSBI2 'transaction done' for a corresponding SSBI2 request. Unless there is a new SSBI2 transaction request, the forwarding clock is shut off after toggling NUM_FCLK cycles at the PMIC SSBI2 clock frequency. The suggested setting (default value) for APQ8064 is 8 clock cycles.
15	FCLK_SW_OVERRIDE	This is a software override bit to control the CGC for forwarding clock. Set this bit to 1 to allow the SSBI2 clock to continue as a forwarding clock through the CGC (provided FLCK_MODE = 1). This override bit is provided to allow continuous toggling clock to SSBI2 slave irrespective of how the HW logic controls the CGC. Set this bit to 0 to enable pure HW control on the forwarding clock CGC.
14	FCLK_MODE	Set this bit to 1 to activate forwarding clock mode. When this bit is 0, the FCLK_SW_OVERRIDE field has no meaning. Out of reset, the mode is set to 0 indicating that the SSBI2 slave does not work off the forwarding clock. When FCLK_MODE = 0; no forwarding clock. When FCLK_MODE = 1; FCLK_SW_OVERRIDE = 1; forwarding clock always toggles. When FCLK_MODE = 1; FCLK_SW_OVERRIDE = 0; forwarding clock is controlled by HW logic.
13	SSBI2_DATA_PDEN	Pulldown enable for SSBI2_DATA pad.
12	PA_CGC_CTRL	This is to control the SSBI2 clock going to this PMIC arbiter. Set this bit to 1 when you want to allow the clock to flow through the CGC. Set this bit to 0 to shut off clock to PMIC arbiter. Out of reset, this bit is set to 1.
11	RESERVED_1	Reserved bit.

PA2_SSBI2_CTL (cont.)

Bits	Name	Description
10:8	SSBI2_ADDR_WIDTH	Specifies what is the addressing mode in SSBI2 mode. This field is only applicable in SSBI2 mode. 0x0: 8-bit addressing mode 0x1: 9-bit addressing mode 0x2: 10-bit addressing mode and so on
7	SSBI2_MODE	Set this bit to 1 when SW wants to switch to new SSBI2 mode. Set this is 0 when in old SSBI mode. 0x0: SSBI 1.0 Mode 0x1: SSBI 2.0 Mode
6	RESERVED_2	Reserved bit.
5:4	SEL_RD_DATA	Specifies which RD_DATA value to select out of four possible combinations. This signal allows the returned data from the slave to be captured inside the master, 1, 2, or 3 symbols late in order to accommodate a large range of routing delay. Based on this field, the entire read transaction length will increase by SEL_RD_DATA number of symbols.
3:2	SSBI2_DATA_DEL	Specifies the number of 1/2 clock periods, SSBI2_DATA will be delayed before sampling inside.
1:0	IDLE_SYMS	The master will ensure there are at least this number of idle symbol periods in between the accesses. The idle time is inserted at the end of the read or write transaction. This supported values are always between 1 - 3.

0x00600004 PA2_SSBI2_INT_ENABLE

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0

Provides control on whether the TRANSACTION-DONE interrupts can be generated or not (per SW master).

PA2_SSBI2_INT_ENABLE

Bits	Name	Description
9:0	ENABLE_SSBI2_INT	SSBI2 transaction done interrupts for each SW master are generated only when the corresponding bits are set. The following list provides the interrupt mapping information. 0x9: Unused: SW to set to 0_1 0x8: Riva A9 0x7: Unused: SW to set to 0_2 0x6: KPSS CPU1 non-secure 0x5: KPSS CPU1 secure 0x4: GSS A5 0x3: LPASS Q6 0x2: KPSS CPU0 non-secure 0x1: KPSS CPU0 secure 0x0: RPM

0x00600008 PA2_SSBI2_PRIORITIES

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0

Specifies the priorities for SSBI2 arbiter ports. The SSBI2 block supports up to maximum of 8 ports for arbitration. Each port has 3 bits to denote its priority. The bits are synchronously reset.

CAUTION Since the reset state value of SSBI2_PRIORITIES is 0, only SW requests (hard-coded to port # 0) can get through. SW has to program this register to allow hardware requests through the SSBI2 arbiter.

NOTE For APQ8064, 6 arbiter ports are used (5 ports for hardware PVC requests and 1 port for software command request). This register will scale based on the number of PVC ports. The port mapping for the HW PVC ports in mentioned in the SSBI2_PVC_CTL register.

PA2_SSBI2_PRIORITIES

Bits	Name	Description
17:15	PRIORITY5	Specifies the port number of host, with a priority that is 1 less then PRIORITY4.
14:12	PRIORITY4	Specifies the port number of host, with a priority that is 1 less then PRIORITY3.
11:9	PRIORITY3	Specifies the port number of host, with a priority that is 1 less then PRIORITY2.

PA2_SSBI2_PRIORITIES (cont.)

Bits	Name	Description
8:6	PRIORITY2	Specifies the port number of host, with a priority that is 1 less then PRIORITY1.
5:3	PRIORITY1	Specifies the port number of host, with a priority that is 1 less then PRIORITY0.
2:0	PRIORITY0	Specifies the port number of the highest priority host.

0x0060000C PA2_SSBI2_BANKS_2_3_CTL

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0xFFFFFFFF

This register specifies whether an access is allowed to banks (pages) 2 and 3 of PM8921. The access control to the banks (pages) 2 and 3 of PM8921 is set per VMID. Bit 0 corresponds to access control for VMID 0 and bit 31 corresponds to access control for VMID 31.

NOTE This register has no meaning when used in conjunction with control for other PMICs such as PM8018.

PA2_SSBI2_BANKS_2_3_CTL

Bits	Name	Description
31:0	ACCESS_CONTROL	Set each of the 32 bits to 1 if the master corresponding to that VMID wishes to initiate SW requests to banks (pages) 2 and 3 of PM8921. For other PMICs, this value has no meaning and is ignored.

0x00600010 PA2_SSBI2_ILLEGAL_STATUS

Type: Read
Clock: AHB_BUS_CLOCK
Reset State: 0

Returns status information of the software master that tried to access a SSBI2 command micro register, and failed security through the VIT table.

PA2_SSBI2_ILLEGAL_STATUS

Bits	Name	Description
5:1	ILLEGAL_VMID_4_0	Indicates the VMID of the master that performed the most recent illegal access. The value in this field is only meaningful when the ILLEGAL_ACCESS bit is set. On software reads, the value is retained unless another illegal access with a different VMID happens. In that case, this field will have the VMID corresponding to the most recent illegal master.
0	ILLEGAL_ACCESS	When set (1) indicates an illegal access. An illegal access is defined as an access that does not find a matching VMID in the SSBI2_VITn registers. This bit is cleared on a software read provided there is no other illegal access in the same clock cycle that a software read happens.

0x00600014 PA2_SSBI2_TEST_BUS_CTL

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0x0

This register is used for test bus (32 bits) control. The following is the bit mapping for the 32 bits. Bits 15:0 correspond to PMIC arbiter # 1 signals and bits 31:16 are the same as 15:0, but for PMIC arbiter # 2.

In the current form, only enabling/disabling the test bus supported. In the future, this register will be expanded to include several test modes.

Table 17-19 Bit mapping

15	ssbi2_master_req	Request from SSBI arbiter to master.
14	ssbi2_master_read	Access type information from SSBI2 arbiter to master.
13	ssbi2_master_ack	Ack from SSBI2 master to arbiter.
12	ssbi2_sw_cmd_done	SW cmd done flag from SSBI2 arbiter to SMD micro.
11	ssbi2_sw_cmd_ack	SW cmd ack from SSBI2 arbiter to CMD micro.
10:8	winner	Arbitration winner.
7	pvc_intf_busy	Indicates that PVC interface is busy.
6	xpu_slave_summary_sel	Indicates xPU security permission for client access.
5	client_valid	xPU signal indicating that access to client region is valid.
4	client_wr	xPU signal indicating the access type to client region.
3	ssbi2_fclk_en_loc	Local signal that controls the CGC for FCLK.
2	fclk_en_hw	Hardware enable to logic that controls the CGC for FCLK.
1	ssbi2_cmd_micro_crif_error	CRIF error from SSBI2 CMD micro.
0	ssbi2_cfg_micro_crif_error	CRIF error from SSBI2 CFG micro.

PA2_SSBI2_TEST_BUS_CTL

Bits	Name	Description
0	TEST_BUS_EN	Set this bit to enable the 32-bit test bus. When reset, the test bus drives all zeros.

0x00600020+4*n PA2_SSBI2_VITn, n=[0..9]

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0

This is the VMID index table used for enabling concurrent SSBI2 SW requests among multiple SW masters. Secure entities are expected to assign a VMID for the SW master corresponding to an index. The SSBI2_VIT0 has the VMID associated with index 0, SSBI2_VIT1 has the VMID associated with index 1 and so on.

CAUTION By default, only the SW master with a VMID of '0' has access to registers in SSBI2 command micro space. SROT/RPM has to populate this table before valid SW masters can initiate SSBI2 SW transactions.

NOTE APQ8064 will have 10 SW masters. The maximum range of n will be 0-31 corresponding to a maximum of 32 VMID masters. Also, the indices n(0-9) should match the interrupt index mapping to processor given in SSBI2_INT_ENABLE.

PA2_SSBI2_VITn

Bits	Name	Description
4:0	VMID	VMID corresponding to index n.

0x006000A0 PA2_SSBI2_PVC_CTL

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0

This register provides the global enable/disable for the PVC interface module, per PVC port enable/disable as well as captures PVC interface busy status.

NOTE In APQ8064 , there are 5 PVC ports (to connect to KPSS SAW CPU0 & CPU1,LPASS SAW, Q6SW & Q6FW). This register will scale in size based on the number of PVC ports (set as a RTL GENERIC).

WARNING In a PMIC arbiter wrapper system having more than 1 PMIC arbiter module; if a PVC port(x) is enabled in one of the PMIC arbiters, the corresponding PVC_port(x) in all

the other PMIC arbiters shall be disabled. If multiple PVC_port(x)'s enabled simultaneously, the hardware does not guarantee correct operation.

PA2_SSBI2_PVC_CTL

Bits	Name	Description
8	PVC_INTF_BUSY	This is a status bit. When set (1) indicates that the PVC interface module is busy (meaning there is at least one PVC transaction being serviced). Busy line goes high when PVC interface detects a new request on one of the PVC ports and stays high until it samples a done from SSBI2 arbiter. Writes to this bit will not have any effect and will be ignored.
7:6	RESERVED	Reserved bits.
5	PVC_PORT5_EN	Set this bit to 1 to enable PVC port 5. PVC port 5 maps to Q6FW
4	PVC_PORT4_EN	Set this bit to 1 to enable PVC port 4. PVC port 4 maps to Q6SW
3	PVC_PORT3_EN	Set this bit to 1 to enable PVC port 3. PVC port 3 maps to SMPSS CPU1 SAW.
2	PVC_PORT2_EN	Set this bit to 1 to enable PVC port 2. PVC port 2 maps to SMPSS CPU 0 SAW.
1	PVC_PORT1_EN	Set this bit to 1 to enable PVC port 1. PVC port 1 maps to LPASS Q6 SAW.
0	PVC_INTF_EN	Set this bit to 1 to enable PVC interface module.

0x006000A4+4*n PA2_SSBI2_PVC_TABLEn, n=[0..19]

Type: Read/write
Clock: AHB_BUS_CLOCK
Reset State: 0

This set of registers indicates the full PVC table corresponding to all the PVC ports. There are 4 entries per PVC port and there are 5 PVC ports in APQ8064 and hence the 20 entries. Each entry is 15-bit address to the SSBI2 slave registers. This indirect addressing from the PVC ports to the SSBI2 slave registers provides a way to enforce security on hardware SSBI2 requests.

NOTE Though this current document shows 20 entries, the number of entries should scale based on the GENERIC settings for the number of PVC ports and the address index width. Also though 15-bit addresses are supported, 10-bit addressing is all that is expected for current PMICs.

PA2_SSBI2_PVC_TABLEn

Bits	Name	Description
14:0	ADDR	15-bit address of the SSBI2 slave registers.

17.15 PA2 SSBI2 Registers (0x00C00000 PA2_SSBI2_CMD_BASE)

This section lists the ARM registers associated with the SSBI2 command micro space.

Following are all the SSBI2 command micro software registers. These registers are open to access by all bus masters that have access to the slave port.

Table 17-20 lists all the SSBI2 command registers along with the type of software access.

Table 17-20 Summary of SW registers

Address offset	Register	SW access type
0x0	SSBI2_CMD	Command write
0x4	SSBI2_RD_STATUS	Read

Treatment of invalid accesses

An invalid access is any read or write access to addresses that do not have a valid SSBI2 command SW register associated with that particular address in the aliased 32-Kb regions within the 1-MB space. Invalid write accesses are ignored and invalid read accesses return all zeroes. An invalid access also triggers a CRIF error which is captured in the test bus.

0x00C00000 PA2_SSBI2_CMD

Type: Write (cmd)
Clock: AHB_BUS_CLOCK
Reset State: 0

The SW masters write to this register to initiate either a read or a write SSBI2 transaction. Through this register, the SW can address up to 32 Kb of SSBI2 slave register space. However the PMICs only house a maximum of 1024 registers and hence the values on the most significant 5-bits of the REG_ADDR_14_8 field are ignored. The REG_DATA field is only applicable for write transaction and is ignored for reads. The read data returned back from the SSBI2 slave is directed to the SSBI2_RD_STATUS register. Bit 23 is left as a reserved bit to enable slave address to grow to 16-bits in the future.

PA2_SSBI2_CMD

Bits	Name	Description
24	RDWRN	Denotes whether the command to perform is a register write (0) or read (1).
23	RESERVED	Reserved bit.
22:16	REG_ADDR_14_8	Specifies the upper 7 bits, 14:8, of SSBI slave register address.
15:8	REG_ADDR_7_0	Lower 8 bits, 7:0, of SSBI slave register address.
7:0	REG_DATA	Write data for a slave register.

0x00C00004 PA2_SSBI2_RD_STATUS

Type: Read
Clock: AHB_BUS_CLOCK
Reset State: 0

This register provides the read data as well as the status of the transaction. This register also returns back information associated with the transaction such as the SSBI2 slave register address and the transaction access type. SW is expected to poll TRANS_DONE and TRANS_DENIED until either of these bits are set to 1.

- TRANS_DONE = 0, TRANS_DENIED = 1; indicates to SW that the current transaction was rejected because the master did not have permissions to access the corresponding SSBI2 slave register.
- TRANS_DONE = 1, TRANS_DENIED = 0; indicates to SW that the current transaction was completed successfully. For writes, it means that the write data was sent out on the SSBI wire and for reads, it means that the read data is returned back and is now in SSBI2_RD_STATUS[REG_DATA]. At this point, the SW is said to have completed one transaction.
- Both TRANS_DONE and TRANS_DENIED is either 0 or 1; does not happen and is not a valid combination.

PA2_SSBI2_RD_STATUS

Bits	Name	Description
27	TRANS_DONE	When set (1), indicates that the SSBI2 has completed the transaction. If this was a write request, the write has completed. If this was a read request, the read data has returned back. This bit is not set for security violations via xPU or PM8921 banks (pages) 2 & 3 access control. NOTE This bit is cleared on read.
26	TRANS_DENIED	When set (1), indicates that a SSBI2 transaction was denied because the master did not have access to the particular SSBI2 slave SW register to where the access was intended. For PM88921 banks (pages) 0 and 1, this bit is set based on xPU blocking the transaction. For PM8921 banks (pages) 2 and 3, this bit is set based on the settings in SSBI2_BANKS_2_3_CTL register that blocked the transaction. NOTE This bit is cleared on read.
25	TRANS_PROG	When set (1), indicates that a SSBI2 transaction is in progress. This signal will be set for the duration from REQ assertion until DONE assertion.
24	RDWRN	Returns the access type of transaction. A value of 1 implies a read transaction and a value of 0 implies a write transaction.
23	RESERVED	Reserved bit.
22:8	REG_ADDR	Returns the address to which the SSBI2 transaction was performed.

PA2_SSBI2_RD_STATUS (cont.)

Bits	Name	Description
7:0	REG_DATA	Returned read register data. NOTE The read data is not cleared on reads, however will return all zeros for a SW master whose transaction was denied or was an illegal SW master.

18 SATA Registers

18.1 Overview

Table 18-1 SATA Bases

Base Name	Parent	Address
SATA_CAP	SATA_BASE	0x29000000
UNIPHY_PLL_REFCLK_CFG	SATA_PHY_BASE	0x1B400000

18.2 SATA Registers (0x29000000 SATA_BASE)

This section contains the description for the registers inside the SATA Host Controller core that can be accessed through the AXI slave interface.

18.2.1 Generic host register descriptions

0x29000000 SATA_CAP

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x6716FF80

SATA_CAP

Bits	Name	Description
31	S64A	Supports 64-bit Addressing DWC_ahsata supports 64-bit addressable data structures by utilizing P FBU and P CLBU registers. Reset Value: Configurable. 0x1: when M_HADDR_WIDTH=64 0x0: when M_HADDR_WIDTH=32 (RO)
30	SNCQ	Supports Native Command Queuing DWC_ahsata supports SATA native command queueing by handling DMA Setup FIS natively. (RO)
29	SSNTF	Supports SNotification Register DWC_ahsata supports P SNTF (SNotification) register and its associated functionality. (RO)
28	SMPS	The bit is Reserved in the current DWC_ahsata configuration, Supports Mechanical Presence Switch This bit is set by the system firmware/BIOS when the platform supports mechanical presence switch for hot plug operation. To use this feature with the DWC_ahsata, the parameter DEV_MP_SWITCH must be set to include in coreConsultant. Otherwise this bit reads 0. Configurable in coreConsultant: This field is implemented when DEV_MP_SWITCH==Include in coreConsultant. When this field is not implemented, this field is reserved, and reads 1b0. (RO)

SATA_CAP (cont.)

Bits	Name	Description
27	SSS	Supports Staggered Spin-up This bit is set by the system firmware/BIOS to indicate platform support for staggered devices spin-up. DWC_ahsata supports this feature through the P CMD.SUD bit functionality. (RO)
26	SALP	Supports Aggressive Link Power Management DWC_ahsata supports auto-generating (Port-initiated) Link Layer requests to the PARTIAL or SLUMBER power management states when there are no commands to process. (RO)
25	SAL	Supports Activity LED DWC_ahsata supports activity indication using signal p _act_led. (RO)
24	SCLO	Supports Command List Override DWC_ahsata supports the P CMD.CLO bit functionality for port multiplier devices enumeration. (RO)
23:20	ISS	Interface Speed Support Selects maximum SATA speed supported: 1.5 GB/sec, 3.0 GB/sec, or 6.0 GB/sec Values: 1.5 GB/sec (1) 3.0 GB/sec (2) 6.0 GB/sec (3) (RO)
19	SNZO	Supports Non-Zero DMA Offsets This feature is not supported. (RO)
18	SAM	Supports AHCI Mode Only DWC_ahsata supports AHCI mode only and does not support legacy, task-file based register interface. (RO)
17	SPM	Supports Port Multiplier DWC_ahsata supports command-based switching port multiplier on any of its ports. (RO)
16	RESERVED_BITS16	Reserved (RO)
15	PMD	PIO Multiple DRQ Block DWC_ahsata supports multiple DRQ block data transfers for the PIO command protocol. (RO)

SATA_CAP (cont.)

Bits	Name	Description
14	SSC	Slumber State Capable DWC_ahsata supports transitions to the interface SLUMBER power management state. (RO)
13	PSC	Partial State Capable DWC_ahsata supports transitions to the interface PARTIAL power management state. (RO)
12:8	NCS	Number of Command Slots DWC_ahsata supports 32 command slots per Port. (RO)
7	CCCS	Command Completion Coalescing Support DWC_ahsata supports command completion coalescing. (RO)
6	EMS	Enclosure Management Support DWC_ahsata does not support enclosure management. (RO)
5	SXS	Supports External SATA The options for this field are: 0x1: Indicates that the DWC_ahsata has one or more Ports that has a signal only connector (power is not part of that connector) that is externally accessible. When this bit is set to 1, the software can refer to the P CMD.ESP bit to determine whether a specific Port has its signal connector externally accessible. 0x0: Indicates that the DWC_ahsata has no Ports that have a signal only connector externally accessible. Reset Value: 0x1: when any of the P CMD.ESP=1 0x0: when all of the P CMD.ESP=0 (RO)
4:0	NP	Number of Ports 0s based value indicating the number of Ports supported by the DWC_ahsata: The options for this field are: 0x00: 1 Port 0x01: 2 Ports 0x02: 3 Ports ...etc. Reset Value: Configurable (AHSATA_NUM_PORTS-1) (RO)

0x29000004 SATA_GHC

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x8000_0000

SATA_GHC

Bits	Name	Description
31	AE	AHCI Enable This bit is always set since DWC_ahsata supports only AHCI mode as indicated by the CAP.SAM=1. (RO) Register type: Read
30:2	RESERVED_BITS30_2	Reserved (RO) Register type: Read
1	IE	Interrupt Enable This global bit enables interrupts from the DWC_ahsata. When cleared, all interrupt sources from all the Ports are disabled (masked). When set, interrupts are enabled and any DWC_ahsata interrupt event causes intrq output assertion. This field is reset on Global reset (GHC.HR=1). (RW) Register type: Read/Write
0	HR	HBA Reset When set by the software, this bit causes an internal Global reset of the DWC_ahsata. All state machines that relate to data transfers and queueing return to an idle state, and all the Ports are re-initialized by sending COMRESET when staggered spin-up is not supported. When staggered spin-up is supported, the software must spin-up each Port after this reset has completed. The DWC_ahsata clears this bit when the reset action is done. A software write of 0 has no effect. (WO) Register type: Write

0x29000008 SATA_IS

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_00000

SATA_IS

Bits	Name	Description
31:2	RESERVED_BITS31_2	Reserved (RO) Register type: Read
1:0	IPS	Interrupt Pending Status When set, this bit indicates that the corresponding Port or Command Completion Coalescing (CCC) logic has an interrupt pending. The software can use this information to determine which ports require service after an interrupt. The bits of this field are set by the ports that have interrupt events pending in the P IS bits and enabled by the P IE or CCC interrupt is generated. Set bits are cleared by the software writing 1 to all bits to clear. (RW1C) Register type: Read/Write (1 clear)

0x2900000C SATA_PI

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x00000000

This register indicates which Ports are exposed by the DWC_ahsata and are available for the software to use. It is loaded by the BIOS. For example, when the DWC_ahsata supports 8 Ports as indicated in the CAP.NP, only Ports 1, 3, 5, and 7 could be available, while Ports 0, 2, 4, and 6 unavailable.

SATA_PI

Bits	Name	Description
31:1	RESERVED_BITS31_1	Reserved (RO) Register type: Read

SATA_PI (cont.)

Bits	Name	Description
0	PI	Ports Implemented This register is bit significant. 1: The corresponding Port is available for the software to use. 0: The Port is not available for the software to use. The maximum number of bits that can be set to 1 is CAP.NP+1. At least one bit must be set to 1. NOTE The contents of this register are relevant to the CCC_PORTS (Command Completion Coalescing Ports) register. The PI register is HwInit. This means that the value is initialized at reset by a system firmware (BIOS). These bits are write-once after power-on reset, then they become read-only. (RO) Register type: Read/Write

0x29000010 SATA_VS

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x00010300

This register indicates the major and minor version of the AHCI specification that the DWC_ahsata implementation supports. The DWC_ahsata supports version 1.30.

BIST register locations (BISTAFR, BISTCR, BISTFCTR, BISTSR, and BISTDECR) are shared between the DWC_ahsata Ports. Before accessing any of the BIST registers, the software must first select the required Port by writing the Port number to the TESTR.PSEL field.

SATA_VS

Bits	Name	Description
31:16	MJR	Major Version Number Indicates that the major AHCI version is 1. (RO)
15:0	MNR	Minor Version Number Indicates that the minor AHCI version is 30. (RO)

0x29000014 SATA_CCC_CTL

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x00010108

This register is used to configure the command completion coalescing (CCC) feature for the DWC_ahsata core. It is reset on global reset.

SATA_CCC_CTL

Bits	Name	Description
31:16	TV	Time-out Value This field specifies the CCC time-out value in 1 ms intervals. The software loads this value prior to enabling CCC. The options for this field are: RW when CCC_CTL.EN==0. RO when CCC_CTL.EN==1. A time-out value of 0x0000 is reserved and should not be used. (RW/RO) Register type: Read/Write
15:8	CC	Command Completions This field specifies the number of command completions that are necessary to cause a CCC interrupt. The value 0x00 for this field disables CCC interrupts being generated based on the number of commands completed. In this case, CCC interrupts are only generated based on the timer. The software loads this value prior to enabling CCC: Field access is: RW when CCC_CTL.EN==0 RO when CCC_CTL.EN==1 (RW/RO) Register type: Read/Write
7:3	INT	Interrupt This field specifies the interrupt used by the CCC feature, using the number of Ports configured for the core. For example, when AHSATA_NUM_PORTS==6 then This field CCC_CTL.INT==6. When a CCC interrupt occurs, the field IS.IPS[INT] is set to 1. (RO) Register type: Read
2:1	RESERVED_BITS2_1	Reserved (RO) Register type: Read

SATA_CCC_CTL (cont.)

Bits	Name	Description
0	EN	Enable The options for this field are: 0x0: CCC feature is disabled and no CCC interrupts are generated. 0x1: CCC feature is enabled and CCC interrupts may be generated based on the time-out or command completion conditions. NOTE When field CCC_CTL.EN==1, the software can not change the fields CCC_CTL.TV and CCC_CTL.CC. (RW) Register type: Read/Write

0x29000018 SATA_CCC_PORTS

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register specifies the Ports that are coalesced as part of the command completion coalescing (CCC) feature when CCC_CTL.EN==1. It is reset on global reset.

SATA_CCC_PORTS

Bits	Name	Description
31:0	PRT	Ports This field is bit significant. Each bit corresponds to a particular Port, where bit 0 corresponds to Port0. The options for this field are: 1: the corresponding Port is part of the CCC feature. 0: the corresponding Port is not part of the CCC feature. Bits set to ’1’ in this register must also have the corresponding bit set to ’1’ in the PI (Ports Implemented Register). (RW)

0x29000024 SATA_CAP2

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0004

This register indicates capabilities of the DWC_ahsata core to the software.

SATA_CAP2

Bits	Name	Description
31:3	RESERVED_BITS31_3	Reserved (RO)
2	APST	Automatic Partial to Slumber Transitions DWC_ahsata supports automatic partial to slumber transitions. (RO)
1:0	RESERVED_BITS1_0	Reserved (RO)

0x290000A0 SATA_BISTAFR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register contains the pattern definition (bits [23:16] of the first DWORD) and data pattern (bits [7:0] of the second DWORD) fields of the received BIST Activate FIS. These fields define the DWC_ahsata loopback responder mode requested by the device. It is updated every time a new BIST Activate FIS is received from the device. Reset on Global or Port reset.

SATA_BISTAFR

Bits	Name	Description
31:16	RESERVED_BITS31_16	Reserved (RO)
15:8	NCP	Non-compliant pattern Least significant byte of the received BIST Activate FIS second DWORD (bits [7:0]). This value defines the required pattern for far-end transmit only mode (BISTAFR.PD=0x80 or 0xA0): 0xF1: Low transition density pattern (LTDP) 0xB5: High transition density pattern (HTDP) 0xAB: Low frequency spectral component pattern (LFSCP) 0x7F: Simultaneous switching outputs pattern (SSOP) 0x8B: Lone bit pattern (LBP) 0x78: Mid frequency test pattern (MFTP) 0x4A: High frequency test pattern (HFTP) 0x7E: Low frequency test pattern (LFTP) When none of these values is decoded, the simultaneous switching pattern is transmitted by default. (RO)

SATA_BISTAFR (cont.)

Bits	Name	Description
7:0	PD	Pattern Definition Indicates the pattern definition field of the received BIST Activate FIS - bits [23:16] of the first DWORD. It is used to put the DWC_ahsata in one of the following BIST modes: 0x10: Far-end retimed 0x08: Far-end analog (when PHY supports this mode) 0x80: Far-end transmit only 0xA0: Far-end transmit only with scrambler bypassed All other values should not be used by the device, otherwise, the FIS is negatively acknowledged with R_ERRp. For far-end transmit only modes BISTAFR.NCP field contains the required data pattern. (RO)

0x290000A4 SATA_BISTCR

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0700

This register is used in BIST initiator modes. It is loaded by the host software prior to sending BIST Activate FIS to the device (via TXBISTPD write). It is reset on a Global or Port reset.

SATA_BISTCR

Bits	Name	Description
31:25	RESERVED_BITS31_25	Reserved (RO) Register type: Read
24	LATE_PHY_READY	Late phy_ready When set, this bit changes monitoring of phy_ready to be the □OR□ of phy_ready or phy_rx_data_vld so that a □late arriving□, or even never asserting□ phy_ready, still functions when RX_OOB_MODE = □Exclude□. This requires that phy_rx_data_vld does not become valid until after the PHY has locked onto post OOB incoming ALIGNs, and the ALIGNs are valid from the PHY. This will not work if phy_rx_data_vld is asserted during OOB data bursts. This behavior is intended for PHYs that assert phy_ready late, but will also work if phy_ready never asserts or is not present. This bit is read/write when RX_OOB_MODE=□Exclude□ and read-only when RX_OOB_MODE=□Include□. (RW) Register type: Read/Write

SATA_BISTCR (cont.)

Bits	Name	Description
23:21	RESERVED_BITS23_21	Reserved (RO) Register type: Read
20	FERLB	Far-end Retimed Loopback When set, this bit is used to put the DWC_ahsata Link into Far-end Retimed mode, without the BIST Activate FIS, regardless whether the device is connected or disconnected (Link in NOCOMM state). This field is one-shot type and reads returns 0. (WO) Register type: Write
19	RESERVED_BIT19	Reserved (RO) Register type: Read
18	TXO	Transmit Only This bit is used to initiate transmission of one of the non-compliant patterns defined by the BISTCR.PATTERN value when the device is disconnected. (WO) Register type: Write
17	CNTCLR	Counter Clear This bit clears BIST error count registers. It is treated as one-shot and reads as 0: No Clear 1: Clear BISTFCTR, BISTSR, and BISTDECR registers. (WO) Register type: Write
16	NEALB	Near-end Analog Loopback This bit places the Port PHY into near-end analog loopback mode. It is treated as one-shot and reads as 0: No Near-end analog loopback 1: Near-end analog loopback request. BISTCR.PATTERN field contains the appropriate pattern. This mode should be initiated either in the PARTIAL or SLUMBER power mode, or with the device disconnected from the Port PHY (Link NOCOMM state). BIST Activate FIS is not sent to the device in this mode. (WO) Register type: Write

SATA_BISTCR (cont.)

Bits	Name	Description
15	LLB	Lab Loopback Mode When set, masks out phy_sig_det from the OOB Detector in BIST Loopback Mode, and the only way to exit BIST Loopback mode is to clear the register bit (requires access to the Device AMBA register interface), then issue COMRESET or receive COMINIT as normal. Alternately, a power on reset will automatically clear the BIST Loopback Mode register bit. (RW) Register type: Read/Write
14	QPHYINIT	The bit is Reserved in the current DWC_ahsata configuration, Quick PHY Init Enable When set, this bit enables quick PHY initialization feature. The Link does not require any ALIGNs to transition from OOB to normal operation. Note: This bit is available only when TX_OOB_MODE = Exclude (0) and ALIGN_MODE = Aligned (1), otherwise it is reserved. (RW) Register type: Read/Write
13	ERRLOSSEN	Error Loss Detect Enable This bit is set on power-up or asynchronous reset if PHY_INTERFACE_TYPE=Synopsys_SATA_6G (2) or PHY_INTERFACE_TYPE = Synopsys_SATA_6G_FPGA_TestChip (3). Note: This feature is present only when RX_OOB_MODE = Include, however, the bit is present in any configuration. This bit controls OOB initialization behavior and signal loss detection for use with Synopsys 6G PHY. Do not change the value of this register bit. (RW) Register type: Read/Write
12	SDFE	Signal Detect Feature Enable 1: Link layer feature to handle unstable/absent phy_sig_det signal is enabled 0: Link layer feature to handle unstable/absent phy_sig_det signal is disabled. This bit is cleared on power-up or asynchronous reset until it is set via programming. It is not affected by a Global reset or COMRESET. Note: For special handling in systems where phy_sig_det may not be present or stable after OOB signalling and during normal operation. For these systems, phy_rx_data_vld must not be tied high and must go low when no data is detected on the wires. (RW) Register type: Read/Write

SATA_BISTCR (cont.)

Bits	Name	Description
11	RESERVED_BIT11	Reserved (RO) Register type: Read
10:8	LLC	Link Layer Control This field controls the Port Link Layer functions: scrambler, descrambler, and repeat primitive drop. Note the different meanings for normal and BIST modes of operation: Bit8SCRAM The options for this field are: 0: Scrambler disabled in normal mode, enabled in BIST mode 1: Scrambler enabled in normal mode, disabled in BIST mode Bit9DESCRAM The options for this field are: 0: Descrambler disabled in normal mode, enabled in BIST mode 1: Descrambler enabled in normal mode, disabled in BIST mode Bit10RPD The options for this field are: 0: Repeat primitive drop function disabled in normal mode, enabled in BIST mode 1: Repeat primitive drop function enabled in normal mode, disabled in BIST mode The SCRAM bit is cleared (enabled) by the Port when the Port enters a responder far-end transmit BIST mode with scrambling enabled (BISTAFR.PD=0x80). In normal mode, the functions scrambler, descrambler, or RPD can be changed only during Port reset (P SCTL.DET=0x1) (RW) Register type: Read/Write
7	RESERVED_BITS7	Reserved (RO) Register type: Read
6	ERREN	Error Enable This bit is used to allow or filter (disable) PHY internal errors outside the FIS boundary to set corresponding P SERR bits. The options for this field are: 0: Filter errors outside the FIS, allow errors inside the FIS; 1: Allow errors outside or inside the FIS. (RW) Register type: Read/Write
5	FLIP	Flip disparity This bit is used to change disparity of the current test pattern to the opposite every time its state is changed by the software. (RW) Register type: Read/Write

SATA_BISTCR (cont.)

Bits	Name	Description
4	PV	Pattern Version This bit is used to select either short or long version of the SSOP, HTDP, LTDP, LFSCP, COMP patterns. The options for this field are: 0: Short pattern version 1: Long pattern version (RW) Register type: Read/Write
3:0	PATTERN	This field defines one of the following SATA compliant patterns for far-end retimed/ far-end analog/ near-end analog initiator modes, or non-compliant patterns for transmit-only responder mode when initiated by the software writing to the BISTCR.TXO bit. The options for this field are: 0000b: Simultaneous switching outputs pattern (SSOP) 0001b: High transition density pattern (HTDP) 0010b: Low transition density pattern (LTDP) 0011b: Low frequency spectral component pattern (LFSCP) 0100b: Composite pattern (COMP) 0101b: Lone bit pattern (LBP) 0110b: Mid frequency test pattern (MFTP) 0111b: High frequency test pattern (HFTP) 1000b: Low frequency test pattern (LFTP) All other values are reserved and should not be used. If the value is none of the listed above, Composite pattern (COMP) is transmitted by default. (RW) Register type: Read/Write

0x290000A8 SATA_BISTFCTR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register contains the received BIST FIS count in the loopback initiator far-end retimed, far-end analog and near-end analog modes. It is updated each time a new BIST FIS is received. It is reset by Global reset, Port reset (COMRESET) or by setting the BISTCR.CNTCLR bit. This register does not roll over and freezes when the FFFF_FFFFh value is reached. It takes approximately 65 hours of continuous BIST operation to reach this value.

SATA_BISTFCTR

Bits	Name	Description
31:0	CNT	Received BIST FIS count (RO)

0x290000AC SATA_BISTSR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register contains errors detected in the received BIST FIS in the loopback initiator far-end retimed, far-end analog and near-end analog modes. It is updated each time a new BIST FIS is received. It is reset by Global reset, Port reset (COMRESET) or by setting the BISTCR.CNTCLR bit.

SATA_BISTSR

Bits	Name	Description
31:24	RESERVED_BITS31_24	Reserved (RO)
23:16	BRSTERR	Burst Error This field contains the burst error count. It is accumulated each time a burst error condition is detected: DWORD error is detected in the received frame and 1.5 seconds (27,000 frames) passed since the previous burst error was detected. The BRSTERR value does not roll over and freezes at FFh. This field is updated when parameter BIST_MODE=DWORD.(RO)
15:0	FRAMERR	Frame Error This field contains the frame error count. It is accumulated (new value is added to the old value) each time a new BIST frame with a CRC error is received. The FRAMERR value does not roll over and freezes at FFFFh.(RO)

0x290000B0 SATA_BISTDECR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register contains the number of DWORD errors detected in the received BIST frame in the loopback initiator far-end retimed, far-end analog and near-end analog modes. It is updated each time a new BIST frame is received. It is reset by Global reset, Port reset (COMRESET) or by setting the BISTCR.CNTCLR bit. This register is updated only when the parameter BIST_MODE=DWORD.

SATA_BISTDECR

Bits	Name	Description
31:0	DWERR	DWORD Error Count This field contains the DWORD error count. It is accumulated (new value is added to the old value) each time a new BIST frame is received. The DWERR value does not roll over and freezes when it exceeds 0xFFFF_F000. (RO)

0x290000B4 SATA_DIAGNR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0003_E000

The register is for debug purposes only (not documented register in Synopsys Databook).

This register reflects the states of the DWC_ahsata FSMs and couple bits from the TCHK Transport errors.

SATA_DIAGNR

Bits	Name	Description
31	E31	err_rxfov (RW1C) Register type: Read/Write (1 clear)
30	E30	tlerr_alps (RW1C) Register type: Read/Write (1 clear)
29	RESERVED_BITS29	Reserved (RO) Register type: Read
28:24	LSM	Link State Machine State Link state machine current state (RO) Register type: Read Only
23:19	TCHK	TCHK State Machine State (RO) Register type: Read Only

SATA_DIAGNR (cont.)

Bits	Name	Description
18:13	TSM	Tx State Machine State (RO) Register type: Read Only
12:7	RFSM	Rx FIS State Machine State (RO) Register type: Read Only
6:0	PDMASM	Port DMA State Machine State (RO) Register type: Read Only

0x290000B8 SATA_DIAGNR1

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

The register is for debug purposes only (not documented register in Synopsys Databook).

This register reflects the states of the DWC_ahsata FSMs and couple of other debug info.

SATA_DIAGNR1

Bits	Name	Description
31	LINK_PRIM_ERR	Link Primitive Error (RO) Register type: Read Only
30	LINK_DATA_DISP	Link Data Disparity Error (RO) Register type: Read Only
29	LINK_DATA_DEC	Link Data 10b8b Decoding Error (RO) Register type: Read Only
28	CMD_ABORT	Cmd Abort status in Reg or SDB FIS (e.g. 51h) (RO) Register type: Read Only

SATA_DIAGNR1 (cont.)

Bits	Name	Description
27	CMD_GOOD	Cmd Good status in Reg or SDB FIS (e.g. 50h) (RO) Register type: Read Only
26	LINK_BAD	Link Bad End (WTRM instead of EOF) Error (RO) Register type: Read Only
25	TLERR_BLPS	TL before Link/Phy error (RW1C) Register type: Read/Write (1 clear)
24:20	RESERVED_BITS24_20	Reserved (RO) Register type: Read Only

0x290000BC SATA_OOBR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x070E182B

This register controls the Link layer OOB detection counters. The default values, MIN_COMWAKE, MAX_COMWAKE, MIN_COMINIT and MAX_COMINIT are calculated based on the RXOOB_CLK_FREQ parameter and loaded on power-up or asynchronous DWC_ahsata reset.

SATA_OOBR

Bits	Name	Description
31	WE	Write Enable The options for this field are: 1: OOBR bits [30:0] can be written 0: OOBR bits [30:0] are read-only This bit is cleared when COMRESET is detected. (RW)
30:24	CWMIN	COMWAKE Minimum value (Default = 7'd6) This field is RW when WE=1 and RO when WE=0. (RW/RO)
23:16	CWMAX	COMWAKE Maximum value (Default = 7'd16) This field is RW when WE=1 and RO when WE=0 (RW/RO)
15:8	CIMIN	COMINIT Minimum value (Default = 7'd18) This field is RW when WE=1 and RO when WE=0. (RW/RO)
7:0	CIMAX	COMINIT Maximum value (Default = 7'd51) This field is RW when WE=1 and RO when WE=0. (RW/RO)

0x290000D0 GPCR

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

General Purpose Control Register

This 32-bit register is used for general purpose control. This register only exists when GP_CTRL parameter s set to □Include□ otherwise this location is reserved. The bits of this register are connected to the corresponding bits of the gp_ctrl output. Resets on power-up (system reset) only to the GP_CTRL_DEF value.

GPCR

Bits	Name	Description
31:0	GP_CTRL	bit31: sel_1k ’ when set(1), 1K boundary is preserved by SATA AXI master, in order to support QSB limitation. ’ when clear(0), 4K boundary is supported by SATA AXI master, as AXI 1.0 requires. bits30:0: for future use (RW) Register type: Read/Write

0x290000D4 GPSR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x1002_0000

General Purpose Status Register

This 32-bit register is used to monitor the general purpose status. This register only exists when GP_STAT parameter is set to □Include□, otherwise, this location is reserved.

The bits of this register reflect the state of the corresponding bits of the gp_status input. Signals connected to the gp_status input can be asynchronous to any of the DWC_ahsata clocks, however they must not change faster than five hclk/aclk periods, otherwise the GPSR register may never be updated with the intermediate changing values.

The register contains the HW version of SATA controller, as defined in IP Catalog Guidelines.

GPSR

Bits	Name	Description
31:28	MAJOR	Indicates different interface version. Major version changes are not backward compatible. There will be a new Programming Guide document per major revision (RO) Register type: Read Only
27:16	MINOR	Indicates expanded functionality. Minor version adds functionality while being backward compatibility for existing features. (RO) Register type: Read Only
15:0	STEP	Indicates a change in the HW which is not intended to impact SW compatibility. (RO) Register type: Read Only

0x290000E0 SATA_TIMER1MS

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0001_86A0

This register is used to generate a 1-ms tick for the command completion coalescing (CCC) logic, based on the AMBA bus clock frequency. The Software must initialize this register with the required value after power up before using the CCC feature. This register is reset to 100,000d (TIMV value for 100-MHz hclk/aclk) on power up and is not affected by Global reset.

SATA_TIMER1MS

Bits	Name	Description
31:20	RESERVED_BITS31_20	Reserved (RO) Register type: Read
19:0	TIMV	1ms Timer Value This field contains the following value for the internal timer to generate 1-ms tick: Fappclk*1000 where Fappclk = AMBA clock frequency in MHz The options for this field are: RW when CCC_CTL.EN=0 RO when CCC_CTL.EN=1. (RW/RO) Register type: Read/Write

0x290000E8 SATA_GPARAM1R

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x5C10_2409

SATA_GPARAM1R

Bits	Name	Description
31	ALIGN_M	Rx Data Alignment This value is derived from the ALIGN_MODE parameter. The options for this field are: 0: Misaligned 1: Aligned (RO)

SATA_GPARAM1R (cont.)

Bits	Name	Description
30	RX_BUFFER	Rx Data Buffer This value is derived from the RX_BUFFER_MODE parameter: 0: Exclude 1: Include (RO)
29:28	PHY_DATA	PHY Data Width This value is derived from the PHY_DATA_WIDTH parameter: The options for this field are: 0x0: 1 0x1: 2 0x2: 4 Other values are reserved. (RO)
27	PHY_RST	PHY Reset Mode This value is derived from the PHY_RST_MODE parameter. The options for this field are: 0: Low 1: High (RO)

0x290000EC SATA_GPARAM2R

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_1E64

This read-only register contains encoded information about the DWC_ahsata global configuration parameters settings.

SATA_GPARAM2R

Bits	Name	Description
31:15	RESERVED_BITS31_15	Reserved (RO)
14	DEV_CP	Cold Presence Detect This value is derived from the DEV_CP_DET parameter. The options for this field are: 0: Exclude 1: Include (RO)
13	DEV_MP	Mechanical Presence Switch This value is derived from the DEV_MP_SWITCH parameter. The options for this field are: 0: Exclude 1: Include (RO)
12	ENCODE_M	8b/10b Encoding/Decoding This value is derived from the ENCODE_MODE parameter. The options for this field are: 0: Exclude 1: Include (RO)

SATA_GPARAM2R (cont.)

Bits	Name	Description
11	RXOOB_CLK_M	Rx OOB Clock Mode This value is derived from the RXOOB_CLK_MODE parameter, The options for this field are: 0: RxClock 1: Separate (RO)
10	RX_OOB_M	Rx OOB Mode This value is derived from the RX_OOB_MODE parameter: The options for this field are: 0: Exclude 1: Include (RO)
9	TX_OOB_M	Tx OOB Mode This value is derived from the TX_OOB_MODE parameter: The options for this field are: 0: Exclude 1: Include (RO)
8:0	RXOOB_CLK	Rx OOB Clock Frequency This value reflects the hexadecimal value of the RXOOB_CLK_FREQ parameter. (RO)

0x290000F0 SATA_PPARAMR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x00000a77

This read-only register contains encoded information about the selected port configuration parameters settings. The port is selected by the TESTR.PSEL field.

SATA_PPARAMR

Bits	Name	Description
31:12	RESERVED_BITS31_12	Reserved (RO)
11	TX_MEM_M	Tx FIFO Memory Read Port Type This value is derived from the P _TX_MEM_MODE parameter: The options for this field are: 0: Async 1: Sync (RO)

SATA_PPARAMR (cont.)

Bits	Name	Description
10	TX_MEM_S	Tx FIFO Memory Type This value is derived from the P _TX_MEM_SELECT parameter: The options for this field are: 0: External 1: Internal (RO)
9	RX_MEM_M	Rx FIFO Memory Read Port Type This value is derived from the P _RX_MEM_MODE parameter: The options for this field are: 0: Async 1: Sync (RO)
8	RX_MEM_S	Rx FIFO Memory Type This value is derived from the P _RX_MEM_SELECT parameter: The options for this field are: 0: External 1: Internal (RO)
7:4	TXFIFO_DEPTH	TX FIFO Depth (in FIFO words) This value is derived from the P _TXFIFO_CAP and M_HDATA_WIDTH parameters: The options for this field are: 0x0 - 0x2: Reserved 0x3: 8 0x4: 16 0x5: 32 0x6: 64 0x7: 128 0x8: 256 0x9: 512 0xA: 1024 0xB: 2048 0xC - 0xF: Reserved (RO)

SATA_PPARAMR (cont.)

Bits	Name	Description
3:0	RXFIFO_DEPTH	RX FIFO Depth (in FIFO words) This value is derived from the P _RXFIFO_CAP and M_HDATA_WIDTH parameters: The options for this field are: 0x0 - 0x3: Reserved 0x4: 16 0x5: 32 0x6: 64 0x7: 128 0x8: 256 0x9: 512 0xA: 1024 0xB: 2048 0xC - 0xF: Reserved (RO)

0x290000F4 SATA_TESTR

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register is used to put the DWC_ahsata slave interface into a test mode and to select a Port for BIST operation.

SATA_TESTR

Bits	Name	Description
31:19	RESERVED_BITS31_19	Reserved (RO) Register type: Read
18:16	PSEL	Port Select This field is used to select a Port for BIST operation. The options for this field are: 0x0: Port0 is selected 0x1: Port1 is selected 0x2: Port2 is selected 0x3: Port3 is selected 0x4: Port4 is selected 0x5: Port5 is selected 0x6: Port6 is selected 0x7: Port7 is selected (RW) Register type: Read/Write

SATA_TESTR (cont.)

Bits	Name	Description
15:1	RESERVED_BITS15_1	Reserved (RO) Register type: Read

SATA_TESTR (cont.)

Bits	Name	Description
0	TEST_IF	TEST_IF: Test Interface This bit is used to put the DWC_ahsata slave interface into the test mode: The options for this field are: 0: Normal mode: the read back value of some registers is a function of the DWC_ahsata state and does not match the value written. 1: Test mode: the read back value of the registers matches the value written. Normal operation is disabled. The following registers can be accessed in this mode: - GHC register IE bit - BISTAFR register NCP and PD bits become read-write - BISTCR register LLC, ERREN, FLIP, PV, PATTERN - BISTFCTR, BISTSR, BISTDECR become read-write - P CLB/CLBU, P FB/FBU registers - P IS register RW1C and UFS bits become read-write - P IE register RW bits (CPDE is RO if DEV_CP_DET = Exclude, DMPE bit is RO if DEV_MP_SWITCH = Exclude) - P CMD register ASP, ALPE, DLAE, ATAPI, PMA bits - P TFD, P SIG registers become read-write - P SCTL register RW bits [9:8], [5:4], and [2:0] (Bits [2:0] can't be written with the 3'b001 value if P CMD.SUD=0) - P SERR register RW1C bits become read-write bits - P SACT, P CI, P SNTF registers become read-write - P DMACR register - P PHYCR register - P PHYSR register becomes read-write - GPSR register becomes read-write (if it is included by GP_STAT=Include(1)) Notes: Interrupt is asserted when any of the IS register bits is set after setting the corresponding P IS and P IE registers and GHC.IE = 1. CAP.SMPS/SSS, PI, P CMD.ESP/CPD/MPSP/HPCP register bits are HwInit type and can not be used in Test mode. They are written once after power-on reset and become read-only. Global DWC_ahsata reset must be issued (GHC.HR=1) after TEST_IF bit is cleared following the Test mode operation. (RW) Register type: Read/Write

0x290000F8 SATA_VERSIONR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x3332_302a

This 32-bit read-only register contains hard-coded hexadecimal DWC_ahsata component version value set by the AHSATA_VERSION_NUM parameter. The value represents an ASCII code of the version number. For example, version 1.24* is coded as 0x3132_342A.

SATA_VERSIONR

Bits	Name	Description
31:0	VERSION_NUM	DWC_ahsata hard-coded hexadecimal version value. (RO)

0x290000FC SATA_IDR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_008C

This register contains a hard-coded hexadecimal DWC_ahsata identification value, as determined by the configuration parameter External User Core ID Port:

SATA_IDR

Bits	Name	Description
31:0	CORE_ID	DWC_ahsata hard-coded hexadecimal identification value. (RO)

18.2.2 Port register descriptions

0x29000100 SATA_P0CLB

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

SATA_P0CLB

Bits	Name	Description
31:10	CLB	Command List Base Address Indicates the 32-bit base physical address for the command list for this Port. This base is used when fetching commands to execute. The structure pointed to by this address range is 1Kbyte in length. This address must be 1Kbyte-aligned as indicated by bits [9:0] being read only. (RW) Register type: Read/Write
9:0	RESERVED_BITS9_0	Reserved (RO) Register type: Read

0x29000104 SATA_P0CLBU

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register exists when M_HADDR_WIDTH=64, otherwise this location is reserved.

SATA_P0CLBU

Bits	Name	Description
31:0	CLBU	Command List Base Address Upper Indicates the upper 32 bits for the command list base physical address for this Port. This base is used when fetching commands to execute. (RW)

0x29000108 SATA_P0FB

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

SATA_P0FB

Bits	Name	Description
31:8	FB	FIS Base Address Indicates the 32-bit base physical address for received FISes. The structure pointed to by this address range is 256 bytes in length. This address must be 256byte-aligned as indicated by bits [7:0] being read only. (RW) Register type: Read/Write
7:0	RESERVED_BITS7_0	Reserved (RO) Register type: Read

0x2900010C SATA_P0FBU

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register exists when M_HADDR_WIDTH=64, otherwise this location is reserved.

SATA_P0FBU

Bits	Name	Description
31:0	FBU	FIS Base Address Upper Indicates the upper 32 bits for the received FIS base physical address for this Port. (RW)

0x29000110 SATA_P0IS

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register is used to generate DWC_ahsata interrupt when any of the bits are set. Bits in this register are set by some internal conditions, and cleared by the software writing ones in the positions it wants to clear. This register is reset on Global DWC_ahsata reset.

SATA_P0IS

Bits	Name	Description
31	CPDS	Cold Port Detect Status This bit is set when the p _cp_det input changes its state due to the insertion or removal of the device. This bit is only valid when the Port supports cold presence detect as indicated by the P CMD.CPD set to 1. This field is RW1C when DEV_CP_DET=Include This field is read-only 0 when DEV_CP_DET =Exclude (RW1C/RO) Register type: Read
30	TFES	Task File Error Status This bit is set whenever the P TFD.STS register is updated by the device and the error bit (bit 0) is set. (RW1C) Register type: Read/Write (1 clear)
29	HBFS	Host Bus Fatal Error Status This bit is set when DWC_ahsata AMBA Master detects an ERROR response from the slave. (RW1C) Register type: Read/Write (1 clear)
28	HBDS	Host Bus Data Error Status This bit is always cleared to 0. (RW1C) Register type: Read/Write (1 clear)
27	IFS	Interface Fatal Error Status This bit is set when any of the following conditions is detected: SYNC escape is received from the device during H2D Register or Data FIS transmission; One or more of the following errors are detected during Data FIS transfer - Protocol (P SERR.ERR_P), CRC (P SERR.DIAG_C), Handshake (P SERR.DIAG_H), PHY Not Ready (P SERR.ERR_C); Unknown FIS is received with good CRC, but the length exceeds 64 bytes; PRD table byte count is zero. Port DMA transitions to a fatal state until the software clears P CMD.ST bit or resets the interface by way of Port or Global reset. (RW1C) Register type: Read/Write (1 clear)

SATA_P0IS (cont.)

Bits	Name	Description
26	INFS	Interface Non-fatal Error Status This bit is set when any of the following conditions is detected: One or more of the following errors are detected during non-data FIS transfer - Protocol (P SERR.ERR_P) - CRC (P SERR.DIAG_C), - Handshake (P SERR.DIAG_H) - PHY Not Ready (P SERR.ERR_C); Command list underflow during read operation (i.e., DMA read) when the software builds command table that has more total bytes than the transaction given to the device. In both cases Port operation continues normally. When error is detected during non-data FIS transmission, this FIS is retransmitted continuously until it succeeds, or until the software times out and resets the interface. (RW1C) Register type: Read/Write (1 clear)
25	RESERVED_BITS25	Reserved (RO) Register type: Read
24	OFS	Overflow Status This bit is set when command list overflow is detected during read or write operation when the software builds command table that has fever total bytes than the transaction given to the device. Port DMA transitions to a fatal state until the software clears P CMD.ST bit or resets the interface by way of Port or Global reset. (RW1C) Register type: Read/Write (1 clear)
23	IPMS	Incorrect Port Multiplier Status Indicates that the HBA received a FIS from a device whose Port Multiplier field did not match what was expected. This bit may be set during enumeration of devices on a Port Multiplier due to the normal Port Multiplier enumeration process. The software must use the IPMS bit only after enumeration is complete on the Port Multiplier. (RW1C) Register type: Read/Write (1 clear)
22	PRCS	PHY Ready Change Status This bit reflects the state of the P SERR.DIAG_N bit. When set to 1, indicates the internal p _phy_ready signal changed state. To clear this bit, the software must clear the P SERR.DIAG_N bit to 0. (RO) Register type: Read

SATA_P0IS (cont.)

Bits	Name	Description
21:8	RESERVED_BITS21_8	Reserved (RO) Register type: Read
7	DMPS	Device Mechanical Presence Status This bit is set when the p _mp_switch input changes its state as a result of a mechanical switch attached to this Port opening or closing. Dependencies: This bit is valid only when both CAP.SMPS and P CMD.MPSP are set to 1. This bit is RW1C when DEV_CP_DET=Include. This bit is read-only 0. when DEV_CP_DET=Exclude,', (RW1C/RO) Register type: Read
6	PCS	Port Connect Change Status This bit reflects the state of the P SERR.DIAG_X bit: 0x1: Change in Current Connect Status; 0x0: No change in Current Connect Status. This bit is cleared only when P SERR.DIAG_X is cleared. (RO) Register type: Read
5	DPS	Descriptor Processed A PRD with the I bit set has transferred all of its data. NOTE This is an opportunistic interrupt and must not be used to definitively indicate the end of a transfer. Two PRD interrupts could happen close in time such that the second interrupt is missed when the first PRD interrupt is being cleared. (RW1C) Register type: Read/Write (1 clear)
4	UFS	Unknown FIS Interrupt When set to 1, indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by the software clearing the P SERR.DIAG_F bit to 0. NOTE The UFS bit does not directly reflect the P SERR.DIAG_F bit. P SERR.DIAG_F bit is set immediately when an unknown FIS is detected, whereas the UFS bit is set when that FIS is posted to memory. The software should wait to act on an unknown FIS until the UFS bit is set to 1 or the two bits may become out of sync. (RO) Register type: Read
3	SDBS	Set Device Bits Interrupt A Set Device Bits FIS has been received with the I bit set and has been copied into system memory. (RW1C) Register type: Read/Write (1 clear)

SATA_P0IS (cont.)

Bits	Name	Description
2	DSS	DMA Setup FIS Interrupt A DMA Setup FIS has been received with the I bit set and has been copied into system memory. (RW1C) Register type: Read/Write (1 clear)
1	PSS	PIO Setup FIS Interrupt A PIO Setup FIS has been received with the I bit set, it has been copied into system memory, and the data related to that FIS has been transferred. NOTE This bit is set even when the data transfer resulted in an error. (RW1C) Register type: Read/Write (1 clear)
0	DHRS	Device to Host Register FIS Interrupt A D2H Register FIS has been received with the I bit set and has been copied into system memory. (RW1C) Register type: Read/Write (1 clear)

0x29000114 SATA_P0IE

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register enables and disables reporting the corresponding interrupt to the software. When a bit is set (1), and the corresponding interrupt condition is active, then the DWC_ahsata intrq output is asserted. Interrupt sources that are disabled (0) are still reflected in the status registers. This register is symmetrical with the P IS register. This register is reset on Global DWC_ahsata reset.

SATA_P0IE

Bits	Name	Description
31	CPDE	Cold Port Detect Enable The options for this field are: When DEV_CP_DET=Include, this bit is read/write. When DEV_CP_DET=Exclude, this bit is read-only 0. Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.CPDS=1 (RW/RO) Register type: Read

SATA_P0IE (cont.)

Bits	Name	Description
30	TFEE	Task File Error Enable Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.TFES=1 (RW) Register type: Read/Write
29	HBFE	Host Bus Fatal Error Enable Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.HBFS=1 (RW) Register type: Read/Write
28	HBDE	Host Bus Data Error Enable Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.HBDS=1 (RW) Register type: Read/Write
27	IFE	Interface Fatal Error Enable Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.IFS=1 (RW) Register type: Read/Write
26	INFE	Interface Non-fatal Error Enable Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.INFS=1 (RW) Register type: Read/Write
25	RESERVED_BITS25	Reserved (RO) Register type: Read

SATA_P0IE (cont.)

Bits	Name	Description
24	OFE	Overflow Enable Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.OFS=1 (RW) Register type: Read/Write
23	IPME	Incorrect Port Multiplier Enable Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.IPMS=1 (RW) Register type: Read/Write
22	PRCE	PHYReady Change Enable Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.PRCS=1 (RW) Register type: Read/Write
21:8	RESERVED_BITS21_8	Reserved (RO) Register type: Read
7	DMPE	Device Mechanical Presence Enable DEV_MP_SWITCH=Include, this bit is read/write. DEV_MP_SWITCH=Exclude, this bit is read-only 0. Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.DMPS=1 (RW/RO) Register type: Read
6	PCE	Port Change Interrupt Enable Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.PCS=1 (RW) Register type: Read/Write

SATA_P0IE (cont.)

Bits	Name	Description
5	DPE	Descriptor Processed Interrupt Enable Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.DPS=1 (RW) Register type: Read/Write

SATA_P0IE (cont.)

Bits	Name	Description
0	DHRE	Device to Host Register FIS Interrupt Dependencies: when the following conditions are true, the intrq output signal is asserted: This bit=1 GHC.IE=1 P IS.DHRS=1 (RW) Register type: Read/Write

0x29000118 SATA_P0CMD

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0004

This register contains bits controlling various Port functions. All RW bits are reset on Global reset.

SATA_P0CMD

Bits	Name	Description
31:28	ICC	Interface Communication Control This field is used to control power management states of the interface. When the Link layer is currently in the L_IDLE state, writes to this field cause the Port to initiate a transition to the interface power management state requested. When the Link layer is not currently in the L_IDLE state, writes to this field have no effect. 0xF - 0x7: Reserved 0x6: Slumber. This causes the Port to request a transition of the interface to the Slumber state. The SATA device can reject the request and the interface remains in its current state. 0x5 - 0x3: Reserved 0x2: Partial. This causes the Port to request a transition of the interface to the Partial state. The SATA device can reject the request and the interface remains in its current state. 0x1: Active. This causes the Port to request a transition of the interface into the active state. 0x0: No-Op/ Idle. This value indicates to the software that the Port is ready to accept a new interface control command, although the transition to the previously selected state may not yet have occurred. When the software writes a non-reserved value other than No-Op (0x0), the Port performs the action and update this field back to Idle (0x0). When the software writes to this field to change the state to a state the link is already in (i.e., interface is in the active state and a request is made to go to the active state), the Port takes no action and returns this field to Idle. When the interface is in a low power state and the software wants to transition to a different low power state, the software must first bring the link to active and then initiate the transition to the desired low power state. NOTE: In the AHCI specification the transition to low power mode is only from the P:Idle state. To get to the P:Idle state, the P0CMD.ST bit has to be set. (RW) Register type: Read/Write

SATA_P0CMD (cont.)

Bits	Name	Description
27	ASP	Aggressive Slumber/ Partial The options for this field are: When set to 1, and P CMD.ALPE=1, the Port aggressively enters the SLUMBER state when one of the following conditions is true: - The Port clears the P CI and the P SACT register is cleared. - The Port clears the P SACT register and P CI is cleared. When cleared to 0, and P CMD.ALPE=1, the Port aggressively enters the PARTIAL state when one of the following conditions is true: - The Port clears the P CI register and the P SACT register is cleared. - The Port clears the P SACT register and P CI is cleared. (RW) Register type: Read/Write
26	ALPE	Aggressive Link Power Management Enable When set to 1, the Port aggressively enters a lower link power state (PARTIAL or SLUMBER) based on the setting of the P CMD.ASP bit. When cleared to 0, aggressive power management state transition is disabled. (RW) Register type: Read/Write
25	DLAE	Drive LED on ATAPI Enable When set to 1, P CMD.ATAPI=1, and commands are active, the Port asserts p _act_led output (RW) Register type: Read/Write
24	ATAPI	Device is ATAPI This bit is used by the Port to control whether to assert p0_act_led output when commands are active The options for this field are: 0: non-ATAPI device 1: ATAPI device (RW) Register type: Read/Write
23	APSTE	Automatic Partial to Slumber Transitions Enable When this bit is set, the DWC_ahsata Link layer transitions from its Partial power management state into Slumber state automatically, regardless whether it was host software-, Port (aggressive)-, or device initiated. (RW) Register type: Read/Write
22	RESERVED_BITS22	Reserved (RO) Register type: Read

SATA_P0CMD (cont.)

Bits	Name	Description
21	ESP	External SATA Port When set to 1, indicates that this Ports signal only connector is externally accessible. When set to 1, CAP.SXS is also set to 1. When cleared to 0, indicates that this Ports signal only connector is not externally accessible. Note: The ESP bit is mutually exclusive with P CMD.HPCP. (RO) Register type: Read
20	CPD	Cold Presence Detection To enable the DWC_ahsata cold presence detection feature, DEV_CP_DET must be set to Include. Otherwise this bit is read-only 0 on reset. The options for this field are: 1: Platform supports cold presence detection on this Port. When this bit is set to 1, P CMD.HPCP must also be set to 1. 0: Platform does not support cold presence detection on this Port. (RO) Register type: Read
19	MPSP	Mechanical Presence Switch Attached to Port To enable the DWC_ahsata mechanical presence detection feature, the DEV_MP_SWITCH parameter must beset to Include, otherwise this bit is read-only 0 on reset. The options for this field are: 1: Indicates the platform supports a mechanical presence switch attached to this Port. 0: Indicates the platform does not support a mechanical presence switch attached to this Port. When this bit is set to 1, P CMD.HPCP should also be set to 1. (RO) Register type: Read
18	HPCP	Hot Plug Capable Port The options for this field are: 1: Indicates that this Ports signal and power connectors are externally accessible via a joint signal-power connector for blindmate device hot plug. 0: Indicates that this Ports signal and power connectors are not externally accessible. Note: The HPCP bit is mutually exclusive with P CMD.ESP. (RO) Register type: Read

SATA_P0CMD (cont.)

Bits	Name	Description
17	PMA	Port Multiplier Attached The software is responsible for detecting whether a Port Multiplier is present; the DWC_ahsata Port does not auto-detect the presence of a Port Multiplier. The options for this field are: 1: A Port Multiplier is attached to this Port. 0: A Port Multiplier is not attached to this Port. (RW) Register type: Read/Write
16	CPS	Cold Presence State This bit reports whether a device is currently detected on this Port as indicated by the p _cp_det input state (assuming P CMD.CPD=1). The options for this field are: 1: device is attached to this Port 0: no device attached to this Port (RO) Register type: Read
15	CR	Command List Running When this bit is set to 1, the command list DMA engine for this Port is running. Register type: Read
14	FR	FIS Receive Running When set to 1, the FIS Receive DMA engine for the Port is running. (RO) Register type: Read
13	MPSS	Mechanical Presence Switch State The software must use this bit only when both CAP.SMPS and P CMD.MPSP are set to 1. This bit reports the state of a mechanical presence switch attached to this Port as indicated by the p _mp_switch input state (assuming CAP.SMPS=1 and P CMD.MPSP=1). The options for this field are: 0: Switch is closed 1: Switch is open When CAP.SMPS=0 then this bit is cleared to 0. (RO) Register type: Read

SATA_P0CMD (cont.)

Bits	Name	Description
12:8	CCS	Current Command Slot This field is set to the command slot value of the command that is currently being issued by the Port. When P CMD.ST transitions from 1 to 0, this field is recleared to 0x00. After P CMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is P CMD.CCS+1. For example, after the Port has issued its first command, when CCS=0x00 and P CI is cleared to 0x3, the next command issued is from command slot 1. This field is valid only when P CMD.ST is set to 1. (RO) Register type: Read
7:5	RESERVED_BITS7_5	Reserved (RO) Register type: Read
4	FRE	FIS Receive Enable When set to 1, the Port may post received FISes into the FIS receive area pointed to by P FB (and P FBU when M_HADDR_WIDTH=64). When cleared, received FISes are not accepted by the Port, except for the first D2H register FIS after the initialization sequence, and no FISes are posted to the FIS receive area. The software must not set this bit until P FB (P FBU) has been programmed with a valid pointer to the FIS receive area When the software wishes to move the base, this bit must first be cleared, and the software must wait for the P CMD.FR bit to be cleared. (RW) Register type: Read/Write
3	CLO	Command List Override Setting this bit to 1 causes P TFD.STS.BSY and P TFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the P TFD.STS register. This bit is cleared to 0 when P TFD.STS.BSY and P TFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 has no effect. This bit should only be set to 1 immediately prior to setting P CMD.ST bit to 1 from a previous value of 0. Setting this bit to 1 at any other time is not supported and results in indeterminate behavior. (WO) Register type: Write

SATA_P0CMD (cont.)

Bits	Name	Description
2	POD	Power On Device This bit is read/write when cold presence detection is supported on this Port as indicated by P CMD.CPD=1. This bit is read-only 1 when cold presence detection is not supported and P CMD.CPD=0. When set, the Port asserts the p _cp_pod output pin so that it may be used to provide power to a cold-presence detectable Port. (RW/RO) Register type: Read
1	SUD	Spin-Up Device This bit is read/write when staggered spin-up is supported as indicated by the CAP.SSS=1. This bit is read-only 1 when staggered spin-up is not supported and CAP.SSS=0. On an edge detect from 0 to 1, the Port starts a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Note: The SUD bit is read-only 0 on power-up until CAP.SSS bit is written with the required value. (RW/RO) Register type: Read
0	ST	Start When set to 1, the Port processes the command list. When cleared, the Port does not process the command list. Whenever this bit is changed from a 0 to a 1, the Port starts processing the command list at entry0. Whenever this bit is changed from a 1 to a 0, the P CI register is cleared by the Port upon transition into an idle state. Refer to AHCI specification, section 10.3.1, for important restrictions on when this bit can be set to 1. Note: P SERR register must be cleared prior to setting ST bit to 1. (RW) Register type: Read/Write

0x29000120 SATA_P0TFD

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_007F

This register contains Error and Status registers updated every time a new Register FIS, PIO Setup FIS, or Set Device Bits FIS is received from the device. Reset on Global or Port reset (COMRESET).

SATA_P0TFD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Reserved (RO)
15:8	ERR	Error This field contains the latest copy of the task file error register. (RO)
7:0	STS	Status This field contains the latest copy of the task file status register. The bits that affect DWC_ahsata operation are: Bit [7] BSY - Indicates the interface is busy Bits [6:4] cs - Command specific Bit [3] DRQ - Indicates a data transfer is requested Bits [2:1] cs - Command specific Bit [0] ERR - Indicates an error during the transfer Note: The Port updates the entire 8-bit field, not just the bits noted above. (RO)

0x29000124 SATA_P0SIG

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0xFFFF_FFFF

SATA_P0SIG

Bits	Name	Description
31:0	SIG	Signature This field contains the signature received from a device on the first D2H Register FIS. The bit order as follows: Bits [31:24] - LBA High (Cylinder High) Register Bits [23:16] - LBA Mid (Cylinder Low) Register Bits [15:8] - LBA Low (Sector Number) Register Bits [7:0] - Sector Count Register This field is updated once after a reset sequence. Reset on Global or Port reset. (RO)

0x29000128 SATA_P0SSTS

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This 32-bit register conveys the current state of the interface and host. The Port updates it continuously and asynchronously. When the Port transmits a COMRESET to the device, this register is updated to its reset values (i.e., Global reset, Port reset, or COMINIT from the device.

SATA_P0SSTS

Bits	Name	Description
31:12	RESERVED_BITS31_12	Reserved (RO)
11:8	IPM	Interface Power Management Indicates the current interface state. The options for this field are: 0x0: Device not present or communication not established 0x1: Interface in active state 0x2: Interface in Partial power management state 0x6: Interface in Slumber power management state All other values are reserved. (RO)
7:4	SPD	Current Interface Speed Indicates the negotiated interface communication speed. The options for this field are: 0x0: Device not present or communication not established 0x1: Generation 1 communication rate negotiated 0x2: Generation 2 communication rate negotiated All other values reserved. (RO)
3:0	DET	Device Detection Indicates the interface device detection and PHY state. The options for this field are: 0x0: No device detected and PHY communication not established 0x1: Device presence detected but PHY communication not established (COMINIT is detected) 0x3: Device presence detected and PHY communication established (PHY Ready is detected) 0x4: PHY in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved. (RO)

0x2900012C SATA_P0SCTL

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This 32-bit read-write register is used by the software to control SATA interface capabilities. Writes to this register result in an action being taken by the port PHY interface. Reads from the

register return the last value written to it. Reset on global reset. These bits are static and should not be changed frequently due to the clock crossing between the transport and link layers. The software must wait for at least seven periods of the slower clock (clk_asic or hclk) before changing this register.

SATA_P0SCTL

Bits	Name	Description
31:12	RESERVED_BITS31_12	Reserved (RO) Register type: Read
11:8	IPM	Interface Power Management Transitions Allowed This field indicates which power states the Port PHY interface is allowed to transition to. When an interface power management state is disabled, the Port does not initiate that state and any request from the device to enter that state is rejected via PMNAKp. The options for this field are: 0x0: No interface power management state restrictions 0x1: Transitions to the Partial state disabled 0x2: Transitions to the Slumber state disabled 0x3: Transitions to both Partial and Slumber states disabled All other values reserved and should not be used. (RW) Register type: Read/Write
7:4	SPD	Speed Allowed This field indicates the highest allowable speed of the Port PHY interface. The options for this field are: 0x0: No speed negotiation restrictions 0x1: Limit speed negotiation to Generation 1 communication rate 0x2: Limit speed negotiation to a rate not greater than Generation 2 communication rate All other values reserved and should not be used. Note: When the host software must change this field value, the host must also reset the Port (P SCTL.DET = 0x1) at the same time to ensure proper speed negotiation. (RW) Register type: Read/Write

SATA_P0SCTL (cont.)

Bits	Name	Description
3:0	DET	Device Detection Initialization Controls the Ports device detection and interface initialization. The options for this field are: 0x0: No device detection or initialization action requested 0x1: Perform interface initialization sequence to establish communication. This results in the interface being reset and communication re initialized. 0x4: Disable the Serial ATA interface and put the Port PHY in offline mode. All other values reserved. Note1: This field may only be modified when P CMD.ST is 0. Changing this field while the P CMD.ST=1 results in undefined behavior. When P CMD.ST is set to 1, this field should have a value of 0x0. Note2: The sequence consists of setting DET to 0x1, and after 1 ms clearing DET to 0x0. The actual behavior is little different than that described in the AHCI spec. The difference is that the COMRESET transmission starts only after clearing DET to 0x0, and not after setting DET to 0x1. However, this does not impact the port reset SW sequence. (RW) Register type: Read/Write

0x29000130 SATA_P0SERR

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This 32-bit register represents all the detected interface errors accumulated since the last time it was cleared. The set bits in the SError register indicate that the corresponding error condition became true one or more times since the last time the bit was cleared. The set bits in this register are explicitly cleared by a write operation to the register, Global reset, or Port reset (COMRESET). The value written to clear the set error bits should have ones encoded in the bit positions corresponding to the bits that are to be cleared. All bits in the following table have a reset value of 0.

SATA_P0SERR

Bits	Name	Description
31:27	RESERVED_BITS31_27	Reserved (RO)

SATA_P0SERR (cont.)

Bits	Name	Description
26	DIAG_X	Exchanged This bit is set to 1 when PHY COMINIT signal is detected. This bit is reflected in the P IS.PCS bit. (RW1C) Register type: Read/Write (1 clear)
25	DIAG_F	Unknown FIS Type This bit indicates that one or more FISes were received by the transport layer with good CRC, but had a type field that was not recognized/known and the length was less than or equal to 64 bytes. Note: When the Unknown FIS length exceeds 64 bytes, the DIAG_F bit is not set and the DIAG_T bit is set instead. (RW1C) Register type: Read/Write (1 clear)
24	DIAG_T	Transport State Transition Error This bit indicates that a transport layer protocol violation was detected since the last time this bit was cleared. (RW1C) Register type: Read/Write (1 clear)
23	DIAG_S	Link Sequence Error This bit indicates that one or more link state machine error conditions was encountered. One of the conditions that cause this bit to be set is device doing SYNC escape during FIS transmission. (RW1C) Register type: Read/Write (1 clear)
22	DIAG_H	Handshake Error This bit indicates that one or more R_ERRp was received in response to frame transmission. Such errors may be the result of a CRC error detected by the device, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame. (RW1C) Register type: Read/Write (1 clear)
21	DIAG_C	CRC Error This bit indicates that one or more CRC errors were detected by the Link layer during FIS reception. (RW1C) Register type: Read/Write (1 clear)
20	DIAG_D	Disparity Error This bit is always cleared to 0 since it is not used by the AHCI specification. (RO) Register type: Read

SATA_P0SERR (cont.)

Bits	Name	Description
19	DIAG_B	10B to 8B Decode Error This bit indicates errors were detected by 10b8b decoder. Note: This bit is set only when an error is detected on the received FIS data dword. This bit is not set when an error is detected on the primitive, regardless whether it is inside or outside the FIS. (RW1C) Register type: Read/Write (1 clear)
18	DIAG_W	Comm Wake This bit is set when PHY COMWAKE signal is detected. (RW1C) Register type: Read/Write (1 clear)
17	DIAG_I	PHY Internal Error This bit is set when the PHY detects some internal error as indicated by the assertion of the p _phy_rx_err input. Note: The setting of this bit is controlled by the BISTCR.ERREN bit: when ERREN==0 (default), only errors occurring inside the received FIS cause DIAG_I bit to be set; when ERREN==1, any error inside or outside the FIS causes the DIAG_I bit to be set. (RW1C) Register type: Read/Write (1 clear)
16	DIAG_N	PHY Ready Change This bit indicates that the PHY Ready signal changed state. This bit is reflected in the P IS.PRCS bit. (RW1C) Register type: Read/Write (1 clear)
15:12	RESERVED_BITS15_12	Reserved (RO) Register type: Read
11	ERR_E	Internal Error This bit is set to 1 when one or more AMBA bus ERROR responses are detected on the master interface. (RW1C) Register type: Read/Write (1 clear)
10	ERR_P	Protocol Error This bit is set to 1 when any of the following conditions are detected. Transport state transition error (DIAG_T) Link sequence error (DIAG_S) RxFIFO overflow Link bad end error (WTRM instead of EOF is received). (RW1C) Register type: Read/Write (1 clear)

SATA_P0SERR (cont.)

Bits	Name	Description
9	ERR_C	Non-recovered Persistent Communication Error This bit is set to 1 when PHY Ready signal is negated due to the loss of communication with the device or problems with interface, but not after transition from active to Partial or Slumber power management state. (RW1C) Register type: Read/Write (1 clear)
8	ERR_T	Non-recovered Transient Data Integrity Error This bit is set when any of the following P SERR register bits is set during Data FIS transfer: ERR_P (Protocol) DIAG_C (CRC) DIAG_H (Handshake) ERR_C (PHY Ready negation) (RW1C) Register type: Read/Write (1 clear)
7:2	RESERVED_BITS7_2	Reserved (RO) Register type: Read
1	ERR_M	Recovered Communication Error This bit is set to 1 when PHY ready condition is detected after interface initialization, but not after transition from partial or slumber power management state to active state. (RW1C) Register type: Read/Write (1 clear)
0	ERR_I	Recovered Data Integrity This bit is set when any of the following P SERR register bits is set during non- Data FIS transfer: ERR_P (Protocol) DIAG_C (CRC) DIAG_H (Handshake) ERR_C (PHY Ready negation) (RW1C) Register type: Read/Write (1 clear)

0x29000134 SATA_P0SACT

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

SATA_P0SACT

Bits	Name	Description
31:0	DS	Device Status This field is bit significant. Each bit corresponds to the TAG and command slot of a native queued command, where bit 0 corresponds to TAG 0 and command slot 0. Software sets this field prior to issuing a native queued command for a particular command slot. Prior to writing P CI[TAG] to 1, the software sets DS[TAG] to 1 to indicate that a command with that TAG is outstanding. This field is cleared to 0 when: The software writes P CMD.ST from a 1 to a 0. The device sends a Set Device Bits FIS to the Port. The Port clears bits in this field that are set to 1 in the SActive field of the Set Device Bits FIS. he Port clears only bits that correspond to native queued commands that have completed successfully. This field is not cleared by the following: Port reset (COMRESET). Software reset. Note: Software must write this field only when P CMD.ST bit is set to 1. (RW1S) Register type: Read/Write (1 set)

0x29000138 SATA_P0CI

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

SATA_P0CI

Bits	Name	Description
31:0	CI	Command Issued This field is bit significant. Each bit corresponds to a command slot, where bit 0 corresponds to command slot 0. This field is set by the software to indicate to the Port that a command has been built in system memory for a command slot and may be sent to the device. When the Port receives a FIS which clears the BSY, DRQ, and ERR bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field can only be set to 1 by the software when P CMD.ST is set to 1. Note: This field is reset when P CMD.ST is written from a 1 to a 0 by the software. (RW1S) Register type: Read/Write (1 set)

0x2900013C SATA_P0SNTF

Type: Read
Clock: CC_SATA_ACLK
Reset State: 0x0000_0000

This register is used to determine when asynchronous notification events have occurred for directly connected devices and devices connected to a port multiplier.

SATA_P0SNTF

Bits	Name	Description
31:16	RESERVED_BITS31_16	Reserved (RO) Register type: Read
15:0	PMN	PM Notify This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the DWC_ahsata Port with the Notification bit set: PM Port 0h sets bit 0, PM Port 1h sets bit 1, ... PM Port Fh sets bit 15. Individual bits are cleared by the software writing 1s to the corresponding bit positions. This field is reset on Global reset, but it is not reset by Port reset (COMRESET) or software reset. (RW1C) Register type: Read/Write (1 clear)

0x29000170 SATA_P0DMACR

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x0000_0044

This register contains bits for controlling the Port DMA engine. The software can change the fields of this register only when P CMD.ST=0. Power-up (system reset), Global reset, or Port reset (COMRESET) reset this register to the default value.

SATA_P0DMACR

Bits	Name	Description
31:8	RESERVED_BITS31_8	Reserved (RO) Register type: Read

SATA_P0DMACR (cont.)

Bits	Name	Description
7:4	RXTS	Receive Transaction Size This field defines the Port DMA transaction size in DWORDs for receive (system bus write, device read) operation. The options for this field are: 0x0: 1 DWORD 0x1: 2 DWORDs 0x2: 4 DWORDs 0x3: 8 DWORDs 0x4: 16 DWORDs (maximum value when P _RXFIFO_DEPTH=64) 0x5: 32 DWORDs 0x6: 64 DWORDs (maximum value when P _RXFIFO_DEPTH=128) 0x7: 128 DWORDs (maximum value when P _RXFIFO_DEPTH=256) 0x8: 256 DWORDs (maximum value when P _RXFIFO_DEPTH=512) 0x9: 512 DWORDs (maximum value when P _RXFIFO_DEPTH=1024) 0xA: 1024 DWORDs (maximum value when P _RXFIFO_DEPTH=2048) All other values are reserved and should not be used. This field is read-write when P CMD.ST=0 and read-only when P CMD.ST=1. The maximum value of this field is determined by the RxFIFO depth set by the P _RXFIFO_DEPTH parameter. When the software attempts to write a value exceeding this value, the maximum value would be set instead. (RW/RO) Register type: Read/Write

SATA_P0DMACR (cont.)

Bits	Name	Description
3:0	TXTS	Transmit Transaction Size This field defines the DMA transaction size in DWORDs for transmit (system bus read, device write) operation. The options for this field are: 0x0: 1 DWORD 0x1: 2 DWORDs 0x2: 4 DWORDs 0x3: 8 DWORDs 0x4: 16 DWORDs (maximum value when P_TXFIFO_DEPTH=32) 0x5: 32 DWORDs (maximum value when P_TXFIFO_DEPTH=64) 0x6: 64 DWORDs (maximum value when _TXFIFO_DEPTH=128) 0x7: 128 DWORDs (maximum value when P_TXFIFO_DEPTH=256) 0x8: 256 DWORDs (maximum value when P_TXFIFO_DEPTH=512) 0x9: 512 DWORDs (maximum value when P_TXFIFO_DEPTH=1024) 0xA: 1024 DWORDs (maximum value when P_TXFIFO_DEPTH=2048) All other values are reserved and should not be used. This field is read-write when P CMD.ST=0 and read-only when P CMD.ST=1. The maximum value of this field is determined by the TxFIFO depth set by the P _TXFIFO_DEPTH parameter. When the software attempts to write a value exceeding this value, the maximum value would be set instead. (RW/RO) Register type: Read/Write

0x29000178 SATA_P0PHYCR

Type: Read/Write
Clock: CC_SATA_ACLK
Reset State: 0x00000000

This register is used for Port PHY control. This register only exists when PHY_CTRL_W parameter is set to a non-zero value, otherwise this location is reserved. The width is set by the PHY_CTRL_W parameter (valid range: 0 to 32). When PHY_CTRL_W < 32, the remaining bits are reserved: reads return zeros, writes have no effect. Bits of this register are connected to the corresponding bits of the p _phy_ctrl output Port. Resets on power-up (system reset) only to the PHY_CTRL_DEF value.

SATA_P0PHYCR

Bits	Name	Description
31:16	NOP_BITS31_16	NO operation bits(RW) Register type: Read/Write

SATA_P0PHYCR (cont.)

Bits	Name	Description
15	SET_RXOOB0_CLKON_NOT	SET_RXOOB0_CLKON_NOT When this bit is clear(0), sata_rxoob0_clkon is constantly asserted. This bit should not be set if device initiated wakeup is expected. Register type: Read/Write
14	SET_PMALIVE_CLKON_NOT	SET_PMALIVE_CLKON_NOT When this bit is clear(0), sata_pmalive_clkon is constantly asserted. This bit should not be set if device initiated wakeup is expected. Register type: Read/Write
13	SET_PHY_CFG_CLKON_NOT	SET_PHY_CFG_CLKON_NOT When this bit is clear(0), sata_phy_cfg_clkon is constantly asserted. Register type: Read/Write
12	SET_AXI_CLKON_NOT	SET_AXI_CLKON_NOT When this bit is clear(0), sata_axi_clkon is constantly asserted. Register type: Read/Write
11:9	NOP_BITS11_9	NO operation bits (RW) Register type: Read/Write
8	FORCE_RX_DATA_VLD	When this bit is set(1), rx_data_vld input port is constant ’11’. (RW) Register type: Read/Write
7:4	TBS	Test Bus Select This field is used to select the input to the 32-bit SATA controller test bus port (sata_test_bus). The TBS pins selects from eight possible pages each with 32 possible observability points. When TBS[3:0] = 3’b0000 the output of the 32-bit test bus is set to logical 0’s. (RW) Register type: Read/Write
3	TSTB_FEED	SATA Testbus Feedthru This field is directly connected to output pin sata_test_bus[31] when TBS /= 0 and TBS[MSB] /= 1. It is used for debug and FPGA control. (RW) Register type: Read/Write

SATA_P0PHYCR (cont.)

Bits	Name	Description
2	NLB_M	Near-End Analog Mode This field is used to allow the SATA controller to enter a low power mode (partial/slumber) without actually placing the SATA PHY in that low power mode. This bit masks the p0_phy_partial and p0_phy_slumber signals to the SATA PHY. The Link can only get to the NEALB state through the L_POWER_DOWN state see (DW_SATA_link_sm) or the NO_CONN sate. But the SATA PHY cannot be placed into low power states since the clocks are turned off. When set to 1, the PHY will not enter any low power mode. (RW) Register type: Read/Write
1	PHY_PHYRESET_DISABLE	When this bit is set(1), p0_phy_phyreset output port is never asserted.
0	PHY_SRST	PHY Software Reset This field provides an active-high software reset to the SATA PHY. (RW) Register type: Read/Write

0x2900017C SATA_P0PHYSR

Type: Read
Clock: CC_SATA_ACLK
Reset State: Undefined

This register is used to monitor PHY status. This register only exists when PHY_STAT_W parameter is set to a non-zero value, otherwise this location is reserved. The width is set by the PHY_STAT_W parameter (valid range: 0 to 32). When PHY_CTRL_W < 32, the remaining bits are reserved: reads return zeros, writes have no effect. The bits of this register reflect the state of the corresponding bits of the p0_phy_status input.

Signals connected to the p _phy_status input can be asynchronous to any of the DWC_ahsata clocks, however they must not change faster than five hclk periods, otherwise the P PHYSR register may never be updated with the intermediate changing values.

Bits	Name	Description
1	RX_CHK_ERR_EN	Enable generation three error bits during PRBS/COMP/CHANNEL check loop - 0: disabled - 1: enabled
0	GEN_SHORT_PATTERN	- 0: Generate pattern data until rx_pat_chk_en set to 00 - 1: Generate 1composite pattern or N Channel Test Patterns (N is set by SATA_PHY_CHAN_COMP_CHK register), or PRBS generate 2^10 pattern then stop, depending on which is selected by rx_pat_chk_en.

0x1B40019C SATA_PHY_LBK_CTRL

Type: Read/Write
Clock: WCLK
Reset State: 0x00000000

This register configures.

SATA_PHY_LBK_CTRL

Bits	Name	Description
31:8	UNUSED	
7:2	RESERVED	
1	NE_LBK_EN_SEL	MUX selection for NE_lbk_en - 0: control by external nearafelb - 1: control by register bits
0	NEARAFELB_EN	MUX selection for NE_lbk_en - 0: control by external nearafelb - 1: control by register bits

0x1B4001A0 SATA_PHY_TEST_DEBUG_CTRL

Type: Read/Write
Clock: WCLK
Reset State: 0x00000000

This register configures.

SATA_PHY_TEST_DEBUG_CTRL

Bits	Name	Description
31:8	UNUSED	
7:5	DEBUG_BUS_SEL	MUX selection for 32 bit debug bus - 000: 32 bit debug bus value is zero. - 001: 32 bit debug bus value from SATA_PHY_DEBUG_BUS_STAT3/2/1/0. - 010: 32 bit debug bus value from UNIPHY PLL debug bus selected by UNIPHY_PLL_DEBUG_BUS_SEL[7:0]
4:0	DTESTMUX_SEL	- 32 internal digital signals to be selected to a single TPA pad

0x1B4001A4 SATA_PHY_ALIGNP

Type: Read/Write
Clock: WCLK
Reset State: 0x0000004F

This register configures the ALIGNp counter settings.

SATA_PHY_ALIGNP

Bits	Name	Description
31:8	UNUSED	
7	RESERVED	
6	COM_DET_ENA	Enables comma detection output - 0: Disabled - 1: Enabled
5	CFG_ALIGNP_DET_DIS	Disables alignp detection. - 0: Not disabled - 1: Disabled.
4:0	CFG_MAX_ALIGNP_CONT	Alignp counter settings - 5 bits - 64 continous ALIGNp Dword per cont including the align dword count cfg_max_alignp_cont is the maximum upper 5 bits of the 11 bit counter - 00000 : 2^6 Dword - 00001 : 2^7 Dword - 00011 : 2^8 Dword - 00111 : 2^9 Dword - 01111 : 2^10 Dword - 11111: 2^11 Dword The default max alignp dword is 2^10-1, the max upper 5 bits, is 5b0_1111 as the default value

0x1B4001A8 SATA_PHY_PRBS_CFG0

Type: Read/Write
Clock: WCLK
Reset State: 0x000000FF

Action Time: Writes to this register take effect immediately.

This register configures the PRBS settings. A seed value of 0x67 should not be used.

SATA_PHY_PRBS_CFG0

Bits	Name	Description
31:8	UNUSED	
7:0	PRBS_SEED_7_0	User defined PRBS seed for the Generator and Checker. Some example seeds for the user: data_seed[9:0]: - 1010110010 - 1101000111 - 0111110101 - 1000010000

0x1B4001AC SATA_PHY_PRBS_CFG1

Type: Read/Write
Clock: WCLK
Reset State: 0x00000003

Action Time: Writes to this register take effect immediately.

This register configures the PRBS settings. A seed value of 0x67 should not be used.

SATA_PHY_PRBS_CFG1

Bits	Name	Description
31:8	UNUSED	
7:2	RESERVED	
1:0	PRBS_SEED_9_8	User defined PRBS seed for the Generator and Checker.

0x1B4001B0 SATA_PHY_PRBS_CFG2

Type: Read/Write
Clock: WCLK
Reset State: 0x00000009

Action Time: Writes to this register take effect immediately.

This register configures the PRBS settings.

SATA_PHY_PRBS_CFG2

Bits	Name	Description
31:8	UNUSED	
7:0	PRBS_POLYNOM_7_0	User defined PRBS polynomial for the Generator and Checker. An example polynomial for the user: prbs_polynom[10:0]: - 100_0000_1001

0x1B4001B4 SATA_PHY_PRBS_CFG3

Type: Read/Write
Clock: WCLK
Reset State: 0x00000000

Action Time: Writes to this register take effect immediately.

This register configures the PRBS settings.

SATA_PHY_PRBS_CFG3

Bits	Name	Description
31:8	UNUSED	
7:2	RESERVED	
1:0	PRBS_POLYNOM_9_8	User defined PRBS polynomial for the Generator and Checker. Bit 10 is assumed to be 1 and therefore ommitting the need to explicity specify via register write.

0x1B4001B8 SATA_PHY_CHAN_COMP_CHK_CNT

Type: Read/Write
Clock: WCLK
Reset State: 0x0000003F

This register configures the error checker duration for short Channel and Composite error checks.

SATA_PHY_CHAN_COMP_CHK_CNT

Bits	Name	Description
31:8	UNUSED	

SATA_PHY_CHAN_COMP_CHK_CNT (cont.)

Bits	Name	Description
7:0	CHAN_COMP_CHK_CNT	When the short pattern option is set and the Channel Test Pattersn type is selected, this counter specifies how long the active error check duration is. This is user programmable from 15 to 4095 cycles, in 16 cycle increments. chan_comp_chk_cnt[7:0] - 0000_0000: 15 cycles - 0000_0001: 31 cycles - 0000_0010: 47 cycles ... - 1111_1111: 4095 cycles

0x1B4001BC SATA_PHY_RESET_CTRL

Type: Read/Write
Clock: WCLK
Reset State: 0x00000000

This register allows the application of the S/W Reset.

SATA_PHY_RESET_CTRL

Bits	Name	Description
31:8	UNUSED	
7:1	RESERVED	
0	SW_RESET	S/W Reset Control

0x1B4001C0 SATA_PHY_RX_CLR

Type: Read/Write
Clock: WCLK
Reset State: 0x00000000

This register allows for the clearing of select SATA_PHY_RX related registers.

SATA_PHY_RX_CLR

Bits	Name	Description
31:8	UNUSED	
7:5	RESERVED_1	
4	FORCE_RX_ENABLE_ON	When asserted, the PHY offline mode feature is disabled
3:1	RESERVED_2	

SATA_PHY_RX_CLR (cont.)

Bits	Name	Description
0	RX_STAT_CLR	When asserted, the contents of SATA_PHY_RX_CHK_ERR_CNT0, SATA_PHY_RX_CHK_ERR_CNT1will be cleared. SW should assert this bit then de-assert the bit after the registers values have been cleared.

0x1B4001C4 SATA_PHY_RX_EBUF_CTRL

Type: Read/Write
Clock: WCLK
Reset State: 0x00000002

This register is for elastic buffer retime loop back for debug purpose.

SATA_PHY_RX_EBUF_CTRL

Bits	Name	Description
31:8	UNUSED	
7:4	RESERVED	
3	RX_EBUF_COMMA_INSERT_EN	When EBUF empty, 1 => comma symbol inserted,0 => zero inserted
2	RX_EBUF_ALIGNP_INSERT_EN	When EBUF empty, two back-back ALIGNP inserted
1	RX_EBUF_ALIGNP_DROP_EN	Drop ALIGNP before RX data pushed into EBUF
0	RX_EBUF_EN	Enable elastic buffer retime loopback

0x1B4001C8 SATA_PHY_REVISION_ID0

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows the status of the ID0 <7:0>.

SATA_PHY_REVISION_ID0

Bits	Name	Description
31:8	UNUSED	
7:0	STEP_7_0	READ ONLY No description for this yet.

0x1B4001CC SATA_PHY_REVISION_ID1

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows the status of the ID1 <7:0>.

SATA_PHY_REVISION_ID1

Bits	Name	Description
31:8	UNUSED	
7:0	STEP_15_8	READ ONLY No description for this yet.

0x1B4001D0 SATA_PHY_REVISION_ID2

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows the status of the ID2 <7:0>.

SATA_PHY_REVISION_ID2

Bits	Name	Description
31:8	UNUSED	
7:0	MINOR_7_0	READ ONLY No description for this yet.

0x1B4001D4 SATA_PHY_REVISION_ID3

Type: Read
Clock: WCLK
Reset State: 0x00000010

This register shows the status of the ID3 <7:0>.

SATA_PHY_REVISION_ID3

Bits	Name	Description
31:8	UNUSED	
7:4	MAJOR	READ ONLY No description for this yet.

SATA_PHY_REVISION_ID3 (cont.)

Bits	Name	Description
3:0	MINOR_11_8	READ ONLY No description for this yet.

0x1B4001D8 SATA_PHY_RX_CHK_ERR_CNT0

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows the status of the RX Checker Error Counter.

SATA_PHY_RX_CHK_ERR_CNT0

Bits	Name	Description
31:8	UNUSED	
7:0	RX_CHK_ERR_CNT_7_0	READ ONLY LSBs of the 16 bit RX BIST Error Checker Counter

0x1B4001DC SATA_PHY_RX_CHK_ERR_CNT1

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows the status of the RX Checker Error Counter.

SATA_PHY_RX_CHK_ERR_CNT1

Bits	Name	Description
31:8	UNUSED	
7:0	RX_CHK_ERR_CNT_15_8	READ ONLY MSBs of the 16 bit RX BIST Error Checker Counter.

0x1B4001E0 SATA_PHY_RX_CHK_STAT

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows the status of the RX BIST Checker.

SATA_PHY_RX_CHK_STAT

Bits	Name	Description
31:8	UNUSED	
7	RESERVED_1	
6	CDR_ALIGN_DET	READ ONLY Asserts when the specified number of ALIGNp patterns have been detected.
5	RX_SIGNAL_VALID	READ ONLY High indicates that the concurrent RX_DATA outputs are valid. Low indicates that the RX_DATA outputs should be ignored.
4	RXCHK_HEADER_SEL	READ ONLY Indicates whether the rxchk header is used.
3	RESERVED_2	
2	PAT_DATA_NOT_FOUND	READ ONLY Indicates that the RX Checker FSM has found the Header but can not find the Pattern data and timeout has occurred. - 0: Pattern Data check timeout has not occurred. - 1: Can not find Pattern Data, timeout has occurred.
1	HEADER_NOT_FOUND	READ ONLY Indicates that the RX Checker FSM has not found the Header for the pattern. - 0: Header Timeout has not occured. - 1: Can not find Header, timeout has occurred.
0	CHECK_DONE	READ ONLY Indicates when the RX Checker FSM has finished the short pattern check

0x1B4001E4 SATA_PHY_TX_IMCAL_STAT

Type: Read
Clock: WCLK
Reset State: 0x00000020

This register shows the status of the TX calibration.

SATA_PHY_TX_IMCAL_STAT

Bits	Name	Description
31:8	UNUSED	
7	RESERVED	
6	TX_IMCAL_VOTER_ERROR	READ ONLY

SATA_PHY_TX_IMCAL_STAT (cont.)

Bits	Name	Description
5:1	TX_IMCAL_STR	READ ONLY Value of calibraton string.
0	TX_IMCAL_DONE	READ ONLY Value of calibration done.

0x1B4001E8 SATA_PHY_RX_IMCAL_STAT

Type: Read
Clock: WCLK
Reset State: 0x00000020

This register shows the status of the RX calibration.

SATA_PHY_RX_IMCAL_STAT

Bits	Name	Description
31:8	UNUSED	
7	RESERVED	
6	RX_IMCAL_VOTER_ERRO R	READ ONLY
5:1	RX_IMCAL_STR	READ ONLY Value of calibraton string.
0	RX_IMCAL_DONE	READ ONLY Value of calibration done.

0x1B4001EC SATA_PHY_RX_EBUF_STAT

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows elastic buffer error status

SATA_PHY_RX_EBUF_STAT

Bits	Name	Description
31:8	UNUSED	
7	RESERVED	
6:5	RX_EBUF_ERR_OVERFLO W	READ ONLY Bit 0 => FIFO overflow, 1 => Tx data buffer overflow

SATA_PHY_RX_EBUF_STAT (cont.)

Bits	Name	Description
4:0	RX_EBUF_ERR_CNT	READ ONLY Number of RX data ALIGNP errors

0x1B4001F0 SATA_PHY_DEBUG_BUS_STAT0

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows debug bus status

SATA_PHY_DEBUG_BUS_STAT0

Bits	Name	Description
31:8	UNUSED	
7:0	DEBUG_BUS_STAT0	READ ONLY Status of debug bus zero

0x1B4001F4 SATA_PHY_DEBUG_BUS_STAT1

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows debug bus status

SATA_PHY_DEBUG_BUS_STAT1

Bits	Name	Description
31:8	UNUSED	
7:0	DEBUG_BUS_STAT1	READ ONLY Status of debug bus zero

0x1B4001F8 SATA_PHY_DEBUG_BUS_STAT2

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows debug bus status

SATA_PHY_DEBUG_BUS_STAT2

Bits	Name	Description
31:8	UNUSED	
7:0	DEBUG_BUS_STAT2	READ ONLY Status of debug bus zero

0x1B4001FC SATA_PHY_DEBUG_BUS_STAT3

Type: Read
Clock: WCLK
Reset State: 0x00000000

This register shows debug bus status

SATA_PHY_DEBUG_BUS_STAT3

Bits	Name	Description
31:8	UNUSED	
7:0	DEBUG_BUS_STAT3	READ ONLY Status of debug bus zero

19 SFPB Wrapper Registers

19.1 Overview

Table 19-1 SFPB_Wrapper Bases

Base Name	Parent	Address
SFPB_XPU_APU_RGn_RACR	SFPB_WRAPPER_XPU_BASE	0x00E00000
SFPB_SFPB_CTRL_STATUS	SFPB_WRAPPER_BASE	0x00F00000
SFPB_MUTEX_MUTEX_SW_RESET	SFPB_WRAPPER_MUTEX_BASE	0x01200000
SFPB_1x2_SFPB_CTRL_STATUS	SFPB_WRAPPER_1x2_BASE	0x01600000
SFPB_2x1_SFPB_CTRL_STATUS	SFPB_WRAPPER_2x1_BASE	0x01800000

19.2 SFPB XPU Registers (0x00E00000 SFPB_WRAPPER_XPU_BASE)

This section contains System FPB XPU registers.

19.2 XPU Registers

0x00E00000+ 4*n SFPB_XPU_APU_RGn_RACR, n=[0..23]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type APU. These registers include a single bit per VMID granting read access.

SFPB_XPU_APU_RGn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x00E00400+ 4*n SFPB_XPU_APU_RGn_WACR, n=[0..23]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when APU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type APU.

SFPB_XPU_APU_RGn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x00E00F80 SFPB_XPU_APU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

APU Configuration Register: This register includes fields governing various APU behaviors.

SFPB_XPU_APU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set APU_ESR. APU_EAR and APU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set APU_ESR. APU_EAR and APU_ESYNR0 updated with address and syndrome of error.
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x00E00F84 SFPB_XPU_APU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

SFPB_XPU_APU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x00E00F88 SFPB_XPU_APU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the APU_ESYNRn registers, which are merely the "syndrome" of an error indicated by APU_ESR.

SFPB_XPU_APU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x00E00F8C SFPB_XPU_APU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

SFPB_XPU_APU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x00E00F90 SFPB_XPU_APU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

SFPB_XPU_APU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x00E00F94 SFPB_XPU_APU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

SFPB_XPU_APU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x00E00FF4 SFPB_XPU_APU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

SFPB_XPU_APU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved

SFPB_XPU_APU_REV (cont.)

Bits	Name	Description
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x00E00FF8 SFPB_XPU_APU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x00001C17

APU ID Register: Read-only register that defines various configuration attributes of the APU instance.

SFPB_XPU_APU_IDR

Bits	Name	Description
31:29	RESERVED31_21	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.

SFPB_XPU_APU_IDR (cont.)

Bits	Name	Description
9:8	RESERVED9_8	Reserved
7:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x00E00FFC SFPB_XPU_APU_APU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

SFPB_XPU_APU_APU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APUs (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

19.3 System FPB 2x23 Registers (0x00F00000 SFPB_WRAPPER_BASE)

This section contains System FPB configuration registers.

19.3.1 Configuration registers

0x00F00000 SFPB_SFPB_CTRL_STATUS

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000

The SFPB_CTRL_STATUS register is a general configuration register.

SFPB_SFPB_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0)
11	RPM_ARM7_IRQ_EN	SW: RW, HW: R ARM7InterruptEnable When set, the ARM7 receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	SC_IRQ_EN	SW: RW, HW: R ScorpionInterruptEnable When set, the Scorpion receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

SFPB_SFPB_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x6: Select the S1_M1 ahb2ahb bdg tbus.

0x00F00044 SFPB_SFPB_PORT_EN

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFF

The SFPB_PORT_EN register is a SFPB master port enable register.

SFPB_SFPB_PORT_EN

Bits	Name	Description
31:2	RESERVED_BIT31_2	
1	M1_PORT_EN	SW: RW, HW: R M1PortEnable When cleared (0), M1 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

19.3.2 Bus error registers and additional configure registers

0x00F00050 SFPB_SFPB_ERROR_STAT

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000000

The SFPB_ERROR_STAT register is the bus error status register.

SFPB_SFPB_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the channel ID that caused the detected error when CID is valid for the master of the access. If not, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Master0 0x1: Master1
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	

SFPB_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the SFPB_ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x00F00054 SFPB_SFPB_ERROR_ADDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x00000000

The SFPB_ERROR_ADDR register contains the bus error address.

SFPB_SFPB_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when SFPB_ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x00F00058 SFPB_SFPB_GPREG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0000

The SFPB_GPREG register is a configurable general purpose register.

SFPB_SFPB_GPREG

Bits	Name	Description
31:18	RESERVED_BITS31_18	
17	SFPB_MSM_BRIDGE_TIME_OUT_EN	SW: RW, HW: W GpregContent Enable/Disable SFPB APQ BRIDGE TIME OUT EN. Power up value is clear (0)
16:9	SFPB_MSM_BRIDGE_TIME_OUT_VAL	SW: RW, HW: W GpregContent Set SFPB APQ BRIDGE TIME OUT COUNTER. Power up value is clear (0)
8	MPM_MSM_BRIDGE_TIME_OUT_EN	SW: RW, HW: W GpregContent Enable/Disable MPM APQ BRIDGE TIME OUT EN. Power up value is clear (0)
7:0	MPM_MSM_BRIDGE_TIME_OUT_VAL	SW: RW, HW: W GpregContent Set MPM APQ BRIDGE TIME OUT COUNTER. Power up value is clear (0)

0x00F0005C SFPB_SFPB_XPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFFFFFF

The SFPB_XPU_ACR register is a SFPB Access Control Register for configure register protection.

SFPB_SFPB_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R ACR RWE SFPB XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the SFPB configure space, including this register itself. Power up value is set (1)

0x00F00060 SFPB_SFPB_HW_CLK_GATING_CFG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0000

The SFPB_HW_CLK_GATING_CFG register is for hardware clock gating configuration register.

SFPB_SFPB_HW_CLK_GATING_CFG

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	HYSTERESIS_CNT_SW	SW: RW, HW: R Hysteresis Conter Value The value of this field is from SW to set the hysteresis counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING set to 1. Power up value is clear (0)
3:0	WAKE_CNT_SW	SW: RW, HW: R Wakeup Counter Value The value of this field is from SW to set the wakeup counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING set to 1. Power up value is clear (0)

19.4 SFPB MUTEX Registers (0x01200000 SFPB_WRAPPER_MUTEX_BASE)

This section describes all of the System FPM MUTEX registers including behavior. The behavior of any MUTEX register is split into read and write. On a Processor read, the value stored is simply returned. On a Processor write, if the value to be written is `0' then it is written; if the value to be written is non-zero, then it is written only if the stored value is `0'.

0x01200600 SFPB_MUTEX_MUTEX_SW_RESET

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0

MUTEX_SW_RESET register resets the MUTEX_REGn blocks. Software has to assert and then de-assert the reset in order to clear the MUTEX_REGn.

SFPB_MUTEX_MUTEX_SW_RESET

Bits	Name	Description
0	RESET	0x0: de-asserts reset 0x1: asserts reset

0x01200604+4*n SFPB_MUTEX_MUTEX_REGn, n=[0..31]

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0

The MUTEX_REGn register specifies the information regarding the access status of each of the 32 sections of memory, which is denoted by n. Register contents of 0 imply that the respective section of memory is free to use, and therefore unlocked. Non-zero contents would imply that the respective section of memory is in use, and therefore locked.

SFPB_MUTEX_MUTEX_REGn

Bits	Name	Description
3:0	REG_DATA	Mutex register data.

19.5 System FPB 1x2 Registers (0x01600000 SFPB_WRAPPER_1x2_BASE)

This section contains the System FPB 1x2 registers.

19.5.1 Configuration registers

0x01600000 SFPB_1X2_SFPB_CTRL_STATUS

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000

The SFPB_CTRL_STATUS register is a general configuration register

SFPB_1X2_SFPB_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0)
11	RPM_ARM7_IRQ_EN	SW: RW, HW: R ARM7InterruptEnable When set, the ARM7 receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	SC_IRQ_EN	SW: RW, HW: R ScorpionInterruptEnable When set, the Scorpion receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

SFPB_1X2_SFPB_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x7: Select the M0 ahb2ahb bridge test bus.

0x01600004+ 0x4*a SFPB_1X2_SFPB_AHB2AHB_CFG_Ma, a=[0..0]

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x09

The SFPB_AHB2AHB_CFG_Ma register is to configure the AHB2AHB bridge of master Ma. The AHB2AHB bridge is instantiated if the AHB interface is async (Generic: MASTER_ASYNC_IF(a) = ’1’). Otherwise this register is reserved.

SFPB_1X2_SFPB_AHB2AHB_CFG_Ma

Bits	Name	Description
30:6	RESERVED_BITS30_6	
5:4	M_AHB2AHB_TEST_EN	SW: RW, HW: R Test enable for the Sa lite_bridge. Power up value is 00 0x0: DISABLED 0x1: Select slave side test signals 0x2: Select master side test signals 0x3: RESERVED_PROGRAMMING
3	M_WPOST_EN	SW: RW, HW: R MaWritePostEnable When set (1), the ahb2ahb bridge will support posting of write data. When cleared (0), each write request must complete across the bus before the next is accepted. Power up value is set (1)
2	M_HALT_ACK	SW:R, HW:W Indicates the Ma acknowledgement of halt_req asserted by software. Power up value is clear (0).

SFPB_1X2_SFPB_AHB2AHB_CFG_Ma (cont.)

Bits	Name	Description
1	M_HALT_REQ	SW:RW, HW:R Software should write to this register to request the Ma lite_bridge master to cleanly halt. Power up value is clear (0).
0	M_IDLE	SW:R, HW:W Indicates that the Ma lite bridge master FSM is in IDLE state. Power up value is set (1).

0x01600044 SFPB_1X2_SFPB_PORT_EN

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x1

The SFPB_PORT_EN register is a SFPB master port enable register.

SFPB_1X2_SFPB_PORT_EN

Bits	Name	Description
31:1	RESERVED_BIT31_1	
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

19.5.2 Bus error registers and additional configure registers

0x01600050 SFPB_1X2_SFPB_ERROR_STAT

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000000

The SFPB_ERROR_STAT register is the bus error status register.

SFPB_1X2_SFPB_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	

SFPB_1X2_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the channel ID that caused the detected error when CID is valid for the master of the access. If not, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Master0 0x1: Master1 0x2: Master2 0x3: Master3 0x4: Master4 0x5: Master5 0x6: Master6 0x7: Master7 0x8: Master8 0x9: Master9 0xA: Master10 0xB: Master11 0xC: Master12 0xD: Master13 0xE: Master14 0xF: Master15
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	

SFPB_1X2_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the SFPB_ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x01600054 SFPB_1X2_SFPB_ERROR_ADDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x00000000

The SFPB_ERROR_ADDR register contains the bus error address.

SFPB_1X2_SFPB_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when SFPB_ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x01600058 SFPB_1X2_SFPB_GPREG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0000

The SFPB_GPREG register is a configurable general purpose register.

SFPB_1X2_SFPB_GPREG

Bits	Name	Description
31:0	RESERVED_BIT31_0	

0x0160005C SFPB_1X2_SFPB_XPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFFFFFF

The SFPB_XPU_ACR register is a SFPB Access Control Register for configure register protection.

SFPB_1X2_SFPB_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R ACR RWE SFPB XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the SFPB configure space, including this register itself. Power up value is set (1)

0x01600060 SFPB_1X2_SFPB_HW_CLK_GATING_CFG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0000

The SFPB_HW_CLK_GATING_CFG register is for hardware clock gating configuration register.

SFPB_1X2_SFPB_HW_CLK_GATING_CFG

Bits	Name	Description
31:11	RESERVED_BITS31_11	

SFPB_1X2_SFPB_HW_CLK_GATING_CFG (cont.)

Bits	Name	Description
10:4	HYSTERESIS_CNT_SW	SW: RW, HW: R Hysteresis Counter Value The value of this field is from SW to set the hysteresis counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING set to 1. Power up value is clear (0)
3:0	WAKE_CNT_SW	SW: RW, HW: R Wakeup Counter Value The value of this field is from SW to set the wakeup counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING set to 1. Power up value is clear (0)

19.6 System FPB 2x1 Registers (0x01800000 SFPB_WRAPPER_2x1_BASE)

This section contains the System FPB 2x1 registers.

19.6.1 System FPB 2x1 Registers

19.6.1.1 Configuration registers

0x01800000 SFPB_2X1_SFPB_CTRL_STATUS

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000

The SFPB_CTRL_STATUS register is a general configuration register.

SFPB_2X1_SFPB_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0)
11	RPM_ARM7_IRQ_EN	SW: RW, HW: R ARM7InterruptEnable When set, the ARM7 receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	SC_IRQ_EN	SW: RW, HW: R ScorpionInterruptEnable When set, the Scorpion (or other application processors such as Krait) receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

SFPB_2X1_SFPB_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x6: Select the S1_M1 ahb2ahb bdg tbus.

0x01800044 SFPB_2X1_SFPB_PORT_EN

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFF

The SFPB_PORT_EN register is a SFPB master port enable register.

SFPB_2X1_SFPB_PORT_EN

Bits	Name	Description
31:2	RESERVED_BIT31_2	
1	M1_PORT_EN	SW: RW, HW: R M1PortEnable When cleared (0), M1 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

19.6.1.2 Bus error registers and additional configure registers

0x01800050 SFPB_2X1_SFPB_ERROR_STAT

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000000

The SFPB_ERROR_STAT register is the bus error status register.

SFPB_2X1_SFPB_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the channel ID that caused the detected error when CID is valid for the master of the access. If not, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Master0 0x1: Master1
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	

SFPB_2X1_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the SFPB_ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x01800054 SFPB_2X1_SFPB_ERROR_ADDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x00000000

The SFPB_ERROR_ADDR register contains the bus error address.

SFPB_2X1_SFPB_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when SFPB_ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x01800058 SFPB_2X1_SFPB_GPREG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0000

The SFPB_GPREG register is a configurable general purpose register.

SFPB_2X1_SFPB_GPREG

Bits	Name	Description
31:0	RESERVED_BITS31_0	

0x0180005C SFPB_2X1_SFPB_XPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFFFFFF

The SFPB_XPU_ACR register is a SFPB Access Control Register for configure register protection.

SFPB_2X1_SFPB_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R ACR RWE SFPB XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the SFPB configure space, including this register itself. Power up value is set (1)

0x01800060 SFPB_2X1_SFPB_HW_CLK_GATING_CFG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0000

The SFPB_HW_CLK_GATING_CFG register is for hardware clock gating configuration register.

SFPB_2X1_SFPB_HW_CLK_GATING_CFG

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	HYSTERESIS_CNT_SW	SW: RW, HW: R Hysteresis Counter Value The value of this field is from SW to set the hysteresis counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING set to 1. Power up value is clear (0)

SFPB_2X1_SFPB_HW_CLK_GATING_CFG (cont.)

Bits	Name	Description
3:0	WAKE_CNT_SW	SW: RW, HW: R Wakeup Counter Value The value of this field is from SW to set the wakeup counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING set to 1. Power up value is clear (0)

0x01800064 SFPB_2X1_SFPB_XPU_ACR_ERR_STATUS

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0000

The SFPB_XPU_ACR_ERR_STATUS register is for capturing the status when there is an XPU (ACR) access error.

SFPB_2X1_SFPB_XPU_ACR_ERR_STATUS

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:22	HVMID	SW: RW, HW: W HVMID of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
21	HWRITE	SW: RW, HW: W HVMID of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
20:9	HADDR	SW: RW, HW: W HADDR of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
8:6	HSIZE	SW: RW, HW: W HSIZE of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).

SFPB_2X1_SFPB_XPU_ACR_ERR_STATUS (cont.)

Bits	Name	Description
5	HPROTNS	SW: RW, HW: W HPROTNS of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
4:1	HPROT	SW: RW, HW: W HPROT of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
0	ERROR_DETECT_CSR	SW: RW, HW: RW ErrorDetect during CSR accesses. When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the SFPB_XPU_ACR_ERR_STATUS register to capture the next error detected. Power up value is clear (0)

19.6.1.3 M2VMT (hmaster index) registers(existing when VMIDMAPPER=1)

0x01801000+ 0x4*n SFPB_2X1_M2VMT_M2VMRn, n=[0..1]

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where n = NUM_M2VMT_ENTRIES from the design generics

SFPB_2X1_M2VMT_M2VMRn

Bits	Name	Description
31:5	RESERVED	n = NUM_M2VMT_ENTRIES from the design generic/parameter.

SFPB_2X1_M2VMT_M2VMRn (cont.)

Bits	Name	Description
4:0	VMID	Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRn address associations.

0x01801F80 SFPB_2X1_M2VMT_CR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: xxx0

Global configuration register.

Note: When REMOVE_M2VMT_RPU = ’1’, this register is not available. Also, bit [2], is not valid or has no effect when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT =‘1’.

SFPB_2X1_M2VMT_CR

Bits	Name	Description
31:4	RESERVED	
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., in valid addresses) are recorded as such. Decode error is asserted when config access to un-implemented and/or unmapped register/address are done. Also, note that decode error is never asserted for client port accesses. When value is set to ’0’ i.e., ’do not record’, decode errors do not set the M2VMT_ESR[CFG], and M2VMT_EAR & M2VMT_SYNRn is not updated. When value is set to ’1’, i.e., ’record’, decode errors set M2VMT_ESR[CFG] and M2VMT_EAR & M2VMT_SYNRn is updated with the address and the syndrome of the error. Reset State: x
2	RPUEIE	RPU error interrupt Enable: When set, configuration port errors are reported directly to the interrupt controller via the M2VMT_intr, interrupt output signal. Interrupt output is asserted if M2VMT_CR[RPUIE_EN] is ’1’ and ANY bit is set in the M2VMT_ESR register. Special Note: Not valid or has no effect on the interrupt when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=’1’. Reset State: x

SFPB_2X1_M2VMT_CR (cont.)

Bits	Name	Description
1	RPUERE	RPU error report enable: When set, M2VMT reports configuration port errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via CRIF port will use a decode error, rather than a slave error. Regardless of the value of this field, both configuration port errors are terminated by the M2VMT as RAZ/WI, and are recorded in M2VMT_ESR register. Reset State: X
0	RPUE	RPU Enable: Governs whether M2VMT_RPU_ACR is enabled to check the VMID of the configuration request. When set, all configuration port accesses are checked against M2VMT_RPU_ACR register for access permissions. It's cleared by reset. Set once SROT configures MID->VMID mapping tables Reset State: 0

0x01801F84 SFPB_2X1_M2VMT_EAR

Type: Read
Clock: CC_SFPB_CLK
Reset State: unknown

When there is an error, this register holds the physical address of the errant transaction.

SFPB_2X1_M2VMT_EAR

Bits	Name	Description
31:0	PA	M2VMT Error Address Register: Physical address[31:0]. Contains the physical address of the errant request. Based on implementation, it may not contain the full 32 bits of the address. Captures the address on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. Special Note: When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT = '1', this register is not available and therefore access to this register are treated as RAZ/WI.

0x01801F88 SFPB_2X1_M2VMT_ESR

Type: Read/Write to clear
Clock: CC_SFPB_CLK
Reset State: Undefined

M2VMT Error Status Register:

Captures the status upon M2VMT configuration errors, as determined by the M2VMT_RPU_ACR.

This register has read/write-clear access, meaning that reads simply provide a value in the register, while writes are performed by clearing those bits corresponding to ’1’s in the value written data, and leaving unchanged those bits corresponding to 0s n the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old error. A write with a ’1’ set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

The presence of an asserted value on any bit in this register is what prompts the assertion when enabled by M2VMT_CR[RPUEIE] of the M2MVT’s interrupt output. Therefore these bits must be cleared by the interrupt handler. This is contrasted with the fields in the M2VMT_ESYNRn register, which are merely the ’syndrome’ of an error indicated by the M2VMT_ESR.

For M2VMT, there is only one defined error status bit in the M2VMT_SER (actually two, if you count multi-error).

SFPB_2X1_M2VMT_ESR

Bits	Name	Description
31	MULTI	Multi-Error: When set to ’1’, indicates that an additional error occurred while M2VMT_ESR is non-zero. The M2VMT_EAR,M2VMT_ESYNRn and M2VMT_ESR registers (with the exception of this bit) lock on the first error, and must be cleared to unlock. Therefore, the status and the syndrome of errors that occurred while M2VMT_ESR[CFG] is ’1’ are lost, i.e., syndrome register and status register stores only details of the first error. **NOTE** When REMOVE_M2VMT_RPU=’1’ OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT=’1’, this register is not available and therefore access to this register is treated as RAZ/WI.
30:1	RESERVED	
0	CFG	Configuration Port Error: When set to ’1’, indicates an error associated with a configuration port request.

0x01801F8C SFPB_2X1_M2VMT_ESRRESTORE

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: unknown

SFPB_2X1_M2VMT_ESRRESTORE

Bits	Name	Description
31:0	M2VMT_ESRRTORE	M2VMT Error Status Register Restore This is just an aliased address for M2VMT_ESR, which provides direct write access (rather than write-clear) for restoration purpose **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this register is treated as RAZ/WI.

0x01801F90 SFPB_2X1_M2VMT_ESYNR0

Type: Read
Clock: CC_SFPB_CLK
Reset State: undefined

Error Syndrome Register 0:

Captures the syndrome on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) 'lock' upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., the syndrome register and the status register stores details of only the first error.

SFPB_2X1_M2VMT_ESYNR0

Bits	Name	Description
31:24	ATID	ATID[7:0] field of errant request. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT="1", this register is not available and therefore access to this register is treated as RAZ/WI.
23:21	RESERVED	
20:16	AVMID	AVMID[4:0] field of errant request.
15:0	AMID	AMID[15:0] field of errant request.

0x01801F94 SFPB_2X1_M2VMT_ESYNR1

Type: Read
Clock: CC_SFPB_CLK
Reset State: Undefined

Error Syndrome Register 1:

Captures syndrome upon M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) 'lock' upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., the syndrome register and the status register stores details of only the first error.

SFPB_2X1_M2VMT_ESYNR1

Bits	Name	Description
31	DCD	Decode: Indicates configuration port error due to invalid/ unrecognized/ unmapped/ un-implemented address (e.g., a reserved register address). Includes decode errors within the global address space. Also, note that decode error is never asserted for client port accesses. For APQ8064, all other bit values will be tied to zero except, bit [6]= APROTNS. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this registers is treated as RAZ/WI.
30	AC	Access control: Indicates configuration port error due to lack of permission, as specified by the access control registers
29:25	RESERVED	
24	AFULL	AFULL field of the errant request
23	AOOOWR	AOOOWR field of the errant request
22	AOOORD	AOOORD field of the errant request.
21:20	ALOCK	ALOCK[1:0] (ALOCK field of the errant request).
19	RESERVED_2	
18:16	ASIZE	ASIZE[2:0] field of the errant request).
15:12	ALEN	ALEN[3:0] field of the errant request.
11:10	ABURST	ABURST[1:0] field of the errant request.
9	RESERVED_1	
8	AWRITE	AWRITE field of the errant request.
7	AINST	AINST field of the errant request.
6	APROTNS	APROTNS field of the errant request.
5	APRIV	APRIV field of the errant request.
4	AINNERSHARED	AINNERSHARED field of the errant request.

SFPB_2X1_M2VMT_ESYNR1 (cont.)

Bits	Name	Description
3	ASHARED	ASHARED field of the errant request.
2:0	AMEMTYPE	AMEMTYPE[2:0] field of the errant request.

0x01801FF4 SFPB_2X1_M2VMT_REV

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x00000010

Reports the revision information for the M2VMT core and wrapper.

SFPB_2X1_M2VMT_REV

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	Major variant field. APQ8064: MAJOR = 0001
3:0	MINOR	Minor variant field. MINOR = 0000.

0x01801FF8 SFPB_2X1_M2VMT_IDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: Undefined

Reports the size of the M2VMT table. It is a read-only register.

SFPB_2X1_M2VMT_IDR

Bits	Name	Description
31:9	RESERVED	M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.

SFPB_2X1_M2VMT_IDR (cont.)

Bits	Name	Description
8:0	M2VMTSIZE	.M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping.

0x01801FFC SFPB_2X1_M2VMT_RPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: Undefined

Using the incoming VMID, this register controls access to the global register space.

SFPB_2X1_M2VMT_RPU_ACR

Bits	Name	Description
31:0	RWE	M2VMT local RPU Access control Register. Each bit position corresponds to a VMID. When set to ’1’, that VMID is granted VMID read/write access to the entire block of registers within the M2VMT’s 4KB global address space, including this register itself. In practice, this register designates the VMID(s) that can act as SROT (e.g., scorpion-secure) or pseudo SROT (e.g. RPM ARM11). Special Note: When REMOVE_M2VMT_RPU=’1’, this register is not available and therefore access to this register is treated as RAZ/WI.

20.2 SPS SIC Secure Registers (0x120C0000 SIC_BASE)

This section contains the Smart Peripheral System registers for the secure domain.

Smart Peripheral System (SPS) Interrupt Controller (SIC) has two domains of registers. One is non secure domain, the other is secure domain.

0x120C0000 SIC_DISTRIB0_REG0

Type: Read/Write
Clock: CRIF_CLK
Reset State: 0x00000000

Enabled bit for interrupt source 31 to 0. This is reserved for SIC Distributor 0

SIC_DISTRIB0_REG0

Bits	Name	Description
31:0	SIC_DISTRIB0_REG0	Enable bit for Interrupt [31:0].

0x120C0004 SIC_DISTRIB0_REG1

Type: Read/Write
Clock: CRIF_CLK
Reset State: 0x00000000

Enabled bit for interrupt source 63 to 32. This is reserved for SIC Distributor 0

SIC_DISTRIB0_REG1

Bits	Name	Description
31:0	SIC_DISTRIB0_REG1	Enable bit for Interrupt [63:32].

0x120C0008 SIC_DISTRIB0_REG2

Type: Read/Write
Clock: CRIF_CLK
Reset State: 0x00000000

Enabled bit for interrupt source 95 to 64. This is reserved for SIC Distributor 0

SIC_DISTRIB0_REG2

Bits	Name	Description
31:0	SIC_DISTRIB0_REG2	Enable bit for Interrupt [95:64].

0x120C000C SIC_DISTRIB0_REG3

Type: Read/Write
Clock: CRIF_CLK
Reset State: 0x00000000

Enabled bit for interrupt source 127 to 96. This is reserved for SIC Distributor 0

SIC_DISTRIB0_REG3

Bits	Name	Description
31:0	SIC_DISTRIB0_REG3	Enable bit for Interrupt [127:96].

0x120C0080 SIC_VMID0

Type: Read /Write
Clock: CRIF_CLK
Reset State: 0x00000000

SIC Virtual Master ID Setup for Interrupt Controller 0.

SIC_VMID0

Bits	Name	Description
31:29	RESERVED_1	RESERVED
28	SIC_VMID0_EN	SIC VMID0 Compare Enable
27:5	RESERVED_2	RESERVED
4:0	SIC_VMID0	SIC VMID Setup for Interrupt Controller 0

0x120C0100 SIC_DISTRIB1_REG0

Type: Read/Write
Clock: CRIF_CLK
Reset State: 0x00000000

Enabled bit for interrupt source 31 to 0. This is reserved for SIC Distributor 1

SIC_DISTRIB1_REG0

Bits	Name	Description
31:0	SIC_DISTRIB1_REG1	Enable bit for Interrupt [31:0].

0x120C0104 SIC_DISTRIB1_REG1

Type: Read/Write
Clock: CRIF_CLK
Reset State: 0x00000000

Enabled bit for interrupt source 63 to 32. This is reserved for SIC Distributor 1

SIC_DISTRIB1_REG1

Bits	Name	Description
31:0	SIC_DISTRIB1_REG1	Enable bit for Interrupt [63:32].

0x120C0108 SIC_DISTRIB1_REG2

Type: Read/Write
Clock: CRIF_CLK
Reset State: 0x00000000

Enabled bit for interrupt source 95 to 64. This is reserved for SIC Distributor 1

SIC_DISTRIB1_REG2

Bits	Name	Description
31:0	SIC_DISTRIB1_REG2	Enable bit for Interrupt [95:64].

0x120C010C SIC_DISTRIB1_REG3

Type: Read/Write
Clock: CRIF_CLK
Reset State: 0x00000000

Enabled bit for interrupt source 127 to 96. This is reserved for SIC Distributor 1

SIC_DISTRIB1_REG3

Bits	Name	Description
31:0	SIC_DISTRIB1_REG3	Enable bit for Interrupt [127:96].

0x120C0180 SIC_VMID1

Type: Read /Write
Clock: CRIF_CLK
Reset State: 0x00000000

SIC VMID Setup for Interrupt Controller 1.

SIC_VMID1

Bits	Name	Description
31:29	RESERVED_1	RESERVED
28	SIC_VMID1_EN	SIC VMID 1 Compare Enable
27:5	RESERVED_2	RESERVED

20.3 SPS SIC XPU Registers (0x120C2000 SIC_APU_BASE)

This section contains the Smart Peripheral System SIC XPU registers.

0x120C2000+ 4*n SPS_SIC_APU_RGn_ACR, n=[0..31]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 10, i.e, a multi-VMID full access vs. no access permission type APU. These registers include a single bit per VMID granting full access

SPS_SIC_APU_RGn_ACR

Bits	Name	Description
31:0	RWE	Read/Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the registers in the associated resource group.

0x120C2F80 SPS_SIC_APU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

APU Configuration Register: This register includes fields governing various APU behaviors.

SPS_SIC_APU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set APU_ESR. APU_EAR and APU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set APU_ESR. APU_EAR and APU_ESYNR0 updated with address and syndrome of error.
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR

SPS_SIC_APU_CR (cont.)

Bits	Name	Description
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x120C2F84 SPS_SIC_APU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

SPS_SIC_APU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x120C2F88 SPS_SIC_APU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is

contrasted with the fields in the APU_ESYNRn registers, which are merely the "syndrome" of an error indicated by APU_ESR.

SPS_SIC_APU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x120C2F8C SPS_SIC_APU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

SPS_SIC_APU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x120C2F90 SPS_SIC_APU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

SPS_SIC_APU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x120C2F94 SPS_SIC_APU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

SPS_SIC_APU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved

SPS_SIC_APU_ESYNR1 (cont.)

Bits	Name	Description
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x120C2FF4 SPS_SIC_APU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

SPS_SIC_APU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x120C2FF8 SPS_SIC_APU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x0000141F

APU ID Register: Read-only register that defines various configuration attributes of the APU instance.

SPS_SIC_APU_IDR

Bits	Name	Description
31:29	RESERVED31_21	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.
9:8	RESERVED9_8	Reserved
7:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x120C2FFC SPS_SIC_APU_APU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

SPS_SIC_APU_APU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APUs (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

20.4 Interrupt Controller 0 Registers (0x12100000 INTCTL0_BASE)

This section contains Interrupt Controller 0 registers.

20.4.1 Configuration registers

These registers are used to configure the Interrupt Controller

0x12100000 INTCTL0_INT_SELECT_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_0 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL0_INT_SELECT_0

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12100004 INTCTL0_INT_SELECT_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_1 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL0_INT_SELECT_1

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12100010 INTCTL0_INT_ENABLE_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_0 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor.

INTCTL0_INT_ENABLE_0

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12100014 INTCTL0_INT_ENABLE_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_1 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor

INTCTL0_INT_ENABLE_1

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12100020 INTCTL0_INT_ENABLE_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_0 register is used to clear (to 0) the bits of the INT_ENABLE_0 register.

INTCTL0_INT_ENABLE_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear.

0x12100024 INTCTL0_INT_ENABLE_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_1 register is used to clear (to 0) the bits of the INT_ENABLE_1 register.

INTCTL0_INT_ENABLE_CLEAR_1

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Clear.

0x12100030 INTCTL0_INT_ENABLE_SET_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_0 register is used to set (to 1) the bits of the INT_ENABLE_0 register.

INTCTL0_INT_ENABLE_SET_0

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Set.

0x12100034 INTCTL0_INT_ENABLE_SET_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_1 register is used to set (to 1) the bits of the INT_ENABLE_1 register.

INTCTL0_INT_ENABLE_SET_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Set.

0x12100040 INTCTL0_INT_TYPE_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL0_INT_TYPE_0

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12100044 INTCTL0_INT_TYPE_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL0_INT_TYPE_1

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12100050 INTCTL0_INT_POLARITY_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL0_INT_POLARITY_0

Bits	Name	Description
31:0	POL	0x1: neg 0x0: pos

0x12100054 INTCTL0_INT_POLARITY_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL0_INT_POLARITY_1

Bits	Name	Description
31:0	POL	0x1: neg 0x0: posl

0x12100060 INTCTL0_NO_PEND_VAL

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

The NO_PEND_VALUE indicates the 32-bit value returned when reading VEC_RD or PEND_RD when there is no available interrupt. The reset value is the traditional indicator of no pending interrupt. It is convenient to refer to this value as the NULL interrupt.

When using the Interrupt Controller in Vector Mode, it may be useful to set this register to a value where software can jump to perform common end of ISR handling.

INTCTL0_NO_PEND_VAL

Bits	Name	Description
31:0	NULL_VALUE	This value is returned when VEC_RD or PEND_RD when there is no available interrupt

0x12100064 INTCTL0_MASTER_ENABLE

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The MASTER_ENABLE register is the IRQ and FIQ master enable register. The two bits in this register can be used to block the IRQ and/or FIQ signals from reaching the processor. These enables are used to gate off the interrupt signals at IRQ_STATUS and FIQ_STATUS. This will cause irq_n and fiq_n de-asserted if they were previously asserted and stay de-asserted. Note that if a Vector Port transaction has started, it will complete with irq_n still held asserted by the Vector Port logic.

Writing this register has no affect on the INT_ENABLE register.

NOTE The RAW_STATUS register will hold interrupts that have been detected by the Interrupt Controller even if disabled by INT_ENABLE.

INTCTL0_MASTER_ENABLE

Bits	Name	Description
1	FIQ_ENABLE	0x0: Disable 0x1: Enable.
0	IRQ_ENABLE	0x0: Disable 0x1: Enable.

0x12100068 INTCTL0_VIC_CONFIG

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The VIC_CONFIG register is used to enable Vector Port interface.

INTCTL0_VIC_CONFIG

Bits	Name	Description
0	VECTOR_MODE	0x1: Enable 0x0: Disable

0x1210006C INTCTL0_SECURITY

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The SECURITY register is used to enable or disable non-secure bus transactions. The bus security status is signaled to the Interrupt Controller via the ns pin. When ns is set to 0 the state of the SECURITY register is not considered - a secure transaction is allowed if the device is set to non-secure mode. When ns is set to 1, the SECURITY register's SECURE bit must be 0 for access to be granted. If set to 1, the non-secure (ns) transaction is denied. When access is denied, a write is ignored, and a read will return 0x0. No error is signaled.

INTCTL0_SECURITY

Bits	Name	Description
0	SECURE	When enabled, only secure agents can access the registers. When disabled, both secure and non-secure agents can access the registers. 0x1: Enable 0x0: Disable

0x12100200+4*n INTCTL0_PRIORITYn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x0

The PRIORITYn registers are used to determine the priority for each interrupt source.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

NOTE Only IRQs are prioritized. Thus PRIORITYn registers have no affect on FIQ.

INTCTL0_PRIORITYn

Bits	Name	Description
2:0	PRIORITY	Priority for each interrupt source.

0x12100400+4*n INTCTL0_VECT_ADDRn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: NA

The VECT_ADDRn registers provide the vector handle address for each interrupt source N.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

INTCTL0_VECT_ADDRn

Bits	Name	Description
31:2	ADDR	Vector handle (the ISR's starting address) for interrupt source n

INTCTL0_VECT_ADDRn (cont.)

Bits	Name	Description
1:0	RESERVED_BITS1_0	

20.4.2 Operational registers

0x12100080 INTCTL0_IRQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

IRQ_STATUS_0 shows which interrupt sources zero to 31 designated for irq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 0) are currently being held by RAW_STATUS_0.

The bits set in IRQ_STATUS form the inputs to the Interrupt Controller's priority encoder (PIC) logic and ultimately result in asserting irq_n to interrupt the CPU.

0x12100090 INTCTL0_FIQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_0 shows which interrupt sources zero to 31 designated for fiq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_0.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL0_FIQ_STATUS_0

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_0 fields

0x12100094 INTCTL0_FIQ_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_1 shows which interrupt sources 32 to 63 designated for fiq_n by INT_SELECT_1 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_1.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL0_FIQ_STATUS_1

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_1 fields

0x121000A0 INTCTL0_RAW_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_0 shows which interrupt sources zero to 31 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_0. Bits set in RAW_STATUS_0 are steered to generate irq_n or fiq_n by INT_SELECT_0 if enabled by both INT_ENABLE_0 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_0 by writing SOFT_INT_0.

INTCTL0_RAW_STATUS_0

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_0

0x121000A4 INTCTL0_RAW_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_1 shows which interrupt sources 32 to 63 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_1. Bits set in RAW_STATUS_1 are steered to generate irq_n or fiq_n by INT_SELECT_1 if enabled by both INT_ENABLE _1 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_1 by writing SOFT_INT_1.

INTCTL0_RAW_STATUS_1

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_1

0x121000B0 INTCTL0_INT_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_0 is used to clear bits in RAW_STATUS_0. For any bit written 0x1 to INT_CLEAR_0, the corresponding bit position is cleared in RAW_STATUS_0.

INTCTL0_INT_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121000B4 INTCTL0_INT_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_1 is used to clear bits in RAW_STATUS_1. For any bit written 0x1 to INT_CLEAR_1, the corresponding bit position is cleared in RAW_STATUS_1.

INTCTL0_INT_CLEAR_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121000C0 INTCTL0_SOFT_INT_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_0 is used to set bits in RAW_STATUS_0 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_0, the corresponding bit position is set in RAW_STATUS_0.

INTCTL0_SOFT_INT_0

Bits	Name	Description
31:0	SW_INT	0x0: Do nothing 0x1: Set

0x121000C4 INTCTL0_SOFT_INT_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_1 is used to set bits in RAW_STATUS_1 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_1, the corresponding bit position is set in RAW_STATUS_1.

INTCTL0_SOFT_INT_1

Bits	Name	Description
31:0	SW_INT	See IRQ_STATUS_1 for bit map. 0x0: Do nothing 0x1: Set

0x121000D0 INTCTL0_VEC_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack PUSH in the PIC, and if an interrupt is causing irq_n returns it.

Assuming an interrupt is available and irq_n is asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU has seen irq_n.
- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine.
- The PIC will set a bit in IN_STACK for the sw level that has been interrupted (including "main").
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that caused the irq_n.
- Subsequently irq_n may only be asserted for an interrupt source designated at a higher priority level than the highest priority level indicated by IN_SERVICE.

If irq_n is asserted, the value returned when reading VEC_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If irq_n is not asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When the Interrupt Controller is in Vector Mode, as designated by VIC_CONFIG, VEC_RD should not be read. The controller still needs to be informed that the CPU is taking the interrupt. This is done by a Vector Port transaction. However, if VEC_RD is read in while in Vector Mode, the read will have the same effect as in PIC mode. However, the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE Using this register while the system is in Vector Mode may not be reliable as CPU hardware may initiate a Vector Port transaction while launching the read transaction to VEC_RD. This race condition could have undesirable results.

INTCTL0_VEC_RD

Bits	Name	Description
31:0	INDEX	Reading from this register provides the index of the current interrupt selected by the PIC, and indicates to the priority hardware that the interrupt is being serviced. Though the practice is not recommended, if this register is read in Vector Mode, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to VEC_RD. The commanded PUSH is performed. If irq_n is not currently active, reading this register returns the value stored in NO_PEND_VAL. There are no side effects in this case - the commanded PUSH is not performed.

0x121000D4 INTCTL0_PEND_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack POP in the PIC, and if an interrupt is pending returns it.

Assuming an interrupt is available and irq_n is not asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine, and ending the previous ISR routine.
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that is now starting.
- The PIC will clear the most significant bit found set in IN_SERVICE for the priority of the interrupt ISR routine just ended if the priority of the interrupt now starting is different.

If an interrupt is available and irq_n is asserted or if no interrupt is available the PIC will behave as if the VEC_WR command register was written. That is, the command issued to the PIC will be interpreted as a POP.

The value returned when reading PEND_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If no interrupt is asserted or if irq_n is asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When Vector Mode is enabled, unlike the VEC_RD register, PEND_RD must be read in order to inform the PIC that the ISR has finished processing. There is no equivalent

Vector Port transaction. When not in Vector Mode, the interrupts index (bit position) is returned.

NOTE In Vector Mode the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE VEC_WR can be substituted for PEND_RD to inform the PIC that the ISR has finished processing without returning a pending interrupt.

INTCTL0_PEND_RD

Bits	Name	Description
31:0	HANDLE	Reading from this register provides the index of the current interrupt selected by the PIC as a pending interrupt. It also indicates to the priority hardware that the current ISR is finished, and if an interrupt is pending that a new ISR is starting. In Vector Mode, when an interrupt is pending, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to PEND_RD. The commanded POP is performed. If an interrupt is not pending, reading this register returns the value stored in NO_PEND_VAL. The commanded POP is still performed.

0x121000D8 INTCTL0_VEC_WR

Type: Write (command)
Clock: INT_CTL_CLK
Reset State: NA

This is a write command register. It affects a logical stack POP in the PIC without returning any (possibly) pending interrupt. The resulting state of the PIC is to request a new irq_n if any bits are set in IRQ_STATUS.

Writing this register has the following side effects:

- Informs the PIC logic that the CPU is ending the current ISR routine.
- The PIC will clear the most significant bit found set in IN_SERVICE.
- The PIC will clear the most significant bit found set in IN_STACK.

NOTE PEND_RD can be substituted for VEC_WR to inform the PIC that the ISR has finished processing and to return a pending interrupt at the same time.

INTCTL0_VEC_WR

Bits	Name	Description
31:0	RESERVED	Data written is not used.

20.4.3 Debug and legacy registers

0x121000E0 INTCTL0_IN_SERVICE

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_SERVICE register provides the Interrupt Controller's state information regarding which ISR priority levels are currently in service by the processor. This is provided for debug purposes only.

INTCTL0_IN_SERVICE

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL7	0x1: In service 0x0: Not in service
6	LEVEL6	0x1: In service 0x0: Not in service
5	LEVEL5	0x1: In service 0x0: Not in service
4	LEVEL4	0x1: In service 0x0: Not in service
3	LEVEL3	0x1: In service 0x0: Not in service
2	LEVEL2	0x1: In service 0x0: Not in service
1	LEVEL1	0x1: In service 0x0: Not in service
0	LEVEL0	0x1: In service 0x0: Not in service

0x121000E4 INTCTL0_IN_STACK

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_STACK register provides the Interrupt Controller's state information regarding which ISR priority levels are currently nested (stacked) in the CPU. This is provided for debug purposes only.

INTCTL0_IN_STACK

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL6	0x1: Nested 0x0: Not nested
6	LEVEL5	0x1: Nested 0x0: Not nested
5	LEVEL4	0x1: Nested 0x0: Not nested
4	LEVEL3	0x1: Nested 0x0: Not nested
3	LEVEL2	0x1: Nested 0x0: Not nested
2	LEVEL1	0x1: Nested 0x0: Not nested
1	LEVEL0	0x1: Nested 0x0: Not nested
0	MAIN	0x1: Nested 0x0: Not nested

0x121000E8 INTCTL0_TEST_BUS_SEL

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

Select signals to be directed to Interrupt Controller test_bus 32-bit output port.

INTCTL0_TEST_BUS_SEL

Bits	Name	Description
31:2	RESERVED	
1:0	SEL	NOTE The Interrupt Controller may have as few as 33 interrupts. Setting to HIGH_INTS will not have meaning if there are less than 61 interrupt inputs. 0x0: NONE (output 0x0) 0x1: LOW_INTS (31 - IRQn, 30 - FIQn, intsource[29:0]) 0x2: MID_INTS (31 - IRQn, 30 - FIQn, pad 0 as needed, intsource[N up to 59:30]) 0x3: HIGH_INTS (31 - IRQn, 30 - FIQn, 28 bits 0, intsource[63:60])

0x121000EC INTCTL0_INT_CTL_CONFIG

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

The INT_CTL_CONFIG register provides additional configuration options for the interrupt controller used for debug purposes.

INTCTL0_INT_CTL_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_1	
0	NO_NESTING_MODE	Default : 0 This register bit is used to configure the interrupt controller before any interrupts occur. When this bit is cleared (0), the PIC priority logic is used to determine when to assert irq_n. When the software allows hardware interrupt nesting, this bit should be cleared (0). If this bit is set (1), irq_n is asserted whenever there is at least one bit set in IRQ_STATUS. This bit should be set (1) right after power up if the software does not need any hardware nesting functions. 0x0: NESTED 0x1: NOT NESTED

20.5 SPS SIC Non-Secure Registers (0x12100000 SIC_NON_SECURE_BASE)

This section contains the Smart Peripheral System registers for the non-secure domain.

Smart Peripheral System (SPS) Interrupt Controller (SIC) has two domains of registers. One is non secure domain, the other is secure domain..

Addresses are offset from zero. When constants are exported, they are re-assigned to the appropriate base address.

Only word accesses are supported by the SIC. Byte and half-word accesses are not supported.

20.6 Interrupt Controller 1 Registers (0x12100800 INTCTL1_BASE)

This section contains Interrupt Controller 1 registers.

20.6.1 Configuration registers

These registers are used to configure the Interrupt Controller.

0x12100800 INTCTL1_INT_SELECT_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_0 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL1_INT_SELECT_0

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12100804 INTCTL1_INT_SELECT_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_1 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL1_INT_SELECT_1

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12100810 INTCTL1_INT_ENABLE_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_0 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor.

INTCTL1_INT_ENABLE_0

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12100814 INTCTL1_INT_ENABLE_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_1 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor

INTCTL1_INT_ENABLE_1

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12100820 INTCTL1_INT_ENABLE_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_0 register is used to clear (to 0) the bits of the INT_ENABLE_0 register.

INTCTL1_INT_ENABLE_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear.

0x12100824 INTCTL1_INT_ENABLE_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_1 register is used to clear (to 0) the bits of the INT_ENABLE_1 register.

INTCTL1_INT_ENABLE_CLEAR_1

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Clear.

0x12100830 INTCTL1_INT_ENABLE_SET_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_0 register is used to set (to 1) the bits of the INT_ENABLE_0 register.

INTCTL1_INT_ENABLE_SET_0

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Set.

0x12100834 INTCTL1_INT_ENABLE_SET_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_1 register is used to set (to 1) the bits of the INT_ENABLE_1 register.

INTCTL1_INT_ENABLE_SET_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Set.

0x12100840 INTCTL1_INT_TYPE_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL1_INT_TYPE_0

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12100844 INTCTL1_INT_TYPE_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL1_INT_TYPE_1

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12100850 INTCTL1_INT_POLARITY_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL1_INT_POLARITY_0

Bits	Name	Description
31:0	POL	0x1: neg 0x0: pos

0x12100854 INTCTL1_INT_POLARITY_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL1_INT_POLARITY_1

Bits	Name	Description
31:0	POL	0x1: neg 0x0: posl

0x12100860 INTCTL1_NO_PEND_VAL

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

The NO_PEND_VALUE indicates the 32-bit value returned when reading VEC_RD or PEND_RD when there is no available interrupt. The reset value is the traditional indicator of no pending interrupt. It is convenient to refer to this value as the NULL interrupt.

When using the Interrupt Controller in Vector Mode, it may be useful to set this register to a value where software can jump to perform common end of ISR handling.

INTCTL1_NO_PEND_VAL

Bits	Name	Description
31:0	NULL_VALUE	This value is returned when VEC_RD or PEND_RD when there is no available interrupt

0x12100864 INTCTL1_MASTER_ENABLE

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The MASTER_ENABLE register is the IRQ and FIQ master enable register. The two bits in this register can be used to block the IRQ and/or FIQ signals from reaching the processor. These enables are used to gate off the interrupt signals at IRQ_STATUS and FIQ_STATUS. This will cause irq_n and fiq_n de-asserted if they were previously asserted and stay de-asserted. Note that if a Vector Port transaction has started, it will complete with irq_n still held asserted by the Vector Port logic.

Writing this register has no affect on the INT_ENABLE register.

NOTE The RAW_STATUS register will hold interrupts that have been detected by the Interrupt Controller even if disabled by INT_ENABLE.

INTCTL1_MASTER_ENABLE

Bits	Name	Description
1	FIQ_ENABLE	0x0: Disable 0x1: Enable.
0	IRQ_ENABLE	0x0: Disable 0x1: Enable.

0x12100868 INTCTL1_VIC_CONFIG

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The VIC_CONFIG register is used to enable Vector Port interface.

INTCTL1_VIC_CONFIG

Bits	Name	Description
0	VECTOR_MODE	0x1: Enable 0x0: Disable

0x1210086C INTCTL1_SECURITY

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The SECURITY register is used to enable or disable non-secure bus transactions. The bus security status is signaled to the Interrupt Controller via the ns pin. When ns is set to 0 the state of the SECURITY register is not considered - a secure transaction is allowed if the device is set to non-secure mode. When ns is set to 1, the SECURITY register's SECURE bit must be 0 for access to be granted. If set to 1, the non-secure (ns) transaction is denied. When access is denied, a write is ignored, and a read will return 0x0. No error is signaled.

INTCTL1_SECURITY

Bits	Name	Description
0	SECURE	When enabled, only secure agents can access the registers. When disabled, both secure and non-secure agents can access the registers. 0x1: Enable 0x0: Disable

0x12100A00+ 4*n INTCTL1_PRIORITYn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x0

The PRIORITYn registers are used to determine the priority for each interrupt source.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

NOTE Only IRQs are prioritized. Thus PRIORITYn registers have no affect on FIQ.

INTCTL1_PRIORITYn

Bits	Name	Description
2:0	PRIORITY	Priority for each interrupt source.

0x12100C00+ 4*n INTCTL1_VECT_ADDRn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: NA

The VECT_ADDRn registers provide the vector handle address for each interrupt source N.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

INTCTL1_VECT_ADDRn

Bits	Name	Description
31:2	ADDR	Vector handle (the ISR's starting address) for interrupt source n

INTCTL1_VECT_ADDRn (cont.)

Bits	Name	Description
1:0	RESERVED_BITS1_0	

20.6.2 Operational registers

0x12100880 INTCTL1_IRQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

IRQ_STATUS_0 shows which interrupt sources zero to 31 designated for irq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 0) are currently being held by RAW_STATUS_0.

The bits set in IRQ_STATUS form the inputs to the Interrupt Controller's priority encoder (PIC) logic and ultimately result in asserting irq_n to interrupt the CPU.

INTCTL1_IRQ_STATUS_0

0x12100884 INTCTL1_IRQ_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

IRQ_STATUS_1 shows which interrupt sources 32 to 63 designated for irq_n by INT_SELECT_1 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 0) are currently being held by RAW_STATUS_1.

The bits set in IRQ_STATUS form the inputs to the Interrupt Controller's priority encoder (PIC) logic and ultimately result in asserting irq_n to interrupt the CPU.

INTCTL1_IRQ_STATUS_1

Bits	Name	Description
31	INT_SRC63	See bit 0's description
30	INT_SRC62	
29	INT_SRC61	

INTCTL1_IRQ_STATUS_1 (cont.)

3	INT_SRC35	
2	INT_SRC34	
1	INT_SRC33	
0	INT_SRC32	Data for interrupt source bit 32 0x1: active 0x0: inactive

0x12100890 INTCTL1_FIQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_0 shows which interrupt sources zero to 31 designated for fiq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_0.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL1_FIQ_STATUS_0

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_0 fields

0x12100894 INTCTL1_FIQ_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_1 shows which interrupt sources 32 to 63 designated for fiq_n by INT_SELECT_1 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_1.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL1_FIQ_STATUS_1

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_1 fields

0x121008A0 INTCTL1_RAW_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_0 shows which interrupt sources zero to 31 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_0. Bits set in RAW_STATUS_0 are steered to generate irq_n or fiq_n by INT_SELECT_0 if enabled by both INT_ENABLE_0 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_0 by writing SOFT_INT_0.

INTCTL1_RAW_STATUS_0

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_0

0x121008A4 INTCTL1_RAW_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_1 shows which interrupt sources 32 to 63 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_1. Bits set in RAW_STATUS_1 are steered to generate irq_n or fiq_n by INT_SELECT_1 if enabled by both INT_ENABLE _1 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_1 by writing SOFT_INT_1.

INTCTL1_RAW_STATUS_1

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_1

0x121008B0 INTCTL1_INT_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_0 is used to clear bits in RAW_STATUS_0. For any bit written 0x1 to INT_CLEAR_0, the corresponding bit position is cleared in RAW_STATUS_0.

INTCTL1_INT_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121008B4 INTCTL1_INT_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_1 is used to clear bits in RAW_STATUS_1. For any bit written 0x1 to INT_CLEAR_1, the corresponding bit position is cleared in RAW_STATUS_1.

INTCTL1_INT_CLEAR_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121008C0 INTCTL1_SOFT_INT_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_0 is used to set bits in RAW_STATUS_0 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_0, the corresponding bit position is set in RAW_STATUS_0.

INTCTL1_SOFT_INT_0

Bits	Name	Description
31:0	SW_INT	0x0: Do nothing 0x1: Set

0x121008C4 INTCTL1_SOFT_INT_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_1 is used to set bits in RAW_STATUS_1 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_1, the corresponding bit position is set in RAW_STATUS_1.

INTCTL1_SOFT_INT_1

Bits	Name	Description
31:0	SW_INT	See IRQ_STATUS_1 for bit map. 0x0: Do nothing 0x1: Set

0x121008D0 INTCTL1_VEC_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack PUSH in the PIC, and if an interrupt is causing irq_n returns it.

Assuming an interrupt is available and irq_n is asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU has seen irq_n.
- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine.
- The PIC will set a bit in IN_STACK for the sw level that has been interrupted (including "main").
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that caused the irq_n.
- Subsequently irq_n may only be asserted for an interrupt source designated at a higher priority level than the highest priority level indicated by IN_SERVICE.

If irq_n is asserted, the value returned when reading VEC_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If irq_n is not asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When the Interrupt Controller is in Vector Mode, as designated by VIC_CONFIG, VEC_RD should not be read. The controller still needs to be informed that the CPU is taking the interrupt. This is done by a Vector Port transaction. However, if VEC_RD is read in while in Vector Mode, the read will have the same effect as in PIC mode. However, the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE Using this register while the system is in Vector Mode may not be reliable as CPU hardware may initiate a Vector Port transaction while launching the read transaction to VEC_RD. This race condition could have undesirable results.

INTCTL1_VEC_RD

Bits	Name	Description
31:0	INDEX	Reading from this register provides the index of the current interrupt selected by the PIC, and indicates to the priority hardware that the interrupt is being serviced. Though the practice is not recommended, if this register is read in Vector Mode, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to VEC_RD. The commanded PUSH is performed. If irq_n is not currently active, reading this register returns the value stored in NO_PEND_VAL. There are no side effects in this case - the commanded PUSH is not performed.

0x121008D4 INTCTL1_PEND_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack POP in the PIC, and if an interrupt is pending returns it.

Assuming an interrupt is available and irq_n is not asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine, and ending the previous ISR routine.
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that is now starting.
- The PIC will clear the most significant bit found set in IN_SERVICE for the priority of the interrupt ISR routine just ended if the priority of the interrupt now starting is different.

If an interrupt is available and irq_n is asserted or if no interrupt is available, the PIC will behave as if the VEC_WR command register was written. That is, the command issued to the PIC will be interpreted as a POP.

The value returned when reading PEND_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If no interrupt is asserted or if irq_n is asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When Vector Mode is enabled, unlike the VEC_RD register, PEND_RD must be read in order to inform the PIC that the ISR has finished processing. There is no equivalent

Vector Port transaction. When not in Vector Mode, the interrupts index (bit position) is returned.

NOTE In Vector Mode the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE VEC_WR can be substituted for PEND_RD to inform the PIC that the ISR has finished processing without returning a pending interrupt.

INTCTL1_PEND_RD

Bits	Name	Description
31:0	HANDLE	Reading from this register provides the index of the current interrupt selected by the PIC as a pending interrupt. It also indicates to the priority hardware that the current ISR is finished, and if an interrupt is pending that a new ISR is starting. In Vector Mode, when an interrupt is pending, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to PEND_RD. The commanded POP is performed. If an interrupt is not pending, reading this register returns the value stored in NO_PEND_VAL. The commanded POP is still performed.

0x121008D8 INTCTL1_VEC_WR

Type: Write (command)
Clock: INT_CTL_CLK
Reset State: NA

This is a write command register. It affects a logical stack POP in the PIC without returning any (possibly) pending interrupt. The resulting state of the PIC is to request a new irq_n if any bits are set in IRQ_STATUS.

Writing this register has the following side effects:

- Informs the PIC logic that the CPU is ending the current ISR routine.
- The PIC will clear the most significant bit found set in IN_SERVICE.
- The PIC will clear the most significant bit found set in IN_STACK.

NOTE PEND_RD can be substituted for VEC_WR to inform the PIC that the ISR has finished processing and to return a pending interrupt at the same time.

INTCTL1_VEC_WR

Bits	Name	Description
31:0	RESERVED	Data written is not used.

20.6.3 Debug and legacy registers

0x121008E0 INTCTL1_IN_SERVICE

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_SERVICE register provides the Interrupt Controller's state information regarding which ISR priority levels are currently in service by the processor. This is provided for debug purposes only.

INTCTL1_IN_SERVICE

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL7	0x1: In service 0x0: Not in service
6	LEVEL6	0x1: In service 0x0: Not in service
5	LEVEL5	0x1: In service 0x0: Not in service
4	LEVEL4	0x1: In service 0x0: Not in service
3	LEVEL3	0x1: In service 0x0: Not in service
2	LEVEL2	0x1: In service 0x0: Not in service
1	LEVEL1	0x1: In service 0x0: Not in service
0	LEVEL0	0x1: In service 0x0: Not in service

0x121008E4 INTCTL1_IN_STACK

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_STACK register provides the Interrupt Controller's state information regarding which ISR priority levels are currently nested (stacked) in the CPU. This is provided for debug purposes only.

INTCTL1_IN_STACK

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL6	0x1: Nested 0x0: Not nested
6	LEVEL5	0x1: Nested 0x0: Not nested
5	LEVEL4	0x1: Nested 0x0: Not nested
4	LEVEL3	0x1: Nested 0x0: Not nested
3	LEVEL2	0x1: Nested 0x0: Not nested
2	LEVEL1	0x1: Nested 0x0: Not nested
1	LEVEL0	0x1: Nested 0x0: Not nested
0	MAIN	0x1: Nested 0x0: Not nested

0x121008E8 INTCTL1_TEST_BUS_SEL

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

Select signals to be directed to Interrupt Controller test_bus 32-bit output port.

INTCTL1_TEST_BUS_SEL

Bits	Name	Description
31:2	RESERVED	
1:0	SEL	NOTE The Interrupt Controller may have as few as 33 interrupts. Setting to HIGH_INTS will not have meaning if there are less than 61 interrupt inputs. 0x0: NONE (output 0x0) 0x1: LOW_INTS (31 - IRQn, 30 - FIQn, intsource[29:0]) 0x2: MID_INTS (31 - IRQn, 30 - FIQn, pad 0 as needed, intsource[N up to 59:30]) 0x3: HIGH_INTS (31 - IRQn, 30 - FIQn, 28 bits 0, intsource[63:60])

0x121008EC INTCTL1_INT_CTL_CONFIG

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

The INT_CTL_CONFIG register provides additional configuration options for the interrupt controller used for debug purposes.

INTCTL1_INT_CTL_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_1	
0	NO_NESTING_MODE	Default : 0 This register bit is used to configure the interrupt controller before any interrupts occur. When this bit is cleared (0), the PIC priority logic is used to determine when to assert irq_n. When the software allows hardware interrupt nesting, this bit should be cleared (0). If this bit is set (1), irq_n is asserted whenever there is at least one bit set in IRQ_STATUS. This bit should be set (1) right after power up if the software does not need any hardware nesting functions. 0x0: NESTED 0x1: NOT NESTED

20.7 Interrupt Controller 2 Registers (0x12101000 INTCTL2_BASE)

This section contains Interrupt Controller 2 registers.

20.7.1 Configuration registers

These registers are used to configure the Interrupt Controller

0x12101000 INTCTL2_INT_SELECT_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_0 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL2_INT_SELECT_0

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12101004 INTCTL2_INT_SELECT_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_1 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL2_INT_SELECT_1

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12101010 INTCTL2_INT_ENABLE_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_0 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor.

INTCTL2_INT_ENABLE_0

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12101014 INTCTL2_INT_ENABLE_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_1 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor

INTCTL2_INT_ENABLE_1

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12101020 INTCTL2_INT_ENABLE_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_0 register is used to clear (to 0) the bits of the INT_ENABLE_0 register.

INTCTL2_INT_ENABLE_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear.

0x12101024 INTCTL2_INT_ENABLE_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_1 register is used to clear (to 0) the bits of the INT_ENABLE_1 register.

INTCTL2_INT_ENABLE_CLEAR_1

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Clear.

0x12101030 INTCTL2_INT_ENABLE_SET_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_0 register is used to set (to 1) the bits of the INT_ENABLE_0 register.

INTCTL2_INT_ENABLE_SET_0

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Set.

0x12101034 INTCTL2_INT_ENABLE_SET_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_1 register is used to set (to 1) the bits of the INT_ENABLE_1 register.

INTCTL2_INT_ENABLE_SET_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Set.

0x12101040 INTCTL2_INT_TYPE_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL2_INT_TYPE_0

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12101044 INTCTL2_INT_TYPE_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL2_INT_TYPE_1

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12101050 INTCTL2_INT_POLARITY_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL2_INT_POLARITY_0

Bits	Name	Description
31:0	POL	0x1: neg 0x0: pos

0x12101054 INTCTL2_INT_POLARITY_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL2_INT_POLARITY_1

Bits	Name	Description
31:0	POL	0x1: neg 0x0: posl

0x12101060 INTCTL2_NO_PEND_VAL

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

The NO_PEND_VALUE indicates the 32-bit value returned when reading VEC_RD or PEND_RD when there is no available interrupt. The reset value is the traditional indicator of no pending interrupt. It is convenient to refer to this value as the NULL interrupt.

When using the Interrupt Controller in Vector Mode, it may be useful to set this register to a value where software can jump to perform common end of ISR handling.

INTCTL2_NO_PEND_VAL

Bits	Name	Description
31:0	NULL_VALUE	This value is returned when VEC_RD or PEND_RD when there is no available interrupt

0x12101064 INTCTL2_MASTER_ENABLE

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The MASTER_ENABLE register is the IRQ and FIQ master enable register. The two bits in this register can be used to block the IRQ and/or FIQ signals from reaching the processor. These enables are used to gate off the interrupt signals at IRQ_STATUS and FIQ_STATUS. This will cause irq_n and fiq_n de-asserted if they were previously asserted and stay de-asserted. Note that if a Vector Port transaction has started, it will complete with irq_n still held asserted by the Vector Port logic.

Writing this register has no affect on the INT_ENABLE register.

NOTE The RAW_STATUS register will hold interrupts that have been detected by the Interrupt Controller even if disabled by INT_ENABLE.

INTCTL2_MASTER_ENABLE

Bits	Name	Description
1	FIQ_ENABLE	0x0: Disable 0x1: Enable.
0	IRQ_ENABLE	0x0: Disable 0x1: Enable.

0x12101068 INTCTL2_VIC_CONFIG

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The VIC_CONFIG register is used to enable Vector Port interface.

INTCTL2_VIC_CONFIG

Bits	Name	Description
0	VECTOR_MODE	0x1: Enable 0x0: Disable

0x1210106C INTCTL2_SECURITY

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The SECURITY register is used to enable or disable non-secure bus transactions. The bus security status is signaled to the Interrupt Controller via the ns pin. When ns is set to 0 the state of the SECURITY register is not considered - a secure transaction is allowed if the device is set to non-secure mode. When ns is set to 1, the SECURITY register's SECURE bit must be 0 for access to be granted. If set to 1, the non-secure (ns) transaction is denied. When access is denied, a write is ignored, and a read will return 0x0. No error is signaled.

INTCTL2_SECURITY

Bits	Name	Description
0	SECURE	When enabled, only secure agents can access the registers. When disabled, both secure and non-secure agents can access the registers. 0x1: Enable 0x0: Disable

0x12101200+4*n INTCTL2_PRIORITYn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x0

The PRIORITYn registers are used to determine the priority for each interrupt source.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

NOTE Only IRQs are prioritized. Thus PRIORITYn registers have no affect on FIQ.

INTCTL2_PRIORITYn

Bits	Name	Description
2:0	PRIORITY	Priority for each interrupt source.

0x12101400+4*n INTCTL2_VECT_ADDRn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: NA

The VECT_ADDRn registers provide the vector handle address for each interrupt source N.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

INTCTL2_VECT_ADDRn

Bits	Name	Description
31:2	ADDR	Vector handle (the ISR's starting address) for interrupt source n

INTCTL2_VECT_ADDRn (cont.)

Bits	Name	Description
1:0	RESERVED_BITS1_0	

20.7.2 Operational registers

0x12101080 INTCTL2_IRQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

IRQ_STATUS_0 shows which interrupt sources zero to 31 designated for irq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 0) are currently being held by RAW_STATUS_0.

The bits set in IRQ_STATUS form the inputs to the Interrupt Controller's priority encoder (PIC) logic and ultimately result in asserting irq_n to interrupt the CPU.

INTCTL2_IRQ_STATUS_0

0x12101090 INTCTL2_FIQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_0 shows which interrupt sources zero to 31 designated for fiq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_0.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL2_FIQ_STATUS_0

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_0 fields

0x12101094 INTCTL2_FIQ_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_1 shows which interrupt sources 32 to 63 designated for fiq_n by INT_SELECT_1 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_1.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL2_FIQ_STATUS_1

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_1 fields

0x121010A0 INTCTL2_RAW_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_0 shows which interrupt sources zero to 31 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_0. Bits set in RAW_STATUS_0 are steered to generate irq_n or fiq_n by INT_SELECT_0 if enabled by both INT_ENABLE_0 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_0 by writing SOFT_INT_0.

INTCTL2_RAW_STATUS_0

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_0

0x121010A4 INTCTL2_RAW_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_1 shows which interrupt sources 32 to 63 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_1. Bits set in RAW_STATUS_1 are steered to generate irq_n or fiq_n by INT_SELECT_1 if enabled by both INT_ENABLE _1 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_1 by writing SOFT_INT_1.

INTCTL2_RAW_STATUS_1

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_1

0x121010B0 INTCTL2_INT_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_0 is used to clear bits in RAW_STATUS_0. For any bit written 0x1 to INT_CLEAR_0, the corresponding bit position is cleared in RAW_STATUS_0.

INTCTL2_INT_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121010B4 INTCTL2_INT_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_1 is used to clear bits in RAW_STATUS_1. For any bit written 0x1 to INT_CLEAR_1, the corresponding bit position is cleared in RAW_STATUS_1.

INTCTL2_INT_CLEAR_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121010C0 INTCTL2_SOFT_INT_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_0 is used to set bits in RAW_STATUS_0 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_0, the corresponding bit position is set in RAW_STATUS_0.

INTCTL2_SOFT_INT_0

Bits	Name	Description
31:0	SW_INT	0x0: Do nothing 0x1: Set

0x121010C4 INTCTL2_SOFT_INT_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_1 is used to set bits in RAW_STATUS_1 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_1, the corresponding bit position is set in RAW_STATUS_1.

INTCTL2_SOFT_INT_1

Bits	Name	Description
31:0	SW_INT	See IRQ_STATUS_1 for bit map. 0x0: Do nothing 0x1: Set

0x121010D0 INTCTL2_VEC_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack PUSH in the PIC, and if an interrupt is causing irq_n returns it.

Assuming an interrupt is available and irq_n is asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU has seen irq_n.
- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine.
- The PIC will set a bit in IN_STACK for the sw level that has been interrupted (including "main").
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that caused the irq_n.
- Subsequently irq_n may only be asserted for an interrupt source designated at a higher priority level than the highest priority level indicated by IN_SERVICE.

If irq_n is asserted, the value returned when reading VEC_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If irq_n is not asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When the Interrupt Controller is in Vector Mode, as designated by VIC_CONFIG, VEC_RD should not be read. The controller still needs to be informed that the CPU is taking the interrupt. This is done by a Vector Port transaction. However, if VEC_RD is read in while in Vector Mode, the read will have the same effect as in PIC mode. However, the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE Using this register while the system is in Vector Mode may not be reliable as CPU hardware may initiate a Vector Port transaction while launching the read transaction to VEC_RD. This race condition could have undesirable results.

INTCTL2_VEC_RD

Bits	Name	Description
31:0	INDEX	Reading from this register provides the index of the current interrupt selected by the PIC, and indicates to the priority hardware that the interrupt is being serviced. Though the practice is not recommended, if this register is read in Vector Mode, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to VEC_RD. The commanded PUSH is performed. If irq_n is not currently active, reading this register returns the value stored in NO_PEND_VAL. There are no side effects in this case - the commanded PUSH is not performed.

0x121010D4 INTCTL2_PEND_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack POP in the PIC, and if an interrupt is pending returns it.

Assuming an interrupt is available and irq_n is not asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine, and ending the previous ISR routine.
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that is now starting.
- The PIC will clear the most significant bit found set in IN_SERVICE for the priority of the interrupt ISR routine just ended if the priority of the interrupt now starting is different.

If an interrupt is available and irq_n is asserted or if no interrupt is available the PIC will behave as if the VEC_WR command register was written. That is, the command issued to the PIC will be interpreted as a POP.

The value returned when reading PEND_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If no interrupt is asserted or if irq_n is asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When Vector Mode is enabled, unlike the VEC_RD register, PEND_RD must be read in order to inform the PIC that the ISR has finished processing. There is no equivalent

Vector Port transaction. When not in Vector Mode, the interrupts index (bit position) is returned.

NOTE In Vector Mode the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE VEC_WR can be substituted for PEND_RD to inform the PIC that the ISR has finished processing without returning a pending interrupt.

INTCTL2_PEND_RD

Bits	Name	Description
31:0	HANDLE	Reading from this register provides the index of the current interrupt selected by the PIC as a pending interrupt. It also indicates to the priority hardware that the current ISR is finished, and if an interrupt is pending that a new ISR is starting. In Vector Mode, when an interrupt is pending, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to PEND_RD. The commanded POP is performed. If an interrupt is not pending, reading this register returns the value stored in NO_PEND_VAL. The commanded POP is still performed.

0x121010D8 INTCTL2_VEC_WR

Type: Write (command)
Clock: INT_CTL_CLK
Reset State: NA

This is a write command register. It affects a logical stack POP in the PIC without returning any (possibly) pending interrupt. The resulting state of the PIC is to request a new irq_n if any bits are set in IRQ_STATUS.

Writing this register has the following side effects:

- Informs the PIC logic that the CPU is ending the current ISR routine.
- The PIC will clear the most significant bit found set in IN_SERVICE.
- The PIC will clear the most significant bit found set in IN_STACK.

NOTE PEND_RD can be substituted for VEC_WR to inform the PIC that the ISR has finished processing and to return a pending interrupt at the same time.

INTCTL2_VEC_WR

Bits	Name	Description
31:0	RESERVED	Data written is not used.

20.7.3 Debug and legacy registers

0x121010E0 INTCTL2_IN_SERVICE

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_SERVICE register provides the Interrupt Controller's state information regarding which ISR priority levels are currently in service by the processor. This is provided for debug purposes only.

INTCTL2_IN_SERVICE

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL7	0x1: In service 0x0: Not in service
6	LEVEL6	0x1: In service 0x0: Not in service
5	LEVEL5	0x1: In service 0x0: Not in service
4	LEVEL4	0x1: In service 0x0: Not in service
3	LEVEL3	0x1: In service 0x0: Not in service
2	LEVEL2	0x1: In service 0x0: Not in service
1	LEVEL1	0x1: In service 0x0: Not in service
0	LEVEL0	0x1: In service 0x0: Not in service

0x121010E4 INTCTL2_IN_STACK

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_STACK register provides the Interrupt Controller's state information regarding which ISR priority levels are currently nested (stacked) in the CPU. This is provided for debug purposes only.

INTCTL2_IN_STACK

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL6	0x1: Nested 0x0: Not nested
6	LEVEL5	0x1: Nested 0x0: Not nested
5	LEVEL4	0x1: Nested 0x0: Not nested
4	LEVEL3	0x1: Nested 0x0: Not nested
3	LEVEL2	0x1: Nested 0x0: Not nested
2	LEVEL1	0x1: Nested 0x0: Not nested
1	LEVEL0	0x1: Nested 0x0: Not nested
0	MAIN	0x1: Nested 0x0: Not nested

0x121010E8 INTCTL2_TEST_BUS_SEL

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

Select signals to be directed to Interrupt Controller test_bus 32-bit output port.

INTCTL2_TEST_BUS_SEL

Bits	Name	Description
31:2	RESERVED	
1:0	SEL	NOTE The Interrupt Controller may have as few as 33 interrupts. Setting to HIGH_INTS will not have meaning if there are less than 61 interrupt inputs. 0x0: NONE (output 0x0) 0x1: LOW_INTS (31 - IRQn, 30 - FIQn, intsource[29:0]) 0x2: MID_INTS (31 - IRQn, 30 - FIQn, pad 0 as needed, intsource[N up to 59:30]) 0x3: HIGH_INTS (31 - IRQn, 30 - FIQn, 28 bits 0, intsource[63:60])

0x121010EC INTCTL2_INT_CTL_CONFIG

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

The INT_CTL_CONFIG register provides additional configuration options for the interrupt controller used for debug purposes.

INTCTL2_INT_CTL_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_1	
0	NO_NESTING_MODE	Default : 0 This register bit is used to configure the interrupt controller before any interrupts occur. When this bit is cleared (0), the PIC priority logic is used to determine when to assert irq_n. When the software allows hardware interrupt nesting, this bit should be cleared (0). If this bit is set (1), irq_n is asserted whenever there is at least one bit set in IRQ_STATUS. This bit should be set (1) right after power up if the software does not need any hardware nesting functions. 0x0: NESTED 0x1: NOT NESTED

20.8 Interrupt Controller 3 Registers (0x12101800 INTCTL3_BASE)

This section contains Interrupt Controller 3 registers.

20.8.1 Configuration registers

These registers are used to configure the Interrupt Controller

0x12101800 INTCTL3_INT_SELECT_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_0 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL3_INT_SELECT_0

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12101804 INTCTL3_INT_SELECT_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_1 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL3_INT_SELECT_1

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12101810 INTCTL3_INT_ENABLE_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_0 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor.

INTCTL3_INT_ENABLE_0

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12101814 INTCTL3_INT_ENABLE_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_1 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor

INTCTL3_INT_ENABLE_1

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12101820 INTCTL3_INT_ENABLE_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_0 register is used to clear (to 0) the bits of the INT_ENABLE_0 register.

INTCTL3_INT_ENABLE_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear.

0x12101824 INTCTL3_INT_ENABLE_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_1 register is used to clear (to 0) the bits of the INT_ENABLE_1 register.

INTCTL3_INT_ENABLE_CLEAR_1

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Clear.

0x12101830 INTCTL3_INT_ENABLE_SET_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_0 register is used to set (to 1) the bits of the INT_ENABLE_0 register.

INTCTL3_INT_ENABLE_SET_0

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Set.

0x12101834 INTCTL3_INT_ENABLE_SET_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_1 register is used to set (to 1) the bits of the INT_ENABLE_1 register.

INTCTL3_INT_ENABLE_SET_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Set.

0x12101840 INTCTL3_INT_TYPE_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL3_INT_TYPE_0

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12101844 INTCTL3_INT_TYPE_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL3_INT_TYPE_1

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12101850 INTCTL3_INT_POLARITY_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL3_INT_POLARITY_0

Bits	Name	Description
31:0	POL	0x1: neg 0x0: pos

0x12101854 INTCTL3_INT_POLARITY_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL3_INT_POLARITY_1

Bits	Name	Description
31:0	POL	0x1: neg 0x0: posl

0x12101860 INTCTL3_NO_PEND_VAL

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

The NO_PEND_VALUE indicates the 32-bit value returned when reading VEC_RD or PEND_RD when there is no available interrupt. The reset value is the traditional indicator of no pending interrupt. It is convenient to refer to this value as the NULL interrupt.

When using the Interrupt Controller in Vector Mode, it may be useful to set this register to a value where software can jump to perform common end of ISR handling.

INTCTL3_NO_PEND_VAL

Bits	Name	Description
31:0	NULL_VALUE	This value is returned when VEC_RD or PEND_RD when there is no available interrupt

0x12101864 INTCTL3_MASTER_ENABLE

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The MASTER_ENABLE register is the IRQ and FIQ master enable register. The two bits in this register can be used to block the IRQ and/or FIQ signals from reaching the processor. These enables are used to gate off the interrupt signals at IRQ_STATUS and FIQ_STATUS. This will cause irq_n and fiq_n de-asserted if they were previously asserted and stay de-asserted. Note that if a Vector Port transaction has started, it will complete with irq_n still held asserted by the Vector Port logic.

Writing this register has no affect on the INT_ENABLE register.

NOTE The RAW_STATUS register will hold interrupts that have been detected by the Interrupt Controller even if disabled by INT_ENABLE.

INTCTL3_MASTER_ENABLE

Bits	Name	Description
1	FIQ_ENABLE	0x0: Disable 0x1: Enable.
0	IRQ_ENABLE	0x0: Disable 0x1: Enable.

0x12101868 INTCTL3_VIC_CONFIG

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The VIC_CONFIG register is used to enable Vector Port interface.

INTCTL3_VIC_CONFIG

Bits	Name	Description
0	VECTOR_MODE	0x1: Enable 0x0: Disable

0x1210186C INTCTL3_SECURITY

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The SECURITY register is used to enable or disable non-secure bus transactions. The bus security status is signaled to the Interrupt Controller via the ns pin. When ns is set to 0 the state of the SECURITY register is not considered - a secure transaction is allowed if the device is set to non-secure mode. When ns is set to 1, the SECURITY register's SECURE bit must be 0 for access to be granted. If set to 1, the non-secure (ns) transaction is denied. When access is denied, a write is ignored, and a read will return 0x0. No error is signaled.

INTCTL3_SECURITY

Bits	Name	Description
0	SECURE	When enabled, only secure agents can access the registers. When disabled, both secure and non-secure agents can access the registers. 0x1: Enable 0x0: Disable

0x12101A00+ 4*n INTCTL3_PRIORITYn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x0

The PRIORITYn registers are used to determine the priority for each interrupt source.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

NOTE Only IRQs are prioritized. Thus PRIORITYn registers have no affect on FIQ.

INTCTL3_PRIORITYn

Bits	Name	Description
2:0	PRIORITY	Priority for each interrupt source.

0x12101C00+ 4*n INTCTL3_VECT_ADDRn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: NA

The VECT_ADDRn registers provide the vector handle address for each interrupt source N.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

INTCTL3_VECT_ADDRn

Bits	Name	Description
31:2	ADDR	Vector handle (the ISR's starting address) for interrupt source n

INTCTL3_VECT_ADDRn (cont.)

Bits	Name	Description
1:0	RESERVED_BITS1_0	

20.8.2 Operational registers

0x12101880 INTCTL3_IRQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

IRQ_STATUS_0 shows which interrupt sources zero to 31 designated for irq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 0) are currently being held by RAW_STATUS_0.

The bits set in IRQ_STATUS form the inputs to the Interrupt Controller's priority encoder (PIC) logic and ultimately result in asserting irq_n to interrupt the CPU.

0x12101890 INTCTL3_FIQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_0 shows which interrupt sources zero to 31 designated for fiq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_0.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL3_FIQ_STATUS_0

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_0 fields

0x12101894 INTCTL3_FIQ_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_1 shows which interrupt sources 32 to 63 designated for fiq_n by INT_SELECT_1 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_1.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL3_FIQ_STATUS_1

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_1 fields

0x121018A0 INTCTL3_RAW_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_0 shows which interrupt sources zero to 31 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_0. Bits set in RAW_STATUS_0 are steered to generate irq_n or fiq_n by INT_SELECT_0 if enabled by both INT_ENABLE_0 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_0 by writing SOFT_INT_0.

INTCTL3_RAW_STATUS_0

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_0

0x121018A4 INTCTL3_RAW_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_1 shows which interrupt sources 32 to 63 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_1. Bits set in RAW_STATUS_1 are steered to generate irq_n or fiq_n by INT_SELECT_1 if enabled by both INT_ENABLE _1 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_1 by writing SOFT_INT_1.

INTCTL3_RAW_STATUS_1

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_1

0x121018B0 INTCTL3_INT_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_0 is used to clear bits in RAW_STATUS_0. For any bit written 0x1 to INT_CLEAR_0, the corresponding bit position is cleared in RAW_STATUS_0.

INTCTL3_INT_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121018B4 INTCTL3_INT_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_1 is used to clear bits in RAW_STATUS_1. For any bit written 0x1 to INT_CLEAR_1, the corresponding bit position is cleared in RAW_STATUS_1.

INTCTL3_INT_CLEAR_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121018C0 INTCTL3_SOFT_INT_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_0 is used to set bits in RAW_STATUS_0 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_0, the corresponding bit position is set in RAW_STATUS_0.

INTCTL3_SOFT_INT_0

Bits	Name	Description
31:0	SW_INT	0x0: Do nothing 0x1: Set

0x121018C4 INTCTL3_SOFT_INT_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_1 is used to set bits in RAW_STATUS_1 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_1, the corresponding bit position is set in RAW_STATUS_1.

INTCTL3_SOFT_INT_1

Bits	Name	Description
31:0	SW_INT	See IRQ_STATUS_1 for bit map. 0x0: Do nothing 0x1: Set

0x121018D0 INTCTL3_VEC_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack PUSH in the PIC, and if an interrupt is causing irq_n returns it.

Assuming an interrupt is available and irq_n is asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU has seen irq_n.
- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine.
- The PIC will set a bit in IN_STACK for the sw level that has been interrupted (including "main").
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that caused the irq_n.
- Subsequently irq_n may only be asserted for an interrupt source designated at a higher priority level than the highest priority level indicated by IN_SERVICE.

If irq_n is asserted, the value returned when reading VEC_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If irq_n is not asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When the Interrupt Controller is in Vector Mode, as designated by VIC_CONFIG, VEC_RD should not be read. The controller still needs to be informed that the CPU is taking the interrupt. This is done by a Vector Port transaction. However, if VEC_RD is read in while in Vector Mode, the read will have the same effect as in PIC mode. However, the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE Using this register while the system is in Vector Mode may not be reliable as CPU hardware may initiate a Vector Port transaction while launching the read transaction to VEC_RD. This race condition could have undesirable results.

INTCTL3_VEC_RD

Bits	Name	Description
31:0	INDEX	Reading from this register provides the index of the current interrupt selected by the PIC, and indicates to the priority hardware that the interrupt is being serviced. Though the practice is not recommended, if this register is read in Vector Mode, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to VEC_RD. The commanded PUSH is performed. If irq_n is not currently active, reading this register returns the value stored in NO_PEND_VAL. There are no side effects in this case - the commanded PUSH is not performed.

0x121018D4 INTCTL3_PEND_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack POP in the PIC, and if an interrupt is pending returns it.

Assuming an interrupt is available and irq_n is not asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine, and ending the previous ISR routine.
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that is now starting.
- The PIC will clear the most significant bit found set in IN_SERVICE for the priority of the interrupt ISR routine just ended if the priority of the interrupt now starting is different.

If an interrupt is available and irq_n is asserted or if no interrupt is available the PIC will behave as if the VEC_WR command register was written. That is, the command issued to the PIC will be interpreted as a POP.

The value returned when reading PEND_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If no interrupt is asserted or if irq_n is asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When Vector Mode is enabled, unlike the VEC_RD register, PEND_RD must be read in order to inform the PIC that the ISR has finished processing. There is no equivalent

Vector Port transaction. When not in Vector Mode, the interrupts index (bit position) is returned.

NOTE In Vector Mode the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE VEC_WR can be substituted for PEND_RD to inform the PIC that the ISR has finished processing without returning a pending interrupt.

INTCTL3_PEND_RD

Bits	Name	Description
31:0	HANDLE	Reading from this register provides the index of the current interrupt selected by the PIC as a pending interrupt. It also indicates to the priority hardware that the current ISR is finished, and if an interrupt is pending that a new ISR is starting. In Vector Mode, when an interrupt is pending, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to PEND_RD. The commanded POP is performed. If an interrupt is not pending, reading this register returns the value stored in NO_PEND_VAL. The commanded POP is still performed.

0x121018D8 INTCTL3_VEC_WR

Type: Write (command)
Clock: INT_CTL_CLK
Reset State: NA

This is a write command register. It affects a logical stack POP in the PIC without returning any (possibly) pending interrupt. The resulting state of the PIC is to request a new irq_n if any bits are set in IRQ_STATUS.

Writing this register has the following side effects:

- Informs the PIC logic that the CPU is ending the current ISR routine.
- The PIC will clear the most significant bit found set in IN_SERVICE.
- The PIC will clear the most significant bit found set in IN_STACK.

NOTE PEND_RD can be substituted for VEC_WR to inform the PIC that the ISR has finished processing and to return a pending interrupt at the same time.

INTCTL3_VEC_WR

Bits	Name	Description
31:0	RESERVED	Data written is not used.

20.8.3 Debug and legacy registers

0x121018E0 INTCTL3_IN_SERVICE

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_SERVICE register provides the Interrupt Controller's state information regarding which ISR priority levels are currently in service by the processor. This is provided for debug purposes only.

INTCTL3_IN_SERVICE

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL7	0x1: In service 0x0: Not in service
6	LEVEL6	0x1: In service 0x0: Not in service
5	LEVEL5	0x1: In service 0x0: Not in service
4	LEVEL4	0x1: In service 0x0: Not in service
3	LEVEL3	0x1: In service 0x0: Not in service
2	LEVEL2	0x1: In service 0x0: Not in service
1	LEVEL1	0x1: In service 0x0: Not in service
0	LEVEL0	0x1: In service 0x0: Not in service

0x121018E4 INTCTL3_IN_STACK

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_STACK register provides the Interrupt Controller's state information regarding which ISR priority levels are currently nested (stacked) in the CPU. This is provided for debug purposes only.

INTCTL3_IN_STACK

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL6	0x1: Nested 0x0: Not nested
6	LEVEL5	0x1: Nested 0x0: Not nested
5	LEVEL4	0x1: Nested 0x0: Not nested
4	LEVEL3	0x1: Nested 0x0: Not nested
3	LEVEL2	0x1: Nested 0x0: Not nested
2	LEVEL1	0x1: Nested 0x0: Not nested
1	LEVEL0	0x1: Nested 0x0: Not nested
0	MAIN	0x1: Nested 0x0: Not nested

0x121018E8 INTCTL3_TEST_BUS_SEL

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

Select signals to be directed to Interrupt Controller test_bus 32-bit output port.

INTCTL3_TEST_BUS_SEL

Bits	Name	Description
31:2	RESERVED	
1:0	SEL	NOTE The Interrupt Controller may have as few as 33 interrupts. Setting to HIGH_INTS will not have meaning if there are less than 61 interrupt inputs. 0x0: NONE (output 0x0) 0x1: LOW_INTS (31 - IRQn, 30 - FIQn, intsource[29:0]) 0x2: MID_INTS (31 - IRQn, 30 - FIQn, pad 0 as needed, intsource[N up to 59:30]) 0x3: HIGH_INTS (31 - IRQn, 30 - FIQn, 28 bits 0, intsource[63:60])

0x121018EC INTCTL3_INT_CTL_CONFIG

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

The INT_CTL_CONFIG register provides additional configuration options for the interrupt controller used for debug purposes.

INTCTL3_INT_CTL_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_1	
0	NO_NESTING_MODE	Default : 0 This register bit is used to configure the interrupt controller before any interrupts occur. When this bit is cleared (0), the PIC priority logic is used to determine when to assert irq_n. When the software allows hardware interrupt nesting, this bit should be cleared (0). If this bit is set (1), irq_n is asserted whenever there is at least one bit set in IRQ_STATUS. This bit should be set (1) right after power up if the software does not need any hardware nesting functions. 0x0: NESTED 0x1: NOT NESTED

20.9 Interrupt Controller 4 Registers (0x12102000 INTCTL4_BASE)

This section contains Interrupt Controller 4 registers.

20.9.1 Configuration registers

These registers are used to configure the Interrupt Controller.

0x12102000 INTCTL4_INT_SELECT_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_0 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL4_INT_SELECT_0

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12102004 INTCTL4_INT_SELECT_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_1 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL4_INT_SELECT_1

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12102010 INTCTL4_INT_ENABLE_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_0 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor.

INTCTL4_INT_ENABLE_0

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12102014 INTCTL4_INT_ENABLE_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_1 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor

INTCTL4_INT_ENABLE_1

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12102020 INTCTL4_INT_ENABLE_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_0 register is used to clear (to 0) the bits of the INT_ENABLE_0 register.

INTCTL4_INT_ENABLE_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear.

0x12102024 INTCTL4_INT_ENABLE_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_1 register is used to clear (to 0) the bits of the INT_ENABLE_1 register.

INTCTL4_INT_ENABLE_CLEAR_1

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Clear.

0x12102030 INTCTL4_INT_ENABLE_SET_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_0 register is used to set (to 1) the bits of the INT_ENABLE_0 register.

INTCTL4_INT_ENABLE_SET_0

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Set.

0x12102034 INTCTL4_INT_ENABLE_SET_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_1 register is used to set (to 1) the bits of the INT_ENABLE_1 register.

INTCTL4_INT_ENABLE_SET_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Set.

0x12102040 INTCTL4_INT_TYPE_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL4_INT_TYPE_0

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12102044 INTCTL4_INT_TYPE_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL4_INT_TYPE_1

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12102050 INTCTL4_INT_POLARITY_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL4_INT_POLARITY_0

Bits	Name	Description
31:0	POL	0x1: neg 0x0: pos

0x12102054 INTCTL4_INT_POLARITY_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL4_INT_POLARITY_1

Bits	Name	Description
31:0	POL	0x1: neg 0x0: posl

0x12102060 INTCTL4_NO_PEND_VAL

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

The NO_PEND_VALUE indicates the 32-bit value returned when reading VEC_RD or PEND_RD when there is no available interrupt. The reset value is the traditional indicator of no pending interrupt. It is convenient to refer to this value as the NULL interrupt.

When using the Interrupt Controller in Vector Mode, it may be useful to set this register to a value where software can jump to perform common end of ISR handling.

INTCTL4_NO_PEND_VAL

Bits	Name	Description
31:0	NULL_VALUE	This value is returned when VEC_RD or PEND_RD when there is no available interrupt

0x12102064 INTCTL4_MASTER_ENABLE

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The MASTER_ENABLE register is the IRQ and FIQ master enable register. The two bits in this register can be used to block the IRQ and/or FIQ signals from reaching the processor. These enables are used to gate off the interrupt signals at IRQ_STATUS and FIQ_STATUS. This will cause irq_n and fiq_n de-asserted if they were previously asserted and stay de-asserted. Note that if a Vector Port transaction has started, it will complete with irq_n still held asserted by the Vector Port logic.

Writing this register has no affect on the INT_ENABLE register.

NOTE The RAW_STATUS register will hold interrupts that have been detected by the Interrupt Controller even if disabled by INT_ENABLE.

INTCTL4_MASTER_ENABLE

Bits	Name	Description
1	FIQ_ENABLE	0x0: Disable 0x1: Enable.
0	IRQ_ENABLE	0x0: Disable 0x1: Enable.

0x12102068 INTCTL4_VIC_CONFIG

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The VIC_CONFIG register is used to enable Vector Port interface.

INTCTL4_VIC_CONFIG

Bits	Name	Description
0	VECTOR_MODE	0x1: Enable 0x0: Disable

0x1210206C INTCTL4_SECURITY

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The SECURITY register is used to enable or disable non-secure bus transactions. The bus security status is signaled to the Interrupt Controller via the ns pin. When ns is set to 0 the state of the SECURITY register is not considered - a secure transaction is allowed if the device is set to non-secure mode. When ns is set to 1, the SECURITY register's SECURE bit must be 0 for access to be granted. If set to 1, the non-secure (ns) transaction is denied. When access is denied, a write is ignored, and a read will return 0x0. No error is signaled.

INTCTL4_SECURITY

Bits	Name	Description
0	SECURE	When enabled, only secure agents can access the registers. When disabled, both secure and non-secure agents can access the registers. 0x1: Enable 0x0: Disable

0x12102200+4*n INTCTL4_PRIORITYn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x0

The PRIORITYn registers are used to determine the priority for each interrupt source.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

NOTE Only IRQs are prioritized. Thus PRIORITYn registers have no affect on FIQ.

INTCTL4_PRIORITYn

Bits	Name	Description
2:0	PRIORITY	Priority for each interrupt source.

0x12102400+4*n INTCTL4_VECT_ADDRn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: NA

The VECT_ADDRn registers provide the vector handle address for each interrupt source N.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

INTCTL4_VECT_ADDRn

Bits	Name	Description
31:2	ADDR	Vector handle (the ISR's starting address) for interrupt source n

INTCTL4_VECT_ADDRn (cont.)

Bits	Name	Description
1:0	RESERVED_BITS1_0	

20.9.2 Operational registers

0x12102080 INTCTL4_IRQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

IRQ_STATUS_0 shows which interrupt sources zero to 31 designated for irq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 0) are currently being held by RAW_STATUS_0.

The bits set in IRQ_STATUS form the inputs to the Interrupt Controller's priority encoder (PIC) logic and ultimately result in asserting irq_n to interrupt the CPU.

INTCTL4_IRQ_STATUS_0

0x12102090 INTCTL4_FIQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_0 shows which interrupt sources zero to 31 designated for fiq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_0.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL4_FIQ_STATUS_0

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_0 fields

0x12102094 INTCTL4_FIQ_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_1 shows which interrupt sources 32 to 63 designated for fiq_n by INT_SELECT_1 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_1.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL4_FIQ_STATUS_1

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_1 fields

0x121020A0 INTCTL4_RAW_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_0 shows which interrupt sources zero to 31 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_0. Bits set in RAW_STATUS_0 are steered to generate irq_n or fiq_n by INT_SELECT_0 if enabled by both INT_ENABLE_0 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_0 by writing SOFT_INT_0.

INTCTL4_RAW_STATUS_0

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_0

0x121020A4 INTCTL4_RAW_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_1 shows which interrupt sources 32 to 63 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_1. Bits set in RAW_STATUS_1 are steered to generate irq_n or fiq_n by INT_SELECT_1 if enabled by both INT_ENABLE _1 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_1 by writing SOFT_INT_1.

INTCTL4_RAW_STATUS_1

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_1

0x121020B0 INTCTL4_INT_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_0 is used to clear bits in RAW_STATUS_0. For any bit written 0x1 to INT_CLEAR_0, the corresponding bit position is cleared in RAW_STATUS_0.

INTCTL4_INT_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121020B4 INTCTL4_INT_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_1 is used to clear bits in RAW_STATUS_1. For any bit written 0x1 to INT_CLEAR_1, the corresponding bit position is cleared in RAW_STATUS_1.

INTCTL4_INT_CLEAR_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121020C0 INTCTL4_SOFT_INT_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_0 is used to set bits in RAW_STATUS_0 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_0, the corresponding bit position is set in RAW_STATUS_0.

INTCTL4_SOFT_INT_0

Bits	Name	Description
31:0	SW_INT	0x0: Do nothing 0x1: Set

0x121020C4 INTCTL4_SOFT_INT_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_1 is used to set bits in RAW_STATUS_1 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_1, the corresponding bit position is set in RAW_STATUS_1.

INTCTL4_SOFT_INT_1

Bits	Name	Description
31:0	SW_INT	See IRQ_STATUS_1 for bit map. 0x0: Do nothing 0x1: Set

0x121020D0 INTCTL4_VEC_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack PUSH in the PIC, and if an interrupt is causing irq_n returns it.

Assuming an interrupt is available and irq_n is asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU has seen irq_n.
- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine.
- The PIC will set a bit in IN_STACK for the sw level that has been interrupted (including "main").
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that caused the irq_n.
- Subsequently irq_n may only be asserted for an interrupt source designated at a higher priority level than the highest priority level indicated by IN_SERVICE.

If irq_n is asserted, the value returned when reading VEC_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If irq_n is not asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When the Interrupt Controller is in Vector Mode, as designated by VIC_CONFIG, VEC_RD should not be read. The controller still needs to be informed that the CPU is taking the interrupt. This is done by a Vector Port transaction. However, if VEC_RD is read in while in Vector Mode, the read will have the same effect as in PIC mode. However, the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE Using this register while the system is in Vector Mode may not be reliable as CPU hardware may initiate a Vector Port transaction while launching the read transaction to VEC_RD. This race condition could have undesirable results.

INTCTL4_VEC_RD

Bits	Name	Description
31:0	INDEX	Reading from this register provides the index of the current interrupt selected by the PIC, and indicates to the priority hardware that the interrupt is being serviced. Though the practice is not recommended, if this register is read in Vector Mode, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to VEC_RD. The commanded PUSH is performed. If irq_n is not currently active, reading this register returns the value stored in NO_PEND_VAL. There are no side effects in this case - the commanded PUSH is not performed.

0x121020D4 INTCTL4_PEND_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack POP in the PIC, and if an interrupt is pending returns it.

Assuming an interrupt is available and irq_n is not asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine, and ending the previous ISR routine.
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that is now starting.
- The PIC will clear the most significant bit found set in IN_SERVICE for the priority of the interrupt ISR routine just ended if the priority of the interrupt now starting is different.

If an interrupt is available and irq_n is asserted or if no interrupt is available the PIC will behave as if the VEC_WR command register was written. That is, the command issued to the PIC will be interpreted as a POP.

The value returned when reading PEND_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If no interrupt is asserted or if irq_n is asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When Vector Mode is enabled, unlike the VEC_RD register, PEND_RD must be read in order to inform the PIC that the ISR has finished processing. There is no equivalent

Vector Port transaction. When not in Vector Mode, the interrupts index (bit position) is returned.

NOTE In Vector Mode the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE VEC_WR can be substituted for PEND_RD to inform the PIC that the ISR has finished processing without returning a pending interrupt.

INTCTL4_PEND_RD

Bits	Name	Description
31:0	HANDLE	Reading from this register provides the index of the current interrupt selected by the PIC as a pending interrupt. It also indicates to the priority hardware that the current ISR is finished, and if an interrupt is pending that a new ISR is starting. In Vector Mode, when an interrupt is pending, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to PEND_RD. The commanded POP is performed. If an interrupt is not pending, reading this register returns the value stored in NO_PEND_VAL. The commanded POP is still performed.

0x121020D8 INTCTL4_VEC_WR

Type: Write (command)
Clock: INT_CTL_CLK
Reset State: NA

This is a write command register. It affects a logical stack POP in the PIC without returning any (possibly) pending interrupt. The resulting state of the PIC is to request a new irq_n if any bits are set in IRQ_STATUS.

Writing this register has the following side effects:

- Informs the PIC logic that the CPU is ending the current ISR routine.
- The PIC will clear the most significant bit found set in IN_SERVICE.
- The PIC will clear the most significant bit found set in IN_STACK.

NOTE PEND_RD can be substituted for VEC_WR to inform the PIC that the ISR has finished processing and to return a pending interrupt at the same time.

INTCTL4_VEC_WR

Bits	Name	Description
31:0	RESERVED	Data written is not used.

20.9.3 Debug and legacy registers

0x121020E0 INTCTL4_IN_SERVICE

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_SERVICE register provides the Interrupt Controller's state information regarding which ISR priority levels are currently in service by the processor. This is provided for debug purposes only.

INTCTL4_IN_SERVICE

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL7	0x1: In service 0x0: Not in service
6	LEVEL6	0x1: In service 0x0: Not in service
5	LEVEL5	0x1: In service 0x0: Not in service
4	LEVEL4	0x1: In service 0x0: Not in service
3	LEVEL3	0x1: In service 0x0: Not in service
2	LEVEL2	0x1: In service 0x0: Not in service
1	LEVEL1	0x1: In service 0x0: Not in service
0	LEVEL0	0x1: In service 0x0: Not in service

0x121020E4 INTCTL4_IN_STACK

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_STACK register provides the Interrupt Controller's state information regarding which ISR priority levels are currently nested (stacked) in the CPU. This is provided for debug purposes only.

INTCTL4_IN_STACK

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL6	0x1: Nested 0x0: Not nested
6	LEVEL5	0x1: Nested 0x0: Not nested
5	LEVEL4	0x1: Nested 0x0: Not nested
4	LEVEL3	0x1: Nested 0x0: Not nested
3	LEVEL2	0x1: Nested 0x0: Not nested
2	LEVEL1	0x1: Nested 0x0: Not nested
1	LEVEL0	0x1: Nested 0x0: Not nested
0	MAIN	0x1: Nested 0x0: Not nested

0x121020E8 INTCTL4_TEST_BUS_SEL

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

Select signals to be directed to Interrupt Controller test_bus 32-bit output port.

INTCTL4_TEST_BUS_SEL

Bits	Name	Description
31:2	RESERVED	
1:0	SEL	NOTE The Interrupt Controller may have as few as 33 interrupts. Setting to HIGH_INTS will not have meaning if there are less than 61 interrupt inputs. 0x0: NONE (output 0x0) 0x1: LOW_INTS (31 - IRQn, 30 - FIQn, intsource[29:0]) 0x2: MID_INTS (31 - IRQn, 30 - FIQn, pad 0 as needed, intsource[N up to 59:30]) 0x3: HIGH_INTS (31 - IRQn, 30 - FIQn, 28 bits 0, intsource[63:60])

0x121020EC INTCTL4_INT_CTL_CONFIG

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

The INT_CTL_CONFIG register provides additional configuration options for the interrupt controller used for debug purposes.

INTCTL4_INT_CTL_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_1	
0	NO_NESTING_MODE	Default : 0 This register bit is used to configure the interrupt controller before any interrupts occur. When this bit is cleared (0), the PIC priority logic is used to determine when to assert irq_n. When the software allows hardware interrupt nesting, this bit should be cleared (0). If this bit is set (1), irq_n is asserted whenever there is at least one bit set in IRQ_STATUS. This bit should be set (1) right after power up if the software does not need any hardware nesting functions. 0x0: NESTED 0x1: NOT NESTED

20.10 Interrupt Controller 5 Registers (0x12102800 INTCTL5_BASE)

This section contains Interrupt Controller 5 registers.

20.10.1 Configuration registers

These registers are used to configure the Interrupt Controller

0x12102800 INTCTL5_INT_SELECT_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_0 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL5_INT_SELECT_0

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12102804 INTCTL5_INT_SELECT_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_1 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL5_INT_SELECT_1

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12102810 INTCTL5_INT_ENABLE_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_0 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor.

INTCTL5_INT_ENABLE_0

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12102814 INTCTL5_INT_ENABLE_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_1 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor

INTCTL5_INT_ENABLE_1

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12102820 INTCTL5_INT_ENABLE_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_0 register is used to clear (to 0) the bits of the INT_ENABLE_0 register.

INTCTL5_INT_ENABLE_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear.

0x12102824 INTCTL5_INT_ENABLE_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_1 register is used to clear (to 0) the bits of the INT_ENABLE_1 register.

INTCTL5_INT_ENABLE_CLEAR_1

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Clear.

0x12102830 INTCTL5_INT_ENABLE_SET_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_0 register is used to set (to 1) the bits of the INT_ENABLE_0 register.

INTCTL5_INT_ENABLE_SET_0

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Set.

0x12102834 INTCTL5_INT_ENABLE_SET_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_1 register is used to set (to 1) the bits of the INT_ENABLE_1 register.

INTCTL5_INT_ENABLE_SET_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Set.

0x12102840 INTCTL5_INT_TYPE_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL5_INT_TYPE_0

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12102844 INTCTL5_INT_TYPE_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL5_INT_TYPE_1

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12102850 INTCTL5_INT_POLARITY_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL5_INT_POLARITY_0

Bits	Name	Description
31:0	POL	0x1: neg 0x0: pos

0x12102854 INTCTL5_INT_POLARITY_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL5_INT_POLARITY_1

Bits	Name	Description
31:0	POL	0x1: neg 0x0: posl

0x12102860 INTCTL5_NO_PEND_VAL

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

The NO_PEND_VALUE indicates the 32-bit value returned when reading VEC_RD or PEND_RD when there is no available interrupt. The reset value is the traditional indicator of no pending interrupt. It is convenient to refer to this value as the NULL interrupt.

When using the Interrupt Controller in Vector Mode, it may be useful to set this register to a value where software can jump to perform common end of ISR handling.

INTCTL5_NO_PEND_VAL

Bits	Name	Description
31:0	NULL_VALUE	This value is returned when VEC_RD or PEND_RD when there is no available interrupt

0x12102864 INTCTL5_MASTER_ENABLE

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The MASTER_ENABLE register is the IRQ and FIQ master enable register. The two bits in this register can be used to block the IRQ and/or FIQ signals from reaching the processor. These enables are used to gate off the interrupt signals at IRQ_STATUS and FIQ_STATUS. This will cause irq_n and fiq_n de-asserted if they were previously asserted and stay de-asserted. Note that if a Vector Port transaction has started, it will complete with irq_n still held asserted by the Vector Port logic.

Writing this register has no affect on the INT_ENABLE register.

NOTE The RAW_STATUS register will hold interrupts that have been detected by the Interrupt Controller even if disabled by INT_ENABLE.

INTCTL5_MASTER_ENABLE

Bits	Name	Description
1	FIQ_ENABLE	0x0: Disable 0x1: Enable.
0	IRQ_ENABLE	0x0: Disable 0x1: Enable.

0x12102868 INTCTL5_VIC_CONFIG

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The VIC_CONFIG register is used to enable Vector Port interface.

INTCTL5_VIC_CONFIG

Bits	Name	Description
0	VECTOR_MODE	0x1: Enable 0x0: Disable

0x1210286C INTCTL5_SECURITY

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The SECURITY register is used to enable or disable non-secure bus transactions. The bus security status is signaled to the Interrupt Controller via the ns pin. When ns is set to 0 the state of the SECURITY register is not considered - a secure transaction is allowed if the device is set to non-secure mode. When ns is set to 1, the SECURITY register's SECURE bit must be 0 for access to be granted. If set to 1, the non-secure (ns) transaction is denied. When access is denied, a write is ignored, and a read will return 0x0. No error is signaled.

INTCTL5_SECURITY

Bits	Name	Description
0	SECURE	When enabled, only secure agents can access the registers. When disabled, both secure and non-secure agents can access the registers. 0x1: Enable 0x0: Disable

0x12102A00+ 4*n INTCTL5_PRIORITYn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x0

The PRIORITYn registers are used to determine the priority for each interrupt source.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

NOTE Only IRQs are prioritized. Thus PRIORITYn registers have no affect on FIQ.

INTCTL5_PRIORITYn

Bits	Name	Description
2:0	PRIORITY	Priority for each interrupt source.

0x12102C00+ 4*n INTCTL5_VECT_ADDRn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: NA

The VECT_ADDRn registers provide the vector handle address for each interrupt source N.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

INTCTL5_VECT_ADDRn

Bits	Name	Description
31:2	ADDR	Vector handle (the ISR's starting address) for interrupt source n

INTCTL5_VECT_ADDRn (cont.)

Bits	Name	Description
1:0	RESERVED_BITS1_0	

20.10.2 Operational registers

0x12102880 INTCTL5_IRQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

IRQ_STATUS_0 shows which interrupt sources zero to 31 designated for irq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 0) are currently being held by RAW_STATUS_0.

The bits set in IRQ_STATUS form the inputs to the Interrupt Controller's priority encoder (PIC) logic and ultimately result in asserting irq_n to interrupt the CPU.

INTCTL5_IRQ_STATUS_0

0x12102890 INTCTL5_FIQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_0 shows which interrupt sources zero to 31 designated for fiq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_0.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL5_FIQ_STATUS_0

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_0 fields

0x12102894 INTCTL5_FIQ_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_1 shows which interrupt sources 32 to 63 designated for fiq_n by INT_SELECT_1 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_1.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL5_FIQ_STATUS_1

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_1 fields

0x121028A0 INTCTL5_RAW_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_0 shows which interrupt sources zero to 31 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_0. Bits set in RAW_STATUS_0 are steered to generate irq_n or fiq_n by INT_SELECT_0 if enabled by both INT_ENABLE_0 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_0 by writing SOFT_INT_0.

INTCTL5_RAW_STATUS_0

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_0

0x121028A4 INTCTL5_RAW_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_1 shows which interrupt sources 32 to 63 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_1. Bits set in RAW_STATUS_1 are steered to generate irq_n or fiq_n by INT_SELECT_1 if enabled by both INT_ENABLE _1 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_1 by writing SOFT_INT_1.

INTCTL5_RAW_STATUS_1

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_1

0x121028B0 INTCTL5_INT_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_0 is used to clear bits in RAW_STATUS_0. For any bit written 0x1 to INT_CLEAR_0, the corresponding bit position is cleared in RAW_STATUS_0.

INTCTL5_INT_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121028B4 INTCTL5_INT_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_1 is used to clear bits in RAW_STATUS_1. For any bit written 0x1 to INT_CLEAR_1, the corresponding bit position is cleared in RAW_STATUS_1.

INTCTL5_INT_CLEAR_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121028C0 INTCTL5_SOFT_INT_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_0 is used to set bits in RAW_STATUS_0 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_0, the corresponding bit position is set in RAW_STATUS_0.

INTCTL5_SOFT_INT_0

Bits	Name	Description
31:0	SW_INT	0x0: Do nothing 0x1: Set

0x121028C4 INTCTL5_SOFT_INT_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_1 is used to set bits in RAW_STATUS_1 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_1, the corresponding bit position is set in RAW_STATUS_1.

INTCTL5_SOFT_INT_1

Bits	Name	Description
31:0	SW_INT	See IRQ_STATUS_1 for bit map. 0x0: Do nothing 0x1: Set

0x121028D0 INTCTL5_VEC_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack PUSH in the PIC, and if an interrupt is causing irq_n returns it.

Assuming an interrupt is available and irq_n is asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU has seen irq_n.
- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine.
- The PIC will set a bit in IN_STACK for the sw level that has been interrupted (including "main").
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that caused the irq_n.
- Subsequently irq_n may only be asserted for an interrupt source designated at a higher priority level than the highest priority level indicated by IN_SERVICE.

If irq_n is asserted, the value returned when reading VEC_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If irq_n is not asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When the Interrupt Controller is in Vector Mode, as designated by VIC_CONFIG, VEC_RD should not be read. The controller still needs to be informed that the CPU is taking the interrupt. This is done by a Vector Port transaction. However, if VEC_RD is read in while in Vector Mode, the read will have the same effect as in PIC mode. However, the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE Using this register while the system is in Vector Mode may not be reliable as CPU hardware may initiate a Vector Port transaction while launching the read transaction to VEC_RD. This race condition could have undesirable results.

INTCTL5_VEC_RD

Bits	Name	Description
31:0	INDEX	Reading from this register provides the index of the current interrupt selected by the PIC, and indicates to the priority hardware that the interrupt is being serviced. Though the practice is not recommended, if this register is read in Vector Mode, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to VEC_RD. The commanded PUSH is performed. If irq_n is not currently active, reading this register returns the value stored in NO_PEND_VAL. There are no side effects in this case - the commanded PUSH is not performed.

0x121028D4 INTCTL5_PEND_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack POP in the PIC, and if an interrupt is pending returns it.

Assuming an interrupt is available and irq_n is not asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine, and ending the previous ISR routine.
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that is now starting.
- The PIC will clear the most significant bit found set in IN_SERVICE for the priority of the interrupt ISR routine just ended if the priority of the interrupt now starting is different.

If an interrupt is available and irq_n is asserted or if no interrupt is available the PIC will behave as if the VEC_WR command register was written. That is, the command issued to the PIC will be interpreted as a POP.

The value returned when reading PEND_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If no interrupt is asserted or if irq_n is asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When Vector Mode is enabled, unlike the VEC_RD register, PEND_RD must be read in order to inform the PIC that the ISR has finished processing. There is no equivalent

Vector Port transaction. When not in Vector Mode, the interrupts index (bit position) is returned.

NOTE In Vector Mode the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE VEC_WR can be substituted for PEND_RD to inform the PIC that the ISR has finished processing without returning a pending interrupt.

INTCTL5_PEND_RD

Bits	Name	Description
31:0	HANDLE	Reading from this register provides the index of the current interrupt selected by the PIC as a pending interrupt. It also indicates to the priority hardware that the current ISR is finished, and if an interrupt is pending that a new ISR is starting. In Vector Mode, when an interrupt is pending, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to PEND_RD. The commanded POP is performed. If an interrupt is not pending, reading this register returns the value stored in NO_PEND_VAL. The commanded POP is still performed.

0x121028D8 INTCTL5_VEC_WR

Type: Write (command)
Clock: INT_CTL_CLK
Reset State: NA

This is a write command register. It affects a logical stack POP in the PIC without returning any (possibly) pending interrupt. The resulting state of the PIC is to request a new irq_n if any bits are set in IRQ_STATUS.

Writing this register has the following side effects:

- Informs the PIC logic that the CPU is ending the current ISR routine.
- The PIC will clear the most significant bit found set in IN_SERVICE.
- The PIC will clear the most significant bit found set in IN_STACK.

NOTE PEND_RD can be substituted for VEC_WR to inform the PIC that the ISR has finished processing and to return a pending interrupt at the same time.

INTCTL5_VEC_WR

Bits	Name	Description
31:0	RESERVED	Data written is not used.

20.10.3 Debug and legacy registers

0x121028E0 INTCTL5_IN_SERVICE

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_SERVICE register provides the Interrupt Controller's state information regarding which ISR priority levels are currently in service by the processor. This is provided for debug purposes only.

INTCTL5_IN_SERVICE

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL7	0x1: In service 0x0: Not in service
6	LEVEL6	0x1: In service 0x0: Not in service
5	LEVEL5	0x1: In service 0x0: Not in service
4	LEVEL4	0x1: In service 0x0: Not in service
3	LEVEL3	0x1: In service 0x0: Not in service
2	LEVEL2	0x1: In service 0x0: Not in service
1	LEVEL1	0x1: In service 0x0: Not in service
0	LEVEL0	0x1: In service 0x0: Not in service

0x121028E4 INTCTL5_IN_STACK

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_STACK register provides the Interrupt Controller's state information regarding which ISR priority levels are currently nested (stacked) in the CPU. This is provided for debug purposes only.

INTCTL5_IN_STACK

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL6	0x1: Nested 0x0: Not nested
6	LEVEL5	0x1: Nested 0x0: Not nested
5	LEVEL4	0x1: Nested 0x0: Not nested
4	LEVEL3	0x1: Nested 0x0: Not nested
3	LEVEL2	0x1: Nested 0x0: Not nested
2	LEVEL1	0x1: Nested 0x0: Not nested
1	LEVEL0	0x1: Nested 0x0: Not nested
0	MAIN	0x1: Nested 0x0: Not nested

0x121028E8 INTCTL5_TEST_BUS_SEL

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

Select signals to be directed to Interrupt Controller test_bus 32-bit output port.

INTCTL5_TEST_BUS_SEL

Bits	Name	Description
31:2	RESERVED	
1:0	SEL	NOTE The Interrupt Controller may have as few as 33 interrupts. Setting to HIGH_INTS will not have meaning if there are less than 61 interrupt inputs. 0x0: NONE (output 0x0) 0x1: LOW_INTS (31 - IRQn, 30 - FIQn, intsource[29:0]) 0x2: MID_INTS (31 - IRQn, 30 - FIQn, pad 0 as needed, intsource[N up to 59:30]) 0x3: HIGH_INTS (31 - IRQn, 30 - FIQn, 28 bits 0, intsource[63:60])

0x121028EC INTCTL5_INT_CTL_CONFIG

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

The INT_CTL_CONFIG register provides additional configuration options for the interrupt controller used for debug purposes.

INTCTL5_INT_CTL_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_1	
0	NO_NESTING_MODE	Default : 0 This register bit is used to configure the interrupt controller before any interrupts occur. When this bit is cleared (0), the PIC priority logic is used to determine when to assert irq_n. When the software allows hardware interrupt nesting, this bit should be cleared (0). If this bit is set (1), irq_n is asserted whenever there is at least one bit set in IRQ_STATUS. This bit should be set (1) right after power up if the software does not need any hardware nesting functions. 0x0: NESTED 0x1: NOT NESTED

20.11 Interrupt Controller 6 Registers (0x12103000 INTCTL6_BASE)

This section contains Interrupt Controller 6 registers.

20.11.1 IConfiguration registers

These registers are used to configure the Interrupt Controller

0x12103000 INTCTL6_INT_SELECT_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_0 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL6_INT_SELECT_0

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12103004 INTCTL6_INT_SELECT_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_1 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL6_INT_SELECT_1

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12103010 INTCTL6_INT_ENABLE_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_0 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor.

INTCTL6_INT_ENABLE_0

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12103014 INTCTL6_INT_ENABLE_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_1 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor

INTCTL6_INT_ENABLE_1

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12103020 INTCTL6_INT_ENABLE_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_0 register is used to clear (to 0) the bits of the INT_ENABLE_0 register.

INTCTL6_INT_ENABLE_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear.

0x12103024 INTCTL6_INT_ENABLE_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_1 register is used to clear (to 0) the bits of the INT_ENABLE_1 register.

INTCTL6_INT_ENABLE_CLEAR_1

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Clear.

0x12103030 INTCTL6_INT_ENABLE_SET_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_0 register is used to set (to 1) the bits of the INT_ENABLE_0 register.

INTCTL6_INT_ENABLE_SET_0

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Set.

0x12103034 INTCTL6_INT_ENABLE_SET_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_1 register is used to set (to 1) the bits of the INT_ENABLE_1 register.

INTCTL6_INT_ENABLE_SET_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Set.

0x12103040 INTCTL6_INT_TYPE_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL6_INT_TYPE_0

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12103044 INTCTL6_INT_TYPE_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL6_INT_TYPE_1

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12103050 INTCTL6_INT_POLARITY_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL6_INT_POLARITY_0

Bits	Name	Description
31:0	POL	0x1: neg 0x0: pos

0x12103054 INTCTL6_INT_POLARITY_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL6_INT_POLARITY_1

Bits	Name	Description
31:0	POL	0x1: neg 0x0: posl

0x12103060 INTCTL6_NO_PEND_VAL

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

The NO_PEND_VALUE indicates the 32-bit value returned when reading VEC_RD or PEND_RD when there is no available interrupt. The reset value is the traditional indicator of no pending interrupt. It is convenient to refer to this value as the NULL interrupt.

When using the Interrupt Controller in Vector Mode, it may be useful to set this register to a value where software can jump to perform common end of ISR handling.

INTCTL6_NO_PEND_VAL

Bits	Name	Description
31:0	NULL_VALUE	This value is returned when VEC_RD or PEND_RD when there is no available interrupt

0x12103064 INTCTL6_MASTER_ENABLE

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The MASTER_ENABLE register is the IRQ and FIQ master enable register. The two bits in this register can be used to block the IRQ and/or FIQ signals from reaching the processor. These enables are used to gate off the interrupt signals at IRQ_STATUS and FIQ_STATUS. This will cause irq_n and fiq_n de-asserted if they were previously asserted and stay de-asserted. Note that if a Vector Port transaction has started, it will complete with irq_n still held asserted by the Vector Port logic.

Writing this register has no affect on the INT_ENABLE register.

NOTE The RAW_STATUS register will hold interrupts that have been detected by the Interrupt Controller even if disabled by INT_ENABLE.

INTCTL6_MASTER_ENABLE

Bits	Name	Description
1	FIQ_ENABLE	0x0: Disable 0x1: Enable.
0	IRQ_ENABLE	0x0: Disable 0x1: Enable.

0x12103068 INTCTL6_VIC_CONFIG

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The VIC_CONFIG register is used to enable Vector Port interface.

INTCTL6_VIC_CONFIG

Bits	Name	Description
0	VECTOR_MODE	0x1: Enable 0x0: Disable

0x1210306C INTCTL6_SECURITY

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The SECURITY register is used to enable or disable non-secure bus transactions. The bus security status is signaled to the Interrupt Controller via the ns pin. When ns is set to 0 the state of the SECURITY register is not considered - a secure transaction is allowed if the device is set to non-secure mode. When ns is set to 1, the SECURITY register's SECURE bit must be 0 for access to be granted. If set to 1, the non-secure (ns) transaction is denied. When access is denied, a write is ignored, and a read will return 0x0. No error is signaled.

INTCTL6_SECURITY

Bits	Name	Description
0	SECURE	When enabled, only secure agents can access the registers. When disabled, both secure and non-secure agents can access the registers. 0x1: Enable 0x0: Disable

0x12103200+4*n INTCTL6_PRIORITYn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x0

The PRIORITYn registers are used to determine the priority for each interrupt source.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

NOTE Only IRQs are prioritized. Thus PRIORITYn registers have no affect on FIQ.

INTCTL6_PRIORITYn

Bits	Name	Description
2:0	PRIORITY	Priority for each interrupt source.

0x12103400+4*n INTCTL6_VECT_ADDRn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: NA

The VECT_ADDRn registers provide the vector handle address for each interrupt source N.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

INTCTL6_VECT_ADDRn

Bits	Name	Description
31:2	ADDR	Vector handle (the ISR's starting address) for interrupt source n

INTCTL6_VECT_ADDRn (cont.)

Bits	Name	Description
1:0	RESERVED_BITS1_0	

20.11.2 Operational registers

0x12103080 INTCTL6_IRQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

IRQ_STATUS_0 shows which interrupt sources zero to 31 designated for irq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 0) are currently being held by RAW_STATUS_0.

The bits set in IRQ_STATUS form the inputs to the Interrupt Controller's priority encoder (PIC) logic and ultimately result in asserting irq_n to interrupt the CPU.

INTCTL6_IRQ_STATUS_0

0x12103090 INTCTL6_FIQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_0 shows which interrupt sources zero to 31 designated for fiq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_0.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL6_FIQ_STATUS_0

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_0 fields

0x12103094 INTCTL6_FIQ_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_1 shows which interrupt sources 32 to 63 designated for fiq_n by INT_SELECT_1 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_1.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL6_FIQ_STATUS_1

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_1 fields

0x121030A0 INTCTL6_RAW_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_0 shows which interrupt sources zero to 31 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_0. Bits set in RAW_STATUS_0 are steered to generate irq_n or fiq_n by INT_SELECT_0 if enabled by both INT_ENABLE_0 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_0 by writing SOFT_INT_0.

INTCTL6_RAW_STATUS_0

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_0

0x121030A4 INTCTL6_RAW_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_1 shows which interrupt sources 32 to 63 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_1. Bits set in RAW_STATUS_1 are steered to generate irq_n or fiq_n by INT_SELECT_1 if enabled by both INT_ENABLE _1 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_1 by writing SOFT_INT_1.

INTCTL6_RAW_STATUS_1

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_1

0x121030B0 INTCTL6_INT_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_0 is used to clear bits in RAW_STATUS_0. For any bit written 0x1 to INT_CLEAR_0, the corresponding bit position is cleared in RAW_STATUS_0.

INTCTL6_INT_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121030B4 INTCTL6_INT_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_1 is used to clear bits in RAW_STATUS_1. For any bit written 0x1 to INT_CLEAR_1, the corresponding bit position is cleared in RAW_STATUS_1.

INTCTL6_INT_CLEAR_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121030C0 INTCTL6_SOFT_INT_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_0 is used to set bits in RAW_STATUS_0 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_0, the corresponding bit position is set in RAW_STATUS_0.

INTCTL6_SOFT_INT_0

Bits	Name	Description
31:0	SW_INT	0x0: Do nothing 0x1: Set

0x121030C4 INTCTL6_SOFT_INT_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_1 is used to set bits in RAW_STATUS_1 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_1, the corresponding bit position is set in RAW_STATUS_1.

INTCTL6_SOFT_INT_1

Bits	Name	Description
31:0	SW_INT	See IRQ_STATUS_1 for bit map. 0x0: Do nothing 0x1: Set

0x121030D0 INTCTL6_VEC_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack PUSH in the PIC, and if an interrupt is causing irq_n returns it.

Assuming an interrupt is available and irq_n is asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU has seen irq_n.
- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine.
- The PIC will set a bit in IN_STACK for the sw level that has been interrupted (including "main").
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that caused the irq_n.
- Subsequently irq_n may only be asserted for an interrupt source designated at a higher priority level than the highest priority level indicated by IN_SERVICE.

If irq_n is asserted, the value returned when reading VEC_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If irq_n is not asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When the Interrupt Controller is in Vector Mode, as designated by VIC_CONFIG, VEC_RD should not be read. The controller still needs to be informed that the CPU is taking the interrupt. This is done by a Vector Port transaction. However, if VEC_RD is read in while in Vector Mode, the read will have the same effect as in PIC mode. However, the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE Using this register while the system is in Vector Mode may not be reliable as CPU hardware may initiate a Vector Port transaction while launching the read transaction to VEC_RD. This race condition could have undesirable results.

INTCTL6_VEC_RD

Bits	Name	Description
31:0	INDEX	Reading from this register provides the index of the current interrupt selected by the PIC, and indicates to the priority hardware that the interrupt is being serviced. Though the practice is not recommended, if this register is read in Vector Mode, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to VEC_RD. The commanded PUSH is performed. If irq_n is not currently active, reading this register returns the value stored in NO_PEND_VAL. There are no side effects in this case - the commanded PUSH is not performed.

0x121030D4 INTCTL6_PEND_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack POP in the PIC, and if an interrupt is pending returns it.

Assuming an interrupt is available and irq_n is not asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine, and ending the previous ISR routine.
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that is now starting.
- The PIC will clear the most significant bit found set in IN_SERVICE for the priority of the interrupt ISR routine just ended if the priority of the interrupt now starting is different.

If an interrupt is available and irq_n is asserted or if no interrupt is available the PIC will behave as if the VEC_WR command register was written. That is, the command issued to the PIC will be interpreted as a POP.

The value returned when reading PEND_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If no interrupt is asserted or if irq_n is asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When Vector Mode is enabled, unlike the VEC_RD register, PEND_RD must be read in order to inform the PIC that the ISR has finished processing. There is no equivalent

Vector Port transaction. When not in Vector Mode, the interrupts index (bit position) is returned.

NOTE In Vector Mode the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE VEC_WR can be substituted for PEND_RD to inform the PIC that the ISR has finished processing without returning a pending interrupt.

INTCTL6_PEND_RD

Bits	Name	Description
31:0	HANDLE	Reading from this register provides the index of the current interrupt selected by the PIC as a pending interrupt. It also indicates to the priority hardware that the current ISR is finished, and if an interrupt is pending that a new ISR is starting. In Vector Mode, when an interrupt is pending, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to PEND_RD. The commanded POP is performed. If an interrupt is not pending, reading this register returns the value stored in NO_PEND_VAL. The commanded POP is still performed.

0x121030D8 INTCTL6_VEC_WR

Type: Write (command)
Clock: INT_CTL_CLK
Reset State: NA

This is a write command register. It affects a logical stack POP in the PIC without returning any (possibly) pending interrupt. The resulting state of the PIC is to request a new irq_n if any bits are set in IRQ_STATUS.

Writing this register has the following side effects:

- Informs the PIC logic that the CPU is ending the current ISR routine.
- The PIC will clear the most significant bit found set in IN_SERVICE.
- The PIC will clear the most significant bit found set in IN_STACK.

NOTE PEND_RD can be substituted for VEC_WR to inform the PIC that the ISR has finished processing and to return a pending interrupt at the same time.

INTCTL6_VEC_WR

Bits	Name	Description
31:0	RESERVED	Data written is not used.

20.11.3 Debug and legacy registers

0x121030E0 INTCTL6_IN_SERVICE

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_SERVICE register provides the Interrupt Controller's state information regarding which ISR priority levels are currently in service by the processor. This is provided for debug purposes only.

INTCTL6_IN_SERVICE

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL7	0x1: In service 0x0: Not in service
6	LEVEL6	0x1: In service 0x0: Not in service
5	LEVEL5	0x1: In service 0x0: Not in service
4	LEVEL4	0x1: In service 0x0: Not in service
3	LEVEL3	0x1: In service 0x0: Not in service
2	LEVEL2	0x1: In service 0x0: Not in service
1	LEVEL1	0x1: In service 0x0: Not in service
0	LEVEL0	0x1: In service 0x0: Not in service

0x121030E4 INTCTL6_IN_STACK

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_STACK register provides the Interrupt Controller's state information regarding which ISR priority levels are currently nested (stacked) in the CPU. This is provided for debug purposes only.

INTCTL6_IN_STACK

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL6	0x1: Nested 0x0: Not nested
6	LEVEL5	0x1: Nested 0x0: Not nested
5	LEVEL4	0x1: Nested 0x0: Not nested
4	LEVEL3	0x1: Nested 0x0: Not nested
3	LEVEL2	0x1: Nested 0x0: Not nested
2	LEVEL1	0x1: Nested 0x0: Not nested
1	LEVEL0	0x1: Nested 0x0: Not nested
0	MAIN	0x1: Nested 0x0: Not nested

0x121030E8 INTCTL6_TEST_BUS_SEL

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

Select signals to be directed to Interrupt Controller test_bus 32-bit output port.

INTCTL6_TEST_BUS_SEL

Bits	Name	Description
31:2	RESERVED	
1:0	SEL	NOTE The Interrupt Controller may have as few as 33 interrupts. Setting to HIGH_INTS will not have meaning if there are less than 61 interrupt inputs. 0x0: NONE (output 0x0) 0x1: LOW_INTS (31 - IRQn, 30 - FIQn, intsource[29:0]) 0x2: MID_INTS (31 - IRQn, 30 - FIQn, pad 0 as needed, intsource[N up to 59:30]) 0x3: HIGH_INTS (31 - IRQn, 30 - FIQn, 28 bits 0, intsource[63:60])

0x121030EC INTCTL6_INT_CTL_CONFIG

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

The INT_CTL_CONFIG register provides additional configuration options for the interrupt controller used for debug purposes.

INTCTL6_INT_CTL_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_1	
0	NO_NESTING_MODE	Default : 0 This register bit is used to configure the interrupt controller before any interrupts occur. When this bit is cleared (0), the PIC priority logic is used to determine when to assert irq_n. When the software allows hardware interrupt nesting, this bit should be cleared (0). If this bit is set (1), irq_n is asserted whenever there is at least one bit set in IRQ_STATUS. This bit should be set (1) right after power up if the software does not need any hardware nesting functions. 0x0: NESTED 0x1: NOT NESTED

20.12 Interrupt Controller 7 Registers (0x12103800 INTCTL7_BASE)

This section contains Interrupt Controller 7 registers.

20.12.1 Configuration registers

These registers are used to configure the Interrupt Controller

0x12103800 INTCTL7_INT_SELECT_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_0 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL7_INT_SELECT_0

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12103804 INTCTL7_INT_SELECT_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_SELECT_1 register selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt.

INTCTL7_INT_SELECT_1

Bits	Name	Description
31:0	SELECT	Selects whether the corresponding interrupt source generates an FIQ or IRQ interrupt. 0x0: IRQ interrupt 0x1: FIQ interrupt

0x12103810 INTCTL7_INT_ENABLE_0

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_0 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor.

INTCTL7_INT_ENABLE_0

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12103814 INTCTL7_INT_ENABLE_1

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_ENABLE_1 register enables interrupts sources to generate either an IRQ or an FIQ interrupt to the processor

INTCTL7_INT_ENABLE_1

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x12103820 INTCTL7_INT_ENABLE_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_0 register is used to clear (to 0) the bits of the INT_ENABLE_0 register.

INTCTL7_INT_ENABLE_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear.

0x12103824 INTCTL7_INT_ENABLE_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_CLEAR_1 register is used to clear (to 0) the bits of the INT_ENABLE_1 register.

INTCTL7_INT_ENABLE_CLEAR_1

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Clear.

0x12103830 INTCTL7_INT_ENABLE_SET_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_0 register is used to set (to 1) the bits of the INT_ENABLE_0 register.

INTCTL7_INT_ENABLE_SET_0

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Set.

0x12103834 INTCTL7_INT_ENABLE_SET_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

The INT_ENABLE_SET_1 register is used to set (to 1) the bits of the INT_ENABLE_1 register.

INTCTL7_INT_ENABLE_SET_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Set.

0x12103840 INTCTL7_INT_TYPE_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL7_INT_TYPE_0

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12103844 INTCTL7_INT_TYPE_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_TYPE_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL7_INT_TYPE_1

Bits	Name	Description
31:0	SRC_TYPE	0x1: Edge 0x0: Level

0x12103850 INTCTL7_INT_POLARITY_0

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_0 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL7_INT_POLARITY_0

Bits	Name	Description
31:0	POL	0x1: neg 0x0: pos

0x12103854 INTCTL7_INT_POLARITY_1

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x00000000

The INT_POLARITY_1 register determines whether the corresponding interrupt is detected on a rising edge or is detected when asserted high, edge or level sensitive respectively.

INTCTL7_INT_POLARITY_1

Bits	Name	Description
31:0	POL	0x1: neg 0x0: posl

0x12103860 INTCTL7_NO_PEND_VAL

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

The NO_PEND_VALUE indicates the 32-bit value returned when reading VEC_RD or PEND_RD when there is no available interrupt. The reset value is the traditional indicator of no pending interrupt. It is convenient to refer to this value as the NULL interrupt.

When using the Interrupt Controller in Vector Mode, it may be useful to set this register to a value where software can jump to perform common end of ISR handling.

INTCTL7_NO_PEND_VAL

Bits	Name	Description
31:0	NULL_VALUE	This value is returned when VEC_RD or PEND_RD when there is no available interrupt

0x12103864 INTCTL7_MASTER_ENABLE

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The MASTER_ENABLE register is the IRQ and FIQ master enable register. The two bits in this register can be used to block the IRQ and/or FIQ signals from reaching the processor. These enables are used to gate off the interrupt signals at IRQ_STATUS and FIQ_STATUS. This will cause irq_n and fiq_n de-asserted if they were previously asserted and stay de-asserted. Note that if a Vector Port transaction has started, it will complete with irq_n still held asserted by the Vector Port logic.

Writing this register has no affect on the INT_ENABLE register.

NOTE The RAW_STATUS register will hold interrupts that have been detected by the Interrupt Controller even if disabled by INT_ENABLE.

INTCTL7_MASTER_ENABLE

Bits	Name	Description
1	FIQ_ENABLE	0x0: Disable 0x1: Enable.
0	IRQ_ENABLE	0x0: Disable 0x1: Enable.

0x12103868 INTCTL7_VIC_CONFIG

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The VIC_CONFIG register is used to enable Vector Port interface.

INTCTL7_VIC_CONFIG

Bits	Name	Description
0	VECTOR_MODE	0x1: Enable 0x0: Disable

0x1210386C INTCTL7_SECURITY

Type: Read/write
Clock: INT_CTL_CLK
Reset State: 0x0

The SECURITY register is used to enable or disable non-secure bus transactions. The bus security status is signaled to the Interrupt Controller via the ns pin. When ns is set to 0 the state of the SECURITY register is not considered - a secure transaction is allowed if the device is set to non-secure mode. When ns is set to 1, the SECURITY register's SECURE bit must be 0 for access to be granted. If set to 1, the non-secure (ns) transaction is denied. When access is denied, a write is ignored, and a read will return 0x0. No error is signaled.

INTCTL7_SECURITY

Bits	Name	Description
0	SECURE	When enabled, only secure agents can access the registers. When disabled, both secure and non-secure agents can access the registers. 0x1: Enable 0x0: Disable

0x12103A00+ 4*n INTCTL7_PRIORITYn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: 0x0

The PRIORITYn registers are used to determine the priority for each interrupt source.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

NOTE Only IRQs are prioritized. Thus PRIORITYn registers have no affect on FIQ.

INTCTL7_PRIORITYn

Bits	Name	Description
2:0	PRIORITY	Priority for each interrupt source.

0x12103C00+ 4*n INTCTL7_VECT_ADDRn, n=[0..63]

Type: Read/Write
Clock: INT_CTL_CLK
Reset State: NA

The VECT_ADDRn registers provide the vector handle address for each interrupt source N.

NOTE N-1 in the array definition (not "n") needs to be replaced with the number of interrupts (minus one) required by the system. System designers using the Interrupt Controller must copy and update this document in order to use QCT's address generation scripts.

INTCTL7_VECT_ADDRn

Bits	Name	Description
31:2	ADDR	Vector handle (the ISR's starting address) for interrupt source n

INTCTL7_VECT_ADDRn (cont.)

Bits	Name	Description
1:0	RESERVED_BITS1_0	

20.12.2 Operational registers

0x12103880 INTCTL7_IRQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

IRQ_STATUS_0 shows which interrupt sources zero to 31 designated for irq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 0) are currently being held by RAW_STATUS_0.

The bits set in IRQ_STATUS form the inputs to the Interrupt Controller's priority encoder (PIC) logic and ultimately result in asserting irq_n to interrupt the CPU.

0x12103890 INTCTL7_FIQ_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_0 shows which interrupt sources zero to 31 designated for fiq_n by INT_SELECT_0 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_0.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL7_FIQ_STATUS_0

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_0 fields

0x12103894 INTCTL7_FIQ_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

FIQ_STATUS_1 shows which interrupt sources 32 to 63 designated for fiq_n by INT_SELECT_1 and enabled by both INT_ENABLE and MASTER_ENABLE (bit 1) are currently being held by RAW_STATUS_1.

The bits set in FIQ_STATUS generate fiq_n to interrupt the CPU.

INTCTL7_FIQ_STATUS_1

Bits	Name	Description
31:0	INT_SRC	Same as IRQ_STATUS_1 fields

0x121038A0 INTCTL7_RAW_STATUS_0

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_0 shows which interrupt sources zero to 31 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_0. Bits set in RAW_STATUS_0 are steered to generate irq_n or fiq_n by INT_SELECT_0 if enabled by both INT_ENABLE_0 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_0 by writing SOFT_INT_0.

INTCTL7_RAW_STATUS_0

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_0

0x121038A4 INTCTL7_RAW_STATUS_1

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

RAW_STATUS_1 shows which interrupt sources 32 to 63 have been detected by the input edge or level detection logic. Interrupt sources are designated for edge or level by INT_TYPE_1. Bits set in RAW_STATUS_1 are steered to generate irq_n or fiq_n by INT_SELECT_1 if enabled by both INT_ENABLE _1 and MASTER_ENABLE.

Software may choose to set one or more bits in RAW_STATUS_1 by writing SOFT_INT_1.

INTCTL7_RAW_STATUS_1

Bits	Name	Description
31:0	STATUS	See IRQ_STATUS_1

0x121038B0 INTCTL7_INT_CLEAR_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_0 is used to clear bits in RAW_STATUS_0. For any bit written 0x1 to INT_CLEAR_0, the corresponding bit position is cleared in RAW_STATUS_0.

INTCTL7_INT_CLEAR_0

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121038B4 INTCTL7_INT_CLEAR_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing INT_CLEAR_1 is used to clear bits in RAW_STATUS_1. For any bit written 0x1 to INT_CLEAR_1, the corresponding bit position is cleared in RAW_STATUS_1.

INTCTL7_INT_CLEAR_1

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x121038C0 INTCTL7_SOFT_INT_0

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_0 is used to set bits in RAW_STATUS_0 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_0, the corresponding bit position is set in RAW_STATUS_0.

INTCTL7_SOFT_INT_0

Bits	Name	Description
31:0	SW_INT	0x0: Do nothing 0x1: Set

0x121038C4 INTCTL7_SOFT_INT_1

Type: Write (Command)
Clock: INT_CTL_CLK
Reset State: NA

Writing SOFT_INT_1 is used to set bits in RAW_STATUS_1 for EDGE detected interrupts. For any bit written 0x1 to SOFT_INT_1, the corresponding bit position is set in RAW_STATUS_1.

INTCTL7_SOFT_INT_1

Bits	Name	Description
31:0	SW_INT	See IRQ_STATUS_1 for bit map. 0x0: Do nothing 0x1: Set

0x121038D0 INTCTL7_VEC_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack PUSH in the PIC, and if an interrupt is causing irq_n returns it.

Assuming an interrupt is available and irq_n is asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU has seen irq_n.
- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine.
- The PIC will set a bit in IN_STACK for the sw level that has been interrupted (including "main").
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that caused the irq_n.
- Subsequently irq_n may only be asserted for an interrupt source designated at a higher priority level than the highest priority level indicated by IN_SERVICE.

If irq_n is asserted, the value returned when reading VEC_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If irq_n is not asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When the Interrupt Controller is in Vector Mode, as designated by VIC_CONFIG, VEC_RD should not be read. The controller still needs to be informed that the CPU is taking the interrupt. This is done by a Vector Port transaction. However, if VEC_RD is read in while in Vector Mode, the read will have the same effect as in PIC mode. However, the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE Using this register while the system is in Vector Mode may not be reliable as CPU hardware may initiate a Vector Port transaction while launching the read transaction to VEC_RD. This race condition could have undesirable results.

INTCTL7_VEC_RD

Bits	Name	Description
31:0	INDEX	Reading from this register provides the index of the current interrupt selected by the PIC, and indicates to the priority hardware that the interrupt is being serviced. Though the practice is not recommended, if this register is read in Vector Mode, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to VEC_RD. The commanded PUSH is performed. If irq_n is not currently active, reading this register returns the value stored in NO_PEND_VAL. There are no side effects in this case - the commanded PUSH is not performed.

0x121038D4 INTCTL7_PEND_RD

Type: Read
Clock: INT_CTL_CLK
Reset State: 0xFFFFFFFF

This is a read command register. It affects a logical stack POP in the PIC, and if an interrupt is pending returns it.

Assuming an interrupt is available and irq_n is not asserted, reading this register has the following side effects:

- Informs the PIC logic that the CPU is taking the interrupt.
- Informs the PIC logic that the CPU is starting to process the ISR routine, and ending the previous ISR routine.
- The PIC will set a bit in IN_SERVICE for the priority for the interrupt that is now starting.
- The PIC will clear the most significant bit found set in IN_SERVICE for the priority of the interrupt ISR routine just ended if the priority of the interrupt now starting is different.

If an interrupt is available and irq_n is asserted or if no interrupt is available the PIC will behave as if the VEC_WR command register was written. That is, the command issued to the PIC will be interpreted as a POP.

The value returned when reading PEND_RD is the interrupt index (0..N-1) of the highest priority interrupt of those currently available (set 1) in IRQ_STATUS. If no interrupt is asserted or if irq_n is asserted, the value stored in NO_PEND_VAL is returned instead.

NOTE When Vector Mode is enabled, unlike the VEC_RD register, PEND_RD must be read in order to inform the PIC that the ISR has finished processing. There is no equivalent

Vector Port transaction. When not in Vector Mode, the interrupts index (bit position) is returned.

NOTE In Vector Mode the value returned will be the result of reading the Vector Address Table addressed by the interrupt index.

NOTE VEC_WR can be substituted for PEND_RD to inform the PIC that the ISR has finished processing without returning a pending interrupt.

INTCTL7_PEND_RD

Bits	Name	Description
31:0	HANDLE	Reading from this register provides the index of the current interrupt selected by the PIC as a pending interrupt. It also indicates to the priority hardware that the current ISR is finished, and if an interrupt is pending that a new ISR is starting. In Vector Mode, when an interrupt is pending, the index of the current interrupt is used as the address to read VECT_ADDRn. The result of that read is the data returned for the read to PEND_RD. The commanded POP is performed. If an interrupt is not pending, reading this register returns the value stored in NO_PEND_VAL. The commanded POP is still performed.

0x121038D8 INTCTL7_VEC_WR

Type: Write (command)
Clock: INT_CTL_CLK
Reset State: NA

This is a write command register. It affects a logical stack POP in the PIC without returning any (possibly) pending interrupt. The resulting state of the PIC is to request a new irq_n if any bits are set in IRQ_STATUS.

Writing this register has the following side effects:

- Informs the PIC logic that the CPU is ending the current ISR routine.
- The PIC will clear the most significant bit found set in IN_SERVICE.
- The PIC will clear the most significant bit found set in IN_STACK.

NOTE PEND_RD can be substituted for VEC_WR to inform the PIC that the ISR has finished processing and to return a pending interrupt at the same time.

INTCTL7_VEC_WR

Bits	Name	Description
31:0	RESERVED	Data written is not used.

20.12.3 Debug and legacy registers

0x121038E0 INTCTL7_IN_SERVICE

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_SERVICE register provides the Interrupt Controller's state information regarding which ISR priority levels are currently in service by the processor. This is provided for debug purposes only.

INTCTL7_IN_SERVICE

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL7	0x1: In service 0x0: Not in service
6	LEVEL6	0x1: In service 0x0: Not in service
5	LEVEL5	0x1: In service 0x0: Not in service
4	LEVEL4	0x1: In service 0x0: Not in service
3	LEVEL3	0x1: In service 0x0: Not in service
2	LEVEL2	0x1: In service 0x0: Not in service
1	LEVEL1	0x1: In service 0x0: Not in service
0	LEVEL0	0x1: In service 0x0: Not in service

0x121038E4 INTCTL7_IN_STACK

Type: Read
Clock: INT_CTL_CLK
Reset State: 0x00000000

The IN_STACK register provides the Interrupt Controller's state information regarding which ISR priority levels are currently nested (stacked) in the CPU. This is provided for debug purposes only.

INTCTL7_IN_STACK

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	LEVEL6	0x1: Nested 0x0: Not nested
6	LEVEL5	0x1: Nested 0x0: Not nested
5	LEVEL4	0x1: Nested 0x0: Not nested
4	LEVEL3	0x1: Nested 0x0: Not nested
3	LEVEL2	0x1: Nested 0x0: Not nested
2	LEVEL1	0x1: Nested 0x0: Not nested
1	LEVEL0	0x1: Nested 0x0: Not nested
0	MAIN	0x1: Nested 0x0: Not nested

0x121038E8 INTCTL7_TEST_BUS_SEL

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

Select signals to be directed to Interrupt Controller test_bus 32-bit output port.

INTCTL7_TEST_BUS_SEL

Bits	Name	Description
31:2	RESERVED	
1:0	SEL	NOTE The Interrupt Controller may have as few as 33 interrupts. Setting to HIGH_INTS will not have meaning if there are less than 61 interrupt inputs. 0x0: NONE (output 0x0) 0x1: LOW_INTS (31 - IRQn, 30 - FIQn, intsource[29:0]) 0x2: MID_INTS (31 - IRQn, 30 - FIQn, pad 0 as needed, intsource[N up to 59:30]) 0x3: HIGH_INTS (31 - IRQn, 30 - FIQn, 28 bits 0, intsource[63:60])

0x121038EC INTCTL7_INT_CTL_CONFIG

Type: Read/Write (Command)
Clock: INT_CTL_CLK
Reset State: 0x0

The INT_CTL_CONFIG register provides additional configuration options for the interrupt controller used for debug purposes.

INTCTL7_INT_CTL_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_1	
0	NO_NESTING_MODE	Default : 0 This register bit is used to configure the interrupt controller before any interrupts occur. When this bit is cleared (0), the PIC priority logic is used to determine when to assert irq_n. When the software allows hardware interrupt nesting, this bit should be cleared (0). If this bit is set (1), irq_n is asserted whenever there is at least one bit set in IRQ_STATUS. This bit should be set (1) right after power up if the software does not need any hardware nesting functions. 0x0: NESTED 0x1: NOT NESTED

20.13 SDC2_MCI_POWER (0x12140000 SDC2_BASE)

This section contains the SDC2 base registers.

0x12140000 SDC2_MCI_POWER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00000000

(ARM name: MCIPower)

SDC2_MCI_POWER

Bits	Name	Description
31:7	RESERVED_1	Always reads zero. Writes 'don't care' but by convention write zero.
6	OPEN_DRAIN	MCICMD Output Control. See Note 2 below
5:1	RESERVED_2	Always reads zero. Writes 'don't care' by convention write zero.
0	CONTROL	This register is used to control the operation of the memory controller. value 0: power-off value 1: power-on Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register again. Note:2 - This bit is reserved for the use mentioned in the Description but it is not implemented in HW. The open drain mode is preserved such that when enabled, the command output is driven low when the logic is low and undriven (so that the pull up can pull high) when the logic is high. Whether this gets used in the system is up to SW/system but the HW does support this mode.

0x12140004 SDC2_MCI_CLK

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x01008000

(ARM name: MCIClock)

SDC2_MCI_CLK

Bits	Name	Description
31:27	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
26	SDCC_CLK_EXT_EN	Value 0 (default) - sdcc_clkout is driven via the clock pad and external clock can’t be used for testing the cm_dll_sdc4. Value 1- External clock can be used as a test clock.
25	RX_FLOW_TIMING	Configuration bit which selects the cycle which RxFlowControl will be asserted when UHS mode is used Value 0 (default) - RxFlowControl is asserted one clock before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 1). Value 1 - RxFlowControl is asserted two clocks before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 2).
24:23	SDC4_MCLK_SEL	Selects the sdc4_mclk - input clock of cm_dll_sdc4 Value 0 - gated version of MCLK Value 1 - feedback clock from CLK pad Value 2 (default) - free running mclk (gated between the transactions)
22	CLK_INV	When set(1), the input clock which is inserted into the input macros is inverted.
21	IO_PAD_PWR_SWITCH	Indication to Pad that power has to be switched from 3.3V to 1.8V.
20	CLK_FB_DLY_SEL	Selects the source of feedback clock used by the controller. Value 1 - output of cm_dll_sdc4 is used as feedback clock Value 0 - feedback clock from CLK pad is used
19:18	SD_DEV_SEL	Select the active device if more than one device are connected in shared bus mode. (range: ’00’ - ’11’).
17	HCLKON_SW_EN	SW enable of AHB clock request of SDCC4. value 0: HW clock request mechanism is used value 1: clock request signal is always high
16:14	SELECT_IN	Select to latch data and command coming in: value 000: on the falling edge of internal MCLK. value 001: on the rising edge of internal MCLK. value 010: using feedback clock (default). value 011: DDR mode - In DDR mode, the SDC_CLK output will be SDCn_APPS_CLK divided by 2. value 100: UHS mode - MCLK is used internally. value 101: UHS mode - divided frequency (MCLK/2) is used internally.
13	INVERT_OUT	Clear (0) to change data and command going out on the falling edge. Set (1) to change data and command going out on the rising edge.
12	FLOW_ENA	Enable flow control: value 0: disable (default) value 1: enable

SDC2_MCI_CLK (cont.)

Bits	Name	Description
11:10	WIDEBUS	Enable wide bus mode: value 00: 1 bit mode value 10: 4 bit mode value 01 or 11: 8 bit mode
9	PWRSAVE	Disable Prime-Cell MCI clock output when bus is idle to save power. value 0: Power save disabled - always enabled if bit 8 is set. value 1: Power save enabled - clock enabled only when bus is active and bit 8 is set.
8	ENABLE	Enable Prime-Cell MCI bus clock: value 0: clock disabled value 1: clock enabled
7:0	RESERVED_2	Always reads zero. Writes 'don't care' but by convention write zero. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_CLK register and before accessing this register again.

0x12140008 SDC2_MCI_ARGUMENT

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC2_MCI_ARGUMENT

Bits	Name	Description
31:0	CMD_ARG	Command argument.

0x1214000C SDC2_MCI_CMD

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00000000

(ARM name: MMCCommand) CPSM: 'Command Path State Machine'.

SDC2_MCI_CMD

Bits	Name	Description
31:17	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.

SDC2_MCI_CMD (cont.)

Bits	Name	Description
16	AUTO_CMD19	If set (1), CPSM sends CMD19 automatically before sending CMD17 or CMD18. This sequence is needed for CDR auto-calibration of cm_dll_sdc4.
15	CCS_DISABLE	If set (1), CPSM sends Command_Completion_Signal (CCS) disable sequence to the external CE-ATA device.
14	CCS_ENABLE	If set (1), CPSM waits for CCS from external card CE-ATA device.
13	MCIABORT	Signals the next command will be an abort (stop) command. This bit always read as (0) due to the hardware implementation. See note 2 below.
12	DAT_CMD	If set (1) indicates that this is a Command with Data. See note 2 below.
11	PROG_ENA	If set (1), PROG_DONE status bit will be asserted when busy is de-asserted. This bit is to be used with a stop or status command after a block write is performed. Does not effect CPSM.
10	ENABLE	The action of writing to this register (MCI_CMD) with this bit set (1), triggers CPSM to leave the 'Idle State'.
9	PENDING	If set (1), CPSM waits for 'CmdPend' from the DPSM before it starts sending a command. See note 3 below.
8	INTERRUPT	If set (1), CPSM disables command timer and waits for interrupt request (Card Response). See note 4 below.
7	LONGRSP	If set (1), receives a 136-bit long response.
6	RESPONSE	If set (1), CPSM waits for a response subject to INTERRUPT above.

SDC2_MCI_CMD (cont.)

Bits	Name	Description
5:0	CMD_INDEX	Command index. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_CMD register and before accessing this register again. Note 2: These bits don't have any effect on the CPSM. They are used to signal the SDIO Interrupt state machine that a Multi Block (CMD18, CMD25, CMD53, etc.) data transaction is taking place. The DAT_CMD bit signals the start of the data transaction while the MCIABORT bit signals the end. For a pure SD Memory card, these bits are a 'don't care' and should be set to zero by convention. However, some software drivers may chose to manipulate the bits in order to maintain compatibility with Combo cards and/or pure SDIO cards. Note 3: This bit is designed to be used with SD CMD18 (READ_MULTIPLE_BLOCK) and SD CMD25 (WRITE_MULTIPLE_BLOCK) which must be terminated with a SD CMD12 (STOP_TRANSMISSION). After CMD18 or CMD25 is sent, the DPSM is enabled to send or receive data of amount MCI_DATA_LENGTH. After the DPSM finishes the transferring the data, it sends 'CmdPend' to the CPSM and goes idle. When the CPSM receives this signal, it sends the currently loaded command which software would normally establish as CMD12. Note 4: The START, CMD_INDEX, ARGUMENT, and CRC are a total of 48 bits in length. If the INTERRUPT bit is zero, the CPSM will wait (63-47) 16 MCLK ticks for a response before going back to IDLE. If the INTERRUP bit is set, the CPSM will wait indefinitely for a card response.

0x12140010 SDC2_MCI_RESP_CMD

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIRespCmd)

SDC2_MCI_RESP_CMD

Bits	Name	Description
31:6	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
5:0	RESPCMD	Response command index.

0x12140014+4*n SDC2_MCI_RESPn, n=[0..3]

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIResponse0-3). Note that MCIResponse3 has 31 bits; the other three (*RESP0, *RESP1, *RESP2) have 32 bits.

The card status size can be 32 or 127 bits, depending on the response type (see Table 1-2). The most significant bit of the card status is received first. The MCIResponse3 register LSB is always 0.

Table 20-2 Response type and card status size

Description	Short response	Long response
MCIResponse0	Card Status [31:0]	Card status [127:96]
MCIResponse1	Unused	Card status [95:64]
MCIResponse2	Unused	Card status [63:32]
MCIResponse3	Unused	Card status [31:1]

SDC2_MCI_RESPn

Bits	Name	Description
31:0	STATUS	Card status.

0x12140024 SDC2_MCI_DATA_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataTimer).

There is no way to disable this timer. The timer starts counting as soon as a transaction is initiated. The time counts in MCLK ticks.

SDC2_MCI_DATA_TIMER

Bits	Name	Description
31:0	DATA_TIME	Data timeout period.

0x12140028 SDC2_MCI_DATA_LENGTH

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataLength)

Total number of bytes in the transaction regardless of mode (stream or block). In block mode, must be an exact multiple of block size. During an infinite transfer the value of DATALENGTH should be programmed to 0.

SDC2_MCI_DATA_LENGTH

Bits	Name	Description
31:25	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
24:0	DATALENGTH	Data length value.

0x1214002C SDC2_MCI_DATA_CTL

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00100000

(ARM name: MCIDataCtrl). Data Path State Machine (DPSM).

SDC2_MCI_DATA_CTL

Bits	Name	Description
31:22	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
21	SW_SDC4_CMD19	The input of cm_dll_sdc4 - sdc4_cmd19 can be driven by SW if AUTO_CMD19 (bit 16 in MCI_CMD) feature is not used. Value 1 - sdc4_cmd19 is driven by SW Value 0 (default) - sdc4_cmd19 is driven by HW
20	RX_DATA_PEND	If set (1), timeout counter will start counting only after the RX command (with data) was sent instead of counting from initialization of DPSM. The feature is enabled by default.

SDC2_MCI_DATA_CTL (cont.)

Bits	Name	Description
19	AUTO_PROG_DONE	If set (1), automatic detection of PROG_DONE condition is executed without sending CMD12, CMD13, CMD52 or any other 'dummy' command. SW should set this bit in the following cases only: 1. When sending CMD53 for SDIO write transaction. 2. When sending CMD24. 3. When sending CMD25 and CMD23 was issued before to inform card about the exact number of blocks to be written. 4. When sending CMD19 for testing bus procedure. CMD12 is not required in this case.
18	INFINITE_TRANSFER	If set (1), infinite transfer is enabled. MCI_DATA_LENGTH register should set to 0 during infinite transfer.
17	DATA_PEND	If set (1), DPSM waits for 'DataPend' from the CPSM before it enables the DPSM. See note 2 below.
16:4	BLOCKSIZE	Data block length in bytes (1 to 4096).
3	DM_ENABLE	Enable DM interface: 0: DM disabled 1: DM enabled
2	MODE	Data transfer mode: 0: block data transfer 1: stream data transfer
1	DIRECTION	Data transfer direction: 0: controller to card 1: card to controller
0	ENABLE	Data transfer enabled. If zero, DPSM unconditionally reset. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_DATA_CTL register and before accessing this register again. Note 2: This bit is designed to be used with SD CMD24 and CMD25 (WRITE_SINGLE_BLOCK and WRITE_MULTIPLE_BLOCK) to automatically start the DPSM after a normal (non-error) response is received. This register should be written with the enable bit and the pending bit asserted before MCI_CMD is enabled.

0x12140030 SDC2_MCI_DATA_COUNT

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataCnt)

NOTE There is no mechanism to ensure that a read of this counter will be accurate as it is not synchronized. The reason being the value read is async to the clock domain in which the reading is done. It is only useful as a debug tool for diagnostic purposes only.

SDC2_MCI_DATA_COUNT

Bits	Name	Description
31:25	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
24:0	DATACOUNT	Value of data counter in MciDPSM block. Represents remaining data of transaction.

0x12140034 SDC2_MCI_STATUS

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x000C0000

(ARM name: MCIStatus)

This register may need exclusion for QCSR POR Test for bits 25 and 22.

Static[30:26], [24:23] and [10:0]

These remain asserted until they are cleared by writing to the appropriate bit in the Clear Register (see MCI_CLEAR)

XCIS

The means used to send the SDIO external-card-interrupt-signal (XCIS) to the SDCC depends on the transfer mode: 1-bit, 4-bit, or 8-bit. Under 1 bit transfer mode, the XCIS has a dedicated physical connection to the SDCC. Hence once it is asserted, it remain at a high level. Under 4 and 8 bit transfer modes, the XCIS is time multiplexed with physical connection data bit 1. The XCIS is recognized as valid during specific time slots on data bit 1 by the SDCC. How this 'recognition' takes places shows up as different behaviors on SDIO_INTR_OPER, SDIO_INTR, and the actual interrupt sent to the ARM through MCI_INT_MASKn.

Special[25]

The SDIO_INTR_OPER indicator reflects the true state of XCIS as it would be observed inside the external SDIO card. As such, there is no bit 25 in MCI_CLEAR. The only way to clear SDIO_INTR_OPER is to clear the appropriate bit in the external card Common Card Control Registers (CCCR). Like 'static' above and 'dynamic' below, bit 25 in MCI_INT_MASKn controls actually sending this indicator value to the ARM. This indicator of XCIS is used for normal SDCC operation.

Special[22]

The SDIO_INTR indicator reflects that there has been a low-to-high transition on the connection as explained under XCIS above. This indicator is cleared via bit 22 of MCI_CLEAR but any low-to-high transition on the connection will set this indicator again. Further note that this indicator is not routed through the MCI_INT_MASKn to the ARM. For bit 22, the raw value of the connection is routed through the MCI_INT_MASKn to the ARM. As this raw connection is not aware of 'specific time slots', the signal sent to the ARM generally toggles in an unpredictable fashion. This

is generally not useful during normal SDCC operation. However, for wake-up with clocks off, the raw connection is desirable.

Dynamic[21:11]

These change state depending on the state of the underlying logic (for example, FIFO full and empty flags are asserted and de-asserted as data while written to the FIFO).

SDC2_MCI_STATUS

Bits	Name	Description
31	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
30	AUTO_CMD19_TIMEOUT	Response or tuning pattern wasn't received after automatic CMD19's transmission. This status bit should be read only if AUTO_CMD19 (MCI_CMD(16)) was set.
29	BOOT_TIMEOUT	Data wasn't received within the valid time (according to MCI_CCS_TIMER) from the start of boot operation.
28	BOOT_ACK_ERR	Acknowledge pattern wasn't received correctly or not within the valid time (according to MCI_ACK_TIMER) from the start of boot operation.
27	BOOT_ACK_REC	Acknowledge pattern was received correctly.
26	CCS_TIMEOUT	CE-ATA Command Completion Signal timeout.
25	SDIO_INTR_OPER	SDIO interrupt indicator for normal operation.
24	ATA_CMD_COMPL	CE-ATA Command Completion Signal has been detected.
23	PROG_DONE	Programming done.
22	SDIO_INTR	SDIO interrupt indicator for wake-up.
21	RXDATA_AVLBL	Data available in receive FIFO. At least 1 word in the RX FIFO. SW can read 1 word only from the FIFO.
20	TXDATA_AVLBL	Data available in transmit FIFO. At least 1 word in the TX FIFO.
19	RXFIFO_EMPTY	Receive FIFO empty. SW can't read FIFO.
18	TXFIFO_EMPTY	Transmit FIFO empty. SW can write 8 words into the FIFO.
17	RXFIFO_FULL	Receive FIFO full. SW can read 8 words from the FIFO.
16	TXFIFO_FULL	Transmit FIFO full. TX FIFO contains 8 words. SW can't write to FIFO.
15	RXFIFO_HALF_FULL	Receive FIFO half full. SW can read 8 words from the FIFO.
14	TXFIFO_HALF_FULL	Transmit FIFO half full. SW can write 8 words into the FIFO.
13	RXACTIVE	Data receive in progress.
12	TXACTIVE	Data transmit in progress.
11	CMD_ACTIVE	Command transfer in progress.
10	DATA_BLK_END	Data block sent / received (CRC check passed).

SDC2_MCI_STATUS (cont.)

Bits	Name	Description
9	START_BIT_ERR	Start Bit Error flag
8	DATAEND	Data end (data counter is zero).
7	CMD_SENT	Command sent (no response required).
6	CMD_RESPONSE_END	Command response received (CRC check passed).
5	RX_OVERRUN	Receive FIFO overrun error.
4	TX_UNDERRUN	Transmit FIFO underrun error.
3	DATA_TIMEOUT	Data timeout.
2	CMD_TIMEOUT	Command response timeout.
1	DATA_CRC_FAIL	Data block sent / received (CRC check failed).
0	CMD_CRC_FAIL	Command response received (CRC check failed).

0x12140038 SDC2_MCI_CLEAR

Type: Write
Clock: SAME_RATE_AS_HCLK

(ARM name: MCIClear)

SDC2_MCI_CLEAR

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	AUTO_CMD19_TIMEOUT_CLR	Clears AUTO_CMD19_TIMEOUT flag.
29	BOOT_TIMEOUT_CLR	Clears BOOT_TIMEOUT flag.
28	BOOT_ACK_ERR_CLR	Clears BOOT_ACK_ERR flag.
27	BOOT_ACK_REC_CLR	Clears BOOT_ACK_REC flag.
26	CCS_TIMEOUT_CLR	Clears CCSTimeOut flag.
24	ATA_CMD_COMPL_CLR	Clears AtaCmdCompl flag.
23	PROG_DONE_CLR	Clears ProgDone flag.
22	SDIO_INTR_CLR	Clears SDIOInt flag.
10	DATA_BLK_END_CLR	Clears DataBlockEnd flag.
9	START_BIT_ERR_CLR	Clears StartBitErr flag.
8	DATA_END_CLR	Clears DataEnd flag.
7	CMD_SENT_CLR	Clears commandSent flag.

SDC2_MCI_CLEAR (cont.)

Bits	Name	Description
6	CMD_RESP_END_CLT	Clears CmdRespEnd flag.
5	RX_OVERRUN_CLR	Clears RxOverrunClr flag.
4	TX_UNDERRUN_CLR	Clears TxUnderrun flag.
3	DATA_TIMEOUT_CLR	Clears DataTimeOut flag.
2	CMD_TIMOUT_CLR	Clears CmdTimOutflag.
1	DATA_CRC_FAIL_CLR	Clears DataCrcFail flag.
0	CMD_CRC_FAIL_CLR	Clears CmdCrcFail flag.

0x1214003C+ 4*n SDC2_MCI_INT_MASKn, n=[0..1]

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIMask0, MCIMask1)

SDC2_MCI_INT_MASKn

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	MASK30	MASK AUTO_CMD19_TIMEOUT flag.
29	MASK29	MASK BOOT_TIMEOUT flag.
28	MASK28	MASK BOOT_ACK_ERR flag.
27	MASK27	MASK BOOT_ACK_REC flag.
26	MASK26	MASK CCSTimeOut flag.
25	MASK25	MASK SDIOIntOper flag.
24	MASK24	MASK AtaCmdCompl flag.
23	MASK23	MASK ProgDone flag.
22	MASK22	MASK SDIOInt flag.
21	MASK21	MASK RxDataAvlbl flag.
20	MASK20	MASK TxDataAvlbl flag.
19	MASK19	MASK RxFifoEmpty flag.
18	MASK18	MASK TxFifoEmpty flag.
17	MASK17	MASK RxFifoFull flag.
16	MASK16	MASK TxFifoFull flag.

SDC2_MCI_INT_MASKn (cont.)

Bits	Name	Description
15	MASK15	MASK RxFifoHalfFull flag.
14	MASK14	MASK TxFifoHalfFull flag.
13	MASK13	MASK RxActive flag.
12	MASK12	MASK TxActive flag.

3	MASK3	MASK DataTimeOut flag.
2	MASK2	MASK CmdTimeOut flag.
1	MASK1	MASK DataCmdCrcFail flag.
0	MASK0	MASK CmdCrcFail flag.

0x12140044 SDC2_MCI_FIFO_COUNT

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

The SDCC core operates in two clock domains ’ MCLK and HCLK. The CPSM and DPSM operate in MCLK domain and MciFifoDmaCtl (FIFO/DMA Controller) operates in HCLK domain. The MCI_FIFO_COUNT is a counter of FIFO Controller that monitors how many words of data are still needed to be transferred through the FIFO. At the beginning of data transaction the MCI_FIFO_COUNT counter will be loaded with the (MCI_DATA_LENGTH / 4) value and then will count down during the data transaction until it reach zero. This register is only useful for debug purposes and should not be used for normal operation since it does not reflect data which may or may not be in the pipeline.

SDC2_MCI_FIFO_COUNT

Bits	Name	Description
31:24	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
23:0	DATA_COUNT	Remaining data.

0x12140048 SDC2_MCI_BOOT

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

Handling the boot operation.

SDC2_MCI_BOOT

Bits	Name	Description
31:3	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
2	BOOT_ACK_EN	If set to '1' then Host waits for acknowledge pattern after initiating the boot operation.
1	BOOT_EN	When this bit is asserted, the boot operation is initiated in both of the modes.
0	BOOT_MODE	If set to '1' then CMD line is low during the boot operation. If boot_mode = '0', then CMD0 with the argument 0xFFFFFFFA is sent.

0x1214004C SDC2_MCI_BOOT_ACK_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

Timer for boot operation - the time until receiving the acknowledge pattern.

SDC2_MCI_BOOT_ACK_TIMER

Bits	Name	Description
31:0	BOOT_ACK_TIMER	Timer for counting the cycles from initiating the boot operation until the acknowledge pattern is accepted.

0x12140050 SDC2_MCI_VERSION

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: see below

This register should be excluded for QCSR POR testing.

SDC2_MCI_VERSION

Bits	Name	Description
31:0	MCI_VERSION	SDCC4 core version. This value corresponds to Z according to core release tag: sdcc4_pXqYrZ.

0x12140054 SDC2_MCI_EMULATION_DLY_LINE

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

The register is responsible for handling DCM which is used in emulation supports 256 values of shift intervals so 8 bits are required (0:255). Bits [31:30] are used for emulation purposes only.

The procedure for activating the DCM is:

1. Setting bit 28 - DCM_RESET.
2. Clearing bit 28 - DCM_RESET.
3. Waiting until bit 29 DCM_LOCKED is high.
4. Writing a new phase in SD_CLK_DLY_CTRL field and setting the DCM_START bit (bit 30).

The clock's placement was executed by the DCM when DCM_DONE is asserted.

SDC2_MCI_EMULATION_DLY_LINE

Bits	Name	Description
31	DCM_DONE	The shift process was finished in DCM and CMD19 can be sent towards the card. This is a read-only bit.
30	DCM_START	A new value of SD_CLK_DLY_CTRL is ready. Clears the DCM_DONE bit.
29	DCM_LOCKED	Reading the status of the LOCKED DCM's output which indicates that the output clock is ready for use.
28	DCM_RESET	Driving reset to DCM.
27:8	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
7:0	SD_CLK_DLY_CTRL	Input to DCM block in FPGA (8 bits). Controlling the change of the delay interval. The value's range may be 0-255 in DCM block.

0x12140058 SDC2_MCI_CCS_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

This register is used for operation with CE-ATA devices. The CCS timer starts to count at the end of SD transaction and it advances with every MCLK clock cycle. In boot operation this register is used for storing the number of cycles from initiating the boot operation until the first data is received.

SDC2_MCI_CCS_TIMER

Bits	Name	Description
31:0	CCS_TIMER	CE-ATA Command Completion Signal timeout period.

0x1214005C SDC2_MCI_RESPONSE_MASK

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC2_MCI_RESPONSE_MASK

Bits	Name	Description
31:0	RESPONSE_MASK	Mask used to verify the 32 status error bits. Active only when the data pending bit is set in the MCI_DATA_CTL register. When bit of this mask is set, the corresponding bit from response [39:8] is checked to be 0, i.e., shows there is no error. If all bits from mask shows no error, the DPSM will be activated without waiting for software write.

0x12140060 SDC2_MCI_DLL_CONFIG

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x60006400

SDC2_MCI_DLL_CONFIG

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	DLL_RST	Setting this bit to 1 resets cm_dll_sdc4. cm_dll_sdc4 should be reset every time the MCLK frequency is changed.

SDC2_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
29	PDN	Power Down Value 0 - analog blocks are enabled Value 1 - analog blocks are powered down (default)
28	CK_INTP_SEL	Selects interpolator output
27	CK_INTP_EN	Enable clock interpolation for finer resolution
26:24	MCLK_FREQ	Frequency of MCLK Value 000 -100 ’ 112 (MHz) Value 001 -112 ’ 125 Value 010 -125 ’ 137 Value 011 -137 ’ 150 Value 100 -150 ’ 162 Value 101 -162 ’ 175 Value 110 -175 ’ 187 Value 111 -187 ’ 200
23:20	CDR_SELEXT	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1000 - phase 8 Value 1001 - phase 9 Value 1011 - phase 10 Value 1010 - phase 11 Value 1110 - phase 12 Value 1111 - phase 13 Value 1101 - phase 14 Value 1100 - phase 15
19	CDR_EXT_EN	Enable external control of cdr phase select
18	CK_OUT_EN	Enable output clock (default value is ’1’)
17	CDR_EN	Enable CDR function
16	DLL_EN	Enable DLL function
15:14	CDR_UPD_RATE	CDR update rate, low pass filtering window of CDR Max update rate: Value 00 - 0.5 MCLK frequency Value 01 - 0.25 MCLK Frequency (default) Value 10 - 0.125 MCLK frequency Value 11 - 1/16 MCLK Frequency

SDC2_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
13:12	DLL_UPD_RATE	DLL update rate Value 00 - sdc4_mclk/10 Value 01 - sdc4_mclk/20 Value 10 - sdc4_mclk/40 (default) Value 11 - sdc4_mclk/80
11:10	DLL_PHASE_DET	DLL phase detector low pass average window Value 00 - 4 cycles Value 01 - 8 cycles (default) Value 10 - 16 cycles Value 11 - 32 cycles
9:8	CDR_ALGORITHM_SEL	CDR algorithm select Value 00 - Edge 1 (default) Value 01 - Edge 2 Value 10 - level Value 11- Constant delay
7:6	CMUX0_SHIFT_PHASE	Clock mux0 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
5:4	CMUX1_SHIFT_PHASE	Clock mux1 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
3:2	CMUX2_SHIFT_PHASE	Clock mux2 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
1:0	CMUX3_SHIFT_PHASE	Clock mux3 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable

0x12140064 SDC2_MCI_DLL_TEST_CTL

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC2_MCI_DLL_TEST_CTL

Bits	Name	Description
31:26	VTH_CTRL	Vth control: change current in delay cell. Higher number means less delay.
25:22	DELTA_VGS_CTRL	dVgs control: change current in delay cell. Higher number means less delay.
21	DLL_BIAS_EXT_EN	Enable dll bias external control Value 0 - disable external control (default) Value 1 - enable external control
20:19	CDR_TEST_CTRL	External input to increment or decrement CDR output phase by 1 step Phase is changed on rising edge of signal. Example: To increment phase by 2 steps: 10 -> 00 -> 10 Value 00 - hold (default) Value 01 - decrement Value 10 - increment Value 11 - invalid
18	EXT_UP_DN	external control up/dn signal Value 0 - disable (default) Value 1 - enable
17	ATEST_CTRL	atest control Value 0 - disable (default) Value 1 - enable
16:14	ATEST_OUT_MUX_CTRL	Atest output mux control Value 000 - Avss (default) Value 001 - Vth current Value 010 - delta Vgs current Value 011 - Vthn Value 100- Pbias Value 101 - Nbias Value 110 - reserved Value 111 - External bias current
13	DTEST_CTRL	dtest control Value 0 - disable (default) Value 1 - enable

SDC2_MCI_DLL_TEST_CTL (cont.)

Bits	Name	Description
12:10	DTEST_OUT_MUX_CTRL	dtest output mux control. Output signals are paired for measurements Value 000 - sdc4_mclk, sdc4_mclk (default) Value 001 - da_ phout<0>, da_phout<7> Value 010 - da_ phout<3>, da_phout<4> Value 011 - da_phout<0>, da_phout<15> Value 100 - sd4_clk_out, sd4_data_out<0> Value 101 - sd4_clk_out, sd4_data_out<1> Value 110 - sd4_clk_out, sd4_data_out<2> Value 111 - sd4_clk_out, sd4_data_out<3>
9	DLL_TAP_CTRL	Delay line tap control - change number of unit delay cell in each tap Delay value Value 0 - 1 (default) Value 1 - 2
8:7	DLL_CUR_CTRL	Delay line current control - change current mirror ratio in each delay tap Delay value Value 00 - 1x (default) Value 01 - 2x Value 10 - 3x Value 11 - 4x
6	INT_REF_CLK	Value 0 (default) - use internal generated clock for delay line reference Value 1 - use sdc4_mclk for delay line reference
5	FEEDBACK_CLK_EN	Value 0 (default) - enable delay line feedback Value 1 - disable delay line feedback
4:0	RESERVED	These reserved bits can be accessed by the SW and connected to cm_dll_sdc4's input

0x12140068 SDC2_MCI_DLL_STATUS

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC2_MCI_DLL_STATUS

Bits	Name	Description
31:8	RESERVED_1	Always reads zero. Writes 'don't care' but by convention write zero.
7	DLL_LOCK	DLL lock status Value 0 - Not locked Value 1 - Locked

SDC2_MCI_DLL_STATUS (cont.)

Bits	Name	Description
6:3	CDR_PHASE	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1000 - phase 8 Value 1001 - phase 9 Value 1011 - phase 10 Value 1010 - phase 11 Value 1110 - phase 12 Value 1111 - phase 13 Value 1101 - phase 14 Value 1100 - phase 15
2	DDLL_COARSE_CAL	Value 1 - done Value 0 - not done
1:0	RESERVED_2	Connected to cm_dll_sdc4's output.

0x1214006C SDC2_MCI_STATUS2

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC2_MCI_STATUS2

Bits	Name	Description
31:1	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
0	MCLK_REG_WR_ACTIVE	Value 0 - No active register write to MCLK domain Value 1 - Active register write to MCLK domain. The bit indicates if a write operation to one of the following registers is in process (synchronization between HCLK and MCLK): MCI_POWER MCI_CLOCK MCI_CMD MCI_DATA_CTL

0x12140070 SDC2_MCI_GENERICS

Type: Read
Clock: SAME_RATE_AS_HCLK

SDC2_MCI_GENERICS

Bits	Name	Description
31:27	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
26:23	SD_DATA_WIDTH	Number of DAT lines Value 4 - 4 DAT lines (SD, SDIO) Value 8 - 8 DAT lines (MMC, eMMC)
22:10	RAM_SIZE	Size of RAM size: Optional Values: 512, 1024, 2048 or 4096 bytes.
9	USE_SPS	Value 1 - BAM and DML are used and USB core is connected to SDCC4, Value 0 - BAM and DML are not used.
8:6	NUM_OF_DEV	Number of eSD or eSDIO devices supported on shared SD bus. Can be set from 1 to 4.
5:1	MAX_PIPES	Number of simultaneous parallel pipes supported by the BAM and attached peripheral pair. Can be set from 1 to 31.
0	USE_DLL_SDC4	Enables the instantiation of cm_dll_sdc4. Value 0 - cm_dll_sdc4 isn't integrated with SDCC4 Value 1 - cm_dll_sdc4 is used with SDCC4.

0x12140080 SDC2_MCI_FIFO

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC2_MCI_FIFO

Bits	Name	Description
31:0	DATA	FIFO data. This register is aliased to 16 words, 0x080 - 0xBC. In SDCC3, an access to the FIFO was executed with 16 words so 16 addresses were defined. However, in SDCC4 only 8 words are used in each burst so only 8 addresses from the range should be used. When writing to the external SD_Card, writes to the data path FIFO. When reading from the external SD_Card, reads from the data path FIFO.

0x121400CC SDC2_MCI_TESTBUS_CONFIG

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

NOTE mclk_mux is the selected internal mclk: the original mclk or divided mclk during divided frequency mode.

Table 20-3 TESTBUS signals

TESTBUS bits	Signal	Clock
test_bus0(0)	sdcc_crif_wr_en	hclk
test_bus0(1)	sdcc_crif_rd_en	hclk
test_bus0(2)	sdcc_crif_core_select	hclk

SDC2_MCI_TESTBUS_CONFIG

Bits	Name	Description
31:8	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
7:4	SPARE_FIELD	SW spare bits.
3	TESTBUS_ENA	0x1: Enable 0x0: Disable

SDC2_MCI_TESTBUS_CONFIG (cont.)

Bits	Name	Description
2:0	TESTBUS_SEL	These bits select from different test signals. Refer to Table 1-3 for a list of test signals. TESTBUS_SELBus testbus_sel = 0sdcc_test_bus <= test_bus0 testbus_sel = 1 sdcc_test_bus <= test_bus1 testbus_sel = 2sdcc_test_bus <= test_bus2 testbus_sel = 3sdcc_test_bus <= test_bus3 testbus_sel = 4sdcc_test_bus <= test_bus4 testbus_sel = 5sdcc_test_bus <= test_bus5 testbus_sel = 6sdcc_test_bus <= test_bus6 testbus_sel = 7sdcc_test_bus <= test_bus7

0x121400D0 SDC2_MCI_TEST_CTL

Type: Read/Write
Clock: PCLK
Reset State: 0x00000000

(ARM name: MCITCR)

SDC2_MCI_TEST_CTL

Bits	Name	Description
31:4	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
3	REGTEST	Register Test Bit: Set 0: normal mode (default--accesses to the registers are controlled by the hardware protection circuitry) Set 1: test mode (the hardware protection circuitry is bypassed. Normal Write/Read/Write/ Read tests can be performed independently of the link side.
2:1	RESERVED_2	Always reads zero. Writes ’don’t care’ but by convention write zero.
0	ITEN	Integration Test Enable. This bit places PrimeCell MCI in the following modes: Set 0: normal mode Set 1: Integration test mode

0x121400D4 SDC2_MCI_TEST_INPUT

Type: Read
Clock: PCLK

(ARM name: MCIITIP)

SDC2_MCI_TEST_INPUT

Bits	Name	Description
31:10	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
9:6	MCIDATIN_7_4	Reads return the value on the MCIDATIN[7:4] primary inputs.
5	MCICMDIN	Reads return the value on the MCICMDIN primary input.
4:1	MCIDATIN_3_0	Reads return the value on the MCIDATIN[3:0] primary inputs.
0	RESERVED_2	Always reads zero. Writes ’don’t care’ but by convention write zero.

0x121400D8 SDC2_MCI_TEST_OUT

Type: Read/Write
Clock: PCLK

(ARM name: MCIITOP)

SDC2_MCI_TEST_OUT

Bits	Name	Description
31:16	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
15:12	MCIDATOUT_7_4	Primary output. Writes specify the value to be driven on the MCIDATOUT[7:4] primary output in the integration test mode. Reads return the value written into this field.
10	MCICMDOUT	Primary output. Writes specify the value to be driven on the MCICMDOUT primary output in the integration test mode. Reads return the value written into this field.
9:6	MCIDATOUT_3_0	Primary output. Writes specify the value to be driven on the MCIDATOUT[3:0] primary output in the integration test mode. Reads return the value written into this field.
1	MCIINTR1	Intra-chip output. Writes specify the value to be driven on the intra-chip MCIINTR1 output in the integration test mode. This bit is write-only.
0	MCIINTR0	Intra-chip output. Writes specify the value to be driven on the intra-chip MCIINTR0 output in the integration test mode. This bit is write-only.

20.14 SDC2_DML_CONFIG (0x12140800 SDC2_DML_BASE)

This section contains the SDC2 DML registers.

20.14.1 DML Registers

The address field is a relative address. A base will be supplied by the SOC team and documented at the start of the chip SW Manual.

0x12140800 SDC2_DML_CONFIG

Type: Read/Write
Clock: HCLK
Reset State: 0x00010000

SW has the responsibility to set the CRCI SEL fields correctly when both Consumer and Producer sides are enabled at the same time. For example, setting both to 01 or setting both to 10 is an invalid setting if both producer and consumer sides are kicked off. The DML does NOT assume responsibility for incorrect setting of CRCI SEL fields and hence its function is not defined in such cases.

SDC2_DML_CONFIG

Bits	Name	Description
31:19	RESERVED31	reserved
18	INFINITE_CONS_TRANS	If set, this bit means the consumer transaction is of infinite size. Hence the transaction_end_rec signal from BAM will be ignored.
17	DIRECT_MODE	If set, DML is assumed to directly MASTER the AHB bus, in essence, no BAM or BAM is bypassed. This bit value is also routed to the direct_mode hardware port on the DML to be connected to BAM. See Direct_mode_BASE_addr register.
16	BYPASS	If set, the CRCI pairs will be passed through for legacy central DM support. The config AHB slave interface will be directly accessing the peripheral core for config, command and data movement functions. NOTE: The reset value of this bit is `1' which means the DML come out of PoReset in BYPASS state.
15:6	RESERVED15	reserved
5	PRODUCER_BLOCK_END_HPROT2	If set, DML drives high hprot[2] to BAM when block_end is high, else DML drives low hprot[2] to BAM when block_end is high
4	PRODUCER_TRANS_END_EN	When set, transaction_end signal is asserted at the end of DML transaction. When cleared, transaction_end signal is NOT asserted at the end of DML transaction. This feature allows to divide one BAM transaction to two Peripheral transactions.

SDC2_DML_CONFIG (cont.)

Bits	Name	Description
3:2	CONSUMER_CRCI_SEL	When set to 00, Consumer side is Disabled When set to 01, CRCI-x pair is the consumer CRCI When set to 10, CRCI-y pair is the consumerCRCI If set to 11, its a invalid setting.
1:0	PRODUCER_CRCI_SEL	When set to 00, Producer side is Disabled When set to 01, CRCI-x pair is the producer CRCI When set to 10, CRCI-y pair is the producer CRCI If set to 11, its a invalid setting.

0x12140804 SDC2_DML_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00010001

SDC2_DML_STATUS

Bits	Name	Description
31:17	RESERVED31	reserved
16	CONSUMER_IDLE	0x0: Consumer is busy 0x1: Consumer is IDLE
15:1	RESERVED15	reserved
0	PRODUCER_IDLE	0x0: Producer is busy 0x1: Producer is IDLE

0x12140808 SDC2_DML_SW_RESET

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register resets the DML core. All internal state information will be lost and all register values will be reset as well.

SDC2_DML_SW_RESET

Bits	Name	Description
31:0	RESERVED	reserved

0x1214080C SDC2_DML_PRODUCER_START

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register triggers the DML's Producer state machine. No SW register values will be altered. Only the internal counters and settings related to Producer activity will be reset and started afresh. This register should be written to after POR to kick off producer side. This register should also be used to restart the producer once it has reached IDLE state (as indicated by the STATUS register) after completing the current transaction.

SDC2_DML_PRODUCER_START

Bits	Name	Description
31:0	RESERVED	reserved

0x12140810 SDC2_DML_CONSUMER_START

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register triggers the DML's consumer state machine. No SW register values will be altered. Only the internal counters and settings related to consumer activity will be reset and started afresh. This register should be written to after POR to kick off consumer side. This register should also be used to restart the consumer once it has reached IDLE state (as indicated by the STATUS register) after completing the current transaction..

SDC2_DML_CONSUMER_START

Bits	Name	Description
31:0	RESERVED	reserved

0x12140814 SDC2_DML_PRODUCER_PIPE_LOGICAL_SIZE

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

This register holds the size of the producer pipe (in units of bytes) _to_ which the peripheral can keep writing data to when its the PRODUCER. The value of this register should be consistent with what the BAM registers are programmed with as well. The DML in response to producer side CRCI requests starts writing out data (generated by the Peripheral) from address 0x0 (on its AHB Master Interface). For subsequent Producer side data accesses, the DML keeps on incrementing

the address. Upon reaching the max value as indicated by this register, the address rolls over back to 0x0. The address also rolls over back to 0x0 after reaching the end of a transaction.

This register value decides the range of addresses seen on the DML AHB Master address bus during Producer activity.

The value of this register is restricted to any power of two and greater than or equal to the Producer BAM Block Size setting. This is to avoid DML overwriting its own data in the pipe as the data is not committed until block_end is received by the BAM.

The recommended value for this register is 4096(decimal)

SDC2_DML_PRODUCER_PIPE_LOGICAL_SIZE

Bits	Name	Description
31:16	RESERVED31	reserved31
15:0	PRODUCER_LOGICAL_SIZE	The size of the producer pipe (in units of bytes) to which a producer peripheral can keep writing the data it produces.

0x12140818 SDC2_DML_CONSUMER_PIPE_LOGICAL_SIZE

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

This register holds the size of the consumer pipe (in units of bytes) _from_ which the peripheral can keep _reading_ data from when its the CONSUMER. The value of this register should be consistent with what the BAM registers are programmed with as well. The DML in response to consumer side CRCI requests starts reading out data (needed by the Peripheral) from address 0x0 (on its AHB Master Interface). For subsequent consumer side data accesses, the DML keeps on incrementing the address. Upon reaching the max value as indicated by this register, the address rolls over back to 0x0. The address also rolls over back to 0x0 after reaching the end of a transaction.

This register value decides the range of addresses seen on the DML AHB Master address bus during consumer activity.

The value of this register is restricted to any power of two and no smaller than 32 bytes, that is, no smaller than a "beat-8" burst on a 32 bit AHB.

The recommended value for this register is 4096(decimal)

SDC2_DML_CONSUMER_PIPE_LOGICAL_SIZE

Bits	Name	Description
31:16	RESERVED31	reserved31
15:0	CONSUMER_LOGICAL_SIZE	The size of the consumer pipe (in units of bytes) to which a consumer peripheral can keep reading the data from it needs.

0x1214081C SDC2_DML_PIPE_ID

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds pipe IDs that services the producer and consumer side of the peripheral.

- The producer pipe ID is fed to the BAM when servicing the producer side of the peripheral.
- The consumer pipe ID is fed to the BAM when servicing the consumer side of the peripheral.
- The DML also uses this ID value to look into the appropriate side band signals from BAM like pipe_empty, pipe_full etc before initiating the said AHB transaction.

SDC2_DML_PIPE_ID

Bits	Name	Description
31:21	RESERVED31	reserved
20:16	CONSUMER_PIPE_ID	consumer pipe ID
15:5	RESERVED15	reserved
4:0	PRODUCER_PIPE_ID	producer pipe ID

0x12140820 SDC2_DML_PRODUCER_TRACKERS

Type: Read
Clock: HCLK
Reset State: 0x00000000

.This register is for debug purposes only. They reflect the value of the producer block and transaction counters when read. The values may be dynamically changing when a transaction is in progress.

SDC2_DML_PRODUCER_TRACKERS

Bits	Name	Description
31:16	PROD_TRANS_CNT	Value of the 16bit tracker tracking the Producer Transaction Count for the current transaction. Should read 0 at the end of the transaction.
15:0	PROD_BLOCK_CNT	Value of the 16 bit tracker that tracks the Producer Block Count. Need not be zero at the end of transaction.

0x12140824 SDC2_DML_PRODUCER_BAM_BLOCK_SIZE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds the "block" size, in units of bytes, associated with the Producer BAM. The DML asserts the block_end side band signal to the BAM whenever the producer side of the peripheral has generated the said amount of data. This register value should be an integral multiple of the Producer CRCI Block Size.

Legal values for Producer BAM Block Size are 64, 128, 192, 256, 512, 1024, 2048 and 4096.

The recommended value for this register is 512(decimal)

SDC2_DML_PRODUCER_BAM_BLOCK_SIZE

Bits	Name	Description
31:16	RESERVED	reserved
15:0	PRODUCER_BLK_SIZE	Size of the one "block" on the producer side in units of bytes.

0x12140828 SDC2_DML_PRODUCER_BAM_TRANS_SIZE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds the "transaction" size, in units of bytes, associated with the Producer BAM. The DML asserts the transaction_end side band signal to the BAM whenever the producer side of the peripheral has generated the said amount of data. This signal is asserted only during the address phase of the AHB transaction that carries the last byte corresponding to the size mentioned in this register. Once this value is reached for a given transaction, the address for subsequent data access rolls back to 0x0 and all the block size, CRCI size and transaction size counters also get reset to 0 and start all over again. A value of zero in this register during a producer transaction start means infinite size transaction and hence transaction_end may not get asserted.

This value can be anything up to a maximum of 4294967295 bytes (4 GB -1). If this register value is zero when the DML is started, then an infinite transaction size is assumed. No transaction_end will be generated.

SDC2_DML_PRODUCER_BAM_TRANS_SIZE

Bits	Name	Description
31:0	PRODUCER_TRANS_SIZE	Size of the one "transaction" on the producer side in units of bytes or if zero, then infinite transaction size assumed.

0x1214082C SDC2_DML_DIRECT_MODE_BASE_ADDR

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register is used whenever the DIRECT_MODE bit in config register is set. The programmed 16bits will be used as DML AHB Master address bus MSBits for consumer (AHB read) and producer (AHB Write) operations. The lower 16bits would be dictated by the pipe logical size register.

SDC2_DML_DIRECT_MODE_BASE_ADDR

Bits	Name	Description
31:16	CONSUMER_BASE_ADDR	used as AHB Master address (31:16) when doing direct mode consumer operations if direct_mode bit is set.
15:0	PRODUCER_BASE_ADDR	used as AHB Master address (31:16) when doing direct mode producer operations if direct_mode bit is set.

0x12140830 SDC2_DML_DEBUG

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

Enables Test Bus of the DML and also selects which side signals to drive the test bus with.

SDC2_DML_DEBUG

Bits	Name	Description
31:2	RESERVED	reserved
1	STATUS_2_SEL	If set, selects the set of signals listed out in DML_BAM_SIDE_STATUS_2 register onto Test bus, else selects set of signals listed out in DML_BAM_SIDE_STATUS_1 register to be muxed onto test bus. Valid only if bit 0 is set.
0	TESTBUS_EN	0x0: Disable Test Bus 0x1: Enable Test Bus

0x12140834 SDC2_DML_BAM_SIDE_STATUS_1

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the instantaneous value of the side band signals with BAM.

SDC2_DML_BAM_SIDE_STATUS_1

Bits	Name	Description
31:24	RESERVED31	reserved
23	ACK_ON_SUCCESS_TOGGLE	for selected consumer pipe
22	ACK_BYTES_AVAIL_TOGGLE	for selected consumer pipe
21	PIPE_BYTES_AVAIL_TOGGLE	for selected consumer pipe
20	TRANSACTION_END_REC	transaction end received for selected consumer pipe.
19	PIPE_BYTES_FREE_TOGGLE	bytes free toggle signal for selected producer pipe
18:3	PIPE_BYTES_FREE	bytes free value for selected producer pipe
2	MESSAGING_ONLY	DML output status
1	TRANSACTION_END	DML output status
0	BLOCK_END	DML output status

0x12140838 SDC2_DML_BAM_SIDE_STATUS_2

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the instantaneous value of the side band signals with BAM.

SDC2_DML_BAM_SIDE_STATUS_2

Bits	Name	Description
31:16	ACK_ON_SUCCESS_TOGGLE_SIZE	for selected consumer pipe
15:0	PIPE_BYTES_AVAIL	for selected consumer pipe

0x1214083C SDC2_DML_RTL_GENERICS_1

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the RTL Generics set during the integration of the DML into a SPS Wrapper or other entity.

SDC2_DML_RTL_GENERICS_1

Bits	Name	Description
31:17	RESERVED31	reserved
16:11	PERIPHERAL_ADDR_WIDTH	represents the width set (in binary format)
10:6	MAX_PIPES	represents the number of pipe value set (in binary format)
5:3	CONSUMER_CRCI_BLK	101:.256 bytes 0x0: 16 bytes 0x1: 32 bytes 0x2: 64 bytes 0x3: 128 bytes 0x4: 192 bytes
2:0	PRODUCER_CRCI_BLK	101:.256 bytes 0x0: 16 bytes 0x1: 32 bytes 0x2: 64 bytes 0x3: 128 bytes 0x4: 192 bytes

0x12140840 SDC2_DML_RTL_GENERICS_2

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the PROD_DMR_RD_ADDR Generic set in RTL during the integration of the DML into a SPS Wrapper or other entity.

SDC2_DML_RTL_GENERICS_2

Bits	Name	Description
31:0	PROD_RD_DMR_ADDR	32bit Value of the PROD_DMR_RD_ADDR generic

0x12140844 SDC2_DML_RTL_GENERICS_3

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the CONS_DMR_WR_ADDR Generic set in RTL during the integration of the DML into a SPS Wrapper or other entity.

SDC2_DML_RTL_GENERICS_3

Bits	Name	Description
31:0	CONS_WR_DMR_ADDR	32bit Value of the CONS_DMR_WR_ADDR generic

0x12140848 SDC2_DML_INTERRUPT_ENABLE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

SDC2_DML_INTERRUPT_ENABLE

Bits	Name	Description
31:1	RESERVED31	reserved
0	PROD_IDLE_START_INTR_EN	Enable DML to generate an interrupt when PRODUCER enters an IDLE state.

0x1214084C SDC2_DML_INTERRUPT_CLEAR

Type: Write
Clock: HCLK
Reset State: 0xXXXXXXXX

SDC2_DML_INTERRUPT_CLEAR

Bits	Name	Description
31:1	RESERVED31	reserved
0	PROD_IDLE_START_INTR_CLR	Clear PROD_IDLE_START_INTR interrupt.

20.15 SDC2 BAM Registers (0x12142000 SDC2_BAM_BASE)

This section contains the SDC2 BAM registers.

BAM supports only Word (4 byte) aligned writes and reads on the Configuration Bus interface.

BAM has MAX_PIPES hardware generic parameter defining the number of pipes it supports. Each BAM can have up to 31 pipes supported.

BAM has BAM_CONF_AHBS_ADDR_WIDTH hardware generic parameter defining the Bit Number for selecting BAM access or Peripheral access. Legal Ranges are 14 to 20. Count starts from 1, meaning a value of 17 will set BAM Base address as 0x0001_0000.

20.15.1 BAM control registers

BAM Control registers configure the BAM operational state, SW reset, interrupts and others.

0x12142F80 SDC2_BAM_CTRL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

BAM Control register allows global controls for the BAM.

SDC2_BAM_CTRL

Bits	Name	Description
31:17	RESERVED_BITS31_17	Set to Zero (0)
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1’b1 - Enable Power Saving Mode 1’b0 - Disable Power Saving Mode

SDC2_BAM_CTRL (cont.)

Bits	Name	Description
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2’b00 - Cache when current descriptor has less than 64 bytes left. 2’b01 - Cache when current descriptor has less than 128 bytes left. 2’b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2’b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
12	RESERVED_BITS12	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_SIC_SEL
11:5	BAM_TESTBUS_SEL	Set to Zero (0) Obsolete field: BAM_TESTBUS_SEL Test Bus selector. Supported until (including) bam_p3q3r29 (BlackBird). Moved to a dedicated register - BAM_TEST_BUS_SEL in the following releases.
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
3	RESERVED_BITS3	Set to Zero (0)
2	RESERVED_BITS2	Set to Zero (0)

SDC2_BAM_CTRL (cont.)

Bits	Name	Description
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x12142F84 SDC2_BAM_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

SDC2_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)

SDC2_BAM_REVISION (cont.)

Bits	Name	Description
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists
16	SECURED	This field indicates BAM/BAM-Lite has security support (APU inside) 1'b1 - Secured 1'b0 - Not Secured
15:12	RESERVED_BITS15_12	Set to Zero (0)
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRCS*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRCS*_EEn registers exist for n=[0..3].
7:0	REVISION	This field contains the revision number of the core, Hard Coded. 8'h01 - Voyager (bam_p3q3r22 +) 8'h02 - BlackBird (bam_p3q3r27 +) 8'h03 - Waverider BAM (bam_p3q3r30 +) 8'h04 - Aurora BAM (bam_p3q2r43 +) 8'h05 - Shelby BAM (bam_p2q2r45 +) 8'h10 - Waverider BAM Lite (bam_lite_p1q1r0 +) 8'h11 - Aurora BAM Lite (bam_lite_p3q2r16 +) 8'h12 - Shelby BAM Lite (bam_lite_p2q2r18 +)

0x12142FBC SDC2_BAM_NUM_PIPES

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

SDC2_BAM_NUM_PIPES

Bits	Name	Description
31:24	BAM_NON_PIPE_GRP	This field contains the number of BAM Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
23:16	PERIPH_NON_PIPE_GRP	This field contains the number of Peripheral's Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
15:8	RESERVED_BITS15_8	Set to Zero (0)
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x12142FC0 SDC2_BAM_TIMER

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

SDC2_BAM_TIMER

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12142FC4 SDC2_BAM_TIMER_CTRL

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

The resolution of the BAM inactivity timer are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define

the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * TIMER_TRSHLD.

SDC2_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12142F88 SDC2_BAM_DESC_CNT_TRSHLD

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

SDC2_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0).
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. Available in BAM only

0x12142F8C SDC2_BAM_IRQ_SRCS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

SDC2_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12142F90 SDC2_BAM_IRQ_SRCS_MSK

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

SDC2_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12142FB0 SDC2_BAM_IRQ_SRCS_UNMASKED

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

SDC2_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x12142F94 SDC2_BAM_IRQ_STTS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

SDC2_BAM_IRQ_STTS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.

SDC2_BAM_IRQ_STTS (cont.)

Bits	Name	Description
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12142F98 SDC2_BAM_IRQ_CLR

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

SDC2_BAM_IRQ_CLR

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12142F9C SDC2_BAM_IRQ_EN

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

SDC2_BAM_IRQ_EN

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12142FA0 SDC2_BAM_RESERVED_1

Type: Read
Clock: BAM_CLK
Reset State: 0x00000000

SDC2_BAM_RESERVED_1

Bits	Name	Description
31	RESERVED_BITS31	Set to Zero (0) Obsolete field: BAM_IRQ_SIC_SEL
30:0	RESERVED_BITS30_0	Set to Zero (0) Obsolete field: P_IRQ_SIC_SEL

0x12142FA4 SDC2_BAM_AHB_MASTER_ERR_CTRLS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC2_BAM_AHB_MASTER_ERR_CTRLS

Bits	Name	Description
31:23	RESERVED_BITS31_16	Set to Zero (0)
22:18	BAM_ERR_HVMID	HVMID
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x12142FA8 SDC2_BAM_AHB_MASTER_ERR_ADDR

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC2_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x12142FAC SDC2_BAM_AHB_MASTER_ERR_DATA

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC2_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x12142FB4 SDC2_BAM_RESERVED_2

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

SDC2_BAM_RESERVED_2

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_IRQ_DEST_ADDR

0x12142FB8 SDC2_BAM_RESERVED_3

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

.

SDC2_BAM_RESERVED_3

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_DEST_ADDR

0x12142FF0 SDC2_BAM_TRUST_REG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside - SECURED field in the BAM_REVISION register) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC2_BAM_TRUST_REG

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_VMID	Those bits indicate the VMID value to be used when performing BAM type accesses to the bus. BAM Type accesses include BAM MTI (or Direct Mode accesses, not applicable for BAM Lite)
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable
6:2	RESERVED_BITS6_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_EE	This Field Indicates the EE (0,1,2,3) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12142FF4 SDC2_BAM_TEST_BUS_SEL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is the testbus selector register.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC2_BAM_TEST_BUS_SEL

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	BAM_DATA_ERASE	When enabled, BAM will be instructed to erase all the data it currently has inside. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Erase 1'b0 - Disabled
17	BAM_DATA_FLUSH	When enabled, BAM will be instructed to flush all the data it currently has inside. BAM will only flush the data once it has enough data and a valid destination for it. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Flush 1'b0 - Disabled
16	BAM_CLK_ALWAYS_ON	This bit controls the BAM to issue 'always on' clock request. 1'b1 - Enable Always On clock request. 1'b0 - Disabled
15:7	RESERVED_BITS15_7	Set to Zero (0)
6:0	BAM_TESTBUS_SEL	Test Bus selector. Values with bit[11] set high are reserved for the BAM Lite integrator to provide testbus from outside of the BAM Lite. For example, eDML testbus may reside at X'100_0000' to X'111_1111' selector values. eDML has no registers thus has no test bus selector, so its test bus is combined with the BAM lite's. BAM provides zeroes on its testbus when external values selected. X'000_0000' - Zeros X'000_0001' - Slave test bus X'000_0010' - Pipe state machine test bus X'000_0011' - Buffer test bus X'000_0100' - Sideband test bus X'000_1101' - Bus Manager test bus X'001_0000' - Reg file test bus X'1''_''''' - BAM Lite sets zeroes on the test bus, leaving it for external use

0x12142FF8 SDC2_BAM_TEST_BUS_REG

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the value being output to the testbus of the chip. It is not intended for SW usage but for lab debugging of the BAM. Values here can change every cycle.

SDC2_BAM_TEST_BUS_REG

Bits	Name	Description
31:0	BAM_TESTBUS_REG	32 bit Testbus value. To select the Block in BAM to show here, use the BAM_TESTBUS_SEL field in BAM_CTRL register.

0x12142FFC SDC2_BAM_CNFG_BITS

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

SDC2_BAM_CNFG_BITS

Bits	Name	Description
31:27	RESERVED_BITS31_27	Set to Zero (0)
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only

SDC2_BAM_CNFG_BITS (cont.)

Bits	Name	Description
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there are available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided.. 1’b1 - Enable 1’b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission savepoint, but into the illegal’s pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1’b1 - Enabled 1’b0 - Disable Available in BAM only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1’b1 - Enable 1’b0 - Disable Available in BAM only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there’s no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1’b1 - Enable 1’b0 - Disable Available in BAM only

SDC2_BAM_CNFG_BITS (cont.)

Bits	Name	Description
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1'b1 - 1'b0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix) 1'b1 - Enable 1'b0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM's common clock request. 1'b1 - Propagate Sideband Clock Request 1'b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. 1'b1 - Enable Power Saving 1'b0 - Disable Power Saving

SDC2_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reset pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1’b1 - Enable external block pipe reset 1’b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. This functionality has been found to be buggy and was removed from APQ8064. Bit is currently unused. 1’b1 - Enable 1’b0 - Disable Available in BAM only
10:4	RESERVED_BITS10_4	Set to Zero (0)
3	BAM_ADML_SYNC_BRIDGE	0x1: Use a Synchronous Configuration bridge in aDML. 0x0: Use a Asynchronous Configuration bridge in aDML.
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It’s invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1’b1 - Enable 1’b0 - Disable Available in BAM only
1	BAM_ADML_DEEP_CONS_FIFO	0x1: Use a deep Consumer FIFO in aDML (16 dwords) 0x0: Use a shallow Consumer FIFO in aDML (8 dwords)
0	BAM_ADML_INCR4_EN_N	0x1: Don’t allow INCR4 aDML-BAM accesses. 0x0: Allow INCR 4 aDML-BAM accesses.

0x12143800+ 128*n SDC2_BAM_IRQ_SRCS_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC2_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12143804+ 128*n SDC2_BAM_IRQ_SRCS_MSK_EEn, n=[0..3]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC2_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12143808+ 128*n SDC2_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC2_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

20.15.2 BAM PIPE management registers

BAM Pipe management registers control each pipe's parameters. Those reside in physical registers.

0x12142000+ 128*n SDC2_BAM_P_CTRLn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Control register provides various controls for the pipe.

SDC2_BAM_P_CTRLn

Bits	Name	Description
31:11	RESERVED_BITS31_11	Set to Zero (0)
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be pre-fetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

SDC2_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only.When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
2	RESERVED_BITS2	Set to Zero (0)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe
0	RESERVED_BITS0	Set to Zero (0)

0x12142004+ 128*n SDC2_BAM_P_RSTn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

SDC2_BAM_P_RSTn

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	P_SW_RST	This resets the pipe and its' registers, (Both Flip-Flops and RAM). 1'b1 - Reset 1'b0 - Do Nothing

0x12142008+ 128*n SDC2_BAM_P_HALTn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Halt register Enables/Disables the Halt Sequence.

This is a self-modifying register.

SDC2_BAM_P_HALTn

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it.

0x12142030+ 128*n SDC2_BAM_P_TRUST_REGn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC2_BAM_P_TRUST_REGn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_P_VMID	Those bits indicate the VMID value to be used when performing Pipe type accesses to the bus. BAM Type accesses include Pipe MTI, Data and Descriptors.
7:2	RESERVED_BITS7_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_P_EE	This Field Indicates the EE (0,1,2,3) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12142010+ 128*n SDC2_BAM_P_IRQ_STTSn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

SDC2_BAM_P_IRQ_STTSn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

0x12142014+128*n SDC2_BAM_P_IRQ_CLRn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

SDC2_BAM_P_IRQ_CLRn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_CLR	1’b1 - Clear 1’b0 - Unchanged
4	P_ERR_CLR	1’b1 - Clear 1’b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1’b1 - Clear 1’b0 - Unchanged

SDC2_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

0x12142018+ 128*n SDC2_BAM_P_IRQ_ENn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

SDC2_BAM_P_IRQ_ENn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

0x1214201C+ 128*n SDC2_BAM_P_TIMERn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the pipe.

SDC2_BAM_P_TIMERn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12142020+ 128*n SDC2_BAM_P_TIMER_CTRLn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the P_TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * P_TIMER_TRSHLD.

SDC2_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12142024+ 128*n SDC2_BAM_P_PRDCR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

SDC2_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value

0x12142028+ 128*n SDC2_BAM_P_CNSMR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

SDC2_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value

20.15.3 BAM PIPE configuration registers (RAM)

BAM Pipe management registers configure each pipes' parameters.

Pipe Address span: currently defining each pipe to have 32 addresses, therefore inter pipe offset is 32*4=128=0x80 bytes.

0x1214302C+ 64*n SDC2_BAM_P_EVNT_DEST_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

SDC2_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x12143018+64*n SDC2_BAM_P_EVNT_REGn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

SDC2_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x12143000+64*n SDC2_BAM_P_SW_OFSTSn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC2_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode.
15:0	SW_DESC_OFST	Descriptor FIFO offset.

0x12143024+ 64*n SDC2_BAM_P_DATA_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

SDC2_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x1214301C+ 64*n SDC2_BAM_P_DESC_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

SDC2_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x12143028+64*n SDC2_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When a BAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

SDC2_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x12143020+64*n SDC2_BAM_P_FIFO_SIZESn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

SDC2_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors.

20.15.4 BAM PIPE internal state registers (RAM)

BAM Pipe debug registers allow a software look inside on the internal parameters of the BAM State Machines stored in RAM.

Those shouldn't be normally used or altered by the software.

0x12143034+ 64*n SDC2_BAM_P_RETR_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context stored for retransmission.

This is being stored by Ack Update state machine in consumer mode or by the Writeback state machine in producer mode.

This is being loaded by the Writeback state machine when retransmission happens.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC2_BAM_P_RETR_CNTXT_n

Bits	Name	Description
31:16	RETR_DESC_OFST	Descriptor Fifo Offset for retransmission.
15:0	RETR_OFST_IN_DESC	The Offset inside the Descriptor for retransmission.

0x12143038+ 64*n SDC2_BAM_P_SI_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Sideband Inform state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC2_BAM_P_SI_CNTXT_n

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

0x12143004+ 64*n SDC2_BAM_P_AU_PSM_CNTXT_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Ack Update state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC2_BAM_P_AU_PSM_CNTXT_1_n

Bits	Name	Description
31:16	AU_PSM_ACCUMED	PSM: The acknowledged (EOB/T) number of bytes since last Write Event. AU: The accumulation of the descriptor sizes for the present ack_on_success event. This is never bigger than the ACKED field. Once the ACCUMED values are bigger than Event Threshold, an Event will be issued, the ACKED value will decrease by the ACCUMED size and this value will be zeroed. This also serves as the Bytes Consumed value in the Event.
15:0	AU_ACKED	AU: The left over of the number of bytes that were received via the ack_on_success, that did not cause a descriptor closure. This value is down counting upon issuing Read Event. PSM:

0x12143008+ 64*n SDC2_BAM_P_PSM_CNTXT_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC2_BAM_P_PSM_CNTXT_2_n

Bits	Name	Description
31	PSM_DESC_VALID	The Descriptor Valid bit provided by the Writeback state machine to Pipe state machine.
30	PSM_DESC_IRQ	The Descriptor Interrupt bit provided by the Writeback state machine to pipe state machine.
29	PSM_DESC_IRQ_DONE	The Descriptor Interrupt needed selection bit.
28:25	PSM_GENERAL_BITS	General Context Switch Bits
24:22	PSM_CONS_STATE	State of the Pipe Consumer state machine.
21:19	PSM_PROD_SYS_STATE	State of the Pipe Producer System state machine.
18:16	PSM_PROD_B2B_STATE	State of the Pipe Producer BAM to BAM state machine.
15:0	PSM_DESC_SIZE	The Descriptor Size provided by the Writeback state machine to pipe state machine.

0x1214300C+ 64*n SDC2_BAM_P_PSM_CNTXT_3_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC2_BAM_P_PSM_CNTXT_3_n

Bits	Name	Description
31:0	PSM_DESC_ADDR	The Data Address provided in the current descriptor from the Writeback state machine.

0x12143010+ 64*n SDC2_BAM_P_PSM_CNTXT_4_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC2_BAM_P_PSM_CNTXT_4_n

Bits	Name	Description
31:16	PSM_DESC_OFST	The running Descriptor Fifo Offset of the Writeback state machine
15:0	PSM_SAVED_ACCUMED_SIZE	The Saved Accumulated Size from the Pipe state machine.

0x12143014+64*n SDC2_BAM_P_PSM_CNTXT_5_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC2_BAM_P_PSM_CNTXT_5_n

Bits	Name	Description
31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

0x12143030+64*n SDC2_BAM_P_RESERVED_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

SDC2_BAM_P_RESERVED_1_n

Bits	Name	Description
31:0	BAM_P_RES_1	Set to zero (0) Reserved

0x1214303C+64*n SDC2_BAM_P_RESERVED_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

SDC2_BAM_P_RESERVED_2_n

Bits	Name	Description
31:0	BAM_P_RES_2	Set to zero (0) Obsolete Register: BAM_P_IRQ_DEST_ADDRn, n=[0..30]

20.16 SDC3 Registers (0x12180000 SDC3_BASE)

This section contains the SDC3 base registers.

0x12180000 SDC3_MCI_POWER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00000000

(ARM name: MCIPower)

SDC3_MCI_POWER

Bits	Name	Description
31:7	RESERVED_1	Always reads zero. Writes 'don't care' but by convention write zero.
6	OPEN_DRAIN	MCICMD Output Control. See Note 2 below
5:1	RESERVED_2	Always reads zero. Writes 'don't care' by convention write zero.
0	CONTROL	This register is used to control the operation of the memory controller. value 0: power-off value 1: power-on Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register again. Note:2 - This bit is reserved for the use mentioned in the Description but it is not implemented in HW. The open drain mode is preserved such that when enabled, the command output is driven low when the logic is low and undriven (so that the pull up can pull high) when the logic is high. Whether this gets used in the system is up to SW/system but the HW does support this mode.

0x12180004 SDC3_MCI_CLK

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x01008000

(ARM name: MCIClock)

SDC3_MCI_CLK

Bits	Name	Description
31:27	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
26	SDCC_CLK_EXT_EN	Value 0 (default) - sdcc_clkout is driven via the clock pad and external clock can’t be used for testing the cm_dll_sdc4. Value 1- External clock can be used as a test clock.
25	RX_FLOW_TIMING	Configuration bit which selects the cycle which RxFlowControl will be asserted when UHS mode is used Value 0 (default) - RxFlowControl is asserted one clock before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 1). Value 1 - RxFlowControl is asserted two clocks before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 2).
24:23	SDC4_MCLK_SEL	Selects the sdc4_mclk - input clock of cm_dll_sdc4 Value 0 - gated version of MCLK Value 1 - feedback clock from CLK pad Value 2 (default) - free running mclk (gated between the transactions)
22	CLK_INV	When set(1), the input clock which is inserted into the input macros is inverted.
21	IO_PAD_PWR_SWITCH	Indication to Pad that power has to be switched from 3.3V to 1.8V.
20	CLK_FB_DLY_SEL	Selects the source of feedback clock used by the controller. Value 1 - output of cm_dll_sdc4 is used as feedback clock Value 0 - feedback clock from CLK pad is used
19:18	SD_DEV_SEL	Select the active device if more than one device are connected in shared bus mode. (range: ’00’ - ’11’).
17	HCLKON_SW_EN	SW enable of AHB clock request of SDCC4. value 0: HW clock request mechanism is used value 1: clock request signal is always high
16:14	SELECT_IN	Select to latch data and command coming in: value 000: on the falling edge of internal MCLK. value 001: on the rising edge of internal MCLK. value 010: using feedback clock (default). value 011: DDR mode - In DDR mode, the SDC_CLK output will be SDCn_APPS_CLK divided by 2. value 100: UHS mode - MCLK is used internally. value 101: UHS mode - divided frequency (MCLK/2) is used internally.
13	INVERT_OUT	Clear (0) to change data and command going out on the falling edge. Set (1) to change data and command going out on the rising edge.
12	FLOW_ENA	Enable flow control: value 0: disable (default) value 1: enable

SDC3_MCI_CLK (cont.)

Bits	Name	Description
11:10	WIDEBUS	Enable wide bus mode: value 00: 1 bit mode value 10: 4 bit mode value 01 or 11: 8 bit mode
9	PWRSAVE	Disable Prime-Cell MCI clock output when bus is idle to save power. value 0: Power save disabled - always enabled if bit 8 is set. value 1: Power save enabled - clock enabled only when bus is active and bit 8 is set.
8	ENABLE	Enable Prime-Cell MCI bus clock: value 0: clock disabled value 1: clock enabled
7:0	RESERVED_2	Always reads zero. Writes 'don't care' but by convention write zero. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_CLK register and before accessing this register again.

0x12180008 SDC3_MCI_ARGUMENT

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIArgument)

SDC3_MCI_ARGUMENT

Bits	Name	Description
31:0	CMD_ARG	Command argument.

0x1218000C SDC3_MCI_CMD

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00000000

(ARM name: MMCCommand) CPSM: 'Command Path State Machine'.

SDC3_MCI_CMD

Bits	Name	Description
31:17	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
16	AUTO_CMD19	If set (1), CPSM sends CMD19 automatically before sending CMD17 or CMD18. This sequence is needed for CDR auto-calibration of cm_dll_sdc4.
15	CCS_DISABLE	If set (1), CPSM sends Command_Completion_Signal (CCS) disable sequence to the external CE-ATA device.
14	CCS_ENABLE	If set (1), CPSM waits for CCS from external card CE-ATA device.
13	MCIABORT	Signals the next command will be an abort (stop) command. This bit always read as (0) due to the hardware implementation. See note 2 below.
12	DAT_CMD	If set (1) indicates that this is a Command with Data. See note 2 below.
11	PROG_ENA	If set (1), PROG_DONE status bit will be asserted when busy is de-asserted. This bit is to be used with a stop or status command after a block write is performed. Does not effect CPSM.
10	ENABLE	The action of writing to this register (MCI_CMD) with this bit set (1), triggers CPSM to leave the ’Idle State’.
9	PENDING	If set (1), CPSM waits for ’CmdPend’ from the DPSM before it starts sending a command. See note 3 below.
8	INTERRUPT	If set (1), CPSM disables command timer and waits for interrupt request (Card Response). See note 4 below.
7	LONGRSP	If set (1), receives a 136-bit long response.
6	RESPONSE	If set (1), CPSM waits for a response subject to INTERRUPT above.

SDC3_MCI_CMD (cont.)

Bits	Name	Description
5:0	CMD_INDEX	Command index. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_CMD register and before accessing this register again. Note 2: These bits don't have any effect on the CPSM. They are used to signal the SDIO Interrupt state machine that a Multi Block (CMD18, CMD25, CMD53, etc.) data transaction is taking place. The DAT_CMD bit signals the start of the data transaction while the MCIABORT bit signals the end. For a pure SD Memory card, these bits are a 'don't care' and should be set to zero by convention. However, some software drivers may chose to manipulate the bits in order to maintain compatibility with Combo cards and/or pure SDIO cards. Note 3: This bit is designed to be used with SD CMD18 (READ_MULTIPLE_BLOCK) and SD CMD25 (WRITE_MULTIPLE_BLOCK) which must be terminated with a SD CMD12 (STOP_TRANSMISSION). After CMD18 or CMD25 is sent, the DPSM is enabled to send or receive data of amount MCI_DATA_LENGTH. After the DPSM finishes the transferring the data, it sends 'CmdPend' to the CPSM and goes idle. When the CPSM receives this signal, it sends the currently loaded command which software would normally establish as CMD12. Note 4: The START, CMD_INDEX, ARGUMENT, and CRC are a total of 48 bits in length. If the INTERRUPT bit is zero, the CPSM will wait (63-47) 16 MCLK ticks for a response before going back to IDLE. If the INTERRUP bit is set, the CPSM will wait indefinitely for a card response.

0x12180010 SDC3_MCI_RESP_CMD

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIRespCmd)

SDC3_MCI_RESP_CMD

Bits	Name	Description
31:6	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
5:0	RESPCMD	Response command index.

0x12180014+4*n SDC3_MCI_RESPn, n=[0..3]

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIResponse0-3). Note that MCIResponse3 has 31 bits; the other three (*RESP0, *RESP1, *RESP2) have 32 bits.

The card status size can be 32 or 127 bits, depending on the response type (see Table 1-2). The most significant bit of the card status is received first. The MCIResponse3 register LSB is always 0.

Table 20-4 MCIResponse and card status size

Description	Short response	Long response
MCIResponse0	Card Status [31:0]	Card status [127:96]
MCIResponse1	Unused	Card status [95:64]
MCIResponse2	Unused	Card status [63:32]
MCIResponse3	Unused	Card status [31:1]

SDC3_MCI_RESPn

Bits	Name	Description
31:0	STATUS	Card status

0x12180024 SDC3_MCI_DATA_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataTimer).

There is no way to disable this timer. The timer starts counting as soon as a transaction is initiated. The time counts in MCLK ticks.

SDC3_MCI_DATA_TIMER

Bits	Name	Description
31:0	DATA_TIME	Data timeout period.

0x12180028 SDC3_MCI_DATA_LENGTH

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataLength)

Total number of bytes in the transaction regardless of mode (stream or block). In block mode, must be an exact multiple of block size. During an infinite transfer the value of DATALENGTH should be programmed to 0.

SDC3_MCI_DATA_LENGTH

Bits	Name	Description
31:25	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
24:0	DATALENGTH	Data length value.

0x1218002C SDC3_MCI_DATA_CTL

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00100000

(ARM name: MCIDataCtrl). Data Path State Machine (DPSM).

SDC3_MCI_DATA_CTL

Bits	Name	Description
31:22	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
21	SW_SDC4_CMD19	The input of cm_dll_sdc4 - sdc4_cmd19 can be driven by SW if AUTO_CMD19 (bit 16 in MCI_CMD) feature is not used. Value 1 - sdc4_cmd19 is driven by SW Value 0 (default) - sdc4_cmd19 is driven by HW
20	RX_DATA_PEND	If set (1), timeout counter will start counting only after the RX command (with data) was sent instead of counting from initialization of DPSM. The feature is enabled by default.

SDC3_MCI_DATA_CTL (cont.)

Bits	Name	Description
19	AUTO_PROG_DONE	If set (1), automatic detection of PROG_DONE condition is executed without sending CMD12, CMD13, CMD52 or any other 'dummy' command. SW should set this bit in the following cases only: 1. When sending CMD53 for SDIO write transaction. 2. When sending CMD24. 3. When sending CMD25 and CMD23 was issued before to inform card about the exact number of blocks to be written. 4. When sending CMD19 for testing bus procedure. CMD12 is not required in this case.
18	INFINITE_TRANSFER	If set (1), infinite transfer is enabled. MCI_DATA_LENGTH register should set to 0 during infinite transfer.
17	DATA_PEND	If set (1), DPSM waits for 'DataPend' from the CPSM before it enables the DPSM. See note 2 below.
16:4	BLOCKSIZE	Data block length in bytes (1 to 4096).
3	DM_ENABLE	Enable DM interface: 0: DM disabled 1: DM enabled
2	MODE	Data transfer mode: 0: block data transfer 1: stream data transfer
1	DIRECTION	Data transfer direction: 0: controller to card 1: card to controller
0	ENABLE	Data transfer enabled. If zero, DPSM unconditionally reset. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_DATA_CTL register and before accessing this register again. Note 2: This bit is designed to be used with SD CMD24 and CMD25 (WRITE_SINGLE_BLOCK and WRITE_MULTIPLE_BLOCK) to automatically start the DPSM after a normal (non-error) response is received. This register should be written with the enable bit and the pending bit asserted before MCI_CMD is enabled.

0x12180030 SDC3_MCI_DATA_COUNT

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataCnt)

NOTE There is no mechanism to ensure that a read of this counter will be accurate as it is not synchronized. The reason being the value read is async to the clock domain in which the reading is done. It is only useful as a debug tool for diagnostic purposes only.

SDC3_MCI_DATA_COUNT

Bits	Name	Description
31:25	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
24:0	DATACOUNT	Value of data counter in MciDPSM block. Represents remaining data of transaction.

0x12180034 SDC3_MCI_STATUS

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x000C0000

(ARM name: MCIStatus)

This register may need exclusion for QCSR POR Test for bits 25 and 22.

Static[30:26], [24:23] and [10:0]

These remain asserted until they are cleared by writing to the appropriate bit in the Clear Register (see MCI_CLEAR)

XCIS

The means used to send the SDIO external-card-interrupt-signal (XCIS) to the SDCC depends on the transfer mode: 1-bit, 4-bit, or 8-bit. Under 1 bit transfer mode, the XCIS has a dedicated physical connection to the SDCC. Hence once it is asserted, it remain at a high level. Under 4 and 8 bit transfer modes, the XCIS is time multiplexed with physical connection data bit 1. The XCIS is recognized as valid during specific time slots on data bit 1 by the SDCC. How this 'recognition' takes places shows up as different behaviors on SDIO_INTR_OPER, SDIO_INTR, and the actual interrupt sent to the ARM through MCI_INT_MASKn.

Special[25]

The SDIO_INTR_OPER indicator reflects the true state of XCIS as it would be observed inside the external SDIO card. As such, there is no bit 25 in MCI_CLEAR. The only way to clear SDIO_INTR_OPER is to clear the appropriate bit in the external card Common Card Control Registers (CCCR). Like 'static' above and 'dynamic' below, bit 25 in MCI_INT_MASKn controls actually sending this indicator value to the ARM. This indicator of XCIS is used for normal SDCC operation.

Special[22]

The SDIO_INTR indicator reflects that there has been a low-to-high transition on the connection as explained under XCIS above. This indicator is cleared via bit 22 of MCI_CLEAR but any low-to-high transition on the connection will set this indicator again. Further note that this indicator is not routed through the MCI_INT_MASKn to the ARM. For bit 22, the raw value of the connection is routed through the MCI_INT_MASKn to the ARM. As this raw connection is not aware of 'specific time slots', the signal sent to the ARM generally toggles in an unpredictable fashion. This

is generally not useful during normal SDCC operation. However, for wake-up with clocks off, the raw connection is desirable.

Dynamic[21:11]

These change state depending on the state of the underlying logic (for example, FIFO full and empty flags are asserted and de-asserted as data while written to the FIFO).

SDC3_MCI_STATUS

Bits	Name	Description
31	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
30	AUTO_CMD19_TIMEOUT	Response or tuning pattern wasn't received after automatic CMD19's transmission. This status bit should be read only if AUTO_CMD19 (MCI_CMD(16)) was set.
29	BOOT_TIMEOUT	Data wasn't received within the valid time (according to MCI_CCS_TIMER) from the start of boot operation.
28	BOOT_ACK_ERR	Acknowledge pattern wasn't received correctly or not within the valid time (according to MCI_ACK_TIMER) from the start of boot operation.
27	BOOT_ACK_REC	Acknowledge pattern was received correctly.
26	CCS_TIMEOUT	CE-ATA Command Completion Signal timeout.
25	SDIO_INTR_OPER	SDIO interrupt indicator for normal operation.
24	ATA_CMD_COMPL	CE-ATA Command Completion Signal has been detected.
23	PROG_DONE	Programming done.
22	SDIO_INTR	SDIO interrupt indicator for wake-up.
21	RXDATA_AVLBL	Data available in receive FIFO. At least 1 word in the RX FIFO. SW can read 1 word only from the FIFO.
20	TXDATA_AVLBL	Data available in transmit FIFO. At least 1 word in the TX FIFO.
19	RXFIFO_EMPTY	Receive FIFO empty. SW can't read FIFO.
18	TXFIFO_EMPTY	Transmit FIFO empty. SW can write 8 words into the FIFO.
17	RXFIFO_FULL	Receive FIFO full. SW can read 8 words from the FIFO.
16	TXFIFO_FULL	Transmit FIFO full. TX FIFO contains 8 words. SW can't write to FIFO.
15	RXFIFO_HALF_FULL	Receive FIFO half full. SW can read 8 words from the FIFO.
14	TXFIFO_HALF_FULL	Transmit FIFO half full. SW can write 8 words into the FIFO.
13	RXACTIVE	Data receive in progress.
12	TXACTIVE	Data transmit in progress.
11	CMD_ACTIVE	Command transfer in progress.
10	DATA_BLK_END	Data block sent / received (CRC check passed).

SDC3_MCI_STATUS (cont.)

Bits	Name	Description
9	START_BIT_ERR	Start Bit Error flag
8	DATAEND	Data end (data counter is zero).
7	CMD_SENT	Command sent (no response required).
6	CMD_RESPONSE_END	Command response received (CRC check passed).
5	RX_OVERRUN	Receive FIFO overrun error.
4	TX_UNDERRUN	Transmit FIFO underrun error.
3	DATA_TIMEOUT	Data timeout.
2	CMD_TIMEOUT	Command response timeout.
1	DATA_CRC_FAIL	Data block sent / received (CRC check failed).
0	CMD_CRC_FAIL	Command response received (CRC check failed).

0x12180038 SDC3_MCI_CLEAR

Type: Write
Clock: SAME_RATE_AS_HCLK

(ARM name: MCIClear)

SDC3_MCI_CLEAR

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	AUTO_CMD19_TIMEOUT_CLR	Clears AUTO_CMD19_TIMEOUT flag.
29	BOOT_TIMEOUT_CLR	Clears BOOT_TIMEOUT flag.
28	BOOT_ACK_ERR_CLR	Clears BOOT_ACK_ERR flag.
27	BOOT_ACK_REC_CLR	Clears BOOT_ACK_REC flag.
26	CCS_TIMEOUT_CLR	Clears CCSTimeOut flag.
24	ATA_CMD_COMPL_CLR	Clears AtaCmdCompl flag.
23	PROG_DONE_CLR	Clears ProgDone flag.
22	SDIO_INTR_CLR	Clears SDIOInt flag.
10	DATA_BLK_END_CLR	Clears DataBlockEnd flag.
9	START_BIT_ERR_CLR	Clears StartBitErr flag.
8	DATA_END_CLR	Clears DataEnd flag.
7	CMD_SENT_CLR	Clears commandSent flag.

SDC3_MCI_CLEAR (cont.)

Bits	Name	Description
6	CMD_RESP_END_CLT	Clears CmdRespEnd flag.
5	RX_OVERRUN_CLR	Clears RxOverrunClr flag.
4	TX_UNDERRUN_CLR	Clears TxUnderrun flag.
3	DATA_TIMEOUT_CLR	Clears DataTimeOut flag.
2	CMD_TIMOUT_CLR	Clears CmdTimOutflag.
1	DATA_CRC_FAIL_CLR	Clears DataCrcFail flag.
0	CMD_CRC_FAIL_CLR	Clears CmdCrcFail flag.

0x1218003C+4*n SDC3_MCI_INT_MASKn, n=[0..1]

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIMask0, MCIMask1)

SDC3_MCI_INT_MASKn

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	MASK30	MASK AUTO_CMD19_TIMEOUT flag.
29	MASK29	MASK BOOT_TIMEOUT flag.
28	MASK28	MASK BOOT_ACK_ERR flag.
27	MASK27	MASK BOOT_ACK_REC flag.
26	MASK26	MASK CCSTimeOut flag.
25	MASK25	MASK SDIOIntOper flag.
24	MASK24	MASK AtaCmdCompl flag.
23	MASK23	MASK ProgDone flag.
22	MASK22	MASK SDIOInt flag.
21	MASK21	MASK RxDataAvlbl flag.
20	MASK20	MASK TxDataAvlbl flag.
19	MASK19	MASK RxFifoEmpty flag.
18	MASK18	MASK TxFifoEmpty flag.
17	MASK17	MASK RxFifoFull flag.
16	MASK16	MASK TxFifoFull flag.

SDC3_MCI_INT_MASKn (cont.)

Bits	Name	Description
15	MASK15	MASK RxFifoHalfFull flag.
14	MASK14	MASK TxFifoHalfFull flag.
13	MASK13	MASK RxActive flag.
12	MASK12	MASK TxActive flag.
11	MASK11	MASK CmdActive flag.
10	MASK10	MASK DataBlockEnd flag.
9	MASK9	MASK StartBitErr
8	MASK8	MASK DataEnd flag.
7	MASK7	MASK CmdSent flag.
6	MASK6	MASK CmdRespEnd flag.
5	MASK5	MASK RxOverrun flag.
4	MASK4	MASK TxOverrun flag.
3	MASK3	MASK DataTimeOut flag.
2	MASK2	MASK CmdTimeOut flag.
1	MASK1	MASK DataCmdCrcFail flag.
0	MASK0	MASK CmdCrcFail flag.

0x12180044 SDC3_MCI_FIFO_COUNT

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

The SDCC core operates in two clock domains ’ MCLK and HCLK. The CPSM and DPSM operate in MCLK domain and MciFifoDmaCtl (FIFO/DMA Controller) operates in HCLK domain. The MCI_FIFO_COUNT is a counter of FIFO Controller that monitors how many words of data are still needed to be transferred through the FIFO. At the beginning of data transaction the MCI_FIFO_COUNT counter will be loaded with the (MCI_DATA_LENGTH / 4) value and then will count down during the data transaction until it reach zero. This register is only useful for debug purposes and should not be used for normal operation since it does not reflect data which may or may not be in the pipeline.

SDC3_MCI_FIFO_COUNT

Bits	Name	Description
31:24	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
23:0	DATA_COUNT	Remaining data.

0x12180048 SDC3_MCI_BOOT

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

Handling the boot operation.

SDC3_MCI_BOOT

Bits	Name	Description
31:3	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
2	BOOT_ACK_EN	If set to '1' then Host waits for acknowledge pattern after initiating the boot operation.
1	BOOT_EN	When this bit is asserted, the boot operation is initiated in both of the modes.
0	BOOT_MODE	If set to '1' then CMD line is low during the boot operation. If boot_mode = '0', then CMD0 with the argument 0xFFFFFFFA is sent.

0x1218004C SDC3_MCI_BOOT_ACK_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

Timer for boot operation - the time until receiving the acknowledge pattern.

SDC3_MCI_BOOT_ACK_TIMER

Bits	Name	Description
31:0	BOOT_ACK_TIMER	Timer for counting the cycles from initiating the boot operation until the acknowledge pattern is accepted.

0x12180050 SDC3_MCI_VERSION

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: see below

This register should be excluded for QCSR POR testing.

SDC3_MCI_VERSION

Bits	Name	Description
31:0	MCI_VERSION	SDCC4 core version. This value corresponds to Z according to core release tag: sdcc4_pXqYrZ.

0x12180054 SDC3_MCI_EMULATION_DLY_LINE

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

The register is responsible for handling DCM which is used in emulation supports 256 values of shift intervals so 8 bits are required (0:255). Bits [31:30] are used for emulation purposes only.

The procedure for activating the DCM is:

1. Setting bit 28 - DCM_RESET.
2. Clearing bit 28 - DCM_RESET.
3. Waiting until bit 29 DCM_LOCKED is high.
4. Writing a new phase in SD_CLK_DLY_CTRL field and setting the DCM_START bit (bit 30).

The clock's placement was executed by the DCM when DCM_DONE is asserted.

SDC3_MCI_EMULATION_DLY_LINE

Bits	Name	Description
31	DCM_DONE	The shift process was finished in DCM and CMD19 can be sent towards the card. This is a read-only bit.
30	DCM_START	A new value of SD_CLK_DLY_CTRL is ready. Clears the DCM_DONE bit.
29	DCM_LOCKED	Reading the status of the LOCKED DCM's output which indicates that the output clock is ready for use.
28	DCM_RESET	Driving reset to DCM.
27:8	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
7:0	SD_CLK_DLY_CTRL	Input to DCM block in FPGA (8 bits). Controlling the change of the delay interval. The value's range may be 0-255 in DCM block.

0x12180058 SDC3_MCI_CCS_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

This register is used for operation with CE-ATA devices. The CCS timer starts to count at the end of SD transaction and it advances with every MCLK clock cycle. In boot operation this register is used for storing the number of cycles from initiating the boot operation until the first data is received.

SDC3_MCI_CCS_TIMER

Bits	Name	Description
31:0	CCS_TIMER	CE-ATA Command Completion Signal timeout period.

0x1218005C SDC3_MCI_RESPONSE_MASK

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC3_MCI_RESPONSE_MASK

Bits	Name	Description
31:0	RESPONSE_MASK	Mask used to verify the 32 status error bits. Active only when the data pending bit is set in the MCI_DATA_CTL register. When bit of this mask is set the corresponding bit from response [39:8] is checked to be 0, i.e., shows there is no error. If all bits from mask shows no error, the DPSM will be activated without waiting for software write.

0x12180060 SDC3_MCI_DLL_CONFIG

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x60006400

SDC3_MCI_DLL_CONFIG

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	DLL_RST	Setting this bit to 1 resets cm_dll_sdc4. cm_dll_sdc4 should be reset every time the MCLK frequency is changed.

SDC3_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
29	PDN	Power Down Value 0 - analog blocks are enabled Value 1 - analog blocks are powered down (default)
28	CK_INTP_SEL	Selects interpolator output
27	CK_INTP_EN	Enable clock interpolation for finer resolution
26:24	MCLK_FREQ	Frequency of MCLK Value 000 -100 ’ 112 (MHz) Value 001 -112 ’ 125 Value 010 -125 ’ 137 Value 011 -137 ’ 150 Value 100 -150 ’ 162 Value 101 -162 ’ 175 Value 110 -175 ’ 187 Value 111 -187 ’ 200
23:20	CDR_SELEXT	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1000 - phase 8 Value 1001 - phase 9 Value 1011 - phase 10 Value 1010 - phase 11 Value 1110 - phase 12 Value 1111 - phase 13 Value 1101 - phase 14 Value 1100 - phase 15
19	CDR_EXT_EN	Enable external control of cdr phase select
18	CK_OUT_EN	Enable output clock (default value is ’1’)
17	CDR_EN	Enable CDR function
16	DLL_EN	Enable DLL function
15:14	CDR_UPD_RATE	CDR update rate, low pass filtering window of CDR Max update rate: Value 00 - 0.5 MCLK frequency Value 01 - 0.25 MCLK Frequency (default) Value 10 - 0.125 MCLK frequency Value 11 - 1/16 MCLK Frequency

SDC3_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
13:12	DLL_UPD_RATE	DLL update rate Value 00 - sdc4_mclk/10 Value 01 - sdc4_mclk/20 Value 10 - sdc4_mclk/40 (default) Value 11 - sdc4_mclk/80
11:10	DLL_PHASE_DET	DLL phase detector low pass average window Value 00 - 4 cycles Value 01 - 8 cycles (default) Value 10 - 16 cycles Value 11 - 32 cycles
9:8	CDR_ALGORITHM_SEL	CDR algorithm select Value 00 - Edge 1 (default) Value 01 - Edge 2 Value 10 - level Value 11- Constant delay
7:6	CMUX0_SHIFT_PHASE	Clock mux0 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
5:4	CMUX1_SHIFT_PHASE	Clock mux1 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
3:2	CMUX2_SHIFT_PHASE	Clock mux2 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
1:0	CMUX3_SHIFT_PHASE	Clock mux3 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable

0x12180064 SDC3_MCI_DLL_TEST_CTL

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC3_MCI_DLL_TEST_CTL

Bits	Name	Description
31:26	VTH_CTRL	Vth control: change current in delay cell. Higher number means less delay.
25:22	DELTA_VGS_CTRL	dVgs control: change current in delay cell. Higher number means less delay.
21	DLL_BIAS_EXT_EN	Enable dll bias external control Value 0 - disable external control (default) Value 1 - enable external control
20:19	CDR_TEST_CTRL	External input to increment or decrement CDR output phase by 1 step Phase is changed on rising edge of signal. Ex. To increment phase by 2 steps: 10 -> 00 -> 10 Value 00 - hold (default) Value 01 - decrement Value 10 - increment Value 11 - invalid
18	EXT_UP_DN	external control up/dn signal Value 0 - disable (default) Value 1 - enable
17	ATEST_CTRL	atest control Value 0 - disable (default) Value 1 - enable
16:14	ATEST_OUT_MUX_CTRL	Atest output mux control Value 000 - Avss (default) Value 001 - Vth current Value 010 - delta Vgs current Value 011 - Vthn Value 100- Pbias Value 101 - Nbias Value 110 - reserved Value 111 - External bias current
13	DTEST_CTRL	dtest control Value 0 - disable (default) Value 1 - enable

SDC3_MCI_DLL_TEST_CTL (cont.)

Bits	Name	Description
12:10	DTEST_OUT_MUX_CTRL	dtest output mux control. Output signals are paired for measurements Value 000 - sdc4_mclk, sdc4_mclk (default) Value 001 - da_ phout<0>, da_phout<7> Value 010 - da_ phout<3>, da_phout<4> Value 011 - da_phout<0>, da_phout<15> Value 100 - sd4_clk_out, sd4_data_out<0> Value 101 - sd4_clk_out, sd4_data_out<1> Value 110 - sd4_clk_out, sd4_data_out<2> Value 111 - sd4_clk_out, sd4_data_out<3>
9	DLL_TAP_CTRL	Delay line tap control - change number of unit delay cell in each tap Delay value Value 0 - 1 (default) Value 1 - 2
8:7	DLL_CUR_CTRL	Delay line current control - change current mirror ratio in each delay tap Delay value Value 00 - 1x (default) Value 01 - 2x Value 10 - 3x Value 11 - 4x
6	INT_REF_CLK	Value 0 (default) - use internal generated clock for delay line reference Value 1 - use sdc4_mclk for delay line reference
5	FEEDBACK_CLK_EN	Value 0 (default) - enable delay line feedback Value 1 - disable delay line feedback
4:0	RESERVED	These reserved bits can be accessed by the SW and connected to cm_dll_sdc4's input

0x12180068 SDC3_MCI_DLL_STATUS

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC3_MCI_DLL_STATUS

Bits	Name	Description
31:8	RESERVED_1	Always reads zero. Writes 'don't care' but by convention write zero.
7	DLL_LOCK	DLL lock status Value 0 - Not locked Value 1 - Locked

SDC3_MCI_DLL_STATUS (cont.)

Bits	Name	Description
6:3	CDR_PHASE	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1000 - phase 8 Value 1001 - phase 9 Value 1011 - phase 10 Value 1010 - phase 11 Value 1110 - phase 12 Value 1111 - phase 13 Value 1101 - phase 14 Value 1100 - phase 15
2	DDLL_COARSE_CAL	Value 1 - done Value 0 - not done
1:0	RESERVED_2	Connected to cm_dll_sdc4's output.

0x1218006C SDC3_MCI_STATUS2

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC3_MCI_STATUS2

Bits	Name	Description
31:1	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
0	MCLK_REG_WR_ACTIVE	Value 0 - No active register write to MCLK domain Value 1 - Active register write to MCLK domain. The bit indicates if a write operation to one of the following registers is in process (synchronization between HCLK and MCLK): MCI_POWER MCI_CLOCK MCI_CMD MCI_DATA_CTL

0x12180070 SDC3_MCI_GENERICS

Type: Read
Clock: SAME_RATE_AS_HCLK

SDC3_MCI_GENERICS

Bits	Name	Description
31:27	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
26:23	SD_DATA_WIDTH	Number of DAT lines Value 4 - 4 DAT lines (SD, SDIO) Value 8 - 8 DAT lines (MMC, eMMC)
22:10	RAM_SIZE	Size of RAM size: Optional Values: 512, 1024, 2048 or 4096 bytes.
9	USE_SPS	Value 1 - BAM and DML are used and USB core is connected to SDCC4, Value 0 - BAM and DML are not used.
8:6	NUM_OF_DEV	Number of eSD or eSDIO devices supported on shared SD bus. Can be set from 1 to 4.
5:1	MAX_PIPES	Number of simultaneous parallel pipes supported by the BAM and attached peripherla pair. Can be set from 1 to 31.
0	USE_DLL_SDC4	Enables the instantiation of cm_dll_sdc4. Value 0 - cm_dll_sdc4 isn't integrated with SDCC4 Value 1 - cm_dll_sdc4 is used with SDCC4.

0x12180080 SDC3_MCI_FIFO

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC3_MCI_FIFO

Bits	Name	Description
31:0	DATA	FIFO data. This register is aliased to 16 words, 0x080 - 0xBC. In SDCC3, an access to the FIFO was executed with 16 words so 16 addresses were defined. However, in SDCC4 only 8 words are used in each burst so only 8 addresses from the range should be used. When writing to the external SD_Card, writes to the data path FIFO. When reading from the external SD_Card, reads from the data path FIFO.

0x121800CC SDC3_MCI_TESTBUS_CONFIG

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

NOTE mclk_mux is the selected internal mclk: the original mclk or divided mclk during divided frequency mode.

Table 20-5 TESTBUS signals

TESTBUS bits	Signal	Clock

SDC3_MCI_TESTBUS_CONFIG

Bits	Name	Description
31:8	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
7:4	SPARE_FIELD	SW spare bits.
3	TESTBUS_ENA	0x1: Enable 0x0: Disable

SDC3_MCI_TESTBUS_CONFIG (cont.)

Bits	Name	Description
2:0	TESTBUS_SEL	These bits select from different test signals. Refer to Table 1-3 for a list of test signals. TESTBUS_SELBus testbus_sel = 0sdcc_test_bus <= test_bus0 testbus_sel = 1 sdcc_test_bus <= test_bus1 testbus_sel = 2sdcc_test_bus <= test_bus2 testbus_sel = 3sdcc_test_bus <= test_bus3 testbus_sel = 4sdcc_test_bus <= test_bus4 testbus_sel = 5sdcc_test_bus <= test_bus5 testbus_sel = 6sdcc_test_bus <= test_bus6 testbus_sel = 7sdcc_test_bus <= test_bus7

0x121800D0 SDC3_MCI_TEST_CTL

Type: Read/Write
Clock: PCLK
Reset State: 0x00000000

(ARM name: MCITCR)

SDC3_MCI_TEST_CTL

Bits	Name	Description
31:4	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
3	REGTEST	Register Test Bit: Set 0: normal mode (default--accesses to the registers are controlled by the hardware protection circuitry) Set 1: test mode (the hardware protection circuitry is bypassed. Normal Write/Read/Write/ Read tests can be performed independently of the link side.
2:1	RESERVED_2	Always reads zero. Writes ’don’t care’ but by convention write zero.
0	ITEN	Integration Test Enable. This bit places PrimeCell MCI in the following modes: Set 0: normal mode Set 1: Integration test mode

0x121800D4 SDC3_MCI_TEST_INPUT

Type: Read
Clock: PCLK

(ARM name: MCIITIP)

SDC3_MCI_TEST_INPUT

Bits	Name	Description
31:10	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
9:6	MCIDATIN_7_4	Reads return the value on the MCIDATIN[7:4] primary inputs.
5	MCICMDIN	Reads return the value on the MCICMDIN primary input.
4:1	MCIDATIN_3_0	Reads return the value on the MCIDATIN[3:0] primary inputs.
0	RESERVED_2	Always reads zero. Writes ’don’t care’ but by convention write zero.

0x121800D8 SDC3_MCI_TEST_OUT

Type: Read/Write
Clock: PCLK

(ARM name: MCIITOP)

SDC3_MCI_TEST_OUT

Bits	Name	Description
31:16	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
15:12	MCIDATOUT_7_4	Primary output. Writes specify the value to be driven on the MCIDATOUT[7:4] primary output in the integration test mode. Reads return the value written into this field.
10	MCICMDOUT	Primary output. Writes specify the value to be driven on the MCICMDOUT primary output in the integration test mode. Reads return the value written into this field.
9:6	MCIDATOUT_3_0	Primary output. Writes specify the value to be driven on the MCIDATOUT[3:0] primary output in the integration test mode. Reads return the value written into this field.
1	MCIINTR1	Intra-chip output. Writes specify the value to be driven on the intra-chip MCIINTR1 output in the integration test mode. This bit is write-only.
0	MCIINTR0	Intra-chip output. Writes specify the value to be driven on the intra-chip MCIINTR0 output in the integration test mode. This bit is write-only.

20.17 SDC3 DML Registers (0x12180800 SDC3_DML_BASE)

This section contains the SDC3 DML registers.

The address field is a relative address. A base will be supplied by the SOC team and documented at the start of the chip SW Manual.

0x12180800 SDC3_DML_CONFIG

Type: Read/Write
Clock: HCLK
Reset State: 0x00010000

SW has the responsibility to set the CRCI SEL fields correctly when both Consumer and Producer sides are enabled at the same time. For example, setting both to 01 or setting both to 10 is an invalid setting if both producer and consumer sides are kicked off. The DML does NOT assume responsibility for incorrect setting of CRCI SEL fields and hence its function is not defined in such cases.

SDC3_DML_CONFIG

Bits	Name	Description
31:19	RESERVED31	reserved
18	INFINITE_CONS_TRANS	If set, this bit means the consumer transaction is of infinite size. Hence the transaction_end_rec signal from BAM will be ignored.
17	DIRECT_MODE	If set, DML is assumed to directly MASTER the AHB bus, in essence, no BAM or BAM is bypassed. This bit value is also routed to the direct_mode hardware port on the DML to be connected to BAM. See Direct_mode_BASE_addr register.
16	BYPASS	If set, the CRCI pairs will be passed through for legacy central DM support. The config AHB slave interface will be directly accessing the peripheral core for config, command and data movement functions. NOTE: The reset value of this bit is `1' which means the DML come out of PoReset in BYPASS state.
15:6	RESERVED15	reserved
5	PRODUCER_BLOCK_END_HPROT2	If set, DML drives high hprot[2] to BAM when block_end is high, else DML drives low hprot[2] to BAM when block_end is high
4	PRODUCER_TRANS_END_EN	When set, transaction_end signal is asserted at the end of DML transaction. When cleared, transaction_end signal is NOT asserted at the end of DML transaction. This feature allows to divide one BAM transaction to two Peripheral transactions.
3:2	CONSUMER_CRCI_SEL	When set to 00, Consumer side is Disabled When set to 01, CRCI-x pair is the consumer CRCI When set to 10, CRCI-y pair is the consumerCRCI If set to 11, its a invalid setting.

SDC3_DML_CONFIG (cont.)

Bits	Name	Description
1:0	PRODUCER_CRCI_SEL	When set to 00, Producer side is Disabled When set to 01, CRCI-x pair is the producer CRCI When set to 10, CRCI-y pair is the producer CRCI If set to 11, its a invalid setting.

0x12180804 SDC3_DML_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00010001

SDC3_DML_STATUS

Bits	Name	Description
31:17	RESERVED31	reserved
16	CONSUMER_IDLE	0x0: Consumer is busy 0x1: Consumer is IDLE
15:1	RESERVED15	reserved
0	PRODUCER_IDLE	0x0: Producer is busy 0x1: Producer is IDLE

0x12180808 SDC3_DML_SW_RESET

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register resets the DML core. All internal state information will be lost and all register values will be reset as well.

SDC3_DML_SW_RESET

Bits	Name	Description
31:0	RESERVED	reserved

0x1218080C SDC3_DML_PRODUCER_START

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register triggers the DML's Producer state machine. No SW register values will be altered. Only the internal counters and settings related to Producer activity will be reset and started afresh. This register should be written to after POR to kick off producer side. This register should also be used to restart the producer once it has reached IDLE state (as indicated by the STATUS register) after completing the current transaction.

SDC3_DML_PRODUCER_START

Bits	Name	Description
31:0	RESERVED	reserved

0x12180810 SDC3_DML_CONSUMER_START

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register triggers the DML's consumer state machine. No SW register values will be altered. Only the internal counters and settings related to consumer activity will be reset and started afresh. This register should be written to after POR to kick off consumer side. This register should also be used to restart the consumer once it has reached IDLE state (as indicated by the STATUS register) after completing the current transaction..

SDC3_DML_CONSUMER_START

Bits	Name	Description
31:0	RESERVED	reserved

0x12180814 SDC3_DML_PRODUCER_PIPE_LOGICAL_SIZE

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

This register holds the size of the producer pipe (in units of bytes) _to_ which the peripheral can keep writing data to when its the PRODUCER. The value of this register should be consistent with what the BAM registers are programmed with as well. The DML in response to producer side CRCI requests starts writing out data (generated by the Peripheral) from address 0x0 (on its AHB Master Interface). For subsequent Producer side data accesses, the DML keeps on incrementing the address. Upon reaching the max value as indicated by this register, the address rolls over back to 0x0. The address also rolls over back to 0x0 after reaching the end of a transaction.

This register value decides the range of addresses seen on the DML AHB Master address bus during Producer activity.

The value of this register is restricted to any power of two and greater than or equal to the Producer BAM Block Size setting. This is to avoid DML overwriting its own data in the pipe as the data is not committed until block_end is received by the BAM.

The recommended value for this register is 4096(decimal)

SDC3_DML_PRODUCER_PIPE_LOGICAL_SIZE

Bits	Name	Description
31:16	RESERVED31	reserved31
15:0	PRODUCER_LOGICAL_SIZE	The size of the producer pipe (in units of bytes) to which a producer peripheral can keep writing the data it produces.

0x12180818 SDC3_DML_CONSUMER_PIPE_LOGICAL_SIZE

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

This register holds the size of the consumer pipe (in units of bytes) _from_ which the peripheral can keep _reading_ data from when its the CONSUMER. The value of this register should be consistent with what the BAM registers are programmed with as well. The DML in response to consumer side CRCI requests starts reading out data (needed by the Peripheral) from address 0x0 (on its AHB Master Interface). For subsequent consumer side data accesses, the DML keeps on incrementing the address. Upon reaching the max value as indicated by this register, the address rolls over back to 0x0. The address also rolls over back to 0x0 after reaching the end of a transaction.

This register value decides the range of addresses seen on the DML AHB Master address bus during consumer activity.

The value of this register is restricted to any power of two and no smaller than 32 bytes, that is, no smaller than a "beat-8" burst on a 32 bit AHB.

The recommended value for this register is 4096(decimal)

SDC3_DML_CONSUMER_PIPE_LOGICAL_SIZE

Bits	Name	Description
31:16	RESERVED31	reserved31
15:0	CONSUMER_LOGICAL_SIZE	The size of the consumer pipe (in units of bytes) to which a consumer peripheral can keep reading the data from it needs.

0x1218081C SDC3_DML_PIPE_ID

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds pipe IDs that services the producer and consumer side of the peripheral.

- The producer pipe ID is fed to the BAM when servicing the producer side of the peripheral.
- The consumer pipe ID is fed to the BAM when servicing the consumer side of the peripheral.
- The DML also uses this ID value to look into the appropriate side band signals from BAM like pipe_empty, pipe_full etc before initiating the said AHB transaction.

SDC3_DML_PIPE_ID

Bits	Name	Description
31:21	RESERVED31	reserved
20:16	CONSUMER_PIPE_ID	consumer pipe ID
15:5	RESERVED15	reserved
4:0	PRODUCER_PIPE_ID	producer pipe ID

0x12180820 SDC3_DML_PRODUCER_TRACKERS

Type: Read
Clock: HCLK
Reset State: 0x00000000

.This register is for debug purposes only. They reflect the value of the producer block and transaction counters when read. The values may be dynamically changing when a transaction is in progress.

SDC3_DML_PRODUCER_TRACKERS

Bits	Name	Description
31:16	PROD_TRANS_CNT	Value of the 16bit tracker tracking the Producer Transaction Count for the current transaction. Should read 0 at the end of the transaction.
15:0	PROD_BLOCK_CNT	Value of the 16 bit tracker that tracks the Producer Block Count. Need not be zero at the end of transaction.

0x12180824 SDC3_DML_PRODUCER_BAM_BLOCK_SIZE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds the "block" size, in units of bytes, associated with the Producer BAM. The DML asserts the block_end side band signal to the BAM whenever the producer side of the peripheral has generated the said amount of data. This register value should be an integral multiple of the Producer CRCI Block Size.

Legal values for Producer BAM Block Size are 64, 128, 192, 256, 512, 1024, 2048 and 4096.

The recommended value for this register is 512(decimal)

SDC3_DML_PRODUCER_BAM_BLOCK_SIZE

Bits	Name	Description
31:16	RESERVED	reserved
15:0	PRODUCER_BLK_SIZE	Size of the one "block" on the producer side in units of bytes.

0x12180828 SDC3_DML_PRODUCER_BAM_TRANS_SIZE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds the "transaction" size, in units of bytes, associated with the Producer BAM. The DML asserts the transaction_end side band signal to the BAM whenever the producer side of the peripheral has generated the said amount of data. This signal is asserted only during the address phase of the AHB transaction that carries the last byte corresponding to the size mentioned in this register. Once this value is reached for a given transaction, the address for subsequent data access rolls back to 0x0 and all the block size, CRCI size and transaction size counters also get reset to 0 and start all over again. A value of zero in this register during a producer transaction start means infinite size transaction and hence transaction_end may not get asserted.

This value can be anything up to a maximum of 4294967295 bytes (4 GB -1). If this register value is zero when the DML is started, then an infinite transaction size is assumed. No transaction_end will be generated.

SDC3_DML_PRODUCER_BAM_TRANS_SIZE

Bits	Name	Description
31:0	PRODUCER_TRANS_SIZE	Size of the one "transaction" on the producer side in units of bytes or if zero, then infinite transaction size assumed.

0x1218082C SDC3_DML_DIRECT_MODE_BASE_ADDR

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register is used whenever the DIRECT_MODE bit in config register is set. The programmed 16bits will be used as DML AHB Master address bus MSBits for consumer (AHB read) and producer (AHB Write) operations. The lower 16bits would be dictated by the pipe logical size register.

SDC3_DML_DIRECT_MODE_BASE_ADDR

Bits	Name	Description
31:16	CONSUMER_BASE_ADDR	used as AHB Master address (31:16) when doing direct mode consumer operations if direct_mode bit is set.
15:0	PRODUCER_BASE_ADDR	used as AHB Master address (31:16) when doing direct mode producer operations if direct_mode bit is set.

0x12180830 SDC3_DML_DEBUG

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

Enables Test Bus of the DML and also selects which side signals to drive the test bus with.

SDC3_DML_DEBUG

Bits	Name	Description
31:2	RESERVED	reserved
1	STATUS_2_SEL	If set, selects the set of signals listed out in DML_BAM_SIDE_STATUS_2 register onto Test bus, else selects set of signals listed out in DML_BAM_SIDE_STATUS_1 register to be muxed onto test bus. Valid only if bit 0 is set.
0	TESTBUS_EN	0x0: Disable Test Bus 0x1: Enable Test Bus

0x12180834 SDC3_DML_BAM_SIDE_STATUS_1

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the instantaneous value of the side band signals with BAM.

SDC3_DML_BAM_SIDE_STATUS_1

Bits	Name	Description
31:24	RESERVED31	reserved
23	ACK_ON_SUCCESS_TOGGLE	for selected consumer pipe
22	ACK_BYTES_AVAIL_TOGGLE	for selected consumer pipe
21	PIPE_BYTES_AVAIL_TOGGLE	for selected consumer pipe
20	TRANSACTION_END_REC	transaction end received for selected consumer pipe.
19	PIPE_BYTES_FREE_TOGGLE	bytes free toggle signal for selected producer pipe
18:3	PIPE_BYTES_FREE	bytes free value for selected producer pipe
2	MESSAGING_ONLY	DML output status
1	TRANSACTION_END	DML output status
0	BLOCK_END	DML output status

0x12180838 SDC3_DML_BAM_SIDE_STATUS_2

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the instantaneous value of the side band signals with BAM.

SDC3_DML_BAM_SIDE_STATUS_2

Bits	Name	Description
31:16	ACK_ON_SUCCESS_TOGGLE_SIZE	for selected consumer pipe
15:0	PIPE_BYTES_AVAIL	for selected consumer pipe

0x1218083C SDC3_DML_RTL_GENERICS_1

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the RTL Generics set during the integration of the DML into a SPS Wrapper or other entity.

SDC3_DML_RTL_GENERICS_1

Bits	Name	Description
31:17	RESERVED31	reserved
16:11	PERIPHERAL_ADDR_WIDTH	represents the width set (in binary format)
10:6	MAX_PIPES	represents the number of pipe value set (in binary format)
5:3	CONSUMER_CRCI_BLK	101:.256 bytes 0x0: 16 bytes 0x1: 32 bytes 0x2: 64 bytes 0x3: 128 bytes 0x4: 192 bytes
2:0	PRODUCER_CRCI_BLK	101:.256 bytes 0x0: 16 bytes 0x1: 32 bytes 0x2: 64 bytes 0x3: 128 bytes 0x4: 192 bytes

0x12180840 SDC3_DML_RTL_GENERICS_2

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the PROD_DMR_RD_ADDR Generic set in RTL during the integration of the DML into a SPS Wrapper or other entity.

SDC3_DML_RTL_GENERICS_2

Bits	Name	Description
31:0	PROD_RD_DMR_ADDR	32bit Value of the PROD_DMR_RD_ADDR generic

0x12180844 SDC3_DML_RTL_GENERICS_3

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the CONS_DMR_WR_ADDR Generic set in RTL during the integration of the DML into a SPS Wrapper or other entity.

SDC3_DML_RTL_GENERICS_3

Bits	Name	Description
31:0	CONS_WR_DMR_ADDR	32bit Value of the CONS_DMR_WR_ADDR generic

0x12180848 SDC3_DML_INTERRUPT_ENABLE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

SDC3_DML_INTERRUPT_ENABLE

Bits	Name	Description
31:1	RESERVED31	reserved
0	PROD_IDLE_START_INTR_EN	Enable DML to generate an interrupt when PRODUCER enters an IDLE state.

0x1218084C SDC3_DML_INTERRUPT_CLEAR

Type: Write
Clock: HCLK
Reset State: 0xXXXXXXXX

SDC3_DML_INTERRUPT_CLEAR

Bits	Name	Description
31:1	RESERVED31	reserved
0	PROD_IDLE_START_INTR_CLR	Clear PROD_IDLE_START_INTR interrupt.

20.18 SDC3 BAM Registers (0x12182000 SDC3_BAM_BASE)

This section contains the SDC3 BAM registers.

BAM supports only Word (4 byte) aligned writes and reads on the Configuration Bus interface.

BAM has MAX_PIPES hardware generic parameter defining the number of pipes it supports. Each BAM can have up to 31 pipes supported.

BAM has BAM_CONF_AHBS_ADDR_WIDTH hardware generic parameter defining the Bit Number for selecting BAM access or Peripheral access. Legal Ranges are 14 to 20. Count starts from 1, meaning a value of 17 will set BAM Base address as 0x0001_0000.

20.18.1 BAM control registers

BAM Control registers configure the BAM operational state, SW reset, interrupts and others.

0x12182F80 SDC3_BAM_CTRL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

BAM Control register allows global controls for the BAM.

SDC3_BAM_CTRL

Bits	Name	Description
31:17	RESERVED_BITS31_17	Set to Zero (0)
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1’b1 - Enable Power Saving Mode 1’b0 - Disable Power Saving Mode

SDC3_BAM_CTRL (cont.)

Bits	Name	Description
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2’b00 - Cache when current descriptor has less than 64 bytes left. 2’b01 - Cache when current descriptor has less than 128 bytes left. 2’b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2’b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
12	RESERVED_BITS12	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_SIC_SEL
11:5	BAM_TESTBUS_SEL	Set to Zero (0) Obsolete field: BAM_TESTBUS_SEL Test Bus selector. Supported until (including) bam_p3q3r29 (BlackBird). Moved to a dedicated register - BAM_TEST_BUS_SEL in the following releases.
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
3	RESERVED_BITS3	Set to Zero (0)
2	RESERVED_BITS2	Set to Zero (0)

SDC3_BAM_CTRL (cont.)

Bits	Name	Description
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x12182F84 SDC3_BAM_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

SDC3_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)

SDC3_BAM_REVISION (cont.)

Bits	Name	Description
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists
16	SECURED	This field indicates BAM/BAM-Lite has security support (APU inside) 1'b1 - Secured 1'b0 - Not Secured
15:12	RESERVED_BITS15_12	Set to Zero (0)
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRCS*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRCS*_EEn registers exist for n=[0..3].
7:0	REVISION	This field contains the revision number of the core, Hard Coded. 8'h01 - Voyager (bam_p3q3r22 +) 8'h02 - BlackBird (bam_p3q3r27 +) 8'h03 - Waverider BAM (bam_p3q3r30 +) 8'h04 - Aurora BAM (bam_p3q2r43 +) 8'h05 - Shelby BAM (bam_p2q2r45 +) 8'h10 - Waverider BAM Lite (bam_lite_p1q1r0 +) 8'h11 - Aurora BAM Lite (bam_lite_p3q2r16 +) 8'h12 - Shelby BAM Lite (bam_lite_p2q2r18 +)

0x12182FBC SDC3_BAM_NUM_PIPES

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

SDC3_BAM_NUM_PIPES

Bits	Name	Description
31:24	BAM_NON_PIPE_GRP	This field contains the number of BAM Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
23:16	PERIPH_NON_PIPE_GRP	This field contains the number of Peripheral's Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
15:8	RESERVED_BITS15_8	Set to Zero (0)
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x12182FC0 SDC3_BAM_TIMER

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

SDC3_BAM_TIMER

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12182FC4 SDC3_BAM_TIMER_CTRL

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

The resolution of the BAM inactivity timer are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define

the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * TIMER_TRSHLD.

SDC3_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12182F88 SDC3_BAM_DESC_CNT_TRSHLD

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

SDC3_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0).
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. Available in BAM only

0x12182F8C SDC3_BAM_IRQ_SRCS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

SDC3_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12182F90 SDC3_BAM_IRQ_SRCS_MSK

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

SDC3_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12182FB0 SDC3_BAM_IRQ_SRCS_UNMASKED

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

SDC3_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x12182F94 SDC3_BAM_IRQ_STTS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

SDC3_BAM_IRQ_STTS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.

SDC3_BAM_IRQ_STTS (cont.)

Bits	Name	Description
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12182F98 SDC3_BAM_IRQ_CLR

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

SDC3_BAM_IRQ_CLR

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12182F9C SDC3_BAM_IRQ_EN

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

SDC3_BAM_IRQ_EN

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12182FA0 SDC3_BAM_RESERVED_1

Type: Read
Clock: BAM_CLK
Reset State: 0x00000000

SDC3_BAM_RESERVED_1

Bits	Name	Description
31	RESERVED_BITS31	Set to Zero (0) Obsolete field: BAM_IRQ_SIC_SEL
30:0	RESERVED_BITS30_0	Set to Zero (0) Obsolete field: P_IRQ_SIC_SEL

0x12182FA4 SDC3_BAM_AHB_MASTER_ERR_CTRLS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC3_BAM_AHB_MASTER_ERR_CTRLS

Bits	Name	Description
31:23	RESERVED_BITS31_16	Set to Zero (0)
22:18	BAM_ERR_HVMID	HVMID
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x12182FA8 SDC3_BAM_AHB_MASTER_ERR_ADDR

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC3_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x12182FAC SDC3_BAM_AHB_MASTER_ERR_DATA

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC3_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x12182FB4 SDC3_BAM_RESERVED_2

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

SDC3_BAM_RESERVED_2

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_IRQ_DEST_ADDR

0x12182FB8 SDC3_BAM_RESERVED_3

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

.

SDC3_BAM_RESERVED_3

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_DEST_ADDR

0x12182FF0 SDC3_BAM_TRUST_REG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside - SECURED field in the BAM_REVISION register) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC3_BAM_TRUST_REG

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_VMID	Those bits indicate the VMID value to be used when performing BAM type accesses to the bus. BAM Type accesses include BAM MTI (or Direct Mode accesses, not applicable for BAM Lite)
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable
6:2	RESERVED_BITS6_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_EE	This Field Indicates the EE (0,1,2,3) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12182FF4 SDC3_BAM_TEST_BUS_SEL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is the testbus selector register.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC3_BAM_TEST_BUS_SEL

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	BAM_DATA_ERASE	When enabled, BAM will be instructed to erase all the data it currently has inside. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Erase 1'b0 - Disabled
17	BAM_DATA_FLUSH	When enabled, BAM will be instructed to flush all the data it currently has inside. BAM will only flush the data once it has enough data and a valid destination for it. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Flush 1'b0 - Disabled
16	BAM_CLK_ALWAYS_ON	This bit controls the BAM to issue 'always on' clock request. 1'b1 - Enable Always On clock request. 1'b0 - Disabled
15:7	RESERVED_BITS15_7	Set to Zero (0)
6:0	BAM_TESTBUS_SEL	Test Bus selector. Values with bit[11] set high are reserved for the BAM Lite integrator to provide testbus from outside of the BAM Lite. For example, eDML testbus may reside at X'100_0000' to X'111_1111' selector values. eDML has no registers thus has no test bus selector, so its test bus is combined with the BAM lite's. BAM provides zeroes on its testbus when external values selected. X'000_0000' - Zeros X'000_0001' - Slave test bus X'000_0010' - Pipe state machine test bus X'000_0011' - Buffer test bus X'000_0100' - Sideband test bus X'000_1101' - Bus Manager test bus X'001_0000' - Reg file test bus X'1''_''''' - BAM Lite sets zeroes on the test bus, leaving it for external use

0x12182FF8 SDC3_BAM_TEST_BUS_REG

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the value being output to the testbus of the chip. It is not intended for SW usage but for lab debugging of the BAM. Values here can change every cycle.

SDC3_BAM_TEST_BUS_REG

Bits	Name	Description
31:0	BAM_TESTBUS_REG	32 bit Testbus value. To select the Block in BAM to show here, use the BAM_TESTBUS_SEL field in BAM_CTRL register.

0x12182FFC SDC3_BAM_CNFG_BITS

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

SDC3_BAM_CNFG_BITS

Bits	Name	Description
31:27	RESERVED_BITS31_27	Set to Zero (0)
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1'b1 - Enable Fix 1'b0 - Disable Available in BAM only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset. 1'b1 - Enable Fix 1'b0 - Disable Available in BAM only

SDC3_BAM_CNFG_BITS (cont.)

Bits	Name	Description
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there are available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided.. 1’b1 - Enable 1’b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission savepoint, but into the illegal’s pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1’b1 - Enabled 1’b0 - Disable Available in BAM only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1’b1 - Enable 1’b0 - Disable Available in BAM only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there’s no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1’b1 - Enable 1’b0 - Disable Available in BAM only

SDC3_BAM_CNFG_BITS (cont.)

Bits	Name	Description
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1'b1 - 1'b0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix) 1'b1 - Enable 1'b0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM's common clock request. 1'b1 - Propagate Sideband Clock Request 1'b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. 1'b1 - Enable Power Saving 1'b0 - Disable Power Saving

SDC3_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reset pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1’b1 - Enable external block pipe reset 1’b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. This functionality has been found to be buggy and was removed from APQ8064. Bit is currently unused. 1’b1 - Enable 1’b0 - Disable Available in BAM only
10:4	RESERVED_BITS10_4	Set to Zero (0)
3	BAM_ADML_SYNC_BRIDGE	0x1: Use a Synchronous Configuration bridge in aDML. 0x0: Use a Asynchronous Configuration bridge in aDML.
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It’s invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1’b1 - Enable 1’b0 - Disable Available in BAM only
1	BAM_ADML_DEEP_CONS_FIFO	0x1: Use a deep Consumer FIFO in aDML (16 dwords) 0x0: Use a shallow Consumer FIFO in aDML (8 dwords)
0	BAM_ADML_INCR4_EN_N	0x1: Don’t allow INCR4 aDML-BAM accesses. 0x0: Allow INCR 4 aDML-BAM accesses.

0x12183800+ 128*n SDC3_BAM_IRQ_SRCS_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC3_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12183804+ 128*n SDC3_BAM_IRQ_SRCS_MSK_EEn, n=[0..3]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC3_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12183808+ 128*n SDC3_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC3_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

20.18.2 BAM PIPE management registers

BAM Pipe management registers control each pipe's parameters. Those reside in physical registers.

0x12182000+ 128*n SDC3_BAM_P_CTRLn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Control register provides various controls for the pipe.

SDC3_BAM_P_CTRLn

Bits	Name	Description
31:11	RESERVED_BITS31_11	Set to Zero (0)
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be pre-fetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

SDC3_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only.When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
2	RESERVED_BITS2	Set to Zero (0)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe
0	RESERVED_BITS0	Set to Zero (0)

0x12182004+ 128*n SDC3_BAM_P_RSTn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

SDC3_BAM_P_RSTn

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	P_SW_RST	This resets the pipe and its' registers, (Both Flip-Flops and RAM). 1'b1 - Reset 1'b0 - Do Nothing

0x12182008+ 128*n SDC3_BAM_P_HALTn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Halt register Enables/Disables the Halt Sequence.

This is a self-modifying register.

SDC3_BAM_P_HALTn

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it.

0x12182030+ 128*n SDC3_BAM_P_TRUST_REGn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC3_BAM_P_TRUST_REGn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_P_VMID	Those bits indicate the VMID value to be used when performing Pipe type accesses to the bus. BAM Type accesses include Pipe MTI, Data and Descriptors.
7:2	RESERVED_BITS7_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_P_EE	This Field Indicates the EE (0,1,2,3) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12182010+ 128*n SDC3_BAM_P_IRQ_STTSn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

SDC3_BAM_P_IRQ_STTSn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

0x12182014+128*n SDC3_BAM_P_IRQ_CLRn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

SDC3_BAM_P_IRQ_CLRn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_CLR	1’b1 - Clear 1’b0 - Unchanged
4	P_ERR_CLR	1’b1 - Clear 1’b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1’b1 - Clear 1’b0 - Unchanged

SDC3_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

0x12182018+128*n SDC3_BAM_P_IRQ_ENn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

SDC3_BAM_P_IRQ_ENn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

0x1218201C+ 128*n SDC3_BAM_P_TIMERn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the pipe.

SDC3_BAM_P_TIMERn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12182020+ 128*n SDC3_BAM_P_TIMER_CTRLn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the P_TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * P_TIMER_TRSHLD.

SDC3_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12182024+ 128*n SDC3_BAM_P_PRDCR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

SDC3_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value

0x12182028+ 128*n SDC3_BAM_P_CNSMR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

SDC3_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value

20.18.3 BAM PIPE configuration registers (RAM)

BAM Pipe management registers configure each pipes' parameters.

Pipe Address span: currently defining each pipe to have 32 addresses, therefore inter pipe offset is 32*4=128=0x80 bytes.

0x1218302C+ 64*n SDC3_BAM_P_EVNT_DEST_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

SDC3_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x12183018+64*n SDC3_BAM_P_EVNT_REGn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

SDC3_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x12183000+64*n SDC3_BAM_P_SW_OFSTSn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC3_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode.
15:0	SW_DESC_OFST	Descriptor FIFO offset.

0x12183024+ 64*n SDC3_BAM_P_DATA_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

SDC3_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x1218301C+ 64*n SDC3_BAM_P_DESC_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

SDC3_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x12183028+64*n SDC3_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When aBAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

SDC3_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x12183020+64*n SDC3_BAM_P_FIFO_SIZESn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

SDC3_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors.

20.18.4 BAM PIPE internal state registers (RAM)

BAM Pipe debug registers allow a software look inside on the internal parameters of the BAM State Machines stored in RAM.

Those shouldn't be normally used or altered by the software.

0x12183034+64*n SDC3_BAM_P_RETR_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context stored for retransmission.

This is being stored by Ack Update state machine in consumer mode or by the Writeback state machine in producer mode.

This is being loaded by the Writeback state machine when retransmission happens.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC3_BAM_P_RETR_CNTXT_n

Bits	Name	Description
31:16	RETR_DESC_OFST	Descriptor Fifo Offset for retransmission.
15:0	RETR_OFST_IN_DESC	The Offset inside the Descriptor for retransmission.

0x12183038+64*n SDC3_BAM_P_SI_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Sideband Inform state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC3_BAM_P_SI_CNTXT_n

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

0x12183004+ 64*n SDC3_BAM_P_AU_PSM_CNTXT_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Ack Update state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC3_BAM_P_AU_PSM_CNTXT_1_n

Bits	Name	Description
31:16	AU_PSM_ACCUMED	PSM: The acknowledged (EOB/T) number of bytes since last Write Event. AU: The accumulation of the descriptor sizes for the present ack_on_success event. This is never bigger than the ACKED field. Once the ACCUMED values are bigger than Event Threshold, an Event will be issued, the ACKED value will decrease by the ACCUMED size and this value will be zeroed. This also serves as the Bytes Consumed value in the Event.
15:0	AU_ACKED	AU: The left over of the number of bytes that were received via the ack_on_success, that did not cause a descriptor closure. This value is down counting upon issuing Read Event. PSM:

0x12183008+ 64*n SDC3_BAM_P_PSM_CNTXT_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC3_BAM_P_PSM_CNTXT_2_n

Bits	Name	Description
31	PSM_DESC_VALID	The Descriptor Valid bit provided by the Writeback state machine to Pipe state machine.
30	PSM_DESC_IRQ	The Descriptor Interrupt bit provided by the Writeback state machine to pipe state machine.
29	PSM_DESC_IRQ_DONE	The Descriptor Interrupt needed selection bit.
28:25	PSM_GENERAL_BITS	General Context Switch Bits
24:22	PSM_CONS_STATE	State of the Pipe Consumer state machine.
21:19	PSM_PROD_SYS_STATE	State of the Pipe Producer System state machine.
18:16	PSM_PROD_B2B_STATE	State of the Pipe Producer BAM to BAM state machine.
15:0	PSM_DESC_SIZE	The Descriptor Size provided by the Writeback state machine to pipe state machine.

0x1218300C+ 64*n SDC3_BAM_P_PSM_CNTXT_3_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC3_BAM_P_PSM_CNTXT_3_n

Bits	Name	Description
31:0	PSM_DESC_ADDR	The Data Address provided in the current descriptor from the Writeback state machine.

0x12183010+ 64*n SDC3_BAM_P_PSM_CNTXT_4_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC3_BAM_P_PSM_CNTXT_4_n

Bits	Name	Description
31:16	PSM_DESC_OFST	The running Descriptor Fifo Offset of the Writeback state machine
15:0	PSM_SAVED_ACCUMED_SIZE	The Saved Accumulated Size from the Pipe state machine.

0x12183014+64*n SDC3_BAM_P_PSM_CNTXT_5_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC3_BAM_P_PSM_CNTXT_5_n

Bits	Name	Description
31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

0x12183030+64*n SDC3_BAM_P_RESERVED_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

SDC3_BAM_P_RESERVED_1_n

Bits	Name	Description
31:0	BAM_P_RES_1	Set to zero (0) Reserved

0x1218303C+64*n SDC3_BAM_P_RESERVED_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

SDC3_BAM_P_RESERVED_2_n

Bits	Name	Description
31:0	BAM_P_RES_2	Set to zero (0) Obsolete Register: BAM_P_IRQ_DEST_ADDRn, n=[0..30]

20.19 SDC4 Registers (0x121C0000 SDC4_BASE)

This section contains the SDC4 base registers.

0x121C0000 SDC4_MCI_POWER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00000000

(ARM name: MCIPower)

SDC4_MCI_POWER

Bits	Name	Description
31:7	RESERVED_1	Always reads zero. Writes 'don't care' but by convention write zero.
6	OPEN_DRAIN	MCICMD Output Control. See Note 2 below
5:1	RESERVED_2	Always reads zero. Writes 'don't care' by convention write zero.
0	CONTROL	This register is used to control the operation of the memory controller. value 0: power-off value 1: power-on Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register again. Note:2 - This bit is reserved for the use mentioned in the Description but it is not implemented in HW. The open drain mode is preserved such that when enabled, the command output is driven low when the logic is low and undriven (so that the pull up can pull high) when the logic is high. Whether this gets used in the system is up to SW/system but the HW does support this mode.

0x121C0004 SDC4_MCI_CLK

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x01008000

(ARM name: MCIClock)

SDC4_MCI_CLK

Bits	Name	Description
31:27	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
26	SDCC_CLK_EXT_EN	Value 0 (default) - sdcc_clkout is driven via the clock pad and external clock can’t be used for testing the cm_dll_sdc4. Value 1- External clock can be used as a test clock.
25	RX_FLOW_TIMING	Configuration bit which selects the cycle which RxFlowControl will be asserted when UHS mode is used Value 0 (default) - RxFlowControl is asserted one clock before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 1). Value 1 - RxFlowControl is asserted two clocks before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 2).
24:23	SDC4_MCLK_SEL	Selects the sdc4_mclk - input clock of cm_dll_sdc4 Value 0 - gated version of MCLK Value 1 - feedback clock from CLK pad Value 2 (default) - free running mclk (gated between the transactions)
22	CLK_INV	When set(1), the input clock which is inserted into the input macros is inverted.
21	IO_PAD_PWR_SWITCH	Indication to Pad that power has to be switched from 3.3V to 1.8V.
20	CLK_FB_DLY_SEL	Selects the source of feedback clock used by the controller. Value 1 - output of cm_dll_sdc4 is used as feedback clock Value 0 - feedback clock from CLK pad is used
19:18	SD_DEV_SEL	Select the active device if more than one device are connected in shared bus mode. (range: ’00’ - ’11’).
17	HCLKON_SW_EN	SW enable of AHB clock request of SDCC4. value 0: HW clock request mechanism is used value 1: clock request signal is always high
16:14	SELECT_IN	Select to latch data and command coming in: value 000: on the falling edge of internal MCLK. value 001: on the rising edge of internal MCLK. value 010: using feedback clock (default). value 011: DDR mode - In DDR mode, the SDC_CLK output will be SDCn_APPS_CLK divided by 2. value 100: UHS mode - MCLK is used internally. value 101: UHS mode - divided frequency (MCLK/2) is used internally.
13	INVERT_OUT	Clear (0) to change data and command going out on the falling edge. Set (1) to change data and command going out on the rising edge.
12	FLOW_ENA	Enable flow control: value 0: disable (default) value 1: enable

SDC4_MCI_CLK (cont.)

Bits	Name	Description
11:10	WIDEBUS	Enable wide bus mode: value 00: 1 bit mode value 10: 4 bit mode value 01 or 11: 8 bit mode
9	PWRSAVE	Disable Prime-Cell MCI clock output when bus is idle to save power. value 0: Power save disabled - always enabled if bit 8 is set. value 1: Power save enabled - clock enabled only when bus is active and bit 8 is set.
8	ENABLE	Enable Prime-Cell MCI bus clock: value 0: clock disabled value 1: clock enabled
7:0	RESERVED_2	Always reads zero. Writes 'don't care' but by convention write zero. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_CLK register and before accessing this register again.

0x121C0008 SDC4_MCI_ARGUMENT

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIArgument)

SDC4_MCI_ARGUMENT

Bits	Name	Description
31:0	CMD_ARG	Command argument.

0x121C000C SDC4_MCI_CMD

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00000000

(ARM name: MMCCommand) CPSM: 'Command Path State Machine'.

SDC4_MCI_CMD

Bits	Name	Description
31:17	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
16	AUTO_CMD19	If set (1), CPSM sends CMD19 automatically before sending CMD17 or CMD18. This sequence is needed for CDR auto-calibration of cm_dll_sdc4.
15	CCS_DISABLE	If set (1), CPSM sends Command_Completion_Signal (CCS) disable sequence to the external CE-ATA device.
14	CCS_ENABLE	If set (1), CPSM waits for CCS from external card CE-ATA device.
13	MCIABORT	Signals the next command will be an abort (stop) command. This bit always read as (0) due to the hardware implementation. See note 2 below.
12	DAT_CMD	If set (1) indicates that this is a Command with Data. See note 2 below.
11	PROG_ENA	If set (1), PROG_DONE status bit will be asserted when busy is de-asserted. This bit is to be used with a stop or status command after a block write is performed. Does not effect CPSM.
10	ENABLE	The action of writing to this register (MCI_CMD) with this bit set (1), triggers CPSM to leave the ’Idle State’.
9	PENDING	If set (1), CPSM waits for ’CmdPend’ from the DPSM before it starts sending a command. See note 3 below.
8	INTERRUPT	If set (1), CPSM disables command timer and waits for interrupt request (Card Response). See note 4 below.
7	LONGRSP	If set (1), receives a 136-bit long response.
6	RESPONSE	If set (1), CPSM waits for a response subject to INTERRUPT above.

SDC4_MCI_CMD (cont.)

Bits	Name	Description
5:0	CMD_INDEX	Command index. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_CMD register and before accessing this register again. Note 2: These bits don't have any effect on the CPSM. They are used to signal the SDIO Interrupt state machine that a Multi Block (CMD18, CMD25, CMD53, etc.) data transaction is taking place. The DAT_CMD bit signals the start of the data transaction while the MCIABORT bit signals the end. For a pure SD Memory card, these bits are a 'don't care' and should be set to zero by convention. However, some software drivers may chose to manipulate the bits in order to maintain compatibility with Combo cards and/or pure SDIO cards. Note 3: This bit is designed to be used with SD CMD18 (READ_MULTIPLE_BLOCK) and SD CMD25 (WRITE_MULTIPLE_BLOCK) which must be terminated with a SD CMD12 (STOP_TRANSMISSION). After CMD18 or CMD25 is sent, the DPSM is enabled to send or receive data of amount MCI_DATA_LENGTH. After the DPSM finishes the transferring the data, it sends 'CmdPend' to the CPSM and goes idle. When the CPSM receives this signal, it sends the currently loaded command which software would normally establish as CMD12. Note 4: The START, CMD_INDEX, ARGUMENT, and CRC are a total of 48 bits in length. If the INTERRUPT bit is zero, the CPSM will wait (63-47) 16 MCLK ticks for a response before going back to IDLE. If the INTERRUP bit is set, the CPSM will wait indefinitely for a card response.

0x121C0010 SDC4_MCI_RESP_CMD

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIRespCmd)

SDC4_MCI_RESP_CMD

Bits	Name	Description
31:6	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
5:0	RESPCMD	Response command index.

0x121C0014+4*n SDC4_MCI_RESPn, n=[0..3]

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIResponse0-3). Note that MCIResponse3 has 31 bits; the other three (*RESP0, *RESP1, *RESP2) have 32 bits.

The card status size can be 32 or 127 bits, depending on the response type (see Table 1-2). The most significant bit of the card status is received first. The MCIResponse3 register LSB is always 0.

Table 20-6 MCIResponse and card status size

Description	Short response	Long response
MCIResponse0	Card Status [31:0]	Card status [127:96]
MCIResponse1	Unused	Card status [95:64]
MCIResponse2	Unused	Card status [63:32]
MCIResponse3	Unused	Card status [31:1]

SDC4_MCI_RESPn

Bits	Name	Description
31:0	STATUS	Card status.

0x121C0024 SDC4_MCI_DATA_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataTimer).

There is no way to disable this timer. The timer starts counting as soon as a transaction is initiated. The time counts in MCLK ticks.

SDC4_MCI_DATA_TIMER

Bits	Name	Description
31:0	DATA_TIME	Data timeout period.

0x121C0028 SDC4_MCI_DATA_LENGTH

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataLength)

Total number of bytes in the transaction regardless of mode (stream or block). In block mode, must be an exact multiple of block size. During an infinite transfer the value of DATALENGTH should be programmed to 0.

SDC4_MCI_DATA_LENGTH

Bits	Name	Description
31:25	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
24:0	DATALENGTH	Data length value.

0x121C002C SDC4_MCI_DATA_CTL

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00100000

(ARM name: MCIDataCtrl). Data Path State Machine (DPSM).

SDC4_MCI_DATA_CTL

Bits	Name	Description
31:22	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
21	SW_SDC4_CMD19	The input of cm_dll_sdc4 - sdc4_cmd19 can be driven by SW if AUTO_CMD19 (bit 16 in MCI_CMD) feature is not used. Value 1 - sdc4_cmd19 is driven by SW Value 0 (default) - sdc4_cmd19 is driven by HW
20	RX_DATA_PEND	If set (1), timeout counter will start counting only after the RX command (with data) was sent instead of counting from initialization of DPSM. The feature is enabled by default.

SDC4_MCI_DATA_CTL (cont.)

Bits	Name	Description
19	AUTO_PROG_DONE	If set (1), automatic detection of PROG_DONE condition is executed without sending CMD12, CMD13, CMD52 or any other 'dummy' command. SW should set this bit in the following cases only: 1. When sending CMD53 for SDIO write transaction. 2. When sending CMD24. 3. When sending CMD25 and CMD23 was issued before to inform card about the exact number of blocks to be written. 4. When sending CMD19 for testing bus procedure. CMD12 is not required in this case.
18	INFINITE_TRANSFER	If set (1), infinite transfer is enabled. MCI_DATA_LENGTH register should set to 0 during infinite transfer.
17	DATA_PEND	If set (1), DPSM waits for 'DataPend' from the CPSM before it enables the DPSM. See note 2 below.
16:4	BLOCKSIZE	Data block length in bytes (1 to 4096).
3	DM_ENABLE	Enable DM interface: 0: DM disabled 1: DM enabled
2	MODE	Data transfer mode: 0: block data transfer 1: stream data transfer
1	DIRECTION	Data transfer direction: 0: controller to card 1: card to controller
0	ENABLE	Data transfer enabled. If zero, DPSM unconditionally reset. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_DATA_CTL register and before accessing this register again. Note 2: This bit is designed to be used with SD CMD24 and CMD25 (WRITE_SINGLE_BLOCK and WRITE_MULTIPLE_BLOCK) to automatically start the DPSM after a normal (non-error) response is received. This register should be written with the enable bit and the pending bit asserted before MCI_CMD is enabled.

0x121C0030 SDC4_MCI_DATA_COUNT

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataCnt)

NOTE There is no mechanism to ensure that a read of this counter will be accurate as it is not synchronized. The reason being the value read is async to the clock domain in which the reading is done. It is only useful as a debug tool for diagnostic purposes only.

SDC4_MCI_DATA_COUNT

Bits	Name	Description
31:25	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
24:0	DATACOUNT	Value of data counter in MciDPSM block. Represents remaining data of transaction.

0x121C0034 SDC4_MCI_STATUS

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x000C0000

(ARM name: MCIStatus)

This register may need exclusion for QCSR POR Test for bits 25 and 22.

Static[30:26], [24:23] and [10:0]

These remain asserted until they are cleared by writing to the appropriate bit in the Clear Register (see MCI_CLEAR)

XCIS

The means used to send the SDIO external-card-interrupt-signal (XCIS) to the SDCC depends on the transfer mode: 1-bit, 4-bit, or 8-bit. Under 1 bit transfer mode, the XCIS has a dedicated physical connection to the SDCC. Hence once it is asserted, it remain at a high level. Under 4 and 8 bit transfer modes, the XCIS is time multiplexed with physical connection data bit 1. The XCIS is recognized as valid during specific time slots on data bit 1 by the SDCC. How this 'recognition' takes places shows up as different behaviors on SDIO_INTR_OPER, SDIO_INTR, and the actual interrupt sent to the ARM through MCI_INT_MASKn.

Special[25]

The SDIO_INTR_OPER indicator reflects the true state of XCIS as it would be observed inside the external SDIO card. As such, there is no bit 25 in MCI_CLEAR. The only way to clear SDIO_INTR_OPER is to clear the appropriate bit in the external card Common Card Control Registers (CCCR). Like 'static' above and 'dynamic' below, bit 25 in MCI_INT_MASKn controls actually sending this indicator value to the ARM. This indicator of XCIS is used for normal SDCC operation.

Special[22]

The SDIO_INTR indicator reflects that there has been a low-to-high transition on the connection as explained under XCIS above. This indicator is cleared via bit 22 of MCI_CLEAR but any low-to-high transition on the connection will set this indicator again. Further note that this indicator is not routed through the MCI_INT_MASKn to the ARM. For bit 22, the raw value of the connection is routed through the MCI_INT_MASKn to the ARM. As this raw connection is not aware of 'specific time slots', the signal sent to the ARM generally toggles in an unpredictable fashion. This

is generally not useful during normal SDCC operation. However, for wake-up with clocks off, the raw connection is desirable.

Dynamic[21:11]

These change state depending on the state of the underlying logic (for example, FIFO full and empty flags are asserted and de-asserted as data while written to the FIFO).

SDC4_MCI_STATUS

Bits	Name	Description
31	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
30	AUTO_CMD19_TIMEOUT	Response or tuning pattern wasn't received after automatic CMD19's transmission. This status bit should be read only if AUTO_CMD19 (MCI_CMD(16)) was set.
29	BOOT_TIMEOUT	Data wasn't received within the valid time (according to MCI_CCS_TIMER) from the start of boot operation.
28	BOOT_ACK_ERR	Acknowledge pattern wasn't received correctly or not within the valid time (according to MCI_ACK_TIMER) from the start of boot operation.
27	BOOT_ACK_REC	Acknowledge pattern was received correctly.
26	CCS_TIMEOUT	CE-ATA Command Completion Signal timeout.
25	SDIO_INTR_OPER	SDIO interrupt indicator for normal operation.
24	ATA_CMD_COMPL	CE-ATA Command Completion Signal has been detected.
23	PROG_DONE	Programming done.
22	SDIO_INTR	SDIO interrupt indicator for wake-up.
21	RXDATA_AVLBL	Data available in receive FIFO. At least 1 word in the RX FIFO. SW can read 1 word only from the FIFO.
20	TXDATA_AVLBL	Data available in transmit FIFO. At least 1 word in the TX FIFO.
19	RXFIFO_EMPTY	Receive FIFO empty. SW can't read FIFO.
18	TXFIFO_EMPTY	Transmit FIFO empty. SW can write 8 words into the FIFO.
17	RXFIFO_FULL	Receive FIFO full. SW can read 8 words from the FIFO.
16	TXFIFO_FULL	Transmit FIFO full. TX FIFO contains 8 words. SW can't write to FIFO.
15	RXFIFO_HALF_FULL	Receive FIFO half full. SW can read 8 words from the FIFO.
14	TXFIFO_HALF_FULL	Transmit FIFO half full. SW can write 8 words into the FIFO.
13	RXACTIVE	Data receive in progress.
12	TXACTIVE	Data transmit in progress.
11	CMD_ACTIVE	Command transfer in progress.
10	DATA_BLK_END	Data block sent / received (CRC check passed).

SDC4_MCI_STATUS (cont.)

Bits	Name	Description
9	START_BIT_ERR	Start Bit Error flag
8	DATAEND	Data end (data counter is zero).
7	CMD_SENT	Command sent (no response required).
6	CMD_RESPONSE_END	Command response received (CRC check passed).
5	RX_OVERRUN	Receive FIFO overrun error.
4	TX_UNDERRUN	Transmit FIFO underrun error.
3	DATA_TIMEOUT	Data timeout.
2	CMD_TIMEOUT	Command response timeout.
1	DATA_CRC_FAIL	Data block sent / received (CRC check failed).
0	CMD_CRC_FAIL	Command response received (CRC check failed).

0x121C0038 SDC4_MCI_CLEAR

Type: Write
Clock: SAME_RATE_AS_HCLK

(ARM name: MCIClear)

SDC4_MCI_CLEAR

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	AUTO_CMD19_TIMEOUT_CLR	Clears AUTO_CMD19_TIMEOUT flag.
29	BOOT_TIMEOUT_CLR	Clears BOOT_TIMEOUT flag.
28	BOOT_ACK_ERR_CLR	Clears BOOT_ACK_ERR flag.
27	BOOT_ACK_REC_CLR	Clears BOOT_ACK_REC flag.
26	CCS_TIMEOUT_CLR	Clears CCSTimeOut flag.
24	ATA_CMD_COMPL_CLR	Clears AtaCmdCompl flag.
23	PROG_DONE_CLR	Clears ProgDone flag.
22	SDIO_INTR_CLR	Clears SDIOInt flag.
10	DATA_BLK_END_CLR	Clears DataBlockEnd flag.
9	START_BIT_ERR_CLR	Clears StartBitErr flag.
8	DATA_END_CLR	Clears DataEnd flag.
7	CMD_SENT_CLR	Clears commandSent flag.

SDC4_MCI_CLEAR (cont.)

Bits	Name	Description
6	CMD_RESP_END_CLT	Clears CmdRespEnd flag.
5	RX_OVERRUN_CLR	Clears RxOverrunClr flag.
4	TX_UNDERRUN_CLR	Clears TxUnderrun flag.
3	DATA_TIMEOUT_CLR	Clears DataTimeOut flag.
2	CMD_TIMOUT_CLR	Clears CmdTimOutflag.
1	DATA_CRC_FAIL_CLR	Clears DataCrcFail flag.
0	CMD_CRC_FAIL_CLR	Clears CmdCrcFail flag.

0x121C003C+4*n SDC4_MCI_INT_MASKn, n=[0..1]

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIMask0, MCIMask1)

SDC4_MCI_INT_MASKn

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	MASK30	MASK AUTO_CMD19_TIMEOUT flag.
29	MASK29	MASK BOOT_TIMEOUT flag.
28	MASK28	MASK BOOT_ACK_ERR flag.
27	MASK27	MASK BOOT_ACK_REC flag.
26	MASK26	MASK CCSTimeOut flag.
25	MASK25	MASK SDIOIntOper flag.
24	MASK24	MASK AtaCmdCompl flag.
23	MASK23	MASK ProgDone flag.
22	MASK22	MASK SDIOInt flag.
21	MASK21	MASK RxDataAvlbl flag.
20	MASK20	MASK TxDataAvlbl flag.
19	MASK19	MASK RxFifoEmpty flag.
18	MASK18	MASK TxFifoEmpty flag.
17	MASK17	MASK RxFifoFull flag.
16	MASK16	MASK TxFifoFull flag.

SDC4_MCI_INT_MASKn (cont.)

Bits	Name	Description
15	MASK15	MASK RxFifoHalfFull flag.
14	MASK14	MASK TxFifoHalfFull flag.
13	MASK13	MASK RxActive flag.
12	MASK12	MASK TxActive flag.
11	MASK11	MASK CmdActive flag.
10	MASK10	MASK DataBlockEnd flag.
9	MASK9	MASK StartBitErr
8	MASK8	MASK DataEnd flag.
7	MASK7	MASK CmdSent flag.
6	MASK6	MASK CmdRespEnd flag.
5	MASK5	MASK RxOverrun flag.
4	MASK4	MASK TxOverrun flag.
3	MASK3	MASK DataTimeOut flag.
2	MASK2	MASK CmdTimeOut flag.
1	MASK1	MASK DataCmdCrcFail flag.
0	MASK0	MASK CmdCrcFail flag.

0x121C0044 SDC4_MCI_FIFO_COUNT

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

The SDCC core operates in two clock domains ’ MCLK and HCLK. The CPSM and DPSM operate in MCLK domain and MciFifoDmaCtl (FIFO/DMA Controller) operates in HCLK domain. The MCI_FIFO_COUNT is a counter of FIFO Controller that monitors how many words of data are still needed to be transferred through the FIFO. At the beginning of data transaction the MCI_FIFO_COUNT counter will be loaded with the (MCI_DATA_LENGTH / 4) value and then will count down during the data transaction until it reach zero. This register is only useful for debug purposes and should not be used for normal operation since it does not reflect data which may or may not be in the pipeline.

SDC4_MCI_FIFO_COUNT

Bits	Name	Description
31:24	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
23:0	DATA_COUNT	Remaining data.

0x121C0048 SDC4_MCI_BOOT

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

Handling the boot operation.

SDC4_MCI_BOOT

Bits	Name	Description
31:3	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
2	BOOT_ACK_EN	If set to '1' then Host waits for acknowledge pattern after initiating the boot operation.
1	BOOT_EN	When this bit is asserted, the boot operation is initiated in both of the modes.
0	BOOT_MODE	If set to '1' then CMD line is low during the boot operation. If boot_mode = '0', then CMD0 with the argument 0xFFFFFFFA is sent.

0x121C004C SDC4_MCI_BOOT_ACK_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

Timer for boot operation - the time until receiving the acknowledge pattern.

SDC4_MCI_BOOT_ACK_TIMER

Bits	Name	Description
31:0	BOOT_ACK_TIMER	Timer for counting the cycles from initiating the boot operation until the acknowledge pattern is accepted.

0x121C0050 SDC4_MCI_VERSION

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: see below

This register should be excluded for QCSR POR testing.

SDC4_MCI_VERSION

Bits	Name	Description
31:0	MCI_VERSION	SDCC4 core version. This value corresponds to Z according to core release tag: sdcc4_pXqYrZ.

0x121C0054 SDC4_MCI_EMULATION_DLY_LINE

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

The register is responsible for handling DCM which is used in emulation supports 256 values of shift intervals so 8 bits are required (0:255). Bits [31:30] are used for emulation purposes only.

The procedure for activating the DCM is:

1. Setting bit 28 - DCM_RESET.
2. Clearing bit 28 - DCM_RESET.
3. Waiting until bit 29 DCM_LOCKED is high.
4. Writing a new phase in SD_CLK_DLY_CTRL field and setting the DCM_START bit (bit 30).

The clock's placement was executed by the DCM when DCM_DONE is asserted.

SDC4_MCI_EMULATION_DLY_LINE

Bits	Name	Description
31	DCM_DONE	The shift process was finished in DCM and CMD19 can be sent towards the card. This is a read-only bit.
30	DCM_START	A new value of SD_CLK_DLY_CTRL is ready. Clears the DCM_DONE bit.
29	DCM_LOCKED	Reading the status of the LOCKED DCM's output which indicates that the output clock is ready for use.
28	DCM_RESET	Driving reset to DCM.
27:8	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
7:0	SD_CLK_DLY_CTRL	Input to DCM block in FPGA (8 bits). Controlling the change of the delay interval. The value's range may be 0-255 in DCM block.

0x121C0058 SDC4_MCI_CCS_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

This register is used for operation with CE-ATA devices. The CCS timer starts to count at the end of SD transaction and it advances with every MCLK clock cycle. In boot operation this register is used for storing the number of cycles from initiating the boot operation until the first data is received.

SDC4_MCI_CCS_TIMER

Bits	Name	Description
31:0	CCS_TIMER	CE-ATA Command Completion Signal timeout period.

0x121C005C SDC4_MCI_RESPONSE_MASK

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC4_MCI_RESPONSE_MASK

Bits	Name	Description
31:0	RESPONSE_MASK	Mask used to verify the 32 status error bits. Active only when the data pending bit is set in the MCI_DATA_CTL register. When bit of this mask is set the corresponding bit from response [39:8] is checked to be , i.e., shows there is no error. If all bits from mask shows no error, the DPSM will be activated without waiting for software write.

0x121C0060 SDC4_MCI_DLL_CONFIG

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x60006400

SDC4_MCI_DLL_CONFIG

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	DLL_RST	Setting this bit to 1 resets cm_dll_sdc4. cm_dll_sdc4 should be reset every time the MCLK frequency is changed.

SDC4_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
29	PDN	Power Down Value 0 - analog blocks are enabled Value 1 - analog blocks are powered down (default)
28	CK_INTP_SEL	Selects interpolator output
27	CK_INTP_EN	Enable clock interpolation for finer resolution
26:24	MCLK_FREQ	Frequency of MCLK Value 000 -100 ’ 112 (MHz) Value 001 -112 ’ 125 Value 010 -125 ’ 137 Value 011 -137 ’ 150 Value 100 -150 ’ 162 Value 101 -162 ’ 175 Value 110 -175 ’ 187 Value 111 -187 ’ 200
23:20	CDR_SELEXT	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1000 - phase 8 Value 1001 - phase 9 Value 1011 - phase 10 Value 1010 - phase 11 Value 1110 - phase 12 Value 1111 - phase 13 Value 1101 - phase 14 Value 1100 - phase 15
19	CDR_EXT_EN	Enable external control of cdr phase select
18	CK_OUT_EN	Enable output clock (default value is ’1’)
17	CDR_EN	Enable CDR function
16	DLL_EN	Enable DLL function
15:14	CDR_UPD_RATE	CDR update rate, low pass filtering window of CDR Max update rate: Value 00 - 0.5 MCLK frequency Value 01 - 0.25 MCLK Frequency (default) Value 10 - 0.125 MCLK frequency Value 11 - 1/16 MCLK Frequency

SDC4_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
13:12	DLL_UPD_RATE	DLL update rate Value 00 - sdc4_mclk/10 Value 01 - sdc4_mclk/20 Value 10 - sdc4_mclk/40 (default) Value 11 - sdc4_mclk/80
11:10	DLL_PHASE_DET	DLL phase detector low pass average window Value 00 - 4 cycles Value 01 - 8 cycles (default) Value 10 - 16 cycles Value 11 - 32 cycles
9:8	CDR_ALGORITHM_SEL	CDR algorithm select Value 00 - Edge 1 (default) Value 01 - Edge 2 Value 10 - level Value 11- Constant delay
7:6	CMUX0_SHIFT_PHASE	Clock mux0 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
5:4	CMUX1_SHIFT_PHASE	Clock mux1 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
3:2	CMUX2_SHIFT_PHASE	Clock mux2 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
1:0	CMUX3_SHIFT_PHASE	Clock mux3 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable

0x121C0064 SDC4_MCI_DLL_TEST_CTL

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC4_MCI_DLL_TEST_CTL

Bits	Name	Description
31:26	VTH_CTRL	Vth control: change current in delay cell. Higher number means less delay.
25:22	DELTA_VGS_CTRL	dVgs control: change current in delay cell. Higher number means less delay.
21	DLL_BIAS_EXT_EN	Enable dll bias external control Value 0 - disable external control (default) Value 1 - enable external control
20:19	CDR_TEST_CTRL	External input to increment or decrement CDR output phase by 1 step Phase is changed on rising edge of signal. Ex. To increment phase by 2 steps: 10 -> 00 -> 10 Value 00 - hold (default) Value 01 - decrement Value 10 - increment Value 11 - invalid
18	EXT_UP_DN	external control up/dn signal Value 0 - disable (default) Value 1 - enable
17	ATEST_CTRL	atest control Value 0 - disable (default) Value 1 - enable
16:14	ATEST_OUT_MUX_CTRL	Atest output mux control Value 000 - Avss (default) Value 001 - Vth current Value 010 - delta Vgs current Value 011 - Vthn Value 100- Pbias Value 101 - Nbias Value 110 - reserved Value 111 - External bias current
13	DTEST_CTRL	dtest control Value 0 - disable (default) Value 1 - enable

SDC4_MCI_DLL_TEST_CTL (cont.)

Bits	Name	Description
12:10	DTEST_OUT_MUX_CTRL	dtest output mux control. Output signals are paired for measurements Value 000 - sdc4_mclk, sdc4_mclk (default) Value 001 - da_ phout<0>, da_phout<7> Value 010 - da_ phout<3>, da_phout<4> Value 011 - da_phout<0>, da_phout<15> Value 100 - sd4_clk_out, sd4_data_out<0> Value 101 - sd4_clk_out, sd4_data_out<1> Value 110 - sd4_clk_out, sd4_data_out<2> Value 111 - sd4_clk_out, sd4_data_out<3>
9	DLL_TAP_CTRL	Delay line tap control - change number of unit delay cell in each tap Delay value Value 0 - 1 (default) Value 1 - 2
8:7	DLL_CUR_CTRL	Delay line current control - change current mirror ratio in each delay tap Delay value Value 00 - 1x (default) Value 01 - 2x Value 10 - 3x Value 11 - 4x
6	INT_REF_CLK	Value 0 (default) - use internal generated clock for delay line reference Value 1 - use sdc4_mclk for delay line reference
5	FEEDBACK_CLK_EN	Value 0 (default) - enable delay line feedback Value 1 - disable delay line feedback
4:0	RESERVED	These reserved bits can be accessed by the SW and connected to cm_dll_sdc4's input

0x121C0068 SDC4_MCI_DLL_STATUS

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC4_MCI_DLL_STATUS

Bits	Name	Description
31:8	RESERVED_1	Always reads zero. Writes 'don't care' but by convention write zero.
7	DLL_LOCK	DLL lock status Value 0 - Not locked Value 1 - Locked

SDC4_MCI_DLL_STATUS (cont.)

Bits	Name	Description
6:3	CDR_PHASE	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1000 - phase 8 Value 1001 - phase 9 Value 1011 - phase 10 Value 1010 - phase 11 Value 1110 - phase 12 Value 1111 - phase 13 Value 1101 - phase 14 Value 1100 - phase 15
2	DDLL_COARSE_CAL	Value 1 - done Value 0 - not done
1:0	RESERVED_2	Connected to cm_dll_sdc4's output.

0x121C006C SDC4_MCI_STATUS2

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC4_MCI_STATUS2

Bits	Name	Description
31:1	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
0	MCLK_REG_WR_ACTIVE	Value 0 - No active register write to MCLK domain Value 1 - Active register write to MCLK domain. The bit indicates if a write operation to one of the following registers is in process (synchronization between HCLK and MCLK): MCI_POWER MCI_CLOCK MCI_CMD MCI_DATA_CTL

0x121C0070 SDC4_MCI_GENERICS

Type: Read
Clock: SAME_RATE_AS_HCLK

SDC4_MCI_GENERICS

Bits	Name	Description
31:27	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
26:23	SD_DATA_WIDTH	Number of DAT lines Value 4 - 4 DAT lines (SD, SDIO) Value 8 - 8 DAT lines (MMC, eMMC)
22:10	RAM_SIZE	Size of RAM size: Optional Values: 512, 1024, 2048 or 4096 bytes.
9	USE_SPS	Value 1 - BAM and DML are used and USB core is connected to SDCC4, Value 0 - BAM and DML are not used.
8:6	NUM_OF_DEV	Number of eSD or eSDIO devices supported on shared SD bus. Can be set from 1 to 4.
5:1	MAX_PIPES	Number of simultaneous parallel pipes supported by the BAM and attached peripherla pair. Can be set from 1 to 31.
0	USE_DLL_SDC4	Enables the instantiation of cm_dll_sdc4. Value 0 - cm_dll_sdc4 isn't integrated with SDCC4 Value 1 - cm_dll_sdc4 is used with SDCC4.

0x121C0080 SDC4_MCI_FIFO

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC4_MCI_FIFO

Bits	Name	Description
31:0	DATA	FIFO data. This register is aliased to 16 words, 0x080 - 0xBC. In SDCC3, an access to the FIFO was executed with 16 words so 16 addresses were defined. However, in SDCC4 only 8 words are used in each burst so only 8 addresses from the range should be used. When writing to the external SD_Card, writes to the data path FIFO. When reading from the external SD_Card, reads from the data path FIFO.

0x121C00CC SDC4_MCI_TESTBUS_CONFIG

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

NOTE mclk_mux is the selected internal mclk: the original mclk or divided mclk during divided frequency mode.

Table 20-7 TESTBUS signals

TESTBUS bits	Signal	Clock
test_bus0(0)	sdcc_crif_wr_en	hclk
test_bus0(1)	sdcc_crif_rd_en	hclk
test_bus0(2)	sdcc_crif_core_select	hclk

SDC4_MCI_TESTBUS_CONFIG

Bits	Name	Description
31:8	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
7:4	SPARE_FIELD	SW spare bits.
3	TESTBUS_ENA	0x1: Enable 0x0: Disable

SDC4_MCI_TESTBUS_CONFIG (cont.)

Bits	Name	Description
2:0	TESTBUS_SEL	These bits select from different test signals. Refer to Table 1-3 for a list of test signals. TESTBUS_SELBus testbus_sel = 0sdcc_test_bus <= test_bus0 testbus_sel = 1 sdcc_test_bus <= test_bus1 testbus_sel = 2sdcc_test_bus <= test_bus2 testbus_sel = 3sdcc_test_bus <= test_bus3 testbus_sel = 4sdcc_test_bus <= test_bus4 testbus_sel = 5sdcc_test_bus <= test_bus5 testbus_sel = 6sdcc_test_bus <= test_bus6 testbus_sel = 7sdcc_test_bus <= test_bus7

0x121C00D0 SDC4_MCI_TEST_CTL

Type: Read/Write
Clock: PCLK
Reset State: 0x00000000

(ARM name: MCITCR)

SDC4_MCI_TEST_CTL

Bits	Name	Description
31:4	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
3	REGTEST	Register Test Bit: Set 0: normal mode (default--accesses to the registers are controlled by the hardware protection circuitry) Set 1: test mode (the hardware protection circuitry is bypassed. Normal Write/Read/Write/ Read tests can be performed independently of the link side.
2:1	RESERVED_2	Always reads zero. Writes ’don’t care’ but by convention write zero.
0	ITEN	Integration Test Enable. This bit places PrimeCell MCI in the following modes: Set 0: normal mode Set 1: Integration test mode

0x121C00D4 SDC4_MCI_TEST_INPUT

Type: Read
Clock: PCLK

(ARM name: MCIITIP)

SDC4_MCI_TEST_INPUT

Bits	Name	Description
31:10	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
9:6	MCIDATIN_7_4	Reads return the value on the MCIDATIN[7:4] primary inputs.
5	MCICMDIN	Reads return the value on the MCICMDIN primary input.
4:1	MCIDATIN_3_0	Reads return the value on the MCIDATIN[3:0] primary inputs.
0	RESERVED_2	Always reads zero. Writes ’don’t care’ but by convention write zero.

0x121C00D8 SDC4_MCI_TEST_OUT

Type: Read/Write
Clock: PCLK

(ARM name: MCIITOP)

SDC4_MCI_TEST_OUT

Bits	Name	Description
31:16	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
15:12	MCIDATOUT_7_4	Primary output. Writes specify the value to be driven on the MCIDATOUT[7:4] primary output in the integration test mode. Reads return the value written into this field.
10	MCICMDOUT	Primary output. Writes specify the value to be driven on the MCICMDOUT primary output in the integration test mode. Reads return the value written into this field.
9:6	MCIDATOUT_3_0	Primary output. Writes specify the value to be driven on the MCIDATOUT[3:0] primary output in the integration test mode. Reads return the value written into this field.
1	MCIINTR1	Intra-chip output. Writes specify the value to be driven on the intra-chip MCIINTR1 output in the integration test mode. This bit is write-only.
0	MCIINTR0	Intra-chip output. Writes specify the value to be driven on the intra-chip MCIINTR0 output in the integration test mode. This bit is write-only.

20.20 SDC4 DML Registers (0x121C0800 SDC4_DML_BASE)

This section contains the SDC4 DML registers.

The address field is a relative address. A base will be supplied by the SOC team and documented at the start of the chip SW Manual.

0x121C0800 SDC4_DML_CONFIG

Type: Read/Write
Clock: HCLK
Reset State: 0x00010000

SW has the responsibility to set the CRCI SEL fields correctly when both Consumer and Producer sides are enabled at the same time. For example, setting both to 01 or setting both to 10 is an invalid setting if both producer and consumer sides are kicked off. The DML does NOT assume responsibility for incorrect setting of CRCI SEL fields and hence its function is not defined in such cases.

SDC4_DML_CONFIG

Bits	Name	Description
31:19	RESERVED31	reserved
18	INFINITE_CONS_TRANS	If set, this bit means the consumer transaction is of infinite size. Hence the transaction_end_rec signal from BAM will be ignored.
17	DIRECT_MODE	If set, DML is assumed to directly MASTER the AHB bus, in essence, no BAM or BAM is bypassed. This bit value is also routed to the direct_mode hardware port on the DML to be connected to BAM. See Direct_mode_BASE_addr register.
16	BYPASS	If set, the CRCI pairs will be passed through for legacy central DM support. The config AHB slave interface will be directly accessing the peripheral core for config, command and data movement functions. NOTE: The reset value of this bit is `1' which means the DML come out of PoReset in BYPASS state.
15:6	RESERVED15	reserved
5	PRODUCER_BLOCK_END_HPROT2	If set, DML drives high hprot[2] to BAM when block_end is high, else DML drives low hprot[2] to BAM when block_end is high
4	PRODUCER_TRANS_END_EN	When set, transaction_end signal is asserted at the end of DML transaction. When cleared, transaction_end signal is NOT asserted at the end of DML transaction. This feature allows to divide one BAM transaction to two Peripheral transactions.
3:2	CONSUMER_CRCI_SEL	When set to 00, Consumer side is Disabled When set to 01, CRCI-x pair is the consumer CRCI When set to 10, CRCI-y pair is the consumerCRCI If set to 11, its a invalid setting.

SDC4_DML_CONFIG (cont.)

Bits	Name	Description
1:0	PRODUCER_CRCI_SEL	When set to 00, Producer side is Disabled When set to 01, CRCI-x pair is the producer CRCI When set to 10, CRCI-y pair is the producer CRCI If set to 11, its a invalid setting.

0x121C0804 SDC4_DML_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00010001

SDC4_DML_STATUS

Bits	Name	Description
31:17	RESERVED31	reserved
16	CONSUMER_IDLE	0x0: Consumer is busy 0x1: Consumer is IDLE
15:1	RESERVED15	reserved
0	PRODUCER_IDLE	0x0: Producer is busy 0x1: Producer is IDLE

0x121C0808 SDC4_DML_SW_RESET

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register resets the DML core. All internal state information will be lost and all register values will be reset as well.

SDC4_DML_SW_RESET

Bits	Name	Description
31:0	RESERVED	reserved

0x121C080C SDC4_DML_PRODUCER_START

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register triggers the DML's Producer state machine. No SW register values will be altered. Only the internal counters and settings related to Producer activity will be reset and started afresh. This register should be written to after POR to kick off producer side. This register should also be used to restart the producer once it has reached IDLE state (as indicated by the STATUS register) after completing the current transaction.

SDC4_DML_PRODUCER_START

Bits	Name	Description
31:0	RESERVED	reserved

0x121C0810 SDC4_DML_CONSUMER_START

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register triggers the DML's consumer state machine. No SW register values will be altered. Only the internal counters and settings related to consumer activity will be reset and started afresh. This register should be written to after POR to kick off consumer side. This register should also be used to restart the consumer once it has reached IDLE state (as indicated by the STATUS register) after completing the current transaction..

SDC4_DML_CONSUMER_START

Bits	Name	Description
31:0	RESERVED	reserved

0x121C0814 SDC4_DML_PRODUCER_PIPE_LOGICAL_SIZE

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

This register holds the size of the producer pipe (in units of bytes) _to_ which the peripheral can keep writing data to when its the PRODUCER. The value of this register should be consistent with what the BAM registers are programmed with as well. The DML in response to producer side CRCI requests starts writing out data (generated by the Peripheral) from address 0x0 (on its AHB Master Interface). For subsequent Producer side data accesses, the DML keeps on incrementing the address. Upon reaching the max value as indicated by this register, the address rolls over back to 0x0. The address also rolls over back to 0x0 after reaching the end of a transaction.

This register value decides the range of addresses seen on the DML AHB Master address bus during Producer activity.

The value of this register is restricted to any power of two and greater than or equal to the Producer BAM Block Size setting. This is to avoid DML overwriting its own data in the pipe as the data is not committed until block_end is received by the BAM.

The recommended value for this register is 4096(decimal)

SDC4_DML_PRODUCER_PIPE_LOGICAL_SIZE

Bits	Name	Description
31:16	RESERVED31	reserved31
15:0	PRODUCER_LOGICAL_SIZE	The size of the producer pipe (in units of bytes) to which a producer peripheral can keep writing the data it produces.

0x121C0818 SDC4_DML_CONSUMER_PIPE_LOGICAL_SIZE

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

This register holds the size of the consumer pipe (in units of bytes) _from_ which the peripheral can keep _reading_ data from when its the CONSUMER. The value of this register should be consistent with what the BAM registers are programmed with as well. The DML in response to consumer side CRCI requests starts reading out data (needed by the Peripheral) from address 0x0 (on its AHB Master Interface). For subsequent consumer side data accesses, the DML keeps on incrementing the address. Upon reaching the max value as indicated by this register, the address rolls over back to 0x0. The address also rolls over back to 0x0 after reaching the end of a transaction.

This register value decides the range of addresses seen on the DML AHB Master address bus during consumer activity.

The value of this register is restricted to any power of two and no smaller than 32 bytes, that is, no smaller than a "beat-8" burst on a 32 bit AHB.

The recommended value for this register is 4096(decimal)

SDC4_DML_CONSUMER_PIPE_LOGICAL_SIZE

Bits	Name	Description
31:16	RESERVED31	reserved31
15:0	CONSUMER_LOGICAL_SIZE	The size of the consumer pipe (in units of bytes) to which a consumer peripheral can keep reading the data from it needs.

0x121C081C SDC4_DML_PIPE_ID

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds pipe IDs that services the producer and consumer side of the peripheral.

- The producer pipe ID is fed to the BAM when servicing the producer side of the peripheral.
- The consumer pipe ID is fed to the BAM when servicing the consumer side of the peripheral.
- The DML also uses this ID value to look into the appropriate side band signals from BAM like pipe_empty, pipe_full etc before initiating the said AHB transaction.

SDC4_DML_PIPE_ID

Bits	Name	Description
31:21	RESERVED31	reserved
20:16	CONSUMER_PIPE_ID	consumer pipe ID
15:5	RESERVED15	reserved
4:0	PRODUCER_PIPE_ID	producer pipe ID

0x121C0820 SDC4_DML_PRODUCER_TRACKERS

Type: Read
Clock: HCLK
Reset State: 0x00000000

.This register is for debug purposes only. They reflect the value of the producer block and transaction counters when read. The values may be dynamically changing when a transaction is in progress.

SDC4_DML_PRODUCER_TRACKERS

Bits	Name	Description
31:16	PROD_TRANS_CNT	Value of the 16bit tracker tracking the Producer Transaction Count for the current transaction. Should read 0 at the end of the transaction.
15:0	PROD_BLOCK_CNT	Value of the 16 bit tracker that tracks the Producer Block Count. Need not be zero at the end of transaction.

0x121C0824 SDC4_DML_PRODUCER_BAM_BLOCK_SIZE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds the "block" size, in units of bytes, associated with the Producer BAM. The DML asserts the block_end side band signal to the BAM whenever the producer side of the peripheral has generated the said amount of data. This register value should be an integral multiple of the Producer CRCI Block Size.

Legal values for Producer BAM Block Size are 64, 128, 192, 256, 512, 1024, 2048 and 4096.

The recommended value for this register is 512(decimal)

SDC4_DML_PRODUCER_BAM_BLOCK_SIZE

Bits	Name	Description
31:16	RESERVED	reserved
15:0	PRODUCER_BLK_SIZE	Size of the one "block" on the producer side in units of bytes.

0x121C0828 SDC4_DML_PRODUCER_BAM_TRANS_SIZE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds the "transaction" size, in units of bytes, associated with the Producer BAM. The DML asserts the transaction_end side band signal to the BAM whenever the producer side of the peripheral has generated the said amount of data. This signal is asserted only during the address phase of the AHB transaction that carries the last byte corresponding to the size mentioned in this register. Once this value is reached for a given transaction, the address for subsequent data access rolls back to 0x0 and all the block size, CRCI size and transaction size counters also get reset to 0 and start all over again. A value of zero in this register during a producer transaction start means infinite size transaction and hence transaction_end may not get asserted.

This value can be anything up to a maximum of 4294967295 bytes (4 GB -1). If this register value is zero when the DML is started, then an infinite transaction size is assumed. No transaction_end will be generated.

SDC4_DML_PRODUCER_BAM_TRANS_SIZE

Bits	Name	Description
31:0	PRODUCER_TRANS_SIZE	Size of the one "transaction" on the producer side in units of bytes or if zero, then infinite transaction size assumed.

0x121C082C SDC4_DML_DIRECT_MODE_BASE_ADDR

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register is used whenever the DIRECT_MODE bit in config register is set. The programmed 16bits will be used as DML AHB Master address bus MSBits for consumer (AHB read) and producer (AHB Write) operations. The lower 16bits would be dictated by the pipe logical size register.

SDC4_DML_DIRECT_MODE_BASE_ADDR

Bits	Name	Description
31:16	CONSUMER_BASE_ADDR	used as AHB Master address (31:16) when doing direct mode consumer operations if direct_mode bit is set.
15:0	PRODUCER_BASE_ADDR	used as AHB Master address (31:16) when doing direct mode producer operations if direct_mode bit is set.

0x121C0830 SDC4_DML_DEBUG

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

Enables Test Bus of the DML and also selects which side signals to drive the test bus with.

SDC4_DML_DEBUG

Bits	Name	Description
31:2	RESERVED	reserved
1	STATUS_2_SEL	If set, selects the set of signals listed out in DML_BAM_SIDE_STATUS_2 register onto Test bus, else selects set of signals listed out in DML_BAM_SIDE_STATUS_1 register to be muxed onto test bus. Valid only if bit 0 is set.
0	TESTBUS_EN	0x0: Disable Test Bus 0x1: Enable Test Bus

0x121C0834 SDC4_DML_BAM_SIDE_STATUS_1

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the instantaneous value of the side band signals with BAM.

SDC4_DML_BAM_SIDE_STATUS_1

Bits	Name	Description
31:24	RESERVED31	reserved
23	ACK_ON_SUCCESS_TOGGLE	for selected consumer pipe
22	ACK_BYTES_AVAIL_TOGGLE	for selected consumer pipe
21	PIPE_BYTES_AVAIL_TOGGLE	for selected consumer pipe
20	TRANSACTION_END_REC	transaction end received for selected consumer pipe.
19	PIPE_BYTES_FREE_TOGGLE	bytes free toggle signal for selected producer pipe
18:3	PIPE_BYTES_FREE	bytes free value for selected producer pipe
2	MESSAGING_ONLY	DML output status
1	TRANSACTION_END	DML output status
0	BLOCK_END	DML output status

0x121C0838 SDC4_DML_BAM_SIDE_STATUS_2

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the instantaneous value of the side band signals with BAM.

SDC4_DML_BAM_SIDE_STATUS_2

Bits	Name	Description
31:16	ACK_ON_SUCCESS_TOGGLE_SIZE	for selected consumer pipe
15:0	PIPE_BYTES_AVAIL	for selected consumer pipe

0x121C083C SDC4_DML_RTL_GENERICS_1

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the RTL Generics set during the integration of the DML into a SPS Wrapper or other entity.

SDC4_DML_RTL_GENERICS_1

Bits	Name	Description
31:17	RESERVED31	reserved
16:11	PERIPHERAL_ADDR_WIDTH	represents the width set (in binary format)
10:6	MAX_PIPES	represents the number of pipe value set (in binary format)
5:3	CONSUMER_CRCI_BLK	101:.256 bytes 0x0: 16 bytes 0x1: 32 bytes 0x2: 64 bytes 0x3: 128 bytes 0x4: 192 bytes
2:0	PRODUCER_CRCI_BLK	101:.256 bytes 0x0: 16 bytes 0x1: 32 bytes 0x2: 64 bytes 0x3: 128 bytes 0x4: 192 bytes

0x121C0840 SDC4_DML_RTL_GENERICS_2

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the PROD_DMR_RD_ADDR Generic set in RTL during the integration of the DML into a SPS Wrapper or other entity.

SDC4_DML_RTL_GENERICS_2

Bits	Name	Description
31:0	PROD_RD_DMR_ADDR	32bit Value of the PROD_DMR_RD_ADDR generic

0x121C0844 SDC4_DML_RTL_GENERICS_3

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the CONS_DMR_WR_ADDR Generic set in RTL during the integration of the DML into a SPS Wrapper or other entity.

SDC4_DML_RTL_GENERICS_3

Bits	Name	Description
31:0	CONS_WR_DMR_ADDR	32bit Value of the CONS_DMR_WR_ADDR generic

0x121C0848 SDC4_DML_INTERRUPT_ENABLE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

SDC4_DML_INTERRUPT_ENABLE

Bits	Name	Description
31:1	RESERVED31	reserved
0	PROD_IDLE_START_INTR_EN	Enable DML to generate an interrupt when PRODUCER enters an IDLE state.

0x121C084C SDC4_DML_INTERRUPT_CLEAR

Type: Write
Clock: HCLK
Reset State: 0xXXXXXXXX

SDC4_DML_INTERRUPT_CLEAR

Bits	Name	Description
31:1	RESERVED31	reserved
0	PROD_IDLE_START_INTR_CLR	Clear PROD_IDLE_START_INTR interrupt.

20.21 SDC4 BAM Registers (0x121C2000 SDC4_BAM_BASE)

This section contains the SDC4 BAM registers.

BAM supports only Word (4 byte) aligned writes and reads on the Configuration Bus interface.

BAM has MAX_PIPES hardware generic parameter defining the number of pipes it supports. Each BAM can have up to 31 pipes supported.

BAM has BAM_CONF_AHBS_ADDR_WIDTH hardware generic parameter defining the Bit Number for selecting BAM access or Peripheral access. Legal Ranges are 14 to 20. Count starts from 1, meaning a value of 17 will set BAM Base address as 0x0001_0000.

20.21.1 BAM control registers

BAM Control registers configure the BAM operational state, SW reset, interrupts and others.

0x121C2F80 SDC4_BAM_CTRL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

BAM Control register allows global controls for the BAM.

SDC4_BAM_CTRL

Bits	Name	Description
31:17	RESERVED_BITS31_17	Set to Zero (0)
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1’b1 - Enable Power Saving Mode 1’b0 - Disable Power Saving Mode

SDC4_BAM_CTRL (cont.)

Bits	Name	Description
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2’b00 - Cache when current descriptor has less than 64 bytes left. 2’b01 - Cache when current descriptor has less than 128 bytes left. 2’b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2’b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
12	RESERVED_BITS12	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_SIC_SEL
11:5	BAM_TESTBUS_SEL	Set to Zero (0) Obsolete field: BAM_TESTBUS_SEL Test Bus selector. Supported until (including) bam_p3q3r29 (BlackBird). Moved to a dedicated register - BAM_TEST_BUS_SEL in the following releases.
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
3	RESERVED_BITS3	Set to Zero (0)
2	RESERVED_BITS2	Set to Zero (0)

SDC4_BAM_CTRL (cont.)

Bits	Name	Description
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x121C2F84 SDC4_BAM_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

SDC4_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)

SDC4_BAM_REVISION (cont.)

Bits	Name	Description
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists
16	SECURED	This field indicates BAM/BAM-Lite has security support (APU inside) 1'b1 - Secured 1'b0 - Not Secured
15:12	RESERVED_BITS15_12	Set to Zero (0)
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRCS*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRCS*_EEn registers exist for n=[0..3].
7:0	REVISION	This field contains the revision number of the core, Hard Coded. 8'h01 - Voyager (bam_p3q3r22 +) 8'h02 - BlackBird (bam_p3q3r27 +) 8'h03 - Waverider BAM (bam_p3q3r30 +) 8'h04 - Aurora BAM (bam_p3q2r43 +) 8'h05 - Shelby BAM (bam_p2q2r45 +) 8'h10 - Waverider BAM Lite (bam_lite_p1q1r0 +) 8'h11 - Aurora BAM Lite (bam_lite_p3q2r16 +) 8'h12 - Shelby BAM Lite (bam_lite_p2q2r18 +)

0x121C2FBC SDC4_BAM_NUM_PIPES

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

SDC4_BAM_NUM_PIPES

Bits	Name	Description
31:24	BAM_NON_PIPE_GRP	This field contains the number of BAM Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
23:16	PERIPH_NON_PIPE_GRP	This field contains the number of Peripheral's Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
15:8	RESERVED_BITS15_8	Set to Zero (0)
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x121C2FC0 SDC4_BAM_TIMER

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

SDC4_BAM_TIMER

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x121C2FC4 SDC4_BAM_TIMER_CTRL

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

The resolution of the BAM inactivity timer are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define

the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * TIMER_TRSHLD.

SDC4_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x121C2F88 SDC4_BAM_DESC_CNT_TRSHLD

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

SDC4_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0).
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. Available in BAM only

0x121C2F8C SDC4_BAM_IRQ_SRCS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

SDC4_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x121C2F90 SDC4_BAM_IRQ_SRCS_MSK

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

SDC4_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x121C2FB0 SDC4_BAM_IRQ_SRCS_UNMASKED

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

SDC4_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x121C2F94 SDC4_BAM_IRQ_STTS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

SDC4_BAM_IRQ_STTS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.

SDC4_BAM_IRQ_STTS (cont.)

Bits	Name	Description
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x121C2F98 SDC4_BAM_IRQ_CLR

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

SDC4_BAM_IRQ_CLR

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x121C2F9C SDC4_BAM_IRQ_EN

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

SDC4_BAM_IRQ_EN

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x121C2FA0 SDC4_BAM_RESERVED_1

Type: Read
Clock: BAM_CLK
Reset State: 0x00000000

SDC4_BAM_RESERVED_1

Bits	Name	Description
31	RESERVED_BITS31	Set to Zero (0) Obsolete field: BAM_IRQ_SIC_SEL
30:0	RESERVED_BITS30_0	Set to Zero (0) Obsolete field: P_IRQ_SIC_SEL

0x121C2FA4 SDC4_BAM_AHB_MASTER_ERR_CTRLS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC4_BAM_AHB_MASTER_ERR_CTRLS

Bits	Name	Description
31:23	RESERVED_BITS31_16	Set to Zero (0)
22:18	BAM_ERR_HVMID	HVMID
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x121C2FA8 SDC4_BAM_AHB_MASTER_ERR_ADDR

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC4_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x121C2FAC SDC4_BAM_AHB_MASTER_ERR_DATA

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC4_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x121C2FB4 SDC4_BAM_RESERVED_2

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

SDC4_BAM_RESERVED_2

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_IRQ_DEST_ADDR

0x121C2FB8 SDC4_BAM_RESERVED_3

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

SDC4_BAM_RESERVED_3

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_DEST_ADDR

0x121C2FF0 SDC4_BAM_TRUST_REG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside - SECURED field in the BAM_REVISION register) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC4_BAM_TRUST_REG

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_VMID	Those bits indicate the VMID value to be used when performing BAM type accesses to the bus. BAM Type accesses include BAM MTI (or Direct Mode accesses, not applicable for BAM Lite)
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable
6:2	RESERVED_BITS6_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_EE	This Field Indicates the EE (0,1,2,3) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x121C2FF4 SDC4_BAM_TEST_BUS_SEL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is the testbus selector register.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC4_BAM_TEST_BUS_SEL

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	BAM_DATA_ERASE	When enabled, BAM will be instructed to erase all the data it currently has inside. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Erase 1'b0 - Disabled
17	BAM_DATA_FLUSH	When enabled, BAM will be instructed to flush all the data it currently has inside. BAM will only flush the data once it has enough data and a valid destination for it. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Flush 1'b0 - Disabled
16	BAM_CLK_ALWAYS_ON	This bit controls the BAM to issue 'always on' clock request. 1'b1 - Enable Always On clock request. 1'b0 - Disabled
15:7	RESERVED_BITS15_7	Set to Zero (0)
6:0	BAM_TESTBUS_SEL	Test Bus selector. Values with bit[11] set high are reserved for the BAM Lite integrator to provide testbus from outside of the BAM Lite. For example, eDML testbus may reside at X'100_0000' to X'111_1111' selector values. eDML has no registers thus has no test bus selector, so its test bus is combined with the BAM lite's. BAM provides zeroes on its testbus when external values selected. X'000_0000' - Zeros X'000_0001' - Slave test bus X'000_0010' - Pipe state machine test bus X'000_0011' - Buffer test bus X'000_0100' - Sideband test bus X'000_1101' - Bus Manager test bus X'001_0000' - Reg file test bus X'1''_''''' - BAM Lite sets zeroes on the test bus, leaving it for external use

0x121C2FF8 SDC4_BAM_TEST_BUS_REG

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the value being output to the testbus of the chip. It is not intended for SW usage but for lab debugging of the BAM. Values here can change every cycle.

SDC4_BAM_TEST_BUS_REG

Bits	Name	Description
31:0	BAM_TESTBUS_REG	32 bit Testbus value. To select the Block in BAM to show here, use the BAM_TESTBUS_SEL field in BAM_CTRL register.

0x121C2FFC SDC4_BAM_CNFG_BITS

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

SDC4_BAM_CNFG_BITS

Bits	Name	Description
31:27	RESERVED_BITS31_27	Set to Zero (0)
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only

SDC4_BAM_CNFG_BITS (cont.)

Bits	Name	Description
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there are available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided.. 1’b1 - Enable 1’b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission savepoint, but into the illegal’s pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1’b1 - Enabled 1’b0 - Disable Available in BAM only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1’b1 - Enable 1’b0 - Disable Available in BAM only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there’s no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1’b1 - Enable 1’b0 - Disable Available in BAM only

SDC4_BAM_CNFG_BITS (cont.)

Bits	Name	Description
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1'b1 - 1'b0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix) 1'b1 - Enable 1'b0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM's common clock request. 1'b1 - Propagate Sideband Clock Request 1'b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. 1'b1 - Enable Power Saving 1'b0 - Disable Power Saving

SDC4_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reset pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1’b1 - Enable external block pipe reset 1’b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. This functionality has been found to be buggy and was removed from APQ8064. Bit is currently unused. 1’b1 - Enable 1’b0 - Disable Available in BAM only
10:4	RESERVED_BITS10_4	Set to Zero (0)
3	BAM_ADML_SYNC_BRIDGE	0x1: Use a Synchronous Configuration bridge in aDML. 0x0: Use a Asynchronous Configuration bridge in aDML.
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It’s invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1’b1 - Enable 1’b0 - Disable Available in BAM only
1	BAM_ADML_DEEP_CONS_FIFO	0x1: Use a deep Consumer FIFO in aDML (16 dwords) 0x0: Use a shallow Consumer FIFO in aDML (8 dwords)
0	BAM_ADML_INCR4_EN_N	0x1: Don’t allow INCR4 aDML-BAM accesses. 0x0: Allow INCR 4 aDML-BAM accesses.

0x121C3800+ 128*n SDC4_BAM_IRQ_SRCS_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC4_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x121C3804+ 128*n SDC4_BAM_IRQ_SRCS_MSK_EEn, n=[0..3]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC4_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x121C3808+ 128*n SDC4_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC4_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

20.21.2 BAM PIPE management registers

BAM Pipe management registers control each pipe's parameters. Those reside in physical registers.

0x121C2000+ 128*n SDC4_BAM_P_CTRLn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Control register provides various controls for the pipe.

SDC4_BAM_P_CTRLn

Bits	Name	Description
31:11	RESERVED_BITS31_11	Set to Zero (0)
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be pre-fetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

SDC4_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only.When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
2	RESERVED_BITS2	Set to Zero (0)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe
0	RESERVED_BITS0	Set to Zero (0)

0x121C2004+ 128*n SDC4_BAM_P_RSTn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

SDC4_BAM_P_RSTn

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	P_SW_RST	This resets the pipe and its' registers, (Both Flip-Flops and RAM). 1'b1 - Reset 1'b0 - Do Nothing

0x121C2008+ 128*n SDC4_BAM_P_HALTn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Halt register Enables/Disables the Halt Sequence.

This is a self-modifying register.

SDC4_BAM_P_HALTn

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it..

0x121C2030+ 128*n SDC4_BAM_P_TRUST_REGn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC4_BAM_P_TRUST_REGn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_P_VMID	Those bits indicate the VMID value to be used when performing Pipe type accesses to the bus. BAM Type accesses include Pipe MTI, Data and Descriptors.
7:2	RESERVED_BITS7_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_P_EE	This Field Indicates the EE (0,1,2,3) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x121C2010+ 128*n SDC4_BAM_P_IRQ_STTSn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

SDC4_BAM_P_IRQ_STTSn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

0x121C2014+ 128*n SDC4_BAM_P_IRQ_CLRn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

SDC4_BAM_P_IRQ_CLRn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_CLR	1’b1 - Clear 1’b0 - Unchanged
4	P_ERR_CLR	1’b1 - Clear 1’b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1’b1 - Clear 1’b0 - Unchanged

SDC4_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

0x121C2018+ 128*n SDC4_BAM_P_IRQ_ENn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

SDC4_BAM_P_IRQ_ENn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

0x121C201C+128*n SDC4_BAM_P_TIMERn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the pipe.

SDC4_BAM_P_TIMERn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x121C2020+128*n SDC4_BAM_P_TIMER_CTRLn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the P_TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * P_TIMER_TRSHLD.

SDC4_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x121C2024+ 128*n SDC4_BAM_P_PRDCR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

SDC4_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value

0x121C2028+ 128*n SDC4_BAM_P_CNSMR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

SDC4_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value

20.21.3 BAM PIPE configuration registers (RAM)

BAM Pipe management registers configure each pipes' parameters.

Pipe Address span: currently defining each pipe to have 32 addresses, therefore inter pipe offset is 32*4=128=0x80 bytes.

0x121C302C+64*n SDC4_BAM_P_EVNT_DEST_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

SDC4_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x121C3018+ 64*n SDC4_BAM_P_EVNT_REGn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

SDC4_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x121C3000+ 64*n SDC4_BAM_P_SW_OFSTSn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC4_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode.
15:0	SW_DESC_OFST	Descriptor FIFO offset.

0x121C3024+64*n SDC4_BAM_P_DATA_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

SDC4_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x121C301C+64*n SDC4_BAM_P_DESC_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

SDC4_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x121C3028+ 64*n SDC4_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When a BAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

SDC4_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x121C3020+ 64*n SDC4_BAM_P_FIFO_SIZESn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

SDC4_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors.

20.21.4 BAM PIPE internal state registers (RAM)

BAM Pipe debug registers allow a software look inside on the internal parameters of the BAM State Machines stored in RAM.

Those shouldn't be normally used or altered by the software.

0x121C3034+ 64*n SDC4_BAM_P_RETR_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context stored for retransmission.

This is being stored by Ack Update state machine in consumer mode or by the Writeback state machine in producer mode.

This is being loaded by the Writeback state machine when retransmission happens.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC4_BAM_P_RETR_CNTXT_n

Bits	Name	Description
31:16	RETR_DESC_OFST	Descriptor Fifo Offset for retransmission.
15:0	RETR_OFST_IN_DESC	The Offset inside the Descriptor for retransmission.

0x121C3038+ 64*n SDC4_BAM_P_SI_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Sideband Inform state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC4_BAM_P_SI_CNTXT_n

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

0x121C3004+ 64*n SDC4_BAM_P_AU_PSM_CNTXT_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Ack Update state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC4_BAM_P_AU_PSM_CNTXT_1_n

Bits	Name	Description
31:16	AU_PSM_ACCUMED	PSM: The acknowledged (EOB/T) number of bytes since last Write Event. AU: The accumulation of the descriptor sizes for the present ack_on_success event. This is never bigger than the ACKED field. Once the ACCUMED values are bigger than Event Threshold, an Event will be issued, the ACKED value will decrease by the ACCUMED size and this value will be zeroed. This also serves as the Bytes Consumed value in the Event.
15:0	AU_ACKED	AU: The left over of the number of bytes that were received via the ack_on_success, that did not cause a descriptor closure. This value is down counting upon issuing Read Event. PSM:

0x121C3008+ 64*n SDC4_BAM_P_PSM_CNTXT_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC4_BAM_P_PSM_CNTXT_2_n

Bits	Name	Description
31	PSM_DESC_VALID	The Descriptor Valid bit provided by the Writeback state machine to Pipe state machine.
30	PSM_DESC_IRQ	The Descriptor Interrupt bit provided by the Writeback state machine to pipe state machine.
29	PSM_DESC_IRQ_DONE	The Descriptor Interrupt needed selection bit.
28:25	PSM_GENERAL_BITS	General Context Switch Bits
24:22	PSM_CONS_STATE	State of the Pipe Consumer state machine.
21:19	PSM_PROD_SYS_STATE	State of the Pipe Producer System state machine.
18:16	PSM_PROD_B2B_STATE	State of the Pipe Producer BAM to BAM state machine.
15:0	PSM_DESC_SIZE	The Descriptor Size provided by the Writeback state machine to pipe state machine.

0x121C300C+64*n SDC4_BAM_P_PSM_CNTXT_3_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC4_BAM_P_PSM_CNTXT_3_n

Bits	Name	Description
31:0	PSM_DESC_ADDR	The Data Address provided in the current descriptor from the Writeback state machine.

0x121C3010+64*n SDC4_BAM_P_PSM_CNTXT_4_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC4_BAM_P_PSM_CNTXT_4_n

Bits	Name	Description
31:16	PSM_DESC_OFST	The running Descriptor Fifo Offset of the Writeback state machine
15:0	PSM_SAVED_ACCUMED_SIZE	The Saved Accumulated Size from the Pipe state machine.

0x121C3014+ 64*n SDC4_BAM_P_PSM_CNTXT_5_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC4_BAM_P_PSM_CNTXT_5_n

Bits	Name	Description
31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

0x121C3030+ 64*n SDC4_BAM_P_RESERVED_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

SDC4_BAM_P_RESERVED_1_n

Bits	Name	Description
31:0	BAM_P_RES_1	Set to zero (0) Reserved

0x121C303C+64*n SDC4_BAM_P_RESERVED_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

SDC4_BAM_P_RESERVED_2_n

Bits	Name	Description
31:0	BAM_P_RES_2	Set to zero (0) Obsolete Register: BAM_P_IRQ_DEST_ADDRn, n=[0..30]

20.22 BAM DMA Registers (0x12240000 BAM_DMA_BASE)

This section contains the BAM DMA registers.

The BAM registers may be accessed via a burst on AHB.

Registers in this file are offsets from zero. DMA_BASE_ADDRESS is allocated separately since DMA block in instantiated in a standalone BAM.

0x12240000 BAM_DMA_DMA_ENBL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000001

This register enables the BAM DMA.

BAM_DMA_DMA_ENBL

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	DMA_ENABLE	When de-asserted - will stop any transaction in any channel of DMA

0x12240004+4*n BAM_DMA_DMA_CHNL_CONFIGn, n=[0..9]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000131

This register configures channel number n.

Bits [18:16] are read only.

BAM_DMA_DMA_CHNL_CONFIGn

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	PRODUCER_PIPE_ENABLED	When 0x1 - Producer pipe (as received from BAM) is enabled)
17	CONSUMER_PIPE_ENABLED	When 0x1 - Consumer pipe (as received from BAM) is enabled
16	DMA_CHNL_HALT_DONE	Channel n has inserted halt functionality. Read only bit
15:13	RESERVED_BITS15_13	Set to Zero (0)

BAM_DMA_DMA_CHNL_CONFIGn (cont.)

Bits	Name	Description
12	DMA_CHNL_HALT	Halt channel n
11:9	RESERVED_BITS11_9	
8	DMA_CHNL_ENABLE	Enable channel n
7:6	RESERVED_BITS7_6	
5:4	DMA_CHNL_ACT_THRESH	This field sets the threshold value of the channel 2'b11 - 512 Bytes 2'b10 - 256 Bytes 2'b01 - 128 Bytes 2'b00 - 64 Bytes
3	RESERVED_BITS3	Set to Zero (0)
2:0	DMA_CHNL_WEIGHT	This field sets the weight of the channel. The higher the weight is the more successive transactions are allowed. 3'b111 - Weight is 7 3'b110 - Weight is 6 3'b101 - Weight is 5 3'b100 - Weight is 4 3'b011 - Weight is 3 3'b010 - Weight is 2 3'b001 - Weight is 1 3'b000 - Channel won't be invoked. If set to this value when this channel id currently active, it would finish its chunk as with former weight and then be disabled

0x1224003C BAM_DMA_DMA_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0X00000001

This register holds a hard coded revision of the DMA RTL.

BAM_DMA_DMA_REVISION

Bits	Name	Description
31:0	REVISION	This fields holds the RTL version of the DMA (hard-coded).

0x12240040 BAM_DMA_DMA_CONFIG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This register selects the testbus bits of BAM DMA.

BAM_DMA_DMA_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1:0	TESTBUS_SELECT	0x3: All bits are zero. 0x2: BAM testbus is selected 0x1: BAM_DMA testbus is selected 0x0: All bits are zero (default.)

20.23 BAM DMA BAM Registers (0x12244000 BAM_DMA_BAM_BASE)

This section contains the BAM DMA BAM registers.

BAM supports only Word (4 byte) aligned writes and reads on the Configuration Bus interface.

BAM has MAX_PIPES hardware generic parameter defining the number of pipes it supports. Each BAM can have up to 31 pipes supported.

BAM has BAM_CONF_AHBS_ADDR_WIDTH hardware generic parameter defining the Bit Number for selecting BAM access or Peripheral access. Legal Ranges are 14 to 20. Count starts from 1, meaning a value of 17 will set BAM Base address as 0x0001_0000.

20.23.1 BAM control registers

BAM Control registers configure the BAM operational state, SW reset, interrupts and others.

0x12244F80 BAM_DMA_BAM_CTRL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

BAM Control register allows global controls for the BAM.

BAM_DMA_BAM_CTRL

Bits	Name	Description
31:17	RESERVED_BITS31_17	Set to Zero (0)
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1’b1 - Enable Power Saving Mode 1’b0 - Disable Power Saving Mode

BAM_DMA_BAM_CTRL (cont.)

Bits	Name	Description
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2’b00 - Cache when current descriptor has less than 64 bytes left. 2’b01 - Cache when current descriptor has less than 128 bytes left. 2’b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2’b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
12	RESERVED_BITS12	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_SIC_SEL
11:5	BAM_TESTBUS_SEL	Set to Zero (0) Obsolete field: BAM_TESTBUS_SEL Test Bus selector. Supported until (including) bam_p3q3r29 (BlackBird). Moved to a dedicated register - BAM_TEST_BUS_SEL in the following releases.
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
3	RESERVED_BITS3	Set to Zero (0)
2	RESERVED_BITS2	Set to Zero (0)

BAM_DMA_BAM_CTRL (cont.)

Bits	Name	Description
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x12244F84 BAM_DMA_BAM_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

BAM_DMA_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)

BAM_DMA_BAM_REVISION (cont.)

Bits	Name	Description
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists
16	SECURED	This field indicates BAM/BAM-Lite has security support (APU inside) 1'b1 - Secured 1'b0 - Not Secured
15:12	RESERVED_BITS15_12	Set to Zero (0)
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRCS*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRCS*_EEn registers exist for n=[0..3].
7:0	REVISION	This field contains the revision number of the core, Hard Coded. 8'h01 - Voyager (bam_p3q3r22 +) 8'h02 - BlackBird (bam_p3q3r27 +) 8'h03 - Waverider BAM (bam_p3q3r30 +) 8'h04 - Aurora BAM (bam_p3q2r43 +) 8'h05 - Shelby BAM (bam_p2q2r45 +) 8'h10 - Waverider BAM Lite (bam_lite_p1q1r0 +) 8'h11 - Aurora BAM Lite (bam_lite_p3q2r16 +) 8'h12 - Shelby BAM Lite (bam_lite_p2q2r18 +)

0x12244FBC BAM_DMA_BAM_NUM_PIPES

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

BAM_DMA_BAM_NUM_PIPES

Bits	Name	Description
31:24	BAM_NON_PIPE_GRP	This field contains the number of BAM Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
23:16	PERIPH_NON_PIPE_GRP	This field contains the number of Peripheral's Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
15:8	RESERVED_BITS15_8	Set to Zero (0)
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x12244FC0 BAM_DMA_BAM_TIMER

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

BAM_DMA_BAM_TIMER

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12244FC4 BAM_DMA_BAM_TIMER_CTRL

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

The resolution of the BAM inactivity timer are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define

the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * TIMER_TRSHLD.

BAM_DMA_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12244F88 BAM_DMA_BAM_DESC_CNT_TRSHLD

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

BAM_DMA_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0).
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. Available in BAM only

0x12244F8C BAM_DMA_BAM_IRQ_SRCS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

BAM_DMA_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12244F90 BAM_DMA_BAM_IRQ_SRCS_MSK

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

BAM_DMA_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12244FB0 BAM_DMA_BAM_IRQ_SRCS_UNMASKED

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

BAM_DMA_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x12244F94 BAM_DMA_BAM_IRQ_STTS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

BAM_DMA_BAM_IRQ_STTS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.

BAM_DMA_BAM_IRQ_STTS (cont.)

Bits	Name	Description
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12244F98 BAM_DMA_BAM_IRQ_CLR

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

BAM_DMA_BAM_IRQ_CLR

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12244F9C BAM_DMA_BAM_IRQ_EN

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

BAM_DMA_BAM_IRQ_EN

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12244FA0 BAM_DMA_BAM_RESERVED_1

Type: Read
Clock: BAM_CLK
Reset State: 0x00000000

BAM_DMA_BAM_RESERVED_1

Bits	Name	Description
31	RESERVED_BITS31	Set to Zero (0) Obsolete field: BAM_IRQ_SIC_SEL
30:0	RESERVED_BITS30_0	Set to Zero (0) Obsolete field: P_IRQ_SIC_SEL

0x12244FA4 BAM_DMA_BAM_AHB_MASTER_ERR_CTRLS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

BAM_DMA_BAM_AHB_MASTER_ERR_CTRLS

Bits	Name	Description
31:23	RESERVED_BITS31_16	Set to Zero (0)
22:18	BAM_ERR_HVMID	HVMID
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x12244FA8 BAM_DMA_BAM_AHB_MASTER_ERR_ADDR

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

BAM_DMA_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x12244FAC BAM_DMA_BAM_AHB_MASTER_ERR_DATA

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

BAM_DMA_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x12244FB4 BAM_DMA_BAM_RESERVED_2

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

BAM_DMA_BAM_RESERVED_2

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_IRQ_DEST_ADDR

0x12244FB8 BAM_DMA_BAM_RESERVED_3

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

BAM_DMA_BAM_RESERVED_3

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_DEST_ADDR

0x12244FF0 BAM_DMA_BAM_TRUST_REG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside - SECURED field in the BAM_REVISION register) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

BAM_DMA_BAM_TRUST_REG

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_VMID	Those bits indicate the VMID value to be used when performing BAM type accesses to the bus. BAM Type accesses include BAM MTI (or Direct Mode accesses, not applicable for BAM Lite)
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable
6:2	RESERVED_BITS6_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_EE	This Field Indicates the EE (0,1,2,3) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12244FF4 BAM_DMA_BAM_TEST_BUS_SEL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is the testbus selector register.

Supported in releases after bam_p3q3r29 (BlackBird).

BAM_DMA_BAM_TEST_BUS_SEL

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	BAM_DATA_ERASE	When enabled, BAM will be instructed to erase all the data it currently has inside. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Erase 1'b0 - Disabled
17	BAM_DATA_FLUSH	When enabled, BAM will be instructed to flush all the data it currently has inside. BAM will only flush the data once it has enough data and a valid destination for it. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Flush 1'b0 - Disabled
16	BAM_CLK_ALWAYS_ON	This bit controls the BAM to issue 'always on' clock request. 1'b1 - Enable Always On clock request. 1'b0 - Disabled
15:7	RESERVED_BITS15_7	Set to Zero (0)
6:0	BAM_TESTBUS_SEL	Test Bus selector. Values with bit[11] set high are reserved for the BAM Lite integrator to provide testbus from outside of the BAM Lite. For example, eDML testbus may reside at X'100_0000' to X'111_1111' selector values. eDML has no registers thus has no test bus selector, so its test bus is combined with the BAM lite's. BAM provides zeroes on its testbus when external values selected. X'000_0000' - Zeros X'000_0001' - Slave test bus X'000_0010' - Pipe state machine test bus X'000_0011' - Buffer test bus X'000_0100' - Sideband test bus X'000_1101' - Bus Manager test bus X'001_0000' - Reg file test bus X'1''_''''' - BAM Lite sets zeroes on the test bus, leaving it for external use

0x12244FF8 BAM_DMA_BAM_TEST_BUS_REG

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the value being output to the testbus of the chip. It is not intended for SW usage but for lab debugging of the BAM. Values here can change every cycle.

BAM_DMA_BAM_TEST_BUS_REG

Bits	Name	Description
31:0	BAM_TESTBUS_REG	32 bit Testbus value. To select the Block in BAM to show here, use the BAM_TESTBUS_SEL field in BAM_CTRL register.

0x12244FFC BAM_DMA_BAM_CNFG_BITS

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

BAM_DMA_BAM_CNFG_BITS

Bits	Name	Description
31:27	RESERVED_BITS31_27	Set to Zero (0)
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only

BAM_DMA_BAM_CNFG_BITS (cont.)

Bits	Name	Description
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there are available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided.. 1’b1 - Enable 1’b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission savepoint, but into the illegal’s pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1’b1 - Enabled 1’b0 - Disable Available in BAM only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1’b1 - Enable 1’b0 - Disable Available in BAM only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there’s no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1’b1 - Enable 1’b0 - Disable Available in BAM only

BAM_DMA_BAM_CNFG_BITS (cont.)

Bits	Name	Description
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1'b1 - 1'b0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix) 1'b1 - Enable 1'b0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM's common clock request. 1'b1 - Propagate Sideband Clock Request 1'b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. 1'b1 - Enable Power Saving 1'b0 - Disable Power Saving

BAM_DMA_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reset pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1’b1 - Enable external block pipe reset 1’b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. This functionality has been found to be buggy and was removed from APQ8064. Bit is currently unused. 1’b1 - Enable 1’b0 - Disable Available in BAM only
10:4	RESERVED_BITS10_4	Set to Zero (0)
3	BAM_ADML_SYNC_BRIDGE	0x1: Use a Synchronous Configuration bridge in aDML. 0x0: Use a Asynchronous Configuration bridge in aDML.
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It’s invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1’b1 - Enable 1’b0 - Disable Available in BAM only
1	BAM_ADML_DEEP_CONS_FIFO	0x1: Use a deep Consumer FIFO in aDML (16 dwords) 0x0: Use a shallow Consumer FIFO in aDML (8 dwords)
0	BAM_ADML_INCR4_EN_N	0x1: Don’t allow INCR4 aDML-BAM accesses. 0x0: Allow INCR 4 aDML-BAM accesses.

0x12245800+ 128*n BAM_DMA_BAM_IRQ_SRCS_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

BAM_DMA_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12245804+ 128*n BAM_DMA_BAM_IRQ_SRCS_MSK_EEn, n=[0..3]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

BAM_DMA_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12245808+ 128*n BAM_DMA_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

BAM_DMA_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

20.23.2 BAM PIPE management registers

BAM Pipe management registers control each pipe's parameters. Those reside in physical registers.

0x12244000+ 128*n BAM_DMA_BAM_P_CTRLn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Control register provides various controls for the pipe.

BAM_DMA_BAM_P_CTRLn

Bits	Name	Description
31:11	RESERVED_BITS31_11	Set to Zero (0)
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be pre-fetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

BAM_DMA_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only.When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
2	RESERVED_BITS2	Set to Zero (0)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe
0	RESERVED_BITS0	Set to Zero (0)

0x12244004+ 128*n BAM_DMA_BAM_P_RSTn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

BAM_DMA_BAM_P_RSTn

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	P_SW_RST	This resets the pipe and its' registers, (Both Flip-Flops and RAM). 1'b1 - Reset 1'b0 - Do Nothing

0x12244008+ 128*n BAM_DMA_BAM_P_HALTn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Halt register Enables/Disables the Halt Sequence.

This is a self-modifying register.

BAM_DMA_BAM_P_HALTn

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it.

0x12244030+ 128*n BAM_DMA_BAM_P_TRUST_REGn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

BAM_DMA_BAM_P_TRUST_REGn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_P_VMID	Those bits indicate the VMID value to be used when performing Pipe type accesses to the bus. BAM Type accesses include Pipe MTI, Data and Descriptors.
7:2	RESERVED_BITS7_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_P_EE	This Field Indicates the EE (0,1,2,3) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12244010+ 128*n BAM_DMA_BAM_P_IRQ_STTSn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

BAM_DMA_BAM_P_IRQ_STTSn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

0x12244014+128*n BAM_DMA_BAM_P_IRQ_CLRn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

BAM_DMA_BAM_P_IRQ_CLRn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_CLR	1'b1 - Clear 1'b0 - Unchanged
4	P_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1'b1 - Clear 1'b0 - Unchanged

BAM_DMA_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

0x12244018+ 128*n BAM_DMA_BAM_P_IRQ_ENn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

BAM_DMA_BAM_P_IRQ_ENn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

0x1224401C+ 128*n BAM_DMA_BAM_P_TIMERn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the pipe.

BAM_DMA_BAM_P_TIMERn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12244020+ 128*n BAM_DMA_BAM_P_TIMER_CTRLn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the P_TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * P_TIMER_TRSHLD.

BAM_DMA_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12244024+ 128*n BAM_DMA_BAM_P_PRDCR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

BAM_DMA_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value

0x12244028+ 128*n BAM_DMA_BAM_P_CNSMR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

BAM_DMA_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value

20.23.3 BAM PIPE configuration registers (RAM)

BAM Pipe management registers configure each pipes' parameters.

Pipe Address span: currently defining each pipe to have 32 addresses, therefore inter pipe offset is 32*4=128=0x80 bytes.

0x1224502C+ 64*n BAM_DMA_BAM_P_EVNT_DEST_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

BAM_DMA_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x12245018+64*n BAM_DMA_BAM_P_EVNT_REGn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

BAM_DMA_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x12245000+64*n BAM_DMA_BAM_P_SW_OFSTSn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_DMA_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode.
15:0	SW_DESC_OFST	Descriptor FIFO offset.

0x12245024+64*n BAM_DMA_BAM_P_DATA_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

BAM_DMA_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x1224501C+64*n BAM_DMA_BAM_P_DESC_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

BAM_DMA_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x12245028+64*n BAM_DMA_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When aBAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

BAM_DMA_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x12245020+64*n BAM_DMA_BAM_P_FIFO_SIZESn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

BAM_DMA_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors.

20.23.4 BAM PIPE internal state registers (RAM)

BAM Pipe debug registers allow a software look inside on the internal parameters of the BAM State Machines stored in RAM.

Those shouldn't be normally used or altered by the software.

0x12245034+64*n BAM_DMA_BAM_P_RETR_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context stored for retransmission.

This is being stored by Ack Update state machine in consumer mode or by the Writeback state machine in producer mode.

This is being loaded by the Writeback state machine when retransmission happens.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_DMA_BAM_P_RETR_CNTXT_n

Bits	Name	Description
31:16	RETR_DESC_OFST	Descriptor Fifo Offset for retransmission.
15:0	RETR_OFST_IN_DESC	The Offset inside the Descriptor for retransmission.

0x12245038+64*n BAM_DMA_BAM_P_SI_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Sideband Inform state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_DMA_BAM_P_SI_CNTXT_n

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

0x12245004+ 64*n BAM_DMA_BAM_P_AU_PSM_CNTXT_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Ack Update state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_DMA_BAM_P_AU_PSM_CNTXT_1_n

Bits	Name	Description
31:16	AU_PSM_ACCUMED	PSM: The acknowledged (EOB/T) number of bytes since last Write Event. AU: The accumulation of the descriptor sizes for the present ack_on_success event. This is never bigger than the ACKED field. Once the ACCUMED values are bigger than Event Threshold, an Event will be issued, the ACKED value will decrease by the ACCUMED size and this value will be zeroed. This also serves as the Bytes Consumed value in the Event.
15:0	AU_ACKED	AU: The left over of the number of bytes that were received via the ack_on_success, that did not cause a descriptor closure. This value is down counting upon issuing Read Event. PSM:

0x12245008+ 64*n BAM_DMA_BAM_P_PSM_CNTXT_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_DMA_BAM_P_PSM_CNTXT_2_n

Bits	Name	Description
31	PSM_DESC_VALID	The Descriptor Valid bit provided by the Writeback state machine to Pipe state machine.
30	PSM_DESC_IRQ	The Descriptor Interrupt bit provided by the Writeback state machine to pipe state machine.
29	PSM_DESC_IRQ_DONE	The Descriptor Interrupt needed selection bit.
28:25	PSM_GENERAL_BITS	General Context Switch Bits
24:22	PSM_CONS_STATE	State of the Pipe Consumer state machine.
21:19	PSM_PROD_SYS_STATE	State of the Pipe Producer System state machine.
18:16	PSM_PROD_B2B_STATE	State of the Pipe Producer BAM to BAM state machine.
15:0	PSM_DESC_SIZE	The Descriptor Size provided by the Writeback state machine to pipe state machine.

0x1224500C+64*n BAM_DMA_BAM_P_PSM_CNTXT_3_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_DMA_BAM_P_PSM_CNTXT_3_n

Bits	Name	Description
31:0	PSM_DESC_ADDR	The Data Address provided in the current descriptor from the Writeback state machine.

0x12245010+64*n BAM_DMA_BAM_P_PSM_CNTXT_4_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_DMA_BAM_P_PSM_CNTXT_4_n

Bits	Name	Description
31:16	PSM_DESC_OFST	The running Descriptor Fifo Offset of the Writeback state machine
15:0	PSM_SAVED_ACCUMED_SIZE	The Saved Accumulated Size from the Pipe state machine.

0x12245014+64*n BAM_DMA_BAM_P_PSM_CNTXT_5_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_DMA_BAM_P_PSM_CNTXT_5_n

Bits	Name	Description
31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

0x12245030+64*n BAM_DMA_BAM_P_RESERVED_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

BAM_DMA_BAM_P_RESERVED_1_n

Bits	Name	Description
31:0	BAM_P_RES_1	Set to zero (0) Reserved

0x1224503C+64*n BAM_DMA_BAM_P_RESERVED_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

BAM_DMA_BAM_P_RESERVED_2_n

Bits	Name	Description
31:0	BAM_P_RES_2	Set to zero (0) Obsolete Register: BAM_P_IRQ_DEST_ADDRn, n=[0..30]

20.24 BAM DMA XPU Registers (0x12246000 BAM_DMA_BAM_XPU_BASE)

This section contains the BAM DMA XPU registers.

0x12246000+4*n BAM_DMA_APU_RGn_ACR, n=[0..38]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 10, i.e, a multi-VMID full access vs. no access permission type APU. These registers include a single bit per VMID granting full access

BAM_DMA_APU_RGn_ACR

Bits	Name	Description
31:0	RWE	Read/Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the registers in the associated resource group.

0x12246F80 BAM_DMA_APU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

APU Configuration Register: This register includes fields governing various APU behaviors.

BAM_DMA_APU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set APU_ESR. APU_EAR and APU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set APU_ESR. APU_EAR and APU_ESYNR0 updated with address and syndrome of error.
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR

BAM_DMA_APU_CR (cont.)

Bits	Name	Description
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x12246F84 BAM_DMA_APU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

BAM_DMA_APU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x12246F88 BAM_DMA_APU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is

contrasted with the fields in the APU_ESYNRn registers, which are merely the "syndrome" of an error indicated by APU_ESR.

BAM_DMA_APU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x12246F8C BAM_DMA_APU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

BAM_DMA_APU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x12246F90 BAM_DMA_APU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

BAM_DMA_APU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x12246F94 BAM_DMA_APU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

BAM_DMA_APU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved

BAM_DMA_APU_ESYNR1 (cont.)

Bits	Name	Description
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x12246FF4 BAM_DMA_APU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

BAM_DMA_APU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x12246FF8 BAM_DMA_APU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x00001426

APU ID Register: Read-only register that defines various configuration attributes of the APU instance.

BAM_DMA_APU_IDR

Bits	Name	Description
31:29	RESERVED31_21	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.
9	RESERVED9	Reserved
8:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x12246FFC BAM_DMA_APU_APU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

BAM_DMA_APU_APU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APUs (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

20.25 SDC1 Registers (0x12400000 SDC1_BASE)

This section contains the SDC1 base registers.

0x12400000 SDC1_MCI_POWER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00000000

(ARM name: MCIPower)

SDC1_MCI_POWER

Bits	Name	Description
31:7	RESERVED_1	Always reads zero. Writes 'don't care' but by convention write zero.
6	OPEN_DRAIN	MCICMD Output Control. See Note 2 below
5:1	RESERVED_2	Always reads zero. Writes 'don't care' by convention write zero.
0	CONTROL	This register is used to control the operation of the memory controller. value 0: power-off value 1: power-on Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register again. Note:2 - This bit is reserved for the use mentioned in the Description but it is not implemented in HW. The open drain mode is preserved such that when enabled, the command output is driven low when the logic is low and undriven (so that the pull up can pull high) when the logic is high. Whether this gets used in the system is up to SW/system but the HW does support this mode.

0x12400004 SDC1_MCI_CLK

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x01008000

(ARM name: MCIClock)

SDC1_MCI_CLK

Bits	Name	Description
31:27	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
26	SDCC_CLK_EXT_EN	Value 0 (default) - sdcc_clkout is driven via the clock pad and external clock can’t be used for testing the cm_dll_sdc4. Value 1- External clock can be used as a test clock.
25	RX_FLOW_TIMING	Configuration bit which selects the cycle which RxFlowControl will be asserted when UHS mode is used Value 0 (default) - RxFlowControl is asserted one clock before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 1). Value 1 - RxFlowControl is asserted two clocks before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 2).
24:23	SDC4_MCLK_SEL	Selects the sdc4_mclk - input clock of cm_dll_sdc4 Value 0 - gated version of MCLK Value 1 - feedback clock from CLK pad Value 2 (default) - free running mclk (gated between the transactions)
22	CLK_INV	When set(1), the input clock which is inserted into the input macros is inverted.
21	IO_PAD_PWR_SWITCH	Indication to Pad that power has to be switched from 3.3V to 1.8V.
20	CLK_FB_DLY_SEL	Selects the source of feedback clock used by the controller. Value 1 - output of cm_dll_sdc4 is used as feedback clock Value 0 - feedback clock from CLK pad is used
19:18	SD_DEV_SEL	Select the active device if more than one device are connected in shared bus mode. (range: ’00’ - ’11’).
17	HCLKON_SW_EN	SW enable of AHB clock request of SDCC4. value 0: HW clock request mechanism is used value 1: clock request signal is always high
16:14	SELECT_IN	Select to latch data and command coming in: value 000: on the falling edge of internal MCLK. value 001: on the rising edge of internal MCLK. value 010: using feedback clock (default). value 011: DDR mode - In DDR mode, the SDC_CLK output will be SDCn_APPS_CLK divided by 2. value 100: UHS mode - MCLK is used internally. value 101: UHS mode - divided frequency (MCLK/2) is used internally.
13	INVERT_OUT	Clear (0) to change data and command going out on the falling edge. Set (1) to change data and command going out on the rising edge.
12	FLOW_ENA	Enable flow control: value 0: disable (default) value 1: enable

SDC1_MCI_CLK (cont.)

Bits	Name	Description
11:10	WIDEBUS	Enable wide bus mode: value 00: 1 bit mode value 10: 4 bit mode value 01 or 11: 8 bit mode
9	PWRSAVE	Disable Prime-Cell MCI clock output when bus is idle to save power. value 0: Power save disabled - always enabled if bit 8 is set. value 1: Power save enabled - clock enabled only when bus is active and bit 8 is set.
8	ENABLE	Enable Prime-Cell MCI bus clock: value 0: clock disabled value 1: clock enabled
7:0	RESERVED_2	Always reads zero. Writes 'don't care' but by convention write zero. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_CLK register and before accessing this register again.

0x12400008 SDC1_MCI_ARGUMENT

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIArgument)

SDC1_MCI_ARGUMENT

Bits	Name	Description
31:0	CMD_ARG	Command argument.

0x1240000C SDC1_MCI_CMD

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00000000

(ARM name: MMCCommand) CPSM: 'Command Path State Machine'.

SDC1_MCI_CMD

Bits	Name	Description
31:17	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
16	AUTO_CMD19	If set (1), CPSM sends CMD19 automatically before sending CMD17 or CMD18. This sequence is needed for CDR auto-calibration of cm_dll_sdc4.
15	CCS_DISABLE	If set (1), CPSM sends Command_Completion_Signal (CCS) disable sequence to the external CE-ATA device.
14	CCS_ENABLE	If set (1), CPSM waits for CCS from external card CE-ATA device.
13	MCIABORT	Signals the next command will be an abort (stop) command. This bit always read as (0) due to the hardware implementation. See note 2 below.
12	DAT_CMD	If set (1) indicates that this is a Command with Data. See note 2 below.
11	PROG_ENA	If set (1), PROG_DONE status bit will be asserted when busy is de-asserted. This bit is to be used with a stop or status command after a block write is performed. Does not effect CPSM.
10	ENABLE	The action of writing to this register (MCI_CMD) with this bit set (1), triggers CPSM to leave the ’Idle State’. .
9	PENDING	If set (1), CPSM waits for ’CmdPend’ from the DPSM before it starts sending a command. See note 3 below.
8	INTERRUPT	If set (1), CPSM disables command timer and waits for interrupt request (Card Response). See note 4 below.
7	LONGRSP	If set (1), receives a 136-bit long response.
6	RESPONSE	If set (1), CPSM waits for a response subject to INTERRUPT above.

SDC1_MCI_CMD (cont.)

Bits	Name	Description
5:0	CMD_INDEX	Command index. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_CMD register and before accessing this register again. Note 2: These bits don't have any effect on the CPSM. They are used to signal the SDIO Interrupt state machine that a Multi Block (CMD18, CMD25, CMD53, etc.) data transaction is taking place. The DAT_CMD bit signals the start of the data transaction while the MCIABORT bit signals the end. For a pure SD Memory card, these bits are a 'don't care' and should be set to zero by convention. However, some software drivers may chose to manipulate the bits in order to maintain compatibility with Combo cards and/or pure SDIO cards. Note 3: This bit is designed to be used with SD CMD18 (READ_MULTIPLE_BLOCK) and SD CMD25 (WRITE_MULTIPLE_BLOCK) which must be terminated with a SD CMD12 (STOP_TRANSMISSION). After CMD18 or CMD25 is sent, the DPSM is enabled to send or receive data of amount MCI_DATA_LENGTH. After the DPSM finishes the transferring the data, it sends 'CmdPend' to the CPSM and goes idle. When the CPSM receives this signal, it sends the currently loaded command which software would normally establish as CMD12. Note 4: The START, CMD_INDEX, ARGUMENT, and CRC are a total of 48 bits in length. If the INTERRUPT bit is zero, the CPSM will wait (63-47) 16 MCLK ticks for a response before going back to IDLE. If the INTERRUP bit is set, the CPSM will wait indefinitely for a card response.

0x12400010 SDC1_MCI_RESP_CMD

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIRespCmd)

SDC1_MCI_RESP_CMD

Bits	Name	Description
31:6	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
5:0	RESPCMD	Response command index.

0x12400014+4*n SDC1_MCI_RESPn, n=[0..3]

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIResponse0-3). Note that MCIResponse3 has 31 bits; the other three (*RESP0, *RESP1, *RESP2) have 32 bits.

The card status size can be 32 or 127 bits, depending on the response type (see Table 1-2). The most significant bit of the card status is received first. The MCIResponse3 register LSB is always 0.

Table 20-8MCIResponse and card status size

Description	Short response	Long response
MCIResponse0	Card Status [31:0]	Card status [127:96]
MCIResponse1	Unused	Card status [95:64]
MCIResponse2	Unused	Card status [63:32]
MCIResponse3	Unused	Card status [31:1]

SDC1_MCI_RESPn

Bits	Name	Description
31:0	STATUS	Card status.

0x12400024 SDC1_MCI_DATA_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataTimer).

There is no way to disable this timer. The timer starts counting as soon as a transaction is initiated. The time counts in MCLK ticks.

SDC1_MCI_DATA_TIMER

Bits	Name	Description
31:0	DATA_TIME	Data timeout period.

0x12400028 SDC1_MCI_DATA_LENGTH

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataLength)

Total number of bytes in the transaction regardless of mode (stream or block). In block mode, must be an exact multiple of block size. During an infinite transfer the value of DATALENGTH should be programmed to 0.

SDC1_MCI_DATA_LENGTH

Bits	Name	Description
31:25	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
24:0	DATALENGTH	Data length value.

0x1240002C SDC1_MCI_DATA_CTL

Type: Read/Write
Clock: SAME_RATE_AS_HCLK_SEE_NOTE_1_BELOW_
Reset State: 0x00100000

(ARM name: MCIDataCtrl). Data Path State Machine (DPSM).

SDC1_MCI_DATA_CTL

Bits	Name	Description
31:22	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
21	SW_SDC4_CMD19	The input of cm_dll_sdc4 - sdc4_cmd19 can be driven by SW if AUTO_CMD19 (bit 16 in MCI_CMD) feature is not used. Value 1 - sdc4_cmd19 is driven by SW Value 0 (default) - sdc4_cmd19 is driven by HW
20	RX_DATA_PEND	If set (1), timeout counter will start counting only after the RX command (with data) was sent instead of counting from initialization of DPSM. The feature is enabled by default.

SDC1_MCI_DATA_CTL (cont.)

Bits	Name	Description
19	AUTO_PROG_DONE	If set (1), automatic detection of PROG_DONE condition is executed without sending CMD12, CMD13, CMD52 or any other 'dummy' command. SW should set this bit in the following cases only: 1. When sending CMD53 for SDIO write transaction. 2. When sending CMD24. 3. When sending CMD25 and CMD23 was issued before to inform card about the exact number of blocks to be written. 4. When sending CMD19 for testing bus procedure. CMD12 is not required in this case.
18	INFINITE_TRANSFER	If set (1), infinite transfer is enabled. MCI_DATA_LENGTH register should set to 0 during infinite transfer.
17	DATA_PEND	If set (1), DPSM waits for 'DataPend' from the CPSM before it enables the DPSM. See note 2 below.
16:4	BLOCKSIZE	Data block length in bytes (1 to 4096).
3	DM_ENABLE	Enable DM interface: 0: DM disabled 1: DM enabled
2	MODE	Data transfer mode: 0: block data transfer 1: stream data transfer
1	DIRECTION	Data transfer direction: 0: controller to card 1: card to controller
0	ENABLE	Data transfer enabled. If zero, DPSM unconditionally reset. Note:1 - This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_DATA_CTL register and before accessing this register again. Note 2: This bit is designed to be used with SD CMD24 and CMD25 (WRITE_SINGLE_BLOCK and WRITE_MULTIPLE_BLOCK) to automatically start the DPSM after a normal (non-error) response is received. This register should be written with the enable bit and the pending bit asserted before MCI_CMD is enabled.

0x12400030 SDC1_MCI_DATA_COUNT

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIDataCnt)

NOTE There is no mechanism to ensure that a read of this counter will be accurate as it is not synchronized. The reason being the value read is async to the clock domain in which the reading is done. It is only useful as a debug tool for diagnostic purposes only.

SDC1_MCI_DATA_COUNT

Bits	Name	Description
31:25	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
24:0	DATACOUNT	Value of data counter in MciDPSM block. Represents remaining data of transaction.

0x12400034 SDC1_MCI_STATUS

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x000C0000

(ARM name: MCIStatus)

This register may need exclusion for QCSR POR Test for bits 25 and 22.

Static[30:26], [24:23] and [10:0]

These remain asserted until they are cleared by writing to the appropriate bit in the Clear Register (see MCI_CLEAR)

XCIS

The means used to send the SDIO external-card-interrupt-signal (XCIS) to the SDCC depends on the transfer mode: 1-bit, 4-bit, or 8-bit. Under 1 bit transfer mode, the XCIS has a dedicated physical connection to the SDCC. Hence once it is asserted, it remain at a high level. Under 4 and 8 bit transfer modes, the XCIS is time multiplexed with physical connection data bit 1. The XCIS is recognized as valid during specific time slots on data bit 1 by the SDCC. How this 'recognition' takes places shows up as different behaviors on SDIO_INTR_OPER, SDIO_INTR, and the actual interrupt sent to the ARM through MCI_INT_MASKn.

Special[25]

The SDIO_INTR_OPER indicator reflects the true state of XCIS as it would be observed inside the external SDIO card. As such, there is no bit 25 in MCI_CLEAR. The only way to clear SDIO_INTR_OPER is to clear the appropriate bit in the external card Common Card Control Registers (CCCR). Like 'static' above and 'dynamic' below, bit 25 in MCI_INT_MASKn controls actually sending this indicator value to the ARM. This indicator of XCIS is used for normal SDCC operation.

Special[22]

The SDIO_INTR indicator reflects that there has been a low-to-high transition on the connection as explained under XCIS above. This indicator is cleared via bit 22 of MCI_CLEAR but any low-to-high transition on the connection will set this indicator again. Further note that this indicator is not routed through the MCI_INT_MASKn to the ARM. For bit 22, the raw value of the connection is routed through the MCI_INT_MASKn to the ARM. As this raw connection is not aware of 'specific time slots', the signal sent to the ARM generally toggles in an unpredictable fashion. This

is generally not useful during normal SDCC operation. However, for wake-up with clocks off, the raw connection is desirable.

Dynamic[21:11]

These change state depending on the state of the underlying logic (for example, FIFO full and empty flags are asserted and de-asserted as data while written to the FIFO).

SDC1_MCI_STATUS

Bits	Name	Description
31	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
30	AUTO_CMD19_TIMEOUT	Response or tuning pattern wasn't received after automatic CMD19's transmission. This status bit should be read only if AUTO_CMD19 (MCI_CMD(16)) was set.
29	BOOT_TIMEOUT	Data wasn't received within the valid time (according to MCI_CCS_TIMER) from the start of boot operation.
28	BOOT_ACK_ERR	Acknowledge pattern wasn't received correctly or not within the valid time (according to MCI_ACK_TIMER) from the start of boot operation.
27	BOOT_ACK_REC	Acknowledge pattern was received correctly.
26	CCS_TIMEOUT	CE-ATA Command Completion Signal timeout.
25	SDIO_INTR_OPER	SDIO interrupt indicator for normal operation.
24	ATA_CMD_COMPL	CE-ATA Command Completion Signal has been detected.
23	PROG_DONE	Programming done.
22	SDIO_INTR	SDIO interrupt indicator for wake-up.
21	RXDATA_AVLBL	Data available in receive FIFO. At least 1 word in the RX FIFO. SW can read 1 word only from the FIFO.
20	TXDATA_AVLBL	Data available in transmit FIFO. At least 1 word in the TX FIFO.
19	RXFIFO_EMPTY	Receive FIFO empty. SW can't read FIFO.
18	TXFIFO_EMPTY	Transmit FIFO empty. SW can write 8 words into the FIFO.
17	RXFIFO_FULL	Receive FIFO full. SW can read 8 words from the FIFO.
16	TXFIFO_FULL	Transmit FIFO full. TX FIFO contains 8 words. SW can't write to FIFO.
15	RXFIFO_HALF_FULL	Receive FIFO half full. SW can read 8 words from the FIFO.
14	TXFIFO_HALF_FULL	Transmit FIFO half full. SW can write 8 words into the FIFO.
13	RXACTIVE	Data receive in progress.
12	TXACTIVE	Data transmit in progress.
11	CMD_ACTIVE	Command transfer in progress.
10	DATA_BLK_END	Data block sent / received (CRC check passed).

SDC1_MCI_STATUS (cont.)

Bits	Name	Description
9	START_BIT_ERR	Start Bit Error flag
8	DATAEND	Data end (data counter is zero).
7	CMD_SENT	Command sent (no response required).
6	CMD_RESPONSE_END	Command response received (CRC check passed).
5	RX_OVERRUN	Receive FIFO overrun error.
4	TX_UNDERRUN	Transmit FIFO underrun error.
3	DATA_TIMEOUT	Data timeout.
2	CMD_TIMEOUT	Command response timeout.
1	DATA_CRC_FAIL	Data block sent / received (CRC check failed).
0	CMD_CRC_FAIL	Command response received (CRC check failed).

0x12400038 SDC1_MCI_CLEAR

Type: Write
Clock: SAME_RATE_AS_HCLK

(ARM name: MCIClear)

SDC1_MCI_CLEAR

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	AUTO_CMD19_TIMEOUT_CLR	Clears AUTO_CMD19_TIMEOUT flag.
29	BOOT_TIMEOUT_CLR	Clears BOOT_TIMEOUT flag.
28	BOOT_ACK_ERR_CLR	Clears BOOT_ACK_ERR flag.
27	BOOT_ACK_REC_CLR	Clears BOOT_ACK_REC flag.
26	CCS_TIMEOUT_CLR	Clears CCSTimeOut flag.
24	ATA_CMD_COMPL_CLR	Clears AtaCmdCompl flag.
23	PROG_DONE_CLR	Clears ProgDone flag.
22	SDIO_INTR_CLR	Clears SDIOInt flag.
10	DATA_BLK_END_CLR	Clears DataBlockEnd flag.
9	START_BIT_ERR_CLR	Clears StartBitErr flag.
8	DATA_END_CLR	Clears DataEnd flag.
7	CMD_SENT_CLR	Clears commandSent flag.

SDC1_MCI_CLEAR (cont.)

Bits	Name	Description
6	CMD_RESP_END_CLT	Clears CmdRespEnd flag.
5	RX_OVERRUN_CLR	Clears RxOverrunClr flag.
4	TX_UNDERRUN_CLR	Clears TxUnderrun flag.
3	DATA_TIMEOUT_CLR	Clears DataTimeOut flag.
2	CMD_TIMOUT_CLR	Clears CmdTimOutflag.
1	DATA_CRC_FAIL_CLR	Clears DataCrcFail flag.
0	CMD_CRC_FAIL_CLR	Clears CmdCrcFail flag.

0x1240003C+4*n SDC1_MCI_INT_MASKn, n=[0..1]

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

(ARM name: MCIMask0, MCIMask1)

SDC1_MCI_INT_MASKn

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	MASK30	MASK AUTO_CMD19_TIMEOUT flag.
29	MASK29	MASK BOOT_TIMEOUT flag.
28	MASK28	MASK BOOT_ACK_ERR flag.
27	MASK27	MASK BOOT_ACK_REC flag.
26	MASK26	MASK CCSTimeOut flag.
25	MASK25	MASK SDIOIntOper flag.
24	MASK24	MASK AtaCmdCompl flag.
23	MASK23	MASK ProgDone flag.
22	MASK22	MASK SDIOInt flag.
21	MASK21	MASK RxDataAvlbl flag.
20	MASK20	MASK TxDataAvlbl flag.
19	MASK19	MASK RxFifoEmpty flag.
18	MASK18	MASK TxFifoEmpty flag.
17	MASK17	MASK RxFifoFull flag.
16	MASK16	MASK TxFifoFull flag.

SDC1_MCI_INT_MASKn (cont.)

Bits	Name	Description
15	MASK15	MASK RxFifoHalfFull flag.
14	MASK14	MASK TxFifoHalfFull flag.
13	MASK13	MASK RxActive flag.
12	MASK12	MASK TxActive flag.
11	MASK11	MASK CmdActive flag.
10	MASK10	MASK DataBlockEnd flag.
9	MASK9	MASK StartBitErr
8	MASK8	MASK DataEnd flag.
7	MASK7	MASK CmdSent flag.
6	MASK6	MASK CmdRespEnd flag.
5	MASK5	MASK RxOverrun flag.
4	MASK4	MASK TxOverrun flag.
3	MASK3	MASK DataTimeOut flag.
2	MASK2	MASK CmdTimeOut flag.
1	MASK1	MASK DataCmdCrcFail flag.
0	MASK0	MASK CmdCrcFail flag.

0x12400044 SDC1_MCI_FIFO_COUNT

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

The SDCC core operates in two clock domains ’ MCLK and HCLK. The CPSM and DPSM operate in MCLK domain and MciFifoDmaCtl (FIFO/DMA Controller) operates in HCLK domain. The MCI_FIFO_COUNT is a counter of FIFO Controller that monitors how many words of data are still needed to be transferred through the FIFO. At the beginning of data transaction the MCI_FIFO_COUNT counter will be loaded with the (MCI_DATA_LENGTH / 4) value and then will count down during the data transaction until it reach zero. This register is only useful for debug purposes and should not be used for normal operation since it does not reflect data which may or may not be in the pipeline.

SDC1_MCI_FIFO_COUNT

Bits	Name	Description
31:24	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
23:0	DATA_COUNT	Remaining data.

0x12400048 SDC1_MCI_BOOT

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

Handling the boot operation.

SDC1_MCI_BOOT

Bits	Name	Description
31:3	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
2	BOOT_ACK_EN	If set to '1' then Host waits for acknowledge pattern after initiating the boot operation.
1	BOOT_EN	When this bit is asserted, the boot operation is initiated in both of the modes.
0	BOOT_MODE	If set to '1' then CMD line is low during the boot operation. If boot_mode = '0', then CMD0 with the argument 0xFFFFFFFA is sent.

0x1240004C SDC1_MCI_BOOT_ACK_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

Timer for boot operation - the time until receiving the acknowledge pattern.

SDC1_MCI_BOOT_ACK_TIMER

Bits	Name	Description
31:0	BOOT_ACK_TIMER	Timer for counting the cycles from initiating the boot operation until the acknowledge pattern is accepted.

0x12400050 SDC1_MCI_VERSION

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: see below

This register should be excluded for QCSR POR testing.

SDC1_MCI_VERSION

Bits	Name	Description
31:0	MCI_VERSION	SDCC4 core version. This value corresponds to Z according to core release tag: sdcc4_pXqYrZ.

0x12400054 SDC1_MCI_EMULATION_DLY_LINE

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

The register is responsible for handling DCM which is used in emulation supports 256 values of shift intervals so 8 bits are required (0:255). Bits [31:30] are used for emulation purposes only.

The procedure for activating the DCM is:

1. Setting bit 28 - DCM_RESET.
2. Clearing bit 28 - DCM_RESET.
3. Waiting until bit 29 DCM_LOCKED is high.
4. Writing a new phase in SD_CLK_DLY_CTRL field and setting the DCM_START bit (bit 30).

The clock's placement was executed by the DCM when DCM_DONE is asserted.

SDC1_MCI_EMULATION_DLY_LINE

Bits	Name	Description
31	DCM_DONE	The shift process was finished in DCM and CMD19 can be sent towards the card. This is a read-only bit.
30	DCM_START	A new value of SD_CLK_DLY_CTRL is ready. Clears the DCM_DONE bit.
29	DCM_LOCKED	Reading the status of the LOCKED DCM's output which indicates that the output clock is ready for use.
28	DCM_RESET	Driving reset to DCM.
27:8	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
7:0	SD_CLK_DLY_CTRL	Input to DCM block in FPGA (8 bits). Controlling the change of the delay interval. The value's range may be 0-255 in DCM block.

0x12400058 SDC1_MCI_CCS_TIMER

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

This register is used for operation with CE-ATA devices. The CCS timer starts to count at the end of SD transaction and it advances with every MCLK clock cycle. In boot operation this register is used for storing the number of cycles from initiating the boot operation until the first data is received.

SDC1_MCI_CCS_TIMER

Bits	Name	Description
31:0	CCS_TIMER	CE-ATA Command Completion Signal timeout period.

0x1240005C SDC1_MCI_RESPONSE_MASK

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC1_MCI_RESPONSE_MASK

Bits	Name	Description
31:0	RESPONSE_MASK	Mask used to verify the 32 status error bits. Active only when the data pending bit is set in the MCI_DATA_CTL register. When bit of this mask is set the corresponding bit from response [39:8] is checked to be 0, i.e., shows there is no error. If all bits from mask shows no error, the DPSM will be activated without waiting for software write.

0x12400060 SDC1_MCI_DLL_CONFIG

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x60006400

SDC1_MCI_DLL_CONFIG

Bits	Name	Description
31	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
30	DLL_RST	Setting this bit to 1 resets cm_dll_sdc4. cm_dll_sdc4 should be reset every time the MCLK frequency is changed.

SDC1_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
29	PDN	Power Down Value 0 - analog blocks are enabled Value 1 - analog blocks are powered down (default)
28	CK_INTP_SEL	Selects interpolator output
27	CK_INTP_EN	Enable clock interpolation for finer resolution
26:24	MCLK_FREQ	Frequency of MCLK Value 000 -100 ’ 112 (MHz) Value 001 -112 ’ 125 Value 010 -125 ’ 137 Value 011 -137 ’ 150 Value 100 -150 ’ 162 Value 101 -162 ’ 175 Value 110 -175 ’ 187 Value 111 -187 ’ 200
23:20	CDR_SELEXT	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1000 - phase 8 Value 1001 - phase 9 Value 1011 - phase 10 Value 1010 - phase 11 Value 1110 - phase 12 Value 1111 - phase 13 Value 1101 - phase 14 Value 1100 - phase 15
19	CDR_EXT_EN	Enable external control of cdr phase select
18	CK_OUT_EN	Enable output clock (default value is ’1’)
17	CDR_EN	Enable CDR function
16	DLL_EN	Enable DLL function
15:14	CDR_UPD_RATE	CDR update rate, low pass filtering window of CDR Max update rate: Value 00 - 0.5 MCLK frequency Value 01 - 0.25 MCLK Frequency (default) Value 10 - 0.125 MCLK frequency Value 11 - 1/16 MCLK Frequency

SDC1_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
13:12	DLL_UPD_RATE	DLL update rate Value 00 - sdc4_mclk/10 Value 01 - sdc4_mclk/20 Value 10 - sdc4_mclk/40 (default) Value 11 - sdc4_mclk/80
11:10	DLL_PHASE_DET	DLL phase detector low pass average window Value 00 - 4 cycles Value 01 - 8 cycles (default) Value 10 - 16 cycles Value 11 - 32 cycles
9:8	CDR_ALGORITHM_SEL	CDR algorithm select Value 00 - Edge 1 (default) Value 01 - Edge 2 Value 10 - level Value 11- Constant delay
7:6	CMUX0_SHIFT_PHASE	Clock mux0 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
5:4	CMUX1_SHIFT_PHASE	Clock mux1 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
3:2	CMUX2_SHIFT_PHASE	Clock mux2 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable
1:0	CMUX3_SHIFT_PHASE	Clock mux3 shift phase shift control Value 00 - Nominal (default) Value 01 - +1 Value 10 - -1 Value 11 - disable

0x12400064 SDC1_MCI_DLL_TEST_CTL

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC1_MCI_DLL_TEST_CTL

Bits	Name	Description
31:26	VTH_CTRL	Vth control: change current in delay cell. Higher number means less delay.
25:22	DELTA_VGS_CTRL	dVgs control: change current in delay cell. Higher number means less delay.
21	DLL_BIAS_EXT_EN	Enable dll bias external control Value 0 - disable external control (default) Value 1 - enable external control
20:19	CDR_TEST_CTRL	External input to increment or decrement CDR output phase by 1 step Phase is changed on rising edge of signal. Ex. To increment phase by 2 steps: 10 -> 00 -> 10 Value 00 - hold (default) Value 01 - decrement Value 10 - increment Value 11 - invalid
18	EXT_UP_DN	external control up/dn signal Value 0 - disable (default) Value 1 - enable
17	ATEST_CTRL	atest control Value 0 - disable (default) Value 1 - enable
16:14	ATEST_OUT_MUX_CTRL	Atest output mux control Value 000 - Avss (default) Value 001 - Vth current Value 010 - delta Vgs current Value 011 - Vthn Value 100- Pbias Value 101 - Nbias Value 110 - reserved Value 111 - External bias current
13	DTEST_CTRL	dtest control Value 0 - disable (default) Value 1 - enable

SDC1_MCI_DLL_TEST_CTL (cont.)

Bits	Name	Description
12:10	DTEST_OUT_MUX_CTRL	dtest output mux control. Output signals are paired for measurements Value 000 - sdc4_mclk, sdc4_mclk (default) Value 001 - da_ phout<0>, da_phout<7> Value 010 - da_ phout<3>, da_phout<4> Value 011 - da_phout<0>, da_phout<15> Value 100 - sd4_clk_out, sd4_data_out<0> Value 101 - sd4_clk_out, sd4_data_out<1> Value 110 - sd4_clk_out, sd4_data_out<2> Value 111 - sd4_clk_out, sd4_data_out<3>
9	DLL_TAP_CTRL	Delay line tap control - change number of unit delay cell in each tap Delay value Value 0 - 1 (default) Value 1 - 2
8:7	DLL_CUR_CTRL	Delay line current control - change current mirror ratio in each delay tap Delay value Value 00 - 1x (default) Value 01 - 2x Value 10 - 3x Value 11 - 4x
6	INT_REF_CLK	Value 0 (default) - use internal generated clock for delay line reference Value 1 - use sdc4_mclk for delay line reference
5	FEEDBACK_CLK_EN	Value 0 (default) - enable delay line feedback Value 1 - disable delay line feedback
4:0	RESERVED	These reserved bits can be accessed by the SW and connected to cm_dll_sdc4's input

0x12400068 SDC1_MCI_DLL_STATUS

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC1_MCI_DLL_STATUS

Bits	Name	Description
31:8	RESERVED_1	Always reads zero. Writes 'don't care' but by convention write zero.
7	DLL_LOCK	DLL lock status Value 0 - Not locked Value 1 - Locked

SDC1_MCI_DLL_STATUS (cont.)

Bits	Name	Description
6:3	CDR_PHASE	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1000 - phase 8 Value 1001 - phase 9 Value 1011 - phase 10 Value 1010 - phase 11 Value 1110 - phase 12 Value 1111 - phase 13 Value 1101 - phase 14 Value 1100 - phase 15
2	DDLL_COARSE_CAL	Value 1 - done Value 0 - not done
1:0	RESERVED_2	Connected to cm_dll_sdc4's output.

0x1240006C SDC1_MCI_STATUS2

Type: Read
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC1_MCI_STATUS2

Bits	Name	Description
31:1	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
0	MCLK_REG_WR_ACTIVE	Value 0 - No active register write to MCLK domain Value 1 - Active register write to MCLK domain. The bit indicates if a write operation to one of the following registers is in process (synchronization between HCLK and MCLK): MCI_POWER MCI_CLOCK MCI_CMD MCI_DATA_CTL

0x12400070 SDC1_MCI_GENERICS

Type: Read
Clock: SAME_RATE_AS_HCLK

SDC1_MCI_GENERICS

Bits	Name	Description
31:27	RESERVED	Always reads zero. Writes 'don't care' but by convention write zero.
26:23	SD_DATA_WIDTH	Number of DAT lines Value 4 - 4 DAT lines (SD, SDIO) Value 8 - 8 DAT lines (MMC, eMMC)
22:10	RAM_SIZE	Size of RAM size: Optional Values: 512, 1024, 2048 or 4096 bytes.
9	USE_SPS	Value 1 - BAM and DML are used and USB core is connected to SDCC4, Value 0 - BAM and DML are not used.
8:6	NUM_OF_DEV	Number of eSD or eSDIO devices supported on shared SD bus. Can be set from 1 to 4.
5:1	MAX_PIPES	Number of simultaneous parallel pipes supported by the BAM and attached peripheral pair. Can be set from 1 to 31.
0	USE_DLL_SDC4	Enables the instantiation of cm_dll_sdc4. Value 0 - cm_dll_sdc4 isn't integrated with SDCC4 Value 1 - cm_dll_sdc4 is used with SDCC4.

0x12400080 SDC1_MCI_FIFO

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

SDC1_MCI_FIFO

Bits	Name	Description
31:0	DATA	FIFO data. This register is aliased to 16 words, 0x080 - 0xBC. In SDCC3, an access to the FIFO was executed with 16 words so 16 addresses were defined. However, in SDCC4 only 8 words are used in each burst so only 8 addresses from the range should be used. When writing to the external SD_Card, writes to the data path FIFO. When reading from the external SD_Card, reads from the data path FIFO.

0x124000CC SDC1_MCI_TESTBUS_CONFIG

Type: Read/Write
Clock: SAME_RATE_AS_HCLK
Reset State: 0x00000000

NOTE mclk_mux is the selected internal mclk: the original mclk or divided mclk during divided frequency mode.

Table 20-9 TESTBUS signals

TESTBUS bits	Signal	Clock
test_bus0(0)	sdcc_crif_wr_en	hclk
test_bus0(1)	sdcc_crif_rd_en	hclk
test_bus0(2)	sdcc_crif_core_select	hclk
test_bus0(6 downto 3)	sdcc_crif_wr_data[3:0]	hclk
test_bus0(10 downto 7)	sdcc_crif_rd_data[3:0]	hclk
test_bus0(14 downto 11)	sdcc_crif_addr[5:2]	hclk
test_bus0(15)	sdcc_crif_ready	hclk
test_bus0(16)	adm_crci4_ack	-
test_bus0(17)	adm_crci4_req	hclk
test_bus0(18)	rx_fifo_rd_en	hclk
test_bus0(19)	tx_fifo_wr_en	hclk
test_bus0(20)	dm_cnt_rst	hclk
test_bus0(28 downto 21)	ram_addr	mclk_mux
test_bus0(29)	ram_we_n	mclk_mux
test_bus0(30)	ram_cs_n	mclk_mux

SDC1_MCI_TESTBUS_CONFIG

Bits	Name	Description
31:8	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
7:4	SPARE_FIELD	SW spare bits.
3	TESTBUS_ENA	0x1: Enable 0x0: Disable

SDC1_MCI_TESTBUS_CONFIG (cont.)

Bits	Name	Description
2:0	TESTBUS_SEL	These bits select from different test signals. Refer to Table 1-3 for a list of test signals. TESTBUS_SELBus testbus_sel = 0sdcc_test_bus <= test_bus0 testbus_sel = 1 sdcc_test_bus <= test_bus1 testbus_sel = 2sdcc_test_bus <= test_bus2 testbus_sel = 3sdcc_test_bus <= test_bus3 testbus_sel = 4sdcc_test_bus <= test_bus4 testbus_sel = 5sdcc_test_bus <= test_bus5 testbus_sel = 6sdcc_test_bus <= test_bus6 testbus_sel = 7sdcc_test_bus <= test_bus7

0x124000D0 SDC1_MCI_TEST_CTL

Type: Read/Write
Clock: PCLK
Reset State: 0x00000000

(ARM name: MCITCR)

SDC1_MCI_TEST_CTL

Bits	Name	Description
31:4	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
3	REGTEST	Register Test Bit: Set 0: normal mode (default--accesses to the registers are controlled by the hardware protection circuitry) Set 1: test mode (the hardware protection circuitry is bypassed. Normal Write/Read/Write/ Read tests can be performed independently of the link side.
2:1	RESERVED_2	Always reads zero. Writes ’don’t care’ but by convention write zero.
0	ITEN	Integration Test Enable. This bit places PrimeCell MCI in the following modes: Set 0: normal mode Set 1: Integration test mode

0x124000D4 SDC1_MCI_TEST_INPUT

Type: Read
Clock: PCLK

(ARM name: MCIITIP)

SDC1_MCI_TEST_INPUT

Bits	Name	Description
31:10	RESERVED_1	Always reads zero. Writes ’don’t care’ but by convention write zero.
9:6	MCIDATIN_7_4	Reads return the value on the MCIDATIN[7:4] primary inputs.
5	MCICMDIN	Reads return the value on the MCICMDIN primary input.
4:1	MCIDATIN_3_0	Reads return the value on the MCIDATIN[3:0] primary inputs.
0	RESERVED_2	Always reads zero. Writes ’don’t care’ but by convention write zero.

0x124000D8 SDC1_MCI_TEST_OUT

Type: Read/Write
Clock: PCLK

(ARM name: MCIITOP)

SDC1_MCI_TEST_OUT

Bits	Name	Description
31:16	RESERVED	Always reads zero. Writes ’don’t care’ but by convention write zero.
15:12	MCIDATOUT_7_4	Primary output. Writes specify the value to be driven on the MCIDATOUT[7:4] primary output in the integration test mode. Reads return the value written into this field.
10	MCICMDOUT	Primary output. Writes specify the value to be driven on the MCICMDOUT primary output in the integration test mode. Reads return the value written into this field.
9:6	MCIDATOUT_3_0	Primary output. Writes specify the value to be driven on the MCIDATOUT[3:0] primary output in the integration test mode. Reads return the value written into this field.
1	MCIINTR1	Intra-chip output. Writes specify the value to be driven on the intra-chip MCIINTR1 output in the integration test mode. This bit is write-only.
0	MCIINTR0	Intra-chip output. Writes specify the value to be driven on the intra-chip MCIINTR0 output in the integration test mode. This bit is write-only.

20.26 USB1 HS OTG Registers (0x12500000 USB1_HS_BASE)

This section contains the USB OTG HS registers.

20.26.1 Identification registers

Identification registers are used to declare the slave interface presence and include a table of the hardware configuration parameters.

0x12500000 USB1_HS_USB_OTG_HS_ID

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0042FA05

The USB_OTG_HS_ID register is the identification register. It provides a simple way to determine if the USB-HS USB 2.0 core is provided in the system. The ID register identifies the USB-HS USB 2.0 core and its revision.

USB1_HS_USB_OTG_HS_ID

Bits	Name	Description
31:24	RESERVED_BITS31_24	These bits are reserved and should be set to zero.
23:16	REVISON_7_0	This field contains the revision number of the core - 0x42.
15:8	NID_5_0	This field contains the complement version of ID[7:0] - 0xFA.
7:0	ID_5_0	This field is the configuration number. This number is set to 0x05 and indicates that the peripheral is the USB-HS USB 2.0 core.

0x12500004 USB1_HS_USB_OTG_HS_HWGENERAL

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x5C2

The USB_OTG_HS_HWGENERAL register contains the general hardware parameters.

USB1_HS_USB_OTG_HS_HWGENERAL

Bits	Name	Description
31:10	RESERVED_BITS31_10	Clear (0) these bits.
9	SM	VUSB_HS_PHY_SERIAL = 2
8:6	PHYM	VUSB_HS_PHY_TYPE = 7
5:4	PHYW	VUSB_HS_PHY16_8 = 0

USB1_HS_USB_OTG_HS_HWGENERAL (cont.)

Bits	Name	Description
3	BWT	This bit is reserved for internal testing = 0
2:1	CLCK	VUSB_HS_CLOCK_CONFIGURATION = 1
0	RT	VUSB_HS_RESET_TYPE = 0

0x12500008 USB1_HS_USB_OTG_HS_HWHOST

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x10020001

The USB_OTG_HS_HWHOST register contains the host hardware parameters.

USB1_HS_USB_OTG_HS_HWHOST

Bits	Name	Description
31:24	TTPER	VUSB_HS_TT_PERIODIC_CONTEXTS
23:16	TTASY	VUSB_HS_TT_ASYNC_CONTEXTS
15:4	RESERVED_BITS15_4	Clear (0) these bits.
3:1	NPORT	VUSB_HS_NUM_PORT-1
0	HC	VUSB_HS_HOST

0x1250000C USB1_HS_USB_OTG_HS_HWDEVICE

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000021

The USB_OTG_HS_HWDEVICE register contains the device hardware parameters.

USB1_HS_USB_OTG_HS_HWDEVICE

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5:1	DEVEP	VUSB_HS_DEV_EP
0	DC	Device capable; [VUSB_HS_DEV/=0]

0x12500010 USB1_HS_USB_OTG_HS_HWTXBUF

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x80070B08

The USB_OTG_HS_HWTXBUF register contains the Tx buffer hardware parameters.

USB1_HS_USB_OTG_HS_HWTXBUF

Bits	Name	Description
31	TXLCR	This bit is fixed to 1'b1 so that the local context register's are included in the design. This means that the DMA context is implemented in FlipFlops.
30:24	RESERVED_BITS30_24	Clear (0) these bits.
23:16	TXCHANADD	VUSB_HS_TX_CHAN_ADD - Defines the number of address lines needed per Endpoint per the TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
15:8	TXADD	VUSB_HS_TX_ADD - Defines the number of address lines needed per the entire TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
7:0	TXBURST	VUSB_HS_TX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the TX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst length is will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x12500014 USB1_HS_USB_OTG_HS_HWRXBUF

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000808

The USB_OTG_HS_HWRXBUF register contains the Rx buffer hardware parameters.

USB1_HS_USB_OTG_HS_HWRXBUF

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits).
15:8	RX_ADD	VUSB_HS_RX_ADD - Defines the number of address lines needed per the entire RX latency buffer. It's reset value is taken from a GENERIC value passed to the core.

USB1_HS_USB_OTG_HS_HWRXBUF (cont.)

Bits	Name	Description
7:0	RX_BURST	VUSB_HS_RX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the RX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst length is will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x12500040+ 4*n USB1_HS_USB_OTG_HS_SCRATCH_RAMn, n=[0..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

USB_OTG_HS_SCRATCH_RAMn registers are 16 32bit scratch registers.Required for passing USB software information between different images.

USB1_HS_USB_OTG_HS_SCRATCH_RAMn

Bits	Name	Description
31:0	SCRATCH_REGISTER	32 bit scratch register

20.26.2 Device/host timer registers

The host/device controller drivers can measure time related activities using these timer registers.

NOTE These registers are not part of the standard EHCI controller.

0x12500080 USB1_HS_USB_OTG_HS_GPTIMER0LD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER0LD register is the general purpose timer 0 load register. This register contains the timer duration or load value. See the GPTIMER0CTRL register for a description of the timer functions.

USB1_HS_USB_OTG_HS_GPTIMER0LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

USB1_HS_USB_OTG_HS_GPTIMER0LD (cont.)

Bits	Name	Description
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFFF or 16.777215 seconds

0x12500084 USB1_HS_USB_OTG_HS_GPTIMER0CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER0CTRL register is the general purpose timer 0 control register. This register contains the control for the timer and a data field can be queried to determine the running count value. This timer has a granularity of 1 ms and can be programmed to a little over 16 seconds. There are two modes supported by this timer: the first is a one-shot and the second is a looped count, which is described in the register table below. When the timer counter value transitions to zero, an interrupt can be generated though the use of the timer interrupts in the USBTS and USBINTR registers.

USB1_HS_USB_OTG_HS_GPTIMER0CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.

USB1_HS_USB_OTG_HS_GPTIMER0CTRL (cont.)

Bits	Name	Description
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

0x12500088 USB1_HS_USB_OTG_HS_GPTIMER1LD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER1LD register is the general purpose timer 1 control register. This register contains the timer duration or load value. See the GPTIMER0LDregister for a description of the timer functions.

USB1_HS_USB_OTG_HS_GPTIMER1LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFFF or 16.777215 seconds.

0x1250008C USB1_HS_USB_OTG_HS_GPTIMER1CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER1CTRL register is the general purpose timer 1 control register. See the description of the USB_OTG_HS_GPTIMER0CTRL register for details about this register.

USB1_HS_USB_OTG_HS_GPTIMER1CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

20.26.3 Wrapper operational registers

0x12500090 USB1_HS_USB_OTG_HS_AHB_BURST

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_AHB_BURST register determines the AHB master mode of the USB HS Core.

NOTE If the USB_OTG_HS_AHB_MODE is configured to be 0x0 (the AHB Transactor is used), this register must be 0x0 as well, otherwise the AHB Master bus behavior is undefined. Use values other than 0x0 only if setting USB_OTG_HS_AHB_MODE to 0x1.

USB1_HS_USB_OTG_HS_AHB_BURST

Bits	Name	Description
31:3	RESERVED_BITS31_3	Should be set to zero.
2:0	AHB_BURST	AMBA AHB BURST. This is a r/w field that selects the following options for the m_hburst signal of the AMBA master interface: In all cases where the unspecified length burst is allowed, singles access may also occur, this is mostly true when the transaction is not 32-bit aligned. Two consecutive single accesses should not happen. When a INCRx burst size is selected and the transfer is not multiple of the INCRx burst, the burst is decomposed in the different ways. With AHBBRST[2] = 1, the smaller bursts will be unspecified length. with AHBBRST[2] = 0, the smaller bursts will be smaller INCRx or singles. For example, lets say that it's required at a given time, to transfer 22 words of information, for the following values of AHBBRST the master sequence will be: This field after reset is set to a default value that can be configured in the file vusb_hs_cfg.vhd. The AHBBRST field is only used if the AMBA-AHB system interface has been selected. It has no effect for cores featuring BVCI interface. In the later case the read will return zeros. When this field is different from zero, the value of the fields TXBURST /RXBURST in register BURSTSIZE 160h, will be ignored by the controller. Internally the BURSTSIZE will be set to the value of the INCRx AMBA burst. Since this has a direct relation with the burst sizes you must be careful with AHB burst selected. Although the TXBURST / RXBURST are bypassed, this register can still be written / read with no effect, while the AHBBRST field is non-zero. 0x0: INCR burst of unspecified length 0x1: INCR4, non-multiple transfers of INCR4 will be decomposed into singles 0x2: INCR8, non-multiple transfers of INCR8, will be decomposed into INCR4 or singles 0x3: INCR16, non-multiple transfers of INCR16, will be decomposed into INCR8, INCR4 or singles 0x4: This value is reserved and should not be used 0x5: INCR4, non-multiple transfers of INCR4 will be decomposed into smaller unspecified length bursts 0x6: INCR8, non-multiple transfers of INCR8 will be decomposed into smaller unspecified length bursts 0x7: INCR16, non-multiple transfers of INCR16 will be decomposed into smaller unspecified length bursts 0x5: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+ INCR unspec. length 0x6: INCR8+INCR8+INCR4+ INCR unspec. length 0x7: INCR16+INCR4+ INCR unspec. length 0x1: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+SINGLE+SINGLE 0x2: INCR8+INCR8+INCR4+SINGLE+SINGLE 0x3: INCR16+INCR4+SINGLE+SINGLE

0x12500094 USB1_HS_USB_OTG_HS_XTOR_STS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_XTOR_STS register is currently a placeholder for future status bits from the AHB2AHB Transactor.

USB1_HS_USB_OTG_HS_XTOR_STS

Bits	Name	Description
31:2	RESERVED_BITS31_2	Not used currently.
1	GRANT_STOLEN	Reports whether the arbiter removed the hgrant signal prior to completing a transaction. This is currently supported in WRITES ONLY. This bit can be cleared by writing a ’1’ to the GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register. To enable this bit again, write a ’0’ to he GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register.
0	RESERVED_BIT0	Not used currently.

0x12500098 USB1_HS_USB_OTG_HS_AHB_MODE

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1

USB1_HS_USB_OTG_HS_AHB_MODE

Bits	Name	Description
31	ASYNC_BRIDGES_BYPASS	Default is ’0’. When ’0’ the asynchronous bridge on the master AHB interface is used. When ’1’, it is bypassed. The bridge on the slave AHB is always used.
30:5	RESERVED_BITS30_5	Not used currently.
4	INCR_OVERRIDE	Valid only if the Transactor is bypassed: When ’1’, all INCR bursts from the USB Core will be internally transformed into SINGLE transfers. When ’0’, if the USB Core issues an INCR burst, it will propagate to the external master AHB port.

USB1_HS_USB_OTG_HS_AHB_MODE (cont.)

Bits	Name	Description
3:2	HPROT_MODE	When ’00’ the HPROT signal out of the USB Wrapper is ’0001’, and all transactions are non-posted. When ’01’ the HPROT signal out of the USB Wrapper is ’0101’, and all transactions are posted. When ’10’ the HPROT signal out of the USB Wrapper alternates according to the context of the AHB bus access. Control structures are non-posted while data transfer is posted. When ’11’, reserved value, but currently maps to non-posted (same as ’00’).
1	GRANT_STOLEN_CLEAR	Clears the grant stolen field of the USB_OTG_HS_XTOR_STS register. To enable this bit again, write ’0’ after clearing the GRANT_STOLEN (’1’).
0	XTOR_BYPASS	When this bit is set (1), the AHB Transactor is bypassed, and the USB HS Core’s AHB Master interface is directly connected to the AHB system. In this case, the USB_OTG_HS_AHB_BURST register value will determine the bus characteristics. When this bit is reset (0), the AHB Transactor is used to connect the USB HS Core to the AHB system.

0x1250009C USB1_HS_USB_OTG_HS_GEN_CONFIG

Type: Read/write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXX0830

The USB_OTG_HS_GEN_CONFIG register is used to configure various features that have been added to the HS USB Core.

USB1_HS_USB_OTG_HS_GEN_CONFIG

Bits	Name	Description
31:16	USB_OTG_HS_HW_QVERSION	HW revision of the USB OTG HS core. This version changes with every official release of USB_OTG_HS core.
15	SYS_CLK_SW_EN	This bit is applicable only in SPS Device mode. When this bit is set then USB core always voting for USB_SYSTEM_CLK. Default value is 0 - USB core doesn’t request USB_SYSTEM_CLK when in Low Power Mode.
14	TESTMUX_SEL_4	see TESTMUX_SEL_3_0 the first 4 bits of this register.
13	USB_BAM_DISABLE	This bit disables the bam logic inside the USB and makes him work in Legacy mode.
12	DMA_HPROT_CTRL	When this bit is set Link Controller always does non-posted dQH writes.
11	ISO_FIX_EN	This bit enables fix for Isochronous bug in CI core (CR--0000135251).

USB1_HS_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
10	DSC_PE_RST_EN	This bit enables an automatic reset of Device PE State Machine on disconnection event when operating as device. This reset is a HW fix for CR-000940.
9	HOST_SIM_TIMERS_EN_SUSP	When this bit is set (1), the timers used for the USB suspend process short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB suspend process are according to the USB specification.
8	HOST_SIM_TIMERS_EN_STD	When this bit is set (1), the timers used for the USB reset on the ULPI are short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB reset on the ULPI are according to the USB specification.
7	PE_RX_BUF_PENDING_EN	This is only valid in Device Mode. Setting this bit will cause to store a Transaction Status Tag in the Pending register instead of RX Buffer if the RX Buffer is full. The Tag will move from Pending register to RX Buffer as soon as it becomes not full.
6	STREAM_RX_BYPASS_ENABLE	This is only valid in Device Mode. If SDIS bit is set (bit 4 of USB_OTG_HS_USBMODE (0x1A8)), i.e., streaming mode is disabled, setting this bit will cause the RX traffic to override the SDIS bit, and to receive in streaming mode. TX will still be in non-streaming mode.
5	ULPI_SERIAL_EN	This bit must be set to enable operation of ULPI Serial FS/LS mode. Default state is ’1’ - ULPI Serial mode is supported.
4	PE_DP_TXFIFO_IDLE_FORCE	This is only valid in Device Mode. Setting this bit to ’1’ forces the dp_tx_fifo_cmd_dev to be equal to PE_DP_TXFIFO_IDLE when Device PE state machine in REPORT_NAK state and the RX Buffer is full. This bit is used to enable fix of CR-001612. Reset value is ’1’.

USB1_HS_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
3:0	TESTMUX_SEL_3_0	With TESTMUX_SEL_4 select one of the following test buses: Value 00001 Key state machines 01101 hsic_test_bus1 01110 hsic_test_bus2 10000 dma_eng_3 dma_dev_sm_2 10001 dma_eng_4 dma_traf others zeros 0x2: dma_eng_0 dma_dev_sm_1 0x3: dma_eng_1 dma_context 0x4: dma_eng_2 dma_mem_arb 0x5: prot_eng_0 0x6: prot_eng_1 0x7: prot_eng_2 0x8: port_ctrl_0 0x9: port_ctrl_1 0xA: tx_buffer 0xB: rx_buffer 0xC: otg

0x125000A0 USB1_HS_USB_OTG_HS_GEN_CONFIG_2

Type: Read/write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0001F60

Register for the chicken bits. The USB_OTG_HS_GEN_CONFIG_2 register is used to configure various features that have been added to the HS USB Core. By default, all chicken bits are off and the fix is applicable.

USB1_HS_USB_OTG_HS_GEN_CONFIG_2

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	LINESTATE_DIFF_WAKEUP_EN	chicken bit for CR-0000155486.when this bit is set the USB enables the HW fix for Race condition between the attempt to enter LPM and USB bus reset.Default value is 1.
11	ULPI_LPM_PEND_EN	chicken bit for CR-0000153486.when this bit is set the USB enables the HW fix for Function Control and LPM race condition.Default value is 1.
10	RX_FULL_NAK_EN	chicken bit for CR-0000152878.when this bit is set the USB will respond with NAK's for Host Tokens with very slow AHB and when Streaming mode is enabled. Default value is 1.

USB1_HS_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Description
9	ENDLESS_TD_EN	chicken bit for CR-0000152976. When this bit is set Performance enhancements for 'infinite' Producer pipe (out endpoint with eTD that points to itself) are enabled. Default value is 1.
8	SCRATCH_RAM_EN	chicken bit for CR-0000149922. When this bis is set the use of scratch ram is enabled and the SW can read/write from addresses 0x040 - 0x07c. when this bit is clear SW can no longer access those registers. Default value is 1.
7	SESS_VLD_CTRL_EN	When this bit is set then bit 25 of USBCMD register controls sess_vld signal inside the Link Controller. When this bit is clear then Link Controller receives sess_vld directly from PHY. Default value is 0.
6	CI_T_WTSUSRSTHS_EN	When this bit is 0 then Device Port Control State Machine waits 2.5 us from USB Reset detection until starting driving Chirp K. When this bit is 1 then Device Port Control State Machine waits 1.5 ms from USB Reset detection until starting driving Chirp K. Default value is 1 - legacy behavior.
5	CI_T_UCH_EN	When this bit is 0 then Device Port Control State Machine drives Chirp K for 1 ms. When this bit is 1 then Device Port Control State Machine drives Chirp K for 2ms. Default value is 1 - legacy behavior.
4	DP_RESET	chicken bit for fix CI2687: When the OTG core is acting as a Host, and VBUS is turned off, and the attached Device attempts to perform a Session Request Protocol by using Data-line Pulsing, it will not be recognized by the Host. Also, when doing HNP and becoming a Host, a SE0 is forced in the line causing the OPT TD5.4 test to fail, without the software workaround.
3	ZLP_PRIME	chicken bit for fix CI2655: When using ISO IN endpoints with MULT=3 and low bandwidth system bus access, the controller may enter into a wait loop situation without warning the software. Due to the low bandwidth the last packet from a mult3 sequence may not be fetched in time before the last token IN is received (for that uframe/endpoint). This will cause the controller to reply with a zero length packet (ZLP), breaking the prime sequence.
2	NO_SOF_RX_FIFO_FULL	chicken bit for fix CI2581: During normal operation, if the RX Fifo becomes full and the protocol engine needs to send a command to the DMA state machine, it will wait in that state until the RX Fifo becomes not full. As the protocol state machine also handles the SOF generation, the SOFs will no longer be sent. If one SOF is missed, the Host controller will issue a false babble detection. If more than 3.125ms are elapsed without SOFs the peripheral will recognize the idle bus as a USB reset.
1	WRONG_OPMODE_SUSP	chicken bit for fix CI1274: When the Controller enters a Suspend state it asserts opmode with the wrong value, according to specifications 'UTMI+ Specification, Revision 1.0, Section 3.2' and 'UTMI+ Low Pin Interface Specification, Revision 1.1, Section 3.8.5.3'. This causes no issue in actual usage.

USB1_HS_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Description
0	RESUME_END_INTER	chicken bit for fix CI1179: Working as host, when doing resume a port change interrupt was fired at the end of resume. According to the EHCI spec no interrupt should be fired.

20.26.4 Device/host capability registers

0x12500100 USB1_HS_USB_OTG_HS_CAPLENGTH

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x01000040

The USB_OTG_HS_CAPLENGTH register is the capability register length. It is used to indicate which offset to add to the register base address at the beginning of the operational register.

USB1_HS_USB_OTG_HS_CAPLENGTH

Bits	Name	Description
31:16	HCIVERSION_15_0	BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision.
7:0	CAPLENGTH_7_0	Offset at beginning of operational register

0x12500104 USB1_HS_USB_OTG_HS_HCSPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00010011

The USB_OTG_HS_HCSPARAMS register contains the host control structural parameters. The port steering logic capabilities are described in this register.

USB1_HS_USB_OTG_HS_HCSPARAMS

Bits	Name	Description
31:28	RESERVED_BITS31_28	Clear (0) these bits.
27:24	N_TT_3_0	Number of transaction translators This field indicates the number of embedded transaction translators associated with the USB2.0 host controller. For a multi-port host, this field will always equal 0001. For all other implementations, N_TT = 0000. This in a non-EHCI field to support embedded TT.

USB1_HS_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
23:20	N_PTT_3_0	Number of ports per transaction translator This field indicates the number of ports assigned to each transaction translator within the USB2.0 host controller. For a multi-port host this field will always equal N_PORTS. For all other implementations, N_PTT = 0000. This in a non-EHCI field to support embedded TT.
19:17	RESERVED_BITS19_17	Clear (0) these bits.
16	PI_3_0	Port indicator This bit indicates whether the ports support port indicator control. When set (1), the port status and control registers include a read/writable field for controlling the state of the port indicator. This field will always be set (1).
15:12	N_CC_3_0	Number of companion controllers This field indicates the number of companion controllers associated with this USB2.0 host controller. A zero in this field indicates there are no internal companion controllers. Port-ownership hand-off is not supported. A value larger than zero in this field indicates that there are companion USB1.1 host controller(s). Port-ownership hand-offs are supported. High-, full-, and low-speed devices are supported on the host controller root ports. In this implementation, this field will always be clear (0).
11:8	N_PCC_3_0	Number of ports per companion controller This field indicates the number of ports supported per internal companion controller. It is used to indicate the port routing configuration to the system software. For example, if N_PORTS has a value of 6 and N_CC has a value of 2, then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller 1, the next N_PCC ports to companion controller 2, and so on. In the previous example, the N_PCC could have been 4, where the first 4 are routed to companion controller 1 and the last two are routed to companion controller 2. The number in this field must be consistent with N_PORTS and N_CC. In this implementation, this field will always be clear (0).
7:5	RESERVED_BITS7_5	Clear (0) these bits.
4	PPC	Port power control This field indicates whether the host controller implementation includes port power control. Set (1) indicates that the ports have port power switches. Clear (0) indicates that the ports do not have port power switches. The value of this field affects the functionality of the port power field in each port status and control register. This bit will always be clear (0) for a device only implementation.

USB1_HS_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
3:0	N_PORTS_3_0	Number of downstream ports This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the operational register. Valid values are in the range of 1h to Fh. A zero in this field is undefined. The number of ports for a host implementation is configurable from 1 to 8. This field will always be set (1) for device-only implementation.

0x12500108 USB1_HS_USB_OTG_HS_HCCPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0006

The USB_OTG_HS_HCCPARAMS register contains the host control capability parameters. This register identifies multiple mode control (time-base bit functionality) addressing capability.

USB1_HS_USB_OTG_HS_HCCPARAMS

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15:8	EECP_7_0	EHCI extended capabilities pointer Default = 0 This optional field indicates the existence of a capabilities list. A value of 00h indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in PCI configuration space of the first EHCI extended capability. The pointer value must be 40h or greater if implemented to maintain the consistency of the PCI header defined for this class of device. For this implementation, all of these bits are clear (0).
7:4	IST_7_4	Isochronous scheduling threshold Default = implementation dependent This field indicates, relative to the current position of the executing host controller, where the software can reliably update the isochronous schedule. When bit [7] is clear (0), the value of the least significant 3 bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set (1), then host software assumes the host controller may cache an isochronous data structure for an entire frame. All of the bits in this field will always be clear (0).
3	RESERVED_BIT3	Clear (0) this bit.

USB1_HS_USB_OTG_HS_HCCPARAMS (cont.)

Bits	Name	Description
2	ASP	Asynchronous schedule park capability Default = 1 If this bit is set (1), then the host controller supports the park feature for high-speed queue heads in the asynchronous schedule. The feature can be disabled, or enabled and set to a specific level by using the (ASPE) and (ASP[1:0]) fields in the USB_OTG_HS_USBCMD register. This field will always be set (1).
1	PFL	Programmable frame list flag If this bit is clear (0), then the system software must use a frame list length of 1024 elements with this host controller. The FS[2:0] field in the USBCMD register is read-only and must be cleared (0). If this bit is set (1), then the system software can specify and use a smaller frame list, and configure the host controller using the FS[2:0] field in the USBCMD register. The frame list must always be aligned on a 4k-page boundary. This requirement ensures that the frame list is always physically contiguous. This bit in this field will always be set (1).
0	ADC	64-bit addressing capability This field will always be clear (0). No 64-bit addressing capability is supported.

0x12500120 USB1_HS_USB_OTG_HS_DCIVERSION

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1

The USB_OTG_HS_DCIVERSION register contains the device interface version number. The device controller interface conforms to the two-byte BCD encoding of the interface version number contained in this register.

USB1_HS_USB_OTG_HS_DCIVERSION

Bits	Name	Description
15:0	DCIVERSION_15_0	Device interface version number

0x12500124 USB1_HS_USB_OTG_HS_DCCPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x190

The USB_OTG_HS_DCCPARAMS register contains the device control capability parameters. These fields describe the overall host/device capability of the controller.

USB1_HS_USB_OTG_HS_DCCPARAMS

Bits	Name	Description
31:9	RESERVED_BITS31_9	Clear (0) these bits.
8	HC	Host capable When this bit is set (1), this controller is capable of operating as an EHCI-compatible USB 2.0 host controller.
7	DC	Device capable When this bit is set (1), this controller is capable of operating as a USB 2.0 device.
6:5	RESERVED_BITS6_5	Clear (0) these bits.
4:0	DEN_4_0	Device endpoint number This field indicates the number of endpoints build into the device controller. If this controller is not device capable, then this field will be al zeroes. Valid values for this field are 0 through 16.

20.26.5 Device/host operational registers

0x12500140 USB1_HS_USB_OTG_HS_USBCMD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00080000

The USB_OTG_HS_USBCMD register is the USB command register. The serial bus host/device controller executes the command indicated in this register.

USB1_HS_USB_OTG_HS_USBCMD

Bits	Name	Description
31	RST_CTRL	Default value = 0. Set to 1 to block operational reset to xcvr (ser and ulpi) clock domains.
30	ULPI_STP_CTRL	Default value = 0. Set to 1 to block the ulpi_stp signal from going out to ULPI PHY
29	ASYNC_INTR_CTRL	Default value = 0. Set to 1 to allow the async interrupt out from the HS core.
28	SE0_GLITCH_FIX_CTRL	Default value = 0. Set to 1 to activate the SE0 glitch fix mechanism
27	FS_3_WIRE_2_WIRE_SELECT	Default value = 0. Set this bit for enabling the two wire interface on the fs_dat and fs_se0 pins

USB1_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
26	ULPI_SER3_NOT6_SEL	ULPI serial 3 bits select. Read/write Read: Current status of serial data bus wide Write: SW writes ’1’ to this bit to request 3 pins ULPI data wide, or ’0’ to request 6 bit data wide in FsLsSerial Mode.
25	SESS_VLD_CTRL	Default value = 0. Set this bit to enable Link Controller operation after switching interface from Serial to ULPI.
24	RESERVED_BIT24	Clear (0) these bit
23:16	ITC_7_0	Interrupt threshold control Read/write Default 08h The system software uses this field to set the maximum rate at which the host/device controller will issue interrupts. This field contains the maximum interrupt interval measured in micro-frames. Valid values are shown below. Value Maximum interrupt interval 00h Immediate (no threshold) 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames 10h 16 micro-frames 20h 32 micro-frames 40h 64 micro-frames
15	FS2	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.

USB1_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
14	ATDTW	Add dTD tripwire Read/write (Device mode only) This bit is used as a semaphore to ensure the to proper addition of a new dTD to an active (primed) endpoint's linked list. This bit is set (1) and cleared (0) by the software. This bit shall also be cleared (0) by the hardware when the state machine is a hazard region for which adding a dTD to a primed endpoint may go unrecognized.
13	SUTW	Setup tripwire (device mode only) Read/write This bit is used as a semaphore to ensure that the setup data payload of 8 bytes is extracted from a QH by the DCD without being corrupted. If the setup lockout mode is off (see USBMODE) then there exists a hazard when new setup data arrives while the DCD is copying the setup data payload from the QH for a previous setup packet. This bit is set (1) and cleared (0) by software, and will be cleared (0) by hardware when a hazard exists.
12	RESERVED_BITS12	Clear (0) this bit
11	ASPE	Asynchronous schedule park mode enable (OPTIONAL) Read/write If the asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this bit defaults to a 1h and is R/W. Otherwise, the bit must be cleared (0) and is RO. The software uses this bit to enable or disable the park mode. value 1 = Park mode is enabled. value 0 = Park mode is disabled. This field is set (1) in this implementation.
10	RESERVED_BIT10	Clear (0) this bit.
9:8	ASP_1_0	Asynchronous schedule park mode count (OPTIONAL) Read/write If the Asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this field defaults to 3h and is R/W. Otherwise it defaults to zero and is RO. This field contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the asynchronous schedule before continuing traversal of the Asynchronous schedule. See Section 4.10.3.2 for full operational details. Valid values are 1h to 3h. The software must not clear (0) this bit when the ASPE bit in this register is set (1), as this will result in undefined behavior. This field is set to 3h in this implementation.
7	LR	Light host/device controller reset (OPTIONAL) Read only Not implemented. This bit will always be clear (0).

USB1_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
6	IAA	Interrupt on async advance doorbell Read/write This bit is used as a doorbell by the software to tell the host controller to issue an interrupt the next time it advances the asynchronous schedule. The software must set (1) this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule states, it sets (1) the interrupt on the async advance status (AAI) bit in the USBSTS register. If the interrupt on async advance enable (AAE) bit in the USBINTR register is set (1), then the host controller will assert an interrupt at the next interrupt threshold. The host controller clears (0) this bit after it has set (1) the interrupt on async advance status (AAI) bit in the USBSTS register. The software should not set (1) this bit when the asynchronous schedule is inactive. Doing so will yield undefined results. This bit is only used in the host mode. Setting (1) this bit when the device mode is selected will produce undefined results.
5	ASE	Asynchronous Schedule Enable Read/write Default = 0b This bit controls whether the host controller skips processing the asynchronous schedule. value 0 = Do not process the asynchronous schedule value 1 = Use the ASYNCLISTADDR register to access the asynchronous schedule. Only the host controller uses this bit.
4	PSE	Periodic schedule enable Read/write Default 0b This bit controls whether the host controller skips processing the periodic schedule. value 0 = Do not process the periodic schedule value 1 = Use the PERIODICLISTBASE register to access the periodic schedule. Only the host controller uses this bit.

USB1_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
3:2	FS_1_0	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.
1	RST	Controller reset (RESET) Read/write The software uses this bit to reset the controller. This bit is cleared (0) by the host/device controller when the reset process is complete. The software cannot terminate the reset process early by clearing (0) this bit. Host controller: When the software sets (1) this bit, the host controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Any transaction currently in progress on the USB is immediately terminated. A USB reset is not driven on downstream ports. The software should not set (1) this bit when the HCHalted bit in the USBSTS register is clear (0). Attempting to reset an actively running host controller will result in undefined behavior. Device controller: When the software sets (1) this bit, the device controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Setting this bit when the device is in the attached state is not recommended, since the effect on an attached host is undefined. In order to ensure that the device is not in an attached state before initiating a device controller reset, all primed endpoints should be flushed and the USBCMD run/stop bit should be cleared (0).

USB1_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
0	RS	Run/stop Read/Write Default 0b value 1 = Run value 0 = Stop Host controller: When this bit is set (1), the host controller proceeds with the execution of the schedule. The host controller continues execution as long as this bit remains set (1). When this bit is clear (0), the host controller completes the current transaction on the USB and then halts. The HC halted bit in the status register indicates when the host controller has finished the transaction and has entered the stopped state. The software should not set (1) this bit unless the host controller is in the halted state (that is, the HCHalted bit in the USBSTS register is set (1)). Device controller: Setting (1) this bit will cause the device controller to enable a pull-up on D+ and initiate an attach event. This control bit is not directly connected to the pull-up enable, as the pull-up will become disabled upon transitioning into high-speed mode. The software should use this bit to prevent an attach event before the device controller has been properly initialized. Clearing (0) this bit will cause a detach event.

0x12500144 USB1_HS_USB_OTG_HS_USBSTS

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_USBSTS register is the USB status register. This register indicates various states of the host/device controller and any pending interrupts. This register does not indicate status resulting from a transaction on the serial bus. The software clears certain bits in this register by setting (1) them.

USB1_HS_USB_OTG_HS_USBSTS

Bits	Name	Description
31	ULPI_INTR	Default value = 0.This bit is set when Interrupt during ULPI -Serial mode or ULPI Interrupt during LPM occurs. Writing a 1 to this bit will clear it.
30	PHY_SESS_VLD_CHG	This bit is set when PHY_SESS_VLD bit changes its value.
29	PHY_SESS_VLD	This bit presents the SESS_VLD status of PHY.
28	PHY_ALT_INT	This bit is asserted when a non-USB interrupt from PHY is detected. This interrupt is used for procedures like Battery Charging. This bit is set when bit 7 (alt_int) of RX CMD is high. Writing a 1 to this bit will clear it.

USB1_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
27:26	RESERVED_BITS27_26	Clear (0) these bits.
25	TI1	General purpose timer interrupt 1 (GPTINT1) Read/write control This bit is set (1) when the counter in the GPTIMER1CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
24	TI0	General purpose timer interrupt 0 (GPTINT0) Read/write control This bit is set (1) when the counter in the GPTIMER0CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPI	USB host periodic interrupt (USBHSTPERINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set (1) and the TD was from the periodic schedule. This bit is also set (1) by the host controller when a short packet is detected AND the packet is on the periodic schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
18	UAI	USB host asynchronous interrupt (USBHSTASYNCINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set AND the TD was from the asynchronous schedule. This bit is also set (1) by the host when a short packet is detected AND the packet is on the asynchronous schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
17	RESERVED_BIT17	Clear (0) these bits.
16	NAKI	NAK interrupt bit Read only This bit is set (1) by the hardware when, for a particular endpoint, both the Tx/Rx endpoint NAK bit and the corresponding Tx/Rx endpoint NAK enable bit are set (1). This bit is automatically cleared (0) by the hardware when all of the enabled Tx/Rx endpoint NAK bits are cleared (0).

USB1_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
15	AS	Asynchronous schedule status Read only Default = 0 This bit reports the current real status of the asynchronous schedule. When cleared (0), the asynchronous schedule status is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the asynchronous schedule when software transitions the asynchronous schedule enable bit in the USBCMD register. When this bit and the asynchronous schedule enable bit are the same value, the asynchronous schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
14	PS	Periodic schedule status Read only Default = 0 This bit reports the current real status of the periodic schedule. When cleared (0), the periodic schedule is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the periodic schedule when software transitions the periodic schedule enable bit in the USBCMD register. When this bit and the periodic schedule enable bit are the same value, the periodic schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
13	RCL	Reclamation Read only Default = 0 This is a read-only status bit that is used to detect an empty asynchronous schedule. This bit is only used by the host controller.
12	HCH	HC halted Read only Default = 1 This bit is a clear (0) whenever the run/stop bit is set (1). The host controller sets (1) this bit after it has stopped executing, because of the run/stop bit being cleared (0), either by the software or by the host controller hardware (for example, an internal error). This bit is only used by the host controller.
11	RESERVED_BIT11	Clear (0) this bit.
10	ULPII	ULPI interrupt Read/write control Default = 0 When the ULPI viewport is present in the design, an event completion will set (1) this interrupt. This bit is used by both the host and device controllers. It is only present in designs where the configuration constant VUSB_HS_PHY_ULPI = 1.

USB1_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
9	RESERVED_BIT9	Clear (0) this bit.
8	SLI	DC suspend Read/write control Default = 0 When a device controller enters a suspend state from an active state, this bit will be set (1). The device controller clears (0) the bit upon exiting from a suspend state. This bit is only used by the device controller.
7	SRI	SOF received Read/write control Default = 0 When the device controller detects a start of (micro) frame, this bit will be set (1). When a SOF is extremely late, the device controller will automatically set (1) this bit to indicate that an SOF was expected. Therefore, this bit will be set (1) roughly every 1 ms in the device FS mode and every 125 ms in the HS mode, and will be synchronized to the actual SOF that is received. Since the device controller is initialized to FS before connect, this bit will be set (1) at an interval of 1 ms during the prelude to connect and chirp. In the host mode, this bit will be set (1) every 125 us and can be used by the host controller driver as a time base. The software writes a 1 to this bit to clear it. This is a non-EHCI status bit.
6	URI	USB reset received Read/write control Default = 0 When the device controller detects a USB reset and enters the default state, this bit will be set (1). The software can set (1) this bit to clear the USB reset received status bit. This bit is only used by the device controller.
5	AAI	Interrupt on async advance Read/write control Default = 0 The system software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by setting (1) the interrupt on async advance doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source. This bit is only used by the host controller.
4	SEI	System error Read/write control This interrupt is triggered when there is an AHB error (HRESP = ERROR) on the AHB Master interface.

USB1_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
3	FRI	Frame list rollover Read/write control The host controller sets (1) this bit when the frame list index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the frame list size field of the USBCMD register) is 1024, the frame index register rolls over every time FRINDEX [1 3] toggles. Similarly, if the size is 512, the host controller sets (1) this bit to a one every time FHINDEX [12] toggles. This bit is only used by the host controller.
2	PCI	Port change detect Read/write control The host controller sets (1) this bit when a connect status occurs on any port, a port enable/disable change occurs on any port, or the force port resume bit is set (1) as the result of a J-K transition on the suspended port. The device controller sets (1) this bit when the port controller enters the full or high-speed operational state. When the port controller exits the full or high-speed operation states due to reset or suspend events, the notification mechanisms are the USB reset received bit and the DC suspend bits, respectively. This bit is not EHCI compatible.
1	UEI	USB error interrupt (USBERRINT) Read/write control When completion of a USB transaction results in an error condition, this bit is set (1) by the host/device controller. This bit is set (1) along with the USBINT bit, if the TD on which the error interrupt occurred also had its interrupt-on-complete (IOC) bit set (1). The device controller detects resume signaling only.
0	UI	USB interrupt (USBINT) Read/write control This bit is set (1) by the host/device controller when the cause of an interrupt is a completion of a USB transaction where the transfer descriptor (TD) has an interrupt-on-complete (IOC) bit set (1). This bit is also set (1) by the host/device controller when a short packet is detected. A short packet is when the actual number of bytes received was less than the expected number of bytes.

0x12500148

USB1_HS_USB_OTG_HS_USBINTR

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_USBINTR register is the USB interrupt enable register. The interrupts to the software are enabled with this register. An interrupt is generated when a bit is set (1) and the corresponding interrupt is active. The USB status register (USBSTS) still shows interrupt sources, even if they are disabled by the USBINTR register, which allows polling of interrupt events by the software.

USB1_HS_USB_OTG_HS_USBINTR

Bits	Name	Description
31	ULPI_INTR_EN	Default value =0.When this bit is a 1 and ULPI_INTR is a 1, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the ULPI_INTR bit.
30	PHY_SESS_VLD_CHG_EN	Default value =0. When this bit is set then Link Controller will issue an interrupt when PHY_SESS_VLD changes its value.
29:26	RESERVED_BITS29_26	Clear (0) these bits.
25	TIE1	General purpose timer interrupt enable 1 When this bit is set (1), and the GPTINT1 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT1 bit.
24	TIE0	General purpose timer interrupt enable 0 When this bit is set (1), and the GPTINT0 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT0 bit.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPIE	USB host periodic interrupt enable When this bit is set (1), and the USBHSTPERINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTPERINT bit.
18	UAIE	USB host asynchronous interrupt enable When this bit is set (1), and the USBHSTASYNCINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTASYNCINT bit.
17	RESERVED_BIT17	Clear (0) this bit.

USB1_HS_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
16	NAKE	NAK interrupt enable This bit is set (1) by the software if it wants to enable the hardware interrupt for the NAK interrupt bit. If both this bit and the corresponding NAK interrupt bit are set (1), a hardware interrupt is generated.
15:11	RESERVED_BITS15_11	Clear (0) these bits.
10	ULPIE	ULPI enable When this bit is set (1), and the ULPI Interrupt bit in the USBSTS register transitions, the controller will issue and interrupt. The interrupt is acknowledged by the software setting (1) the ULPI interrupt bit. This bit is used by both the host and device controllers. It is only present in designs where configuration constant VUSB_HS_PHY_ULPI = 1.
9	RESERVED_BIT9	Clear (0) this bit.
8	SLE	Sleep enable When this bit is set (1) and the DC suspend bit in the USBSTS register transitions, the device controller will issue an interrupt. The interrupt is acknowledged by the software setting (1) the DC suspend bit. This bit is only used by the device controller.
7	SRE	SOF received enable When this bit is set (1) and the SOF received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the SOF received bit.
6	URE	USB reset enable When this bit is set (1) and the USB reset received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the USB reset received bit.
5	AAE	Interrupt on async advance enable When this bit is set (1) and the interrupt on async advance bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the interrupt on async advance bit. This bit is only used by the host controller.
4	SEE	System error enable When this bit is set (1) and the system error bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the system error bit.

USB1_HS_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
3	FRE	Frame list rollover enable When this bit is set (1) and the frame list rollover bit in the USBSTS register is set (1), the host controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the frame list rollover bit. This bit is only used by the host controller.
2	PCE	Port change detect enable When this bit is set (1) and the port change detect bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the port change detect bit.
1	UEE	USB error interrupt enable When this bit is set (1) and the USBERRINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBERRINT bit in the USBSTS register.
0	UE	USB interrupt enable When this bit is set (1) and the USBINT bit in the USBSTS register is set (1), the host/device controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBINT bit.

0x1250014C USB1_HS_USB_OTG_HS_FRINDEX

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_FRINDEX register is the USB frame index register. This register is used by the host controller to index the periodic frame list. The register updates every 125 microseconds (once each micro-frame). Bits [N:3] are used to select a particular entry in the periodic frame list during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by the system software in the frame list size field in the USBCMD register.

This register must be written as a DWord. Byte writes produce-undefined results. This register cannot be written unless the host controller is in the 'halted' state, as indicated by the HC halted bit. A write to this register while the run/stop bit is set (1) produces undefined results. Writes to this register also affect the SOF value.

In the device mode, this register is read-only and the device controller updates the FRINDEX [13:3] register from the frame number indicated by the SOF marker. Whenever a SOF is received by the USB bus, FRINDEX [13:3] will be checked against the SOF marker. If FRINDEX [13:3] is different from the SOF marker, FRINDEX [13:3] will be set to the SOF value and FRINDEX [2:0] will be cleared (0) (that is, SOF for a 1-ms frame). If FRINDEX [13:3] is equal to the SOF value, FRINDEX [2:0] will be incremented (that is, SOF for 125-ms micro-frame.

USB1_HS_USB_OTG_HS_FRINDEX

Bits	Name	Description
31:14	RESERVED_BITS31_14	Clear (0) these bits.
13:0	FRINDEX_13_0	Frame index The value in this register increments at the end of each time frame (for example, a micro-frame). Bits [N:3] are used for the frame list current index. This means that each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following data shows the values of N based on the value of the frame list size field in the USBCMD register when used in host mode. USBCMD [Frame list size] number Elements N 000b (1024) 12 001b (512) 11 010b (256) 10 011b (128) 9 100b (64) 8 101b (32) 7 110b (16) 6 111b (8) 5 In the device mode, the value is the current frame number of the last frame transmitted. It is not used as an index. In either mode, bits 2:0 indicate the current microframe.

0x12500154 USB1_HS_USB_OTG_HS_PERIODICLISTBASE

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_PERIODICLISTBASE register is the periodic list base address register. This 32-bit register contains the beginning address of the periodic frame list in the system memory. The HCD loads this register prior to starting the schedule execution by the host controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the frame index register (FRINDEX) to enable the host controller to step through the periodic frame list in sequence.

NOTE This device is shared between the host controller and device controller operation. For host controller operation, this is the USB_OTG_HS_ PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

USB1_HS_USB_OTG_HS_PERIODICLISTBASE

Bits	Name	Description
31:12	PERBASE_31_12	Base address (low) These bits correspond to memory address signals [31:12], respectively. Only used by the host controller.
11:0	RESERVED_BITS11_0	This field must be written as zeros. During runtime, the values of these bits are undefined.

0x12500154 USB1_HS_USB_OTG_HS_DEVICEADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_DEVICEADDR register is the USB device address register. The upper seven bits of this register represent the device address. After any controller reset or a USB reset, the device address is set to the default address (0). The default address will match all incoming addresses. The software shall reprogram the address after receiving a SET_ADDRESS descriptor.

The USBADRA is used to accelerate the SET_ADDRESS sequence by allowing the DCD to preset the USBADR register before the status phase of the SET_ADDRESS descriptor.

NOTE This device is shared between the host controller and device controller operations. For host controller operation, this is the USB_OTG_HS_ PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

USB1_HS_USB_OTG_HS_DEVICEADDR

Bits	Name	Description
31:25	USBADR_31_25	Device address These bits correspond to the USB device address.

USB1_HS_USB_OTG_HS_DEVICEADDR (cont.)

Bits	Name	Description
24	USBADRA	Device address advance Default = 0 When this bit is clear (0), any writes to USBADR are instantaneous. When this bit is set (1) at the same time or before USBADR is written, the write to the USBADR field is staged and held in a hidden register. After an IN occurs on endpoint 0 and is ACKed, USBADR will be loaded from the holding register. The hardware will automatically clear (0) this bit on the following conditions: 1. IN is ACKed to endpoint 0 (USBADR is updated from staging register). 2. OUT/SETUP occur to endpoint 0 (USBADR is not updated). 3. Device reset occurs (USBADR is reset to 0). Note: After the status phase of the SET_ADDRESS descriptor, the DCD has 2 ms to program the USBADR field. This mechanism will ensure this specification is met when the DCD can not write of the device address within 2 ms from the SET_ADDRESS status phase. If the DCD writes the USBADR with USBADRA = 1 after the SET_ADDRESS data phase (before the prime of the status phase), the USBADR will be programmed instantly at the correct time and meet the 2-ms USB requirement.
23:0	RESERVED_BITS23_0	These bits must be written as zeros. During runtime, the values of these bits are undefined.

0x12500158 USB1_HS_USB_OTG_HS_ASYNCLISTADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ASYNCLISTADDR register is the next asynchronous list address register. This 32-bit register contains the address of the next asynchronous queue head to be executed by the host. Bits [4:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

USB1_HS_USB_OTG_HS_ASYNCLISTADDR

Bits	Name	Description
31:5	ASYBASE_31_15	Link pointer low (LPL). These bits correspond to memory address signals [31:5], respectively. This field may only reference a queue head (OH). This field is only used by the host controller.
4:0	RESERVED_BITS4_0	The values of these bits has no effect on circuit operation.

0x12500158 USB1_HS_USB_OTG_HS_ENDPOINTLISTADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPOINTLISTADDR register is the endpointlist address register. In the device mode, this register contains the address of the top of the endpoint list in system memory. Bits [10:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

USB1_HS_USB_OTG_HS_ENDPOINTLISTADDR

Bits	Name	Description
31:11	EPBASE_31_11	Endpoint list pointer (low) These bits correspond to memory address signals [31:11], respectively. This field will reference a list of up to 32 queue heads (QH). That is, one queue head per endpoint & direction.
10:0	RESERVED_BITS10_0	The values of these bits has no effect on circuit operation.

0x1250015C USB1_HS_USB_OTG_HS_TTCTRL

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_TTCTRL register is the TT status and control register. This register contains parameters needed for internal TT operations.

NOTE This register is not used in the device controller operation.

USB1_HS_USB_OTG_HS_TTCTRL

Bits	Name	Description
31	RESERVED_BIT31	Not used.
30:24	TTHA	Not used.
23:0	RESERVED_BITS23_0	Not used.

0x12500160 USB1_HS_USB_OTG_HS_BURSTSIZE

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1010

The USB_OTG_HS_BURSTSIZE register is the programmable burst size register. This register is used to control dynamically change the burst size used during data movement on the initiator (master) interface.

USB1_HS_USB_OTG_HS_BURSTSIZE

Bits	Name	Description
31:16	RESERVED_BITS31_16	The value of these bits has no effect on circuit operation.
15:8	TXPBURST	Programmable Tx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from system memory to the USB bus.
7:0	RXPBURST	Programmable Rx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from the USB bus to system memory.

0x12500164 USB1_HS_USB_OTG_HS_TXFILLTUNING

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_TXFILLTUNING register is the host transmit pre-buffer packet tuning register. The fields in this register control performance tuning associated with how the host controller posts data to the Tx latency FIFO before moving the data onto the USB bus. The specific areas of performance include the how much data to post into the FIFO and an estimate for how long that operation should take in the target system.

Definitions:

T0 = Standard packet overhead

T1 = Time to send data payload

Tff = Time to fetch packet into TX FIFO up to specified level.

Ts = Total packet flight time (send-only) packet

Ts = T0 + T1

Tp = Total packet time (fetch and send) packet

Tp = Tff + T0 + T1

Upon discovery of a transmit (OUT/SETUP) packet in the data structures, the host controller checks to ensure Tp remains before the end of the [micro] frame. If so it proceeds to pre-fill the TX FIFO. If at anytime during the pre-fill operation the time remaining the [micro] frame is < Ts, then the packet attempt ceases and the packet is tried at a later time. Although this is not an error condition and the host controller will eventually recover, a mark will be made the scheduler health counter to note the occurrence of a ’back-off’ event. When a back-off event is detected, the partial packet fetched may need to be discarded from the latency buffer to make room for periodic traffic that will begin after the next SOF. Too many back-off events can waste bandwidth and power on the system bus, and thus should be minimized (not necessarily eliminated). Back-offs can be minimized with use of the TSCHHEALTH (Tff), as described in the register table.

USB1_HS_USB_OTG_HS_TXFILLTUNING

Bits	Name	Description
31:22	RESERVED_BITS31_22	The value of these bits has no effect on circuit operation.
21:16	TXFIFOTHRES	FIFO burst threshold Default = 2 This register controls the number of data bursts that are posted to the TX latency FIFO in the host mode before the packet begins on to the bus. The minimum value is 2 and this value should be a low as possible to maximize USB performance. A higher value can be used in systems with unpredictable latency and/or insufficient bandwidth, where the FIFO may underrun because the data transferred from the latency FIFO to USB occurs before it can be replenished from system memory. This value is ignored if the stream disable bit in USBMODE register is set (1).
15:13	RESERVED_BITS15_13	The value of these bits has no effect on circuit operation.

USB1_HS_USB_OTG_HS_TXFILLTUNING (cont.)

Bits	Name	Description
12:8	TXSCHHEALTH	Scheduler health counter Read/write to clear Default = 0 This register increments when the host controller fails to fill the Tx latency FIFO to the level programmed by TXFIFOTHRES before running out of time to send the packet before the next start-of-frame. This health counter measures the number of times this occurs to provide feedback to selecting a proper TXSCHOH. Writing to this register will clear the counter and this counter will be at a maximum at 31.
7:0	TXSCHOH	Scheduler overhead Default = 0 This register adds an additional fixed offset to the schedule time estimator described above as Tff. As an approximation, the value chosen for this register should limit the number of back-off events captured in the TXSCHHEALTH to less than 10 per second in a highly-utilized bus. Choosing a value that is too high for this register is not desired, as it can needlessly reduce USB utilization. The time unit represented in this register is 1.267 ms when a device is connected in the high-speed mode for OTG and SPH. The time unit represented in this register is 6.333 ms when a device is connected in the low/full speed mode for OTG and SPH. The time unit represented in this register is always 1.267 times the MPH product.

0x12500170 USB1_HS_USB_OTG_HS_ULPI_VIEWPORT

Type: Read/write (unless otherwise indicated)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x08000000

The USB_OTG_HS_ULPI_VIEWPORT register provides indirect access to the ULPI PHY register set. Although the core performs access to the ULPI PHY register set, there may be extraordinary circumstances where software may need direct access.

CAUTION Writes to the ULPI through the viewport can substantially harm standard USB operations. Currently, no usage model has been defined where the software should need to execute writes directly to the ULPI - see the exception regarding optional features below.

Executing read operations though the ULPI viewport should have no harmful side effects to standard USB operations.

NOTE The ULPI viewport is only synthesized in the design if the constant VUSB_HS_PHY_ULPI is set (1). If the ULPI interface is not enabled, this register will always read zeros.

Two operations can be performed with the ULPI viewport: wake-up and read/write operations. The wake-up operation is used to put the ULPI interface into normal operation mode and re-enable the clock, if necessary. A wake-up operation is required before accessing the registers when the ULPI interface is operating in the low power mode, serial mode, or car kit mode.

The ULPI state can be determined by reading the sync state bit (ULPISS). If this bit is set (1), then the ULPI interface is running in the normal operation mode and can accept read/write operations. If the ULPISS is clear (0), then read/write operations will not be able to execute. Undefined behavior will result if ULPISS = 0, and a read or write operation is performed.

To execute a wake-up operation, write all 32-bits of the ULPI Viewport where ULPIPORT is constructed appropriately, and the ULPIWU bit is set (1) and the ULPIRUN bit is clear (0). Poll the ULPI viewport until ULPIWU is zero for the operation to complete.

To execute a read or write operation, write all 32-bits of the ULPI viewport where ULPIDATWR, ULPIADDR, ULPIPORT, and ULPIRW are constructed appropriately, and the ULPIRUN bit is set (1). Poll the ULPI viewport until ULPIRUN is zero for the operation to complete. Once ULPIRUN is zero, the ULPIDATRD will be valid if the operation was a read.

The polling method above could also be replaced and an interrupt driven using the ULPI interrupt defined in the USBTS and USBINTR registers. When a wake-up or read/write operation completes, the ULPI interrupt will be set (1).

Several optional features may need to be enabled or disabled by the system software as part of system configuration. These bits are contained in the interface and OTG control registers of the ULPI PHY register set. These registers also contain bits that are controlled by the link dynamically and, therefore, should only be modified by the system software using the set/clear access method. Direct writes to these registers could have harmful side effects to the standard USB operations. The following bits are optional bits:

- Bits 3 through 7 in the interface control register
- Bits 6 and 7 in the OTG control register.

Refer to the ULPI Specification Revision 1.1 for further information on the use of the optional features. For more information on the use of the optional features http://www.ulpi.org/documents.html.

USB1_HS_USB_OTG_HS_ULPI_VIEWPORT

Bits	Name	Description
31	ULPIWU	ULPI wake-up Setting (1) this bit begins the wake-up operation. The bit will automatically transition to 0 after the wake-up is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wake-up and a read/write operation at the same time.

USB1_HS_USB_OTG_HS_ULPI_VIEWPORT (cont.)

Bits	Name	Description
30	ULPIRUN	ULPI read/write run Setting (1) this bit will begin the read/write operation. The bit will automatically transition to 0 after the read/write is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time.
29	ULPIRW	ULPI read/write control This bit selects between running a read or write operation. value 0 = Read value 1 = Write
28	ULPIFORCE	ULPI read/write force This bit enables forcing register access during RX packet value 0 = register access is not forced during RX packet (default) value 1 = register access is forced during RX packet reception
27	ULPISS	ULPI sync state Read Only value 1 = Normal sync state value 0 = In another state (for example, car kit, serial, low power) This bit represents the state of the ULPI interface. Before reading this bit, the ULPIPORT field should be set accordingly if used with the multi-port host. Otherwise, this field should always remain 0.
26:24	ULPIPORT	ULPI port number For the wakeup or read/write operation to be executed, this value selects the port number the ULPI PHY is attached to in the multi-port host. The valid range is 0 to 7. This field should always be written as a 0 for the non-multi port products.
23:16	ULPIADDR	ULPI data address When a read or write operation is commanded, the address of the operation is written to this field.
15:8	ULPIDATRD	ULPI data read Read only After a read operation completes, the result is placed in this field.
7:0	ULPIDATWR	ULPI data write When a write operation is commanded, the data to be sent is written to this field.

0x12500178 USB1_HS_USB_OTG_HS_ENDPTNAK

Type: Read/write clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTNAK register is the endpoint NAK register.

USB1_HS_USB_OTG_HS_ENDPTNAK

Bits	Name	Description
31:16	EPTN_15_0	Tx endpoint NAK Each tx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received IN token for the corresponding endpoint. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0
15:0	EPRN_15_0	Rx endpoint NAK Each rx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received OUT or PING token for the corresponding endpoint. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x1250017C USB1_HS_USB_OTG_HS_ENDPTNAKEN

Type: Read/write clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTNAKEN register is the endpoint NAK enable register.

USB1_HS_USB_OTG_HS_ENDPTNAKEN

Bits	Name	Description
31:16	EPTNE_15_0	Tx endpoint NAK enable Each bit is an enable bit for the corresponding Tx endpoint NAK bit. If this bit is set (1) and the corresponding Tx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0
15:0	EPRNE_15_0	Rx endpoint NAK enable Each bit is an enable bit for the corresponding Rx endpoint NAK bit. If this bit is set (1) and the corresponding Rx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x12500184 USB1_HS_USB_OTG_HS_PORTSC

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xCC000004

This is the USB_OTG_HS_PORTSC register.

USB1_HS_USB_OTG_HS_PORTSC

Bits	Name	Description
31:30	PTS	Parallel transceiver select Read/write This register bit pair is used in conjunction with the configuration constant VUSB_HS_PHY_TYPE to control which parallel transceiver interface is selected. If VUSB_HS_PHY_ TYPE is set for 0, 1, 2, or 3, then this bit is read only. If VUSB_HS_PHY_TYPE is 4, 5, 6, or 7, then this bit is read/write. This field is reset to the following values: 00 if VUSB_HS_PHY_TYPE = 0,4 - UTMI/UTMI+ 01 if VUSB_HS_PHY_TYPE = 1,5 - Reserved 10 if VUSB_HS_PHY_TYPE = 2,6 - ULPI 11 if VUSB_HS_PHY_TYPE = 3,7 - Serial/1.1 PHY (FS only) This bit is not defined in the EHCI specification.
29	STS	Serial transceiver select Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY_SERIAL to control whether the parallel or serial transceiver interface is selected for FS and LS operation. The serial interface engine can be used in combination with the UTMI+ or ULPI physical interface to provide FS/LS signaling instead of the parallel interface. ’ If VUSB_HS_PHY_SERIAL is 0 or 1, then this bit is read only. ’ If VUSB_HS_PHY_SERIAL is 2 or 3, then this bit is read/write. This bit has no effect unless the parallel transceiver select is set to UTMI+ or ULPI. The Serial/1.1 physical interface will use the serial interface engine for FS/LS signaling regardless of this bit value. Note: This bit was reserved for future operation, and is now adding for dynamic use of the serial engine in accord with UMTI+ and ULPI characterization logic. This bit is not defined in the EHCI specification.

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
28	PTW	Parallel transceiver width Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY16_8 to control the data bus width of the UTMI transceiver interface. ' If VUSB_HS_PHY16_8 is 0 or 1, then this bit is read only. ' If VUSB_HS_PHY16_8 is 2 or 3, then this bit is read/write. This bit is reset to 1 if VUSB_HS_PHY16_8 selects a default UTMI interface width of 16-bits, else it is reset to 0. ' Writing this bit to 0 selects the 8-bit [60MHz] UTMI interface. ' Writing this bit to 1 selects the 16-bit [30MHz] UTMI interface. This bit has no effect if the serial interface is selected. This bit is not defined in the EHCI specification.
27:26	PSPD	Port speed Read only This register field indicates the speed at which the port is operating. For HS mode operation in the host controller and HS/FS operation in the device controller, the port routing steers data to the protocol engine. For FS and LS mode operation in the host controller, the port routing steers data to the protocol engine with the embedded transaction translator. value 00 = Full speed value 01 = Low speed value 10 = High speed This bit is not defined in the EHCI specification.
25	SPRT	Short Port Reset Time. shortens port reset time for simulation.
24	PFSC	Port force full speed connect Read/write Default = 0 Setting (1) this bit will force the port to only connect at full speed. It also disables the chirp sequence that allows the port to identify itself as high speed. This is useful for testing FS configurations with a HS host, hub or device. This bit is not defined in the EHCI specification. This bit is for debugging purposes.

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
23	PHCD	PHY low power suspend - clock disable (PLPSCD) Read/write Default = 0 value 1 = Disable the PHY clock. value 0 = Enable the PHY clock. Reading this bit will indicate the status of the PHY clock. Note: The PHY clock cannot be disabled if it is being used as the system clock. In the device mode, The PHY can be put into low power suspend - clock disable when the device is not running (USBCMD run/stop = 0) or the host has signaled suspend (PORTSC SUSPEND = 1). Low power suspend will be cleared automatically when the host has signaled resume. Before forcing a resume from the device, the device controller driver must clear this bit. In the host mode, the PHY can be put into low power suspend - clock disable when the downstream device has been put into the suspend mode or when no downstream device is connected. Low power suspend is completely under the control of the software. This bit is not defined in the EHCI specification.
22	WKOC	Wake on over-current enable (WKOC_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to over-current conditions as wake-up events. This bit is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0). This bit is output from the controller as signal pwrctl_wake_ ovrcurr_en (OTG/host core only) for use by an external power control circuit.
21	WKDS	Wake on disconnect enable (WKDSCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device disconnects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_ dscnnt_en (OTG/host core only) for use by an external power control circuit.

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
20	WKCN	Wake on connect enable (WKCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device connects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_ dscnnt_en (OTG/host core only) for use by an external power control circuit.

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
19:16	PTC_3_0	Port test control Read/write Default = 0000 Any other value than zero indicates that the port is operating in the test mode. Value Specific test The FORCE_ENABLE_FS and FORCE ENABLE_LS tests are extensions to the test mode support, as specified in the EHCI specification. Writing the PTC field to any of the FORCE_ENABLE_{HS/FS/LS} values will force the port into the connected and enabled state at the selected speed. Writing the PTC field back to TEST_MODE_DISABLE will allow the port state machines to progress normally from that point. Note: Low speed operations are not supported as a peripheral device. 0x0: TEST_MODE_DISABLE 0x1: J_ STATE 0x8: K_STATE 0x9: SE0 (host / NAK device) 0x40: Packet 0x41: FORCE_ENABLE_HS 0x48: FORCE_ENABLE_FS 0x49: FORCE_ENABLE_LS 0x3E8: Reserved_1 0x3E9: Reserved_2 0x3EA: Reserved_3 0x3EB: Reserved_4 0x3EC: Reserved_5 0x3ED: Reserved_6 0x3EE: Reserved_7 0x3EF: Reserved_8 0x3F0: Reserved_9 0x3F1: Reserved_10 0x3F2: Reserved_11 0x3F3: Reserved_12 0x3F4: Reserved_13 0x3F5: Reserved_14 0x3F6: Reserved_15 0x3F7: Reserved_16 0x3F8: Reserved_17 0x3F9: Reserved_18 0x3FA: Reserved_19 0x3FB: Reserved_20 0x3FC: Reserved_21 0x3FD: Reserved_22 0x3FE: Reserved_23 0x3FF: Reserved_24

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
15:14	PIC_1_0	Port indicator control Read/write Default = 0 Writing to this field has no effect if the P_INDICATOR bit in the HCSPARAMS register is a zero. If the P_INDICATOR bit is set (1), then this field has the following meanings: Bit value Meaning value 00 Port indicators are off value 01 Amber value 10 Green value 11 Undefined Refer to the USB Specification Revision 2.0 for a description on how these bits are to be used http://www.usb.org/developers/docs/ This field is output from the controller as signals port_ind_ctl_1 and port_ind_ctl_0 for use by an external LED driving circuit.
13	PO	Port owner Read only Port owner hand-off is not implemented in this design, therefore this bit will always read back as clear (0). Default = 0 The EHCI definition is include here for reference: ’ This bit unconditionally goes clear (0) when the configured bit in the CONFIGFLAG register makes a 0-to-1 transition. ’ This bit unconditionally goes set (1) whenever the configured bit is clear (0). The system software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). The software sets (1) this bit when the attached device is not a high-speed device. When this bit is set (1), it indicates that an internal companion controller owns and controls the port.

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
12	PP	Port power (PP) Read/write or read-only The function of this bit depends on the value of the port power switching (PPC) field in the HCSPARAMS register. ’ PPC = 0: PP is read-only. A device controller with no OTG capability does not have port power control switches. ’ PPC = 1: PP is read/write. The host/OTG controller requires port power control switches. This bit represents the current setting of the switch (0 = off, 1 = on). When power is not available on a port (and PP equals a 0), the port is non-functional and will not report attaches, detaches, and so on. When an over-current condition is detected on a powered port and PPC is set (1), the PP bit in each affected port may be transitioned by the host controller driver from a one to a zero, removing power from the port. This feature is implemented in the host/OTG controller (PPC = 1). In a device-only implementation, port power control is not necessary. So, PPC and PP = 0.
11:10	LS_1_0	Line status Read-only These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines: Value Meaning value 00 SE0 value 10 J-state value 01 K-state value 11 Undefined In the host mode, the use of line state by the host controller driver is not necessary (unlike EHCI), because the port controller state machine and the port routing manage the connection of LS and FS. In the device mode, the use of line state by the device controller driver is not necessary.
9	HSP	High-speed port Read-only Default = 0 When the bit is set (1), the host/device connected to the port is in the high-speed mode. When this bit is clear (0), the host/device connected to the port is not in a high-speed mode. Note: HSP is redundant with PSPD(27:26), but will remain in the design for compatibility. This bit is not defined in the EHCI specification.

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
8	PR	Port reset This bit is clear (0) if the port power (PP) bit (bit 12) of this register is clear (0). Host mode: ’ Read/write ’ Default = 0 When the software sets (1) this bit, the bus-reset sequence as defined in the USB Specification Revision 2.0 is started. This bit will automatically clear (go to 0) after the reset sequence is complete. Note: This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the reset duration is timed in the driver. Device mode: This bit is a read-only status bit. Device reset from the USB bus is also indicated in the USBSTS register. 0x1: Port is in reset 0x0: Port is not in reset

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
7	SUSP	Suspend Host mode: ’ Read/write ’ Default = 0 The port enabled bit and suspend bit of this register define the port states: Bit value Port state value 0x Disable value 10 Enable value 11 Suspend When in the suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction if a transaction was in progress when this bit set (1). In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. The host controller will unconditionally clear (0) this bit when the software clears (0) the force port resume bit. The host controller ignores a write of zero to this bit. If the host software sets (1) this bit when the port is not enabled (port enabled bit is a zero), the results are undefined. This field is clear (0) if port power (PP) is clear (0) in the host mode. Device mode: ’ Read only ’ Default = 0 In the device mode, this bit is a read-only status bit. 0x1: Port in suspend state_1 0x0: Port not in suspend st_1 0x1: Port in suspend state_2 0x0: Port not in suspend st_2

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
6	FPR	Force port resume ’ Read/write ’ Default = 0 Host mode: The software sets (1) this bit to drive resume signaling. The host controller sets (1) this bit if a J-to-K transition is detected while the port is in the suspend state. When this bit transitions to a one because a J-to-K transition is detected, the port change detect bit in the USBSTS register is also set (1). This bit will automatically clear (go to 0) after the resume sequence is complete. This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the resume duration is timed in the driver. Note that, when the host controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (full-speed 'K') is driven on the port as long as this bit remains set (1). This bit will remain set (1) until the port has switched to the high-speed idle. Clearing (0) this bit has no affect, because the port controller will time the resume operation and clear (0) the bit when the port control state switches to HS or FS idle. This bit is clear if the port power (PP) is clear (0) in the host mode. This bit is not-EHCI compatible. Device mode: After the device has been in the suspend state for 5 ms or more, the software must set (1) this bit to drive resume signaling before clearing. The device controller will set (1) this bit if a J-to-K transition is detected while the port is in the suspend state. The bit will be cleared (0) when the device returns to normal operation. Also, when this bit transitions to a one because a J-to-K transition was detected, the port change detect bit in the USBSTS register is also set (1). 0x1: Resume detected/driven on port 0x0: No resume (K-state detected/driven on port)
5	OCC	Over-current change Read/write control Default = 0 This bit gets is set (1) when there is a change to over-current active. The software clears this bit by setting (1) this bit position. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
4	OCA	Over-current active Read-only Default = 0 value 1 = This port currently has an over-current condition. value 0 = This port does not have an over-current condition. This bit will automatically transition from set (1) to clear (0) when the over current condition is removed. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).
3	PEC	Port enable/disable change Read/write control value 1 = Port enabled/disabled status has changed value 0 = No change Default = 0 Host mode: For the root hub, this bit gets set (1) only when a port is disabled due to disconnect on the port or due to the appropriate conditions existing at the EOF2 point. The software clears this bit by writing a one to it. This field is clear (0) if the port power (PP) bit in the register is clear (0). Device mode: The device port is always enabled (this bit will be zero).
2	PE	Port enabled/disabled Read/write value 1 = Enable value 0 = Disable Default 0 Host mode: Ports can only be enabled by the host controller as a part of the reset and enable. The software cannot enable a port by setting (1) this field. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by the host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port, due to other host controller and bus events. When the port is disabled, (0) downstream propagation of data is blocked except for reset. This field is clear (0) if the port power (PP) bit is cleared (0) in the host mode. Device mode: The device port is always enabled (this bit will be set [1])

USB1_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
1	CSC	Connect status change Read/write control value 1 = Change in current connect status value 0 = No change Default = 0 Host mode: Indicates that a change has occurred in the port's current connect status. The host/device controller sets (1) this bit for all changes to the port device connect status, even if the system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, the hub hardware will be 'setting' an already-set bit (that is, the bit will remain set). The software clears this bit by writing a one to it. This field is zero if the port power (PP) bit in this register is zero in the host mode. Device mode: This bit is undefined in the device controller mode.
0	CCS	Current connect status Read-only Host mode: value 1 = Device is present on port value 0 = No device is present Default = 0 This value reflects the current state of the port, and may not correspond directly to the event that caused the connect status change bit (bit 1) to be set (1). This field is clear if the port power (PP) bit in this register is clear (0) in host mode. Device mode: value 1 = Attached value 0 = Not attached Default = 0 If this bit is set (1), this indicates that the device successfully attached, and is operating in either high speed or full speed, as indicated by the high speed port bit in this register. If this bit is clear (0), this indicates that the device did not attach successfully or was forcibly disconnected by the software clearing (0) the run bit in the USBCMD register. It does not state the device being disconnected or suspended.

0x125001A4 USB1_HS_USB_OTG_HS_OTGSC

Type: Read/Write

Reset State: 0x00000E20

USB1_HS_USB_OTG_HS_OTGSC

Bits	Name	Description
31	RESERVED_BIT31	Clear (0) this bit.
30	DPIE	Data pulse interrupt enable
29	B_1MSE	1 millisecond timer interrupt enable - read/write
28	BSEIE	B session end interrupt enable Read/write Setting (1) this bit enables the B session end interrupt.
27	BSVIE	B session valid interrupt enable Read/write Setting (1) this bit enables the B session valid interrupt.
26	ASVIE	A session valid interrupt enable Read/write Setting (1) this bit enables the A session valid interrupt.
25	AVVIE	A Vbus valid interrupt enable Read/write Setting (1) this bit enables the A Vbus valid interrupt.
24	IDIE	USB ID interrupt enable Read/write Setting (1) this bit enables the USB ID interrupt.
23	RESERVED_BIT23	Clear (0) this bit.
22	DPIS	Data pulse interrupt status Read/write to clear This bit is set (1) when data bus pulsing occurs on DP or DM. Data bus pulsing is only detected when USBMODE.CM = Host (11) and PORTSC(0). PortPower = Off (0). The software must write a one to clear this bit.
21	B_1MSS	1 millisecond timer interrupt status Read/write to clear This bit is set (1) once every millisecond. The software must write a one to clear this bit.
20	BSEIS	B session end interrupt status Read/write to clear This bit is set (1) when the Vbus has fallen below the B session end threshold. The software must write a one to clear this bit
19	BSVIS	B session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the B session valid threshold (0.8 VDC). The software must write a one to clear this bit.

USB1_HS_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Description
18	ASVIS	A session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the A session valid threshold (0.8 VDC). The software must write a one to clear this bit.
17	AVVIS	A Vbus valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the Vbus valid threshold (4.4 VDC) on an A device. The software must write a one to clear this bit.
16	IDIS	USB ID interrupt status Read/write This bit is set (1) when a change on the ID input has been detected. The software must write a one to clear this bit.
15	RESERVED_BIT15	Clear (0) this bit.
14	DPS	Data bus pulsing status Read-only If this bit is set (1), it indicates that the data bus pulsing is being detected on the port.
13	B_1MST	1 millisecond timer toggle Read-only This bit toggles once per millisecond.
12	BSE	B session end Read-only Indicates that the Vbus is below the B session end threshold.
11	BSV	B session valid Read-only Indicates that the Vbus is above the B session valid threshold.
10	ASV	A session valid Read-only Indicates that the Vbus is above the A session valid threshold.
9	AVV	A Vbus valid Read-only Indicates that the Vbus is above the A Vbus valid threshold.
8	ID	USB ID Read-only value 0 = A device value 1 = B device

USB1_HS_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Description
7	HABA	Hardware assist B-disconnect to A-connect Read/write value 0 = Disabled value 1 = Enable automatic B-disconnect to A-connect sequence.
6	HADP	Hardware assist data-pulse Write to set
5	IDPU	ID pull-up Read/write This bit provides control over the ID pull-up register. value 0 = Off value 1 = On (default) When this bit is clear (0), the ID input will not be sampled.
4	DP	Data pulsing Read/write Setting (1) this bit causes the pull-up on DP to be asserted for data pulsing during SRP.
3	OT	OTG termination Read/write This bit must be set (1) when the OTG device is in the device mode. This controls the pull-down on DM.
2	HAAR	Hardware assist auto-reset Read/write value 0 = Disabled value 1 = Enable automatic reset after connect on host port.
1	VC	Vbus charge Read/write Setting (1) this bit causes the Vbus line to be charged. This is used for Vbus pulsing during SRP.
0	VD	Vbus discharge Read/write Setting (1) this bit causes the Vbus to discharge through a resistor.

0x125001A8 USB1_HS_USB_OTG_HS_USBMODE

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_USBMODE register is the USB device mode register.

USB1_HS_USB_OTG_HS_USBMODE

Bits	Name	Description
31:6	RESERVED_BITS31_6	Clear (0) these bits.
5	VBPS	Vbus power select value 0 - Output is 0 value 1 - Output is 1 This bit is connected to the vbus_pwr_select output and can be used for any generic control, but is named to be used by logic that selects between an on-chip Vbus power source (charge pump) and an off-chip source in systems when both are available.
4	SDIS	Stream disable mode value 0 = Inactive (default) value 1 = Active Device mode: Setting (1) this bit disables double priming on both the Rx and Tx for low bandwidth systems. This mode ensures that, when the Rx and Tx buffers are sufficient to contain an entire packet, the standard double buffering scheme is disabled to prevent overruns/underruns in bandwidth-limited systems. Note: In the high speed mode, a NYET handshake will respond to all packets received when the stream disable is active. Host mode: Setting (1) this bit ensures that overruns/underruns of the latency FIFO are eliminated for low bandwidth systems where the Rx and Tx buffers are sufficient to contain the entire packet. Enabling the stream disable also has the effect of ensuring that the Tx latency is filled to capacity before the packet is launched onto the USB. Note: Time duration to pre-fill the FIFO becomes significant when the stream disable is active. See TXFILLTUNING and TXTTFILLTUNING [MPH only] to characterize the adjustments needed for the scheduler when using this feature. Note: The use of this feature substantially limits of the overall USB performance.
3	SLOM	Setup lockout mode. In the device mode, this bit controls the behavior of the setup lock mechanism. value 0 = Setup lockouts on (default) value 1 = Setup lockouts off (DCD requires use of a setup data buffer tripwire in USBCMD)

USB1_HS_USB_OTG_HS_USBMODE (cont.)

Bits	Name	Description
2	ES	Endian select Read/write This bit can change the byte ordering of the transfer buffers to match the host microprocessor bus architecture. The bit fields in the microprocessor interface and the DMA data structures (including the setup buffer within the device QH) are unaffected by the value of this bit, because they are based upon 32-bit words. value 0 = Little endian (default) - first byte referenced in the least significant byte of a 32-bit word. value 1 = Big endian - first byte referenced in most significant byte of a 32-bit word.
1:0	CM	Controller mode Read/write once The controller mode is defaulted to the proper mode for host-only and device-only implementations. For those designs that contain both host and device capability, the controller will default to an idle state and will need to be initialized to the desired operating mode after reset. For combination host/device controllers, this register can only be written once after reset. If it is necessary to switch modes, the software must reset the controller by writing to the RESET bit in the USBCMD register before reprogramming this register. value 00 = Idle [default for combination host/device] value 01 = Reserved value 10 = Device controller [default for device only controller] value 11 = Host controller [default for host only controller]

0x125001AC USB1_HS_USB_OTG_HS_ENPDTSETUPSTAT

Type: Read/write control
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENPDTSETUPSTAT register is the endpoint set-up status register.

USB1_HS_USB_OTG_HS_ENPDTSETUPSTAT

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.

USB1_HS_USB_OTG_HS_ENPDTSETUPSTAT (cont.)

Bits	Name	Description
15:0	ENDPTSETUPSTAT_15_0	Set-up endpoint status For every set-up transaction that is received, a corresponding bit in this register is set (1). The software must clear or acknowledge the setup transfer by setting (1) a respective bit after it has read the setup data from the queue head. The response to a set-up packet as in the order of operations and total response time is crucial to limit bus time outs while the set-up lock-out mechanism is engaged. See Managing Endpoints in the Device Operational Model. This register is only used in the device mode.

0x125001B0 USB1_HS_USB_OTG_HS_ENDPTPRIME

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTPRIME register is the endpoint initialization register. This register is only used in the device mode.

USB1_HS_USB_OTG_HS_ENDPTPRIME

Bits	Name	Description
31:16	PETB_15_0	Prime endpoint transmit buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a transmit operation in order to respond to a USB IN/INTERRUPT transaction. The software should set (1) the corresponding bit when posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a transmit buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. PETB[15] - Endpoint 15 PETB[1] - Endpoint 1 PETB[0] - Endpoint 0

USB1_HS_USB_OTG_HS_ENDPTPRIME (cont.)

Bits	Name	Description
15:0	PERB_15_0	Prime endpoint receive buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a receive operation for when a USB host initiates a USB OUT transaction. The software should set (1) the corresponding bit whenever posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x125001B4 USB1_HS_USB_OTG_HS_ENDPTFLUSH

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTFLUSH register is the endpoint de-initialize register. This register is only used in the device mode.

USB1_HS_USB_OTG_HS_ENDPTFLUSH

Bits	Name	Description
31:16	FETB_15_0	Flush endpoint transmit buffer Setting (1) a bit in this register will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. FETB[15] - Endpoint 15 FETB[1] - Endpoint 1 FETB[0] - Endpoint 0
15:0	FERB_15_0	Flush endpoint receive buffer Setting a bit (1) will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x125001B8 USB1_HS_USB_OTG_HS_ENDPTSTAT

Type: Read-only
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTSTAT register is the endpoint status register. This register is only used in the device mode.

USB1_HS_USB_OTG_HS_ENDPTSTAT

Bits	Name	Description
31:16	ETBR_15_0	Endpoint transmit buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ETBR[15] - Endpoint 15 ETBR[1] - Endpoint 1 ETBR[0] - Endpoint 0
15:0	ERBR_15_0	Endpoint receive buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ERBR[15] - Endpoint 15 ERBR[1] - Endpoint 1 ERBR[0] - Endpoint 0

0x125001BC USB1_HS_USB_OTG_HS_ENDPTCOMPLETE

Type: Read/write control
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The register is the endpoint complete register. This register is only used in the device mode.

USB1_HS_USB_OTG_HS_ENDPTCOMPLETE

Bits	Name	Description
31:16	ETCE_15_0	Endpoint transmit complete event Each bit indicates that a transmit event (IN/INTERRUPT) occurred and the software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ETCE[15] - Endpoint 15 ETCE[1] - Endpoint 1 ETCE[0] - Endpoint 0
15:0	ERCE_15_0	Endpoint receive complete event Each bit indicates that a received event (OUT/SETUP) occurred and the software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ERCE[15] - Endpoint 15 ERCE[1] - Endpoint 1 ERCE[0] - Endpoint 0

0x125001C0 USB1_HS_USB_OTG_HS_ENDPTCTRL0

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00800080

The USB_OTG_HS_ENDPTCTRL0 register is the endpoint control 0 register. Every device will implement endpoint0 as a control endpoint.

USB1_HS_USB_OTG_HS_ENDPTCTRL0

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

USB1_HS_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
23	TXE	Tx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
22:20	RESERVED_BITS22_20	Clear (0) these bits.
19:18	TXT	Tx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
17	RESERVED_BIT17	Clear (0) this bit.
16	TXS	Tx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
6:4	RESERVED_BITS6_4	Clear (0) these bits.
3:2	RXT	Rx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
1	RESERVED_BIT1	Clear (0) this bit.

USB1_HS_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
0	RXS	Rx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

0x125001C0+4*n USB1_HS_USB_OTG_HS_ENDPTCTRLn, n=[1..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTCTRLn register is the endpoint control n register. There is an ENDPTCTRLn register for each endpoint in a device.

CAUTION If one endpoint direction is enabled and the paired endpoint of the opposite direction is disabled, then the unused direction type must be changed from the default control-type to any other type (such as bulk-type). Leaving an unconfigured endpoint control will cause undefined behavior for the data PID tracking on the active endpoint/direction.

USB1_HS_USB_OTG_HS_ENDPTCTRLn

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23	TXE	Tx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

USB1_HS_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
22	TXR	Tx data toggle reset (WS) value 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and device.
21	TXI	Tx data toggle inhibit value 0 = PID sequencing enabled (default) value 1 = PID sequencing disabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always transmit DATA0 for a data packet.
20	RESERVED_BIT20	Clear (0) this bit.
19:18	TXT	Tx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
17	TXD	Tx endpoint data source value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
16	TXS	Tx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. in most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

USB1_HS_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
6	RXR	Rx data toggle reset (WS) Write 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and the device.
5	RXI	Rx data toggle inhibit value 0 = Disabled (default) value 1 = Enabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always accept a data packet regardless of their data PID.
4	RESERVED_BIT4	Clear (0) this bit.
3:2	RXT	Rx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
1	RXD	Rx endpoint data sink value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
0	RXS	Rx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. in most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

0x125001FC+4*n USB1_HS_USB_OTG_HS_ENDPT_PIPE_IDn, n=[1..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x001F001F

The USB_OTG_HS_ENDPT_PIPE_IDn register is the endpoint pipe number register. There is an USB_OTG_HS_ENDPT_PIPE_IDn register for each endpoint in a device.

NOTE reset value of TX_PIPE_ID and RX_PIPE_ID is 0x1F, which means that Endpoint is not mapped to any pipe.

USB1_HS_USB_OTG_HS_ENDPT_PIPE_IDn

Bits	Name	Description
31:21	RESERVED_BITS31_21	Clear (0) these bits.
20:16	TX_PIPE_ID	This field indicate the pipe number that this tx end point (n) will use in pipe mode.
15:5	RESERVED_BITS15_5	Clear (0) these bits.
4:0	RX_PIPE_ID	This field indicate the pipe number that this rx end point (n) will use in pipe mode.

0x12500240 USB1_HS_USB_OTG_HS_PHY_CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0b1110000111010

The USB_OTG_HS_PHY_CTRL register is used to configure various features in the Synopsys 28nm PHY.

USB1_HS_USB_OTG_HS_PHY_CTRL

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	USB2_PHY_IDHV_CLAMP_EN	Clamp enable for IDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and IDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped high. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
11	USB2_PHY_OTGSESSVLDHV_CLAMP_EN	Clamp enable for OTGSESSVLDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and OTGSESSVLDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.

USB1_HS_USB_OTG_HS_PHY_CTRL (cont.)

Bits	Name	Description
10	PHY_MPM_HV_CLAMP_EN	Clamp enable for HV interrupts level shifters from USB VDD180 domain to VDDPAD MPM in usb2 phy wrapper. When set (1), VLS is active and HV interrupts are translated from 1.8V domain to MPM Vdd domain. When clear (0), VLS is clamped to inactive state. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
9	USB2_PHY_OTGSESSVLD HV_INTEN	Enable HV session valid interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
8	USB2_PHY_IDHV_INTEN	Enable HV id pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
7	USB2_PHY_ULPI_POR	Reset for ULPI PHY Wrapper and ULPI clock domain logic in usb2_phy_wrapper.
6:4	USB2_PHY_FSEL	Reference Clock Frequency Select 011 (Assumes 19.2MHz default)
3	HOST_PORTCTRL_FORCE _SUSEN	Chicken bit for CR-0000153908 - when this bit set the core will enter to low power mode when portctrl host sm enter to suspend mode. Default value is 1.
2	USB2_PHY_SIDDQ	IDDQ Test Enable.
1	USB2_PHY_RETEN	Retention mode enable/disable
0	USB2_PHY_POR	Power-On-Reset (Analog configuration needs to happen before POR is set to 0)

0x12500244 USB1_HS_USB_OTG_HS_GENERIC1

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

The USB_OTG_HS_GENERIC1 register.

USB1_HS_USB_OTG_HS_GENERIC1

Bits	Name	Description
31:16	USB_HS_TX_DEPTH	TX_DEPTH is the number of words in the TX buffer. This number is calculated by the number of bytes allocated per Endpoint divided by 4, times the number of endpoints. The RAM width is 36. In HS USB this value is usually 512 bytes per EP, and for FS ONLY USB it is usually 64 Bytes per EP.
15:0	USB_HS_RX_DEPTH	RX_DEPTH is the number of words in the RX buffer. This number is usually 256, but can support powers of 2 up to 4096. The RAM width is 36.

0x12500248 USB1_HS_USB_OTG_HS_GENERIC2

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

The USB_OTG_HS_GENERIC2 register.

USB1_HS_USB_OTG_HS_GENERIC2

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15	USE_SPS_AHB2AHB	USE_SPS_AHB2AHB generic specifies if AHB2AHB bridge is connected between BAM and SPS Fabric AHB.
14	LPM_SUPPORT	The LPM_SUPPORT generic specifies if USB support Link Power Management.
13:9	USB_HS_DEV_EP	The number of USB endpoints. Valid values for the number of Endpoints are 4, 8, and 16
8:3	MAX_PIPES	The number of simultaneous parallel pipes supported by the BAM. Supported values are 2 to 30
2	USE_SPS	The USE_SPS generic specifies if Bam is connected to USB core.
1	USE_HSIC	The USE_HSIC generic specifies if an HSIC is connected to USB core.
0	UTMI_PHY_SW_IF_EN	The UTMI_PHY_SW_IF_EN generic specifies if UTMI phy Register Interface is enabled

0x12500250 USB1_HS_USB_OTG_HS_L1_EP_CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0000FFFF

The USB_OTG_HS_L1_EP_CTRL register enables/disables transition to L1 and exit from L1 state when specific TX endpoints are primed.

USB1_HS_USB_OTG_HS_L1_EP_CTRL

Bits	Name	Description
31:16	TX_EP_PRIME_L1_EXIT	Those bit's enables Remote Wakeup in L1 state when SW starts Priming The specific Endpoint.
15:0	TX_EP_PRIME_L1_EN	Control bit's that enables/disables transition to L1 when the specific TX Endpoint is active.

0x12500254 USB1_HS_USB_OTG_HS_L1_CONFIG

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_L1_CONFIG register is used to configure various L1 features.

USB1_HS_USB_OTG_HS_L1_CONFIG

Bits	Name	Description
31:12	RESERVED_BITS31_12	Clear (0) these bits.
11	PLL_PWR_DWN_EN	Control bit that enables/disables power down of 480 MHZ PLL in L1 state.
10	PHY_LPM_EN	Control bit that enable/disables entering ULPI Low Power Mode in L1 state
9	GATE_AHB_CLK_EN	Control bit that enable/disables clock request signaling for usb_ahb_clk in L1 state
8	GATE_FS_XCVR_CLK_EN	Control bit that enable/disables clock gating of usb_fs_xcvr_clk in L1 state
7	GATE_SYS_CLK_EN	Control bit that enable/disables clock gating of usb_system_clk in L1 state
6	GATE_XCVR_CLK_EN	Control bit that enable/disables power-down of 480 MHz PLL in L1 state
5	L1_REMOTE_WAKEUP_EN	Control bit that enables/disables Remote Wakeup in L1 state. When this bit is low, then Link Controller never initiates Remote Wakeup in L1 state. When this bit is high, Link Controller can initiate Remote Wakeup.
4	LPM_EN	Control bit that enables/disables LPM support. When this bit is zero a full backward compatibility is ensured - no LPM support and no response for LPM Extended Transaction
3:0	PLL_TURNOFF_MIN_HIRD	Specifying a minimum expected HIRD value from Host that enables HW mechanism for turning off the 480 MHz PLL. The default value is 50us.

0x12500258 USB1_HS_USB_OTG_HS_LPM_DEBUG_1

Type: Read/Clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_DEBUG_1 register is for debug and testing purposes mostly.

USB1_HS_USB_OTG_HS_LPM_DEBUG_1

Bits	Name	Description
31:16	DEBUG_L1_LONG_ENT_CNT	Count number of exits from L1 where duration in L1 is > 200us. Writing to this register clears the counter.
15:0	DEBUG_L1_SHORT_ENT_CNT	Count number of exits from L1 where duration in L1 is <= 200us. Writing to this register clears the counter.

0x1250025C USB1_HS_USB_OTG_HS_LPM_DEBUG_2

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_DEBUG_2 register is for debug and testing purposes mostly.

USB1_HS_USB_OTG_HS_LPM_DEBUG_2

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12:9	L1_RMT_WKUP_TIME	Read/write Specifying How much time the device drives remote wakeup. The default Value is 50us for reset value. Add the value of this register (in us) to the remote wakeup time.
8	L1_FPR	Read/write L1 Force port resume, The software sets (1) this bit to drive resume signaling.
7	HSIC_CLK_PLL_BYPASSNL	Read only. Disables PLL analog logic. Active low. Connects to bypassnl input of NT_PLL.
6	HSIC_CLK_PLL_RESET	Read only. Resets all FF in PLL. Active low. Connects to reset_n input of NT_PLL.
5	HSIC_CLK_GATE	Read only. Clock gating of hsic_clk and ulpi_clk, without turning off HSIC PLL.
4	FS_XCVR_CLK_GATE	Read only. Clock gating of cc_usb_xcvr_fs_clk
3	SYS_CLK_GATE	Read only. Clock gating of cc_usb_system_clk
2	AHB_CLK_GATE	Read only. Clock gating of usb_ahb_clk

USB1_HS_USB_OTG_HS_LPM_DEBUG_2 (cont.)

Bits	Name	Description
1	L1_STATE	Read only. Status bit indicating if Device is in L1 state. When this bit high, Link Controller and HSIC PHY are in L1 state
0	DEBUG_L1_EN	Read/write Control bit that enable/disables DEBUG counters operation.

0x12500260 USB1_HS_USB_OTG_HS_LPM_ATTRIBUTES

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_ATTRIBUTES register store the bmAttribute Field of the LPM transaction.

USB1_HS_USB_OTG_HS_LPM_ATTRIBUTES

Bits	Name	Description
31:5	RESERVED_BITS31_5	Clear (0) these bits.
4	BREMOTEWAKE	A value of one (1B) in this field enables the addressed device to wake the host upon any meaningful application-specific event (e.g. an interrupt for a device with one or more interrupt endpoints). A value of zero (0B) disables the device from initiating remote wake.
3:0	HIRD	Host Initiated Resume Duration.

20.27 SDC1 DML Registers (0x12400800 SDC1_DML_BASE)

This section contains the SDC1 DML registers.

The address field is a relative address. A base will be supplied by the SOC team and documented at the start of the chip SW Manual.

0x12400800 SDC1_DML_CONFIG

Type: Read/Write
Clock: HCLK
Reset State: 0x00010000

SW has the responsibility to set the CRCI SEL fields correctly when both Consumer and Producer sides are enabled at the same time. For example, setting both to 01 or setting both to 10 is an invalid setting if both producer and consumer sides are kicked off. The DML does NOT assume responsibility for incorrect setting of CRCI SEL fields and hence its function is not defined in such cases.

SDC1_DML_CONFIG

Bits	Name	Description
31:19	RESERVED31	reserved
18	INFINITE_CONS_TRANS	If set, this bit means the consumer transaction is of infinite size. Hence the transaction_end_rec signal from BAM will be ignored.
17	DIRECT_MODE	If set, DML is assumed to directly MASTER the AHB bus, in essence, no BAM or BAM is bypassed. This bit value is also routed to the direct_mode hardware port on the DML to be connected to BAM. See Direct_mode_BASE_addr register.
16	BYPASS	If set, the CRCI pairs will be passed through for legacy central DM support. The config AHB slave interface will be directly accessing the peripheral core for config, command and data movement functions. NOTE: The reset value of this bit is `1' which means the DML come out of PoReset in BYPASS state.
15:6	RESERVED15	reserved
5	PRODUCER_BLOCK_END_HPROT2	If set, DML drives high hprot[2] to BAM when block_end is high, else DML drives low hprot[2] to BAM when block_end is high
4	PRODUCER_TRANS_END_EN	When set, transaction_end signal is asserted at the end of DML transaction. When cleared, transaction_end signal is NOT asserted at the end of DML transaction. This feature allows to divide one BAM transaction to two Peripheral transactions.
3:2	CONSUMER_CRCI_SEL	When set to 00, Consumer side is Disabled When set to 01, CRCI-x pair is the consumer CRCI When set to 10, CRCI-y pair is the consumerCRCI If set to 11, its a invalid setting.

SDC1_DML_CONFIG (cont.)

Bits	Name	Description
1:0	PRODUCER_CRCI_SEL	When set to 00, Producer side is Disabled When set to 01, CRCI-x pair is the producer CRCI When set to 10, CRCI-y pair is the producer CRCI If set to 11, its a invalid setting.

0x12400804 SDC1_DML_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00010001

SDC1_DML_STATUS

Bits	Name	Description
31:17	RESERVED31	reserved
16	CONSUMER_IDLE	0x0: Consumer is busy 0x1: Consumer is IDLE
15:1	RESERVED15	reserved
0	PRODUCER_IDLE	0x0: Producer is busy 0x1: Producer is IDLE

0x12400808 SDC1_DML_SW_RESET

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register resets the DML core. All internal state information will be lost and all register values will be reset as well.

SDC1_DML_SW_RESET

Bits	Name	Description
31:0	RESERVED	reserved

0x1240080C SDC1_DML_PRODUCER_START

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register triggers the DML's Producer state machine. No SW register values will be altered. Only the internal counters and settings related to Producer activity will be reset and started afresh. This register should be written to after POR to kick off producer side. This register should also be used to restart the producer once it has reached IDLE state (as indicated by the STATUS register) after completing the current transaction.

SDC1_DML_PRODUCER_START

Bits	Name	Description
31:0	RESERVED	reserved

0x12400810 SDC1_DML_CONSUMER_START

Type: Write
Clock: HCLK
Reset State: 0x00000000

A write to this register triggers the DML's consumer state machine. No SW register values will be altered. Only the internal counters and settings related to consumer activity will be reset and started afresh. This register should be written to after POR to kick off consumer side. This register should also be used to restart the consumer once it has reached IDLE state (as indicated by the STATUS register) after completing the current transaction..

SDC1_DML_CONSUMER_START

Bits	Name	Description
31:0	RESERVED	reserved

0x12400814 SDC1_DML_PRODUCER_PIPE_LOGICAL_SIZE

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

This register holds the size of the producer pipe (in units of bytes) _to_ which the peripheral can keep writing data to when its the PRODUCER. The value of this register should be consistent with what the BAM registers are programmed with as well. The DML in response to producer side CRCI requests starts writing out data (generated by the Peripheral) from address 0x0 (on its AHB Master Interface). For subsequent Producer side data accesses, the DML keeps on incrementing the address. Upon reaching the max value as indicated by this register, the address rolls over back to 0x0. The address also rolls over back to 0x0 after reaching the end of a transaction.

This register value decides the range of addresses seen on the DML AHB Master address bus during Producer activity.

The value of this register is restricted to any power of two and greater than or equal to the Producer BAM Block Size setting. This is to avoid DML overwriting its own data in the pipe as the data is not committed until block_end is received by the BAM.

The recommended value for this register is 4096(decimal)

SDC1_DML_PRODUCER_PIPE_LOGICAL_SIZE

Bits	Name	Description
31:16	RESERVED31	reserved31
15:0	PRODUCER_LOGICAL_SIZE	The size of the producer pipe (in units of bytes) to which a producer peripheral can keep writing the data it produces.

0x12400818 SDC1_DML_CONSUMER_PIPE_LOGICAL_SIZE

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

This register holds the size of the consumer pipe (in units of bytes) _from_ which the peripheral can keep _reading_ data from when its the CONSUMER. The value of this register should be consistent with what the BAM registers are programmed with as well. The DML in response to consumer side CRCI requests starts reading out data (needed by the Peripheral) from address 0x0 (on its AHB Master Interface). For subsequent consumer side data accesses, the DML keeps on incrementing the address. Upon reaching the max value as indicated by this register, the address rolls over back to 0x0. The address also rolls over back to 0x0 after reaching the end of a transaction.

This register value decides the range of addresses seen on the DML AHB Master address bus during consumer activity.

The value of this register is restricted to any power of two and no smaller than 32 bytes, that is, no smaller than a "beat-8" burst on a 32 bit AHB.

The recommended value for this register is 4096(decimal)

SDC1_DML_CONSUMER_PIPE_LOGICAL_SIZE

Bits	Name	Description
31:16	RESERVED31	reserved31
15:0	CONSUMER_LOGICAL_SIZE	The size of the consumer pipe (in units of bytes) to which a consumer peripheral can keep reading the data from it needs.

0x1240081C SDC1_DML_PIPE_ID

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds pipe IDs that services the producer and consumer side of the peripheral.

- The producer pipe ID is fed to the BAM when servicing the producer side of the peripheral.
- The consumer pipe ID is fed to the BAM when servicing the consumer side of the peripheral.
- The DML also uses this ID value to look into the appropriate side band signals from BAM like pipe_empty, pipe_full etc before initiating the said AHB transaction.

SDC1_DML_PIPE_ID

Bits	Name	Description
31:21	RESERVED31	reserved
20:16	CONSUMER_PIPE_ID	consumer pipe ID
15:5	RESERVED15	reserved
4:0	PRODUCER_PIPE_ID	producer pipe ID

0x12400820 SDC1_DML_PRODUCER_TRACKERS

Type: Read
Clock: HCLK
Reset State: 0x00000000

.This register is for debug purposes only. They reflect the value of the producer block and transaction counters when read. The values may be dynamically changing when a transaction is in progress.

SDC1_DML_PRODUCER_TRACKERS

Bits	Name	Description
31:16	PROD_TRANS_CNT	Value of the 16bit tracker tracking the Producer Transaction Count for the current transaction. Should read 0 at the end of the transaction.
15:0	PROD_BLOCK_CNT	Value of the 16 bit tracker that tracks the Producer Block Count. Need not be zero at the end of transaction.

0x12400824 SDC1_DML_PRODUCER_BAM_BLOCK_SIZE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds the "block" size, in units of bytes, associated with the Producer BAM. The DML asserts the block_end side band signal to the BAM whenever the producer side of the peripheral has generated the said amount of data. This register value should be an integral multiple of the Producer CRCI Block Size.

Legal values for Producer BAM Block Size are 64, 128, 192, 256, 512, 1024, 2048 and 4096.

The recommended value for this register is 512(decimal)

SDC1_DML_PRODUCER_BAM_BLOCK_SIZE

Bits	Name	Description
31:16	RESERVED	reserved
15:0	PRODUCER_BLK_SIZE	Size of the one "block" on the producer side in units of bytes.

0x12400828 SDC1_DML_PRODUCER_BAM_TRANS_SIZE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register holds the "transaction" size, in units of bytes, associated with the Producer BAM. The DML asserts the transaction_end side band signal to the BAM whenever the producer side of the peripheral has generated the said amount of data. This signal is asserted only during the address phase of the AHB transaction that carries the last byte corresponding to the size mentioned in this register. Once this value is reached for a given transaction, the address for subsequent data access rolls back to 0x0 and all the block size, CRCI size and transaction size counters also get reset to 0 and start all over again. A value of zero in this register during a producer transaction start means infinite size transaction and hence transaction_end may not get asserted.

This value can be anything up to a maximum of 4294967295 bytes (4 GB -1). If this register value is zero when the DML is started, then an infinite transaction size is assumed. No transaction_end will be generated.

SDC1_DML_PRODUCER_BAM_TRANS_SIZE

Bits	Name	Description
31:0	PRODUCER_TRANS_SIZE	Size of the one "transaction" on the producer side in units of bytes or if zero, then infinite transaction size assumed.

0x1240082C SDC1_DML_DIRECT_MODE_BASE_ADDR

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register is used whenever the DIRECT_MODE bit in config register is set. The programmed 16bits will be used as DML AHB Master address bus MSBits for consumer (AHB read) and producer (AHB Write) operations. The lower 16bits would be dictated by the pipe logical size register.

SDC1_DML_DIRECT_MODE_BASE_ADDR

Bits	Name	Description
31:16	CONSUMER_BASE_ADDR	used as AHB Master address (31:16) when doing direct mode consumer operations if direct_mode bit is set.
15:0	PRODUCER_BASE_ADDR	used as AHB Master address (31:16) when doing direct mode producer operations if direct_mode bit is set.

0x12400830 SDC1_DML_DEBUG

Type: Write/Read
Clock: HCLK
Reset State: 0x00000000

Enables Test Bus of the DML and also selects which side signals to drive the test bus with.

SDC1_DML_DEBUG

Bits	Name	Description
31:2	RESERVED	reserved
1	STATUS_2_SEL	If set, selects the set of signals listed out in DML_BAM_SIDE_STATUS_2 register onto Test bus, else selects set of signals listed out in DML_BAM_SIDE_STATUS_1 register to be muxed onto test bus. Valid only if bit 0 is set.
0	TESTBUS_EN	0x0: Disable Test Bus 0x1: Enable Test Bus

0x12400834 SDC1_DML_BAM_SIDE_STATUS_1

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the instantaneous value of the side band signals with BAM.

SDC1_DML_BAM_SIDE_STATUS_1

Bits	Name	Description
31:24	RESERVED31	reserved
23	ACK_ON_SUCCESS_TOGGLE	for selected consumer pipe
22	ACK_BYTES_AVAIL_TOGGLE	for selected consumer pipe
21	PIPE_BYTES_AVAIL_TOGGLE	for selected consumer pipe
20	TRANSACTION_END_REC	transaction end received for selected consumer pipe.
19	PIPE_BYTES_FREE_TOGGLE	bytes free toggle signal for selected producer pipe
18:3	PIPE_BYTES_FREE	bytes free value for selected producer pipe
2	MESSAGING_ONLY	DML output status
1	TRANSACTION_END	DML output status
0	BLOCK_END	DML output status

0x12400838 SDC1_DML_BAM_SIDE_STATUS_2

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the instantaneous value of the side band signals with BAM.

SDC1_DML_BAM_SIDE_STATUS_2

Bits	Name	Description
31:16	ACK_ON_SUCCESS_TOGGLE_SIZE	for selected consumer pipe
15:0	PIPE_BYTES_AVAIL	for selected consumer pipe

0x1240083C SDC1_DML_RTL_GENERICS_1

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the RTL Generics set during the integration of the DML into a SPS Wrapper or other entity.

SDC1_DML_RTL_GENERICS_1

Bits	Name	Description
31:17	RESERVED31	reserved
16:11	PERIPHERAL_ADDR_WIDTH	represents the width set (in binary format)
10:6	MAX_PIPES	represents the number of pipe value set (in binary format)
5:3	CONSUMER_CRCI_BLK	101:.256 bytes 0x0: 16 bytes 0x1: 32 bytes 0x2: 64 bytes 0x3: 128 bytes 0x4: 192 bytes
2:0	PRODUCER_CRCI_BLK	101:.256 bytes 0x0: 16 bytes 0x1: 32 bytes 0x2: 64 bytes 0x3: 128 bytes 0x4: 192 bytes

0x12400840 SDC1_DML_RTL_GENERICS_2

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the PROD_DMR_RD_ADDR Generic set in RTL during the integration of the DML into a SPS Wrapper or other entity.

SDC1_DML_RTL_GENERICS_2

Bits	Name	Description
31:0	PROD_RD_DMR_ADDR	32bit Value of the PROD_DMR_RD_ADDR generic

0x12400844 SDC1_DML_RTL_GENERICS_3

Type: Read
Clock: HCLK
Reset State: 0xXXXXXXXX

Reflects the value of the CONS_DMR_WR_ADDR Generic set in RTL during the integration of the DML into a SPS Wrapper or other entity.

SDC1_DML_RTL_GENERICS_3

Bits	Name	Description
31:0	CONS_WR_DMR_ADDR	32bit Value of the CONS_DMR_WR_ADDR generic

0x12400848 SDC1_DML_INTERRUPT_ENABLE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

SDC1_DML_INTERRUPT_ENABLE

Bits	Name	Description
31:1	RESERVED31	reserved
0	PROD_IDLE_START_INTR_EN	Enable DML to generate an interrupt when PRODUCER enters an IDLE state.

0x1240084C SDC1_DML_INTERRUPT_CLEAR

Type: Write
Clock: HCLK
Reset State: 0xXXXXXXXX

SDC1_DML_INTERRUPT_CLEAR

Bits	Name	Description
31:1	RESERVED31	reserved
0	PROD_IDLE_START_INTR_CLR	Clear PROD_IDLE_START_INTR interrupt.

20.28 SDC1 BAM Registers (0x12402000 SDC1_BAM_BASE)

BAM supports only Word (4 byte) aligned writes and reads on the Configuration Bus interface.

BAM has MAX_PIPES hardware generic parameter defining the number of pipes it supports. Each BAM can have up to 31 pipes supported.

BAM has BAM_CONF_AHBS_ADDR_WIDTH hardware generic parameter defining the Bit Number for selecting BAM access or Peripheral access. Legal Ranges are 14 to 20. Count starts from 1, meaning a value of 17 will set BAM Base address as 0x0001_0000.

20.28.1 BAM control registers

BAM Control registers configure the BAM operational state, SW reset, interrupts and others.

0x12402F80 SDC1_BAM_CTRL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

BAM Control register allows global controls for the BAM.

SDC1_BAM_CTRL

Bits	Name	Description
31:17	RESERVED_BITS31_17	Set to Zero (0)
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1’b1 - Enable Power Saving Mode 1’b0 - Disable Power Saving Mode
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only

SDC1_BAM_CTRL (cont.)

Bits	Name	Description
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2'b00 - Cache when current descriptor has less than 64 bytes left. 2'b01 - Cache when current descriptor has less than 128 bytes left. 2'b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2'b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
12	RESERVED_BITS12	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_SIC_SEL
11:5	BAM_TESTBUS_SEL	Set to Zero (0) Obsolete field: BAM_TESTBUS_SEL Test Bus selector. Supported until (including) bam_p3q3r29 (BlackBird). Moved to a dedicated register - BAM_TEST_BUS_SEL in the following releases.
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1'b1 - Enabled 1'b0 - Disabled Available in BAM only
3	RESERVED_BITS3	Set to Zero (0)
2	RESERVED_BITS2	Set to Zero (0)
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled

SDC1_BAM_CTRL (cont.)

Bits	Name	Description
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x12402F84 SDC1_BAM_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

SDC1_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists

SDC1_BAM_REVISION (cont.)

Bits	Name	Description
16	SECURED	This field indicates BAM/BAM-Lite has security support (APU inside) 1'b1 - Secured 1'b0 - Not Secured
15:12	RESERVED_BITS15_12	Set to Zero (0)
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRCS*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRCS*_EEn registers exist for n=[0..3].
7:0	REVISION	This field contains the revision number of the core, Hard Coded. 8'h01 - Voyager (bam_p3q3r22 +) 8'h02 - BlackBird (bam_p3q3r27 +) 8'h03 - Waverider BAM (bam_p3q3r30 +) 8'h04 - Aurora BAM (bam_p3q2r43 +) 8'h05 - Shelby BAM (bam_p2q2r45 +) 8'h10 - Waverider BAM Lite (bam_lite_p1q1r0 +) 8'h11 - Aurora BAM Lite (bam_lite_p3q2r16 +) 8'h12 - Shelby BAM Lite (bam_lite_p2q2r18 +)

0x12402FBC SDC1_BAM_NUM_PIPES

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

SDC1_BAM_NUM_PIPES

Bits	Name	Description
31:24	BAM_NON_PIPE_GRP	This field contains the number of BAM Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
23:16	PERIPH_NON_PIPE_GRP	This field contains the number of Peripheral's Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
15:8	RESERVED_BITS15_8	Set to Zero (0)
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x12402FC0 SDC1_BAM_TIMER

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

SDC1_BAM_TIMER

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12402FC4 SDC1_BAM_TIMER_CTRL

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

The resolution of the BAM inactivity timer are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * TIMER_TRSHLD.

SDC1_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12402F88 SDC1_BAM_DESC_CNT_TRSHLD

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

SDC1_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0).
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. Available in BAM only

0x12402F8C SDC1_BAM_IRQ_SRCS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW

reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

SDC1_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12402F90 SDC1_BAM_IRQ_SRCS_MSK

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

SDC1_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12402FB0 SDC1_BAM_IRQ_SRCS_UNMASKED

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

SDC1_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x12402F94 SDC1_BAM_IRQ_STTS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

SDC1_BAM_IRQ_STTS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12402F98 SDC1_BAM_IRQ_CLR

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

SDC1_BAM_IRQ_CLR

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12402F9C SDC1_BAM_IRQ_EN

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

SDC1_BAM_IRQ_EN

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only

SDC1_BAM_IRQ_EN (cont.)

Bits	Name	Description
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12402FA0 SDC1_BAM_RESERVED_1

Type: Read
Clock: BAM_CLK
Reset State: 0x00000000

SDC1_BAM_RESERVED_1

Bits	Name	Description
31	RESERVED_BITS31	Set to Zero (0) Obsolete field: BAM_IRQ_SIC_SEL
30:0	RESERVED_BITS30_0	Set to Zero (0) Obsolete field: P_IRQ_SIC_SEL

0x12402FA4 SDC1_BAM_AHB_MASTER_ERR_CTRLS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC1_BAM_AHB_MASTER_ERR_CTRLS

Bits	Name	Description
31:23	RESERVED_BITS31_16	Set to Zero (0)
22:18	BAM_ERR_HVMID	HVMID

SDC1_BAM_AHB_MASTER_ERR_CTRLS (cont.)

Bits	Name	Description
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x12402FA8 SDC1_BAM_AHB_MASTER_ERR_ADDR

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC1_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x12402FAC SDC1_BAM_AHB_MASTER_ERR_DATA

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

SDC1_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x12402FB4 SDC1_BAM_RESERVED_2

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

SDC1_BAM_RESERVED_2

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_IRQ_DEST_ADDR

0x12402FB8 SDC1_BAM_RESERVED_3

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

.

SDC1_BAM_RESERVED_3

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_DEST_ADDR

0x12402FF0 SDC1_BAM_TRUST_REG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside - SECURED field in the BAM_REVISION register) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC1_BAM_TRUST_REG

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_VMID	Those bits indicate the VMID value to be used when performing BAM type accesses to the bus. BAM Type accesses include BAM MTI (or Direct Mode accesses, not applicable for BAM Lite)
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable
6:2	RESERVED_BITS6_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_EE	This Field Indicates the EE (0,1,2,3) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12402FF4 SDC1_BAM_TEST_BUS_SEL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is the testbus selector register.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC1_BAM_TEST_BUS_SEL

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	BAM_DATA_ERASE	When enabled, BAM will be instructed to erase all the data it currently has inside. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Erase 1'b0 - Disabled
17	BAM_DATA_FLUSH	When enabled, BAM will be instructed to flush all the data it currently has inside. BAM will only flush the data once it has enough data and a valid destination for it. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Flush 1'b0 - Disabled
16	BAM_CLK_ALWAYS_ON	This bit controls the BAM to issue 'always on' clock request. 1'b1 - Enable Always On clock request. 1'b0 - Disabled
15:7	RESERVED_BITS15_7	Set to Zero (0)
6:0	BAM_TESTBUS_SEL	Test Bus selector. Values with bit[11] set high are reserved for the BAM Lite integrator to provide testbus from outside of the BAM Lite. For example, eDML testbus may reside at X'100_0000' to X'111_1111' selector values. eDML has no registers thus has no test bus selector, so its test bus is combined with the BAM lite's. BAM provides zeroes on its testbus when external values selected. X'000_0000' - Zeros X'000_0001' - Slave test bus X'000_0010' - Pipe state machine test bus X'000_0011' - Buffer test bus X'000_0100' - Sideband test bus X'000_1101' - Bus Manager test bus X'001_0000' - Reg file test bus X'1''_''''' - BAM Lite sets zeroes on the test bus, leaving it for external use

0x12402FF8 SDC1_BAM_TEST_BUS_REG

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the value being output to the testbus of the chip. It is not intended for SW usage but for lab debugging of the BAM. Values here can change every cycle.

SDC1_BAM_TEST_BUS_REG

Bits	Name	Description
31:0	BAM_TESTBUS_REG	32 bit Testbus value. To select the Block in BAM to show here, use the BAM_TESTBUS_SEL field in BAM_CTRL register.

0x12402FFC SDC1_BAM_CNFG_BITS

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

SDC1_BAM_CNFG_BITS

Bits	Name	Description
31:27	RESERVED_BITS31_27	Set to Zero (0)
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only

SDC1_BAM_CNFG_BITS (cont.)

Bits	Name	Description
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there are available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided.. 1'b1 - Enable 1'b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission savepoint, but into the illegal's pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1'b1 - Enabled 1'b0 - Disable Available in BAM only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1'b1 - Enable 1'b0 - Disable Available in BAM only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there's no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1'b1 - Enable 1'b0 - Disable Available in BAM only

SDC1_BAM_CNFG_BITS (cont.)

Bits	Name	Description
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1'b1 - 1'b0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix) 1'b1 - Enable 1'b0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM's common clock request. 1'b1 - Propagate Sideband Clock Request 1'b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. 1'b1 - Enable Power Saving 1'b0 - Disable Power Saving

SDC1_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reset pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1’b1 - Enable external block pipe reset 1’b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. This functionality has been found to be buggy and was removed from APQ8064. Bit is currently unused. 1’b1 - Enable 1’b0 - Disable Available in BAM only
10:4	RESERVED_BITS10_4	Set to Zero (0)
3	BAM_ADML_SYNC_BRIDGE	0x1: Use a Synchronous Configuration bridge in aDML. 0x0: Use a Asynchronous Configuration bridge in aDML.
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It’s invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1’b1 - Enable 1’b0 - Disable Available in BAM only
1	BAM_ADML_DEEP_CONS_FIFO	0x1: Use a deep Consumer FIFO in aDML (16 dwords) 0x0: Use a shallow Consumer FIFO in aDML (8 dwords)
0	BAM_ADML_INCR4_EN_N	0x1: Don’t allow INCR4 aDML-BAM accesses. 0x0: Allow INCR 4 aDML-BAM accesses.

0x12403800+ 128*n SDC1_BAM_IRQ_SRCS_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC1_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12403804+ 128*n SDC1_BAM_IRQ_SRCS_MSK_EEn, n=[0..3]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC1_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12403808+ 128*n SDC1_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

SDC1_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

20.28.2 BAM PIPE management registers

BAM Pipe management registers control each pipe's parameters. Those reside in physical registers.

0x12402000+ 128*n SDC1_BAM_P_CTRLn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Control register provides various controls for the pipe.

SDC1_BAM_P_CTRLn

Bits	Name	Description
31:11	RESERVED_BITS31_11	Set to Zero (0)
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be pre-fetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

SDC1_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only.When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
2	RESERVED_BITS2	Set to Zero (0)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe
0	RESERVED_BITS0	Set to Zero (0)

0x12402004+ 128*n SDC1_BAM_P_RSTn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

SDC1_BAM_P_RSTn

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	P_SW_RST	This resets the pipe and its' registers, (Both Flip-Flops and RAM). 1'b1 - Reset 1'b0 - Do Nothing

0x12402008+ 128*n SDC1_BAM_P_HALTn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Halt register Enables/Disables the Halt Sequence.

This is a self-modifying register.

SDC1_BAM_P_HALTn

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it.

0x12402030+ 128*n SDC1_BAM_P_TRUST_REGn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

SDC1_BAM_P_TRUST_REGn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_P_VMID	Those bits indicate the VMID value to be used when performing Pipe type accesses to the bus. BAM Type accesses include Pipe MTI, Data and Descriptors.
7:2	RESERVED_BITS7_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_P_EE	This Field Indicates the EE (0,1,2,3) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12402010+ 128*n SDC1_BAM_P_IRQ_STTSn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

SDC1_BAM_P_IRQ_STTSn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

0x12402014+128*n SDC1_BAM_P_IRQ_CLRn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

SDC1_BAM_P_IRQ_CLRn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_CLR	1’b1 - Clear 1’b0 - Unchanged
4	P_ERR_CLR	1’b1 - Clear 1’b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1’b1 - Clear 1’b0 - Unchanged

SDC1_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

0x12402018+ 128*n SDC1_BAM_P_IRQ_ENn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

SDC1_BAM_P_IRQ_ENn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

0x1240201C+ 128*n SDC1_BAM_P_TIMERn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the pipe.

SDC1_BAM_P_TIMERn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12402020+ 128*n SDC1_BAM_P_TIMER_CTRLn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the P_TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * P_TIMER_TRSHLD.

SDC1_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12402024+ 128*n SDC1_BAM_P_PRDCR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

SDC1_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value

0x12402028+ 128*n SDC1_BAM_P_CNSMR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

SDC1_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value

20.28.3 BAM PIPE configuration registers (RAM)

BAM Pipe management registers configure each pipes' parameters.

Pipe Address span: currently defining each pipe to have 32 addresses, therefore inter pipe offset is 32*4=128=0x80 bytes.

0x1240302C+ 64*n SDC1_BAM_P_EVNT_DEST_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

SDC1_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x12403018+64*n SDC1_BAM_P_EVNT_REGn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

SDC1_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x12403000+64*n SDC1_BAM_P_SW_OFSTSn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC1_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode.
15:0	SW_DESC_OFST	Descriptor FIFO offset.

0x12403024+ 64*n SDC1_BAM_P_DATA_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

SDC1_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x1240301C+ 64*n SDC1_BAM_P_DESC_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

SDC1_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x12403028+ 64*n SDC1_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When a BAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

SDC1_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x12403020+ 64*n SDC1_BAM_P_FIFO_SIZESn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

SDC1_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors.

20.28.4 BAM PIPE internal state registers (RAM)

BAM Pipe debug registers allow a software look inside on the internal parameters of the BAM State Machines stored in RAM.

Those shouldn't be normally used or altered by the software.

0x12403034+ 64*n SDC1_BAM_P_RETR_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context stored for retransmission.

This is being stored by Ack Update state machine in consumer mode or by the Writeback state machine in producer mode.

This is being loaded by the Writeback state machine when retransmission happens.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC1_BAM_P_RETR_CNTXT_n

Bits	Name	Description
31:16	RETR_DESC_OFST	Descriptor Fifo Offset for retransmission.
15:0	RETR_OFST_IN_DESC	The Offset inside the Descriptor for retransmission.

0x12403038+ 64*n SDC1_BAM_P_SI_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Sideband Inform state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC1_BAM_P_SI_CNTXT_n

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

0x12403004+ 64*n SDC1_BAM_P_AU_PSM_CNTXT_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Ack Update state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC1_BAM_P_AU_PSM_CNTXT_1_n

Bits	Name	Description
31:16	AU_PSM_ACCUMED	PSM: The acknowledged (EOB/T) number of bytes since last Write Event. AU: The accumulation of the descriptor sizes for the present ack_on_success event. This is never bigger than the ACKED field. Once the ACCUMED values are bigger than Event Threshold, an Event will be issued, the ACKED value will decrease by the ACCUMED size and this value will be zeroed. This also serves as the Bytes Consumed value in the Event.
15:0	AU_ACKED	AU: The left over of the number of bytes that were received via the ack_on_success, that did not cause a descriptor closure. This value is down counting upon issuing Read Event. PSM:

0x12403008+ 64*n SDC1_BAM_P_PSM_CNTXT_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC1_BAM_P_PSM_CNTXT_2_n

Bits	Name	Description
31	PSM_DESC_VALID	The Descriptor Valid bit provided by the Writeback state machine to Pipe state machine.
30	PSM_DESC_IRQ	The Descriptor Interrupt bit provided by the Writeback state machine to pipe state machine.
29	PSM_DESC_IRQ_DONE	The Descriptor Interrupt needed selection bit.
28:25	PSM_GENERAL_BITS	General Context Switch Bits
24:22	PSM_CONS_STATE	State of the Pipe Consumer state machine.
21:19	PSM_PROD_SYS_STATE	State of the Pipe Producer System state machine.
18:16	PSM_PROD_B2B_STATE	State of the Pipe Producer BAM to BAM state machine.
15:0	PSM_DESC_SIZE	The Descriptor Size provided by the Writeback state machine to pipe state machine.

0x1240300C+ 64*n SDC1_BAM_P_PSM_CNTXT_3_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC1_BAM_P_PSM_CNTXT_3_n

Bits	Name	Description
31:0	PSM_DESC_ADDR	The Data Address provided in the current descriptor from the Writeback state machine.

0x12403010+ 64*n SDC1_BAM_P_PSM_CNTXT_4_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC1_BAM_P_PSM_CNTXT_4_n

Bits	Name	Description
31:16	PSM_DESC_OFST	The running Descriptor Fifo Offset of the Writeback state machine
15:0	PSM_SAVED_ACCUMED_SIZE	The Saved Accumulated Size from the Pipe state machine.

0x12403014+64*n SDC1_BAM_P_PSM_CNTXT_5_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

SDC1_BAM_P_PSM_CNTXT_5_n

Bits	Name	Description
31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

0x12403030+64*n SDC1_BAM_P_RESERVED_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

SDC1_BAM_P_RESERVED_1_n

Bits	Name	Description
31:0	BAM_P_RES_1	Set to zero (0) Reserved

0x1240303C+64*n SDC1_BAM_P_RESERVED_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

SDC1_BAM_P_RESERVED_2_n

Bits	Name	Description
31:0	BAM_P_RES_2	Set to zero (0) Obsolete Register: BAM_P_IRQ_DEST_ADDRn, n=[0..30]

20.29 USB1 HS BAM Registers (0x12502000 USB1_HS_BAM_BASE)

This section contains the USB1 BAM registers.

BAM supports only Word (4 byte) aligned writes and reads on the Configuration Bus interface.

BAM has MAX_PIPES hardware generic parameter defining the number of pipes it supports. Each BAM can have up to 31 pipes supported.

BAM has BAM_CONF_AHBS_ADDR_WIDTH hardware generic parameter defining the Bit Number for selecting BAM access or Peripheral access. Legal Ranges are 14 to 20. Count starts from 1, meaning a value of 17 will set BAM Base address as 0x0001_0000.

20.29.1 BAM control registers

BAM Control registers configure the BAM operational state, SW reset, interrupts and others.

0x12502F80 USB1_HS_BAM_CTRL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

BAM Control register allows global controls for the BAM.

USB1_HS_BAM_CTRL

Bits	Name	Description
31:17	RESERVED_BITS31_17	Set to Zero (0)
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1’b1 - Enable Power Saving Mode 1’b0 - Disable Power Saving Mode

USB1_HS_BAM_CTRL (cont.)

Bits	Name	Description
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2’b00 - Cache when current descriptor has less than 64 bytes left. 2’b01 - Cache when current descriptor has less than 128 bytes left. 2’b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2’b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
12	RESERVED_BITS12	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_SIC_SEL
11:5	BAM_TESTBUS_SEL	Set to Zero (0) Obsolete field: BAM_TESTBUS_SEL Test Bus selector. Supported until (including) bam_p3q3r29 (BlackBird). Moved to a dedicated register - BAM_TEST_BUS_SEL in the following releases.
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
3	RESERVED_BITS3	Set to Zero (0)
2	RESERVED_BITS2	Set to Zero (0)

USB1_HS_BAM_CTRL (cont.)

Bits	Name	Description
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x12502F84 USB1_HS_BAM_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

USB1_HS_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)

USB1_HS_BAM_REVISION (cont.)

Bits	Name	Description
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists
16	SECURED	This field indicates BAM/BAM-Lite has security support (APU inside) 1'b1 - Secured 1'b0 - Not Secured
15:12	RESERVED_BITS15_12	Set to Zero (0)
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRCS*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRCS*_EEn registers exist for n=[0..3].
7:0	REVISION	This field contains the revision number of the core, Hard Coded. 8'h01 - Voyager (bam_p3q3r22 +) 8'h02 - BlackBird (bam_p3q3r27 +) 8'h03 - Waverider BAM (bam_p3q3r30 +) 8'h04 - Aurora BAM (bam_p3q2r43 +) 8'h05 - Shelby BAM (bam_p2q2r45 +) 8'h10 - Waverider BAM Lite (bam_lite_p1q1r0 +) 8'h11 - Aurora BAM Lite (bam_lite_p3q2r16 +) 8'h12 - Shelby BAM Lite (bam_lite_p2q2r18 +)

0x12502FBC USB1_HS_BAM_NUM_PIPES

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

USB1_HS_BAM_NUM_PIPES

Bits	Name	Description
31:24	BAM_NON_PIPE_GRP	This field contains the number of BAM Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
23:16	PERIPH_NON_PIPE_GRP	This field contains the number of Peripheral's Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
15:8	RESERVED_BITS15_8	Set to Zero (0)
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x12502FC0 USB1_HS_BAM_TIMER

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

USB1_HS_BAM_TIMER

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12502FC4 USB1_HS_BAM_TIMER_CTRL

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

The resolution of the BAM inactivity timer are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define

the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * TIMER_TRSHLD.

USB1_HS_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12502F88 USB1_HS_BAM_DESC_CNT_TRSHLD

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

USB1_HS_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0).
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. Available in BAM only

0x12502F8C USB1_HS_BAM_IRQ_SRCS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

USB1_HS_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12502F90 USB1_HS_BAM_IRQ_SRCS_MSK

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

USB1_HS_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12502FB0 USB1_HS_BAM_IRQ_SRCS_UNMASKED

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

USB1_HS_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x12502F94 USB1_HS_BAM_IRQ_STTS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

USB1_HS_BAM_IRQ_STTS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.

USB1_HS_BAM_IRQ_STTS (cont.)

Bits	Name	Description
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12502F98 USB1_HS_BAM_IRQ_CLR

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

USB1_HS_BAM_IRQ_CLR

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12502F9C USB1_HS_BAM_IRQ_EN

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

USB1_HS_BAM_IRQ_EN

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12502FA0 USB1_HS_BAM_RESERVED_1

Type: Read
Clock: BAM_CLK
Reset State: 0x00000000

USB1_HS_BAM_RESERVED_1

Bits	Name	Description
31	RESERVED_BITS31	Set to Zero (0) Obsolete field: BAM_IRQ_SIC_SEL
30:0	RESERVED_BITS30_0	Set to Zero (0) Obsolete field: P_IRQ_SIC_SEL

0x12502FA4 USB1_HS_BAM_AHB_MASTER_ERR_CTRLS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB1_HS_BAM_AHB_MASTER_ERR_CTRLS

Bits	Name	Description
31:23	RESERVED_BITS31_16	Set to Zero (0)
22:18	BAM_ERR_HVMID	HVMID
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x12502FA8 USB1_HS_BAM_AHB_MASTER_ERR_ADDR

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB1_HS_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x12502FAC USB1_HS_BAM_AHB_MASTER_ERR_DATA

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB1_HS_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x12502FB4 USB1_HS_BAM_RESERVED_2

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

USB1_HS_BAM_RESERVED_2

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_IRQ_DEST_ADDR

0x12502FB8 USB1_HS_BAM_RESERVED_3

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

USB1_HS_BAM_RESERVED_3

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_DEST_ADDR

0x12502FF0 USB1_HS_BAM_TRUST_REG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside - SECURED field in the BAM_REVISION register) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

USB1_HS_BAM_TRUST_REG

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_VMID	Those bits indicate the VMID value to be used when performing BAM type accesses to the bus. BAM Type accesses include BAM MTI (or Direct Mode accesses, not applicable for BAM Lite)
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable
6:2	RESERVED_BITS6_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_EE	This Field Indicates the EE (0,1,2,3) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12502FF4 USB1_HS_BAM_TEST_BUS_SEL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is the testbus selector register.

Supported in releases after bam_p3q3r29 (BlackBird).

USB1_HS_BAM_TEST_BUS_SEL

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	BAM_DATA_ERASE	When enabled, BAM will be instructed to erase all the data it currently has inside. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1’b1 - Enable Erase 1’b0 - Disabled
17	BAM_DATA_FLUSH	When enabled, BAM will be instructed to flush all the data it currently has inside. BAM will only flush the data once it has enough data and a valid destination for it. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1’b1 - Enable Flush 1’b0 - Disabled
16	BAM_CLK_ALWAYS_ON	This bit controls the BAM to issue ’always on’ clock request. 1’b1 - Enable Always On clock request. 1’b0 - Disabled
15:7	RESERVED_BITS15_7	Set to Zero (0)
6:0	BAM_TESTBUS_SEL	Test Bus selector. Values with bit[11] set high are reserved for the BAM Lite integrator to provide testbus from outside of the BAM Lite. For example, eDML testbus may reside at X’100_0000’ to X’111_1111’ selector values. eDML has no registers thus has no test bus selector, so its test bus is combined with the BAM lite’s. BAM provides zeroes on its testbus when external values selected. X’000_0000’ - Zeros X’000_0001’ - Slave test bus X’000_0010’ - Pipe state machine test bus X’000_0011’ - Buffer test bus X’000_0100’ - Sideband test bus X’000_1101’ - Bus Manager test bus X’001_0000’ - Reg file test bus X’1’’_’’’’ - BAM Lite sets zeroes on the test bus, leaving it for external use

0x12502FF8 USB1_HS_BAM_TEST_BUS_REG

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the value being output to the testbus of the chip. It is not intended for SW usage but for lab debugging of the BAM. Values here can change every cycle.

USB1_HS_BAM_TEST_BUS_REG

Bits	Name	Description
31:0	BAM_TESTBUS_REG	32 bit Testbus value. To select the Block in BAM to show here, use the BAM_TESTBUS_SEL field in BAM_CTRL register.

0x12502FFC USB1_HS_BAM_CNFG_BITS

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

USB1_HS_BAM_CNFG_BITS

Bits	Name	Description
31:27	RESERVED_BITS31_27	Set to Zero (0)
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only

USB1_HS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there are available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided.. 1'b1 - Enable 1'b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission savepoint, but into the illegal's pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1'b1 - Enabled 1'b0 - Disable Available in BAM only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1'b1 - Enable 1'b0 - Disable Available in BAM only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there's no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1'b1 - Enable 1'b0 - Disable Available in BAM only

USB1_HS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1’b1 - 1’b0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix) 1’b1 - Enable 1’b0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM’s common clock request. 1’b1 - Propagate Sideband Clock Request 1’b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. 1’b1 - Enable Power Saving 1’b0 - Disable Power Saving

USB1_HS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reset pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1’b1 - Enable external block pipe reset 1’b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. This functionality has been found to be buggy and was removed from APQ8064. Bit is currently unused. 1’b1 - Enable 1’b0 - Disable Available in BAM only
10:4	RESERVED_BITS10_4	Set to Zero (0)
3	BAM_ADML_SYNC_BRIDGE	0x1: Use a Synchronous Configuration bridge in aDML. 0x0: Use a Asynchronous Configuration bridge in aDML.
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It’s invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1’b1 - Enable 1’b0 - Disable Available in BAM only
1	BAM_ADML_DEEP_CONS_FIFO	0x1: Use a deep Consumer FIFO in aDML (16 dwords) 0x0: Use a shallow Consumer FIFO in aDML (8 dwords)
0	BAM_ADML_INCR4_EN_N	0x1: Don’t allow INCR4 aDML-BAM accesses. 0x0: Allow INCR 4 aDML-BAM accesses.

0x12503800+ 128*n USB1_HS_BAM_IRQ_SRCS_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB1_HS_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12503804+ 128*n USB1_HS_BAM_IRQ_SRCS_MSK_EEn, n=[0..3]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB1_HS_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12503808+ 128*n USB1_HS_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB1_HS_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

20.29.2 BAM PIPE management registers

BAM Pipe management registers control each pipe's parameters. Those reside in physical registers.

0x12502000+ 128*n USB1_HS_BAM_P_CTRLn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Control register provides various controls for the pipe.

USB1_HS_BAM_P_CTRLn

Bits	Name	Description
31:11	RESERVED_BITS31_11	Set to Zero (0)
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be pre-fetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

USB1_HS_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only.When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
2	RESERVED_BITS2	Set to Zero (0)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe
0	RESERVED_BITS0	Set to Zero (0)

0x12502004+ 128*n USB1_HS_BAM_P_RSTn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

USB1_HS_BAM_P_RSTn

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	P_SW_RST	This resets the pipe and its' registers, (Both Flip-Flops and RAM). 1'b1 - Reset 1'b0 - Do Nothing

0x12502008+ 128*n USB1_HS_BAM_P_HALTn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Halt register Enables/Disables the Halt Sequence.

This is a self-modifying register.

USB1_HS_BAM_P_HALTn

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it

0x12502030+ 128*n USB1_HS_BAM_P_TRUST_REGn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

USB1_HS_BAM_P_TRUST_REGn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_P_VMID	Those bits indicate the VMID value to be used when performing Pipe type accesses to the bus. BAM Type accesses include Pipe MTI, Data and Descriptors.
7:2	RESERVED_BITS7_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_P_EE	This Field Indicates the EE (0,1,2,3) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12502010+ 128*n USB1_HS_BAM_P_IRQ_STTSn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

USB1_HS_BAM_P_IRQ_STTSn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

0x12502014+128*n USB1_HS_BAM_P_IRQ_CLRn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

USB1_HS_BAM_P_IRQ_CLRn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_CLR	1’b1 - Clear 1’b0 - Unchanged
4	P_ERR_CLR	1’b1 - Clear 1’b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1’b1 - Clear 1’b0 - Unchanged

USB1_HS_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

0x12502018+128*n USB1_HS_BAM_P_IRQ_ENn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

USB1_HS_BAM_P_IRQ_ENn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

0x1250201C+ 128*n USB1_HS_BAM_P_TIMERn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the pipe.

USB1_HS_BAM_P_TIMERn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12502020+ 128*n USB1_HS_BAM_P_TIMER_CTRLn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the P_TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * P_TIMER_TRSHLD.

USB1_HS_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12502024+ 128*n USB1_HS_BAM_P_PRDCR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

USB1_HS_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value

0x12502028+ 128*n USB1_HS_BAM_P_CNSMR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

USB1_HS_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value

20.29.3 BAM PIPE configuration registers (RAM)

BAM Pipe management registers configure each pipes' parameters.

Pipe Address span: currently defining each pipe to have 32 addresses, therefore inter pipe offset is 32*4=128=0x80 bytes.

0x1250302C+ 64*n USB1_HS_BAM_P_EVNT_DEST_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

USB1_HS_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x12503018+64*n USB1_HS_BAM_P_EVNT_REGn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

USB1_HS_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x12503000+64*n USB1_HS_BAM_P_SW_OFSTSn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB1_HS_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode.
15:0	SW_DESC_OFST	Descriptor FIFO offset.

0x12503024+ 64*n USB1_HS_BAM_P_DATA_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

USB1_HS_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x1250301C+ 64*n USB1_HS_BAM_P_DESC_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

USB1_HS_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x12503028+64*n USB1_HS_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When a BAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

USB1_HS_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x12503020+64*n USB1_HS_BAM_P_FIFO_SIZESn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

USB1_HS_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors.

20.29.4 BAM PIPE internal state registers (RAM)

BAM Pipe debug registers allow a software look inside on the internal parameters of the BAM State Machines stored in RAM.

Those shouldn't be normally used or altered by the software.

0x12503034+64*n USB1_HS_BAM_P_RETR_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context stored for retransmission.

This is being stored by Ack Update state machine in consumer mode or by the Writeback state machine in producer mode.

This is being loaded by the Writeback state machine when retransmission happens.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB1_HS_BAM_P_RETR_CNTXT_n

Bits	Name	Description
31:16	RETR_DESC_OFST	Descriptor Fifo Offset for retransmission.
15:0	RETR_OFST_IN_DESC	The Offset inside the Descriptor for retransmission.

0x12503038+64*n USB1_HS_BAM_P_SI_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Sideband Inform state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB1_HS_BAM_P_SI_CNTXT_n

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

0x12503004+ 64*n USB1_HS_BAM_P_AU_PSM_CNTXT_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Ack Update state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB1_HS_BAM_P_AU_PSM_CNTXT_1_n

Bits	Name	Description
31:16	AU_PSM_ACCUMED	PSM: The acknowledged (EOB/T) number of bytes since last Write Event. AU: The accumulation of the descriptor sizes for the present ack_on_success event. This is never bigger than the ACKED field. Once the ACCUMED values are bigger than Event Threshold, an Event will be issued, the ACKED value will decrease by the ACCUMED size and this value will be zeroed. This also serves as the Bytes Consumed value in the Event.
15:0	AU_ACKED	AU: The left over of the number of bytes that were received via the ack_on_success, that did not cause a descriptor closure. This value is down counting upon issuing Read Event. PSM:

0x12503008+ 64*n USB1_HS_BAM_P_PSM_CNTXT_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB1_HS_BAM_P_PSM_CNTXT_2_n

Bits	Name	Description
31	PSM_DESC_VALID	The Descriptor Valid bit provided by the Writeback state machine to Pipe state machine.
30	PSM_DESC_IRQ	The Descriptor Interrupt bit provided by the Writeback state machine to pipe state machine.
29	PSM_DESC_IRQ_DONE	The Descriptor Interrupt needed selection bit.
28:25	PSM_GENERAL_BITS	General Context Switch Bits
24:22	PSM_CONS_STATE	State of the Pipe Consumer state machine.
21:19	PSM_PROD_SYS_STATE	State of the Pipe Producer System state machine.
18:16	PSM_PROD_B2B_STATE	State of the Pipe Producer BAM to BAM state machine.
15:0	PSM_DESC_SIZE	The Descriptor Size provided by the Writeback state machine to pipe state machine.

0x1250300C+ 64*n USB1_HS_BAM_P_PSM_CNTXT_3_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB1_HS_BAM_P_PSM_CNTXT_3_n

Bits	Name	Description
31:0	PSM_DESC_ADDR	The Data Address provided in the current descriptor from the Writeback state machine.

0x12503010+ 64*n USB1_HS_BAM_P_PSM_CNTXT_4_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB1_HS_BAM_P_PSM_CNTXT_4_n

Bits	Name	Description
31:16	PSM_DESC_OFST	The running Descriptor Fifo Offset of the Writeback state machine
15:0	PSM_SAVED_ACCUMED_SIZE	The Saved Accumulated Size from the Pipe state machine.

0x12503014+64*n USB1_HS_BAM_P_PSM_CNTXT_5_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB1_HS_BAM_P_PSM_CNTXT_5_n

Bits	Name	Description
31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

0x12503030+64*n USB1_HS_BAM_P_RESERVED_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

USB1_HS_BAM_P_RESERVED_1_n

Bits	Name	Description
31:0	BAM_P_RES_1	Set to zero (0) Reserved

0x1250303C+64*n USB1_HS_BAM_P_RESERVED_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

USB1_HS_BAM_P_RESERVED_2_n

Bits	Name	Description
31:0	BAM_P_RES_2	Set to zero (0) Obsolete Register: BAM_P_IRQ_DEST_ADDRn, n=[0..30]

20.30 USB2 OTG HS Registers (0x12510000 USB2_HSIC_BASE)

This section contains USB2 OTG HS registers.

20.30.1 Identification registers

Identification registers are used to declare the slave interface presence and include a table of the hardware configuration parameters.

0x12510000 USB2_HSIC_USB_OTG_HS_ID

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0042FA05

The USB_OTG_HS_ID register is the identification register. It provides a simple way to determine if the USB-HS USB 2.0 core is provided in the system. The ID register identifies the USB-HS USB 2.0 core and its revision.

USB2_HSIC_USB_OTG_HS_ID

Bits	Name	Description
31:24	RESERVED_BITS31_24	These bits are reserved and should be set to zero.
23:16	REVISON_7_0	This field contains the revision number of the core - 0x42.
15:8	NID_5_0	This field contains the complement version of ID[7:0] - 0xFA.
7:0	ID_5_0	This field is the configuration number. This number is set to 0x05 and indicates that the peripheral is the USB-HS USB 2.0 core.

0x12510004 USB2_HSIC_USB_OTG_HS_HWGENERAL

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x5C2

The USB_OTG_HS_HWGENERAL register contains the general hardware parameters.

USB2_HSIC_USB_OTG_HS_HWGENERAL

Bits	Name	Description
31:10	RESERVED_BITS31_10	Clear (0) these bits.
9	SM	VUSB_HS_PHY_SERIAL = 2
8:6	PHYM	VUSB_HS_PHY_TYPE = 7
5:4	PHYW	VUSB_HS_PHY16_8 = 0

USB2_HSIC_USB_OTG_HS_HWGENERAL (cont.)

Bits	Name	Description
3	BWT	This bit is reserved for internal testing = 0
2:1	CLCK	VUSB_HS_CLOCK_CONFIGURATION = 1
0	RT	VUSB_HS_RESET_TYPE = 0

0x12510008 USB2_HSIC_USB_OTG_HS_HWHOST

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x10020001

The USB_OTG_HS_HWHOST register contains the host hardware parameters.

USB2_HSIC_USB_OTG_HS_HWHOST

Bits	Name	Description
31:24	TTPER	VUSB_HS_TT_PERIODIC_CONTEXTS
23:16	TTASY	VUSB_HS_TT_ASYNC_CONTEXTS
15:4	RESERVED_BITS15_4	Clear (0) these bits.
3:1	NPORT	VUSB_HS_NUM_PORT-1
0	HC	VUSB_HS_HOST

0x1251000C USB2_HSIC_USB_OTG_HS_HWDEVICE

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000021

The USB_OTG_HS_HWDEVICE register contains the device hardware parameters.

USB2_HSIC_USB_OTG_HS_HWDEVICE

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5:1	DEVEP	VUSB_HS_DEV_EP
0	DC	Device capable; [VUSB_HS_DEV/=0]

0x12510010 USB2_HSIC_USB_OTG_HS_HWTXBUF

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x80070B08

The USB_OTG_HS_HWTXBUF register contains the Tx buffer hardware parameters.

USB2_HSIC_USB_OTG_HS_HWTXBUF

Bits	Name	Description
31	TXLCR	This bit is fixed to 1'b1 so that the local context register's are included in the design. This means that the DMA context is implemented in FlipFlops.
30:24	RESERVED_BITS30_24	Clear (0) these bits.
23:16	TXCHANADD	VUSB_HS_TX_CHAN_ADD - Defines the number of address lines needed per Endpoint per the TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
15:8	TXADD	VUSB_HS_TX_ADD - Defines the number of address lines needed per the entire TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
7:0	TXBURST	VUSB_HS_TX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the TX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst length will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x12510014 USB2_HSIC_USB_OTG_HS_HWRXBUF

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000808

The USB_OTG_HS_HWRXBUF register contains the Rx buffer hardware parameters.

USB2_HSIC_USB_OTG_HS_HWRXBUF

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits).
15:8	RX_ADD	VUSB_HS_RX_ADD - Defines the number of address lines needed per the entire RX latency buffer. It's reset value is taken from a GENERIC value passed to the core.

USB2_HSIC_USB_OTG_HS_HWRXBUF (cont.)

Bits	Name	Description
7:0	RX_BURST	VUSB_HS_RX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the RX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst length will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x12510040+4*n USB2_HSIC_USB_OTG_HS_SCRATCH_RAMn, n=[0..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

USB_OTG_HS_SCRATCH_RAMn registers are 16 32bit scratch registers.Required for passing USB software information between different images.

USB2_HSIC_USB_OTG_HS_SCRATCH_RAMn

Bits	Name	Description
31:0	SCRATCH_REGISTER	32 bit scratch register

20.30.2 Device/host timer registers

The host/device controller drivers can measure time related activities using these timer registers.

NOTE These registers are not part of the standard EHCI controller.

0x12510080 USB2_HSIC_USB_OTG_HS_GPTIMER0LD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER0LD register is the general purpose timer 0 load register. This register contains the timer duration or load value. See the GPTIMER0CTRL register for a description of the timer functions.

USB2_HSIC_USB_OTG_HS_GPTIMER0LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_GPTIMER0LD (cont.)

Bits	Name	Description
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFFF or 16.777215 seconds

0x12510084 USB2_HSIC_USB_OTG_HS_GPTIMER0CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER0CTRL register is the general purpose timer 0 control register. This register contains the control for the timer and a data field can be queried to determine the running count value. This timer has a granularity of 1 ms and can be programmed to a little over 16 seconds. There are two modes supported by this timer: the first is a one-shot and the second is a looped count, which is described in the register table below. When the timer counter value transitions to zero, an interrupt can be generated though the use of the timer interrupts in the USBTS and USBINTR registers.

USB2_HSIC_USB_OTG_HS_GPTIMER0CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_GPTIMER0CTRL (cont.)

Bits	Name	Description
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

0x12510088 USB2_HSIC_USB_OTG_HS_GPTIMER1LD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER1LD register is the general purpose timer 1 control register. This register contains the timer duration or load value. See the GPTIMER0LDregister for a description of the timer functions.

USB2_HSIC_USB_OTG_HS_GPTIMER1LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFFF or 16.777215 seconds.

0x1251008C USB2_HSIC_USB_OTG_HS_GPTIMER1CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER1CTRL register is the general purpose timer 1 control register. See the description of the USB_OTG_HS_GPTIMER0CTRL register for details about this register.

USB2_HSIC_USB_OTG_HS_GPTIMER1CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

20.30.3 Wrapper operational registers

0x12510090 USB2_HSIC_USB_OTG_HS_AHB_BURST

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_AHB_BURST register determines the AHB master mode of the USB HS Core.

NOTE If the USB_OTG_HS_AHB_MODE is configured to be 0x0 (the AHB Transactor is used), this register must be 0x0 as well, otherwise the AHB Master bus behavior is undefined. Use values other than 0x0 only if setting USB_OTG_HS_AHB_MODE to 0x1.

USB2_HSIC_USB_OTG_HS_AHB_BURST

Bits	Name	Description
31:3	RESERVED_BITS31_3	Should be set to zero.
2:0	AHB_BURST	AMBA AHB BURST. This is a r/w field that selects the following options for the m_hburst signal of the AMBA master interface: In all cases where the unspecified length burst is allowed, singles access may also occur, this is mostly true when the transaction is not 32-bit aligned. Two consecutive single accesses should not happen. When a INCRx burst size is selected and the transfer is not multiple of the INCRx burst, the burst is decomposed in the different ways. With AHBBRST[2] = 1, the smaller bursts will be unspecified length. with AHBBRST[2] = 0, the smaller bursts will be smaller INCRx or singles. For example, lets say that it's required at a given time, to transfer 22 words of information, for the following values of AHBBRST the master sequence will be: This field after reset is set to a default value that can be configured in the file vusb_hs_cfg.vhd. The AHBBRST field is only used if the AMBA-AHB system interface has been selected. It has no effect for cores featuring BVCI interface. In the later case the read will return zeros. When this field is different from zero, the value of the fields TXBURST /RXBURST in register BURSTSIZE 160h, will be ignored by the controller. Internally the BURSTSIZE will be set to the value of the INCRx AMBA burst. Since this has a direct relation with the burst sizes you must be careful with AHB burst selected. Although the TXBURST / RXBURST are bypassed, this register can still be written / read with no effect, while the AHBBRST field is non-zero. 0x0: INCR burst of unspecified length 0x1: INCR4, non-multiple transfers of INCR4 will be decomposed into singles 0x2: INCR8, non-multiple transfers of INCR8, will be decomposed into INCR4 or singles 0x3: INCR16, non-multiple transfers of INCR16, will be decomposed into INCR8, INCR4 or singles 0x4: This value is reserved and should not be used 0x5: INCR4, non-multiple transfers of INCR4 will be decomposed into smaller unspecified length bursts 0x6: INCR8, non-multiple transfers of INCR8 will be decomposed into smaller unspecified length bursts 0x7: INCR16, non-multiple transfers of INCR16 will be decomposed into smaller unspecified length bursts 0x5: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+ INCR unspec. length 0x6: INCR8+INCR8+INCR4+ INCR unspec. length 0x7: INCR16+INCR4+ INCR unspec. length 0x1: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+SINGLE+SINGLE 0x2: INCR8+INCR8+INCR4+SINGLE+SINGLE 0x3: INCR16+INCR4+SINGLE+SINGLE

0x12510094 USB2_HSIC_USB_OTG_HS_XTOR_STS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_XTOR_STS register is currently a placeholder for future status bits from the AHB2AHB Transactor.

USB2_HSIC_USB_OTG_HS_XTOR_STS

Bits	Name	Description
31:2	RESERVED_BITS31_2	Not used currently.
1	GRANT_STOLEN	Reports whether the arbiter removed the hgrant signal prior to completing a transaction. This is currently supported in WRITES ONLY. This bit can be cleared by writing a ’1’ to the GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register. To enable this bit again, write a ’0’ to he GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register.
0	RESERVED_BIT0	Not used currently.

0x12510098 USB2_HSIC_USB_OTG_HS_AHB_MODE

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1

USB2_HSIC_USB_OTG_HS_AHB_MODE

Bits	Name	Description
31	ASYNC_BRIDGES_BYPASS	Default is ’0’. When ’0’ the asynchronous bridge on the master AHB interface is used. When ’1’, it is bypassed. The bridge on the slave AHB is always used.
30:5	RESERVED_BITS30_5	Not used currently.
4	INCR_OVERRIDE	Valid only if the Transactor is bypassed: When ’1’, all INCR bursts from the USB Core will be internally transformed into SINGLE transfers. When ’0’, if the USB Core issues an INCR burst, it will propagate to the external master AHB port.

USB2_HSIC_USB_OTG_HS_AHB_MODE (cont.)

Bits	Name	Description
3:2	HPROT_MODE	When ’00’ the HPROT signal out of the USB Wrapper is ’0001’, and all transactions are non-posted. When ’01’ the HPROT signal out of the USB Wrapper is ’0101’, and all transactions are posted. When ’10’ the HPROT signal out of the USB Wrapper alternates according to the context of the AHB bus access. Control structures are non-posted while data transfer is posted. When ’11’, reserved value, but currently maps to non-posted (same as ’00’).
1	GRANT_STOLEN_CLEAR	Clears the grant stolen field of the USB_OTG_HS_XTOR_STS register. To enable this bit again, write ’0’ after clearing the GRANT_STOLEN (’1’).
0	XTOR_BYPASS	When this bit is set (1), the AHB Transactor is bypassed, and the USB HS Core’s AHB Master interface is directly connected to the AHB system. In this case, the USB_OTG_HS_AHB_BURST register value will determine the bus characteristics. When this bit is reset (0), the AHB Transactor is used to connect the USB HS Core to the AHB system.

0x1251009C USB2_HSIC_USB_OTG_HS_GEN_CONFIG

Type: Read/write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXX0830

The USB_OTG_HS_GEN_CONFIG register is used to configure various features that have been added to the HS USB Core.

USB2_HSIC_USB_OTG_HS_GEN_CONFIG

Bits	Name	Description
31:16	USB_OTG_HS_HW_QVERSION	HW revision of the USB OTG HS core. This version changes with every official release of USB_OTG_HS core.
15	SYS_CLK_SW_EN	This bit is applicable only in SPS Device mode. When this bit is set then USB core always voting for USB_SYSTEM_CLK. Default value is 0 - USB core doesn’t request USB_SYSTEM_CLK when in Low Power Mode.
14	TESTMUX_SEL_4	see TESTMUX_SEL_3_0 the first 4 bits of this register.
13	USB_BAM_DISABLE	This bit disables the bam logic inside the USB and makes him work in Legacy mode.
12	DMA_HPROT_CTRL	When this bit is set Link Controller always does non-posted dQH writes.
11	ISO_FIX_EN	This bit enables fix for Isochronous bug in CI core (CR--0000135251).

USB2_HSIC_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
10	DSC_PE_RST_EN	This bit enables an automatic reset of Device PE State Machine on disconnection event when operating as device. This reset is a HW fix for CR-000940.
9	HOST_SIM_TIMERS_EN_SUSP	When this bit is set (1), the timers used for the USB suspend process short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB suspend process are according to the USB specification.
8	HOST_SIM_TIMERS_EN_STD	When this bit is set (1), the timers used for the USB reset on the ULPI are short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB reset on the ULPI are according to the USB specification.
7	PE_RX_BUF_PENDING_EN	This is only valid in Device Mode. Setting this bit will cause to store a Transaction Status Tag in the Pending register instead of RX Buffer if the RX Buffer is full. The Tag will move from Pending register to RX Buffer as soon as it becomes not full.
6	STREAM_RX_BYPASS_ENABLE	This is only valid in Device Mode. If SDIS bit is set (bit 4 of USB_OTG_HS_USBMODE (0x1A8)), i.e., streaming mode is disabled, setting this bit will cause the RX traffic to override the SDIS bit, and to receive in streaming mode. TX will still be in non-streaming mode.
5	ULPI_SERIAL_EN	This bit must be set to enable operation of ULPI Serial FS/LS mode. Default state is ’1’ - ULPI Serial mode is supported.
4	PE_DP_TXFIFO_IDLE_FORCE	This is only valid in Device Mode. Setting this bit to ’1’ forces the dp_tx_fifo_cmd_dev to be equal to PE_DP_TXFIFO_IDLE when Device PE state machine in REPORT_NAK state and the RX Buffer is full. This bit is used to enable fix of CR-001612. Reset value is ’1’.

USB2_HSIC_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
3:0	TESTMUX_SEL_3_0	With TESTMUX_SEL_4 select one of the following test buses: Value 00001 Key state machines 01101 hsic_test_bus1 01110 hsic_test_bus2 10000 dma_eng_3 dma_dev_sm_2 10001 dma_eng_4 dma_traf others zeros 0x2: dma_eng_0 dma_dev_sm_1 0x3: dma_eng_1 dma_context 0x4: dma_eng_2 dma_mem_arb 0x5: prot_eng_0 0x6: prot_eng_1 0x7: prot_eng_2 0x8: port_ctrl_0 0x9: port_ctrl_1 0xA: tx_buffer 0xB: rx_buffer 0xC: otg

0x125100A0 USB2_HSIC_USB_OTG_HS_GEN_CONFIG_2

Type: Read/write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0001F60

Register for the chicken bits. The USB_OTG_HS_GEN_CONFIG_2 register is used to configure various features that have been added to the HS USB Core. By default, all chicken bits are off and the fix is applicable.

USB2_HSIC_USB_OTG_HS_GEN_CONFIG_2

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	LINESTATE_DIFF_WAKEUP_EN	chicken bit for CR-0000155486.when this bit is set the USB enables the HW fix for Race condition between the attempt to enter LPM and USB bus reset.Default value is 1.
11	ULPI_LPM_PEND_EN	chicken bit for CR-0000153486.when this bit is set the USB enables the HW fix for Function Control and LPM race condition.Default value is 1.
10	RX_FULL_NAK_EN	chicken bit for CR-0000152878.when this bit is set the USB will respond with NAK's for Host Tokens with very slow AHB and when Streaming mode is enabled. Default value is 1.

USB2_HSIC_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Description
9	ENDLESS_TD_EN	chicken bit for CR-0000152976. When this bit is set Performance enhancements for 'infinite' Producer pipe (out endpoint with eTD that points to itself) are enabled. Default value is 1.
8	SCRATCH_RAM_EN	chicken bit for CR-0000149922. When this bit is set the use of scratch ram is enabled and the SW can read/write from addresses 0x040 - 0x07c. when this bit is clear SW can no longer access those registers. Default value is 1.
7	SESS_VLD_CTRL_EN	When this bit is set then bit 25 of USBCMD register controls sess_vld signal inside the Link Controller. When this bit is clear then Link Controller receives sess_vld directly from PHY. Default value is 0.
6	CI_T_WTSUSRSTHS_EN	When this bit is 0 then Device Port Control State Machine waits 2.5 us from USB Reset detection until starting driving Chirp K. When this bit is 1 then Device Port Control State Machine waits 1.5 ms from USB Reset detection until starting driving Chirp K. Default value is 1 - legacy behavior.
5	CI_T_UCH_EN	When this bit is 0 then Device Port Control State Machine drives Chirp K for 1 ms. When this bit is 1 then Device Port Control State Machine drives Chirp K for 2ms. Default value is 1 - legacy behavior.
4	DP_RESET	chicken bit for fix CI2687: When the OTG core is acting as a Host, and VBUS is turned off, and the attached Device attempts to perform a Session Request Protocol by using Data-line Pulsing, it will not be recognized by the Host. Also, when doing HNP and becoming a Host, a SE0 is forced in the line causing the OPT TD5.4 test to fail, without the software workaround.
3	ZLP_PRIME	chicken bit for fix CI2655: When using ISO IN endpoints with MULT=3 and low bandwidth system bus access, the controller may enter into a wait loop situation without warning the software. Due to the low bandwidth the last packet from a mult3 sequence may not be fetched in time before the last token IN is received (for that uframe/endpoint). This will cause the controller to reply with a zero length packet (ZLP), breaking the prime sequence.
2	NO_SOF_RX_FIFO_FULL	chicken bit for fix CI2581: During normal operation, if the RX Fifo becomes full and the protocol engine needs to send a command to the DMA state machine, it will wait in that state until the RX Fifo becomes not full. As the protocol state machine also handles the SOF generation, the SOFs will no longer be sent. If one SOF is missed, the Host controller will issue a false babble detection. If more than 3.125ms are elapsed without SOFs the peripheral will recognize the idle bus as a USB reset.
1	WRONG_OPMODE_SUSP	chicken bit for fix CI1274: When the Controller enters a Suspend state it asserts opmode with the wrong value, according to specifications 'UTMI+ Specification, Revision 1.0, Section 3.2' and 'UTMI+ Low Pin Interface Specification, Revision 1.1, Section 3.8.5.3'. This causes no issue in actual usage.

USB2_HSIC_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Description
0	RESUME_END_INTER	chicken bit for fix CI1179: Working as host, when doing resume a port change interrupt was fired at the end of resume. According to the EHCI spec no interrupt should be fired.

20.30.4 Device/host capability registers

0x12510100 USB2_HSIC_USB_OTG_HS_CAPLENGTH

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x01000040

The USB_OTG_HS_CAPLENGTH register is the capability register length. It is used to indicate which offset to add to the register base address at the beginning of the operational register.

USB2_HSIC_USB_OTG_HS_CAPLENGTH

Bits	Name	Description
31:16	HCIVERSION_15_0	BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision.
7:0	CAPLENGTH_7_0	Offset at beginning of operational register

0x12510104 USB2_HSIC_USB_OTG_HS_HCSPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00010011

The USB_OTG_HS_HCSPARAMS register contains the host control structural parameters. The port steering logic capabilities are described in this register.

USB2_HSIC_USB_OTG_HS_HCSPARAMS

Bits	Name	Description
31:28	RESERVED_BITS31_28	Clear (0) these bits.
27:24	N_TT_3_0	Number of transaction translators This field indicates the number of embedded transaction translators associated with the USB2.0 host controller. For a multi-port host, this field will always equal 0001. For all other implementations, N_TT = 0000. This in a non-EHCI field to support embedded TT.

USB2_HSIC_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
23:20	N_PTT_3_0	Number of ports per transaction translator This field indicates the number of ports assigned to each transaction translator within the USB2.0 host controller. For a multi-port host this field will always equal N_PORTS. For all other implementations, N_PTT = 0000. This in a non-EHCI field to support embedded TT.
19:17	RESERVED_BITS19_17	Clear (0) these bits.
16	PI_3_0	Port indicator This bit indicates whether the ports support port indicator control. When set (1), the port status and control registers include a read/writable field for controlling the state of the port indicator. This field will always be set (1).
15:12	N_CC_3_0	Number of companion controllers This field indicates the number of companion controllers associated with this USB2.0 host controller. A zero in this field indicates there are no internal companion controllers. Port-ownership hand-off is not supported. A value larger than zero in this field indicates that there are companion USB1.1 host controller(s). Port-ownership hand-offs are supported. High-, full-, and low-speed devices are supported on the host controller root ports. In this implementation, this field will always be clear (0).
11:8	N_PCC_3_0	Number of ports per companion controller This field indicates the number of ports supported per internal companion controller. It is used to indicate the port routing configuration to the system software. For example, if N_PORTS has a value of 6 and N_CC has a value of 2, then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller 1, the next N_PCC ports to companion controller 2, and so on. In the previous example, the N_PCC could have been 4, where the first 4 are routed to companion controller 1 and the last two are routed to companion controller 2. The number in this field must be consistent with N_PORTS and N_CC. In this implementation, this field will always be clear (0).
7:5	RESERVED_BITS7_5	Clear (0) these bits.
4	PPC	Port power control This field indicates whether the host controller implementation includes port power control. Set (1) indicates that the ports have port power switches. Clear (0) indicates that the ports do not have port power switches. The value of this field affects the functionality of the port power field in each port status and control register. This bit will always be clear (0) for a device only implementation.

USB2_HSIC_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
3:0	N_PORTS_3_0	Number of downstream ports This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the operational register. Valid values are in the range of 1h to Fh. A zero in this field is undefined. The number of ports for a host implementation is configurable from 1 to 8. This field will always be set (1) for device-only implementation.

0x12510108 USB2_HSIC_USB_OTG_HS_HCCPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0006

The USB_OTG_HS_HCCPARAMS register contains the host control capability parameters. This register identifies multiple mode control (time-base bit functionality) addressing capability.

USB2_HSIC_USB_OTG_HS_HCCPARAMS

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15:8	EECP_7_0	EHCI extended capabilities pointer Default = 0 This optional field indicates the existence of a capabilities list. A value of 00h indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in PCI configuration space of the first EHCI extended capability. The pointer value must be 40h or greater if implemented to maintain the consistency of the PCI header defined for this class of device. For this implementation, all of these bits are clear (0).
7:4	IST_7_4	Isochronous scheduling threshold Default = implementation dependent This field indicates, relative to the current position of the executing host controller, where the software can reliably update the isochronous schedule. When bit [7] is clear (0), the value of the least significant 3 bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set (1), then host software assumes the host controller may cache an isochronous data structure for an entire frame. All of the bits in this field will always be clear (0).
3	RESERVED_BIT3	Clear (0) this bit.

USB2_HSIC_USB_OTG_HS_HCCPARAMS (cont.)

Bits	Name	Description
2	ASP	Asynchronous schedule park capability Default = 1 If this bit is set (1), then the host controller supports the park feature for high-speed queue heads in the asynchronous schedule. The feature can be disabled, or enabled and set to a specific level by using the (ASPE) and (ASP[1:0]) fields in the USB_OTG_HS_USBCMD register. This field will always be set (1).
1	PFL	Programmable frame list flag If this bit is clear (0), then the system software must use a frame list length of 1024 elements with this host controller. The FS[2:0] field in the USBCMD register is read-only and must be cleared (0). If this bit is set (1), then the system software can specify and use a smaller frame list, and configure the host controller using the FS[2:0] field in the USBCMD register. The frame list must always be aligned on a 4k-page boundary. This requirement ensures that the frame list is always physically contiguous. This bit in this field will always be set (1).
0	ADC	64-bit addressing capability This field will always be clear (0). No 64-bit addressing capability is supported.

0x12510120 USB2_HSIC_USB_OTG_HS_DCIVERSION

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1

The USB_OTG_HS_DCIVERSION register contains the device interface version number. The device controller interface conforms to the two-byte BCD encoding of the interface version number contained in this register.

USB2_HSIC_USB_OTG_HS_DCIVERSION

Bits	Name	Description
15:0	DCIVERSION_15_0	Device interface version number

0x12510124 USB2_HSIC_USB_OTG_HS_DCCPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x190

The USB_OTG_HS_DCCPARAMS register contains the device control capability parameters. These fields describe the overall host/device capability of the controller.

USB2_HSIC_USB_OTG_HS_DCCPARAMS

Bits	Name	Description
31:9	RESERVED_BITS31_9	Clear (0) these bits.
8	HC	Host capable When this bit is set (1), this controller is capable of operating as an EHCI-compatible USB 2.0 host controller.
7	DC	Device capable When this bit is set (1), this controller is capable of operating as a USB 2.0 device.
6:5	RESERVED_BITS6_5	Clear (0) these bits.
4:0	DEN_4_0	Device endpoint number This field indicates the number of endpoints build into the device controller. If this controller is not device capable, then this field will be al zeroes. Valid values for this field are 0 through 16.

20.30.5 Device/host operational registers

0x12510140 USB2_HSIC_USB_OTG_HS_USBCMD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00080000

The USB_OTG_HS_USBCMD register is the USB command register. The serial bus host/device controller executes the command indicated in this register.

USB2_HSIC_USB_OTG_HS_USBCMD

Bits	Name	Description
31	RST_CTRL	Default value = 0. Set to 1 to block operational reset to xcvr (ser and ulpi) clock domains.
30	ULPI_STP_CTRL	Default value = 0. Set to 1 to block the ulpi_stp signal from going out to ULPI PHY
29	ASYNC_INTR_CTRL	Default value = 0. Set to 1 to allow the async interrupt out from the HS core.
28	SE0_GLITCH_FIX_CTRL	Default value = 0. Set to 1 to activate the SE0 glitch fix mechanism
27	FS_3_WIRE_2_WIRE_SELECT	Default value = 0. Set this bit for enabling the two wire interface on the fs_dat and fs_se0 pins

USB2_HSIC_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
26	ULPI_SER3_NOT6_SEL	ULPI serial 3 bits select. Read/write Read: Current status of serial data bus wide Write: SW writes ’1’ to this bit to request 3 pins ULPI data wide, or ’0’ to request 6 bit data wide in FsLsSerial Mode.
25	SESS_VLD_CTRL	Default value = 0. Set this bit to enable Link Controller operation after switching interface from Serial to ULPI.
24	RESERVED_BIT24	Clear (0) these bit
23:16	ITC_7_0	Interrupt threshold control Read/write Default 08h The system software uses this field to set the maximum rate at which the host/device controller will issue interrupts. This field contains the maximum interrupt interval measured in micro-frames. Valid values are shown below. Value Maximum interrupt interval 00h Immediate (no threshold) 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames 10h 16 micro-frames 20h 32 micro-frames 40h 64 micro-frames
15	FS2	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.

USB2_HSIC_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
14	ATDTW	Add dTD tripwire Read/write (Device mode only) This bit is used as a semaphore to ensure the to proper addition of a new dTD to an active (primed) endpoint's linked list. This bit is set (1) and cleared (0) by the software. This bit shall also be cleared (0) by the hardware when the state machine is a hazard region for which adding a dTD to a primed endpoint may go unrecognized.
13	SUTW	Setup tripwire (device mode only) Read/write This bit is used as a semaphore to ensure that the setup data payload of 8 bytes is extracted from a QH by the DCD without being corrupted. If the setup lockout mode is off (see USBMODE) then there exists a hazard when new setup data arrives while the DCD is copying the setup data payload from the QH for a previous setup packet. This bit is set (1) and cleared (0) by software, and will be cleared (0) by hardware when a hazard exists.
12	RESERVED_BITS12	Clear (0) this bit
11	ASPE	Asynchronous schedule park mode enable (OPTIONAL) Read/write If the asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this bit defaults to a 1h and is R/W. Otherwise, the bit must be cleared (0) and is RO. The software uses this bit to enable or disable the park mode. value 1 = Park mode is enabled. value 0 = Park mode is disabled. This field is set (1) in this implementation.
10	RESERVED_BIT10	Clear (0) this bit.
9:8	ASP_1_0	Asynchronous schedule park mode count (OPTIONAL) Read/write If the Asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this field defaults to 3h and is R/W. Otherwise it defaults to zero and is RO. This field contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1h to 3h. The software must not clear (0) this bit when the ASPE bit in this register is set (1), as this will result in undefined behavior. This field is set to 3h in this implementation.
7	LR	Light host/device controller reset (OPTIONAL) Read only Not implemented. This bit will always be clear (0).

USB2_HSIC_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
6	IAA	Interrupt on async advance doorbell Read/write This bit is used as a doorbell by the software to tell the host controller to issue an interrupt the next time it advances the asynchronous schedule. The software must set (1) this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule states, it sets (1) the interrupt on the async advance status (AAI) bit in the USBSTS register. If the interrupt on async advance enable (AAE) bit in the USBINTR register is set (1), then the host controller will assert an interrupt at the next interrupt threshold. The host controller clears (0) this bit after it has set (1) the interrupt on async advance status (AAI) bit in the USBSTS register. The software should not set (1) this bit when the asynchronous schedule is inactive. Doing so will yield undefined results. This bit is only used in the host mode. Setting (1) this bit when the device mode is selected will produce undefined results.
5	ASE	Asynchronous Schedule Enable Read/write Default = 0b This bit controls whether the host controller skips processing the asynchronous schedule. value 0 = Do not process the asynchronous schedule value 1 = Use the ASYNCLISTADDR register to access the asynchronous schedule. Only the host controller uses this bit.
4	PSE	Periodic schedule enable Read/write Default 0b This bit controls whether the host controller skips processing the periodic schedule. value 0 = Do not process the periodic schedule value 1 = Use the PERIODICLISTBASE register to access the periodic schedule. Only the host controller uses this bit.

USB2_HSIC_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
3:2	FS_1_0	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.
1	RST	Controller reset (RESET) Read/write The software uses this bit to reset the controller. This bit is cleared (0) by the host/device controller when the reset process is complete. The software cannot terminate the reset process early by clearing (0) this bit. Host controller: When the software sets (1) this bit, the host controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Any transaction currently in progress on the USB is immediately terminated. A USB reset is not driven on downstream ports. The software should not set (1) this bit when the HCHalted bit in the USBSTS register is clear (0). Attempting to reset an actively running host controller will result in undefined behavior. Device controller: When the software sets (1) this bit, the device controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Setting this bit when the device is in the attached state is not recommended, since the effect on an attached host is undefined. In order to ensure that the device is not in an attached state before initiating a device controller reset, all primed endpoints should be flushed and the USBCMD run/stop bit should be cleared (0).

USB2_HSIC_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
0	RS	Run/stop Read/Write Default 0b value 1 = Run value 0 = Stop Host controller: When this bit is set (1), the host controller proceeds with the execution of the schedule. The host controller continues execution as long as this bit remains set (1). When this bit is clear (0), the host controller completes the current transaction on the USB and then halts. The HC halted bit in the status register indicates when the host controller has finished the transaction and has entered the stopped state. The software should not set (1) this bit unless the host controller is in the halted state (that is, the HCHalted bit in the USBSTS register is set (1)). Device controller: Setting (1) this bit will cause the device controller to enable a pull-up on D+ and initiate an attach event. This control bit is not directly connected to the pull-up enable, as the pull-up will become disabled upon transitioning into high-speed mode. The software should use this bit to prevent an attach event before the device controller has been properly initialized. Clearing (0) this bit will cause a detach event.

0x12510144 USB2_HSIC_USB_OTG_HS_USBSTS

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_USBSTS register is the USB status register. This register indicates various states of the host/device controller and any pending interrupts. This register does not indicate status resulting from a transaction on the serial bus. The software clears certain bits in this register by setting (1) them.

USB2_HSIC_USB_OTG_HS_USBSTS

Bits	Name	Description
31	ULPI_INTR	Default value = 0.This bit is set when Interrupt during ULPI -Serial mode or ULPI Interrupt during LPM occurs. Writing a 1 to this bit will clear it.
30	PHY_SESS_VLD_CHG	This bit is set when PHY_SESS_VLD bit changes its value.
29	PHY_SESS_VLD	This bit presents the SESS_VLD status of PHY.

USB2_HSIC_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
28	PHY_ALT_INT	This bit is asserted when a non-USB interrupt from PHY is detected. This interrupt is used for procedures like Battery Charging. This bit is set when bit 7 (alt_int) of RX CMD is high. Writing a 1 to this bit will clear it.
27:26	RESERVED_BITS27_26	Clear (0) these bits.
25	TI1	General purpose timer interrupt 1 (GPTINT1) Read/write control This bit is set (1) when the counter in the GPTIMER1CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
24	TI0	General purpose timer interrupt 0 (GPTINT0) Read/write control This bit is set (1) when the counter in the GPTIMER0CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPI	USB host periodic interrupt (USBHSTPERINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set (1) and the TD was from the periodic schedule. This bit is also set (1) by the host controller when a short packet is detected AND the packet is on the periodic schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
18	UAI	USB host asynchronous interrupt (USBHSTASYNCINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set AND the TD was from the asynchronous schedule. This bit is also set (1) by the host when a short packet is detected AND the packet is on the asynchronous schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
17	RESERVED_BIT17	Clear (0) these bits.
16	NAKI	NAK interrupt bit Read only This bit is set (1) by the hardware when, for a particular endpoint, both the Tx/Rx endpoint NAK bit and the corresponding Tx/Rx endpoint NAK enable bit are set (1). This bit is automatically cleared (0) by the hardware when all of the enabled Tx/Rx endpoint NAK bits are cleared (0).

USB2_HSIC_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
15	AS	Asynchronous schedule status Read only Default = 0 This bit reports the current real status of the asynchronous schedule. When cleared (0), the asynchronous schedule status is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the asynchronous schedule when software transitions the asynchronous schedule enable bit in the USBCMD register. When this bit and the asynchronous schedule enable bit are the same value, the asynchronous schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
14	PS	Periodic schedule status Read only Default = 0 This bit reports the current real status of the periodic schedule. When cleared (0), the periodic schedule is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the periodic schedule when software transitions the periodic schedule enable bit in the USBCMD register. When this bit and the periodic schedule enable bit are the same value, the periodic schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
13	RCL	Reclamation Read only Default = 0 This is a read-only status bit that is used to detect an empty asynchronous schedule. This bit is only used by the host controller.
12	HCH	HC halted Read only Default = 1 This bit is a clear (0) whenever the run/stop bit is set (1). The host controller sets (1) this bit after it has stopped executing, because of the run/stop bit being cleared (0), either by the software or by the host controller hardware (for example, an internal error). This bit is only used by the host controller.
11	RESERVED_BIT11	Clear (0) this bit.
10	ULPII	ULPI interrupt Read/write control Default = 0 When the ULPI viewport is present in the design, an event completion will set (1) this interrupt. This bit is used by both the host and device controllers. It is only present in designs where the configuration constant VUSB_HS_PHY_ULPI = 1.

USB2_HSIC_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
9	RESERVED_BIT9	Clear (0) this bit.
8	SLI	DC suspend Read/write control Default = 0 When a device controller enters a suspend state from an active state, this bit will be set (1). The device controller clears (0) the bit upon exiting from a suspend state. This bit is only used by the device controller.
7	SRI	SOF received Read/write control Default = 0 When the device controller detects a start of (micro) frame, this bit will be set (1). When a SOF is extremely late, the device controller will automatically set (1) this bit to indicate that an SOF was expected. Therefore, this bit will be set (1) roughly every 1 ms in the device FS mode and every 125 ms in the HS mode, and will be synchronized to the actual SOF that is received. Since the device controller is initialized to FS before connect, this bit will be set (1) at an interval of 1 ms during the prelude to connect and chirp. In the host mode, this bit will be set (1) every 125 us and can be used by the host controller driver as a time base. The software writes a 1 to this bit to clear it. This is a non-EHCI status bit.
6	URI	USB reset received Read/write control Default = 0 When the device controller detects a USB reset and enters the default state, this bit will be set (1). The software can set (1) this bit to clear the USB reset received status bit. This bit is only used by the device controller.
5	AAI	Interrupt on async advance Read/write control Default = 0 The system software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by setting (1) the interrupt on async advance doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source. This bit is only used by the host controller.
4	SEI	System error Read/write control This interrupt is triggered when there is an AHB error (HRESP = ERROR) on the AHB Master interface.

USB2_HSIC_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
3	FRI	Frame list rollover Read/write control The host controller sets (1) this bit when the frame list index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the frame list size field of the USBCMD register) is 1024, the frame index register rolls over every time FRINDEX [1 3] toggles. Similarly, if the size is 512, the host controller sets (1) this bit to a one every time FHINDEX [12] toggles. This bit is only used by the host controller.
2	PCI	Port change detect Read/write control The host controller sets (1) this bit when a connect status occurs on any port, a port enable/disable change occurs on any port, or the force port resume bit is set (1) as the result of a J-K transition on the suspended port. The device controller sets (1) this bit when the port controller enters the full or high-speed operational state. When the port controller exits the full or high-speed operation states due to reset or suspend events, the notification mechanisms are the USB reset received bit and the DC suspend bits, respectively. This bit is not EHCI compatible.
1	UEI	USB error interrupt (USBERRINT) Read/write control When completion of a USB transaction results in an error condition, this bit is set (1) by the host/device controller. This bit is set (1) along with the USBINT bit, if the TD on which the error interrupt occurred also had its interrupt-on-complete (IOC) bit set (1). The device controller detects resume signaling only.
0	UI	USB interrupt (USBINT) Read/write control This bit is set (1) by the host/device controller when the cause of an interrupt is a completion of a USB transaction where the transfer descriptor (TD) has an interrupt-on-complete (IOC) bit set (1). This bit is also set (1) by the host/device controller when a short packet is detected. A short packet is when the actual number of bytes received was less than the expected number of bytes.

0x12510148

USB2_HSIC_USB_OTG_HS_USBINTR

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_USBINTR register is the USB interrupt enable register. The interrupts to the software are enabled with this register. An interrupt is generated when a bit is set (1) and the corresponding interrupt is active. The USB status register (USBSTS) still shows interrupt sources, even if they are disabled by the USBINTR register, which allows polling of interrupt events by the software.

USB2_HSIC_USB_OTG_HS_USBINTR

Bits	Name	Description
31	ULPI_INTR_EN	Default value =0.When this bit is a 1 and ULPI_INTR is a 1, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the ULPI_INTR bit.
30	PHY_SESS_VLD_CHG_EN	Default value =0. When this bit is set then Link Controller will issue an interrupt when PHY_SESS_VLD changes its value.
29:26	RESERVED_BITS29_26	Clear (0) these bits.
25	TIE1	General purpose timer interrupt enable 1 When this bit is set (1), and the GPTINT1 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT1 bit.
24	TIE0	General purpose timer interrupt enable 0 When this bit is set (1), and the GPTINT0 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT0 bit.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPIE	USB host periodic interrupt enable When this bit is set (1), and the USBHSTPERINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTPERINT bit.
18	UAIE	USB host asynchronous interrupt enable When this bit is set (1), and the USBHSTASYNCINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTASYNCINT bit.
17	RESERVED_BIT17	Clear (0) this bit.

USB2_HSIC_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
16	NAKE	NAK interrupt enable This bit is set (1) by the software if it wants to enable the hardware interrupt for the NAK interrupt bit. If both this bit and the corresponding NAK interrupt bit are set (1), a hardware interrupt is generated.
15:11	RESERVED_BITS15_11	Clear (0) these bits.
10	ULPIE	ULPI enable When this bit is set (1), and the ULPI Interrupt bit in the USBSTS register transitions, the controller will issue and interrupt. The interrupt is acknowledged by the software setting (1) the ULPI interrupt bit. This bit is used by both the host and device controllers. It is only present in designs where configuration constant VUSB_HS_PHY_ULPI = 1.
9	RESERVED_BIT9	Clear (0) this bit.
8	SLE	Sleep enable When this bit is set (1) and the DC suspend bit in the USBSTS register transitions, the device controller will issue an interrupt. The interrupt is acknowledged by the software setting (1) the DC suspend bit. This bit is only used by the device controller.
7	SRE	SOF received enable When this bit is set (1) and the SOF received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the SOF received bit.
6	URE	USB reset enable When this bit is set (1) and the USB reset received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the USB reset received bit.
5	AAE	Interrupt on async advance enable When this bit is set (1) and the interrupt on async advance bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the interrupt on async advance bit. This bit is only used by the host controller.
4	SEE	System error enable When this bit is set (1) and the system error bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the system error bit.

USB2_HSIC_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
3	FRE	Frame list rollover enable When this bit is set (1) and the frame list rollover bit in the USBSTS register is set (1), the host controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the frame list rollover bit. This bit is only used by the host controller.
2	PCE	Port change detect enable When this bit is set (1) and the port change detect bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the port change detect bit.
1	UEE	USB error interrupt enable When this bit is set (1) and the USBERRINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBERRINT bit in the USBSTS register.
0	UE	USB interrupt enable When this bit is set (1) and the USBINT bit in the USBSTS register is set (1), the host/device controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBINT bit.

0x1251014C USB2_HSIC_USB_OTG_HS_FRINDEX

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_FRINDEX register is the USB frame index register. This register is used by the host controller to index the periodic frame list. The register updates every 125 microseconds (once each micro-frame). Bits [N:3] are used to select a particular entry in the periodic frame list during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by the system software in the frame list size field in the USBCMD register.

This register must be written as a DWord. Byte writes produce-undefined results. This register cannot be written unless the host controller is in the 'halted' state, as indicated by the HC halted bit. A write to this register while the run/stop bit is set (1) produces undefined results. Writes to this register also affect the SOF value.

In the device mode, this register is read-only and the device controller updates the FRINDEX [13:3] register from the frame number indicated by the SOF marker. Whenever a SOF is received by the USB bus, FRINDEX [13:3] will be checked against the SOF marker. If FRINDEX [13:3] is different from the SOF marker, FRINDEX [13:3] will be set to the SOF value and FRINDEX [2:0] will be cleared (0) (that is, SOF for a 1-ms frame). If FRINDEX [13:3] is equal to the SOF value, FRINDEX [2:0] will be incremented (that is, SOF for 125-ms micro-frame.

USB2_HSIC_USB_OTG_HS_FRINDEX

Bits	Name	Description
31:14	RESERVED_BITS31_14	Clear (0) these bits.
13:0	FRINDEX_13_0	Frame index The value in this register increments at the end of each time frame (for example, a micro-frame). Bits [N:3] are used for the frame list current index. This means that each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following data shows the values of N based on the value of the frame list size field in the USBCMD register when used in host mode. USBCMD [Frame list size] number Elements N 000b (1024) 12 001b (512) 11 010b (256) 10 011b (128) 9 100b (64) 8 101b (32) 7 110b (16) 6 111b (8) 5 In the device mode, the value is the current frame number of the last frame transmitted. It is not used as an index. In either mode, bits 2:0 indicate the current microframe.

0x12510154 USB2_HSIC_USB_OTG_HS_PERIODICLISTBASE

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_PERIODICLISTBASE register is the periodic list base address register. This 32-bit register contains the beginning address of the periodic frame list in the system memory. The HCD loads this register prior to starting the schedule execution by the host controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the frame index register (FRINDEX) to enable the host controller to step through the periodic frame list in sequence.

NOTE This device is shared between the host controller and device controller operation. For host controller operation, this is the USB_OTG_HS_ PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

USB2_HSIC_USB_OTG_HS_PERIODICLISTBASE

Bits	Name	Description
31:12	PERBASE_31_12	Base address (low) These bits correspond to memory address signals [31:12], respectively. Only used by the host controller.
11:0	RESERVED_BITS11_0	This field must be written as zeros. During runtime, the values of these bits are undefined.

0x12510154 USB2_HSIC_USB_OTG_HS_DEVICEADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_DEVICEADDR register is the USB device address register. The upper seven bits of this register represent the device address. After any controller reset or a USB reset, the device address is set to the default address (0). The default address will match all incoming addresses. The software shall reprogram the address after receiving a SET_ADDRESS descriptor.

The USBADRA is used to accelerate the SET_ADDRESS sequence by allowing the DCD to preset the USBADR register before the status phase of the SET_ADDRESS descriptor.

NOTE This device is shared between the host controller and device controller operations. For host controller operation, this is the USB_OTG_HS_ PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

USB2_HSIC_USB_OTG_HS_DEVICEADDR

Bits	Name	Description
31:25	USBADR_31_25	Device address These bits correspond to the USB device address.

USB2_HSIC_USB_OTG_HS_DEVICEADDR (cont.)

Bits	Name	Description
24	USBADRA	Device address advance Default = 0 When this bit is clear (0), any writes to USBADR are instantaneous. When this bit is set (1) at the same time or before USBADR is written, the write to the USBADR field is staged and held in a hidden register. After an IN occurs on endpoint 0 and is ACKed, USBADR will be loaded from the holding register. The hardware will automatically clear (0) this bit on the following conditions: 1. IN is ACKed to endpoint 0 (USBADR is updated from staging register). 2. OUT/SETUP occur to endpoint 0 (USBADR is not updated). 3. Device reset occurs (USBADR is reset to 0). Note: After the status phase of the SET_ADDRESS descriptor, the DCD has 2 ms to program the USBADR field. This mechanism will ensure this specification is met when the DCD can not write of the device address within 2 ms from the SET_ADDRESS status phase. If the DCD writes the USBADR with USBADRA = 1 after the SET_ADDRESS data phase (before the prime of the status phase), the USBADR will be programmed instantly at the correct time and meet the 2-ms USB requirement.
23:0	RESERVED_BITS23_0	These bits must be written as zeros. During runtime, the values of these bits are undefined.

0x12510158 USB2_HSIC_USB_OTG_HS_ASYNCLISTADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ASYNCLISTADDR register is the next asynchronous list address register. This 32-bit register contains the address of the next asynchronous queue head to be executed by the host. Bits [4:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

USB2_HSIC_USB_OTG_HS_ASYNCLISTADDR

Bits	Name	Description
31:5	ASYBASE_31_15	Link pointer low (LPL). These bits correspond to memory address signals [31:5], respectively. This field may only reference a queue head (OH). This field is only used by the host controller.
4:0	RESERVED_BITS4_0	The values of these bits has no effect on circuit operation.

0x12510158 USB2_HSIC_USB_OTG_HS_ENDPOINTLISTADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPOINTLISTADDR register is the endpointlist address register. In the device mode, this register contains the address of the top of the endpoint list in system memory. Bits [10:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

USB2_HSIC_USB_OTG_HS_ENDPOINTLISTADDR

Bits	Name	Description
31:11	EPBASE_31_11	Endpoint list pointer (low) These bits correspond to memory address signals [31:11], respectively. This field will reference a list of up to 32 queue heads (QH). That is, one queue head per endpoint & direction.
10:0	RESERVED_BITS10_0	The values of these bits has no effect on circuit operation.

0x1251015C USB2_HSIC_USB_OTG_HS_TTCTRL

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_TTCTRL register is the TT status and control register. This register contains parameters needed for internal TT operations.

NOTE This register is not used in the device controller operation.

USB2_HSIC_USB_OTG_HS_TTCTRL

Bits	Name	Description
31	RESERVED_BIT31	Not used.
30:24	TTHA	Not used.
23:0	RESERVED_BITS23_0	Not used.

0x12510160 USB2_HSIC_USB_OTG_HS_BURSTSIZE

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1010

The USB_OTG_HS_BURSTSIZE register is the programmable burst size register. This register is used to control dynamically change the burst size used during data movement on the initiator (master) interface.

USB2_HSIC_USB_OTG_HS_BURSTSIZE

Bits	Name	Description
31:16	RESERVED_BITS31_16	The value of these bits has no effect on circuit operation.
15:8	TXPBURST	Programmable Tx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from system memory to the USB bus.
7:0	RXPBURST	Programmable Rx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from the USB bus to system memory.

0x12510164 USB2_HSIC_USB_OTG_HS_TXFILLTUNING

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_TXFILLTUNING register is the host transmit pre-buffer packet tuning register. The fields in this register control performance tuning associated with how the host controller posts data to the Tx latency FIFO before moving the data onto the USB bus. The specific areas of performance include the how much data to post into the FIFO and an estimate for how long that operation should take in the target system.

Definitions:

T0 = Standard packet overhead

T1 = Time to send data payload

Tff = Time to fetch packet into TX FIFO up to specified level.

Ts = Total packet flight time (send-only) packet

Ts = T0 + T1

Tp = Total packet time (fetch and send) packet

Tp = Tff + T0 + T1

Upon discovery of a transmit (OUT/SETUP) packet in the data structures, the host controller checks to ensure Tp remains before the end of the [micro] frame. If so it proceeds to pre-fill the TX FIFO. If at anytime during the pre-fill operation the time remaining the [micro] frame is < Ts, then the packet attempt ceases and the packet is tried at a later time. Although this is not an error condition and the host controller will eventually recover, a mark will be made the scheduler health counter to note the occurrence of a ’back-off’ event. When a back-off event is detected, the partial packet fetched may need to be discarded from the latency buffer to make room for periodic traffic that will begin after the next SOF. Too many back-off events can waste bandwidth and power on the system bus, and thus should be minimized (not necessarily eliminated). Back-offs can be minimized with use of the TSCHHEALTH (Tff), as described in the register table.

USB2_HSIC_USB_OTG_HS_TXFILLTUNING

Bits	Name	Description
31:22	RESERVED_BITS31_22	The value of these bits has no effect on circuit operation.
21:16	TXFIFOTHRES	FIFO burst threshold Default = 2 This register controls the number of data bursts that are posted to the TX latency FIFO in the host mode before the packet begins on to the bus. The minimum value is 2 and this value should be a low as possible to maximize USB performance. A higher value can be used in systems with unpredictable latency and/or insufficient bandwidth, where the FIFO may underrun because the data transferred from the latency FIFO to USB occurs before it can be replenished from system memory. This value is ignored if the stream disable bit in USBMODE register is set (1).
15:13	RESERVED_BITS15_13	The value of these bits has no effect on circuit operation.

USB2_HSIC_USB_OTG_HS_TXFILLTUNING (cont.)

Bits	Name	Description
12:8	TXSCHHEALTH	Scheduler health counter Read/write to clear Default = 0 This register increments when the host controller fails to fill the Tx latency FIFO to the level programmed by TXFIFOTHRES before running out of time to send the packet before the next start-of-frame. This health counter measures the number of times this occurs to provide feedback to selecting a proper TXSCHOH. Writing to this register will clear the counter and this counter will be at a maximum at 31.
7:0	TXSCHOH	Scheduler overhead Default = 0 This register adds an additional fixed offset to the schedule time estimator described above as Tff. As an approximation, the value chosen for this register should limit the number of back-off events captured in the TXSCHHEALTH to less than 10 per second in a highly-utilized bus. Choosing a value that is too high for this register is not desired, as it can needlessly reduce USB utilization. The time unit represented in this register is 1.267 ms when a device is connected in the high-speed mode for OTG and SPH. The time unit represented in this register is 6.333 ms when a device is connected in the low/full speed mode for OTG and SPH. The time unit represented in this register is always 1.267 times the MPH product.

0x12510170 USB2_HSIC_USB_OTG_HS_ULPI_VIEWPORT

Type: Read/write (unless otherwise indicated)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x08000000

The USB_OTG_HS_ULPI_VIEWPORT register provides indirect access to the ULPI PHY register set. Although the core performs access to the ULPI PHY register set, there may be extraordinary circumstances where software may need direct access.

CAUTION Writes to the ULPI through the viewport can substantially harm standard USB operations. Currently, no usage model has been defined where the software should need to execute writes directly to the ULPI - see the exception regarding optional features below.

Executing read operations though the ULPI viewport should have no harmful side effects to standard USB operations.

NOTE The ULPI viewport is only synthesized in the design if the constant VUSB_HS_PHY_ULPI is set (1). If the ULPI interface is not enabled, this register will always read zeros.

Two operations can be performed with the ULPI viewport: wake-up and read/write operations. The wake-up operation is used to put the ULPI interface into normal operation mode and re-enable the clock, if necessary. A wake-up operation is required before accessing the registers when the ULPI interface is operating in the low power mode, serial mode, or car kit mode.

The ULPI state can be determined by reading the sync state bit (ULPISS). If this bit is set (1), then the ULPI interface is running in the normal operation mode and can accept read/write operations. If the ULPISS is clear (0), then read/write operations will not be able to execute. Undefined behavior will result if ULPISS = 0, and a read or write operation is performed.

To execute a wake-up operation, write all 32-bits of the ULPI Viewport where ULPIPORT is constructed appropriately, and the ULPIWU bit is set (1) and the ULPIRUN bit is clear (0). Poll the ULPI viewport until ULPIWU is zero for the operation to complete.

To execute a read or write operation, write all 32-bits of the ULPI viewport where ULPIDATWR, ULPIADDR, ULPIPORT, and ULPIRW are constructed appropriately, and the ULPIRUN bit is set (1). Poll the ULPI viewport until ULPIRUN is zero for the operation to complete. Once ULPIRUN is zero, the ULPIDATRD will be valid if the operation was a read.

The polling method above could also be replaced and an interrupt driven using the ULPI interrupt defined in the USBTS and USBINTR registers. When a wake-up or read/write operation completes, the ULPI interrupt will be set (1).

Several optional features may need to be enabled or disabled by the system software as part of system configuration. These bits are contained in the interface and OTG control registers of the ULPI PHY register set. These registers also contain bits that are controlled by the link dynamically and, therefore, should only be modified by the system software using the set/clear access method. Direct writes to these registers could have harmful side effects to the standard USB operations. The following bits are optional bits:

- Bits 3 through 7 in the interface control register
- Bits 6 and 7 in the OTG control register.

Refer to the ULPI Specification Revision 1.1 for further information on the use of the optional features.

USB2_HSIC_USB_OTG_HS_ULPI_VIEWPORT

Bits	Name	Description
31	ULPIWU	ULPI wake-up Setting (1) this bit begins the wake-up operation. The bit will automatically transition to 0 after the wake-up is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wake-up and a read/write operation at the same time.
30	ULPIRUN	ULPI read/write run Setting (1) this bit will begin the read/write operation. The bit will automatically transition to 0 after the read/write is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time.

USB2_HSIC_USB_OTG_HS_ULPI_VIEWPORT (cont.)

Bits	Name	Description
29	ULPIRW	ULPI read/write control This bit selects between running a read or write operation. value 0 = Read value 1 = Write
28	ULPIFORCE	ULPI read/write force This bit enables forcing register access during RX packet value 0 = register access is not forced during RX packet (default) value 1 = register access is forced during RX packet reception
27	ULPISS	ULPI sync state Read Only value 1 = Normal sync state value 0 = In another state (for example, car kit, serial, low power) This bit represents the state of the ULPI interface. Before reading this bit, the ULPIPORT field should be set accordingly if used with the multi-port host. Otherwise, this field should always remain 0.
26:24	ULPIPORT	ULPI port number For the wakeup or read/write operation to be executed, this value selects the port number the ULPI PHY is attached to in the multi-port host. The valid range is 0 to 7. This field should always be written as a 0 for the non-multi port products.
23:16	ULPIADDR	ULPI data address When a read or write operation is commanded, the address of the operation is written to this field.
15:8	ULPIDATRD	ULPI data read Read only After a read operation completes, the result is placed in this field.
7:0	ULPIDATWR	ULPI data write When a write operation is commanded, the data to be sent is written to this field.

0x12510178 USB2_HSIC_USB_OTG_HS_ENDPTNAK

Type: Read/write clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTNAK register is the endpoint NAK register.

USB2_HSIC_USB_OTG_HS_ENDPTNAK

Bits	Name	Description
31:16	EPTN_15_0	Tx endpoint NAK Each tx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received IN token for the corresponding endpoint. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0
15:0	EPRN_15_0	Rx endpoint NAK Each rx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received OUT or PING token for the corresponding endpoint. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x1251017C USB2_HSIC_USB_OTG_HS_ENDPTNAKEN

Type: Read/write clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTNAKEN register is the endpoint NAK enable register.

USB2_HSIC_USB_OTG_HS_ENDPTNAKEN

Bits	Name	Description
31:16	EPTNE_15_0	Tx endpoint NAK enable Each bit is an enable bit for the corresponding Tx endpoint NAK bit. If this bit is set (1) and the corresponding Tx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0
15:0	EPRNE_15_0	Rx endpoint NAK enable Each bit is an enable bit for the corresponding Rx endpoint NAK bit. If this bit is set (1) and the corresponding Rx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x12510184 USB2_HSIC_USB_OTG_HS_PORTSC

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xCC000004

This is the USB_OTG_HS_PORTSC register.

USB2_HSIC_USB_OTG_HS_PORTSC

Bits	Name	Description
31:30	PTS	Parallel transceiver select Read/write This register bit pair is used in conjunction with the configuration constant VUSB_HS_PHY_TYPE to control which parallel transceiver interface is selected. If VUSB_HS_PHY_ TYPE is set for 0, 1, 2, or 3, then this bit is read only. If VUSB_HS_PHY_TYPE is 4, 5, 6, or 7, then this bit is read/write. This field is reset to the following values: 00 if VUSB_HS_PHY_TYPE = 0,4 - UTMI/UTMI+ 01 if VUSB_HS_PHY_TYPE = 1,5 - Reserved 10 if VUSB_HS_PHY_TYPE = 2,6 - ULPI 11 if VUSB_HS_PHY_TYPE = 3,7 - Serial/1.1 PHY (FS only) This bit is not defined in the EHCI specification.
29	STS	Serial transceiver select Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY_SERIAL to control whether the parallel or serial transceiver interface is selected for FS and LS operation. The serial interface engine can be used in combination with the UTMI+ or ULPI physical interface to provide FS/LS signaling instead of the parallel interface. ’ If VUSB_HS_PHY_SERIAL is 0 or 1, then this bit is read only. ’ If VUSB_HS_PHY_SERIAL is 2 or 3, then this bit is read/write. This bit has no effect unless the parallel transceiver select is set to UTMI+ or ULPI. The Serial/1.1 physical interface will use the serial interface engine for FS/LS signaling regardless of this bit value. Note: This bit was reserved for future operation, and is now adding for dynamic use of the serial engine in accord with UMTI+ and ULPI characterization logic. This bit is not defined in the EHCI specification.

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
28	PTW	Parallel transceiver width Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY16_8 to control the data bus width of the UTMI transceiver interface. ' If VUSB_HS_PHY16_8 is 0 or 1, then this bit is read only. ' If VUSB_HS_PHY16_8 is 2 or 3, then this bit is read/write. This bit is reset to 1 if VUSB_HS_PHY16_8 selects a default UTMI interface width of 16-bits, else it is reset to 0. ' Writing this bit to 0 selects the 8-bit [60MHz] UTMI interface. ' Writing this bit to 1 selects the 16-bit [30MHz] UTMI interface. This bit has no effect if the serial interface is selected. This bit is not defined in the EHCI specification.
27:26	PSPD	Port speed Read only This register field indicates the speed at which the port is operating. For HS mode operation in the host controller and HS/FS operation in the device controller, the port routing steers data to the protocol engine. For FS and LS mode operation in the host controller, the port routing steers data to the protocol engine with the embedded transaction translator. value 00 = Full speed value 01 = Low speed value 10 = High speed This bit is not defined in the EHCI specification.
25	SPRT	Short Port Reset Time. shortens port reset time for simulation.
24	PFSC	Port force full speed connect Read/write Default = 0 Setting (1) this bit will force the port to only connect at full speed. It also disables the chirp sequence that allows the port to identify itself as high speed. This is useful for testing FS configurations with a HS host, hub or device. This bit is not defined in the EHCI specification. This bit is for debugging purposes.

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
23	PHCD	PHY low power suspend - clock disable (PLPSCD) Read/write Default = 0 value 1 = Disable the PHY clock. value 0 = Enable the PHY clock. Reading this bit will indicate the status of the PHY clock. Note: The PHY clock cannot be disabled if it is being used as the system clock. In the device mode, The PHY can be put into low power suspend - clock disable when the device is not running (USBCMD run/stop = 0) or the host has signaled suspend (PORTSC SUSPEND = 1). Low power suspend will be cleared automatically when the host has signaled resume. Before forcing a resume from the device, the device controller driver must clear this bit. In the host mode, the PHY can be put into low power suspend - clock disable when the downstream device has been put into the suspend mode or when no downstream device is connected. Low power suspend is completely under the control of the software. This bit is not defined in the EHCI specification.
22	WKOC	Wake on over-current enable (WKOC_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to over-current conditions as wake-up events. This bit is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0). This bit is output from the controller as signal pwrctl_wake_ ovrcurr_en (OTG/host core only) for use by an external power control circuit.
21	WKDS	Wake on disconnect enable (WKDSCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device disconnects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_ dscnnt_en (OTG/host core only) for use by an external power control circuit.

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
20	WKCN	Wake on connect enable (WKCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device connects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_ dscnnt_en (OTG/host core only) for use by an external power control circuit.

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
19:16	PTC_3_0	Port test control Read/write Default = 0000 Any other value than zero indicates that the port is operating in the test mode. Value Specific test The FORCE_ENABLE_FS and FORCE ENABLE_LS tests are extensions to the test mode support, as specified in the EHCI specification. Writing the PTC field to any of the FORCE_ENABLE_{HS/FS/LS} values will force the port into the connected and enabled state at the selected speed. Writing the PTC field back to TEST_MODE_DISABLE will allow the port state machines to progress normally from that point. Note: Low speed operations are not supported as a peripheral device. 0x0: TEST_MODE_DISABLE 0x1: J_ STATE 0x8: K_STATE 0x9: SE0 (host / NAK device) 0x40: Packet 0x41: FORCE_ENABLE_HS 0x48: FORCE_ENABLE_FS 0x49: FORCE_ENABLE_LS 0x3E8: Reserved_1 0x3E9: Reserved_2 0x3EA: Reserved_3 0x3EB: Reserved_4 0x3EC: Reserved_5 0x3ED: Reserved_6 0x3EE: Reserved_7 0x3EF: Reserved_8 0x3F0: Reserved_9 0x3F1: Reserved_10 0x3F2: Reserved_11 0x3F3: Reserved_12 0x3F4: Reserved_13 0x3F5: Reserved_14 0x3F6: Reserved_15 0x3F7: Reserved_16 0x3F8: Reserved_17 0x3F9: Reserved_18 0x3FA: Reserved_19 0x3FB: Reserved_20 0x3FC: Reserved_21 0x3FD: Reserved_22 0x3FE: Reserved_23 0x3FF: Reserved_24

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
15:14	PIC_1_0	Port indicator control Read/write Default = 0 Writing to this field has no effect if the P_INDICATOR bit in the HCSPARAMS register is a zero. If the P_INDICATOR bit is set (1), then this field has the following meanings: Bit value Meaning value 00 Port indicators are off value 01 Amber value 10 Green value 11 Undefined Refer to the USB Specification Revision 2.0 [3] for a description on how these bits are to be used. This field is output from the controller as signals port_ind_ctl_1 and port_ind_ctl_0 for use by an external LED driving circuit.
13	PO	Port owner Read only Port owner hand-off is not implemented in this design, therefore this bit will always read back as clear (0). Default = 0 The EHCI definition is include here for reference: ’ This bit unconditionally goes clear (0) when the configured bit in the CONFIGFLAG register makes a 0-to-1 transition. ’ This bit unconditionally goes set (1) whenever the configured bit is clear (0). The system software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). The software sets (1) this bit when the attached device is not a high-speed device. When this bit is set (1), it indicates that an internal companion controller owns and controls the port.

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
12	PP	Port power (PP) Read/write or read-only The function of this bit depends on the value of the port power switching (PPC) field in the HCSPARAMS register. ’ PPC = 0: PP is read-only. A device controller with no OTG capability does not have port power control switches. ’ PPC = 1: PP is read/write. The host/OTG controller requires port power control switches. This bit represents the current setting of the switch (0 = off, 1 = on). When power is not available on a port (and PP equals a 0), the port is non-functional and will not report attaches, detaches, and so on. When an over-current condition is detected on a powered port and PPC is set (1), the PP bit in each affected port may be transitioned by the host controller driver from a one to a zero, removing power from the port. This feature is implemented in the host/OTG controller (PPC = 1). In a device-only implementation, port power control is not necessary. So, PPC and PP = 0.
11:10	LS_1_0	Line status Read-only These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines: Value Meaning value 00 SE0 value 10 J-state value 01 K-state value 11 Undefined In the host mode, the use of line state by the host controller driver is not necessary (unlike EHCI), because the port controller state machine and the port routing manage the connection of LS and FS. In the device mode, the use of line state by the device controller driver is not necessary.
9	HSP	High-speed port Read-only Default = 0 When the bit is set (1), the host/device connected to the port is in the high-speed mode. When this bit is clear (0), the host/device connected to the port is not in a high-speed mode. Note: HSP is redundant with PSPD(27:26), but will remain in the design for compatibility. This bit is not defined in the EHCI specification.

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
8	PR	Port reset This bit is clear (0) if the port power (PP) bit (bit 12) of this register is clear (0). Host mode: ’ Read/write ’ Default = 0 When the software sets (1) this bit, the bus-reset sequence as defined in the USB Specification Revision 2.0 is started. This bit will automatically clear (go to 0) after the reset sequence is complete. Note: This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the reset duration is timed in the driver. Device mode: This bit is a read-only status bit. Device reset from the USB bus is also indicated in the USBSTS register. 0x1: Port is in reset 0x0: Port is not in reset

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
7	SUSP	Suspend Host mode: ’ Read/write ’ Default = 0 The port enabled bit and suspend bit of this register define the port states: Bit value Port state value 0x Disable value 10 Enable value 11 Suspend When in the suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction if a transaction was in progress when this bit set (1). In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. The host controller will unconditionally clear (0) this bit when the software clears (0) the force port resume bit. The host controller ignores a write of zero to this bit. If the host software sets (1) this bit when the port is not enabled (port enabled bit is a zero), the results are undefined. This field is clear (0) if port power (PP) is clear (0) in the host mode. Device mode: ’ Read only ’ Default = 0 In the device mode, this bit is a read-only status bit. 0x1: Port in suspend state_1 0x0: Port not in suspend st_1 0x1: Port in suspend state_2 0x0: Port not in suspend st_2

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
6	FPR	Force port resume ’ Read/write ’ Default = 0 Host mode: The software sets (1) this bit to drive resume signaling. The host controller sets (1) this bit if a J-to-K transition is detected while the port is in the suspend state. When this bit transitions to a one because a J-to-K transition is detected, the port change detect bit in the USBSTS register is also set (1). This bit will automatically clear (go to 0) after the resume sequence is complete. This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the resume duration is timed in the driver. Note that, when the host controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (full-speed 'K') is driven on the port as long as this bit remains set (1). This bit will remain set (1) until the port has switched to the high-speed idle. Clearing (0) this bit has no affect, because the port controller will time the resume operation and clear (0) the bit when the port control state switches to HS or FS idle. This bit is clear if the port power (PP) is clear (0) in the host mode. This bit is not-EHCI compatible. Device mode: After the device has been in the suspend state for 5 ms or more, the software must set (1) this bit to drive resume signaling before clearing. The device controller will set (1) this bit if a J-to-K transition is detected while the port is in the suspend state. The bit will be cleared (0) when the device returns to normal operation. Also, when this bit transitions to a one because a J-to-K transition was detected, the port change detect bit in the USBSTS register is also set (1). 0x1: Resume detected/driven on port 0x0: No resume (K-state detected/driven on port)
5	OCC	Over-current change Read/write control Default = 0 This bit gets is set (1) when there is a change to over-current active. The software clears this bit by setting (1) this bit position. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
4	OCA	Over-current active Read-only Default = 0 value 1 = This port currently has an over-current condition. value 0 = This port does not have an over-current condition. This bit will automatically transition from set (1) to clear (0) when the over current condition is removed. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).
3	PEC	Port enable/disable change Read/write control value 1 = Port enabled/disabled status has changed value 0 = No change Default = 0 Host mode: For the root hub, this bit gets set (1) only when a port is disabled due to disconnect on the port or due to the appropriate conditions existing at the EOF2 point. The software clears this bit by writing a one to it. This field is clear (0) if the port power (PP) bit in the register is clear (0). Device mode: The device port is always enabled (this bit will be zero).
2	PE	Port enabled/disabled Read/write value 1 = Enable value 0 = Disable Default 0 Host mode: Ports can only be enabled by the host controller as a part of the reset and enable. The software cannot enable a port by setting (1) this field. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by the host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port, due to other host controller and bus events. When the port is disabled, (0) downstream propagation of data is blocked except for reset. This field is clear (0) if the port power (PP) bit is cleared (0) in the host mode. Device mode: The device port is always enabled (this bit will be set [1])

USB2_HSIC_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
1	CSC	Connect status change Read/write control value 1 = Change in current connect status value 0 = No change Default = 0 Host mode: Indicates that a change has occurred in the port's current connect status. The host/device controller sets (1) this bit for all changes to the port device connect status, even if the system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, the hub hardware will be 'setting' an already-set bit (that is, the bit will remain set). The software clears this bit by writing a one to it. This field is zero if the port power (PP) bit in this register is zero in the host mode. Device mode: This bit is undefined in the device controller mode.
0	CCS	Current connect status Read-only Host mode: value 1 = Device is present on port value 0 = No device is present Default = 0 This value reflects the current state of the port, and may not correspond directly to the event that caused the connect status change bit (bit 1) to be set (1). This field is clear if the port power (PP) bit in this register is clear (0) in host mode. Device mode: value 1 = Attached value 0 = Not attached Default = 0 If this bit is set (1), this indicates that the device successfully attached, and is operating in either high speed or full speed, as indicated by the high speed port bit in this register. If this bit is clear (0), this indicates that the device did not attach successfully or was forcibly disconnected by the software clearing (0) the run bit in the USBCMD register. It does not state the device being disconnected or suspended.

Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000E20

USB2_HSIC_USB_OTG_HS_OTGSC

Bits	Name	Description
31	RESERVED_BIT31	Clear (0) this bit.
30	DPIE	Data pulse interrupt enable
29	B_1MSE	1 millisecond timer interrupt enable - read/write
28	BSEIE	B session end interrupt enable Read/write Setting (1) this bit enables the B session end interrupt.
27	BSVIE	B session valid interrupt enable Read/write Setting (1) this bit enables the B session valid interrupt.
26	ASVIE	A session valid interrupt enable Read/write Setting (1) this bit enables the A session valid interrupt.
25	AVVIE	A Vbus valid interrupt enable Read/write Setting (1) this bit enables the A Vbus valid interrupt.
24	IDIE	USB ID interrupt enable Read/write Setting (1) this bit enables the USB ID interrupt.
23	RESERVED_BIT23	Clear (0) this bit.
22	DPIS	Data pulse interrupt status Read/write to clear This bit is set (1) when data bus pulsing occurs on DP or DM. Data bus pulsing is only detected when USBMODE.CM = Host (11) and PORTSC(0). PortPower = Off (0). The software must write a one to clear this bit.
21	B_1MSS	1 millisecond timer interrupt status Read/write to clear This bit is set (1) once every millisecond. The software must write a one to clear this bit.
20	BSEIS	B session end interrupt status Read/write to clear This bit is set (1) when the Vbus has fallen below the B session end threshold. The software must write a one to clear this bit
19	BSVIS	B session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the B session valid threshold (0.8 VDC). The software must write a one to clear this bit.

USB2_HSIC_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Description
18	ASVIS	A session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the A session valid threshold (0.8 VDC). The software must write a one to clear this bit.
17	AVVIS	A Vbus valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the Vbus valid threshold (4.4 VDC) on an A device. The software must write a one to clear this bit.
16	IDIS	USB ID interrupt status Read/write This bit is set (1) when a change on the ID input has been detected. The software must write a one to clear this bit.
15	RESERVED_BIT15	Clear (0) this bit.
14	DPS	Data bus pulsing status Read-only If this bit is set (1), it indicates that the data bus pulsing is being detected on the port.
13	B_1MST	1 millisecond timer toggle Read-only This bit toggles once per millisecond.
12	BSE	B session end Read-only Indicates that the Vbus is below the B session end threshold.
11	BSV	B session valid Read-only Indicates that the Vbus is above the B session valid threshold.
10	ASV	A session valid Read-only Indicates that the Vbus is above the A session valid threshold.
9	AVV	A Vbus valid Read-only Indicates that the Vbus is above the A Vbus valid threshold.
8	ID	USB ID Read-only value 0 = A device value 1 = B device

USB2_HSIC_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Description
7	HABA	Hardware assist B-disconnect to A-connect Read/write value 0 = Disabled value 1 = Enable automatic B-disconnect to A-connect sequence.
6	HADP	Hardware assist data-pulse Write to set
5	IDPU	ID pull-up Read/write This bit provides control over the ID pull-up register. value 0 = Off value 1 = On (default) When this bit is clear (0), the ID input will not be sampled.
4	DP	Data pulsing Read/write Setting (1) this bit causes the pull-up on DP to be asserted for data pulsing during SRP.
3	OT	OTG termination Read/write This bit must be set (1) when the OTG device is in the device mode. This controls the pull-down on DM.
2	HAAR	Hardware assist auto-reset Read/write value 0 = Disabled value 1 = Enable automatic reset after connect on host port.
1	VC	Vbus charge Read/write Setting (1) this bit causes the Vbus line to be charged. This is used for Vbus pulsing during SRP.
0	VD	Vbus discharge Read/write Setting (1) this bit causes the Vbus to discharge through a resistor.

0x125101A8 USB2_HSIC_USB_OTG_HS_USBMODE

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_USBMODE register is the USB device mode register.

USB2_HSIC_USB_OTG_HS_USBMODE

Bits	Name	Description
31:6	RESERVED_BITS31_6	Clear (0) these bits.
5	VBPS	Vbus power select value 0 - Output is 0 value 1 - Output is 1 This bit is connected to the vbus_pwr_select output and can be used for any generic control, but is named to be used by logic that selects between an on-chip Vbus power source (charge pump) and an off-chip source in systems when both are available.
4	SDIS	Stream disable mode value 0 = Inactive (default) value 1 = Active Device mode: Setting (1) this bit disables double priming on both the Rx and Tx for low bandwidth systems. This mode ensures that, when the Rx and Tx buffers are sufficient to contain an entire packet, the standard double buffering scheme is disabled to prevent overruns/underruns in bandwidth-limited systems. Note: In the high speed mode, a NYET handshake will respond to all packets received when the stream disable is active. Host mode: Setting (1) this bit ensures that overruns/underruns of the latency FIFO are eliminated for low bandwidth systems where the Rx and Tx buffers are sufficient to contain the entire packet. Enabling the stream disable also has the effect of ensuring that the Tx latency is filled to capacity before the packet is launched onto the USB. Note: Time duration to pre-fill the FIFO becomes significant when the stream disable is active. See TXFILLTUNING and TXTTFILLTUNING [MPH only] to characterize the adjustments needed for the scheduler when using this feature. Note: The use of this feature substantially limits of the overall USB performance.
3	SLOM	Setup lockout mode. In the device mode, this bit controls the behavior of the setup lock mechanism. value 0 = Setup lockouts on (default) value 1 = Setup lockouts off (DCD requires use of a setup data buffer tripwire in USBCMD)

USB2_HSIC_USB_OTG_HS_USBMODE (cont.)

Bits	Name	Description
2	ES	Endian select Read/write This bit can change the byte ordering of the transfer buffers to match the host microprocessor bus architecture. The bit fields in the microprocessor interface and the DMA data structures (including the setup buffer within the device QH) are unaffected by the value of this bit, because they are based upon 32-bit words. value 0 = Little endian (default) - first byte referenced in the least significant byte of a 32-bit word. value 1 = Big endian - first byte referenced in most significant byte of a 32-bit word.
1:0	CM	Controller mode Read/write once The controller mode is defaulted to the proper mode for host-only and device-only implementations. For those designs that contain both host and device capability, the controller will default to an idle state and will need to be initialized to the desired operating mode after reset. For combination host/device controllers, this register can only be written once after reset. If it is necessary to switch modes, the software must reset the controller by writing to the RESET bit in the USBCMD register before reprogramming this register. value 00 = Idle [default for combination host/device] value 01 = Reserved value 10 = Device controller [default for device only controller] value 11 = Host controller [default for host only controller]

0x125101AC USB2_HSIC_USB_OTG_HS_ENPDTSETUPSTAT

Type: Read/write control
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENPDTSETUPSTAT register is the endpoint set-up status register.

USB2_HSIC_USB_OTG_HS_ENPDTSETUPSTAT

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_ENPDTSETUPSTAT (cont.)

Bits	Name	Description
15:0	ENDPTSETUPSTAT_15_0	Set-up endpoint status For every set-up transaction that is received, a corresponding bit in this register is set (1). The software must clear or acknowledge the setup transfer by setting (1) a respective bit after it has read the setup data from the queue head. The response to a set-up packet as in the order of operations and total response time is crucial to limit bus time outs while the set-up lock-out mechanism is engaged. See Managing Endpoints in the Device Operational Model. This register is only used in the device mode.

0x125101B0 USB2_HSIC_USB_OTG_HS_ENDPTPRIME

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTPRIME register is the endpoint initialization register. This register is only used in the device mode.

USB2_HSIC_USB_OTG_HS_ENDPTPRIME

Bits	Name	Description
31:16	PETB_15_0	Prime endpoint transmit buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a transmit operation in order to respond to a USB IN/INTERRUPT transaction. The software should set (1) the corresponding bit when posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a transmit buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. PETB[15] - Endpoint 15 PETB[1] - Endpoint 1 PETB[0] - Endpoint 0

USB2_HSIC_USB_OTG_HS_ENDPTPRIME (cont.)

Bits	Name	Description
15:0	PERB_15_0	Prime endpoint receive buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a receive operation for when a USB host initiates a USB OUT transaction. The software should set (1) the corresponding bit whenever posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x125101B4 USB2_HSIC_USB_OTG_HS_ENDPTFLUSH

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTFLUSH register is the endpoint de-initialize register. This register is only used in the device mode.

USB2_HSIC_USB_OTG_HS_ENDPTFLUSH

Bits	Name	Description
31:16	FETB_15_0	Flush endpoint transmit buffer Setting (1) a bit in this register will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. FETB[15] - Endpoint 15 FETB[1] - Endpoint 1 FETB[0] - Endpoint 0
15:0	FERB_15_0	Flush endpoint receive buffer Setting a bit (1) will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x125101B8 USB2_HSIC_USB_OTG_HS_ENDPTSTAT

Type: Read-only
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTSTAT register is the endpoint status register. This register is only used in the device mode.

USB2_HSIC_USB_OTG_HS_ENDPTSTAT

Bits	Name	Description
31:16	ETBR_15_0	Endpoint transmit buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ETBR[15] - Endpoint 15 ETBR[1] - Endpoint 1 ETBR[0] - Endpoint 0
15:0	ERBR_15_0	Endpoint receive buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ERBR[15] - Endpoint 15 ERBR[1] - Endpoint 1 ERBR[0] - Endpoint 0

0x125101BC USB2_HSIC_USB_OTG_HS_ENDPTCOMPLETE

Type: Read/write control
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The register is the endpoint complete register. This register is only used in the device mode.

USB2_HSIC_USB_OTG_HS_ENDPTCOMPLETE

Bits	Name	Description
31:16	ETCE_15_0	Endpoint transmit complete event Each bit indicates that a transmit event (IN/INTERRUPT) occurred and the software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ETCE[15] - Endpoint 15 ETCE[1] - Endpoint 1 ETCE[0] - Endpoint 0
15:0	ERCE_15_0	Endpoint receive complete event Each bit indicates that a received event (OUT/SETUP) occurred and the software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ERCE[15] - Endpoint 15 ERCE[1] - Endpoint 1 ERCE[0] - Endpoint 0

0x125101C0 USB2_HSIC_USB_OTG_HS_ENDPTCTRL0

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00800080

The USB_OTG_HS_ENDPTCTRL0 register is the endpoint control 0 register. Every device will implement endpoint0 as a control endpoint.

USB2_HSIC_USB_OTG_HS_ENDPTCTRL0

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
23	TXE	Tx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
22:20	RESERVED_BITS22_20	Clear (0) these bits.
19:18	TXT	Tx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
17	RESERVED_BIT17	Clear (0) this bit.
16	TXS	Tx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
6:4	RESERVED_BITS6_4	Clear (0) these bits.
3:2	RXT	Rx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
1	RESERVED_BIT1	Clear (0) this bit.

USB2_HSIC_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
0	RXS	Rx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

0x125101C0+4*n USB2_HSIC_USB_OTG_HS_ENDPTCTRLn, n=[1..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTCTRLn register is the endpoint control n register. There is an ENDPTCTRLn register for each endpoint in a device.

CAUTION If one endpoint direction is enabled and the paired endpoint of the opposite direction is disabled, then the unused direction type must be changed from the default control-type to any other type (such as bulk-type). Leaving an unconfigured endpoint control will cause undefined behavior for the data PID tracking on the active endpoint/direction.

USB2_HSIC_USB_OTG_HS_ENDPTCTRLn

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23	TXE	Tx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

USB2_HSIC_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
22	TXR	Tx data toggle reset (WS) value 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and device.
21	TXI	Tx data toggle inhibit value 0 = PID sequencing enabled (default) value 1 = PID sequencing disabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always transmit DATA0 for a data packet.
20	RESERVED_BIT20	Clear (0) this bit.
19:18	TXT	Tx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
17	TXD	Tx endpoint data source value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
16	TXS	Tx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. in most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

USB2_HSIC_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
6	RXR	Rx data toggle reset (WS) Write 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and the device.
5	RXI	Rx data toggle inhibit value 0 = Disabled (default) value 1 = Enabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always accept a data packet regardless of their data PID.
4	RESERVED_BIT4	Clear (0) this bit.
3:2	RXT	Rx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
1	RXD	Rx endpoint data sink value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
0	RXS	Rx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. in most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

0x125101FC+4*n USB2_HSIC_USB_OTG_HS_ENDPT_PIPE_IDn, n=[1..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x001F001F

The USB_OTG_HS_ENDPT_PIPE_IDn register is the endpoint pipe number register. There is an USB_OTG_HS_ENDPT_PIPE_IDn register for each endpoint in a device.

NOTE reset value of TX_PIPE_ID and RX_PIPE_ID is 0x1F, which means that Endpoint is not mapped to any pipe.

USB2_HSIC_USB_OTG_HS_ENDPT_PIPE_IDn

Bits	Name	Description
31:21	RESERVED_BITS31_21	Clear (0) these bits.
20:16	TX_PIPE_ID	This field indicate the pipe number that this tx end point (n) will use in pipe mode.
15:5	RESERVED_BITS15_5	Clear (0) these bits.
4:0	RX_PIPE_ID	This field indicate the pipe number that this rx end point (n) will use in pipe mode.

0x12510240 USB2_HSIC_USB_OTG_HS_PHY_CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0b1110000111010

The USB_OTG_HS_PHY_CTRL register is used to configure various features in the Synopsys 28nm PHY.

USB2_HSIC_USB_OTG_HS_PHY_CTRL

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	USB2_PHY_IDHV_CLAMP_EN	Clamp enable for IDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and IDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped high. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
11	USB2_PHY_OTGSESSVLDHV_CLAMP_EN	Clamp enable for OTGSESSVLDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and OTGSESSVLDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.

USB2_HSIC_USB_OTG_HS_PHY_CTRL (cont.)

Bits	Name	Description
10	PHY_MPM_HV_CLAMP_EN	Clamp enable for HV interrupts level shifters from USB VDD180 domain to VDDPAD MPM in usb2 phy wrapper. When set (1), VLS is active and HV interrupts are translated from 1.8V domain to MPM Vdd domain. When clear (0), VLS is clamped to inactive state. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
9	USB2_PHY_OTGSESSVLD HV_INTEN	Enable HV session valid interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
8	USB2_PHY_IDHV_INTEN	Enable HV id pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
7	USB2_PHY_ULPI_POR	Reset for ULPI PHY Wrapper and ULPI clock domain logic in usb2_phy_wrapper.
6:4	USB2_PHY_FSEL	Reference Clock Frequency Select 011 (Assumes 19.2MHz default)
3	HOST_PORTCTRL_FORCE _SUSEN	Chicken bit for CR-0000153908 - when this bit set the core will enter to low power mode when portctrl host sm enter to suspend mode. Default value is 1.
2	USB2_PHY_SIDDQ	IDDQ Test Enable.
1	USB2_PHY_RETEN	Retention mode enable/disable
0	USB2_PHY_POR	Power-On-Reset (Analog configuration needs to happen before POR is set to 0)

0x12510244 USB2_HSIC_USB_OTG_HS_GENERIC1

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

The USB_OTG_HS_GENERIC1 register.

USB2_HSIC_USB_OTG_HS_GENERIC1

Bits	Name	Description
31:16	USB_HS_TX_DEPTH	TX_DEPTH is the number of words in the TX buffer. This number is calculated by the number of bytes allocated per Endpoint divided by 4, times the number of endpoints. The RAM width is 36. In HS USB this value is usually 512 bytes per EP, and for FS ONLY USB it is usually 64 Bytes per EP.
15:0	USB_HS_RX_DEPTH	RX_DEPTH is the number of words in the RX buffer. This number is usually 256, but can support powers of 2 up to 4096. The RAM width is 36.

0x12510248 USB2_HSIC_USB_OTG_HS_GENERIC2

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

The USB_OTG_HS_GENERIC2 register.

USB2_HSIC_USB_OTG_HS_GENERIC2

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15	USE_SPS_AHB2AHB	USE_SPS_AHB2AHB generic specifies if AHB2AHB bridge is connected between BAM and SPS Fabric AHB.
14	LPM_SUPPORT	The LPM_SUPPORT generic specifies if USB support Link Power Management.
13:9	USB_HS_DEV_EP	The number of USB endpoints. Valid values for the number of Endpoints are 4, 8, and 16
8:3	MAX_PIPES	The number of simultaneous parallel pipes supported by the BAM. Supported values are 2 to 30
2	USE_SPS	The USE_SPS generic specifies if Bam is connected to USB core.
1	USE_HSIC	The USE_HSIC generic specifies if an HSIC is connected to USB core.
0	UTMI_PHY_SW_IF_EN	The UTMI_PHY_SW_IF_EN generic specifies if UTMI phy Register Interface is enabled

0x12510250 USB2_HSIC_USB_OTG_HS_L1_EP_CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0000FFFF

The USB_OTG_HS_L1_EP_CTRL register enables/disables transition to L1 and exit from L1 state when specific TX endpoints are primed.

USB2_HSIC_USB_OTG_HS_L1_EP_CTRL

Bits	Name	Description
31:16	TX_EP_PRIME_L1_EXIT	Those bit's enables Remote Wakeup in L1 state when SW starts Priming The specific Endpoint.
15:0	TX_EP_PRIME_L1_EN	Control bit's that enables/disables transition to L1 when the specific TX Endpoint is active.

0x12510254 USB2_HSIC_USB_OTG_HS_L1_CONFIG

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_L1_CONFIG register is used to configure various L1 features.

USB2_HSIC_USB_OTG_HS_L1_CONFIG

Bits	Name	Description
31:12	RESERVED_BITS31_12	Clear (0) these bits.
11	PLL_PWR_DWN_EN	Control bit that enables/disables power down of 480 MHZ PLL in L1 state.
10	PHY_LPM_EN	Control bit that enable/disables entering ULPI Low Power Mode in L1 state
9	GATE_AHB_CLK_EN	Control bit that enable/disables clock request signaling for usb_ahb_clk in L1 state
8	GATE_FS_XCVR_CLK_EN	Control bit that enable/disables clock gating of usb_fs_xcvr_clk in L1 state
7	GATE_SYS_CLK_EN	Control bit that enable/disables clock gating of usb_system_clk in L1 state
6	GATE_XCVR_CLK_EN	Control bit that enable/disables power-down of 480 MHz PLL in L1 state
5	L1_REMOTE_WAKEUP_EN	Control bit that enables/disables Remote Wakeup in L1 state. When this bit is low, then Link Controller never initiates Remote Wakeup in L1 state. When this bit is high, Link Controller can initiate Remote Wakeup.
4	LPM_EN	Control bit that enables/disables LPM support. When this bit is zero a full backward compatibility is ensured - no LPM support and no response for LPM Extended Transaction
3:0	PLL_TURNOFF_MIN_HIRD	Specifying a minimum expected HIRD value from Host that enables HW mechanism for turning off the 480 MHz PLL. The default value is 50us.

0x12510258 USB2_HSIC_USB_OTG_HS_LPM_DEBUG_1

Type: Read/Clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_DEBUG_1 register is for debug and testing purposes mostly.

USB2_HSIC_USB_OTG_HS_LPM_DEBUG_1

Bits	Name	Description
31:16	DEBUG_L1_LONG_ENT_CNT	Count number of exits from L1 where duration in L1 is > 200us. Writing to this register clears the counter.
15:0	DEBUG_L1_SHORT_ENT_CNT	Count number of exits from L1 where duration in L1 is <= 200us. Writing to this register clears the counter.

0x1251025C USB2_HSIC_USB_OTG_HS_LPM_DEBUG_2

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_DEBUG_2 register is for debug and testing purposes mostly.

USB2_HSIC_USB_OTG_HS_LPM_DEBUG_2

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12:9	L1_RMT_WKUP_TIME	Read/write Specifying How much time the device drives remote wakeup. The default Value is 50us for reset value. Add the value of this register (in us) to the remote wakeup time.
8	L1_FPR	Read/write L1 Force port resume, The software sets (1) this bit to drive resume signaling.
7	HSIC_CLK_PLL_BYPASSNL	Read only. Disables PLL analog logic. Active low. Connects to bypassnl input of NT_PLL.
6	HSIC_CLK_PLL_RESET	Read only. Resets all FF in PLL. Active low. Connects to reset_n input of NT_PLL.
5	HSIC_CLK_GATE	Read only. Clock gating of hsic_clk and ulpi_clk, without turning off HSIC PLL.
4	FS_XCVR_CLK_GATE	Read only. Clock gating of cc_usb_xcvr_fs_clk
3	SYS_CLK_GATE	Read only. Clock gating of cc_usb_system_clk
2	AHB_CLK_GATE	Read only. Clock gating of usb_ahb_clk

USB2_HSIC_USB_OTG_HS_LPM_DEBUG_2 (cont.)

Bits	Name	Description
1	L1_STATE	Read only. Status bit indicating if Device is in L1 state. When this bit high, Link Controller and HSIC PHY are in L1 state
0	DEBUG_L1_EN	Read/write Control bit that enable/disables DEBUG counters operation.

0x12510260 USB2_HSIC_USB_OTG_HS_LPM_ATTRIBUTES

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_ATTRIBUTES register store the bmAttribute Field of the LPM transaction.

USB2_HSIC_USB_OTG_HS_LPM_ATTRIBUTES

Bits	Name	Description
31:5	RESERVED_BITS31_5	Clear (0) these bits.
4	BREMOTEWAKE	A value of one (1B) in this field enables the addressed device to wake the host upon any meaningful application-specific event (e.g. an interrupt for a device with one or more interrupt endpoints). A value of zero (0B) disables the device from initiating remote wake.
3:0	HIRD	Host Initiated Resume Duration.

20.31 USB3 OTG HS Registers (0x12520000 USB3_HS_BASE)

This section contains USB3 OTG HS registers.

20.31.1 Identification registers

Identification registers are used to declare the slave interface presence and include a table of the hardware configuration parameters.

0x12520000 USB3_HS_USB_OTG_HS_ID

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0042FA05

The USB_OTG_HS_ID register is the identification register. It provides a simple way to determine if the USB-HS USB 2.0 core is provided in the system. The ID register identifies the USB-HS USB 2.0 core and its revision.

USB3_HS_USB_OTG_HS_ID

Bits	Name	Description
31:24	RESERVED_BITS31_24	These bits are reserved and should be set to zero.
23:16	REVISON_7_0	This field contains the revision number of the core - 0x42.
15:8	NID_5_0	This field contains the complement version of ID[7:0] - 0xFA.
7:0	ID_5_0	This field is the configuration number. This number is set to 0x05 and indicates that the peripheral is the USB-HS USB 2.0 core.

0x12520004 USB3_HS_USB_OTG_HS_HWGENERAL

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x5C2

The USB_OTG_HS_HWGENERAL register contains the general hardware parameters.

USB3_HS_USB_OTG_HS_HWGENERAL

Bits	Name	Description
31:10	RESERVED_BITS31_10	Clear (0) these bits.
9	SM	VUSB_HS_PHY_SERIAL = 2
8:6	PHYM	VUSB_HS_PHY_TYPE = 7
5:4	PHYW	VUSB_HS_PHY16_8 = 0

USB3_HS_USB_OTG_HS_HWGENERAL (cont.)

Bits	Name	Description
3	BWT	This bit is reserved for internal testing = 0
2:1	CLCK	VUSB_HS_CLOCK_CONFIGURATION = 1
0	RT	VUSB_HS_RESET_TYPE = 0

0x12520008 USB3_HS_USB_OTG_HS_HWHOST

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x10020001

The USB_OTG_HS_HWHOST register contains the host hardware parameters.

USB3_HS_USB_OTG_HS_HWHOST

Bits	Name	Description
31:24	TTPER	VUSB_HS_TT_PERIODIC_CONTEXTS
23:16	TTASY	VUSB_HS_TT_ASYNC_CONTEXTS
15:4	RESERVED_BITS15_4	Clear (0) these bits.
3:1	NPORT	VUSB_HS_NUM_PORT-1
0	HC	VUSB_HS_HOST

0x1252000C USB3_HS_USB_OTG_HS_HWDEVICE

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000021

The USB_OTG_HS_HWDEVICE register contains the device hardware parameters.

USB3_HS_USB_OTG_HS_HWDEVICE

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5:1	DEVEP	VUSB_HS_DEV_EP
0	DC	Device capable; [VUSB_HS_DEV/=0]

0x12520010 USB3_HS_USB_OTG_HS_HWTXBUF

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x80070B08

The USB_OTG_HS_HWTXBUF register contains the Tx buffer hardware parameters.

USB3_HS_USB_OTG_HS_HWTXBUF

Bits	Name	Description
31	TXLCR	This bit is fixed to 1'b1 so that the local context register's are included in the design. This means that the DMA context is implemented in FlipFlops.
30:24	RESERVED_BITS30_24	Clear (0) these bits.
23:16	TXCHANADD	VUSB_HS_TX_CHAN_ADD - Defines the number of address lines needed per Endpoint per the TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
15:8	TXADD	VUSB_HS_TX_ADD - Defines the number of address lines needed per the entire TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
7:0	TXBURST	VUSB_HS_TX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the TX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst length will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x12520014 USB3_HS_USB_OTG_HS_HWRXBUF

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000808

The USB_OTG_HS_HWRXBUF register contains the Rx buffer hardware parameters.

USB3_HS_USB_OTG_HS_HWRXBUF

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits).
15:8	RX_ADD	VUSB_HS_RX_ADD - Defines the number of address lines needed per the entire RX latency buffer. It's reset value is taken from a GENERIC value passed to the core.

USB3_HS_USB_OTG_HS_HWRXBUF (cont.)

Bits	Name	Description
7:0	RX_BURST	VUSB_HS_RX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the RX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst length will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x12520040+4*n USB3_HS_USB_OTG_HS_SCRATCH_RAMn, n=[0..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

USB_OTG_HS_SCRATCH_RAMn registers are 16 32bit scratch registers.Required for passing USB software information between different images.

USB3_HS_USB_OTG_HS_SCRATCH_RAMn

Bits	Name	Description
31:0	SCRATCH_REGISTER	32 bit scratch register

20.31.2 Device/host timer registers

The host/device controller drivers can measure time related activities using these timer registers.

NOTE These registers are not part of the standard EHCI controller.

0x12520080 USB3_HS_USB_OTG_HS_GPTIMER0LD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER0LD register is the general purpose timer 0 load register. This register contains the timer duration or load value. See the GPTIMER0CTRL register for a description of the timer functions.

USB3_HS_USB_OTG_HS_GPTIMER0LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

USB3_HS_USB_OTG_HS_GPTIMER0LD (cont.)

Bits	Name	Description
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFFF or 16.777215 seconds

0x12520084 USB3_HS_USB_OTG_HS_GPTIMER0CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER0CTRL register is the general purpose timer 0 control register. This register contains the control for the timer and a data field can be queried to determine the running count value. This timer has a granularity of 1 ms and can be programmed to a little over 16 seconds. There are two modes supported by this timer: the first is a one-shot and the second is a looped count, which is described in the register table below. When the timer counter value transitions to zero, an interrupt can be generated though the use of the timer interrupts in the USBTS and USBINTR registers.

USB3_HS_USB_OTG_HS_GPTIMER0CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.

USB3_HS_USB_OTG_HS_GPTIMER0CTRL (cont.)

Bits	Name	Description
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

0x12520088 USB3_HS_USB_OTG_HS_GPTIMER1LD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER1LD register is the general purpose timer 1 control register. This register contains the timer duration or load value. See the GPTIMER0LDregister for a description of the timer functions.

USB3_HS_USB_OTG_HS_GPTIMER1LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFFF or 16.777215 seconds.

0x1252008C USB3_HS_USB_OTG_HS_GPTIMER1CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER1CTRL register is the general purpose timer 1 control register. See the description of the USB_OTG_HS_GPTIMER0CTRL register for details about this register.

USB3_HS_USB_OTG_HS_GPTIMER1CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

20.31.3 Wrapper operational registers

0x12520090 USB3_HS_USB_OTG_HS_AHB_BURST

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_AHB_BURST register determines the AHB master mode of the USB HS Core.

NOTE If the USB_OTG_HS_AHB_MODE is configured to be 0x0 (the AHB Transactor is used), this register must be 0x0 as well, otherwise the AHB Master bus behavior is undefined. Use values other than 0x0 only if setting USB_OTG_HS_AHB_MODE to 0x1.

USB3_HS_USB_OTG_HS_AHB_BURST

Bits	Name	Description
31:3	RESERVED_BITS31_3	Should be set to zero.
2:0	AHB_BURST	AMBA AHB BURST. This is a r/w field that selects the following options for the m_hburst signal of the AMBA master interface: In all cases where the unspecified length burst is allowed, singles access may also occur, this is mostly true when the transaction is not 32-bit aligned. Two consecutive single accesses should not happen. When a INCRx burst size is selected and the transfer is not multiple of the INCRx burst, the burst is decomposed in the different ways. With AHBBRST[2] = 1, the smaller bursts will be unspecified length. with AHBBRST[2] = 0, the smaller bursts will be smaller INCRx or singles. For example, lets say that it's required at a given time, to transfer 22 words of information, for the following values of AHBBRST the master sequence will be: This field after reset is set to a default value that can be configured in the file vusb_hs_cfg.vhd. The AHBBRST field is only used if the AMBA-AHB system interface has been selected. It has no effect for cores featuring BVCI interface. In the later case the read will return zeros. When this field is different from zero, the value of the fields TXBURST /RXBURST in register BURSTSIZE 160h, will be ignored by the controller. Internally the BURSTSIZE will be set to the value of the INCRx AMBA burst. Since this has a direct relation with the burst sizes you must be careful with AHB burst selected. Although the TXBURST / RXBURST are bypassed, this register can still be written / read with no effect, while the AHBBRST field is non-zero. 0x0: INCR burst of unspecified length 0x1: INCR4, non-multiple transfers of INCR4 will be decomposed into singles 0x2: INCR8, non-multiple transfers of INCR8, will be decomposed into INCR4 or singles 0x3: INCR16, non-multiple transfers of INCR16, will be decomposed into INCR8, INCR4 or singles 0x4: This value is reserved and should not be used 0x5: INCR4, non-multiple transfers of INCR4 will be decomposed into smaller unspecified length bursts 0x6: INCR8, non-multiple transfers of INCR8 will be decomposed into smaller unspecified length bursts 0x7: INCR16, non-multiple transfers of INCR16 will be decomposed into smaller unspecified length bursts 0x5: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+ INCR unspec. length 0x6: INCR8+INCR8+INCR4+ INCR unspec. length 0x7: INCR16+INCR4+ INCR unspec. length 0x1: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+SINGLE+SINGLE 0x2: INCR8+INCR8+INCR4+SINGLE+SINGLE 0x3: INCR16+INCR4+SINGLE+SINGLE

0x12520094 USB3_HS_USB_OTG_HS_XTOR_STS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_XTOR_STS register is currently a placeholder for future status bits from the AHB2AHB Transactor.

USB3_HS_USB_OTG_HS_XTOR_STS

Bits	Name	Description
31:2	RESERVED_BITS31_2	Not used currently.
1	GRANT_STOLEN	Reports whether the arbiter removed the hgrant signal prior to completing a transaction. This is currently supported in WRITES ONLY. This bit can be cleared by writing a ’1’ to the GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register. To enable this bit again, write a ’0’ to he GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register.
0	RESERVED_BIT0	Not used currently.

0x12520098 USB3_HS_USB_OTG_HS_AHB_MODE

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1

USB3_HS_USB_OTG_HS_AHB_MODE

Bits	Name	Description
31	ASYNC_BRIDGES_BYPASS	Default is ’0’. When ’0’ the asynchronous bridge on the master AHB interface is used. When ’1’, it is bypassed. The bridge on the slave AHB is always used.
30:5	RESERVED_BITS30_5	Not used currently.
4	INCR_OVERRIDE	Valid only if the Transactor is bypassed: When ’1’, all INCR bursts from the USB Core will be internally transformed into SINGLE transfers. When ’0’, if the USB Core issues an INCR burst, it will propagate to the external master AHB port.

USB3_HS_USB_OTG_HS_AHB_MODE (cont.)

Bits	Name	Description
3:2	HPROT_MODE	When ’00’ the HPROT signal out of the USB Wrapper is ’0001’, and all transactions are non-posted. When ’01’ the HPROT signal out of the USB Wrapper is ’0101’, and all transactions are posted. When ’10’ the HPROT signal out of the USB Wrapper alternates according to the context of the AHB bus access. Control structures are non-posted while data transfer is posted. When ’11’, reserved value, but currently maps to non-posted (same as ’00’).
1	GRANT_STOLEN_CLEAR	Clears the grant stolen field of the USB_OTG_HS_XTOR_STS register. To enable this bit again, write ’0’ after clearing the GRANT_STOLEN (’1’).
0	XTOR_BYPASS	When this bit is set (1), the AHB Transactor is bypassed, and the USB HS Core’s AHB Master interface is directly connected to the AHB system. In this case, the USB_OTG_HS_AHB_BURST register value will determine the bus characteristics. When this bit is reset (0), the AHB Transactor is used to connect the USB HS Core to the AHB system.

0x1252009C USB3_HS_USB_OTG_HS_GEN_CONFIG

Type: Read/write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXX0830

The USB_OTG_HS_GEN_CONFIG register is used to configure various features that have been added to the HS USB Core.

USB3_HS_USB_OTG_HS_GEN_CONFIG

Bits	Name	Description
31:16	USB_OTG_HS_HW_QVERSION	HW revision of the USB OTG HS core. This version changes with every official release of USB_OTG_HS core.
15	SYS_CLK_SW_EN	This bit is applicable only in SPS Device mode. When this bit is set then USB core always voting for USB_SYSTEM_CLK. Default value is 0 - USB core doesn’t request USB_SYSTEM_CLK when in Low Power Mode.
14	TESTMUX_SEL_4	see TESTMUX_SEL_3_0 the first 4 bits of this register.
13	USB_BAM_DISABLE	This bit disables the bam logic inside the USB and makes him work in Legacy mode.
12	DMA_HPROT_CTRL	When this bit is set Link Controller always does non-posted dQH writes.
11	ISO_FIX_EN	This bit enables fix for Isochronous bug in CI core (CR--0000135251).

USB3_HS_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
10	DSC_PE_RST_EN	This bit enables an automatic reset of Device PE State Machine on disconnection event when operating as device. This reset is a HW fix for CR-000940.
9	HOST_SIM_TIMERS_EN_SUSP	When this bit is set (1), the timers used for the USB suspend process short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB suspend process are according to the USB specification.
8	HOST_SIM_TIMERS_EN_STD	When this bit is set (1), the timers used for the USB reset on the ULPI are short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB reset on the ULPI are according to the USB specification.
7	PE_RX_BUF_PENDING_EN	This is only valid in Device Mode. Setting this bit will cause to store a Transaction Status Tag in the Pending register instead of RX Buffer if the RX Buffer is full. The Tag will move from Pending register to RX Buffer as soon as it becomes not full.
6	STREAM_RX_BYPASS_ENABLE	This is only valid in Device Mode. If SDIS bit is set (bit 4 of USB_OTG_HS_USBMODE (0x1A8)), i.e., streaming mode is disabled, setting this bit will cause the RX traffic to override the SDIS bit, and to receive in streaming mode. TX will still be in non-streaming mode.
5	ULPI_SERIAL_EN	This bit must be set to enable operation of ULPI Serial FS/LS mode. Default state is ’1’ - ULPI Serial mode is supported.
4	PE_DP_TXFIFO_IDLE_FORCE	This is only valid in Device Mode. Setting this bit to ’1’ forces the dp_tx_fifo_cmd_dev to be equal to PE_DP_TXFIFO_IDLE when Device PE state machine in REPORT_NAK state and the RX Buffer is full. This bit is used to enable fix of CR-001612. Reset value is ’1’.

USB3_HS_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
3:0	TESTMUX_SEL_3_0	With TESTMUX_SEL_4 select one of the following test buses: Value 00001 Key state machines 01101 hsic_test_bus1 01110 hsic_test_bus2 10000 dma_eng_3 dma_dev_sm_2 10001 dma_eng_4 dma_traf others zeros 0x2: dma_eng_0 dma_dev_sm_1 0x3: dma_eng_1 dma_context 0x4: dma_eng_2 dma_mem_arb 0x5: prot_eng_0 0x6: prot_eng_1 0x7: prot_eng_2 0x8: port_ctrl_0 0x9: port_ctrl_1 0xA: tx_buffer 0xB: rx_buffer 0xC: otg

0x125200A0 USB3_HS_USB_OTG_HS_GEN_CONFIG_2

Type: Read/write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0001F60

Register for the chicken bits. The USB_OTG_HS_GEN_CONFIG_2 register is used to configure various features that have been added to the HS USB Core. By default, all chicken bits are off and the fix is applicable.

USB3_HS_USB_OTG_HS_GEN_CONFIG_2

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	LINESTATE_DIFF_WAKEUP_EN	chicken bit for CR-0000155486.when this bit is set the USB enables the HW fix for Race condition between the attempt to enter LPM and USB bus reset.Default value is 1.
11	ULPI_LPM_PEND_EN	chicken bit for CR-0000153486.when this bit is set the USB enables the HW fix for Function Control and LPM race condition.Default value is 1.
10	RX_FULL_NAK_EN	chicken bit for CR-0000152878.when this bit is set the USB will respond with NAK's for Host Tokens with very slow AHB and when Streaming mode is enabled. Default value is 1.

USB3_HS_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Description
9	ENDLESS_TD_EN	chicken bit for CR-0000152976. When this bit is set Performance enhancements for 'infinite' Producer pipe (out endpoint with eTD that points to itself) are enabled. Default value is 1.
8	SCRATCH_RAM_EN	chicken bit for CR-0000149922. When this bit is set the use of scratch ram is enabled and the SW can read/write from addresses 0x040 - 0x07c. when this bit is clear SW can no longer access those registers. Default value is 1.
7	SESS_VLD_CTRL_EN	When this bit is set then bit 25 of USBCMD register controls sess_vld signal inside the Link Controller. When this bit is clear then Link Controller receives sess_vld directly from PHY. Default value is 0.
6	CI_T_WTSUSRSTHS_EN	When this bit is 0 then Device Port Control State Machine waits 2.5 us from USB Reset detection until starting driving Chirp K. When this bit is 1 then Device Port Control State Machine waits 1.5 ms from USB Reset detection until starting driving Chirp K. Default value is 1 - legacy behavior.
5	CI_T_UCH_EN	When this bit is 0 then Device Port Control State Machine drives Chirp K for 1 ms. When this bit is 1 then Device Port Control State Machine drives Chirp K for 2ms. Default value is 1 - legacy behavior.
4	DP_RESET	chicken bit for fix CI2687: When the OTG core is acting as a Host, and VBUS is turned off, and the attached Device attempts to perform a Session Request Protocol by using Data-line Pulsing, it will not be recognized by the Host. Also, when doing HNP and becoming a Host, a SE0 is forced in the line causing the OPT TD5.4 test to fail, without the software workaround.
3	ZLP_PRIME	chicken bit for fix CI2655: When using ISO IN endpoints with MULT=3 and low bandwidth system bus access, the controller may enter into a wait loop situation without warning the software. Due to the low bandwidth the last packet from a mult3 sequence may not be fetched in time before the last token IN is received (for that uframe/endpoint). This will cause the controller to reply with a zero length packet (ZLP), breaking the prime sequence.
2	NO_SOF_RX_FIFO_FULL	chicken bit for fix CI2581: During normal operation, if the RX Fifo becomes full and the protocol engine needs to send a command to the DMA state machine, it will wait in that state until the RX Fifo becomes not full. As the protocol state machine also handles the SOF generation, the SOFs will no longer be sent. If one SOF is missed, the Host controller will issue a false babble detection. If more than 3.125ms are elapsed without SOFs the peripheral will recognize the idle bus as a USB reset.
1	WRONG_OPMODE_SUSP	chicken bit for fix CI1274: When the Controller enters a Suspend state it asserts opmode with the wrong value, according to specifications 'UTMI+ Specification, Revision 1.0, Section 3.2' and 'UTMI+ Low Pin Interface Specification, Revision 1.1, Section 3.8.5.3'. This causes no issue in actual usage.

USB3_HS_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Description
0	RESUME_END_INTER	chicken bit for fix CI1179: Working as host, when doing resume a port change interrupt was fired at the end of resume. According to the EHCI spec no interrupt should be fired.

20.31.4 Device/host capability registers

0x12520100 USB3_HS_USB_OTG_HS_CAPLENGTH

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x01000040

The USB_OTG_HS_CAPLENGTH register is the capability register length. It is used to indicate which offset to add to the register base address at the beginning of the operational register.

USB3_HS_USB_OTG_HS_CAPLENGTH

Bits	Name	Description
31:16	HCIVERSION_15_0	BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision.
7:0	CAPLENGTH_7_0	Offset at beginning of operational register

0x12520104 USB3_HS_USB_OTG_HS_HCSPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00010011

The USB_OTG_HS_HCSPARAMS register contains the host control structural parameters. The port steering logic capabilities are described in this register.

USB3_HS_USB_OTG_HS_HCSPARAMS

Bits	Name	Description
31:28	RESERVED_BITS31_28	Clear (0) these bits.
27:24	N_TT_3_0	Number of transaction translators This field indicates the number of embedded transaction translators associated with the USB2.0 host controller. For a multi-port host, this field will always equal 0001. For all other implementations, N_TT = 0000. This in a non-EHCI field to support embedded TT.

USB3_HS_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
23:20	N_PTT_3_0	Number of ports per transaction translator This field indicates the number of ports assigned to each transaction translator within the USB2.0 host controller. For a multi-port host this field will always equal N_PORTS. For all other implementations, N_PTT = 0000. This in a non-EHCI field to support embedded TT.
19:17	RESERVED_BITS19_17	Clear (0) these bits.
16	PI_3_0	Port indicator This bit indicates whether the ports support port indicator control. When set (1), the port status and control registers include a read/writable field for controlling the state of the port indicator. This field will always be set (1).
15:12	N_CC_3_0	Number of companion controllers This field indicates the number of companion controllers associated with this USB2.0 host controller. A zero in this field indicates there are no internal companion controllers. Port-ownership hand-off is not supported. A value larger than zero in this field indicates that there are companion USB1.1 host controller(s). Port-ownership hand-offs are supported. High-, full-, and low-speed devices are supported on the host controller root ports. In this implementation, this field will always be clear (0).
11:8	N_PCC_3_0	Number of ports per companion controller This field indicates the number of ports supported per internal companion controller. It is used to indicate the port routing configuration to the system software. For example, if N_PORTS has a value of 6 and N_CC has a value of 2, then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller 1, the next N_PCC ports to companion controller 2, and so on. In the previous example, the N_PCC could have been 4, where the first 4 are routed to companion controller 1 and the last two are routed to companion controller 2. The number in this field must be consistent with N_PORTS and N_CC. In this implementation, this field will always be clear (0).
7:5	RESERVED_BITS7_5	Clear (0) these bits.
4	PPC	Port power control This field indicates whether the host controller implementation includes port power control. Set (1) indicates that the ports have port power switches. Clear (0) indicates that the ports do not have port power switches. The value of this field affects the functionality of the port power field in each port status and control register. This bit will always be clear (0) for a device only implementation.

USB3_HS_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
3:0	N_PORTS_3_0	Number of downstream ports This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the operational register. Valid values are in the range of 1h to Fh. A zero in this field is undefined. The number of ports for a host implementation is configurable from 1 to 8. This field will always be set (1) for device-only implementation.

0x12520108 USB3_HS_USB_OTG_HS_HCCPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0006

The USB_OTG_HS_HCCPARAMS register contains the host control capability parameters. This register identifies multiple mode control (time-base bit functionality) addressing capability.

USB3_HS_USB_OTG_HS_HCCPARAMS

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15:8	EECP_7_0	EHCI extended capabilities pointer Default = 0 This optional field indicates the existence of a capabilities list. A value of 00h indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in PCI configuration space of the first EHCI extended capability. The pointer value must be 40h or greater if implemented to maintain the consistency of the PCI header defined for this class of device. For this implementation, all of these bits are clear (0).
7:4	IST_7_4	Isochronous scheduling threshold Default = implementation dependent This field indicates, relative to the current position of the executing host controller, where the software can reliably update the isochronous schedule. When bit [7] is clear (0), the value of the least significant 3 bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set (1), then host software assumes the host controller may cache an isochronous data structure for an entire frame. All of the bits in this field will always be clear (0).
3	RESERVED_BIT3	Clear (0) this bit.

USB3_HS_USB_OTG_HS_HCCPARAMS (cont.)

Bits	Name	Description
2	ASP	Asynchronous schedule park capability Default = 1 If this bit is set (1), then the host controller supports the park feature for high-speed queue heads in the asynchronous schedule. The feature can be disabled, or enabled and set to a specific level by using the (ASPE) and (ASP[1:0]) fields in the USB_OTG_HS_USBCMD register. This field will always be set (1).
1	PFL	Programmable frame list flag If this bit is clear (0), then the system software must use a frame list length of 1024 elements with this host controller. The FS[2:0] field in the USBCMD register is read-only and must be cleared (0). If this bit is set (1), then the system software can specify and use a smaller frame list, and configure the host controller using the FS[2:0] field in the USBCMD register. The frame list must always be aligned on a 4k-page boundary. This requirement ensures that the frame list is always physically contiguous. This bit in this field will always be set (1).
0	ADC	64-bit addressing capability This field will always be clear (0). No 64-bit addressing capability is supported.

0x12520120 USB3_HS_USB_OTG_HS_DCIVERSION

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1

The USB_OTG_HS_DCIVERSION register contains the device interface version number. The device controller interface conforms to the two-byte BCD encoding of the interface version number contained in this register.

USB3_HS_USB_OTG_HS_DCIVERSION

Bits	Name	Description
15:0	DCIVERSION_15_0	Device interface version number

0x12520124 USB3_HS_USB_OTG_HS_DCCPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x190

The USB_OTG_HS_DCCPARAMS register contains the device control capability parameters. These fields describe the overall host/device capability of the controller.

USB3_HS_USB_OTG_HS_DCCPARAMS

Bits	Name	Description
31:9	RESERVED_BITS31_9	Clear (0) these bits.
8	HC	Host capable When this bit is set (1), this controller is capable of operating as an EHCI-compatible USB 2.0 host controller.
7	DC	Device capable When this bit is set (1), this controller is capable of operating as a USB 2.0 device.
6:5	RESERVED_BITS6_5	Clear (0) these bits.
4:0	DEN_4_0	Device endpoint number This field indicates the number of endpoints build into the device controller. If this controller is not device capable, then this field will be al zeroes. Valid values for this field are 0 through 16.

20.31.5 Device/host operational registers

0x12520140 USB3_HS_USB_OTG_HS_USBCMD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00080000

The USB_OTG_HS_USBCMD register is the USB command register. The serial bus host/device controller executes the command indicated in this register.

USB3_HS_USB_OTG_HS_USBCMD

Bits	Name	Description
31	RST_CTRL	Default value = 0. Set to 1 to block operational reset to xcvr (ser and ulpi) clock domains.
30	ULPI_STP_CTRL	Default value = 0. Set to 1 to block the ulpi_stp signal from going out to ULPI PHY
29	ASYNC_INTR_CTRL	Default value = 0. Set to 1 to allow the async interrupt out from the HS core.
28	SE0_GLITCH_FIX_CTRL	Default value = 0. Set to 1 to activate the SE0 glitch fix mechanism
27	FS_3_WIRE_2_WIRE_SELECT	Default value = 0. Set this bit for enabling the two wire interface on the fs_dat and fs_se0 pins

USB3_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
26	ULPI_SER3_NOT6_SEL	ULPI serial 3 bits select. Read/write Read: Current status of serial data bus wide Write: SW writes ’1’ to this bit to request 3 pins ULPI data wide, or ’0’ to request 6 bit data wide in FsLsSerial Mode.
25	SESS_VLD_CTRL	Default value = 0. Set this bit to enable Link Controller operation after switching interface from Serial to ULPI.
24	RESERVED_BIT24	Clear (0) these bit
23:16	ITC_7_0	Interrupt threshold control Read/write Default 08h The system software uses this field to set the maximum rate at which the host/device controller will issue interrupts. This field contains the maximum interrupt interval measured in micro-frames. Valid values are shown below. Value Maximum interrupt interval 00h Immediate (no threshold) 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames 10h 16 micro-frames 20h 32 micro-frames 40h 64 micro-frames
15	FS2	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.

USB3_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
14	ATDTW	Add dTD tripwire Read/write (Device mode only) This bit is used as a semaphore to ensure the to proper addition of a new dTD to an active (primed) endpoint's linked list. This bit is set (1) and cleared (0) by the software. This bit shall also be cleared (0) by the hardware when the state machine is a hazard region for which adding a dTD to a primed endpoint may go unrecognized.
13	SUTW	Setup tripwire (device mode only) Read/write This bit is used as a semaphore to ensure that the setup data payload of 8 bytes is extracted from a QH by the DCD without being corrupted. If the setup lockout mode is off (see USBMODE) then there exists a hazard when new setup data arrives while the DCD is copying the setup data payload from the QH for a previous setup packet. This bit is set (1) and cleared (0) by software, and will be cleared (0) by hardware when a hazard exists.
12	RESERVED_BITS12	Clear (0) this bit
11	ASPE	Asynchronous schedule park mode enable (OPTIONAL) Read/write If the asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this bit defaults to a 1h and is R/W. Otherwise, the bit must be cleared (0) and is RO. The software uses this bit to enable or disable the park mode. value 1 = Park mode is enabled. value 0 = Park mode is disabled. This field is set (1) in this implementation.
10	RESERVED_BIT10	Clear (0) this bit.
9:8	ASP_1_0	Asynchronous schedule park mode count (OPTIONAL) Read/write If the Asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this field defaults to 3h and is R/W. Otherwise it defaults to zero and is RO. This field contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1h to 3h. The software must not clear (0) this bit when the ASPE bit in this register is set (1), as this will result in undefined behavior. This field is set to 3h in this implementation.
7	LR	Light host/device controller reset (OPTIONAL) Read only Not implemented. This bit will always be clear (0).

USB3_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
6	IAA	Interrupt on async advance doorbell Read/write This bit is used as a doorbell by the software to tell the host controller to issue an interrupt the next time it advances the asynchronous schedule. The software must set (1) this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule states, it sets (1) the interrupt on the async advance status (AAI) bit in the USBSTS register. If the interrupt on async advance enable (AAE) bit in the USBINTR register is set (1), then the host controller will assert an interrupt at the next interrupt threshold. The host controller clears (0) this bit after it has set (1) the interrupt on async advance status (AAI) bit in the USBSTS register. The software should not set (1) this bit when the asynchronous schedule is inactive. Doing so will yield undefined results. This bit is only used in the host mode. Setting (1) this bit when the device mode is selected will produce undefined results.
5	ASE	Asynchronous Schedule Enable Read/write Default = 0b This bit controls whether the host controller skips processing the asynchronous schedule. value 0 = Do not process the asynchronous schedule value 1 = Use the ASYNCLISTADDR register to access the asynchronous schedule. Only the host controller uses this bit.
4	PSE	Periodic schedule enable Read/write Default 0b This bit controls whether the host controller skips processing the periodic schedule. value 0 = Do not process the periodic schedule value 1 = Use the PERIODICLISTBASE register to access the periodic schedule. Only the host controller uses this bit.

USB3_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
3:2	FS_1_0	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.
1	RST	Controller reset (RESET) Read/write The software uses this bit to reset the controller. This bit is cleared (0) by the host/device controller when the reset process is complete. The software cannot terminate the reset process early by clearing (0) this bit. Host controller: When the software sets (1) this bit, the host controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Any transaction currently in progress on the USB is immediately terminated. A USB reset is not driven on downstream ports. The software should not set (1) this bit when the HCHalted bit in the USBSTS register is clear (0). Attempting to reset an actively running host controller will result in undefined behavior. Device controller: When the software sets (1) this bit, the device controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Setting this bit when the device is in the attached state is not recommended, since the effect on an attached host is undefined. In order to ensure that the device is not in an attached state before initiating a device controller reset, all primed endpoints should be flushed and the USBCMD run/stop bit should be cleared (0).

USB3_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
0	RS	Run/stop Read/Write Default 0b value 1 = Run value 0 = Stop Host controller: When this bit is set (1), the host controller proceeds with the execution of the schedule. The host controller continues execution as long as this bit remains set (1). When this bit is clear (0), the host controller completes the current transaction on the USB and then halts. The HC halted bit in the status register indicates when the host controller has finished the transaction and has entered the stopped state. The software should not set (1) this bit unless the host controller is in the halted state (that is, the HCHalted bit in the USBSTS register is set (1)). Device controller: Setting (1) this bit will cause the device controller to enable a pull-up on D+ and initiate an attach event. This control bit is not directly connected to the pull-up enable, as the pull-up will become disabled upon transitioning into high-speed mode. The software should use this bit to prevent an attach event before the device controller has been properly initialized. Clearing (0) this bit will cause a detach event.

0x12520144 USB3_HS_USB_OTG_HS_USBSTS

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_USBSTS register is the USB status register. This register indicates various states of the host/device controller and any pending interrupts. This register does not indicate status resulting from a transaction on the serial bus. The software clears certain bits in this register by setting (1) them.

USB3_HS_USB_OTG_HS_USBSTS

Bits	Name	Description
31	ULPI_INTR	Default value = 0.This bit is set when Interrupt during ULPI -Serial mode or ULPI Interrupt during LPM occurs. Writing a 1 to this bit will clear it.
30	PHY_SESS_VLD_CHG	This bit is set when PHY_SESS_VLD bit changes its value.
29	PHY_SESS_VLD	This bit presents the SESS_VLD status of PHY.

USB3_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
28	PHY_ALT_INT	This bit is asserted when a non-USB interrupt from PHY is detected. This interrupt is used for procedures like Battery Charging. This bit is set when bit 7 (alt_int) of RX CMD is high. Writing a 1 to this bit will clear it.
27:26	RESERVED_BITS27_26	Clear (0) these bits.
25	TI1	General purpose timer interrupt 1 (GPTINT1) Read/write control This bit is set (1) when the counter in the GPTIMER1CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
24	TI0	General purpose timer interrupt 0 (GPTINT0) Read/write control This bit is set (1) when the counter in the GPTIMER0CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPI	USB host periodic interrupt (USBHSTPERINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set (1) and the TD was from the periodic schedule. This bit is also set (1) by the host controller when a short packet is detected AND the packet is on the periodic schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
18	UAI	USB host asynchronous interrupt (USBHSTASYNCINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set AND the TD was from the asynchronous schedule. This bit is also set (1) by the host when a short packet is detected AND the packet is on the asynchronous schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
17	RESERVED_BIT17	Clear (0) these bits.
16	NAKI	NAK interrupt bit Read only This bit is set (1) by the hardware when, for a particular endpoint, both the Tx/Rx endpoint NAK bit and the corresponding Tx/Rx endpoint NAK enable bit are set (1). This bit is automatically cleared (0) by the hardware when all of the enabled Tx/Rx endpoint NAK bits are cleared (0).

USB3_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
15	AS	Asynchronous schedule status Read only Default = 0 This bit reports the current real status of the asynchronous schedule. When cleared (0), the asynchronous schedule status is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the asynchronous schedule when software transitions the asynchronous schedule enable bit in the USBCMD register. When this bit and the asynchronous schedule enable bit are the same value, the asynchronous schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
14	PS	Periodic schedule status Read only Default = 0 This bit reports the current real status of the periodic schedule. When cleared (0), the periodic schedule is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the periodic schedule when software transitions the periodic schedule enable bit in the USBCMD register. When this bit and the periodic schedule enable bit are the same value, the periodic schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
13	RCL	Reclamation Read only Default = 0 This is a read-only status bit that is used to detect an empty asynchronous schedule. This bit is only used by the host controller.
12	HCH	HC halted Read only Default = 1 This bit is a clear (0) whenever the run/stop bit is set (1). The host controller sets (1) this bit after it has stopped executing, because of the run/stop bit being cleared (0), either by the software or by the host controller hardware (for example, an internal error). This bit is only used by the host controller.
11	RESERVED_BIT11	Clear (0) this bit.
10	ULPII	ULPI interrupt Read/write control Default = 0 When the ULPI viewport is present in the design, an event completion will set (1) this interrupt. This bit is used by both the host and device controllers. It is only present in designs where the configuration constant VUSB_HS_PHY_ULPI = 1.

USB3_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
9	RESERVED_BIT9	Clear (0) this bit.
8	SLI	DC suspend Read/write control Default = 0 When a device controller enters a suspend state from an active state, this bit will be set (1). The device controller clears (0) the bit upon exiting from a suspend state. This bit is only used by the device controller.
7	SRI	SOF received Read/write control Default = 0 When the device controller detects a start of (micro) frame, this bit will be set (1). When a SOF is extremely late, the device controller will automatically set (1) this bit to indicate that an SOF was expected. Therefore, this bit will be set (1) roughly every 1 ms in the device FS mode and every 125 ms in the HS mode, and will be synchronized to the actual SOF that is received. Since the device controller is initialized to FS before connect, this bit will be set (1) at an interval of 1 ms during the prelude to connect and chirp. In the host mode, this bit will be set (1) every 125 us and can be used by the host controller driver as a time base. The software writes a 1 to this bit to clear it. This is a non-EHCI status bit.
6	URI	USB reset received Read/write control Default = 0 When the device controller detects a USB reset and enters the default state, this bit will be set (1). The software can set (1) this bit to clear the USB reset received status bit. This bit is only used by the device controller.
5	AAI	Interrupt on async advance Read/write control Default = 0 The system software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by setting (1) the interrupt on async advance doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source. This bit is only used by the host controller.
4	SEI	System error Read/write control This interrupt is triggered when there is an AHB error (HRESP = ERROR) on the AHB Master interface.

USB3_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
3	FRI	Frame list rollover Read/write control The host controller sets (1) this bit when the frame list index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the frame list size field of the USBCMD register) is 1024, the frame index register rolls over every time FRINDEX [1 3] toggles. Similarly, if the size is 512, the host controller sets (1) this bit to a one every time FHINDEX [12] toggles. This bit is only used by the host controller.
2	PCI	Port change detect Read/write control The host controller sets (1) this bit when a connect status occurs on any port, a port enable/disable change occurs on any port, or the force port resume bit is set (1) as the result of a J-K transition on the suspended port. The device controller sets (1) this bit when the port controller enters the full or high-speed operational state. When the port controller exits the full or high-speed operation states due to reset or suspend events, the notification mechanisms are the USB reset received bit and the DC suspend bits, respectively. This bit is not EHCI compatible.
1	UEI	USB error interrupt (USBERRINT) Read/write control When completion of a USB transaction results in an error condition, this bit is set (1) by the host/device controller. This bit is set (1) along with the USBINT bit, if the TD on which the error interrupt occurred also had its interrupt-on-complete (IOC) bit set (1). The device controller detects resume signaling only.
0	UI	USB interrupt (USBINT) Read/write control This bit is set (1) by the host/device controller when the cause of an interrupt is a completion of a USB transaction where the transfer descriptor (TD) has an interrupt-on-complete (IOC) bit set (1). This bit is also set (1) by the host/device controller when a short packet is detected. A short packet is when the actual number of bytes received was less than the expected number of bytes.

0x12520148

USB3_HS_USB_OTG_HS_USBINTR

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_USBINTR register is the USB interrupt enable register. The interrupts to the software are enabled with this register. An interrupt is generated when a bit is set (1) and the corresponding interrupt is active. The USB status register (USBSTS) still shows interrupt sources, even if they are disabled by the USBINTR register, which allows polling of interrupt events by the software.

USB3_HS_USB_OTG_HS_USBINTR

Bits	Name	Description
31	ULPI_INTR_EN	Default value =0.When this bit is a 1 and ULPI_INTR is a 1, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the ULPI_INTR bit.
30	PHY_SESS_VLD_CHG_EN	Default value =0. When this bit is set then Link Controller will issue an interrupt when PHY_SESS_VLD changes its value.
29:26	RESERVED_BITS29_26	Clear (0) these bits.
25	TIE1	General purpose timer interrupt enable 1 When this bit is set (1), and the GPTINT1 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT1 bit.
24	TIE0	General purpose timer interrupt enable 0 When this bit is set (1), and the GPTINT0 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT0 bit.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPIE	USB host periodic interrupt enable When this bit is set (1), and the USBHSTPERINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTPERINT bit.
18	UAIE	USB host asynchronous interrupt enable When this bit is set (1), and the USBHSTASYNCINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTASYNCINT bit.
17	RESERVED_BIT17	Clear (0) this bit.

USB3_HS_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
16	NAKE	NAK interrupt enable This bit is set (1) by the software if it wants to enable the hardware interrupt for the NAK interrupt bit. If both this bit and the corresponding NAK interrupt bit are set (1), a hardware interrupt is generated.
15:11	RESERVED_BITS15_11	Clear (0) these bits.
10	ULPIE	ULPI enable When this bit is set (1), and the ULPI Interrupt bit in the USBSTS register transitions, the controller will issue and interrupt. The interrupt is acknowledged by the software setting (1) the ULPI interrupt bit. This bit is used by both the host and device controllers. It is only present in designs where configuration constant VUSB_HS_PHY_ULPI = 1.
9	RESERVED_BIT9	Clear (0) this bit.
8	SLE	Sleep enable When this bit is set (1) and the DC suspend bit in the USBSTS register transitions, the device controller will issue an interrupt. The interrupt is acknowledged by the software setting (1) the DC suspend bit. This bit is only used by the device controller.
7	SRE	SOF received enable When this bit is set (1) and the SOF received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the SOF received bit.
6	URE	USB reset enable When this bit is set (1) and the USB reset received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the USB reset received bit.
5	AAE	Interrupt on async advance enable When this bit is set (1) and the interrupt on async advance bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the interrupt on async advance bit. This bit is only used by the host controller.
4	SEE	System error enable When this bit is set (1) and the system error bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the system error bit.

USB3_HS_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
3	FRE	Frame list rollover enable When this bit is set (1) and the frame list rollover bit in the USBSTS register is set (1), the host controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the frame list rollover bit. This bit is only used by the host controller.
2	PCE	Port change detect enable When this bit is set (1) and the port change detect bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the port change detect bit.
1	UEE	USB error interrupt enable When this bit is set (1) and the USBERRINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBERRINT bit in the USBSTS register.
0	UE	USB interrupt enable When this bit is set (1) and the USBINT bit in the USBSTS register is set (1), the host/device controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBINT bit.

0x1252014C USB3_HS_USB_OTG_HS_FRINDEX

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_FRINDEX register is the USB frame index register. This register is used by the host controller to index the periodic frame list. The register updates every 125 microseconds (once each micro-frame). Bits [N:3] are used to select a particular entry in the periodic frame list during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by the system software in the frame list size field in the USBCMD register.

This register must be written as a DWord. Byte writes produce-undefined results. This register cannot be written unless the host controller is in the 'halted' state, as indicated by the HC halted bit. A write to this register while the run/stop bit is set (1) produces undefined results. Writes to this register also affect the SOF value.

In the device mode, this register is read-only and the device controller updates the FRINDEX [13:3] register from the frame number indicated by the SOF marker. Whenever a SOF is received by the USB bus, FRINDEX [13:3] will be checked against the SOF marker. If FRINDEX [13:3] is different from the SOF marker, FRINDEX [13:3] will be set to the SOF value and FRINDEX [2:0] will be cleared (0) (that is, SOF for a 1-ms frame). If FRINDEX [13:3] is equal to the SOF value, FRINDEX [2:0] will be incremented (that is, SOF for 125-ms micro-frame.

USB3_HS_USB_OTG_HS_FRINDEX

Bits	Name	Description
31:14	RESERVED_BITS31_14	Clear (0) these bits.
13:0	FRINDEX_13_0	Frame index The value in this register increments at the end of each time frame (for example, a micro-frame). Bits [N:3] are used for the frame list current index. This means that each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following data shows the values of N based on the value of the frame list size field in the USBCMD register when used in host mode. USBCMD [Frame list size] number Elements N 000b (1024) 12 001b (512) 11 010b (256) 10 011b (128) 9 100b (64) 8 101b (32) 7 110b (16) 6 111b (8) 5 In the device mode, the value is the current frame number of the last frame transmitted. It is not used as an index. In either mode, bits 2:0 indicate the current microframe.

0x12520154 USB3_HS_USB_OTG_HS_PERIODICLISTBASE

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_PERIODICLISTBASE register is the periodic list base address register. This 32-bit register contains the beginning address of the periodic frame list in the system memory. The HCD loads this register prior to starting the schedule execution by the host controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the frame index register (FRINDEX) to enable the host controller to step through the periodic frame list in sequence.

NOTE This device is shared between the host controller and device controller operation. For host controller operation, this is the USB_OTG_HS_ PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

USB3_HS_USB_OTG_HS_PERIODICLISTBASE

Bits	Name	Description
31:12	PERBASE_31_12	Base address (low) These bits correspond to memory address signals [31:12], respectively. Only used by the host controller.
11:0	RESERVED_BITS11_0	This field must be written as zeros. During runtime, the values of these bits are undefined.

0x12520154 USB3_HS_USB_OTG_HS_DEVICEADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_DEVICEADDR register is the USB device address register. The upper seven bits of this register represent the device address. After any controller reset or a USB reset, the device address is set to the default address (0). The default address will match all incoming addresses. The software shall reprogram the address after receiving a SET_ADDRESS descriptor.

The USBADRA is used to accelerate the SET_ADDRESS sequence by allowing the DCD to preset the USBADR register before the status phase of the SET_ADDRESS descriptor.

NOTE This device is shared between the host controller and device controller operations. For host controller operation, this is the USB_OTG_HS_ PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

USB3_HS_USB_OTG_HS_DEVICEADDR

Bits	Name	Description
31:25	USBADR_31_25	Device address These bits correspond to the USB device address.

USB3_HS_USB_OTG_HS_DEVICEADDR (cont.)

Bits	Name	Description
24	USBADRA	Device address advance Default = 0 When this bit is clear (0), any writes to USBADR are instantaneous. When this bit is set (1) at the same time or before USBADR is written, the write to the USBADR field is staged and held in a hidden register. After an IN occurs on endpoint 0 and is ACKed, USBADR will be loaded from the holding register. The hardware will automatically clear (0) this bit on the following conditions: 1. IN is ACKed to endpoint 0 (USBADR is updated from staging register). 2. OUT/SETUP occur to endpoint 0 (USBADR is not updated). 3. Device reset occurs (USBADR is reset to 0). Note: After the status phase of the SET_ADDRESS descriptor, the DCD has 2 ms to program the USBADR field. This mechanism will ensure this specification is met when the DCD can not write of the device address within 2 ms from the SET_ADDRESS status phase. If the DCD writes the USBADR with USBADRA = 1 after the SET_ADDRESS data phase (before the prime of the status phase), the USBADR will be programmed instantly at the correct time and meet the 2-ms USB requirement.
23:0	RESERVED_BITS23_0	These bits must be written as zeros. During runtime, the values of these bits are undefined.

0x12520158 USB3_HS_USB_OTG_HS_ASYNCLISTADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ASYNCLISTADDR register is the next asynchronous list address register. This 32-bit register contains the address of the next asynchronous queue head to be executed by the host. Bits [4:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

USB3_HS_USB_OTG_HS_ASYNCLISTADDR

Bits	Name	Description
31:5	ASYBASE_31_15	Link pointer low (LPL). These bits correspond to memory address signals [31:5], respectively. This field may only reference a queue head (OH). This field is only used by the host controller.
4:0	RESERVED_BITS4_0	The values of these bits has no effect on circuit operation.

0x12520158 USB3_HS_USB_OTG_HS_ENDPOINTLISTADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPOINTLISTADDR register is the endpointlist address register. In the device mode, this register contains the address of the top of the endpoint list in system memory. Bits [10:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

USB3_HS_USB_OTG_HS_ENDPOINTLISTADDR

Bits	Name	Description
31:11	EPBASE_31_11	Endpoint list pointer (low) These bits correspond to memory address signals [31:11], respectively. This field will reference a list of up to 32 queue heads (QH). That is, one queue head per endpoint & direction.
10:0	RESERVED_BITS10_0	The values of these bits has no effect on circuit operation.

0x1252015C USB3_HS_USB_OTG_HS_TTCTRL

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_TTCTRL register is the TT status and control register. This register contains parameters needed for internal TT operations.

NOTE This register is not used in the device controller operation.

USB3_HS_USB_OTG_HS_TTCTRL

Bits	Name	Description
31	RESERVED_BIT31	Not used.
30:24	TTHA	Not used.
23:0	RESERVED_BITS23_0	Not used.

0x12520160 USB3_HS_USB_OTG_HS_BURSTSIZE

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1010

The USB_OTG_HS_BURSTSIZE register is the programmable burst size register. This register is used to control dynamically change the burst size used during data movement on the initiator (master) interface.

USB3_HS_USB_OTG_HS_BURSTSIZE

Bits	Name	Description
31:16	RESERVED_BITS31_16	The value of these bits has no effect on circuit operation.
15:8	TXPBURST	Programmable Tx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from system memory to the USB bus.
7:0	RXPBURST	Programmable Rx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from the USB bus to system memory.

0x12520164 USB3_HS_USB_OTG_HS_TXFILLTUNING

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_TXFILLTUNING register is the host transmit pre-buffer packet tuning register. The fields in this register control performance tuning associated with how the host controller posts data to the Tx latency FIFO before moving the data onto the USB bus. The specific areas of performance include the how much data to post into the FIFO and an estimate for how long that operation should take in the target system.

Definitions:

T0 = Standard packet overhead

T1 = Time to send data payload

Tff = Time to fetch packet into TX FIFO up to specified level.

Ts = Total packet flight time (send-only) packet

Ts = T0 + T1

Tp = Total packet time (fetch and send) packet

Tp = Tff + T0 + T1

Upon discovery of a transmit (OUT/SETUP) packet in the data structures, the host controller checks to ensure Tp remains before the end of the [micro] frame. If so it proceeds to pre-fill the TX FIFO. If at anytime during the pre-fill operation the time remaining the [micro] frame is < Ts, then the packet attempt ceases and the packet is tried at a later time. Although this is not an error condition and the host controller will eventually recover, a mark will be made the scheduler health counter to note the occurrence of a ’back-off’ event. When a back-off event is detected, the partial packet fetched may need to be discarded from the latency buffer to make room for periodic traffic that will begin after the next SOF. Too many back-off events can waste bandwidth and power on the system bus, and thus should be minimized (not necessarily eliminated). Back-offs can be minimized with use of the TSCHHEALTH (Tff), as described in the register table.

USB3_HS_USB_OTG_HS_TXFILLTUNING

Bits	Name	Description
31:22	RESERVED_BITS31_22	The value of these bits has no effect on circuit operation.
21:16	TXFIFOTHRES	FIFO burst threshold Default = 2 This register controls the number of data bursts that are posted to the TX latency FIFO in the host mode before the packet begins on to the bus. The minimum value is 2 and this value should be a low as possible to maximize USB performance. A higher value can be used in systems with unpredictable latency and/or insufficient bandwidth, where the FIFO may underrun because the data transferred from the latency FIFO to USB occurs before it can be replenished from system memory. This value is ignored if the stream disable bit in USBMODE register is set (1).
15:13	RESERVED_BITS15_13	The value of these bits has no effect on circuit operation.

USB3_HS_USB_OTG_HS_TXFILLTUNING (cont.)

Bits	Name	Description
12:8	TXSCHHEALTH	Scheduler health counter Read/write to clear Default = 0 This register increments when the host controller fails to fill the Tx latency FIFO to the level programmed by TXFIFOTHRES before running out of time to send the packet before the next start-of-frame. This health counter measures the number of times this occurs to provide feedback to selecting a proper TXSCHOH. Writing to this register will clear the counter and this counter will be at a maximum at 31.
7:0	TXSCHOH	Scheduler overhead Default = 0 This register adds an additional fixed offset to the schedule time estimator described above as Tff. As an approximation, the value chosen for this register should limit the number of back-off events captured in the TXSCHHEALTH to less than 10 per second in a highly-utilized bus. Choosing a value that is too high for this register is not desired, as it can needlessly reduce USB utilization. The time unit represented in this register is 1.267 ms when a device is connected in the high-speed mode for OTG and SPH. The time unit represented in this register is 6.333 ms when a device is connected in the low/full speed mode for OTG and SPH. The time unit represented in this register is always 1.267 times the MPH product.

0x12520170 USB3_HS_USB_OTG_HS_ULPI_VIEWPORT

Type: Read/write (unless otherwise indicated)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x08000000

The USB_OTG_HS_ULPI_VIEWPORT register provides indirect access to the ULPI PHY register set. Although the core performs access to the ULPI PHY register set, there may be extraordinary circumstances where software may need direct access.

CAUTION Writes to the ULPI through the viewport can substantially harm standard USB operations. Currently, no usage model has been defined where the software should need to execute writes directly to the ULPI - see the exception regarding optional features below.

Executing read operations though the ULPI viewport should have no harmful side effects to standard USB operations.

NOTE The ULPI viewport is only synthesized in the design if the constant VUSB_HS_PHY_ULPI is set (1). If the ULPI interface is not enabled, this register will always read zeros.

Two operations can be performed with the ULPI viewport: wake-up and read/write operations. The wake-up operation is used to put the ULPI interface into normal operation mode and re-enable the clock, if necessary. A wake-up operation is required before accessing the registers when the ULPI interface is operating in the low power mode, serial mode, or car kit mode.

The ULPI state can be determined by reading the sync state bit (ULPISS). If this bit is set (1), then the ULPI interface is running in the normal operation mode and can accept read/write operations. If the ULPISS is clear (0), then read/write operations will not be able to execute. Undefined behavior will result if ULPISS = 0, and a read or write operation is performed.

To execute a wake-up operation, write all 32-bits of the ULPI Viewport where ULPIPORT is constructed appropriately, and the ULPIWU bit is set (1) and the ULPIRUN bit is clear (0). Poll the ULPI viewport until ULPIWU is zero for the operation to complete.

To execute a read or write operation, write all 32-bits of the ULPI viewport where ULPIDATWR, ULPIADDR, ULPIPORT, and ULPIRW are constructed appropriately, and the ULPIRUN bit is set (1). Poll the ULPI viewport until ULPIRUN is zero for the operation to complete. Once ULPIRUN is zero, the ULPIDATRD will be valid if the operation was a read.

The polling method above could also be replaced and an interrupt driven using the ULPI interrupt defined in the USBTS and USBINTR registers. When a wake-up or read/write operation completes, the ULPI interrupt will be set (1).

Several optional features may need to be enabled or disabled by the system software as part of system configuration. These bits are contained in the interface and OTG control registers of the ULPI PHY register set. These registers also contain bits that are controlled by the link dynamically and, therefore, should only be modified by the system software using the set/clear access method. Direct writes to these registers could have harmful side effects to the standard USB operations. The following bits are optional bits:

- Bits 3 through 7 in the interface control register
- Bits 6 and 7 in the OTG control register.

Refer to the ULPI Specification Revision 1.1 for further information on the use of the optional features.

USB3_HS_USB_OTG_HS_ULPI_VIEWPORT

Bits	Name	Description
31	ULPIWU	ULPI wake-up Setting (1) this bit begins the wake-up operation. The bit will automatically transition to 0 after the wake-up is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wake-up and a read/write operation at the same time.
30	ULPIRUN	ULPI read/write run Setting (1) this bit will begin the read/write operation. The bit will automatically transition to 0 after the read/write is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time.

USB3_HS_USB_OTG_HS_ULPI_VIEWPORT (cont.)

Bits	Name	Description
29	ULPIRW	ULPI read/write control This bit selects between running a read or write operation. value 0 = Read value 1 = Write
28	ULPIFORCE	ULPI read/write force This bit enables forcing register access during RX packet value 0 = register access is not forced during RX packet (default) value 1 = register access is forced during RX packet reception
27	ULPISS	ULPI sync state Read Only value 1 = Normal sync state value 0 = In another state (for example, car kit, serial, low power) This bit represents the state of the ULPI interface. Before reading this bit, the ULPIPORT field should be set accordingly if used with the multi-port host. Otherwise, this field should always remain 0.
26:24	ULPIPORT	ULPI port number For the wakeup or read/write operation to be executed, this value selects the port number the ULPI PHY is attached to in the multi-port host. The valid range is 0 to 7. This field should always be written as a 0 for the non-multi port products.
23:16	ULPIADDR	ULPI data address When a read or write operation is commanded, the address of the operation is written to this field.
15:8	ULPIDATRD	ULPI data read Read only After a read operation completes, the result is placed in this field.
7:0	ULPIDATWR	ULPI data write When a write operation is commanded, the data to be sent is written to this field.

0x12520178 USB3_HS_USB_OTG_HS_ENDPTNAK

Type: Read/write clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTNAK register is the endpoint NAK register.

USB3_HS_USB_OTG_HS_ENDPTNAK

Bits	Name	Description
31:16	EPTN_15_0	Tx endpoint NAK Each tx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received IN token for the corresponding endpoint. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0
15:0	EPRN_15_0	Rx endpoint NAK Each rx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received OUT or PING token for the corresponding endpoint. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x1252017C USB3_HS_USB_OTG_HS_ENDPTNAKEN

Type: Read/write clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTNAKEN register is the endpoint NAK enable register.

USB3_HS_USB_OTG_HS_ENDPTNAKEN

Bits	Name	Description
31:16	EPTNE_15_0	Tx endpoint NAK enable Each bit is an enable bit for the corresponding Tx endpoint NAK bit. If this bit is set (1) and the corresponding Tx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0
15:0	EPRNE_15_0	Rx endpoint NAK enable Each bit is an enable bit for the corresponding Rx endpoint NAK bit. If this bit is set (1) and the corresponding Rx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x12520184 USB3_HS_USB_OTG_HS_PORTSC

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xCC000004

This is the USB_OTG_HS_PORTSC register.

USB3_HS_USB_OTG_HS_PORTSC

Bits	Name	Description
31:30	PTS	Parallel transceiver select Read/write This register bit pair is used in conjunction with the configuration constant VUSB_HS_PHY_TYPE to control which parallel transceiver interface is selected. If VUSB_HS_PHY_ TYPE is set for 0, 1, 2, or 3, then this bit is read only. If VUSB_HS_PHY_TYPE is 4, 5, 6, or 7, then this bit is read/write. This field is reset to the following values: 00 if VUSB_HS_PHY_TYPE = 0,4 - UTMI/UTMI+ 01 if VUSB_HS_PHY_TYPE = 1,5 - Reserved 10 if VUSB_HS_PHY_TYPE = 2,6 - ULPI 11 if VUSB_HS_PHY_TYPE = 3,7 - Serial/1.1 PHY (FS only) This bit is not defined in the EHCI specification.
29	STS	Serial transceiver select Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY_SERIAL to control whether the parallel or serial transceiver interface is selected for FS and LS operation. The serial interface engine can be used in combination with the UTMI+ or ULPI physical interface to provide FS/LS signaling instead of the parallel interface. ’ If VUSB_HS_PHY_SERIAL is 0 or 1, then this bit is read only. ’ If VUSB_HS_PHY_SERIAL is 2 or 3, then this bit is read/write. This bit has no effect unless the parallel transceiver select is set to UTMI+ or ULPI. The Serial/1.1 physical interface will use the serial interface engine for FS/LS signaling regardless of this bit value. Note: This bit was reserved for future operation, and is now adding for dynamic use of the serial engine in accord with UMTI+ and ULPI characterization logic. This bit is not defined in the EHCI specification.

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
28	PTW	Parallel transceiver width Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY16_8 to control the data bus width of the UTMI transceiver interface. ' If VUSB_HS_PHY16_8 is 0 or 1, then this bit is read only. ' If VUSB_HS_PHY16_8 is 2 or 3, then this bit is read/write. This bit is reset to 1 if VUSB_HS_PHY16_8 selects a default UTMI interface width of 16-bits, else it is reset to 0. ' Writing this bit to 0 selects the 8-bit [60MHz] UTMI interface. ' Writing this bit to 1 selects the 16-bit [30MHz] UTMI interface. This bit has no effect if the serial interface is selected. This bit is not defined in the EHCI specification.
27:26	PSPD	Port speed Read only This register field indicates the speed at which the port is operating. For HS mode operation in the host controller and HS/FS operation in the device controller, the port routing steers data to the protocol engine. For FS and LS mode operation in the host controller, the port routing steers data to the protocol engine with the embedded transaction translator. value 00 = Full speed value 01 = Low speed value 10 = High speed This bit is not defined in the EHCI specification.
25	SPRT	Short Port Reset Time. shortens port reset time for simulation.
24	PFSC	Port force full speed connect Read/write Default = 0 Setting (1) this bit will force the port to only connect at full speed. It also disables the chirp sequence that allows the port to identify itself as high speed. This is useful for testing FS configurations with a HS host, hub or device. This bit is not defined in the EHCI specification. This bit is for debugging purposes.

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
23	PHCD	PHY low power suspend - clock disable (PLPSCD) Read/write Default = 0 value 1 = Disable the PHY clock. value 0 = Enable the PHY clock. Reading this bit will indicate the status of the PHY clock. Note: The PHY clock cannot be disabled if it is being used as the system clock. In the device mode, The PHY can be put into low power suspend - clock disable when the device is not running (USBCMD run/stop = 0) or the host has signaled suspend (PORTSC SUSPEND = 1). Low power suspend will be cleared automatically when the host has signaled resume. Before forcing a resume from the device, the device controller driver must clear this bit. In the host mode, the PHY can be put into low power suspend - clock disable when the downstream device has been put into the suspend mode or when no downstream device is connected. Low power suspend is completely under the control of the software. This bit is not defined in the EHCI specification.
22	WKOC	Wake on over-current enable (WKOC_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to over-current conditions as wake-up events. This bit is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0). This bit is output from the controller as signal pwrctl_wake_ ovrcurr_en (OTG/host core only) for use by an external power control circuit.
21	WKDS	Wake on disconnect enable (WKDSCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device disconnects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_ dscnnt_en (OTG/host core only) for use by an external power control circuit.

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
20	WKCN	Wake on connect enable (WKCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device connects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_ dscnnt_en (OTG/host core only) for use by an external power control circuit.

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
19:16	PTC_3_0	Port test control Read/write Default = 0000 Any other value than zero indicates that the port is operating in the test mode. Value Specific test The FORCE_ENABLE_FS and FORCE ENABLE_LS tests are extensions to the test mode support, as specified in the EHCI specification. Writing the PTC field to any of the FORCE_ENABLE_{HS/FS/LS} values will force the port into the connected and enabled state at the selected speed. Writing the PTC field back to TEST_MODE_DISABLE will allow the port state machines to progress normally from that point. Note: Low speed operations are not supported as a peripheral device. 0x0: TEST_MODE_DISABLE 0x1: J_ STATE 0x8: K_STATE 0x9: SE0 (host / NAK device) 0x40: Packet 0x41: FORCE_ENABLE_HS 0x48: FORCE_ENABLE_FS 0x49: FORCE_ENABLE_LS 0x3E8: Reserved_1 0x3E9: Reserved_2 0x3EA: Reserved_3 0x3EB: Reserved_4 0x3EC: Reserved_5 0x3ED: Reserved_6 0x3EE: Reserved_7 0x3EF: Reserved_8 0x3F0: Reserved_9 0x3F1: Reserved_10 0x3F2: Reserved_11 0x3F3: Reserved_12 0x3F4: Reserved_13 0x3F5: Reserved_14 0x3F6: Reserved_15 0x3F7: Reserved_16 0x3F8: Reserved_17 0x3F9: Reserved_18 0x3FA: Reserved_19 0x3FB: Reserved_20 0x3FC: Reserved_21 0x3FD: Reserved_22 0x3FE: Reserved_23 0x3FF: Reserved_24 0x400: Reserved_25 0x401: Reserved_26 0x402: Reserved_27 0x403: Reserved_28 0x404: Reserved_29 0x405: Reserved_30 0x406: Reserved_31 0x407: Reserved_32 0x408: Reserved_33 0x409: Reserved_34 0x40A: Reserved_35

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
19:16	PTC_3_0 (CONTINUED)	0x40B: Reserved_36 0x40C: Reserved_37 0x40D: Reserved_38 0x40E: Reserved_39 0x40F: Reserved_40 0x410: Reserved_41 0x411: Reserved_42 0x412: Reserved_43 0x413: Reserved_44 0x414: Reserved_45 0x415: Reserved_46 0x416: Reserved_47 0x417: Reserved_48 0x418: Reserved_49 0x419: Reserved_50 0x41A: Reserved_51 0x41B: Reserved_52 0x41C: Reserved_53 0x41D: Reserved_54 0x41E: Reserved_55 0x41F: Reserved_56 0x420: Reserved_57 0x421: Reserved_58 0x422: Reserved_59 0x423: Reserved_60 0x424: Reserved_61 0x425: Reserved_62 0x426: Reserved_63 0x427: Reserved_64 0x428: Reserved_65 0x429: Reserved_66 0x42A: Reserved_67 0x42B: Reserved_68 0x42C: Reserved_69 0x42D: Reserved_70 0x42E: Reserved_71 0x42F: Reserved_72 0x430: Reserved_73 0x431: Reserved_74 0x432: Reserved_75 0x433: Reserved_76 0x434: Reserved_77 0x435: Reserved_78 0x436: Reserved_79 0x437: Reserved_80 0x438: Reserved_81 0x439: Reserved_82 0x43A: Reserved_83 0x43B: Reserved_84 0x43C: Reserved_85 0x43D: Reserved_86 0x43E: Reserved_87 0x43F: Reserved_88 0x440: Reserved_89 0x441: Reserved_90 0x442: Reserved_91 0x443: Reserved_92 0x444: Reserved_93 0x445: Reserved_94 0x446: Reserved_95 0x447: Reserved_96 0x448: Reserved_97 0x449: Reserved_98 0x44A: Reserved_99 0x44B: Reserved_100

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
19:16	PTC_3_0 (CONTINUED)	0x44C: Reserved_101 0x44D: Reserved_102 0x44E: Reserved_103 0x44F: Reserved_104 0x450: Reserved_105 0x451: Reserved_106 0x452: Reserved_107 0x453: Reserved_108 0x454: Reserved_109 0x455: Reserved_110 0x456: Reserved_111 0x457: Reserved_112
15:14	PIC_1_0	Port indicator control Read/write Default = 0 Writing to this field has no effect if the P_INDICATOR bit in the HCSPARAMS register is a zero. If the P_INDICATOR bit is set (1), then this field has the following meanings: Bit value Meaning value 00 Port indicators are off value 01 Amber value 10 Green value 11 Undefined Refer to the USB Specification Revision 2.0 [3] for a description on how these bits are to be used. This field is output from the controller as signals port_ind_ctl_1 and port_ind_ctl_0 for use by an external LED driving circuit.
13	PO	Port owner Read only Port owner hand-off is not implemented in this design, therefore this bit will always read back as clear (0). Default = 0 The EHCI definition is include here for reference: ’ This bit unconditionally goes clear (0) when the configured bit in the CONFIGFLAG register makes a 0-to-1 transition. ’ This bit unconditionally goes set (1) whenever the configured bit is clear (0). The system software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). The software sets (1) this bit when the attached device is not a high-speed device. When this bit is set (1), it indicates that an internal companion controller owns and controls the port.

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
12	PP	Port power (PP) Read/write or read-only The function of this bit depends on the value of the port power switching (PPC) field in the HCSPARAMS register. ’ PPC = 0: PP is read-only. A device controller with no OTG capability does not have port power control switches. ’ PPC = 1: PP is read/write. The host/OTG controller requires port power control switches. This bit represents the current setting of the switch (0 = off, 1 = on). When power is not available on a port (and PP equals a 0), the port is non-functional and will not report attaches, detaches, and so on. When an over-current condition is detected on a powered port and PPC is set (1), the PP bit in each affected port may be transitioned by the host controller driver from a one to a zero, removing power from the port. This feature is implemented in the host/OTG controller (PPC = 1). In a device-only implementation, port power control is not necessary. So, PPC and PP = 0.
11:10	LS_1_0	Line status Read-only These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines: Value Meaning value 00 SE0 value 10 J-state value 01 K-state value 11 Undefined In the host mode, the use of line state by the host controller driver is not necessary (unlike EHCI), because the port controller state machine and the port routing manage the connection of LS and FS. In the device mode, the use of line state by the device controller driver is not necessary.
9	HSP	High-speed port Read-only Default = 0 When the bit is set (1), the host/device connected to the port is in the high-speed mode. When this bit is clear (0), the host/device connected to the port is not in a high-speed mode. Note: HSP is redundant with PSPD(27:26), but will remain in the design for compatibility. This bit is not defined in the EHCI specification.

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
8	PR	Port reset This bit is clear (0) if the port power (PP) bit (bit 12) of this register is clear (0). Host mode: ’ Read/write ’ Default = 0 When the software sets (1) this bit, the bus-reset sequence as defined in the USB Specification Revision 2.0 is started. This bit will automatically clear (go to 0) after the reset sequence is complete. Note: This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the reset duration is timed in the driver. Device mode: This bit is a read-only status bit. Device reset from the USB bus is also indicated in the USBSTS register. 0x1: Port is in reset 0x0: Port is not in reset

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
7	SUSP	Suspend Host mode: ' Read/write ' Default = 0 The port enabled bit and suspend bit of this register define the port states: Bit value Port state value 0x Disable value 10 Enable value 11 Suspend When in the suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction if a transaction was in progress when this bit set (1). In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. The host controller will unconditionally clear (0) this bit when the software clears (0) the force port resume bit. The host controller ignores a write of zero to this bit. If the host software sets (1) this bit when the port is not enabled (port enabled bit is a zero), the results are undefined. This field is clear (0) if port power (PP) is clear (0) in the host mode. Device mode: ' Read only ' Default = 0 In the device mode, this bit is a read-only status bit. 0x1: Port in suspend state_1 0x0: Port not in suspend st_1 0x1: Port in suspend state_2 0x0: Port not in suspend st_2

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
6	FPR	Force port resume ’ Read/write ’ Default = 0 Host mode: The software sets (1) this bit to drive resume signaling. The host controller sets (1) this bit if a J-to-K transition is detected while the port is in the suspend state. When this bit transitions to a one because a J-to-K transition is detected, the port change detect bit in the USBSTS register is also set (1). This bit will automatically clear (go to 0) after the resume sequence is complete. This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the resume duration is timed in the driver. Note that, when the host controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (full-speed 'K') is driven on the port as long as this bit remains set (1). This bit will remain set (1) until the port has switched to the high-speed idle. Clearing (0) this bit has no affect, because the port controller will time the resume operation and clear (0) the bit when the port control state switches to HS or FS idle. This bit is clear if the port power (PP) is clear (0) in the host mode. This bit is not-EHCI compatible. Device mode: After the device has been in the suspend state for 5 ms or more, the software must set (1) this bit to drive resume signaling before clearing. The device controller will set (1) this bit if a J-to-K transition is detected while the port is in the suspend state. The bit will be cleared (0) when the device returns to normal operation. Also, when this bit transitions to a one because a J-to-K transition was detected, the port change detect bit in the USBSTS register is also set (1). 0x1: Resume detected/driven on port 0x0: No resume (K-state detected/driven on port)
5	OCC	Over-current change Read/write control Default = 0 This bit gets is set (1) when there is a change to over-current active. The software clears this bit by setting (1) this bit position. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
4	OCA	Over-current active Read-only Default = 0 value 1 = This port currently has an over-current condition. value 0 = This port does not have an over-current condition. This bit will automatically transition from set (1) to clear (0) when the over current condition is removed. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).
3	PEC	Port enable/disable change Read/write control value 1 = Port enabled/disabled status has changed value 0 = No change Default = 0 Host mode: For the root hub, this bit gets set (1) only when a port is disabled due to disconnect on the port or due to the appropriate conditions existing at the EOF2 point. The software clears this bit by writing a one to it. This field is clear (0) if the port power (PP) bit in the register is clear (0). Device mode: The device port is always enabled (this bit will be zero).
2	PE	Port enabled/disabled Read/write value 1 = Enable value 0 = Disable Default 0 Host mode: Ports can only be enabled by the host controller as a part of the reset and enable. The software cannot enable a port by setting (1) this field. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by the host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port, due to other host controller and bus events. When the port is disabled, (0) downstream propagation of data is blocked except for reset. This field is clear (0) if the port power (PP) bit is cleared (0) in the host mode. Device mode: The device port is always enabled (this bit will be set [1])

USB3_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
1	CSC	Connect status change Read/write control value 1 = Change in current connect status value 0 = No change Default = 0 Host mode: Indicates that a change has occurred in the port's current connect status. The host/device controller sets (1) this bit for all changes to the port device connect status, even if the system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, the hub hardware will be 'setting' an already-set bit (that is, the bit will remain set). The software clears this bit by writing a one to it. This field is zero if the port power (PP) bit in this register is zero in the host mode. Device mode: This bit is undefined in the device controller mode.
0	CCS	Current connect status Read-only Host mode: value 1 = Device is present on port value 0 = No device is present Default = 0 This value reflects the current state of the port, and may not correspond directly to the event that caused the connect status change bit (bit 1) to be set (1). This field is clear if the port power (PP) bit in this register is clear (0) in host mode. Device mode: value 1 = Attached value 0 = Not attached Default = 0 If this bit is set (1), this indicates that the device successfully attached, and is operating in either high speed or full speed, as indicated by the high speed port bit in this register. If this bit is clear (0), this indicates that the device did not attach successfully or was forcibly disconnected by the software clearing (0) the run bit in the USBCMD register. It does not state the device being disconnected or suspended.

0x125201A4 USB3_HS_USB_OTG_HS_OTGSC

Type: Read/Write

Reset State: 0x00000E20

USB3_HS_USB_OTG_HS_OTGSC

Bits	Name	Description
31	RESERVED_BIT31	Clear (0) this bit.
30	DPIE	Data pulse interrupt enable
29	B_1MSE	1 millisecond timer interrupt enable - read/write
28	BSEIE	B session end interrupt enable Read/write Setting (1) this bit enables the B session end interrupt.
27	BSVIE	B session valid interrupt enable Read/write Setting (1) this bit enables the B session valid interrupt.
26	ASVIE	A session valid interrupt enable Read/write Setting (1) this bit enables the A session valid interrupt.
25	AVVIE	A Vbus valid interrupt enable Read/write Setting (1) this bit enables the A Vbus valid interrupt.
24	IDIE	USB ID interrupt enable Read/write Setting (1) this bit enables the USB ID interrupt.
23	RESERVED_BIT23	Clear (0) this bit.
22	DPIS	Data pulse interrupt status Read/write to clear This bit is set (1) when data bus pulsing occurs on DP or DM. Data bus pulsing is only detected when USBMODE.CM = Host (11) and PORTSC(0). PortPower = Off (0). The software must write a one to clear this bit.
21	B_1MSS	1 millisecond timer interrupt status Read/write to clear This bit is set (1) once every millisecond. The software must write a one to clear this bit.
20	BSEIS	B session end interrupt status Read/write to clear This bit is set (1) when the Vbus has fallen below the B session end threshold. The software must write a one to clear this bit
19	BSVIS	B session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the B session valid threshold (0.8 VDC). The software must write a one to clear this bit.

USB3_HS_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Description
18	ASVIS	A session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the A session valid threshold (0.8 VDC). The software must write a one to clear this bit.
17	AVVIS	A Vbus valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the Vbus valid threshold (4.4 VDC) on an A device. The software must write a one to clear this bit.
16	IDIS	USB ID interrupt status Read/write This bit is set (1) when a change on the ID input has been detected. The software must write a one to clear this bit.
15	RESERVED_BIT15	Clear (0) this bit.
14	DPS	Data bus pulsing status Read-only If this bit is set (1), it indicates that the data bus pulsing is being detected on the port.
13	B_1MST	1 millisecond timer toggle Read-only This bit toggles once per millisecond.
12	BSE	B session end Read-only Indicates that the Vbus is below the B session end threshold.
11	BSV	B session valid Read-only Indicates that the Vbus is above the B session valid threshold.
10	ASV	A session valid Read-only Indicates that the Vbus is above the A session valid threshold.
9	AVV	A Vbus valid Read-only Indicates that the Vbus is above the A Vbus valid threshold.
8	ID	USB ID Read-only value 0 = A device value 1 = B device

USB3_HS_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Description
7	HABA	Hardware assist B-disconnect to A-connect Read/write value 0 = Disabled value 1 = Enable automatic B-disconnect to A-connect sequence.
6	HADP	Hardware assist data-pulse Write to set
5	IDPU	ID pull-up Read/write This bit provides control over the ID pull-up register. value 0 = Off value 1 = On (default) When this bit is clear (0), the ID input will not be sampled.
4	DP	Data pulsing Read/write Setting (1) this bit causes the pull-up on DP to be asserted for data pulsing during SRP.
3	OT	OTG termination Read/write This bit must be set (1) when the OTG device is in the device mode. This controls the pull-down on DM.
2	HAAR	Hardware assist auto-reset Read/write value 0 = Disabled value 1 = Enable automatic reset after connect on host port.
1	VC	Vbus charge Read/write Setting (1) this bit causes the Vbus line to be charged. This is used for Vbus pulsing during SRP.
0	VD	Vbus discharge Read/write Setting (1) this bit causes the Vbus to discharge through a resistor.

0x125201A8 USB3_HS_USB_OTG_HS_USBMODE

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_USBMODE register is the USB device mode register.

USB3_HS_USB_OTG_HS_USBMODE

Bits	Name	Description
31:6	RESERVED_BITS31_6	Clear (0) these bits.
5	VBPS	Vbus power select value 0 - Output is 0 value 1 - Output is 1 This bit is connected to the vbus_pwr_select output and can be used for any generic control, but is named to be used by logic that selects between an on-chip Vbus power source (charge pump) and an off-chip source in systems when both are available.
4	SDIS	Stream disable mode value 0 = Inactive (default) value 1 = Active Device mode: Setting (1) this bit disables double priming on both the Rx and Tx for low bandwidth systems. This mode ensures that, when the Rx and Tx buffers are sufficient to contain an entire packet, the standard double buffering scheme is disabled to prevent overruns/underruns in bandwidth-limited systems. Note: In the high speed mode, a NYET handshake will respond to all packets received when the stream disable is active. Host mode: Setting (1) this bit ensures that overruns/underruns of the latency FIFO are eliminated for low bandwidth systems where the Rx and Tx buffers are sufficient to contain the entire packet. Enabling the stream disable also has the effect of ensuring that the Tx latency is filled to capacity before the packet is launched onto the USB. Note: Time duration to pre-fill the FIFO becomes significant when the stream disable is active. See TXFILLTUNING and TXTTFILLTUNING [MPH only] to characterize the adjustments needed for the scheduler when using this feature. Note: The use of this feature substantially limits of the overall USB performance.
3	SLOM	Setup lockout mode. In the device mode, this bit controls the behavior of the setup lock mechanism.. value 0 = Setup lockouts on (default) value 1 = Setup lockouts off (DCD requires use of a setup data buffer tripwire in USBCMD)

USB3_HS_USB_OTG_HS_USBMODE (cont.)

Bits	Name	Description
2	ES	Endian select Read/write This bit can change the byte ordering of the transfer buffers to match the host microprocessor bus architecture. The bit fields in the microprocessor interface and the DMA data structures (including the setup buffer within the device QH) are unaffected by the value of this bit, because they are based upon 32-bit words. value 0 = Little endian (default) - first byte referenced in the least significant byte of a 32-bit word. value 1 = Big endian - first byte referenced in most significant byte of a 32-bit word.
1:0	CM	Controller mode Read/write once The controller mode is defaulted to the proper mode for host-only and device-only implementations. For those designs that contain both host and device capability, the controller will default to an idle state and will need to be initialized to the desired operating mode after reset. For combination host/device controllers, this register can only be written once after reset. If it is necessary to switch modes, the software must reset the controller by writing to the RESET bit in the USBCMD register before reprogramming this register. value 00 = Idle [default for combination host/device] value 01 = Reserved value 10 = Device controller [default for device only controller] value 11 = Host controller [default for host only controller]

0x125201AC USB3_HS_USB_OTG_HS_ENPDTSETUPSTAT

Type: Read/write control
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENPDTSETUPSTAT register is the endpoint set-up status register.

USB3_HS_USB_OTG_HS_ENPDTSETUPSTAT

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.

USB3_HS_USB_OTG_HS_ENPDTSETUPSTAT (cont.)

Bits	Name	Description
15:0	ENDPTSETUPSTAT_15_0	Set-up endpoint status For every set-up transaction that is received, a corresponding bit in this register is set (1). The software must clear or acknowledge the setup transfer by setting (1) a respective bit after it has read the setup data from the queue head. The response to a set-up packet as in the order of operations and total response time is crucial to limit bus time outs while the set-up lock-out mechanism is engaged. See Managing Endpoints in the Device Operational Model. This register is only used in the device mode.

0x125201B0 USB3_HS_USB_OTG_HS_ENDPTPRIME

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTPRIME register is the endpoint initialization register. This register is only used in the device mode.

USB3_HS_USB_OTG_HS_ENDPTPRIME

Bits	Name	Description
31:16	PETB_15_0	Prime endpoint transmit buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a transmit operation in order to respond to a USB IN/INTERRUPT transaction. The software should set (1) the corresponding bit when posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a transmit buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. PETB[15] - Endpoint 15 PETB[1] - Endpoint 1 PETB[0] - Endpoint 0

USB3_HS_USB_OTG_HS_ENDPTPRIME (cont.)

Bits	Name	Description
15:0	PERB_15_0	Prime endpoint receive buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a receive operation for when a USB host initiates a USB OUT transaction. The software should set (1) the corresponding bit whenever posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x125201B4 USB3_HS_USB_OTG_HS_ENDPTFLUSH

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTFLUSH register is the endpoint de-initialize register. This register is only used in the device mode.

USB3_HS_USB_OTG_HS_ENDPTFLUSH

Bits	Name	Description
31:16	FETB_15_0	Flush endpoint transmit buffer Setting (1) a bit in this register will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. FETB[15] - Endpoint 15 FETB[1] - Endpoint 1 FETB[0] - Endpoint 0
15:0	FERB_15_0	Flush endpoint receive buffer Setting a bit (1) will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x125201B8 USB3_HS_USB_OTG_HS_ENDPTSTAT

Type: Read-only
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTSTAT register is the endpoint status register. This register is only used in the device mode.

USB3_HS_USB_OTG_HS_ENDPTSTAT

Bits	Name	Description
31:16	ETBR_15_0	Endpoint transmit buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ETBR[15] - Endpoint 15 ETBR[1] - Endpoint 1 ETBR[0] - Endpoint 0
15:0	ERBR_15_0	Endpoint receive buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ERBR[15] - Endpoint 15 ERBR[1] - Endpoint 1 ERBR[0] - Endpoint 0

0x125201BC USB3_HS_USB_OTG_HS_ENDPTCOMPLETE

Type: Read/write control
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The register is the endpoint complete register. This register is only used in the device mode.

USB3_HS_USB_OTG_HS_ENDPTCOMPLETE

Bits	Name	Description
31:16	ETCE_15_0	Endpoint transmit complete event Each bit indicates that a transmit event (IN/INTERRUPT) occurred and the software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ETCE[15] - Endpoint 15 ETCE[1] - Endpoint 1 ETCE[0] - Endpoint 0
15:0	ERCE_15_0	Endpoint receive complete event Each bit indicates that a received event (OUT/SETUP) occurred and the software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ERCE[15] - Endpoint 15 ERCE[1] - Endpoint 1 ERCE[0] - Endpoint 0

0x125201C0 USB3_HS_USB_OTG_HS_ENDPTCTRL0

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00800080

The USB_OTG_HS_ENDPTCTRL0 register is the endpoint control 0 register. Every device will implement endpoint0 as a control endpoint.

USB3_HS_USB_OTG_HS_ENDPTCTRL0

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

USB3_HS_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
23	TXE	Tx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
22:20	RESERVED_BITS22_20	Clear (0) these bits.
19:18	TXT	Tx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
17	RESERVED_BIT17	Clear (0) this bit.
16	TXS	Tx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
6:4	RESERVED_BITS6_4	Clear (0) these bits.
3:2	RXT	Rx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
1	RESERVED_BIT1	Clear (0) this bit.

USB3_HS_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
0	RXS	Rx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

0x125201C0+4*n USB3_HS_USB_OTG_HS_ENDPTCTRLn, n=[1..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTCTRLn register is the endpoint control n register. There is an ENDPTCTRLn register for each endpoint in a device.

CAUTION If one endpoint direction is enabled and the paired endpoint of the opposite direction is disabled, then the unused direction type must be changed from the default control-type to any other type (such as bulk-type). Leaving an unconfigured endpoint control will cause undefined behavior for the data PID tracking on the active endpoint/direction.

USB3_HS_USB_OTG_HS_ENDPTCTRLn

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23	TXE	Tx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

USB3_HS_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
22	TXR	Tx data toggle reset (WS) value 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and device.
21	TXI	Tx data toggle inhibit value 0 = PID sequencing enabled (default) value 1 = PID sequencing disabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always transmit DATA0 for a data packet.
20	RESERVED_BIT20	Clear (0) this bit.
19:18	TXT	Tx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
17	TXD	Tx endpoint data source value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
16	TXS	Tx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. in most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

USB3_HS_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
6	RXR	Rx data toggle reset (WS) Write 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and the device.
5	RXI	Rx data toggle inhibit value 0 = Disabled (default) value 1 = Enabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always accept a data packet regardless of their data PID.
4	RESERVED_BIT4	Clear (0) this bit.
3:2	RXT	Rx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
1	RXD	Rx endpoint data sink value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
0	RXS	Rx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. in most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

0x125201FC+4*n USB3_HS_USB_OTG_HS_ENDPT_PIPE_IDn, n=[1..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x001F001F

The USB_OTG_HS_ENDPT_PIPE_IDn register is the endpoint pipe number register. There is an USB_OTG_HS_ENDPT_PIPE_IDn register for each endpoint in a device.

NOTE reset value of TX_PIPE_ID and RX_PIPE_ID is 0x1F, which means that Endpoint is not mapped to any pipe.

USB3_HS_USB_OTG_HS_ENDPT_PIPE_IDn

Bits	Name	Description
31:21	RESERVED_BITS31_21	Clear (0) these bits.
20:16	TX_PIPE_ID	This field indicate the pipe number that this tx end point (n) will use in pipe mode.
15:5	RESERVED_BITS15_5	Clear (0) these bits.
4:0	RX_PIPE_ID	This field indicate the pipe number that this rx end point (n) will use in pipe mode.

0x12520240 USB3_HS_USB_OTG_HS_PHY_CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0b1110000111010

The USB_OTG_HS_PHY_CTRL register is used to configure various features in the Synopsys 28nm PHY.

USB3_HS_USB_OTG_HS_PHY_CTRL

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	USB2_PHY_IDHV_CLAMP_EN	Clamp enable for IDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and IDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped high. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
11	USB2_PHY_OTGSESSVLDHV_CLAMP_EN	Clamp enable for OTGSESSVLDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and OTGSESSVLDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.

USB3_HS_USB_OTG_HS_PHY_CTRL (cont.)

Bits	Name	Description
10	PHY_MPM_HV_CLAMP_EN	Clamp enable for HV interrupts level shifters from USB VDD180 domain to VDDPAD MPM in usb2 phy wrapper. When set (1), VLS is active and HV interrupts are translated from 1.8V domain to MPM Vdd domain. When clear (0), VLS is clamped to inactive state. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
9	USB2_PHY_OTGSESSVLD HV_INTEN	Enable HV session valid interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
8	USB2_PHY_IDHV_INTEN	Enable HV id pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
7	USB2_PHY_ULPI_POR	Reset for ULPI PHY Wrapper and ULPI clock domain logic in usb2_phy_wrapper.
6:4	USB2_PHY_FSEL	Reference Clock Frequency Select 011 (Assumes 19.2MHz default)
3	HOST_PORTCTRL_FORCE _SUSEN	Chicken bit for CR-0000153908 - when this bit set the core will enter to low power mode when portctrl host sm enter to suspend mode. Default value is 1.
2	USB2_PHY_SIDDQ	IDDQ Test Enable.
1	USB2_PHY_RETEN	Retention mode enable/disable
0	USB2_PHY_POR	Power-On-Reset (Analog configuration needs to happen before POR is set to 0)

0x12520244 USB3_HS_USB_OTG_HS_GENERIC1

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

The USB_OTG_HS_GENERIC1 register.

USB3_HS_USB_OTG_HS_GENERIC1

Bits	Name	Description
31:16	USB_HS_TX_DEPTH	TX_DEPTH is the number of words in the TX buffer. This number is calculated by the number of bytes allocated per Endpoint divided by 4, times the number of endpoints. The RAM width is 36. In HS USB this value is usually 512 bytes per EP, and for FS ONLY USB it is usually 64 Bytes per EP.
15:0	USB_HS_RX_DEPTH	RX_DEPTH is the number of words in the RX buffer. This number is usually 256, but can support powers of 2 up to 4096. The RAM width is 36.

0x12520248 USB3_HS_USB_OTG_HS_GENERIC2

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

The USB_OTG_HS_GENERIC2 register.

USB3_HS_USB_OTG_HS_GENERIC2

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15	USE_SPS_AHB2AHB	USE_SPS_AHB2AHB generic specifies if AHB2AHB bridge is connected between BAM and SPS Fabric AHB.
14	LPM_SUPPORT	The LPM_SUPPORT generic specifies if USB support Link Power Management.
13:9	USB_HS_DEV_EP	The number of USB endpoints. Valid values for the number of Endpoints are 4, 8, and 16
8:3	MAX_PIPES	The number of simultaneous parallel pipes supported by the BAM. Supported values are 2 to 30
2	USE_SPS	The USE_SPS generic specifies if Bam is connected to USB core.
1	USE_HSIC	The USE_HSIC generic specifies if an HSIC is connected to USB core.
0	UTMI_PHY_SW_IF_EN	The UTMI_PHY_SW_IF_EN generic specifies if UTMI phy Register Interface is enabled

0x12520250 USB3_HS_USB_OTG_HS_L1_EP_CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0000FFFF

The USB_OTG_HS_L1_EP_CTRL register enables/disables transition to L1 and exit from L1 state when specific TX endpoints are primed.

USB3_HS_USB_OTG_HS_L1_EP_CTRL

Bits	Name	Description
31:16	TX_EP_PRIME_L1_EXIT	Those bit's enables Remote Wakeup in L1 state when SW starts Priming The specific Endpoint.
15:0	TX_EP_PRIME_L1_EN	Control bit's that enables/disables transition to L1 when the specific TX Endpoint is active.

0x12520254 USB3_HS_USB_OTG_HS_L1_CONFIG

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_L1_CONFIG register is used to configure various L1 features.

USB3_HS_USB_OTG_HS_L1_CONFIG

Bits	Name	Description
31:12	RESERVED_BITS31_12	Clear (0) these bits.
11	PLL_PWR_DWN_EN	Control bit that enables/disables power down of 480 MHZ PLL in L1 state.
10	PHY_LPM_EN	Control bit that enable/disables entering ULPI Low Power Mode in L1 state
9	GATE_AHB_CLK_EN	Control bit that enable/disables clock request signaling for usb_ahb_clk in L1 state
8	GATE_FS_XCVR_CLK_EN	Control bit that enable/disables clock gating of usb_fs_xcvr_clk in L1 state
7	GATE_SYS_CLK_EN	Control bit that enable/disables clock gating of usb_system_clk in L1 state
6	GATE_XCVR_CLK_EN	Control bit that enable/disables power-down of 480 MHz PLL in L1 state
5	L1_REMOTE_WAKEUP_EN	Control bit that enables/disables Remote Wakeup in L1 state. When this bit is low, then Link Controller never initiates Remote Wakeup in L1 state. When this bit is high, Link Controller can initiate Remote Wakeup.
4	LPM_EN	Control bit that enables/disables LPM support. When this bit is zero a full backward compatibility is ensured - no LPM support and no response for LPM Extended Transaction
3:0	PLL_TURNOFF_MIN_HIRD	Specifying a minimum expected HIRD value from Host that enables HW mechanism for turning off the 480 MHz PLL. The default value is 50us.

0x12520258 USB3_HS_USB_OTG_HS_LPM_DEBUG_1

Type: Read/Clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_DEBUG_1 register is for debug and testing purposes mostly.

USB3_HS_USB_OTG_HS_LPM_DEBUG_1

Bits	Name	Description
31:16	DEBUG_L1_LONG_ENT_CNT	Count number of exits from L1 where duration in L1 is > 200us. Writing to this register clears the counter.
15:0	DEBUG_L1_SHORT_ENT_CNT	Count number of exits from L1 where duration in L1 is <= 200us. Writing to this register clears the counter.

0x1252025C USB3_HS_USB_OTG_HS_LPM_DEBUG_2

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_DEBUG_2 register is for debug and testing purposes mostly.

USB3_HS_USB_OTG_HS_LPM_DEBUG_2

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12:9	L1_RMT_WKUP_TIME	Read/write Specifying How much time the device drives remote wakeup. The default Value is 50us for reset value. Add the value of this register (in us) to the remote wakeup time.
8	L1_FPR	Read/write L1 Force port resume, The software sets (1) this bit to drive resume signaling.
7	HSIC_CLK_PLL_BYPASSNL	Read only. Disables PLL analog logic. Active low. Connects to bypassnl input of NT_PLL.
6	HSIC_CLK_PLL_RESET	Read only. Resets all FF in PLL. Active low. Connects to reset_n input of NT_PLL.
5	HSIC_CLK_GATE	Read only. Clock gating of hsic_clk and ulpi_clk, without turning off HSIC PLL.
4	FS_XCVR_CLK_GATE	Read only. Clock gating of cc_usb_xcvr_fs_clk
3	SYS_CLK_GATE	Read only. Clock gating of cc_usb_system_clk
2	AHB_CLK_GATE	Read only. Clock gating of usb_ahb_clk

USB3_HS_USB_OTG_HS_LPM_DEBUG_2 (cont.)

Bits	Name	Description
1	L1_STATE	Read only. Status bit indicating if Device is in L1 state. When this bit high, Link Controller and HSIC PHY are in L1 state
0	DEBUG_L1_EN	Read/write Control bit that enable/disables DEBUG counters operation.

0x12520260 USB3_HS_USB_OTG_HS_LPM_ATTRIBUTES

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_ATTRIBUTES register store the bmAttribute Field of the LPM transaction.

USB3_HS_USB_OTG_HS_LPM_ATTRIBUTES

Bits	Name	Description
31:5	RESERVED_BITS31_5	Clear (0) these bits.
4	BREMOTEWAKE	A value of one (1B) in this field enables the addressed device to wake the host upon any meaningful application-specific event (e.g. an interrupt for a device with one or more interrupt endpoints). A value of zero (0B) disables the device from initiating remote wake.
3:0	HIRD	Host Initiated Resume Duration.

20.32 USB3 HS BAM Registers (0x12522000 USB3_HS_BAM_BASE)

This section contains the USB3 BAM registers.

BAM supports only Word (4 byte) aligned writes and reads on the Configuration Bus interface.

BAM has MAX_PIPES hardware generic parameter defining the number of pipes it supports. Each BAM can have up to 31 pipes supported.

BAM has BAM_CONF_AHBS_ADDR_WIDTH hardware generic parameter defining the Bit Number for selecting BAM access or Peripheral access. Legal Ranges are 14 to 20. Count starts from 1, meaning a value of 17 will set BAM Base address as 0x0001_0000.

20.32.1 BAM control registers

BAM Control registers configure the BAM operational state, SW reset, interrupts and others.

0x12522F80 USB3_HS_BAM_CTRL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

BAM Control register allows global controls for the BAM.

USB3_HS_BAM_CTRL

Bits	Name	Description
31:17	RESERVED_BITS31_17	Set to Zero (0)
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1’b1 - Enable Power Saving Mode 1’b0 - Disable Power Saving Mode

USB3_HS_BAM_CTRL (cont.)

Bits	Name	Description
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2’b00 - Cache when current descriptor has less than 64 bytes left. 2’b01 - Cache when current descriptor has less than 128 bytes left. 2’b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2’b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
12	RESERVED_BITS12	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_SIC_SEL
11:5	BAM_TESTBUS_SEL	Set to Zero (0) Obsolete field: BAM_TESTBUS_SEL Test Bus selector. Supported until (including) bam_p3q3r29 (BlackBird). Moved to a dedicated register - BAM_TEST_BUS_SEL in the following releases.
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
3	RESERVED_BITS3	Set to Zero (0)
2	RESERVED_BITS2	Set to Zero (0)

USB3_HS_BAM_CTRL (cont.)

Bits	Name	Description
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x12522F84 USB3_HS_BAM_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

USB3_HS_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)

USB3_HS_BAM_REVISION (cont.)

Bits	Name	Description
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists
16	SECURED	This field indicates BAM/BAM-Lite has security support (APU inside) 1'b1 - Secured 1'b0 - Not Secured
15:12	RESERVED_BITS15_12	Set to Zero (0)
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRCS*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRCS*_EEn registers exist for n=[0..3].
7:0	REVISION	This field contains the revision number of the core, Hard Coded. 8'h01 - Voyager (bam_p3q3r22 +) 8'h02 - BlackBird (bam_p3q3r27 +) 8'h03 - Waverider BAM (bam_p3q3r30 +) 8'h04 - Aurora BAM (bam_p3q2r43 +) 8'h05 - Shelby BAM (bam_p2q2r45 +) 8'h10 - Waverider BAM Lite (bam_lite_p1q1r0 +) 8'h11 - Aurora BAM Lite (bam_lite_p3q2r16 +) 8'h12 - Shelby BAM Lite (bam_lite_p2q2r18 +)

0x12522FBC USB3_HS_BAM_NUM_PIPES

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

USB3_HS_BAM_NUM_PIPES

Bits	Name	Description
31:24	BAM_NON_PIPE_GRP	This field contains the number of BAM Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
23:16	PERIPH_NON_PIPE_GRP	This field contains the number of Peripheral's Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
15:8	RESERVED_BITS15_8	Set to Zero (0)
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x12522FC0 USB3_HS_BAM_TIMER

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

USB3_HS_BAM_TIMER

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12522FC4 USB3_HS_BAM_TIMER_CTRL

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

The resolution of the BAM inactivity timer are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define

the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * TIMER_TRSHLD.

USB3_HS_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12522F88 USB3_HS_BAM_DESC_CNT_TRSHLD

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

USB3_HS_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0).
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. Available in BAM only

0x12522F8C USB3_HS_BAM_IRQ_SRCS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

USB3_HS_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12522F90 USB3_HS_BAM_IRQ_SRCS_MSK

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

USB3_HS_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12522FB0 USB3_HS_BAM_IRQ_SRCS_UNMASKED

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

USB3_HS_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x12522F94 USB3_HS_BAM_IRQ_STTS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

USB3_HS_BAM_IRQ_STTS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.

USB3_HS_BAM_IRQ_STTS (cont.)

Bits	Name	Description
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12522F98 USB3_HS_BAM_IRQ_CLR

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

USB3_HS_BAM_IRQ_CLR

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12522F9C USB3_HS_BAM_IRQ_EN

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

USB3_HS_BAM_IRQ_EN

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12522FA0 USB3_HS_BAM_RESERVED_1

Type: Read
Clock: BAM_CLK
Reset State: 0x00000000

USB3_HS_BAM_RESERVED_1

Bits	Name	Description
31	RESERVED_BITS31	Set to Zero (0) Obsolete field: BAM_IRQ_SIC_SEL
30:0	RESERVED_BITS30_0	Set to Zero (0) Obsolete field: P_IRQ_SIC_SEL

0x12522FA4 USB3_HS_BAM_AHB_MASTER_ERR_CTRLS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB3_HS_BAM_AHB_MASTER_ERR_CTRLS

Bits	Name	Description
31:23	RESERVED_BITS31_16	Set to Zero (0)
22:18	BAM_ERR_HVMID	HVMID
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x12522FA8 USB3_HS_BAM_AHB_MASTER_ERR_ADDR

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB3_HS_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x12522FAC USB3_HS_BAM_AHB_MASTER_ERR_DATA

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB3_HS_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x12522FB4 USB3_HS_BAM_RESERVED_2

0x12522FB8 USB3_HS_BAM_RESERVED_3

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

.

USB3_HS_BAM_RESERVED_3

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_DEST_ADDR

0x12522FF0 USB3_HS_BAM_TRUST_REG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside - SECURED field in the BAM_REVISION register) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

USB3_HS_BAM_TRUST_REG

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_VMID	Those bits indicate the VMID value to be used when performing BAM type accesses to the bus. BAM Type accesses include BAM MTI (or Direct Mode accesses, not applicable for BAM Lite)
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable
6:2	RESERVED_BITS6_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_EE	This Field Indicates the EE (0,1,2,3) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12522FF4 USB3_HS_BAM_TEST_BUS_SEL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is the testbus selector register.

Supported in releases after bam_p3q3r29 (BlackBird).

USB3_HS_BAM_TEST_BUS_SEL

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	BAM_DATA_ERASE	When enabled, BAM will be instructed to erase all the data it currently has inside. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1’b1 - Enable Erase 1’b0 - Disabled
17	BAM_DATA_FLUSH	When enabled, BAM will be instructed to flush all the data it currently has inside. BAM will only flush the data once it has enough data and a valid destination for it. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1’b1 - Enable Flush 1’b0 - Disabled
16	BAM_CLK_ALWAYS_ON	This bit controls the BAM to issue ’always on’ clock request. 1’b1 - Enable Always On clock request. 1’b0 - Disabled
15:7	RESERVED_BITS15_7	Set to Zero (0)
6:0	BAM_TESTBUS_SEL	Test Bus selector. Values with bit[11] set high are reserved for the BAM Lite integrator to provide testbus from outside of the BAM Lite. For example, eDML testbus may reside at X’100_0000’ to X’111_1111’ selector values. eDML has no registers thus has no test bus selector, so its test bus is combined with the BAM lite’s. BAM provides zeroes on its testbus when external values selected. X’000_0000’ - Zeros X’000_0001’ - Slave test bus X’000_0010’ - Pipe state machine test bus X’000_0011’ - Buffer test bus X’000_0100’ - Sideband test bus X’000_1101’ - Bus Manager test bus X’001_0000’ - Reg file test bus X’1’’_’’’’ - BAM Lite sets zeroes on the test bus, leaving it for external use

0x12522FF8 USB3_HS_BAM_TEST_BUS_REG

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the value being output to the testbus of the chip. It is not intended for SW usage but for lab debugging of the BAM. Values here can change every cycle.

USB3_HS_BAM_TEST_BUS_REG

Bits	Name	Description
31:0	BAM_TESTBUS_REG	32 bit Testbus value. To select the Block in BAM to show here, use the BAM_TESTBUS_SEL field in BAM_CTRL register.

0x12522FFC USB3_HS_BAM_CNFG_BITS

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

USB3_HS_BAM_CNFG_BITS

Bits	Name	Description
31:27	RESERVED_BITS31_27	Set to Zero (0)
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only

USB3_HS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there are available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided.. 1'b1 - Enable 1'b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission savepoint, but into the illegal's pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1'b1 - Enabled 1'b0 - Disable Available in BAM only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1'b1 - Enable 1'b0 - Disable Available in BAM only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there's no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1'b1 - Enable 1'b0 - Disable Available in BAM only

USB3_HS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1’b1 - 1’b0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix) 1’b1 - Enable 1’b0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM’s common clock request. 1’b1 - Propagate Sideband Clock Request 1’b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. 1’b1 - Enable Power Saving 1’b0 - Disable Power Saving

USB3_HS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reset pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1’b1 - Enable external block pipe reset 1’b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. This functionality has been found to be buggy and was removed from APQ8064. Bit is currently unused. 1’b1 - Enable 1’b0 - Disable Available in BAM only
10:4	RESERVED_BITS10_4	Set to Zero (0)
3	BAM_ADML_SYNC_BRIDGE	0x1: Use a Synchronous Configuration bridge in aDML. 0x0: Use a Asynchronous Configuration bridge in aDML.
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It’s invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1’b1 - Enable 1’b0 - Disable Available in BAM only
1	BAM_ADML_DEEP_CONS_FIFO	0x1: Use a deep Consumer FIFO in aDML (16 dwords) 0x0: Use a shallow Consumer FIFO in aDML (8 dwords)
0	BAM_ADML_INCR4_EN_N	0x1: Don’t allow INCR4 aDML-BAM accesses. 0x0: Allow INCR 4 aDML-BAM accesses.

0x12523800+ 128*n USB3_HS_BAM_IRQ_SRCS_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB3_HS_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12523804+ 128*n USB3_HS_BAM_IRQ_SRCS_MSK_EEn, n=[0..3]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB3_HS_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12523808+ 128*n USB3_HS_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB3_HS_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

20.32.2 BAM PIPE management registers

BAM Pipe management registers control each pipe's parameters. Those reside in physical registers.

0x12522000+ 128*n USB3_HS_BAM_P_CTRLn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Control register provides various controls for the pipe.

USB3_HS_BAM_P_CTRLn

Bits	Name	Description
31:11	RESERVED_BITS31_11	Set to Zero (0)
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be pre-fetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

USB3_HS_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only.When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
2	RESERVED_BITS2	Set to Zero (0)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe
0	RESERVED_BITS0	Set to Zero (0)

0x12522004+ 128*n USB3_HS_BAM_P_RSTn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

USB3_HS_BAM_P_RSTn

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	P_SW_RST	This resets the pipe and its' registers, (Both Flip-Flops and RAM). 1'b1 - Reset 1'b0 - Do Nothing

0x12522008+ 128*n USB3_HS_BAM_P_HALTn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Halt register Enables/Disables the Halt Sequence.

This is a self-modifying register.

USB3_HS_BAM_P_HALTn

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it.

0x12522030+ 128*n USB3_HS_BAM_P_TRUST_REGn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

USB3_HS_BAM_P_TRUST_REGn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_P_VMID	Those bits indicate the VMID value to be used when performing Pipe type accesses to the bus. BAM Type accesses include Pipe MTI, Data and Descriptors.
7:2	RESERVED_BITS7_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_P_EE	This Field Indicates the EE (0,1,2,3) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12522010+ 128*n USB3_HS_BAM_P_IRQ_STTSn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

USB3_HS_BAM_P_IRQ_STTSn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

0x12522014+128*n USB3_HS_BAM_P_IRQ_CLRn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

USB3_HS_BAM_P_IRQ_CLRn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_CLR	1'b1 - Clear 1'b0 - Unchanged
4	P_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1'b1 - Clear 1'b0 - Unchanged

USB3_HS_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

0x12522018+ 128*n USB3_HS_BAM_P_IRQ_ENn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

USB3_HS_BAM_P_IRQ_ENn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

0x1252201C+ 128*n USB3_HS_BAM_P_TIMERn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the pipe.

USB3_HS_BAM_P_TIMERn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12522020+ 128*n USB3_HS_BAM_P_TIMER_CTRLn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the P_TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * P_TIMER_TRSHLD.

USB3_HS_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12522024+ 128*n USB3_HS_BAM_P_PRDCR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

USB3_HS_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value

0x12522028+ 128*n USB3_HS_BAM_P_CNSMR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

USB3_HS_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value

20.32.3 BAM PIPE configuration registers (RAM)

BAM Pipe management registers configure each pipes' parameters.

Pipe Address span: currently defining each pipe to have 32 addresses, therefore inter pipe offset is 32*4=128=0x80 bytes.

0x1252302C+ 64*n USB3_HS_BAM_P_EVNT_DEST_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

USB3_HS_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x12523018+64*n USB3_HS_BAM_P_EVNT_REGn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

USB3_HS_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x12523000+64*n USB3_HS_BAM_P_SW_OFSTSn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB3_HS_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode.
15:0	SW_DESC_OFST	Descriptor FIFO offset.

0x12523024+ 64*n USB3_HS_BAM_P_DATA_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

USB3_HS_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x1252301C+ 64*n USB3_HS_BAM_P_DESC_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

USB3_HS_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x12523028+64*n USB3_HS_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When aBAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

USB3_HS_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x12523020+64*n USB3_HS_BAM_P_FIFO_SIZESn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

USB3_HS_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors.

20.32.4 BAM PIPE internal state registers (RAM)

BAM Pipe debug registers allow a software look inside on the internal parameters of the BAM State Machines stored in RAM.

Those shouldn't be normally used or altered by the software.

0x12523034+64*n USB3_HS_BAM_P_RETR_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context stored for retransmission.

This is being stored by Ack Update state machine in consumer mode or by the Writeback state machine in producer mode.

This is being loaded by the Writeback state machine when retransmission happens.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB3_HS_BAM_P_RETR_CNTXT_n

Bits	Name	Description
31:16	RETR_DESC_OFST	Descriptor Fifo Offset for retransmission.
15:0	RETR_OFST_IN_DESC	The Offset inside the Descriptor for retransmission.

0x12523038+64*n USB3_HS_BAM_P_SI_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Sideband Inform state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB3_HS_BAM_P_SI_CNTXT_n

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

0x12523004+ 64*n USB3_HS_BAM_P_AU_PSM_CNTXT_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Ack Update state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB3_HS_BAM_P_AU_PSM_CNTXT_1_n

Bits	Name	Description
31:16	AU_PSM_ACCUMED	PSM: The acknowledged (EOB/T) number of bytes since last Write Event. AU: The accumulation of the descriptor sizes for the present ack_on_success event. This is never bigger than the ACKED field. Once the ACCUMED values are bigger than Event Threshold, an Event will be issued, the ACKED value will decrease by the ACCUMED size and this value will be zeroed. This also serves as the Bytes Consumed value in the Event.
15:0	AU_ACKED	AU: The left over of the number of bytes that were received via the ack_on_success, that did not cause a descriptor closure. This value is down counting upon issuing Read Event. PSM:

0x12523008+ 64*n USB3_HS_BAM_P_PSM_CNTXT_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB3_HS_BAM_P_PSM_CNTXT_2_n

Bits	Name	Description
31	PSM_DESC_VALID	The Descriptor Valid bit provided by the Writeback state machine to Pipe state machine.
30	PSM_DESC_IRQ	The Descriptor Interrupt bit provided by the Writeback state machine to pipe state machine.
29	PSM_DESC_IRQ_DONE	The Descriptor Interrupt needed selection bit.
28:25	PSM_GENERAL_BITS	General Context Switch Bits
24:22	PSM_CONS_STATE	State of the Pipe Consumer state machine.
21:19	PSM_PROD_SYS_STATE	State of the Pipe Producer System state machine.
18:16	PSM_PROD_B2B_STATE	State of the Pipe Producer BAM to BAM state machine.
15:0	PSM_DESC_SIZE	The Descriptor Size provided by the Writeback state machine to pipe state machine.

0x1252300C+64*n USB3_HS_BAM_P_PSM_CNTXT_3_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB3_HS_BAM_P_PSM_CNTXT_3_n

Bits	Name	Description
31:0	PSM_DESC_ADDR	The Data Address provided in the current descriptor from the Writeback state machine.

0x12523010+64*n USB3_HS_BAM_P_PSM_CNTXT_4_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB3_HS_BAM_P_PSM_CNTXT_4_n

Bits	Name	Description
31:16	PSM_DESC_OFST	The running Descriptor Fifo Offset of the Writeback state machine
15:0	PSM_SAVED_ACCUMED_SIZE	The Saved Accumulated Size from the Pipe state machine.

0x12523014+64*n USB3_HS_BAM_P_PSM_CNTXT_5_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB3_HS_BAM_P_PSM_CNTXT_5_n

Bits	Name	Description
31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

0x12523030+64*n USB3_HS_BAM_P_RESERVED_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

USB3_HS_BAM_P_RESERVED_1_n

Bits	Name	Description
31:0	BAM_P_RES_1	Set to zero (0) Reserved

0x1252303C+64*n USB3_HS_BAM_P_RESERVED_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

USB3_HS_BAM_P_RESERVED_2_n

Bits	Name	Description
31:0	BAM_P_RES_2	Set to zero (0) Obsolete Register: BAM_P_IRQ_DEST_ADDRn, n=[0..30]

20.33 USB4 OTG HS Registers (0x12530000 USB4_HS_BASE)

This section contains USB4 OTG HS registers.

20.33.1 Identification registers

Identification registers are used to declare the slave interface presence and include a table of the hardware configuration parameters.

0x12530000 USB4_HS_USB_OTG_HS_ID

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0042FA05

The USB_OTG_HS_ID register is the identification register. It provides a simple way to determine if the USB-HS USB 2.0 core is provided in the system. The ID register identifies the USB-HS USB 2.0 core and its revision.

USB4_HS_USB_OTG_HS_ID

Bits	Name	Description
31:24	RESERVED_BITS31_24	These bits are reserved and should be set to zero.
23:16	REVISON_7_0	This field contains the revision number of the core - 0x42.
15:8	NID_5_0	This field contains the complement version of ID[7:0] - 0xFA.
7:0	ID_5_0	This field is the configuration number. This number is set to 0x05 and indicates that the peripheral is the USB-HS USB 2.0 core.

0x12530004 USB4_HS_USB_OTG_HS_HWGENERAL

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x5C2

The USB_OTG_HS_HWGENERAL register contains the general hardware parameters.

USB4_HS_USB_OTG_HS_HWGENERAL

Bits	Name	Description
31:10	RESERVED_BITS31_10	Clear (0) these bits.
9	SM	VUSB_HS_PHY_SERIAL = 2
8:6	PHYM	VUSB_HS_PHY_TYPE = 7
5:4	PHYW	VUSB_HS_PHY16_8 = 0

USB4_HS_USB_OTG_HS_HWGENERAL (cont.)

Bits	Name	Description
3	BWT	This bit is reserved for internal testing = 0
2:1	CLCK	VUSB_HS_CLOCK_CONFIGURATION = 1
0	RT	VUSB_HS_RESET_TYPE = 0

0x12530008 USB4_HS_USB_OTG_HS_HWHOST

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x10020001

The USB_OTG_HS_HWHOST register contains the host hardware parameters.

USB4_HS_USB_OTG_HS_HWHOST

Bits	Name	Description
31:24	TTPER	VUSB_HS_TT_PERIODIC_CONTEXTS
23:16	TTASY	VUSB_HS_TT_ASYNC_CONTEXTS
15:4	RESERVED_BITS15_4	Clear (0) these bits.
3:1	NPORT	VUSB_HS_NUM_PORT-1
0	HC	VUSB_HS_HOST

0x1253000C USB4_HS_USB_OTG_HS_HWDEVICE

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000021

The USB_OTG_HS_HWDEVICE register contains the device hardware parameters.

USB4_HS_USB_OTG_HS_HWDEVICE

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5:1	DEVEP	VUSB_HS_DEV_EP
0	DC	Device capable; [VUSB_HS_DEV/=0]

0x12530010 USB4_HS_USB_OTG_HS_HWTXBUF

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x80070B08

The USB_OTG_HS_HWTXBUF register contains the Tx buffer hardware parameters.

USB4_HS_USB_OTG_HS_HWTXBUF

Bits	Name	Description
31	TXLCR	This bit is fixed to 1'b1 so that the local context register's are included in the design. This means that the DMA context is implemented in FlipFlops.
30:24	RESERVED_BITS30_24	Clear (0) these bits.
23:16	TXCHANADD	VUSB_HS_TX_CHAN_ADD - Defines the number of address lines needed per Endpoint per the TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
15:8	TXADD	VUSB_HS_TX_ADD - Defines the number of address lines needed per the entire TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
7:0	TXBURST	VUSB_HS_TX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the TX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst lengthis will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x12530014 USB4_HS_USB_OTG_HS_HWRXBUF

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000808

The USB_OTG_HS_HWRXBUF register contains the Rx buffer hardware parameters.

USB4_HS_USB_OTG_HS_HWRXBUF

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits).
15:8	RX_ADD	VUSB_HS_RX_ADD - Defines the number of address lines needed per the entire RX latency buffer. It's reset value is taken from a GENERIC value passed to the core.

USB4_HS_USB_OTG_HS_HWRXBUF (cont.)

Bits	Name	Description
7:0	RX_BURST	VUSB_HS_RX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the RX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst length will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x12530040+ 4*n USB4_HS_USB_OTG_HS_SCRATCH_RAMn, n=[0..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

USB_OTG_HS_SCRATCH_RAMn registers are 16 32bit scratch registers.Required for passing USB software information between different images.

USB4_HS_USB_OTG_HS_SCRATCH_RAMn

Bits	Name	Description
31:0	SCRATCH_REGISTER	32 bit scratch register

20.33.2 Device/host timer registers

The host/device controller drivers can measure time related activities using these timer registers.

NOTE These registers are not part of the standard EHCI controller.

0x12530080 USB4_HS_USB_OTG_HS_GPTIMER0LD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER0LD register is the general purpose timer 0 load register. This register contains the timer duration or load value. See the GPTIMER0CTRL register for a description of the timer functions.

USB4_HS_USB_OTG_HS_GPTIMER0LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

USB4_HS_USB_OTG_HS_GPTIMER0LD (cont.)

Bits	Name	Description
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFFF or 16.777215 seconds

0x12530084 USB4_HS_USB_OTG_HS_GPTIMER0CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER0CTRL register is the general purpose timer 0 control register. This register contains the control for the timer and a data field can be queried to determine the running count value. This timer has a granularity of 1 ms and can be programmed to a little over 16 seconds. There are two modes supported by this timer: the first is a one-shot and the second is a looped count, which is described in the register table below. When the timer counter value transitions to zero, an interrupt can be generated though the use of the timer interrupts in the USBTS and USBINTR registers.

USB4_HS_USB_OTG_HS_GPTIMER0CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.

USB4_HS_USB_OTG_HS_GPTIMER0CTRL (cont.)

Bits	Name	Description
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

0x12530088 USB4_HS_USB_OTG_HS_GPTIMER1LD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER1LD register is the general purpose timer 1 control register. This register contains the timer duration or load value. See the GPTIMER0LDregister for a description of the timer functions.

USB4_HS_USB_OTG_HS_GPTIMER1LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFFF or 16.777215 seconds.

0x1253008C USB4_HS_USB_OTG_HS_GPTIMER1CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER1CTRL register is the general purpose timer 1 control register. See the description of the USB_OTG_HS_GPTIMER0CTRL register for details about this register.

USB4_HS_USB_OTG_HS_GPTIMER1CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

20.33.3 Wrapper operational registers

0x12530090 USB4_HS_USB_OTG_HS_AHB_BURST

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_AHB_BURST register determines the AHB master mode of the USB HS Core.

NOTE If the USB_OTG_HS_AHB_MODE is configured to be 0x0 (the AHB Transactor is used), this register must be 0x0 as well, otherwise the AHB Master bus behavior is undefined. Use values other than 0x0 only if setting USB_OTG_HS_AHB_MODE to 0x1.

USB4_HS_USB_OTG_HS_AHB_BURST

Bits	Name	Description
31:3	RESERVED_BITS31_3	Should be set to zero.
2:0	AHB_BURST	AMBA AHB BURST. This is a r/w field that selects the following options for the m_hburst signal of the AMBA master interface: In all cases where the unspecified length burst is allowed, singles access may also occur, this is mostly true when the transaction is not 32-bit aligned. Two consecutive single accesses should not happen. When a INCRx burst size is selected and the transfer is not multiple of the INCRx burst, the burst is decomposed in the different ways. With AHBBRST[2] = 1, the smaller bursts will be unspecified length. with AHBBRST[2] = 0, the smaller bursts will be smaller INCRx or singles. For example, lets say that it's required at a given time, to transfer 22 words of information, for the following values of AHBBRST the master sequence will be: This field after reset is set to a default value that can be configured in the file vusb_hs_cfg.vhd. The AHBBRST field is only used if the AMBA-AHB system interface has been selected. It has no effect for cores featuring BVCI interface. In the later case the read will return zeros. When this field is different from zero, the value of the fields TXBURST /RXBURST in register BURSTSIZE 160h, will be ignored by the controller. Internally the BURSTSIZE will be set to the value of the INCRx AMBA burst. Since this has a direct relation with the burst sizes you must be careful with AHB burst selected. Although the TXBURST / RXBURST are bypassed, this register can still be written / read with no effect, while the AHBBRST field is non-zero. 0x0: INCR burst of unspecified length 0x1: INCR4, non-multiple transfers of INCR4 will be decomposed into singles 0x2: INCR8, non-multiple transfers of INCR8, will be decomposed into INCR4 or singles 0x3: INCR16, non-multiple transfers of INCR16, will be decomposed into INCR8, INCR4 or singles 0x4: This value is reserved and should not be used 0x5: INCR4, non-multiple transfers of INCR4 will be decomposed into smaller unspecified length bursts 0x6: INCR8, non-multiple transfers of INCR8 will be decomposed into smaller unspecified length bursts 0x7: INCR16, non-multiple transfers of INCR16 will be decomposed into smaller unspecified length bursts 0x5: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+ INCR unspec. length 0x6: INCR8+INCR8+INCR4+ INCR unspec. length 0x7: INCR16+INCR4+ INCR unspec. length 0x1: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+SINGLE+SINGLE 0x2: INCR8+INCR8+INCR4+SINGLE+SINGLE 0x3: INCR16+INCR4+SINGLE+SINGLE

0x12530094 USB4_HS_USB_OTG_HS_XTOR_STS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_XTOR_STS register is currently a placeholder for future status bits from the AHB2AHB Transactor.

USB4_HS_USB_OTG_HS_XTOR_STS

Bits	Name	Description
31:2	RESERVED_BITS31_2	Not used currently.
1	GRANT_STOLEN	Reports whether the arbiter removed the hgrant signal prior to completing a transaction. This is currently supported in WRITES ONLY. This bit can be cleared by writing a ’1’ to the GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register. To enable this bit again, write a ’0’ to he GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register.
0	RESERVED_BIT0	Not used currently.

0x12530098 USB4_HS_USB_OTG_HS_AHB_MODE

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1

USB4_HS_USB_OTG_HS_AHB_MODE

Bits	Name	Description
31	ASYNC_BRIDGES_BYPASS	Default is ’0’. When ’0’ the asynchronous bridge on the master AHB interface is used. When ’1’, it is bypassed. The bridge on the slave AHB is always used.
30:5	RESERVED_BITS30_5	Not used currently.
4	INCR_OVERRIDE	Valid only if the Transactor is bypassed: When ’1’, all INCR bursts from the USB Core will be internally transformed into SINGLE transfers. When ’0’, if the USB Core issues an INCR burst, it will propagate to the external master AHB port.

USB4_HS_USB_OTG_HS_AHB_MODE (cont.)

Bits	Name	Description
3:2	HPROT_MODE	When ’00’ the HPROT signal out of the USB Wrapper is ’0001’, and all transactions are non-posted. When ’01’ the HPROT signal out of the USB Wrapper is ’0101’, and all transactions are posted. When ’10’ the HPROT signal out of the USB Wrapper alternates according to the context of the AHB bus access. Control structures are non-posted while data transfer is posted. When ’11’, reserved value, but currently maps to non-posted (same as ’00’).
1	GRANT_STOLEN_CLEAR	Clears the grant stolen field of the USB_OTG_HS_XTOR_STS register. To enable this bit again, write ’0’ after clearing the GRANT_STOLEN (’1’).
0	XTOR_BYPASS	When this bit is set (1), the AHB Transactor is bypassed, and the USB HS Core’s AHB Master interface is directly connected to the AHB system. In this case, the USB_OTG_HS_AHB_BURST register value will determine the bus characteristics. When this bit is reset (0), the AHB Transactor is used to connect the USB HS Core to the AHB system.

0x1253009C USB4_HS_USB_OTG_HS_GEN_CONFIG

Type: Read/write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXX0830

The USB_OTG_HS_GEN_CONFIG register is used to configure various features that have been added to the HS USB Core.

USB4_HS_USB_OTG_HS_GEN_CONFIG

Bits	Name	Description
31:16	USB_OTG_HS_HW_QVERSION	HW revision of the USB OTG HS core. This version changes with every official release of USB_OTG_HS core.
15	SYS_CLK_SW_EN	This bit is applicable only in SPS Device mode. When this bit is set then USB core always voting for USB_SYSTEM_CLK. Default value is 0 - USB core doesn’t request USB_SYSTEM_CLK when in Low Power Mode.
14	TESTMUX_SEL_4	see TESTMUX_SEL_3_0 the first 4 bits of this register.
13	USB_BAM_DISABLE	This bit disables the bam logic inside the USB and makes him work in Legacy mode.
12	DMA_HPROT_CTRL	When this bit is set Link Controller always does non-posted dQH writes.
11	ISO_FIX_EN	This bit enables fix for Isochronous bug in CI core (CR--0000135251).

USB4_HS_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
10	DSC_PE_RST_EN	This bit enables an automatic reset of Device PE State Machine on disconnection event when operating as device. This reset is a HW fix for CR-000940.
9	HOST_SIM_TIMERS_EN_SUSP	When this bit is set (1), the timers used for the USB suspend process short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB suspend process are according to the USB specification.
8	HOST_SIM_TIMERS_EN_STD	When this bit is set (1), the timers used for the USB reset on the ULPI are short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB reset on the ULPI are according to the USB specification.
7	PE_RX_BUF_PENDING_EN	This is only valid in Device Mode. Setting this bit will cause to store a Transaction Status Tag in the Pending register instead of RX Buffer if the RX Buffer is full. The Tag will move from Pending register to RX Buffer as soon as it becomes not full.
6	STREAM_RX_BYPASS_ENABLE	This is only valid in Device Mode. If SDIS bit is set (bit 4 of USB_OTG_HS_USBMODE (0x1A8)), i.e., streaming mode is disabled, setting this bit will cause the RX traffic to override the SDIS bit, and to receive in streaming mode. TX will still be in non-streaming mode.
5	ULPI_SERIAL_EN	This bit must be set to enable operation of ULPI Serial FS/LS mode. Default state is ’1’ - ULPI Serial mode is supported.
4	PE_DP_TXFIFO_IDLE_FORCE	This is only valid in Device Mode. Setting this bit to ’1’ forces the dp_tx_fifo_cmd_dev to be equal to PE_DP_TXFIFO_IDLE when Device PE state machine in REPORT_NAK state and the RX Buffer is full. This bit is used to enable fix of CR-001612. Reset value is ’1’.

USB4_HS_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
3:0	TESTMUX_SEL_3_0	With TESTMUX_SEL_4 select one of the following test buses: Value 00001 Key state machines 01101 hsic_test_bus1 01110 hsic_test_bus2 10000 dma_eng_3 dma_dev_sm_2 10001 dma_eng_4 dma_traf others zeros 0x2: dma_eng_0 dma_dev_sm_1 0x3: dma_eng_1 dma_context 0x4: dma_eng_2 dma_mem_arb 0x5: prot_eng_0 0x6: prot_eng_1 0x7: prot_eng_2 0x8: port_ctrl_0 0x9: port_ctrl_1 0xA: tx_buffer 0xB: rx_buffer 0xC: otg

0x125300A0 USB4_HS_USB_OTG_HS_GEN_CONFIG_2

Type: Read/write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0001F60

Register for the chicken bits. The USB_OTG_HS_GEN_CONFIG_2 register is used to configure various features that have been added to the HS USB Core. By default, all chicken bits are off and the fix is applicable.

USB4_HS_USB_OTG_HS_GEN_CONFIG_2

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	LINESTATE_DIFF_WAKEUP_EN	chicken bit for CR-0000155486.when this bit is set the USB enables the HW fix for Race condition between the attempt to enter LPM and USB bus reset.Default value is 1.
11	ULPI_LPM_PEND_EN	chicken bit for CR-0000153486.when this bit is set the USB enables the HW fix for Function Control and LPM race condition.Default value is 1.
10	RX_FULL_NAK_EN	chicken bit for CR-0000152878.when this bit is set the USB will respond with NAK's for Host Tokens with very slow AHB and when Streaming mode is enabled. Default value is 1.

USB4_HS_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Description
9	ENDLESS_TD_EN	chicken bit for CR-0000152976. When this bit is set Performance enhancements for 'infinite' Producer pipe (out endpoint with eTD that points to itself) are enabled. Default value is 1.
8	SCRATCH_RAM_EN	chicken bit for CR-0000149922. When this bit is set the use of scratch ram is enabled and the SW can read/write from addresses 0x040 - 0x07c. when this bit is clear SW can no longer access those registers. Default value is 1.
7	SESS_VLD_CTRL_EN	When this bit is set then bit 25 of USBCMD register controls sess_vld signal inside the Link Controller. When this bit is clear then Link Controller receives sess_vld directly from PHY. Default value is 0.
6	CI_T_WTSUSRSTHS_EN	When this bit is 0 then Device Port Control State Machine waits 2.5 us from USB Reset detection until starting driving Chirp K. When this bit is 1 then Device Port Control State Machine waits 1.5 ms from USB Reset detection until starting driving Chirp K. Default value is 1 - legacy behavior.
5	CI_T_UCH_EN	When this bit is 0 then Device Port Control State Machine drives Chirp K for 1 ms. When this bit is 1 then Device Port Control State Machine drives Chirp K for 2ms. Default value is 1 - legacy behavior.
4	DP_RESET	chicken bit for fix CI2687: When the OTG core is acting as a Host, and VBUS is turned off, and the attached Device attempts to perform a Session Request Protocol by using Data-line Pulsing, it will not be recognized by the Host. Also, when doing HNP and becoming a Host, a SE0 is forced in the line causing the OPT TD5.4 test to fail, without the software workaround.
3	ZLP_PRIME	chicken bit for fix CI2655: When using ISO IN endpoints with MULT=3 and low bandwidth system bus access, the controller may enter into a wait loop situation without warning the software. Due to the low bandwidth the last packet from a mult3 sequence may not be fetched in time before the last token IN is received (for that uframe/endpoint). This will cause the controller to reply with a zero length packet (ZLP), breaking the prime sequence.
2	NO_SOF_RX_FIFO_FULL	chicken bit for fix CI2581: During normal operation, if the RX Fifo becomes full and the protocol engine needs to send a command to the DMA state machine, it will wait in that state until the RX Fifo becomes not full. As the protocol state machine also handles the SOF generation, the SOFs will no longer be sent. If one SOF is missed, the Host controller will issue a false babble detection. If more than 3.125ms are elapsed without SOFs the peripheral will recognize the idle bus as a USB reset.
1	WRONG_OPMODE_SUSP	chicken bit for fix CI1274: When the Controller enters a Suspend state it asserts opmode with the wrong value, according to specifications 'UTMI+ Specification, Revision 1.0, Section 3.2' and 'UTMI+ Low Pin Interface Specification, Revision 1.1, Section 3.8.5.3'. This causes no issue in actual usage.

USB4_HS_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Description
0	RESUME_END_INTER	chicken bit for fix CI1179: Working as host, when doing resume a port change interrupt was fired at the end of resume. According to the EHCI spec no interrupt should be fired.

20.33.4 Device/host capability registers

0x12530100 USB4_HS_USB_OTG_HS_CAPLENGTH

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x01000040

The USB_OTG_HS_CAPLENGTH register is the capability register length. It is used to indicate which offset to add to the register base address at the beginning of the operational register.

USB4_HS_USB_OTG_HS_CAPLENGTH

Bits	Name	Description
31:16	HCIVERSION_15_0	BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision.
7:0	CAPLENGTH_7_0	Offset at beginning of operational register

0x12530104 USB4_HS_USB_OTG_HS_HCSPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00010011

The USB_OTG_HS_HCSPARAMS register contains the host control structural parameters. The port steering logic capabilities are described in this register.

USB4_HS_USB_OTG_HS_HCSPARAMS

Bits	Name	Description
31:28	RESERVED_BITS31_28	Clear (0) these bits.
27:24	N_TT_3_0	Number of transaction translators This field indicates the number of embedded transaction translators associated with the USB2.0 host controller. For a multi-port host, this field will always equal 0001. For all other implementations, N_TT = 0000. This in a non-EHCI field to support embedded TT.

USB4_HS_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
23:20	N_PTT_3_0	Number of ports per transaction translator This field indicates the number of ports assigned to each transaction translator within the USB2.0 host controller. For a multi-port host this field will always equal N_PORTS. For all other implementations, N_PTT = 0000. This in a non-EHCI field to support embedded TT.
19:17	RESERVED_BITS19_17	Clear (0) these bits.
16	PI_3_0	Port indicator This bit indicates whether the ports support port indicator control. When set (1), the port status and control registers include a read/writable field for controlling the state of the port indicator. This field will always be set (1).
15:12	N_CC_3_0	Number of companion controllers This field indicates the number of companion controllers associated with this USB2.0 host controller. A zero in this field indicates there are no internal companion controllers. Port-ownership hand-off is not supported. A value larger than zero in this field indicates that there are companion USB1.1 host controller(s). Port-ownership hand-offs are supported. High-, full-, and low-speed devices are supported on the host controller root ports. In this implementation, this field will always be clear (0).
11:8	N_PCC_3_0	Number of ports per companion controller This field indicates the number of ports supported per internal companion controller. It is used to indicate the port routing configuration to the system software. For example, if N_PORTS has a value of 6 and N_CC has a value of 2, then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller 1, the next N_PCC ports to companion controller 2, and so on. In the previous example, the N_PCC could have been 4, where the first 4 are routed to companion controller 1 and the last two are routed to companion controller 2. The number in this field must be consistent with N_PORTS and N_CC. In this implementation, this field will always be clear (0).
7:5	RESERVED_BITS7_5	Clear (0) these bits.
4	PPC	Port power control This field indicates whether the host controller implementation includes port power control. Set (1) indicates that the ports have port power switches. Clear (0) indicates that the ports do not have port power switches. The value of this field affects the functionality of the port power field in each port status and control register. This bit will always be clear (0) for a device only implementation.

USB4_HS_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
3:0	N_PORTS_3_0	Number of downstream ports This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the operational register. Valid values are in the range of 1h to Fh. A zero in this field is undefined. The number of ports for a host implementation is configurable from 1 to 8. This field will always be set (1) for device-only implementation.

0x12530108 USB4_HS_USB_OTG_HS_HCCPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0006

The USB_OTG_HS_HCCPARAMS register contains the host control capability parameters. This register identifies multiple mode control (time-base bit functionality) addressing capability.

USB4_HS_USB_OTG_HS_HCCPARAMS

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15:8	EECP_7_0	EHCI extended capabilities pointer Default = 0 This optional field indicates the existence of a capabilities list. A value of 00h indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in PCI configuration space of the first EHCI extended capability. The pointer value must be 40h or greater if implemented to maintain the consistency of the PCI header defined for this class of device. For this implementation, all of these bits are clear (0).
7:4	IST_7_4	Isochronous scheduling threshold Default = implementation dependent This field indicates, relative to the current position of the executing host controller, where the software can reliably update the isochronous schedule. When bit [7] is clear (0), the value of the least significant 3 bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set (1), then host software assumes the host controller may cache an isochronous data structure for an entire frame. All of the bits in this field will always be clear (0).
3	RESERVED_BIT3	Clear (0) this bit.

USB4_HS_USB_OTG_HS_HCCPARAMS (cont.)

Bits	Name	Description
2	ASP	Asynchronous schedule park capability Default = 1 If this bit is set (1), then the host controller supports the park feature for high-speed queue heads in the asynchronous schedule. The feature can be disabled, or enabled and set to a specific level by using the (ASPE) and (ASP[1:0]) fields in the USB_OTG_HS_USBCMD register. This field will always be set (1).
1	PFL	Programmable frame list flag If this bit is clear (0), then the system software must use a frame list length of 1024 elements with this host controller. The FS[2:0] field in the USBCMD register is read-only and must be cleared (0). If this bit is set (1), then the system software can specify and use a smaller frame list, and configure the host controller using the FS[2:0] field in the USBCMD register. The frame list must always be aligned on a 4k-page boundary. This requirement ensures that the frame list is always physically contiguous. This bit in this field will always be set (1).
0	ADC	64-bit addressing capability This field will always be clear (0). No 64-bit addressing capability is supported.

0x12530120 USB4_HS_USB_OTG_HS_DCIVERSION

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1

The USB_OTG_HS_DCIVERSION register contains the device interface version number. The device controller interface conforms to the two-byte BCD encoding of the interface version number contained in this register.

USB4_HS_USB_OTG_HS_DCIVERSION

Bits	Name	Description
15:0	DCIVERSION_15_0	Device interface version number

0x12530124 USB4_HS_USB_OTG_HS_DCCPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x190

The USB_OTG_HS_DCCPARAMS register contains the device control capability parameters. These fields describe the overall host/device capability of the controller.

USB4_HS_USB_OTG_HS_DCCPARAMS

Bits	Name	Description
31:9	RESERVED_BITS31_9	Clear (0) these bits.
8	HC	Host capable When this bit is set (1), this controller is capable of operating as an EHCI-compatible USB 2.0 host controller.
7	DC	Device capable When this bit is set (1), this controller is capable of operating as a USB 2.0 device.
6:5	RESERVED_BITS6_5	Clear (0) these bits.
4:0	DEN_4_0	Device endpoint number This field indicates the number of endpoints build into the device controller. If this controller is not device capable, then this field will be al zeroes. Valid values for this field are 0 through 16.

20.33.5 Device/host operational registers

0x12530140 USB4_HS_USB_OTG_HS_USBCMD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00080000

The USB_OTG_HS_USBCMD register is the USB command register. The serial bus host/device controller executes the command indicated in this register.

USB4_HS_USB_OTG_HS_USBCMD

Bits	Name	Description
31	RST_CTRL	Default value = 0. Set to 1 to block operational reset to xcvr (ser and ulpi) clock domains.
30	ULPI_STP_CTRL	Default value = 0. Set to 1 to block the ulpi_stp signal from going out to ULPI PHY
29	ASYNC_INTR_CTRL	Default value = 0. Set to 1 to allow the async interrupt out from the HS core.
28	SE0_GLITCH_FIX_CTRL	Default value = 0. Set to 1 to activate the SE0 glitch fix mechanism
27	FS_3_WIRE_2_WIRE_SELECT	Default value = 0. Set this bit for enabling the two wire interface on the fs_dat and fs_se0 pins

USB4_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
26	ULPI_SER3_NOT6_SEL	ULPI serial 3 bits select. Read/write Read: Current status of serial data bus wide Write: SW writes ’1’ to this bit to request 3 pins ULPI data wide, or ’0’ to request 6 bit data wide in FsLsSerial Mode.
25	SESS_VLD_CTRL	Default value = 0. Set this bit to enable Link Controller operation after switching interface from Serial to ULPI.
24	RESERVED_BIT24	Clear (0) these bit
23:16	ITC_7_0	Interrupt threshold control Read/write Default 08h The system software uses this field to set the maximum rate at which the host/device controller will issue interrupts. This field contains the maximum interrupt interval measured in micro-frames. Valid values are shown below. Value Maximum interrupt interval 00h Immediate (no threshold) 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames 10h 16 micro-frames 20h 32 micro-frames 40h 64 micro-frames
15	FS2	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.

USB4_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
14	ATDTW	Add dTD tripwire Read/write (Device mode only) This bit is used as a semaphore to ensure the to proper addition of a new dTD to an active (primed) endpoint's linked list. This bit is set (1) and cleared (0) by the software. This bit shall also be cleared (0) by the hardware when the state machine is a hazard region for which adding a dTD to a primed endpoint may go unrecognized.
13	SUTW	Setup tripwire (device mode only) Read/write This bit is used as a semaphore to ensure that the setup data payload of 8 bytes is extracted from a QH by the DCD without being corrupted. If the setup lockout mode is off (see USBMODE) then there exists a hazard when new setup data arrives while the DCD is copying the setup data payload from the QH for a previous setup packet. This bit is set (1) and cleared (0) by software, and will be cleared (0) by hardware when a hazard exists.
12	RESERVED_BITS12	Clear (0) this bit
11	ASPE	Asynchronous schedule park mode enable (OPTIONAL) Read/write If the asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this bit defaults to a 1h and is R/W. Otherwise, the bit must be cleared (0) and is RO. The software uses this bit to enable or disable the park mode. value 1 = Park mode is enabled. value 0 = Park mode is disabled. This field is set (1) in this implementation.
10	RESERVED_BIT10	Clear (0) this bit.
9:8	ASP_1_0	Asynchronous schedule park mode count (OPTIONAL) Read/write If the Asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this field defaults to 3h and is R/W. Otherwise it defaults to zero and is RO. This field contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the asynchronous schedule before continuing traversal of the Asynchronous schedule. See Section 4.10.3.2 for full operational details. Valid values are 1h to 3h. The software must not clear (0) this bit when the ASPE bit in this register is set (1), as this will result in undefined behavior. This field is set to 3h in this implementation.
7	LR	Light host/device controller reset (OPTIONAL) Read only Not implemented. This bit will always be clear (0).

USB4_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
6	IAA	Interrupt on async advance doorbell Read/write This bit is used as a doorbell by the software to tell the host controller to issue an interrupt the next time it advances the asynchronous schedule. The software must set (1) this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule states, it sets (1) the interrupt on the async advance status (AAI) bit in the USBSTS register. If the interrupt on async advance enable (AAE) bit in the USBINTR register is set (1), then the host controller will assert an interrupt at the next interrupt threshold. The host controller clears (0) this bit after it has set (1) the interrupt on async advance status (AAI) bit in the USBSTS register. The software should not set (1) this bit when the asynchronous schedule is inactive. Doing so will yield undefined results. This bit is only used in the host mode. Setting (1) this bit when the device mode is selected will produce undefined results.
5	ASE	Asynchronous Schedule Enable Read/write Default = 0b This bit controls whether the host controller skips processing the asynchronous schedule. value 0 = Do not process the asynchronous schedule value 1 = Use the ASYNCLISTADDR register to access the asynchronous schedule. Only the host controller uses this bit.
4	PSE	Periodic schedule enable Read/write Default 0b This bit controls whether the host controller skips processing the periodic schedule. value 0 = Do not process the periodic schedule value 1 = Use the PERIODICLISTBASE register to access the periodic schedule. Only the host controller uses this bit.

USB4_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
3:2	FS_1_0	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.
1	RST	Controller reset (RESET) Read/write The software uses this bit to reset the controller. This bit is cleared (0) by the host/device controller when the reset process is complete. The software cannot terminate the reset process early by clearing (0) this bit. Host controller: When the software sets (1) this bit, the host controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Any transaction currently in progress on the USB is immediately terminated. A USB reset is not driven on downstream ports. The software should not set (1) this bit when the HCHalted bit in the USBSTS register is clear (0). Attempting to reset an actively running host controller will result in undefined behavior. Device controller: When the software sets (1) this bit, the device controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Setting this bit when the device is in the attached state is not recommended, since the effect on an attached host is undefined. In order to ensure that the device is not in an attached state before initiating a device controller reset, all primed endpoints should be flushed and the USBCMD run/stop bit should be cleared (0).

USB4_HS_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
0	RS	Run/stop Read/Write Default 0b value 1 = Run value 0 = Stop Host controller: When this bit is set (1), the host controller proceeds with the execution of the schedule. The host controller continues execution as long as this bit remains set (1). When this bit is clear (0), the host controller completes the current transaction on the USB and then halts. The HC halted bit in the status register indicates when the host controller has finished the transaction and has entered the stopped state. The software should not set (1) this bit unless the host controller is in the halted state (that is, the HCHalted bit in the USBSTS register is set (1)). Device controller: Setting (1) this bit will cause the device controller to enable a pull-up on D+ and initiate an attach event. This control bit is not directly connected to the pull-up enable, as the pull-up will become disabled upon transitioning into high-speed mode. The software should use this bit to prevent an attach event before the device controller has been properly initialized. Clearing (0) this bit will cause a detach event.

0x12530144 USB4_HS_USB_OTG_HS_USBSTS

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_USBSTS register is the USB status register. This register indicates various states of the host/device controller and any pending interrupts. This register does not indicate status resulting from a transaction on the serial bus. The software clears certain bits in this register by setting (1) them.

USB4_HS_USB_OTG_HS_USBSTS

Bits	Name	Description
31	ULPI_INTR	Default value = 0.This bit is set when Interrupt during ULPI -Serial mode or ULPI Interrupt during LPM occurs. Writing a 1 to this bit will clear it.
30	PHY_SESS_VLD_CHG	This bit is set when PHY_SESS_VLD bit changes its value.
29	PHY_SESS_VLD	This bit presents the SESS_VLD status of PHY.

USB4_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
28	PHY_ALT_INT	This bit is asserted when a non-USB interrupt from PHY is detected. This interrupt is used for procedures like Battery Charging. This bit is set when bit 7 (alt_int) of RX CMD is high. Writing a 1 to this bit will clear it.
27:26	RESERVED_BITS27_26	Clear (0) these bits.
25	TI1	General purpose timer interrupt 1 (GPTINT1) Read/write control This bit is set (1) when the counter in the GPTIMER1CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
24	TI0	General purpose timer interrupt 0 (GPTINT0) Read/write control This bit is set (1) when the counter in the GPTIMER0CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPI	USB host periodic interrupt (USBHSTPERINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set (1) and the TD was from the periodic schedule. This bit is also set (1) by the host controller when a short packet is detected AND the packet is on the periodic schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
18	UAI	USB host asynchronous interrupt (USBHSTASYNCINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set AND the TD was from the asynchronous schedule. This bit is also set (1) by the host when a short packet is detected AND the packet is on the asynchronous schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
17	RESERVED_BIT17	Clear (0) these bits.
16	NAKI	NAK interrupt bit Read only This bit is set (1) by the hardware when, for a particular endpoint, both the Tx/Rx endpoint NAK bit and the corresponding Tx/Rx endpoint NAK enable bit are set (1). This bit is automatically cleared (0) by the hardware when all of the enabled Tx/Rx endpoint NAK bits are cleared (0).

USB4_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
15	AS	Asynchronous schedule status Read only Default = 0 This bit reports the current real status of the asynchronous schedule. When cleared (0), the asynchronous schedule status is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the asynchronous schedule when software transitions the asynchronous schedule enable bit in the USBCMD register. When this bit and the asynchronous schedule enable bit are the same value, the asynchronous schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
14	PS	Periodic schedule status Read only Default = 0 This bit reports the current real status of the periodic schedule. When cleared (0), the periodic schedule is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the periodic schedule when software transitions the periodic schedule enable bit in the USBCMD register. When this bit and the periodic schedule enable bit are the same value, the periodic schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
13	RCL	Reclamation Read only Default = 0 This is a read-only status bit that is used to detect an empty asynchronous schedule. This bit is only used by the host controller.
12	HCH	HC halted Read only Default = 1 This bit is a clear (0) whenever the run/stop bit is set (1). The host controller sets (1) this bit after it has stopped executing, because of the run/stop bit being cleared (0), either by the software or by the host controller hardware (for example, an internal error). This bit is only used by the host controller.
11	RESERVED_BIT11	Clear (0) this bit.
10	ULPII	ULPI interrupt Read/write control Default = 0 When the ULPI viewport is present in the design, an event completion will set (1) this interrupt. This bit is used by both the host and device controllers. It is only present in designs where the configuration constant VUSB_HS_PHY_ULPI = 1.

USB4_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
9	RESERVED_BIT9	Clear (0) this bit.
8	SLI	DC suspend Read/write control Default = 0 When a device controller enters a suspend state from an active state, this bit will be set (1). The device controller clears (0) the bit upon exiting from a suspend state. This bit is only used by the device controller.
7	SRI	SOF received Read/write control Default = 0 When the device controller detects a start of (micro) frame, this bit will be set (1). When a SOF is extremely late, the device controller will automatically set (1) this bit to indicate that an SOF was expected. Therefore, this bit will be set (1) roughly every 1 ms in the device FS mode and every 125 ms in the HS mode, and will be synchronized to the actual SOF that is received. Since the device controller is initialized to FS before connect, this bit will be set (1) at an interval of 1 ms during the prelude to connect and chirp. In the host mode, this bit will be set (1) every 125 us and can be used by the host controller driver as a time base. The software writes a 1 to this bit to clear it. This is a non-EHCI status bit.
6	URI	USB reset received Read/write control Default = 0 When the device controller detects a USB reset and enters the default state, this bit will be set (1). The software can set (1) this bit to clear the USB reset received status bit. This bit is only used by the device controller.
5	AAI	Interrupt on async advance Read/write control Default = 0 The system software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by setting (1) the interrupt on async advance doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source. This bit is only used by the host controller.
4	SEI	System error Read/write control This interrupt is triggered when there is an AHB error (HRESP = ERROR) on the AHB Master interface.

USB4_HS_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
3	FRI	Frame list rollover Read/write control The host controller sets (1) this bit when the frame list index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the frame list size field of the USBCMD register) is 1024, the frame index register rolls over every time FRINDEX [1 3] toggles. Similarly, if the size is 512, the host controller sets (1) this bit to a one every time FHINDEX [12] toggles. This bit is only used by the host controller.
2	PCI	Port change detect Read/write control The host controller sets (1) this bit when a connect status occurs on any port, a port enable/disable change occurs on any port, or the force port resume bit is set (1) as the result of a J-K transition on the suspended port. The device controller sets (1) this bit when the port controller enters the full or high-speed operational state. When the port controller exits the full or high-speed operation states due to reset or suspend events, the notification mechanisms are the USB reset received bit and the DC suspend bits, respectively. This bit is not EHCI compatible.
1	UEI	USB error interrupt (USBERRINT) Read/write control When completion of a USB transaction results in an error condition, this bit is set (1) by the host/device controller. This bit is set (1) along with the USBINT bit, if the TD on which the error interrupt occurred also had its interrupt-on-complete (IOC) bit set (1). The device controller detects resume signaling only.
0	UI	USB interrupt (USBINT) Read/write control This bit is set (1) by the host/device controller when the cause of an interrupt is a completion of a USB transaction where the transfer descriptor (TD) has an interrupt-on-complete (IOC) bit set (1). This bit is also set (1) by the host/device controller when a short packet is detected. A short packet is when the actual number of bytes received was less than the expected number of bytes.

0x12530148

USB4_HS_USB_OTG_HS_USBINTR

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_USBINTR register is the USB interrupt enable register. The interrupts to the software are enabled with this register. An interrupt is generated when a bit is set (1) and the corresponding interrupt is active. The USB status register (USBSTS) still shows interrupt sources, even if they are disabled by the USBINTR register, which allows polling of interrupt events by the software.

USB4_HS_USB_OTG_HS_USBINTR

Bits	Name	Description
31	ULPI_INTR_EN	Default value =0.When this bit is a 1 and ULPI_INTR is a 1, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the ULPI_INTR bit.
30	PHY_SESS_VLD_CHG_EN	Default value =0. When this bit is set then Link Controller will issue an interrupt when PHY_SESS_VLD changes its value.
29:26	RESERVED_BITS29_26	Clear (0) these bits.
25	TIE1	General purpose timer interrupt enable 1 When this bit is set (1), and the GPTINT1 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT1 bit.
24	TIE0	General purpose timer interrupt enable 0 When this bit is set (1), and the GPTINT0 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT0 bit.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPIE	USB host periodic interrupt enable When this bit is set (1), and the USBHSTPERINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTPERINT bit.
18	UAIE	USB host asynchronous interrupt enable When this bit is set (1), and the USBHSTASYNCINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTASYNCINT bit.
17	RESERVED_BIT17	Clear (0) this bit.

USB4_HS_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
16	NAKE	NAK interrupt enable This bit is set (1) by the software if it wants to enable the hardware interrupt for the NAK interrupt bit. If both this bit and the corresponding NAK interrupt bit are set (1), a hardware interrupt is generated.
15:11	RESERVED_BITS15_11	Clear (0) these bits.
10	ULPIE	ULPI enable When this bit is set (1), and the ULPI Interrupt bit in the USBSTS register transitions, the controller will issue and interrupt. The interrupt is acknowledged by the software setting (1) the ULPI interrupt bit. This bit is used by both the host and device controllers. It is only present in designs where configuration constant VUSB_HS_PHY_ULPI = 1.
9	RESERVED_BIT9	Clear (0) this bit.
8	SLE	Sleep enable When this bit is set (1) and the DC suspend bit in the USBSTS register transitions, the device controller will issue an interrupt. The interrupt is acknowledged by the software setting (1) the DC suspend bit. This bit is only used by the device controller.
7	SRE	SOF received enable When this bit is set (1) and the SOF received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the SOF received bit.
6	URE	USB reset enable When this bit is set (1) and the USB reset received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the USB reset received bit.
5	AAE	Interrupt on async advance enable When this bit is set (1) and the interrupt on async advance bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the interrupt on async advance bit. This bit is only used by the host controller.
4	SEE	System error enable When this bit is set (1) and the system error bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the system error bit.

USB4_HS_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
3	FRE	Frame list rollover enable When this bit is set (1) and the frame list rollover bit in the USBSTS register is set (1), the host controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the frame list rollover bit. This bit is only used by the host controller.
2	PCE	Port change detect enable When this bit is set (1) and the port change detect bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the port change detect bit.
1	UEE	USB error interrupt enable When this bit is set (1) and the USBERRINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBERRINT bit in the USBSTS register.
0	UE	USB interrupt enable When this bit is set (1) and the USBINT bit in the USBSTS register is set (1), the host/device controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBINT bit.

0x1253014C USB4_HS_USB_OTG_HS_FRINDEX

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_FRINDEX register is the USB frame index register. This register is used by the host controller to index the periodic frame list. The register updates every 125 microseconds (once each micro-frame). Bits [N:3] are used to select a particular entry in the periodic frame list during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by the system software in the frame list size field in the USBCMD register.

This register must be written as a DWord. Byte writes produce-undefined results. This register cannot be written unless the host controller is in the 'halted' state, as indicated by the HC halted bit. A write to this register while the run/stop bit is set (1) produces undefined results. Writes to this register also affect the SOF value.

In the device mode, this register is read-only and the device controller updates the FRINDEX [13:3] register from the frame number indicated by the SOF marker. Whenever a SOF is received by the USB bus, FRINDEX [13:3] will be checked against the SOF marker. If FRINDEX [13:3] is different from the SOF marker, FRINDEX [13:3] will be set to the SOF value and FRINDEX [2:0] will be cleared (0) (that is, SOF for a 1-ms frame). If FRINDEX [13:3] is equal to the SOF value, FRINDEX [2:0] will be incremented (that is, SOF for 125-ms micro-frame.

USB4_HS_USB_OTG_HS_FRINDEX

Bits	Name	Description
31:14	RESERVED_BITS31_14	Clear (0) these bits.
13:0	FRINDEX_13_0	Frame index The value in this register increments at the end of each time frame (for example, a micro-frame). Bits [N:3] are used for the frame list current index. This means that each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following data shows the values of N based on the value of the frame list size field in the USBCMD register when used in host mode. USBCMD [Frame list size] number Elements N 000b (1024) 12 001b (512) 11 010b (256) 10 011b (128) 9 100b (64) 8 101b (32) 7 110b (16) 6 111b (8) 5 In the device mode, the value is the current frame number of the last frame transmitted. It is not used as an index. In either mode, bits 2:0 indicate the current microframe.

0x12530154 USB4_HS_USB_OTG_HS_PERIODICLISTBASE

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_PERIODICLISTBASE register is the periodic list base address register. This 32-bit register contains the beginning address of the periodic frame list in the system memory. The HCD loads this register prior to starting the schedule execution by the host controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the frame index register (FRINDEX) to enable the host controller to step through the periodic frame list in sequence.

NOTE This device is shared between the host controller and device controller operation. For host controller operation, this is the USB_OTG_HS_ PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

USB4_HS_USB_OTG_HS_PERIODICLISTBASE

Bits	Name	Description
31:12	PERBASE_31_12	Base address (low) These bits correspond to memory address signals [31:12], respectively. Only used by the host controller.
11:0	RESERVED_BITS11_0	This field must be written as zeros. During runtime, the values of these bits are undefined.

0x12530154 USB4_HS_USB_OTG_HS_DEVICEADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_DEVICEADDR register is the USB device address register. The upper seven bits of this register represent the device address. After any controller reset or a USB reset, the device address is set to the default address (0). The default address will match all incoming addresses. The software shall reprogram the address after receiving a SET_ADDRESS descriptor.

The USBADRA is used to accelerate the SET_ADDRESS sequence by allowing the DCD to preset the USBADR register before the status phase of the SET_ADDRESS descriptor.

NOTE This device is shared between the host controller and device controller operations. For host controller operation, this is the USB_OTG_HS_ PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

USB4_HS_USB_OTG_HS_DEVICEADDR

Bits	Name	Description
31:25	USBADR_31_25	Device address These bits correspond to the USB device address.

USB4_HS_USB_OTG_HS_DEVICEADDR (cont.)

Bits	Name	Description
24	USBADRA	Device address advance Default = 0 When this bit is clear (0), any writes to USBADR are instantaneous. When this bit is set (1) at the same time or before USBADR is written, the write to the USBADR field is staged and held in a hidden register. After an IN occurs on endpoint 0 and is ACKed, USBADR will be loaded from the holding register. The hardware will automatically clear (0) this bit on the following conditions: 1. IN is ACKed to endpoint 0 (USBADR is updated from staging register). 2. OUT/SETUP occur to endpoint 0 (USBADR is not updated). 3. Device reset occurs (USBADR is reset to 0). Note: After the status phase of the SET_ADDRESS descriptor, the DCD has 2 ms to program the USBADR field. This mechanism will ensure this specification is met when the DCD can not write of the device address within 2 ms from the SET_ADDRESS status phase. If the DCD writes the USBADR with USBADRA = 1 after the SET_ADDRESS data phase (before the prime of the status phase), the USBADR will be programmed instantly at the correct time and meet the 2-ms USB requirement.
23:0	RESERVED_BITS23_0	These bits must be written as zeros. During runtime, the values of these bits are undefined.

0x12530158 USB4_HS_USB_OTG_HS_ASYNCLISTADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ASYNCLISTADDR register is the next asynchronous list address register. This 32-bit register contains the address of the next asynchronous queue head to be executed by the host. Bits [4:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

USB4_HS_USB_OTG_HS_ASYNCLISTADDR

Bits	Name	Description
31:5	ASYBASE_31_15	Link pointer low (LPL). These bits correspond to memory address signals [31:5], respectively. This field may only reference a queue head (OH). This field is only used by the host controller.
4:0	RESERVED_BITS4_0	The values of these bits has no effect on circuit operation.

0x12530158 USB4_HS_USB_OTG_HS_ENDPOINTLISTADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPOINTLISTADDR register is the endpointlist address register. In the device mode, this register contains the address of the top of the endpoint list in system memory. Bits [10:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

USB4_HS_USB_OTG_HS_ENDPOINTLISTADDR

Bits	Name	Description
31:11	EPBASE_31_11	Endpoint list pointer (low) These bits correspond to memory address signals [31:11], respectively. This field will reference a list of up to 32 queue heads (QH). That is, one queue head per endpoint & direction.
10:0	RESERVED_BITS10_0	The values of these bits has no effect on circuit operation.

0x1253015C USB4_HS_USB_OTG_HS_TTCTRL

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_TTCTRL register is the TT status and control register. This register contains parameters needed for internal TT operations.

NOTE This register is not used in the device controller operation.

USB4_HS_USB_OTG_HS_TTCTRL

Bits	Name	Description
31	RESERVED_BIT31	Not used.
30:24	TTHA	Not used.
23:0	RESERVED_BITS23_0	Not used.

0x12530160 USB4_HS_USB_OTG_HS_BURSTSIZE

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1010

The USB_OTG_HS_BURSTSIZE register is the programmable burst size register. This register is used to control dynamically change the burst size used during data movement on the initiator (master) interface.

USB4_HS_USB_OTG_HS_BURSTSIZE

Bits	Name	Description
31:16	RESERVED_BITS31_16	The value of these bits has no effect on circuit operation.
15:8	TXPBURST	Programmable Tx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from system memory to the USB bus.
7:0	RXPBURST	Programmable Rx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from the USB bus to system memory.

0x12530164 USB4_HS_USB_OTG_HS_TXFILLTUNING

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_TXFILLTUNING register is the host transmit pre-buffer packet tuning register. The fields in this register control performance tuning associated with how the host controller posts data to the Tx latency FIFO before moving the data onto the USB bus. The specific areas of performance include the how much data to post into the FIFO and an estimate for how long that operation should take in the target system.

Definitions:

T0 = Standard packet overhead

T1 = Time to send data payload

Tff = Time to fetch packet into TX FIFO up to specified level.

Ts = Total packet flight time (send-only) packet

Ts = T0 + T1

Tp = Total packet time (fetch and send) packet

Tp = Tff + T0 + T1

Upon discovery of a transmit (OUT/SETUP) packet in the data structures, the host controller checks to ensure Tp remains before the end of the [micro] frame. If so it proceeds to pre-fill the TX FIFO. If at anytime during the pre-fill operation the time remaining the [micro] frame is < Ts, then the packet attempt ceases and the packet is tried at a later time. Although this is not an error condition and the host controller will eventually recover, a mark will be made the scheduler health counter to note the occurrence of a ’back-off’ event. When a back-off event is detected, the partial packet fetched may need to be discarded from the latency buffer to make room for periodic traffic that will begin after the next SOF. Too many back-off events can waste bandwidth and power on the system bus, and thus should be minimized (not necessarily eliminated). Back-offs can be minimized with use of the TSCHHEALTH (Tff), as described in the register table.

USB4_HS_USB_OTG_HS_TXFILLTUNING

Bits	Name	Description
31:22	RESERVED_BITS31_22	The value of these bits has no effect on circuit operation.
21:16	TXFIFOTHRES	FIFO burst threshold Default = 2 This register controls the number of data bursts that are posted to the TX latency FIFO in the host mode before the packet begins on to the bus. The minimum value is 2 and this value should be a low as possible to maximize USB performance. A higher value can be used in systems with unpredictable latency and/or insufficient bandwidth, where the FIFO may underrun because the data transferred from the latency FIFO to USB occurs before it can be replenished from system memory. This value is ignored if the stream disable bit in USBMODE register is set (1).
15:13	RESERVED_BITS15_13	The value of these bits has no effect on circuit operation.

USB4_HS_USB_OTG_HS_TXFILLTUNING (cont.)

Bits	Name	Description
12:8	TXSCHHEALTH	Scheduler health counter Read/write to clear Default = 0 This register increments when the host controller fails to fill the Tx latency FIFO to the level programmed by TXFIFOTHRES before running out of time to send the packet before the next start-of-frame. This health counter measures the number of times this occurs to provide feedback to selecting a proper TXSCHOH. Writing to this register will clear the counter and this counter will be at a maximum at 31.
7:0	TXSCHOH	Scheduler overhead Default = 0 This register adds an additional fixed offset to the schedule time estimator described above as Tff. As an approximation, the value chosen for this register should limit the number of back-off events captured in the TXSCHHEALTH to less than 10 per second in a highly-utilized bus. Choosing a value that is too high for this register is not desired, as it can needlessly reduce USB utilization. The time unit represented in this register is 1.267 ms when a device is connected in the high-speed mode for OTG and SPH. The time unit represented in this register is 6.333 ms when a device is connected in the low/full speed mode for OTG and SPH. The time unit represented in this register is always 1.267 times the MPH product.

0x12530170 USB4_HS_USB_OTG_HS_ULPI_VIEWPORT

Type: Read/write (unless otherwise indicated)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x08000000

The USB_OTG_HS_ULPI_VIEWPORT register provides indirect access to the ULPI PHY register set. Although the core performs access to the ULPI PHY register set, there may be extraordinary circumstances where software may need direct access.

CAUTION Writes to the ULPI through the viewport can substantially harm standard USB operations. Currently, no usage model has been defined where the software should need to execute writes directly to the ULPI - see the exception regarding optional features below.

Executing read operations though the ULPI viewport should have no harmful side effects to standard USB operations.

NOTE The ULPI viewport is only synthesized in the design if the constant VUSB_HS_PHY_ULPI is set (1). If the ULPI interface is not enabled, this register will always read zeros.

Two operations can be performed with the ULPI viewport: wake-up and read/write operations. The wake-up operation is used to put the ULPI interface into normal operation mode and re-enable the clock, if necessary. A wake-up operation is required before accessing the registers when the ULPI interface is operating in the low power mode, serial mode, or car kit mode.

The ULPI state can be determined by reading the sync state bit (ULPISS). If this bit is set (1), then the ULPI interface is running in the normal operation mode and can accept read/write operations. If the ULPISS is clear (0), then read/write operations will not be able to execute. Undefined behavior will result if ULPISS = 0, and a read or write operation is performed.

To execute a wake-up operation, write all 32-bits of the ULPI Viewport where ULPIPORT is constructed appropriately, and the ULPIWU bit is set (1) and the ULPIRUN bit is clear (0). Poll the ULPI viewport until ULPIWU is zero for the operation to complete.

To execute a read or write operation, write all 32-bits of the ULPI viewport where ULPIDATWR, ULPIADDR, ULPIPORT, and ULPIRW are constructed appropriately, and the ULPIRUN bit is set (1). Poll the ULPI viewport until ULPIRUN is zero for the operation to complete. Once ULPIRUN is zero, the ULPIDATRD will be valid if the operation was a read.

The polling method above could also be replaced and an interrupt driven using the ULPI interrupt defined in the USBTS and USBINTR registers. When a wake-up or read/write operation completes, the ULPI interrupt will be set (1).

Several optional features may need to be enabled or disabled by the system software as part of system configuration. These bits are contained in the interface and OTG control registers of the ULPI PHY register set. These registers also contain bits that are controlled by the link dynamically and, therefore, should only be modified by the system software using the set/clear access method. Direct writes to these registers could have harmful side effects to the standard USB operations. The following bits are optional bits:

- Bits 3 through 7 in the interface control register
- Bits 6 and 7 in the OTG control register.

Refer to the ULPI Specification Revision 1.1 for further information on the use of the optional features.

USB4_HS_USB_OTG_HS_ULPI_VIEWPORT

Bits	Name	Description
31	ULPIWU	ULPI wake-up Setting (1) this bit begins the wake-up operation. The bit will automatically transition to 0 after the wake-up is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wake-up and a read/write operation at the same time.
30	ULPIRUN	ULPI read/write run Setting (1) this bit will begin the read/write operation. The bit will automatically transition to 0 after the read/write is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time.

USB4_HS_USB_OTG_HS_ULPI_VIEWPORT (cont.)

Bits	Name	Description
29	ULPIRW	ULPI read/write control This bit selects between running a read or write operation. value 0 = Read value 1 = Write
28	ULPIFORCE	ULPI read/write force This bit enables forcing register access during RX packet value 0 = register access is not forced during RX packet (default) value 1 = register access is forced during RX packet reception
27	ULPISS	ULPI sync state Read Only value 1 = Normal sync state value 0 = In another state (for example, car kit, serial, low power) This bit represents the state of the ULPI interface. Before reading this bit, the ULPIPORT field should be set accordingly if used with the multi-port host. Otherwise, this field should always remain 0.
26:24	ULPIPORT	ULPI port number For the wakeup or read/write operation to be executed, this value selects the port number the ULPI PHY is attached to in the multi-port host. The valid range is 0 to 7. This field should always be written as a 0 for the non-multi port products.
23:16	ULPIADDR	ULPI data address When a read or write operation is commanded, the address of the operation is written to this field.
15:8	ULPIDATRD	ULPI data read Read only After a read operation completes, the result is placed in this field.
7:0	ULPIDATWR	ULPI data write When a write operation is commanded, the data to be sent is written to this field.

0x12530178 USB4_HS_USB_OTG_HS_ENDPTNAK

Type: Read/write clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTNAK register is the endpoint NAK register.

USB4_HS_USB_OTG_HS_ENDPTNAK

Bits	Name	Description
31:16	EPTN_15_0	Tx endpoint NAK Each tx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received IN token for the corresponding endpoint. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0
15:0	EPRN_15_0	Rx endpoint NAK Each rx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received OUT or PING token for the corresponding endpoint. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x1253017C USB4_HS_USB_OTG_HS_ENDPTNAKEN

Type: Read/write clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTNAKEN register is the endpoint NAK enable register.

USB4_HS_USB_OTG_HS_ENDPTNAKEN

Bits	Name	Description
31:16	EPTNE_15_0	Tx endpoint NAK enable Each bit is an enable bit for the corresponding Tx endpoint NAK bit. If this bit is set (1) and the corresponding Tx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0
15:0	EPRNE_15_0	Rx endpoint NAK enable Each bit is an enable bit for the corresponding Rx endpoint NAK bit. If this bit is set (1) and the corresponding Rx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x12530184 USB4_HS_USB_OTG_HS_PORTSC

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xCC000004

This is the USB_OTG_HS_PORTSC register.

USB4_HS_USB_OTG_HS_PORTSC

Bits	Name	Description
31:30	PTS	Parallel transceiver select Read/write This register bit pair is used in conjunction with the configuration constant VUSB_HS_PHY_TYPE to control which parallel transceiver interface is selected. If VUSB_HS_PHY_ TYPE is set for 0, 1, 2, or 3, then this bit is read only. If VUSB_HS_PHY_TYPE is 4, 5, 6, or 7, then this bit is read/write. This field is reset to the following values: 00 if VUSB_HS_PHY_TYPE = 0,4 - UTMI/UTMI+ 01 if VUSB_HS_PHY_TYPE = 1,5 - Reserved 10 if VUSB_HS_PHY_TYPE = 2,6 - ULPI 11 if VUSB_HS_PHY_TYPE = 3,7 - Serial/1.1 PHY (FS only) This bit is not defined in the EHCI specification.
29	STS	Serial transceiver select Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY_SERIAL to control whether the parallel or serial transceiver interface is selected for FS and LS operation. The serial interface engine can be used in combination with the UTMI+ or ULPI physical interface to provide FS/LS signaling instead of the parallel interface. ’ If VUSB_HS_PHY_SERIAL is 0 or 1, then this bit is read only. ’ If VUSB_HS_PHY_SERIAL is 2 or 3, then this bit is read/write. This bit has no effect unless the parallel transceiver select is set to UTMI+ or ULPI. The Serial/1.1 physical interface will use the serial interface engine for FS/LS signaling regardless of this bit value. Note: This bit was reserved for future operation, and is now adding for dynamic use of the serial engine in accord with UMTI+ and ULPI characterization logic. This bit is not defined in the EHCI specification.

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
28	PTW	Parallel transceiver width Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY16_8 to control the data bus width of the UTMI transceiver interface. ' If VUSB_HS_PHY16_8 is 0 or 1, then this bit is read only. ' If VUSB_HS_PHY16_8 is 2 or 3, then this bit is read/write. This bit is reset to 1 if VUSB_HS_PHY16_8 selects a default UTMI interface width of 16-bits, else it is reset to 0. ' Writing this bit to 0 selects the 8-bit [60MHz] UTMI interface. ' Writing this bit to 1 selects the 16-bit [30MHz] UTMI interface. This bit has no effect if the serial interface is selected. This bit is not defined in the EHCI specification.
27:26	PSPD	Port speed Read only This register field indicates the speed at which the port is operating. For HS mode operation in the host controller and HS/FS operation in the device controller, the port routing steers data to the protocol engine. For FS and LS mode operation in the host controller, the port routing steers data to the protocol engine with the embedded transaction translator. value 00 = Full speed value 01 = Low speed value 10 = High speed This bit is not defined in the EHCI specification.
25	SPRT	Short Port Reset Time. shortens port reset time for simulation.
24	PFSC	Port force full speed connect Read/write Default = 0 Setting (1) this bit will force the port to only connect at full speed. It also disables the chirp sequence that allows the port to identify itself as high speed. This is useful for testing FS configurations with a HS host, hub or device. This bit is not defined in the EHCI specification. This bit is for debugging purposes.

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
23	PHCD	PHY low power suspend - clock disable (PLPSCD) Read/write Default = 0 value 1 = Disable the PHY clock. value 0 = Enable the PHY clock. Reading this bit will indicate the status of the PHY clock. Note: The PHY clock cannot be disabled if it is being used as the system clock. In the device mode, The PHY can be put into low power suspend - clock disable when the device is not running (USBCMD run/stop = 0) or the host has signaled suspend (PORTSC SUSPEND = 1). Low power suspend will be cleared automatically when the host has signaled resume. Before forcing a resume from the device, the device controller driver must clear this bit. In the host mode, the PHY can be put into low power suspend - clock disable when the downstream device has been put into the suspend mode or when no downstream device is connected. Low power suspend is completely under the control of the software. This bit is not defined in the EHCI specification.
22	WKOC	Wake on over-current enable (WKOC_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to over-current conditions as wake-up events. This bit is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0). This bit is output from the controller as signal pwrctl_wake_ ovrcurr_en (OTG/host core only) for use by an external power control circuit.
21	WKDS	Wake on disconnect enable (WKDSCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device disconnects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_ dscnnt_en (OTG/host core only) for use by an external power control circuit.

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
20	WKCN	Wake on connect enable (WKCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device connects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_ dscnnt_en (OTG/host core only) for use by an external power control circuit.

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
19:16	PTC_3_0	Port test control Read/write Default = 0000 Any other value than zero indicates that the port is operating in the test mode. Value Specific test The FORCE_ENABLE_FS and FORCE ENABLE_LS tests are extensions to the test mode support, as specified in the EHCI specification. Writing the PTC field to any of the FORCE_ENABLE_{HS/FS/LS} values will force the port into the connected and enabled state at the selected speed. Writing the PTC field back to TEST_MODE_DISABLE will allow the port state machines to progress normally from that point. Note: Low speed operations are not supported as a peripheral device. 0x0: TEST_MODE_DISABLE 0x1: J_ STATE 0x8: K_STATE 0x9: SE0 (host / NAK device) 0x40: Packet 0x41: FORCE_ENABLE_HS 0x48: FORCE_ENABLE_FS 0x49: FORCE_ENABLE_LS 0x3E8: Reserved_1 0x3E9: Reserved_2 0x3EA: Reserved_3 0x3EB: Reserved_4 0x3EC: Reserved_5 0x3ED: Reserved_6 0x3EE: Reserved_7 0x3EF: Reserved_8 0x3F0: Reserved_9 0x3F1: Reserved_10 0x3F2: Reserved_11 0x3F3: Reserved_12 0x3F4: Reserved_13 0x3F5: Reserved_14 0x3F6: Reserved_15 0x3F7: Reserved_16 0x3F8: Reserved_17 0x3F9: Reserved_18 0x3FA: Reserved_19 0x3FB: Reserved_20 0x3FC: Reserved_21 0x3FD: Reserved_22 0x3FE: Reserved_23 0x3FF: Reserved_24 0x400: Reserved_25 0x401: Reserved_26 0x402: Reserved_27 0x403: Reserved_28 0x404: Reserved_29 0x405: Reserved_30 0x406: Reserved_31

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
15:14	PIC_1_0	Port indicator control Read/write Default = 0 Writing to this field has no effect if the P_INDICATOR bit in the HCSPARAMS register is a zero. If the P_INDICATOR bit is set (1), then this field has the following meanings: Bit value Meaning value 00 Port indicators are off value 01 Amber value 10 Green value 11 Undefined Refer to the USB Specification Revision 2.0 [3] for a description on how these bits are to be used. This field is output from the controller as signals port_ind_ctl_1 and port_ind_ctl_0 for use by an external LED driving circuit.
13	PO	Port owner Read only Port owner hand-off is not implemented in this design, therefore this bit will always read back as clear (0). Default = 0 The EHCI definition is include here for reference: ’ This bit unconditionally goes clear (0) when the configured bit in the CONFIGFLAG register makes a 0-to-1 transition. ’ This bit unconditionally goes set (1) whenever the configured bit is clear (0). The system software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). The software sets (1) this bit when the attached device is not a high-speed device. When this bit is set (1), it indicates that an internal companion controller owns and controls the port.

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
12	PP	Port power (PP) Read/write or read-only The function of this bit depends on the value of the port power switching (PPC) field in the HCSPARAMS register. ’ PPC = 0: PP is read-only. A device controller with no OTG capability does not have port power control switches. ’ PPC = 1: PP is read/write. The host/OTG controller requires port power control switches. This bit represents the current setting of the switch (0 = off, 1 = on). When power is not available on a port (and PP equals a 0), the port is non-functional and will not report attaches, detaches, and so on. When an over-current condition is detected on a powered port and PPC is set (1), the PP bit in each affected port may be transitioned by the host controller driver from a one to a zero, removing power from the port. This feature is implemented in the host/OTG controller (PPC = 1). In a device-only implementation, port power control is not necessary. So, PPC and PP = 0.
11:10	LS_1_0	Line status Read-only These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines: Value Meaning value 00 SE0 value 10 J-state value 01 K-state value 11 Undefined In the host mode, the use of line state by the host controller driver is not necessary (unlike EHCI), because the port controller state machine and the port routing manage the connection of LS and FS. In the device mode, the use of line state by the device controller driver is not necessary.
9	HSP	High-speed port Read-only Default = 0 When the bit is set (1), the host/device connected to the port is in the high-speed mode. When this bit is clear (0), the host/device connected to the port is not in a high-speed mode. Note: HSP is redundant with PSPD(27:26), but will remain in the design for compatibility. This bit is not defined in the EHCI specification.

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
8	PR	Port reset This bit is clear (0) if the port power (PP) bit (bit 12) of this register is clear (0). Host mode: ’ Read/write ’ Default = 0 When the software sets (1) this bit, the bus-reset sequence as defined in the USB Specification Revision 2.0 is started. This bit will automatically clear (go to 0) after the reset sequence is complete. Note: This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the reset duration is timed in the driver. Device mode: This bit is a read-only status bit. Device reset from the USB bus is also indicated in the USBSTS register. 0x1: Port is in reset 0x0: Port is not in reset

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
7	SUSP	Suspend Host mode: ' Read/write ' Default = 0 The port enabled bit and suspend bit of this register define the port states: Bit value Port state value 0x Disable value 10 Enable value 11 Suspend When in the suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction if a transaction was in progress when this bit set (1). In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. The host controller will unconditionally clear (0) this bit when the software clears (0) the force port resume bit. The host controller ignores a write of zero to this bit. If the host software sets (1) this bit when the port is not enabled (port enabled bit is a zero), the results are undefined. This field is clear (0) if port power (PP) is clear (0) in the host mode. Device mode: ' Read only ' Default = 0 In the device mode, this bit is a read-only status bit. 0x1: Port in suspend state_1 0x0: Port not in suspend st_1 0x1: Port in suspend state_2 0x0: Port not in suspend st_2

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
6	FPR	Force port resume ’ Read/write ’ Default = 0 Host mode: The software sets (1) this bit to drive resume signaling. The host controller sets (1) this bit if a J-to-K transition is detected while the port is in the suspend state. When this bit transitions to a one because a J-to-K transition is detected, the port change detect bit in the USBSTS register is also set (1). This bit will automatically clear (go to 0) after the resume sequence is complete. This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the resume duration is timed in the driver. Note that, when the host controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (full-speed 'K') is driven on the port as long as this bit remains set (1). This bit will remain set (1) until the port has switched to the high-speed idle. Clearing (0) this bit has no affect, because the port controller will time the resume operation and clear (0) the bit when the port control state switches to HS or FS idle. This bit is clear if the port power (PP) is clear (0) in the host mode. This bit is not-EHCI compatible. Device mode: After the device has been in the suspend state for 5 ms or more, the software must set (1) this bit to drive resume signaling before clearing. The device controller will set (1) this bit if a J-to-K transition is detected while the port is in the suspend state. The bit will be cleared (0) when the device returns to normal operation. Also, when this bit transitions to a one because a J-to-K transition was detected, the port change detect bit in the USBSTS register is also set (1). 0x1: Resume detected/driven on port 0x0: No resume (K-state detected/driven on port)
5	OCC	Over-current change Read/write control Default = 0 This bit gets is set (1) when there is a change to over-current active. The software clears this bit by setting (1) this bit position. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
4	OCA	Over-current active Read-only Default = 0 value 1 = This port currently has an over-current condition. value 0 = This port does not have an over-current condition. This bit will automatically transition from set (1) to clear (0) when the over current condition is removed. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).
3	PEC	Port enable/disable change Read/write control value 1 = Port enabled/disabled status has changed value 0 = No change Default = 0 Host mode: For the root hub, this bit gets set (1) only when a port is disabled due to disconnect on the port or due to the appropriate conditions existing at the EOF2 point. The software clears this bit by writing a one to it. This field is clear (0) if the port power (PP) bit in the register is clear (0). Device mode: The device port is always enabled (this bit will be zero).
2	PE	Port enabled/disabled Read/write value 1 = Enable value 0 = Disable Default 0 Host mode: Ports can only be enabled by the host controller as a part of the reset and enable. The software cannot enable a port by setting (1) this field. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by the host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port, due to other host controller and bus events. When the port is disabled, (0) downstream propagation of data is blocked except for reset. This field is clear (0) if the port power (PP) bit is cleared (0) in the host mode. Device mode: The device port is always enabled (this bit will be set [1])

USB4_HS_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
1	CSC	Connect status change Read/write control value 1 = Change in current connect status value 0 = No change Default = 0 Host mode: Indicates that a change has occurred in the port's current connect status. The host/device controller sets (1) this bit for all changes to the port device connect status, even if the system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, the hub hardware will be 'setting' an already-set bit (that is, the bit will remain set). The software clears this bit by writing a one to it. This field is zero if the port power (PP) bit in this register is zero in the host mode. Device mode: This bit is undefined in the device controller mode.
0	CCS	Current connect status Read-only Host mode: value 1 = Device is present on port value 0 = No device is present Default = 0 This value reflects the current state of the port, and may not correspond directly to the event that caused the connect status change bit (bit 1) to be set (1). This field is clear if the port power (PP) bit in this register is clear (0) in host mode. Device mode: value 1 = Attached value 0 = Not attached Default = 0 If this bit is set (1), this indicates that the device successfully attached, and is operating in either high speed or full speed, as indicated by the high speed port bit in this register. If this bit is clear (0), this indicates that the device did not attach successfully or was forcibly disconnected by the software clearing (0) the run bit in the USBCMD register. It does not state the device being disconnected or suspended.

USB4_HS_USB_OTG_HS_OTGSC

Bits	Name	Description
31	RESERVED_BIT31	Clear (0) this bit.
30	DPIE	Data pulse interrupt enable
29	B_1MSE	1 millisecond timer interrupt enable - read/write
28	BSEIE	B session end interrupt enable Read/write Setting (1) this bit enables the B session end interrupt.
27	BSVIE	B session valid interrupt enable Read/write Setting (1) this bit enables the B session valid interrupt.
26	ASVIE	A session valid interrupt enable Read/write Setting (1) this bit enables the A session valid interrupt.
25	AVVIE	A Vbus valid interrupt enable Read/write Setting (1) this bit enables the A Vbus valid interrupt.
24	IDIE	USB ID interrupt enable Read/write Setting (1) this bit enables the USB ID interrupt.
23	RESERVED_BIT23	Clear (0) this bit.
22	DPIS	Data pulse interrupt status Read/write to clear This bit is set (1) when data bus pulsing occurs on DP or DM. Data bus pulsing is only detected when USBMODE.CM = Host (11) and PORTSC(0). PortPower = Off (0). The software must write a one to clear this bit.
21	B_1MSS	1 millisecond timer interrupt status Read/write to clear This bit is set (1) once every millisecond. The software must write a one to clear this bit.
20	BSEIS	B session end interrupt status Read/write to clear This bit is set (1) when the Vbus has fallen below the B session end threshold. The software must write a one to clear this bit
19	BSVIS	B session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the B session valid threshold (0.8 VDC). The software must write a one to clear this bit.

USB4_HS_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Description
18	ASVIS	A session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the A session valid threshold (0.8 VDC). The software must write a one to clear this bit.
17	AVVIS	A Vbus valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the Vbus valid threshold (4.4 VDC) on an A device. The software must write a one to clear this bit.
16	IDIS	USB ID interrupt status Read/write This bit is set (1) when a change on the ID input has been detected. The software must write a one to clear this bit.
15	RESERVED_BIT15	Clear (0) this bit.
14	DPS	Data bus pulsing status Read-only If this bit is set (1), it indicates that the data bus pulsing is being detected on the port.
13	B_1MST	1 millisecond timer toggle Read-only This bit toggles once per millisecond.
12	BSE	B session end Read-only Indicates that the Vbus is below the B session end threshold.
11	BSV	B session valid Read-only Indicates that the Vbus is above the B session valid threshold.
10	ASV	A session valid Read-only Indicates that the Vbus is above the A session valid threshold.
9	AVV	A Vbus valid Read-only Indicates that the Vbus is above the A Vbus valid threshold.
8	ID	USB ID Read-only value 0 = A device value 1 = B device

USB4_HS_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Description
7	HABA	Hardware assist B-disconnect to A-connect Read/write value 0 = Disabled value 1 = Enable automatic B-disconnect to A-connect sequence.
6	HADP	Hardware assist data-pulse Write to set
5	IDPU	ID pull-up Read/write This bit provides control over the ID pull-up register. value 0 = Off value 1 = On (default) When this bit is clear (0), the ID input will not be sampled.
4	DP	Data pulsing Read/write Setting (1) this bit causes the pull-up on DP to be asserted for data pulsing during SRP.
3	OT	OTG termination Read/write This bit must be set (1) when the OTG device is in the device mode. This controls the pull-down on DM.
2	HAAR	Hardware assist auto-reset Read/write value 0 = Disabled value 1 = Enable automatic reset after connect on host port.
1	VC	Vbus charge Read/write Setting (1) this bit causes the Vbus line to be charged. This is used for Vbus pulsing during SRP.
0	VD	Vbus discharge Read/write Setting (1) this bit causes the Vbus to discharge through a resistor.

0x125301A8 USB4_HS_USB_OTG_HS_USBMODE

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_USBMODE register is the USB device mode register.

USB4_HS_USB_OTG_HS_USBMODE

Bits	Name	Description
31:6	RESERVED_BITS31_6	Clear (0) these bits.
5	VBPS	Vbus power select value 0 - Output is 0 value 1 - Output is 1 This bit is connected to the vbus_pwr_select output and can be used for any generic control, but is named to be used by logic that selects between an on-chip Vbus power source (charge pump) and an off-chip source in systems when both are available.
4	SDIS	Stream disable mode value 0 = Inactive (default) value 1 = Active Device mode: Setting (1) this bit disables double priming on both the Rx and Tx for low bandwidth systems. This mode ensures that, when the Rx and Tx buffers are sufficient to contain an entire packet, the standard double buffering scheme is disabled to prevent overruns/underruns in bandwidth-limited systems. Note: In the high speed mode, a NYET handshake will respond to all packets received when the stream disable is active. Host mode: Setting (1) this bit ensures that overruns/underruns of the latency FIFO are eliminated for low bandwidth systems where the Rx and Tx buffers are sufficient to contain the entire packet. Enabling the stream disable also has the effect of ensuring that the Tx latency is filled to capacity before the packet is launched onto the USB. Note: Time duration to pre-fill the FIFO becomes significant when the stream disable is active. See TXFILLTUNING and TXTTFILLTUNING [MPH only] to characterize the adjustments needed for the scheduler when using this feature. Note: The use of this feature substantially limits of the overall USB performance.
3	SLOM	Setup lockout mode. In the device mode, this bit controls the behavior of the setup lock mechanism. value 0 = Setup lockouts on (default) value 1 = Setup lockouts off (DCD requires use of a setup data buffer tripwire in USBCMD)

USB4_HS_USB_OTG_HS_USBMODE (cont.)

Bits	Name	Description
2	ES	Endian select Read/write This bit can change the byte ordering of the transfer buffers to match the host microprocessor bus architecture. The bit fields in the microprocessor interface and the DMA data structures (including the setup buffer within the device QH) are unaffected by the value of this bit, because they are based upon 32-bit words. value 0 = Little endian (default) - first byte referenced in the least significant byte of a 32-bit word. value 1 = Big endian - first byte referenced in most significant byte of a 32-bit word.
1:0	CM	Controller mode Read/write once The controller mode is defaulted to the proper mode for host-only and device-only implementations. For those designs that contain both host and device capability, the controller will default to an idle state and will need to be initialized to the desired operating mode after reset. For combination host/device controllers, this register can only be written once after reset. If it is necessary to switch modes, the software must reset the controller by writing to the RESET bit in the USBCMD register before reprogramming this register. value 00 = Idle [default for combination host/device] value 01 = Reserved value 10 = Device controller [default for device only controller] value 11 = Host controller [default for host only controller]

0x125301AC USB4_HS_USB_OTG_HS_ENPDTSETUPSTAT

Type: Read/write control
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENPDTSETUPSTAT register is the endpoint set-up status register.

USB4_HS_USB_OTG_HS_ENPDTSETUPSTAT

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.

USB4_HS_USB_OTG_HS_ENPDTSETUPSTAT (cont.)

Bits	Name	Description
15:0	ENDPTSETUPSTAT_15_0	Set-up endpoint status For every set-up transaction that is received, a corresponding bit in this register is set (1). The software must clear or acknowledge the setup transfer by setting (1) a respective bit after it has read the setup data from the queue head. The response to a set-up packet as in the order of operations and total response time is crucial to limit bus time outs while the set-up lock-out mechanism is engaged. See Managing Endpoints in the Device Operational Model. This register is only used in the device mode.

0x125301B0 USB4_HS_USB_OTG_HS_ENDPTPRIME

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTPRIME register is the endpoint initialization register. This register is only used in the device mode.

USB4_HS_USB_OTG_HS_ENDPTPRIME

Bits	Name	Description
31:16	PETB_15_0	Prime endpoint transmit buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a transmit operation in order to respond to a USB IN/INTERRUPT transaction. The software should set (1) the corresponding bit when posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a transmit buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. PETB[15] - Endpoint 15 PETB[1] - Endpoint 1 PETB[0] - Endpoint 0

USB4_HS_USB_OTG_HS_ENDPTPRIME (cont.)

Bits	Name	Description
15:0	PERB_15_0	Prime endpoint receive buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a receive operation for when a USB host initiates a USB OUT transaction. The software should set (1) the corresponding bit whenever posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x125301B4 USB4_HS_USB_OTG_HS_ENDPTFLUSH

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTFLUSH register is the endpoint de-initialize register. This register is only used in the device mode.

USB4_HS_USB_OTG_HS_ENDPTFLUSH

Bits	Name	Description
31:16	FETB_15_0	Flush endpoint transmit buffer Setting (1) a bit in this register will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. FETB[15] - Endpoint 15 FETB[1] - Endpoint 1 FETB[0] - Endpoint 0
15:0	FERB_15_0	Flush endpoint receive buffer Setting a bit (1) will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x125301B8 USB4_HS_USB_OTG_HS_ENDPTSTAT

Type: Read-only
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTSTAT register is the endpoint status register. This register is only used in the device mode.

USB4_HS_USB_OTG_HS_ENDPTSTAT

Bits	Name	Description
31:16	ETBR_15_0	Endpoint transmit buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ETBR[15] - Endpoint 15 ETBR[1] - Endpoint 1 ETBR[0] - Endpoint 0
15:0	ERBR_15_0	Endpoint receive buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ERBR[15] - Endpoint 15 ERBR[1] - Endpoint 1 ERBR[0] - Endpoint 0

0x125301BC USB4_HS_USB_OTG_HS_ENDPTCOMPLETE

Type: Read/write control
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The register is the endpoint complete register. This register is only used in the device mode.

USB4_HS_USB_OTG_HS_ENDPTCOMPLETE

Bits	Name	Description
31:16	ETCE_15_0	Endpoint transmit complete event Each bit indicates that a transmit event (IN/INTERRUPT) occurred and the software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ETCE[15] - Endpoint 15 ETCE[1] - Endpoint 1 ETCE[0] - Endpoint 0
15:0	ERCE_15_0	Endpoint receive complete event Each bit indicates that a received event (OUT/SETUP) occurred and the software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ERCE[15] - Endpoint 15 ERCE[1] - Endpoint 1 ERCE[0] - Endpoint 0

0x125301C0 USB4_HS_USB_OTG_HS_ENDPTCTRL0

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00800080

The USB_OTG_HS_ENDPTCTRL0 register is the endpoint control 0 register. Every device will implement endpoint0 as a control endpoint.

USB4_HS_USB_OTG_HS_ENDPTCTRL0

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

USB4_HS_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
23	TXE	Tx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
22:20	RESERVED_BITS22_20	Clear (0) these bits.
19:18	TXT	Tx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
17	RESERVED_BIT17	Clear (0) this bit.
16	TXS	Tx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
6:4	RESERVED_BITS6_4	Clear (0) these bits.
3:2	RXT	Rx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
1	RESERVED_BIT1	Clear (0) this bit.

USB4_HS_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
0	RXS	Rx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

0x125301C0+4*n USB4_HS_USB_OTG_HS_ENDPTCTRLn, n=[1..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTCTRLn register is the endpoint control n register. There is an ENDPTCTRLn register for each endpoint in a device.

CAUTION If one endpoint direction is enabled and the paired endpoint of the opposite direction is disabled, then the unused direction type must be changed from the default control-type to any other type (such as bulk-type). Leaving an unconfigured endpoint control will cause undefined behavior for the data PID tracking on the active endpoint/direction.

USB4_HS_USB_OTG_HS_ENDPTCTRLn

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23	TXE	Tx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

USB4_HS_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
22	TXR	Tx data toggle reset (WS) value 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and device.
21	TXI	Tx data toggle inhibit value 0 = PID sequencing enabled (default) value 1 = PID sequencing disabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always transmit DATA0 for a data packet.
20	RESERVED_BIT20	Clear (0) this bit.
19:18	TXT	Tx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
17	TXD	Tx endpoint data source value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
16	TXS	Tx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. in most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

USB4_HS_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
6	RXR	Rx data toggle reset (WS) Write 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and the device.
5	RXI	Rx data toggle inhibit value 0 = Disabled (default) value 1 = Enabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always accept a data packet regardless of their data PID.
4	RESERVED_BIT4	Clear (0) this bit.
3:2	RXT	Rx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
1	RXD	Rx endpoint data sink value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
0	RXS	Rx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. in most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

0x125301FC+4*n USB4_HS_USB_OTG_HS_ENDPT_PIPE_IDn, n=[1..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x001F001F

The USB_OTG_HS_ENDPT_PIPE_IDn register is the endpoint pipe number register. There is an USB_OTG_HS_ENDPT_PIPE_IDn register for each endpoint in a device.

NOTE reset value of TX_PIPE_ID and RX_PIPE_ID is 0x1F, which means that Endpoint is not mapped to any pipe.

USB4_HS_USB_OTG_HS_ENDPT_PIPE_IDn

Bits	Name	Description
31:21	RESERVED_BITS31_21	Clear (0) these bits.
20:16	TX_PIPE_ID	This field indicate the pipe number that this tx end point (n) will use in pipe mode.
15:5	RESERVED_BITS15_5	Clear (0) these bits.
4:0	RX_PIPE_ID	This field indicate the pipe number that this rx end point (n) will use in pipe mode.

0x12530240 USB4_HS_USB_OTG_HS_PHY_CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0b1110000111010

The USB_OTG_HS_PHY_CTRL register is used to configure various features in the Synopsys 28nm PHY.

USB4_HS_USB_OTG_HS_PHY_CTRL

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	USB2_PHY_IDHV_CLAMP_EN	Clamp enable for IDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and IDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped high. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
11	USB2_PHY_OTGSESSVLDHV_CLAMP_EN	Clamp enable for OTGSESSVLDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and OTGSESSVLDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.

USB4_HS_USB_OTG_HS_PHY_CTRL (cont.)

Bits	Name	Description
10	PHY_MPM_HV_CLAMP_EN	Clamp enable for HV interrupts level shifters from USB VDD180 domain to VDDPAD MPM in usb2 phy wrapper. When set (1), VLS is active and HV interrupts are translated from 1.8V domain to MPM Vdd domain. When clear (0), VLS is clamped to inactive state. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
9	USB2_PHY_OTGSESSVLD HV_INTEN	Enable HV session valid interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
8	USB2_PHY_IDHV_INTEN	Enable HV id pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
7	USB2_PHY_ULPI_POR	Reset for ULPI PHY Wrapper and ULPI clock domain logic in usb2_phy_wrapper.
6:4	USB2_PHY_FSEL	Reference Clock Frequency Select 011 (Assumes 19.2MHz default)
3	HOST_PORTCTRL_FORCE _SUSEN	Chicken bit for CR-0000153908 - when this bit set the core will enter to low power mode when portctrl host sm enter to suspend mode. Default value is 1.
2	USB2_PHY_SIDDQ	IDDQ Test Enable.
1	USB2_PHY_RETEN	Retention mode enable/disable
0	USB2_PHY_POR	Power-On-Reset (Analog configuration needs to happen before POR is set to 0)

0x12530244 USB4_HS_USB_OTG_HS_GENERIC1

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

The USB_OTG_HS_GENERIC1 register.

USB4_HS_USB_OTG_HS_GENERIC1

Bits	Name	Description
31:16	USB_HS_TX_DEPTH	TX_DEPTH is the number of words in the TX buffer. This number is calculated by the number of bytes allocated per Endpoint divided by 4, times the number of endpoints. The RAM width is 36. In HS USB this value is usually 512 bytes per EP, and for FS ONLY USB it is usually 64 Bytes per EP.
15:0	USB_HS_RX_DEPTH	RX_DEPTH is the number of words in the RX buffer. This number is usually 256, but can support powers of 2 up to 4096. The RAM width is 36.

0x12530248 USB4_HS_USB_OTG_HS_GENERIC2

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

The USB_OTG_HS_GENERIC2 register.

USB4_HS_USB_OTG_HS_GENERIC2

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15	USE_SPS_AHB2AHB	USE_SPS_AHB2AHB generic specifies if AHB2AHB bridge is connected between BAM and SPS Fabric AHB.
14	LPM_SUPPORT	The LPM_SUPPORT generic specifies if USB support Link Power Management.
13:9	USB_HS_DEV_EP	The number of USB endpoints. Valid values for the number of Endpoints are 4, 8, and 16
8:3	MAX_PIPES	The number of simultaneous parallel pipes supported by the BAM. Supported values are 2 to 30
2	USE_SPS	The USE_SPS generic specifies if Bam is connected to USB core.
1	USE_HSIC	The USE_HSIC generic specifies if an HSIC is connected to USB core.
0	UTMI_PHY_SW_IF_EN	The UTMI_PHY_SW_IF_EN generic specifies if UTMI phy Register Interface is enabled

0x12530250 USB4_HS_USB_OTG_HS_L1_EP_CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0000FFFF

The USB_OTG_HS_L1_EP_CTRL register enables/disables transition to L1 and exit from L1 state when specific TX endpoints are primed.

USB4_HS_USB_OTG_HS_L1_EP_CTRL

Bits	Name	Description
31:16	TX_EP_PRIME_L1_EXIT	Those bit's enables Remote Wakeup in L1 state when SW starts Priming The specific Endpoint.
15:0	TX_EP_PRIME_L1_EN	Control bit's that enables/disables transition to L1 when the specific TX Endpoint is active.

0x12530254 USB4_HS_USB_OTG_HS_L1_CONFIG

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_L1_CONFIG register is used to configure various L1 features.

USB4_HS_USB_OTG_HS_L1_CONFIG

Bits	Name	Description
31:12	RESERVED_BITS31_12	Clear (0) these bits.
11	PLL_PWR_DWN_EN	Control bit that enables/disables power down of 480 MHZ PLL in L1 state.
10	PHY_LPM_EN	Control bit that enable/disables entering ULPI Low Power Mode in L1 state
9	GATE_AHB_CLK_EN	Control bit that enable/disables clock request signaling for usb_ahb_clk in L1 state
8	GATE_FS_XCVR_CLK_EN	Control bit that enable/disables clock gating of usb_fs_xcvr_clk in L1 state
7	GATE_SYS_CLK_EN	Control bit that enable/disables clock gating of usb_system_clk in L1 state
6	GATE_XCVR_CLK_EN	Control bit that enable/disables power-down of 480 MHz PLL in L1 state
5	L1_REMOTE_WAKEUP_EN	Control bit that enables/disables Remote Wakeup in L1 state. When this bit is low, then Link Controller never initiates Remote Wakeup in L1 state. When this bit is high, Link Controller can initiate Remote Wakeup.
4	LPM_EN	Control bit that enables/disables LPM support. When this bit is zero a full backward compatibility is ensured - no LPM support and no response for LPM Extended Transaction
3:0	PLL_TURNOFF_MIN_HIRD	Specifying a minimum expected HIRD value from Host that enables HW mechanism for turning off the 480 MHz PLL. The default value is 50us.

0x12530258 USB4_HS_USB_OTG_HS_LPM_DEBUG_1

Type: Read/Clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_DEBUG_1 register is for debug and testing purposes mostly.

USB4_HS_USB_OTG_HS_LPM_DEBUG_1

Bits	Name	Description
31:16	DEBUG_L1_LONG_ENT_CNT	Count number of exits from L1 where duration in L1 is > 200us. Writing to this register clears the counter.
15:0	DEBUG_L1_SHORT_ENT_CNT	Count number of exits from L1 where duration in L1 is <= 200us. Writing to this register clears the counter.

0x1253025C USB4_HS_USB_OTG_HS_LPM_DEBUG_2

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_DEBUG_2 register is for debug and testing purposes mostly.

USB4_HS_USB_OTG_HS_LPM_DEBUG_2

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12:9	L1_RMT_WKUP_TIME	Read/write Specifying How much time the device drives remote wakeup. The default Value is 50us for reset value. Add the value of this register (in us) to the remote wakeup time.
8	L1_FPR	Read/write L1 Force port resume, The software sets (1) this bit to drive resume signaling.
7	HSIC_CLK_PLL_BYPASSNL	Read only. Disables PLL analog logic. Active low. Connects to bypassnl input of NT_PLL.
6	HSIC_CLK_PLL_RESET	Read only. Resets all FF in PLL. Active low. Connects to reset_n input of NT_PLL.
5	HSIC_CLK_GATE	Read only. Clock gating of hsic_clk and ulpi_clk, without turning off HSIC PLL.
4	FS_XCVR_CLK_GATE	Read only. Clock gating of cc_usb_xcvr_fs_clk
3	SYS_CLK_GATE	Read only. Clock gating of cc_usb_system_clk
2	AHB_CLK_GATE	Read only. Clock gating of usb_ahb_clk

USB4_HS_USB_OTG_HS_LPM_DEBUG_2 (cont.)

Bits	Name	Description
1	L1_STATE	Read only. Status bit indicating if Device is in L1 state. When this bit high, Link Controller and HSIC PHY are in L1 state
0	DEBUG_L1_EN	Read/write Control bit that enable/disables DEBUG counters operation.

0x12530260 USB4_HS_USB_OTG_HS_LPM_ATTRIBUTES

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_ATTRIBUTES register store the bmAttribute Field of the LPM transaction.

USB4_HS_USB_OTG_HS_LPM_ATTRIBUTES

Bits	Name	Description
31:5	RESERVED_BITS31_5	Clear (0) these bits.
4	BREMOTEWAKE	A value of one (1B) in this field enables the addressed device to wake the host upon any meaningful application-specific event (e.g. an interrupt for a device with one or more interrupt endpoints). A value of zero (0B) disables the device from initiating remote wake.
3:0	HIRD	Host Initiated Resume Duration.

20.34 USB4 HS BAM Registers (0x12532000 USB4_HS_BAM_BASE)

This section contains the USB4 BAM registers.

BAM supports only Word (4 byte) aligned writes and reads on the Configuration Bus interface.

BAM has MAX_PIPES hardware generic parameter defining the number of pipes it supports. Each BAM can have up to 31 pipes supported.

BAM has BAM_CONF_AHBS_ADDR_WIDTH hardware generic parameter defining the Bit Number for selecting BAM access or Peripheral access. Legal Ranges are 14 to 20. Count starts from 1, meaning a value of 17 will set BAM Base address as 0x0001_0000.

20.34.1 BAM control registers

BAM Control registers configure the BAM operational state, SW reset, interrupts and others.

0x12532F80 USB4_HS_BAM_CTRL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

BAM Control register allows global controls for the BAM.

USB4_HS_BAM_CTRL

Bits	Name	Description
31:17	RESERVED_BITS31_17	Set to Zero (0)
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1’b1 - Enable Power Saving Mode 1’b0 - Disable Power Saving Mode

USB4_HS_BAM_CTRL (cont.)

Bits	Name	Description
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2’b00 - Cache when current descriptor has less than 64 bytes left. 2’b01 - Cache when current descriptor has less than 128 bytes left. 2’b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2’b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
12	RESERVED_BITS12	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_SIC_SEL
11:5	BAM_TESTBUS_SEL	Set to Zero (0) Obsolete field: BAM_TESTBUS_SEL Test Bus selector. Supported until (including) bam_p3q3r29. Moved to a dedicated register - BAM_TEST_BUS_SEL in the following releases.
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
3	RESERVED_BITS3	Set to Zero (0)
2	RESERVED_BITS2	Set to Zero (0)

USB4_HS_BAM_CTRL (cont.)

Bits	Name	Description
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x12532F84 USB4_HS_BAM_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

USB4_HS_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)

USB4_HS_BAM_REVISION (cont.)

Bits	Name	Description
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists
16	SECURED	This field indicates BAM/BAM-Lite has security support (APU inside) 1'b1 - Secured 1'b0 - Not Secured
15:12	RESERVED_BITS15_12	Set to Zero (0)
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRCS*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRCS*_EEn registers exist for n=[0..3].
7:0	REVISION	This field contains the revision number of the core, Hard Coded. 8'h01 - (bam_p3q3r22 +) 8'h02 - (bam_p3q3r27 +) 8'h03 - BAM (bam_p3q3r30 +) 8'h04 - BAM (bam_p3q2r43 +) 8'h05 - BAM (bam_p2q2r45 +) 8'h10 - BAM Lite (bam_lite_p1q1r0 +) 8'h11 - BAM Lite (bam_lite_p3q2r16 +) 8'h12 - BAM Lite (bam_lite_p2q2r18 +)

0x12532FBC USB4_HS_BAM_NUM_PIPES

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

USB4_HS_BAM_NUM_PIPES

Bits	Name	Description
31:24	BAM_NON_PIPE_GRP	This field contains the number of BAM Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
23:16	PERIPH_NON_PIPE_GRP	This field contains the number of Peripheral's Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
15:8	RESERVED_BITS15_8	Set to Zero (0)
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x12532FC0 USB4_HS_BAM_TIMER

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

USB4_HS_BAM_TIMER

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12532FC4 USB4_HS_BAM_TIMER_CTRL

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

The resolution of the BAM inactivity timer are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define

the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * TIMER_TRSHLD.

USB4_HS_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12532F88 USB4_HS_BAM_DESC_CNT_TRSHLD

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

USB4_HS_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0).
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. Available in BAM only

0x12532F8C USB4_HS_BAM_IRQ_SRCS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

USB4_HS_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12532F90 USB4_HS_BAM_IRQ_SRCS_MSK

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

USB4_HS_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12532FB0 USB4_HS_BAM_IRQ_SRCS_UNMASKED

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

USB4_HS_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x12532F94 USB4_HS_BAM_IRQ_STTS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

USB4_HS_BAM_IRQ_STTS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.

USB4_HS_BAM_IRQ_STTS (cont.)

Bits	Name	Description
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12532F98 USB4_HS_BAM_IRQ_CLR

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

USB4_HS_BAM_IRQ_CLR

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12532F9C USB4_HS_BAM_IRQ_EN

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

USB4_HS_BAM_IRQ_EN

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x12532FA0 USB4_HS_BAM_RESERVED_1

Type: Read
Clock: BAM_CLK
Reset State: 0x00000000

USB4_HS_BAM_RESERVED_1

Bits	Name	Description
31	RESERVED_BITS31	Set to Zero (0) Obsolete field: BAM_IRQ_SIC_SEL
30:0	RESERVED_BITS30_0	Set to Zero (0) Obsolete field: P_IRQ_SIC_SEL

0x12532FA4 USB4_HS_BAM_AHB_MASTER_ERR_CTRLS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB4_HS_BAM_AHB_MASTER_ERR_CTRLS

Bits	Name	Description
31:23	RESERVED_BITS31_16	Set to Zero (0)
22:18	BAM_ERR_HVMID	HVMID
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x12532FA8 USB4_HS_BAM_AHB_MASTER_ERR_ADDR

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB4_HS_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x12532FAC USB4_HS_BAM_AHB_MASTER_ERR_DATA

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB4_HS_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x12532FB4 USB4_HS_BAM_RESERVED_2

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

USB4_HS_BAM_RESERVED_2

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_IRQ_DEST_ADDR

0x12532FB8 USB4_HS_BAM_RESERVED_3

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

USB4_HS_BAM_RESERVED_3

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_DEST_ADDR

0x12532FF0 USB4_HS_BAM_TRUST_REG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside - SECURED field in the BAM_REVISION register) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29.

USB4_HS_BAM_TRUST_REG

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_VMID	Those bits indicate the VMID value to be used when performing BAM type accesses to the bus. BAM Type accesses include BAM MTI (or Direct Mode accesses, not applicable for BAM Lite)
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable
6:2	RESERVED_BITS6_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_EE	This Field Indicates the EE (0,1,2,3) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12532FF4 USB4_HS_BAM_TEST_BUS_SEL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is the testbus selector register.

Supported in releases after bam_p3q3r29.

USB4_HS_BAM_TEST_BUS_SEL

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	BAM_DATA_ERASE	When enabled, BAM will be instructed to erase all the data it currently has inside. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Erase 1'b0 - Disabled
17	BAM_DATA_FLUSH	When enabled, BAM will be instructed to flush all the data it currently has inside. BAM will only flush the data once it has enough data and a valid destination for it. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Flush 1'b0 - Disabled
16	BAM_CLK_ALWAYS_ON	This bit controls the BAM to issue 'always on' clock request. 1'b1 - Enable Always On clock request. 1'b0 - Disabled
15:7	RESERVED_BITS15_7	Set to Zero (0)
6:0	BAM_TESTBUS_SEL	Test Bus selector. Values with bit[11] set high are reserved for the BAM Lite integrator to provide testbus from outside of the BAM Lite. For example, eDML testbus may reside at X'100_0000' to X'111_1111' selector values. eDML has no registers thus has no test bus selector, so its test bus is combined with the BAM lite's. BAM provides zeroes on its testbus when external values selected. X'000_0000' - Zeros X'000_0001' - Slave test bus X'000_0010' - Pipe state machine test bus X'000_0011' - Buffer test bus X'000_0100' - Sideband test bus X'000_1101' - Bus Manager test bus X'001_0000' - Reg file test bus X'1''_''''' - BAM Lite sets zeroes on the test bus, leaving it for external use

0x12532FF8 USB4_HS_BAM_TEST_BUS_REG

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the value being output to the testbus of the chip. It is not intended for SW usage but for lab debugging of the BAM. Values here can change every cycle.

USB4_HS_BAM_TEST_BUS_REG

Bits	Name	Description
31:0	BAM_TESTBUS_REG	32 bit Testbus value. To select the Block in BAM to show here, use the BAM_TESTBUS_SEL field in BAM_CTRL register.

0x12532FFC USB4_HS_BAM_CNFG_BITS

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

USB4_HS_BAM_CNFG_BITS

Bits	Name	Description
31:27	RESERVED_BITS31_27	Set to Zero (0)
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only

USB4_HS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there are available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided.. 1’b1 - Enable 1’b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission savepoint, but into the illegal’s pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1’b1 - Enabled 1’b0 - Disable Available in BAM only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1’b1 - Enable 1’b0 - Disable Available in BAM only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there’s no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1’b1 - Enable 1’b0 - Disable Available in BAM only

USB4_HS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1’b1 - 1’b0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset. 1’b1 - Enable 1’b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix) 1’b1 - Enable 1’b0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM’s common clock request. 1’b1 - Propagate Sideband Clock Request 1’b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. 1’b1 - Enable Power Saving 1’b0 - Disable Power Saving

USB4_HS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reset pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1’b1 - Enable external block pipe reset 1’b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. This functionality has been found to be buggy and was removed from APQ8064. Bit is currently unused. 1’b1 - Enable 1’b0 - Disable Available in BAM only
10:4	RESERVED_BITS10_4	Set to Zero (0)
3	BAM_ADML_SYNC_BRIDGE	0x1: Use a Synchronous Configuration bridge in aDML. 0x0: Use a Asynchronous Configuration bridge in aDML.
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It’s invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1’b1 - Enable 1’b0 - Disable Available in BAM only
1	BAM_ADML_DEEP_CONS_FIFO	0x1: Use a deep Consumer FIFO in aDML (16 dwords) 0x0: Use a shallow Consumer FIFO in aDML (8 dwords)
0	BAM_ADML_INCR4_EN_N	0x1: Don’t allow INCR4 aDML-BAM accesses. 0x0: Allow INCR 4 aDML-BAM accesses.

0x12533800+ 128*n USB4_HS_BAM_IRQ_SRCS_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB4_HS_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x12533804+ 128*n USB4_HS_BAM_IRQ_SRCS_MSK_EEn, n=[0..3]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB4_HS_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x12533808+ 128*n USB4_HS_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB4_HS_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

20.34.2 BAM PIPE management registers

BAM Pipe management registers control each pipe's parameters. Those reside in physical registers.

0x12532000+ 128*n USB4_HS_BAM_P_CTRLn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Control register provides various controls for the pipe.

USB4_HS_BAM_P_CTRLn

Bits	Name	Description
31:11	RESERVED_BITS31_11	Set to Zero (0)
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be pre-fetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

USB4_HS_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only.When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
2	RESERVED_BITS2	Set to Zero (0)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe
0	RESERVED_BITS0	Set to Zero (0)

0x12532004+ 128*n USB4_HS_BAM_P_RSTn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

USB4_HS_BAM_P_RSTn

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	P_SW_RST	This resets the pipe and its' registers, (Both Flip-Flops and RAM). 1'b1 - Reset 1'b0 - Do Nothing

0x12532008+ 128*n USB4_HS_BAM_P_HALTn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Halt register Enables/Disables the Halt Sequence.

This is a self-modifying register.

USB4_HS_BAM_P_HALTn

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it.

0x12532030+ 128*n USB4_HS_BAM_P_TRUST_REGn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29.

USB4_HS_BAM_P_TRUST_REGn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_P_VMID	Those bits indicate the VMID value to be used when performing Pipe type accesses to the bus. BAM Type accesses include Pipe MTI, Data and Descriptors.
7:2	RESERVED_BITS7_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_P_EE	This Field Indicates the EE (0,1,2,3) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x12532010+ 128*n USB4_HS_BAM_P_IRQ_STTSn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

USB4_HS_BAM_P_IRQ_STTSn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

0x12532014+128*n USB4_HS_BAM_P_IRQ_CLRn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

USB4_HS_BAM_P_IRQ_CLRn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_CLR	1’b1 - Clear 1’b0 - Unchanged
4	P_ERR_CLR	1’b1 - Clear 1’b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1’b1 - Clear 1’b0 - Unchanged

USB4_HS_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

0x12532018+ 128*n USB4_HS_BAM_P_IRQ_ENn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

USB4_HS_BAM_P_IRQ_ENn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

0x1253201C+ 128*n USB4_HS_BAM_P_TIMERn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the pipe.

USB4_HS_BAM_P_TIMERn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x12532020+ 128*n USB4_HS_BAM_P_TIMER_CTRLn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the P_TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * P_TIMER_TRSHLD.

USB4_HS_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x12532024+ 128*n USB4_HS_BAM_P_PRDCR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

USB4_HS_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value

0x12532028+ 128*n USB4_HS_BAM_P_CNSMR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

USB4_HS_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value

20.34.3 BAM PIPE configuration registers (RAM)

BAM Pipe management registers configure each pipes' parameters.

Pipe Address span: currently defining each pipe to have 32 addresses, therefore inter pipe offset is 32*4=128=0x80 bytes.

0x1253302C+64*n USB4_HS_BAM_P_EVNT_DEST_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

USB4_HS_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x12533018+64*n USB4_HS_BAM_P_EVNT_REGn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

USB4_HS_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x12533000+64*n USB4_HS_BAM_P_SW_OFSTSn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB4_HS_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode.
15:0	SW_DESC_OFST	Descriptor FIFO offset.

0x12533024+ 64*n USB4_HS_BAM_P_DATA_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

USB4_HS_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x1253301C+ 64*n USB4_HS_BAM_P_DESC_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

USB4_HS_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x12533028+64*n USB4_HS_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When a BAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

USB4_HS_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x12533020+64*n USB4_HS_BAM_P_FIFO_SIZESn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

USB4_HS_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors.

20.34.4 BAM PIPE internal state registers (RAM)

BAM Pipe debug registers allow a software look inside on the internal parameters of the BAM State Machines stored in RAM.

Those shouldn't be normally used or altered by the software.

0x12533034+64*n USB4_HS_BAM_P_RETR_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context stored for retransmission.

This is being stored by Ack Update state machine in consumer mode or by the Writeback state machine in producer mode.

This is being loaded by the Writeback state machine when retransmission happens.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB4_HS_BAM_P_RETR_CNTXT_n

Bits	Name	Description
31:16	RETR_DESC_OFST	Descriptor Fifo Offset for retransmission.
15:0	RETR_OFST_IN_DESC	The Offset inside the Descriptor for retransmission.

0x12533038+64*n USB4_HS_BAM_P_SI_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Sideband Inform state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB4_HS_BAM_P_SI_CNTXT_n

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

0x12533004+ 64*n USB4_HS_BAM_P_AU_PSM_CNTXT_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Ack Update state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB4_HS_BAM_P_AU_PSM_CNTXT_1_n

Bits	Name	Description
31:16	AU_PSM_ACCUMED	PSM: The acknowledged (EOB/T) number of bytes since last Write Event. AU: The accumulation of the descriptor sizes for the present ack_on_success event. This is never bigger than the ACKED field. Once the ACCUMED values are bigger than Event Threshold, an Event will be issued, the ACKED value will decrease by the ACCUMED size and this value will be zeroed. This also serves as the Bytes Consumed value in the Event.
15:0	AU_ACKED	AU: The left over of the number of bytes that were received via the ack_on_success, that did not cause a descriptor closure. This value is down counting upon issuing Read Event. PSM:

0x12533008+ 64*n USB4_HS_BAM_P_PSM_CNTXT_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB4_HS_BAM_P_PSM_CNTXT_2_n

Bits	Name	Description
31	PSM_DESC_VALID	The Descriptor Valid bit provided by the Writeback state machine to Pipe state machine.
30	PSM_DESC_IRQ	The Descriptor Interrupt bit provided by the Writeback state machine to pipe state machine.
29	PSM_DESC_IRQ_DONE	The Descriptor Interrupt needed selection bit.
28:25	PSM_GENERAL_BITS	General Context Switch Bits
24:22	PSM_CONS_STATE	State of the Pipe Consumer state machine.
21:19	PSM_PROD_SYS_STATE	State of the Pipe Producer System state machine.
18:16	PSM_PROD_B2B_STATE	State of the Pipe Producer BAM to BAM state machine.
15:0	PSM_DESC_SIZE	The Descriptor Size provided by the Writeback state machine to pipe state machine.

0x1253300C+64*n USB4_HS_BAM_P_PSM_CNTXT_3_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB4_HS_BAM_P_PSM_CNTXT_3_n

Bits	Name	Description
31:0	PSM_DESC_ADDR	The Data Address provided in the current descriptor from the Writeback state machine.

0x12533010+64*n USB4_HS_BAM_P_PSM_CNTXT_4_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB4_HS_BAM_P_PSM_CNTXT_4_n

Bits	Name	Description
31:16	PSM_DESC_OFST	The running Descriptor Fifo Offset of the Writeback state machine
15:0	PSM_SAVED_ACCUMED_SIZE	The Saved Accumulated Size from the Pipe state machine.

0x12533014+64*n USB4_HS_BAM_P_PSM_CNTXT_5_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

USB4_HS_BAM_P_PSM_CNTXT_5_n

Bits	Name	Description
31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

0x12533030+64*n USB4_HS_BAM_P_RESERVED_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK

20.35 SPS GSBI1Registers (0x12440000 SPS_GSBI1_BASE)

This section contains GSBI 1 registers.

20.35.1 GSBI CTRL Registers

0x12440000 SPS_GSBI1_GSBI_CTRL_REG

Type: Read/write
Clock: HCLK
Reset State: 0x00000000

SPS_GSBI1_GSBI_CTRL_REG

Bits	Name	Description
15:12	RESERVED	reserved
11:8	WRAPPER_CTRL	This field has no predefined use. When a wrapper is constructed around one or more GSBIs there may be a need to configure it. E.g., to select which of several GSBIs will be connected to a particular I2S block. All bits of this field emerge from GSBI as output ports which can be used for any such configuration task.
7	RESERVED_7	Reserved. The host can write and read this field, but its state has no effect on anything.
6:4	PROTOCOL_CODE	This field controls which protocol, if any, is applied to the GSBI's four I/O ports. Most codes assign a single protocol, but codes of "001" and "110" assigns I2C to two of the ports and UART (without flow control signals) or SIM to the other two. 0x0: Idle (null values are applied to all four GSBI I/Os) 0x1: I2C on 2 ports, SIM/R-UIM on other 2 0x2: I2C 0x3: SPI 0x4: UART with flow control (or IRDA) 0x5: SIM/R-UIM 0x6: I2C on 2 ports, UART (without HS flow ctrl on other 2) 0x7: Undefined
3:1	RESERVED_3_1	Reserved. The host can write and read this field, but its state has no effect on anything.
0	CRCI_MUX_CTRL	While this bit is low QUP CRCI ports are connected to the GSBI ports nominally for QUP and UART_DM CRCI ports are connected to the GSBI ports nominally for UART_DM. While this bit is high QUP CRCI ports are connected to the GSBI ports nominally for UART_DM and UART_DM CRCI ports are connected to nothing.

0x12440004 SPS_GSBI1_GSBI_DBG0_REG

Bits	Name	Description
1:0	GSBI_PLAY3	This field has no function beyond the fact that the ARM can write to it and read from it.

20.36 SPS GSBI1 UART DM Registers (0x12450000 SPS_UART1_DM_BASE)

This section contains Smart Peripheral System GSBI 1 UART DM registers.

UART_DM registers are accessible only by the ARM

This section contains the read and write registers for UART1.

20.36.1 Write and read/write registers

0x12450000 SPS_GSBI1_UART_DM_MR1

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_MR1 register is the UART mode register 1. It is used, along with UART_DM_MR2, to configure the operational mode of the UART.

SPS_GSBI1_UART_DM_MR1

Bits	Name	Description
31:8	AUTO_RFR_LEVEL1	These bits are used, along with bits 5:0 (AUTO_RFR_LEVEL0) to program the level in the receive FIFO at which the RFR_N signal is de-asserted, if programmed to do so (see RX_RDY_CTL field of this register). The level counts the number of words inside the RX FIFO. It doesn't count the character that is being received (shift register) or characters in the packing buffer. This value is programmed from 1 to 2^RAM_ADDR_WIDTH. The RFR_N signal is de-asserted when the RX FIFO level (the number of characters remaining in the RX FIFO) is greater than the level that is programmed into this register. · Only RAM_ADDR_WIDTH +1:8 bits are generated.
7	RX_RDY_CTL	Setting (1) this bit enables the automatic ready-for-receiving (RFR_N) control for the receiver. RFR_N is turned off, or set (1), when a valid start bit is received and the channel FIFO is at the level programmed in bits 4 through 0 of this mode register. When the FIFO level falls back to the programmed level, the RFR_N signal is turned on, or clear (0). When this feature is off, the RFR_N signal can be used by normal signal port bit manipulation (see UART_DM_CR register).

SPS_GSBI1_UART_DM_MR1 (cont.)

Bits	Name	Description
6	CTS_CTL	When this bit is set(1), the transmitter checks the CTS_N input to determine whether to begin transmission of a new character. If CTS_N is low, the character is sent. Otherwise the transmitter continues marking until CTS_N goes low, then the next character is transmitted. A change on CTS_N during the transmission of a character has no effect on that character. When this bit is clear(0), the CTS_N input for the channel has no effect on the transmitter.
5:0	AUTO_RFR_LEVEL0	See the description of bit 8 (AUTO_RFR_LEVEL1).

0x12450004 SPS_GSBI1_UART_DM_MR2

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI1_UART_DM_MR2

Bits	Name	Description
9	RX_ERROR_CHAR_OFF	When this bit is asserted, characters with parity or framing errors don't enter RX FIFO. Otherwise they enter RX FIFO.
8	RX_BREAK_ZERO_CHAR_OFF	When this bit is asserted, the zero character received at rx_break doesn't enter RX FIFO. Otherwise it enters RX FIFO.
7	LOOPBACK	Internal use only
6	ERROR_MODE	This bit controls the operation of the two FIFO status bits for the channel (parity or framing error and received break). · When clear (0), the UART operates in character mode and the status bits apply only to the character at the top of the FIFO. · When set (1), the UART operates in block mode and both bits are the "OR" of the status for all previously received characters arriving after the last `reset error status' command was issued (see CR register).
5:4	BITS_PER_CHAR	These bits determine how many bits are transmitted or received per character, not including the start, stop, and parity bits. 0x0: 5 bits 0x1: 6 bits 0x2: 7 bits 0x3: 8 bits

SPS_GSBI1_UART_DM_MR2 (cont.)

Bits	Name	Description
3:2	STOP_BIT_LEN	This field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 9/16, 1, 1+ 9/16, and 2 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. 0x0: 0.563 (9/16 bit times) 0x1: 1.000 bit time 0x2: 1.563 (1+9/16 bit times) 0x3: 2.000 bit times
1:0	PARITY_MODE	These bits determine which parity mode is used. The user can select between odd, even, space, or no parity. 0x0: no parity 0x1: odd parity 0x2: even parity 0x3: space parity

0x12450008 SPS_GSBI1_UART_DM_CSR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_CSR register is the UART clock selection register. This register is used in conjunction with the UART M/N counter registers to determine the bit rate for the transmitter and receiver. The transmitter and receiver can be clocked at different rates.

The rates below are based on a uart_dm_clk rate of 1.8432 MHz (115.2 * 16).

Table 28-12 lists the hexadecimal values for the clock select field and the corresponding data rates.

Table 20-10 Hexadecimal values for clock select field and corresponding data rates

CLK SEL value	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Bit rate (b/sec)	75	150	300	600	1200	2400	3600	4800	7200	9600	14.4k	19.2k	28.8k	38.4k	57.6k	115.2k

SPS_GSBI1_UART_DM_CSR

Bits	Name	Description
7:4	UART_RX_CLK_SEL	Use the CLK SEL values in Table 28-12 to select the appropriate receive and transmit bit rates.
3:0	UART_TX_CLK_SEL	

0x12450070 SPS_GSBI1_UART_DM_TF

Type: Write
Clock: AHB_CLK
Reset State: Undefined

In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM TX FIFO.

SPS_GSBI1_UART_DM_TF

Bits	Name	Description
31:0	UART_TF	The UART_TF register is the UART transmit FIFO register. This register is used to access the channel transmit FIFO. If the FIFO is full at the time of writing, the character is lost and an interrupt is generated (see UART_DM_IMR register).

0x12450074 SPS_GSBI1_UART_DM_TF_2

Type: Write
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_TF_2

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x12450078 SPS_GSBI1_UART_DM_TF_3

Type: Write
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_TF_3

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x1245007C SPS_GSBI1_UART_DM_TF_4

Type: Write
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_TF_4

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x12450010 SPS_GSBI1_UART_DM_CR

Type: Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_CR register is the UART command register. This register is used to issue specific commands to the UART subsystem. This register is updated asynchronously.

CAUTION Do not reset the transmitter and disable it at the same time. Do not reset the receiver and disable it at the same time.

Table 20-11 UART DM command values

Value	Description	Result
0	Null command	Does nothing.
1	Reset receiver	Resets the receiver as if a hardware reset were issued. The receiver is disabled and the FIFO, packing buffer and shift registers are flushed.
2	Reset transmitter	Resets the transmitter as if a hardware reset were issued. The transmitter signal goes high (marking) and the FIFO, unpacking register and shift register are flushed.
3	Reset error status	Clears the overrun error and hunt char received status bits in both the character and block error modes. In the block error mode, it clears the error status and received break.
4	Reset break change interrupt	Clears the break change interrupt status bit.
5	Start break	Forces the transmitter signal low. The transmitter must be enabled. If the transmitter is busy, the break is started when all characters in the transmit FIFO and the transmit shift register have been completely sent.
6	Stop break	If executed while channel is breaking, this command causes the transmitter signal to go high. The signal remains high for at least one bit time before sending out a new character.
7	Reset CTS_N	Clears ISR bit 5.
8	Reset stale interrupt	Clears the stale interrupt.

Table 20-11 UART DM command values

Value	Description	Result
9	Packet mode	Turns on the sample data mode, which causes the receiver to sample the receive data stream at 16 times the programmed baud rate. The data is sampled with the start of the start bit, or the first data bit, and continued until the marking state. To exit this state, write 1100 in the command field.
A	test_parity_on	Internal use only.
B	test_frame_on	Internal use only.
C	Mode reset	Turns off the sample data mode.
D	Set RFR_N	Asserts the ready for receiving signal (active low).
E	Reset RFR_N	De-asserts the ready for receiving signal.
F	uart_reset_int	Internal use only.
10	Reset TX_ERROR	Clears TX_ERROR
11	Clear TX_DONE	Clears the TX_DONE interrupt (ISR bit 9)
12	Reset break start interrupt	Clears the break start interrupt status bit.
13	Reset break end interrupt	Clears the break end interrupt status bit.
14	Reset par_frame_err interrupt	Clears the par_frame_err interrupt status bit.

Table 20-12 UART DM command values

Value	Description	Result
0	Null command	Does nothing.
1	CR Protection Enable	Enables CR HW protection. When two consecutive writes to the CR are detected, the second write is delayed until the command of the first write is finished. The delay is done by de-asserting the AHB ready and this ensures that the first command completes and the second one will be executed right afterward.
2	CR Protection Disable	Disables CR HW protection. SW is responsible for managing delay between writes to the CR register.
3	Reset TX-Ready interrupt	Clears the TX_READY interrupt.
5	Enable Stale Event	Enables the `stale event' mechanism. See Software Procedures.
6	Disable Stale Event	Disables the `stale event' mechanism. See Software Procedures.
4	SW Force Stale	Causes a `stale event' (even if `stale event' is disabled). See Software Procedures.
7	RESERVED	

SPS_GSBI1_UART_DM_CR

Bits	Name	Description
11	CHANNEL_COMMAND_MSB	This is the msb of the CHANNEL_COMMAND bit field.
10:8	GENERAL_COMMAND	Writing the appropriate value to these bits executes the commands that are listed in Table.
7:4	CHANNEL_COMMAND_LSB	Writing the appropriate value to these bits along with bit 11,executes the commands that are listed in Table 28-13.
3	UART_TX_DISABLE	This command terminates the operation of the transmitter after any character in the transmit shift register is sent.
2	UART_TX_EN	This command enables the operation of the transmitter.
1	UART_RX_DISABLE	This command immediately terminates the operation of the channel receiver and any incoming characters are lost. None of the receiver status bits are affected by this command and characters that are already in the receive FIFO remain there.
0	UART_RX_EN	This command enables the channel receiver.

0x12450014 SPS_GSBI1_UART_DM_IMR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IMR register is the UART interrupt mask register. This register is used to enable the corresponding functions in the UART_DM_ISR register. Setting (1) a bit in the UART_DM_IMR register causes an interrupt to be generated, if the corresponding bit in the UART_DM_ISR register is set. Clearing (0) a bit in the UART_DM_IMR register causes the setting of the corresponding bit in the UART_DM_ISR register to have no effect on the interrupt signal.

Bit 6 of the UART_DM_IMR register, CURRENT_CTS, is slightly different. If the current value of the CTS is one (1), no interrupt is generated. However, the user can use bit 6 in this register to mask the CTS value when reading the UART_DM_MISR register or as a general-purpose bit.

SPS_GSBI1_UART_DM_IMR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	This bit is asserted in the same condition at which PAR_FRAME_ERR status bit is asserted. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x14.
11	RXBREAK_END	This bit is set (1) if the end of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x13.

SPS_GSBI1_UART_DM_IMR (cont.)

Bits	Name	Description
10	RXBREAK_START	This bit is set (1) if the start of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x12.
9	TX_DONE	This bit is used only in UIM/SIM_IF mode. Set (1) this bit when the last byte in the transmitter has been sent. · This bit is generated only when SIM_GLUE_GEN generic equals 1.
8	TX_ERROR	Only used in UIM_IF mode. Set (1) this bit to indicate that there has been parity error during transmission. To clear the detection logic associated with this function, write CR[11;7:4]=0x10. · This bit is generated only when SIM_GLUE_GEN generic equals 1.
7	TX_READY	This bit, when set(1), indicates that: 1. TX FIFO is empty. 2. The value written in NO_CHARS_FOR_TX register equals the number of bytes written to the TX FIFO since the register was updated. Note: There may be characters in the unpack buffer or in the shift register. This bit is cleared by issuing `clear TX ready' command (see UART_DM_CR register).
6	CURRENT_CTS	This bit indicates the current state of the CTS input. It never generates an interrupt.
5	DELTA_CTS	This bit, when set (1), indicates that the CTS input has changed states. To clear the detection logic associated with this function, write CR[7:4]=0x7.
4	RXLEV	This bit is set when a character is loaded into the receive FIFO that brings the total number of characters in the FIFO above the programmed watermark level in the FIFO watermark register (RFWR). This bit is cleared after enough characters have been read to bring the level equal to or below the programmed watermark level.
3	RXSTALE	This bit indicates that a `stale event' occurred. See Software procedures for the exact timing of this interrupt. It is cleared by issuing a reset-stale command (see CR register).
2	RXBREAK_CHANGE	This bit is set (1) if the start or end of a break condition is detected. The logic associated with this condition is cleared (0) by writing CR[7:4]=0x4. A detected break is defined as an all-zeros character with an invalid stop bit AND LOW PARITY. The end of a break is defined as a mark condition (1) at least 1/2 bit width. A detected break occupies one position in the Rx FIFO.
1	RXHUNT	This bit is set (1) when an incoming character matches the value programmed into the UART_DM_HCR register. This condition is cleared (0) by issuing a reset error status command (CR[7:4]=0x3).

SPS_GSBI1_UART_DM_IMR (cont.)

Bits	Name	Description
0	TXLEV	This bit is set (1) when a character which is transferred from the transmit FIFO to the transmit shift register brings the total number of characters in the FIFO below or equal to the programmed watermark level in the UART_DM_TFWR register. This bit is cleared (0) after enough characters have been written to the FIFO to bring the level above the programmed watermark level.

0x12450018 SPS_GSBI1_UART_DM_IPR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0xffffff9f

The UART_DM_IPR register is the UART interrupt programming register.

SPS_GSBI1_UART_DM_IPR

Bits	Name	Description
31:7	STALE_TIMEOUT_MSB	These bits are the STALE_TIMEOUT bit field. The stale character time-out duration field contains a number from 1 to 2^30 -1. This number determines how many character times must elapse before a `stale event' is generated. This character time is defined as 10 times the bit rate. It is reset whenever a data bit is received. Do not clear (0) this register if the stale character time-out interrupt is enabled. Note the discontinuity in the bit assignments.
6	SAMPLE_DATA	Setting (1) this bit enables the new sample data mode, which means that the start bit is sampled as well as the rest, when in sample data mode. See the CR register, CHANNEL_COMMAND bit for more information.
5	RESERVED	
4:0	STALE_TIMEOUT_LSB	This bit field is the LSbits of the STALE_TIMEOUT bit field.

0x1245001C SPS_GSBI1_UART_DM_TFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_TFWR register is the UART transmit FIFO watermark register.

SPS_GSBI1_UART_DM_TFWR

Bits	Name	Description
31:0	TFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the transmit FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of TX words in the FIFO) is less than or equal to the value in TFWR. See UART_DM_IMR register. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x12450020 SPS_GSBI1_UART_DM_RFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RFWR register is the UART receive FIFO watermark register.

SPS_GSBI1_UART_DM_RFWR

Bits	Name	Description
31:0	RFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the receive FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of words in the RX FIFO) is greater than the value in RFWR. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x12450024 SPS_GSBI1_UART_DM_HCR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI1_UART_DM_HCR

Bits	Name	Description
7:0	DATA	The UART_DM_HCR register is the UART hunt character register, which contains the character for which the receiver looks to assert a hunt character received interrupt.

0x12450034 SPS_GSBI1_UART_DM_DMRX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI1_UART_DM_DMRX

Bits	Name	Description
24:0	RX_DM_CRCI_CHARS	In the DM mode, the number of chars in the Rx FIFO that are used for CRCI handshake with the DM. The written value of RX_DM_CRCI_ CHARS must be a multiple of 16(bits [3:0] are treated as 0x0). After a value is written, the UART will generate CRCI requests as long as RX_DM_CRCI_CHARS is non zero. Read of DMRX register gives the number of characters that were received since the end of the last transfer. It is reset at the end of each Rx transfer Also is used by the software to indicate `transfer initialization'. See Software procedures.

0x12450038 SPS_GSBI1_UART_DM_IRDA

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IRDA register enables the IRDA function, selects a loopback, and allows inversion of RX and TX data. This register also controls the IRDA transceiver that optionally interfaces between the UART and the DP_RX_DATA and DP_TX_DATA pins.

The UART proper is a standard RX/TX configuration that converts the serial pin input and output lines to 8-bit data for the microprocessor. The configuration contains receive and transmit blocks, a control block, a bit rate generator for RX and TX, and FIFO interfaces with the microprocessor data bus. The IRDA register provides the means of switching IRDA circuits into the serial I/O lines and the IRDA function is normally switched out. The IRDA modulator/demodulator may be enabled or disabled under microprocessor control. When enabled, the RX and TX data paths have individual inversion select bits, so external true or inverted drivers may be used in the signal path.

- The register is generated only when IRDA_IFC_GEN generic equals 1.

SPS_GSBI1_UART_DM_IRDA

Bits	Name	Description
4	MEDIUM_RATE_EN	· Set (1) for 1/4 bit-time pulse length (Medium rate) · Clear (0) for 3/16 bit-time pulse length (Low rate)
3	IRDA_LOOPBACK	· This bit loops the IRDA modulated TX line back into the IRDA RX line. The normal UART loopback mode must be off in order to see this effect.

SPS_GSBI1_UART_DM_IRDA (cont.)

Bits	Name	Description
2	INVERT_IRDA_TX	This bit inverts the polarity of the IRDA modulated signal on the DP_TX_DATA pin. · Set (1) this bit for an inverted polarity. · Clear (0) this bit for a non-inverted polarity.
1	INVERT_IRDA_RX	This bit inverts the polarity of the IRDA received signal on the DP_RX_DATA pin. · Set (1) this bit for inverted the polarity. · Clear (0) this bit for non-inverted polarity.
0	IRDA_EN	· Set (1) this bit to enable the IRDA transceiver. · Clear (0) this bit to bypass the IRDA transceiver and ignore the other bits of this register.

0x1245003C SPS_GSBI1_UART_DM_DMEN

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_DMEN register indicates if Data Mover is enabled for TX and RX channels.

SPS_GSBI1_UART_DM_DMEN

Bits	Name	Description
1	RX_DM_EN	· Set (1) this bit to enable RX DM interface. · Clear (0) this bit to disable RX DM interface. Clearing this bit requires resetting the receiver (see UART_DM_CR register).
0	TX_DM_EN	Set (1) this bit to enable TX DM interface. Clear (0) this bit to disable TX DM interface.

0x12450040 SPS_GSBI1_UART_DM_NO_CHARS_FOR_TX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI1_UART_DM_NO_CHARS_FOR_TX

Bits	Name	Description
23:0	TX_TOTAL_TRANS_LEN	The total number of characters for transmission. Before writing a new value, the TX FIFO must be empty (as indicated by TX_READY interrupt in IMR register or after a reset). It is used by the transmitter to calculate how many characters to transmit in the last word. In DM mode, it is also used for the CRCI mechanism. Any additional writes to the TX FIFO above TX_TOTAL_TRANS_LEN will be discarded. A TX_READY interrupt is triggered after TX_TOTAL_TRANS_LEN number of characters were moved from the TX FIFO to the unpacking register (not all may have been sent).

0x12450044 SPS_GSBI1_UART_DM_BADR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_BADR

Bits	Name	Description
31:2	RX_BASE_ADDR	RX FIFO base address. Both FIFOs use the same RAM (2^RAM_ADDR_WIDTH, 32-bit entries). This register controls the division of the memory to the RX and TX FIFOs. The division is a multiple of 4 entries, since the DM's burst length is 4. The size of the TX FIFO equals RX_BASE_ADDR. The size of the RX FIFO is 2^RAM_ADDR_WIDTH - RX_BASE_ADDR. ® The default is RX_BASE_ADDR = 2^(RAM_ADDR_WIDTH - 1) ® Only RAM_ADDR_WIDTH -1:2 bits are generated.
1:0	UNUSED	

0x12450048 SPS_GSBI1_UART_DM_TESTSL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI1_UART_DM_TESTSL

Bits	Name	Description
4	TEST_EN	Test bus enable
3:0	TEST_SEL	Test bus selector

0x12450060 SPS_GSBI1_UART_DM_MISR_MODE

Type: Read/Write
Clock: WR_CLK

SPS_GSBI1_UART_DM_MISR_MODE

Bits	Name	Description
31:2	RESERVED	unused.
1:0	MODE	0x0: Disabled 0x1: Enabled,TX test 0x2: Enabled, RX test

0x12450064 SPS_GSBI1_UART_DM_MISR_RESET

Type: Write
Clock: WR_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_MISR_RESET

Bits	Name	Description
31:1	RESERVED	unused.
0	RESET	

0x12450068 SPS_GSBI1_UART_DM_MISR_EXPORT

Type: Read/Write
Clock: WR_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_MISR_EXPORT

Bits	Name	Description
31:1	RESERVED	unused.
0	EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., what is the result of the muxing of all the input data streams with <BLOCK>_TEST_MODE) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x1245006C SPS_GSBI1_UART_DM_MISR_VAL

Type: Read
Clock: WR_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_MISR_VAL

Bits	Name	Description
9:0	VAL	Current MISR state

0x12450080 SPS_GSBI1_UART_DM_SIM_CFG

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_SIM_CFG register is used to configure the SIM interface for the UART.

- The register is generated only when SIM_GLUE_GEN generic equals 1.

SPS_GSBI1_UART_DM_SIM_CFG

Bits	Name	Description
17	UIM_TX_MODE	When this bit is set (1), the transmission portion of the SIM interface operates in block mode (T=1). When clear (0), the transmission portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
16	UIM_RX_MODE	When this bit is set (1), the receive portion of the SIM interface operates in block mode (T=1). When clear (0), the receive portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
15:8	SIM_STOP_BIT_LEN	In UIM_IF mode, this field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 1 to 254 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. ..... 11 111110: 254 bit times 0x1: 1 bit times 0x2: 2 bit times
7	SIM_CLK_ON	When this bit is set(1), the UIM_CLK is turned on at either the TD8 or TD4 frequency, as indicated by bit6(UIM_CLK_TD8_SEL). When this bit is cleared, the UIM_CLK is stopped either LOW or HIGH, as indicated by bit 5(UIM_CLK_STOP_HIGH).

SPS_GSBI1_UART_DM_SIM_CFG (cont.)

Bits	Name	Description
6	SIM_CLK_TD8_SEL	This bit selects the UIM_CLK frequency at which the UIM_CLK is turned on. 0x1: TD8 (the UIM_CLK runs at the TD8 frequency) 0x0: TD4 (the UIM_CLK runs at the TD4 frequency)
5	SIM_CLK_STOP_HIGH	This bit indicates at what point - high or low - the UIM_CLK will stop. 0x1: high 0x0: low
4	SIM_CLK_SEL	unused
3	MASK_RX	Setting (1) this bit masks off any 0 on the RX line, which prevents the receiver from seeing the START bit. Set (1) this bit if you do not want to receive the data you transmit.
2	SWAP_D	Setting (1) this bit causes the UIM_IF to swap the 8 data bits (making MSB into LSB, bit 6 into bit1, and so on) before it is read by the microprocessor.
1	INV_D	Set (1) this bit to cause the UIM_IF to invert the 8 data bit before it is read by the microprocessor.
0	SIM_SEL	Set (1) this bit to designate the UIM_IF mode of operation.

0x12450084 SPS_GSBI1_UART_DM_TEST_WR_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI1_UART_DM_TEST_WR_ADDR

Bits	Name	Description
31:0	TEST_WR_ADDR	RAM address at which to write the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x12450088 SPS_GSBI1_UART_DM_TEST_WR_DATA

Type: Write
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_TEST_WR_DATA

Bits	Name	Description
31:0	TEST_WR_DATA	The test data to be written to the RAM. Write to this register triggers the write to the RAM, to TEST_WR_ADDR address.

0x1245008C SPS_GSBI1_UART_DM_TEST_RD_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI1_UART_DM_TEST_RD_ADDR

Bits	Name	Description
31:0	TEST_RD_ADDR	RAM address from which to read the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

20.36.2 Read registers

NOTE The addresses of the read-only registers are mapped into the same addresses of the four write-only registers in the section above this one. They are: UART_DM_CSR, UART_DM_TF, UART_DM_CR, and UART_DM_IMR, respectively.

0x12450008 SPS_GSBI1_UART_DM_SR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_SR register is the UART status register. This register is used to obtain the current state of the UART subsystem. This register is updated asynchronously.

SPS_GSBI1_UART_DM_SR

Bits	Name	Description
8	RX_BREAK_START_LAST	When break start is detected, this bit is set (1). When break end was detected, this bit is reset (0).
7	HUNT_CHAR	When set (1), this bit indicates that the programmed character in the UART_DM_HCR register was received. If programmed, this condition causes the RXHUNT bit to be set (1) in the UART_DM_ISR register. This bit is cleared by issuing a reset error status command.
6	RX_BREAK	When set (1), this bit indicates that an all-zero character of the programmed length was received without a stop bit. If a break begins in the middle of a character, it is detected if the condition remains until the end of the next character time. Only one all zero character is written into the FIFO upon receiving the break. After the RX input returns high for at least half a bit time, then more characters are accepted by the receiver. Whenever the break condition starts or stops as defined above, the RXBREAK bit is set (1) in the UART_DM_ISR register. This bit is appended to the character in the receive FIFO.

SPS_GSBI1_UART_DM_SR (cont.)

Bits	Name	Description
5	PAR_FRAME_ERR	A parity error occurs if parity is programmed to be checked and an incoming character is received with incorrect parity. A framing error occurs when the RX input is low while the stop bit is being sampled. This bit is sampled in the middle of the first stop bit position, regardless of the programmed length of the stop bit. This error bit is appended to the character in the receive FIFO.
4	UART_OVERRUN	An overrun error occurs if one or more incoming characters are lost. This happens when the receive FIFO is full, the packing buffer is full and another character has been received in the shift register. The character in the receive shift register is lost. Upon overrun, this status bit remains high until cleared by a reset error status command.
3	TXEMT	This bit is set (1) when the transmitter under-runs. It is set after the transmission of the stop bit at the end of a character, if there are no characters waiting to be sent. It is reset when a character is written to the transmit FIFO.
2	TXRDY	This bit indicates that the transmit FIFO has space in it. It is reset when the FIFO becomes full and set when space becomes available again. Any characters that are written to the FIFO while this bit is low is lost.
1	RXFULL	This bit is set (1) when the receive FIFO becomes full. It is reset when the CPU reads a word.
0	RXRDY	This bit is set (1) when there is a word in the receive FIFO waiting to be read. It is reset when the last word currently stored in the FIFO is read.

0x12450070 SPS_GSBI1_UART_DM_RF

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RF register is the UART receive FIFO register, which is used to access the channel receive FIFO. In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM RX FIFO.

SPS_GSBI1_UART_DM_RF

Bits	Name	Description
31:0	UART_RF	This register returns the next value in the receive FIFO. After the read is completed, the FIFO read pointer is updated to make the next character available.

0x12450074 SPS_GSBI1_UART_DM_RF_2

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_RF_2

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x12450078 SPS_GSBI1_UART_DM_RF_3

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_RF_3

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x1245007C SPS_GSBI1_UART_DM_RF_4

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_RF_4

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x12450010 SPS_GSBI1_UART_DM_MISR

Type: Read
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI1_UART_DM_MISR

Bits	Name	Description
12:0	UART_MISR	The UART_DM_MISR register is the masked interrupt status register. A read from this register returns the "AND" of the UART_DM_ISR and the UART_DM_IMR registers. This register is updated asynchronously. This bit field is misr <= (isr(12 DOWNTO 7) AND imr(12 DOWNTO 7)) & '0' & (isr(5 DOWNTO 0) AND imr(5 DOWNTO 0)).

0x12450014 SPS_GSBI1_UART_DM_ISR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_ISR register is the UART interrupt status register. This register provides the current status of the possible interrupt conditions. If one of these bits is set (1), and the corresponding bit in the UART_DM_IMR register is set (1), an interrupt is generated (with the exception of bit 6, CURRENT_CTS - see the description of the UART_DM_IMR register). If the corresponding bit in the UART_DM_IMR register is clear (0), setting one of these bits has no effect on the UART interrupt request signal. This register is updated asynchronously.

SPS_GSBI1_UART_DM_ISR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	· See UART_DM_IMR on page 28-9
11	RXBREAK_END	· See UART_DM_IMR on page 28-9
10	RXBREAK_START	· See UART_DM_IMR on page 28-9
9	TX_DONE	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
8	TX_ERROR	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
7	TX_READY	See UART_DM_IMR on page 28-9, for descriptions of the UART_DM_ISR bits.
6	CURRENT_CTS	
5	DELTA_CTS	
4	RXLEV	
3	RXSTALE	
2	RXBREAK	
1	RXHUNT	
0	TXLEV	

0x12450038 SPS_GSBI1_UART_DM_RX_TOTAL_SNAP

Type: Read
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI1_UART_DM_RX_TOTAL_SNAP

Bits	Name	Description
23:0	RX_TOTAL_BYTES	'RX_TOTAL_SNAP register holds the number of characters received since the end of last Rx transfer. It is updated at the end of an Rx transfer (see Software procedures). Rx transfer ends when one of the conditions is met: · The number of characters which were received since the end of the previous transfer equals the value which was written to DMRX at "Transfer initialization". · A stale event occurred (flush operation already performed if was needed).

0x1245004C SPS_GSBI1_UART_DM_TXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_TXFS

Bits	Name	Description
31:14	TX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bit field. · Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	TX_ASYNC_FIFO_STATE	TX asynchronous fifo status - number of characters in the TX asynchronous FIFO.
9:7	TX_BUFFER_STATE	TX unpacking buffer status - number of bytes in the unpacking buffer
6:0	TX_FIFO_STATE_LSB	TX FIFO status - number of words in the TX FIFO

0x12450050 SPS_GSBI1_UART_DM_RXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_RXFS

Bits	Name	Description
31:14	RX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bit field. Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	RX_ASYNC_FIFO_STATE	RX asynchronous fifo status - number of characters in the RX asynchronous FIFO.
9:7	RX_BUFFER_STATE	RX packing buffer status - number of bytes in the packing buffer
6:0	RX_FIFO_STATE_LSB	The number of entries in the RX FIFO that have at least one valid character. It is incremented each time a word is moved from the packing register to the RX FIFO. It is decremented each time a word is read from the RX FIFO. Note: The Uart does not keep track of non-valid characters in each word. (See Software procedures).

0x12450090 SPS_GSBI1_UART_DM_TEST_RD_DATA

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI1_UART_DM_TEST_RD_DATA

Bits	Name	Description
31:0	TEST_RD_DATA	Read from this register triggers the read from the RAM. The register will hold, after read access, data which is found at TEST_RD_ADDR address in the RAM.

20.37 SPS GSBI1 QUP Registers (0x12460000 SPS_QUP1_BASE)

This section contain Smart Peripheral System GBSI 1 QUP registers.

20.37.1 QUP core registers

0x12460000 SPS_GSBI1_QUP_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).

b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:

- N equals 8 or less - shift 24
- N equals 16 to 9 - shift 16
- N equals 24 to 17 - shift 8
- N equals 32 to 25 - no shift

The MINI_CORE clock selected is as follows:

Null: cc_qup_core_clk

SPI: cc_spi_master_clk

SPS_GSBI1_QUP_CONFIG

Bits	Name	Description
31:14	RESERVED_1	reserved
13	CORE_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).
12	APP_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).

SPS_GSBI1_QUP_CONFIG (cont.)

Bits	Name	Description
11:8	MINI_CORE	value: 0000 Null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 I2C slave controller value: 0100 Reserved (I2C master & slave for loop back operation) value: 0101 Reserved (map to null core) value: 0110 Reserved (map to null core value: 0111 Reserved (map to null core) See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a "don't care". The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS _N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	RESERVED_2	Reserved.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x12460004 SPS_GSBI1_QUP_STATE

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000000XX100

SPS_GSBI1_QUP_STATE

Bits	Name	Description
31:5	RESERVED	reserved.
4	I2C_MAST_GEN	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.

SPS_GSBI1_QUP_STATE (cont.)

Bits	Name	Description
1:0	STATE	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to "01", the mini-core and related logic is released from reset and enters the RUN_STATE. When set to "11", the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete. See notes 1 and 2. Note 1: SPI - the "next appropriate point in time" is the next time SPI_CS _N de-asserts. If SPI_CS _N is not asserted when the PAUSE_STATE is entered, the SPI_CS _N is maintained in the not asserted state. The PAUSE_STATE is not available for SLAVE operation. Note 2: I2C -

0x12460008 SPS_GSBI1_QUP_IO_MODES

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000XXXXXXXX

Unless otherwise stated, register bits written return the value when read.

Notes:

a. "Packing" occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. "UnPacking" occurs as follows:

- N equals 8 or less - unpack four values from each QUP output FIFO word.
- N equals 16 to 9 - unpack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

SPS_GSBI1_QUP_IO_MODES

Bits	Name	Description
31:17	RESERVED	reserved
16	OUTPUT_BIT_SHIFT_EN	If set, enables the QUP output FIFO block to do bit shifting on the output data.

SPS_GSBI1_QUP_IO_MODES (cont.)

Bits	Name	Description
15	PACK_EN	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 6x BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode and Data_Mover_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16 BLOCK_SIZE
1:0	OUTPUT_BLOCK_SIZE	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x1246000C SPS_GSBI1_QUP_SW_RESET

Type: Write/cmd
Clock: CRIF_CLK
Reset State: 0x0000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero.

SPS_GSBI1_QUP_SW_RESET

Bits	Name	Description
31:0	RESERVED	NA

0x12460010 SPS_GSBI1_QUP_TIME_OUT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies if the QUP_MX_OUTPUT_COUNT register and/or QUP_MX_INPUT_COUNT register are enabled. Additionally, this register only applies to Block_Mode and Data_Mover_Mode. The timer starts "ticking" when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The timer pauses for the PAUSE_STATE. If the timer expires before the QUP_MX_OUTPUT_COUNT and/or QUP_MX_INPUT_COUNT are exhausted, then the TIME_OUT_ERR flag is set in the QUP_ERROR_FLAGS register and the interrupt gsbi_qup_irq may be asserted.

SPS_GSBI1_QUP_TIME_OUT

Bits	Name	Description
15:0	TIME_OUT_VALUE	Specifies time out value in units of cc_qup_app clock ticks. A value of zero indicates the timer function is not enabled for use. See QUP_CONFIG register for information on clocks.

0x12460014 SPS_GSBI1_QUP_TIME_OUT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

SPS_GSBI1_QUP_TIME_OUT_CURRENT

Bits	Name	Description
31:0	TIME_OUT_CURRENT	Current value of time-out counter.

0x12460018 SPS_GSBI1_QUP_OPERATIONAL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0080

SPS_GSBI1_QUP_OPERATIONAL

Bits	Name	Description
31:10	RESERVED_1	reserved.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Data_Mover_Mode.
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Data_Mover_Mode.
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowledges software has or will read the data. Valid only in all modes.
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowledges software has or will read the data. Valid only in all modes.
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.
3:0	RESERVED_2	reserved.

0x1246001C SPS_GSBI1_QUP_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

SPS_GSBI1_QUP_ERROR_FLAGS

Bits	Name	Description
31:7	RESERVED_1	reserved.
6	TIME_OUT_ERR	The time out limit for a given transfer has been reached.
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ER R	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.
1:0	RESERVED_2	reserved

0x12460020 SPS_GSBI1_QUP_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x007C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of gsbi_qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

SPS_GSBI1_QUP_ERROR_FLAGS_EN

Bits	Name	Description
31:7	RESERVED_1	reserved
6	TIME_OUT_ERR_EN	If set, enables time out error generation.
5	OUTPUT_OVER_RUN_ERR _EN	If set, enables output over run error generation.

SPS_GSBI1_QUP_ERROR_FLAGS_EN (cont.)

Bits	Name	Description
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.
1:0	RESERVED_2	reserved

0x12460024 SPS_GSBI1_QUP_TEST_CTRL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register enables QUP test bus to be actively driven by QUP core signals.

SPS_GSBI1_QUP_TEST_CTRL

Bits	Name	Description
31:1	RESERVED	reserved
0	QUP_TEST_BUS_EN	If set, enables QUP core to actively drive test bus. If zero, the core drives the test bus to all zeros.

20.37.2 QUP output FIFO registers

0x12460100 SPS_GSBI1_QUP_MX_OUTPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not effect the count.

Notes:

a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

SPS_GSBI1_QUP_MX_OUTPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_COUNT	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x12460104 SPS_GSBI1_QUP_MX_OUTPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

SPS_GSBI1_QUP_MX_OUTPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x12460108 SPS_GSBI1_QUP_OUTPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

This register holds the output data hanging out of the QUP output FIFO ready be loaded into the mini-core for the next load operation. This corresponds to signal qup_data_out going into the mini-core block.

SPS_GSBI1_QUP_OUTPUT_DEBUG

Bits	Name	Description
31:0	OUTPUT_DEBUG_DATA	Value waiting at the exit of output FIFO.

0x1246010C SPS_GSBI1_QUP_OUTPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the

value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

SPS_GSBI1_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	OUTPUT_FIFO_WORD_CNT	Number of words in the output FIFO.

0x12460110+4*c SPS_GSBI1_QUP_OUTPUT_FIFOc, c=[0..15]

Type: Write
Clock: CRIF_CLK
Reset State: 0x0000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

SPS_GSBI1_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x12460150 SPS_GSBI1_QUP_MX_WRITE_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the gsbi_qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

SPS_GSBI1_QUP_MX_WRITE_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_COUNT	The number of "writes" of size N. This is used only if the core is in FIFO_Mode.

0x12460154 SPS_GSBI1_QUP_MX_WRITE_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

SPS_GSBI1_QUP_MX_WRITE_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

20.37.3 QUP input FIFO registers

0x12460200 SPS_GSBI1_QUP_MX_INPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

SPS_GSBI1_QUP_MX_INPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_COUNT	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x12460204 SPS_GSBI1_QUP_MX_INPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

SPS_GSBI1_QUP_MX_INPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x12460208 SPS_GSBI1_QUP_MX_READ_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

SPS_GSBI1_QUP_MX_READ_COUNT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_COUNT	The number of "reads" of size N. This is used only if the core is in FIFO_Mode.

0x1246020C SPS_GSBI1_QUP_MX_READ_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

SPS_GSBI1_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x12460210 SPS_GSBI1_QUP_INPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the value of the last loaded in known-good-data into the QUP input FIFO. May be different from what the actual read of input FIFO will return because of packing enabled at the input side. This corresponds to signal qup_data_in coming from the mini-core block synchronized to the crif_clk.

SPS_GSBI1_QUP_INPUT_DEBUG

Bits	Name	Description
31:0	INPUT_DEBUG_DATA	Last known good value shifted into the input FIFO.

0x12460214 SPS_GSBI1_QUP_INPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

SPS_GSBI1_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

0x12460218+4*c SPS_GSBI1_QUP_INPUT_FIFOc, c=[0..15]

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

Consecutive reads to this address reads the input FIFO contents on a FIFO basis.The max address to read the input FIFO is 0x254.

SPS_GSBI1_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

20.37.4 SPI mini-core registers

0x12460300 SPS_GSBI1_SPI_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

SPS_GSBI1_SPI_CONFIG

Bits	Name	Description
31:11	RESERVED_1	Reserved.
10	HS_MODE	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
7:6	RESERVED_2	Reserved.
5	SLAVE_OPERATION	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.
4:0	RESERVED	Reserved.

0x12460304 SPS_GSBI1_SPI_IO_CONTROL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

SPS_GSBI1_SPI_IO_CONTROL

Bits	Name	Description
31:11	RESERVED	Reserved.
10	CLK_IDLE_HIGH	Use SPI_CLK_IDLE_HIGH when set.
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS _N respectively. Setting any of this bit to '1', makes the associated SPI_CS _N active HIGH. This field is a "don't care" in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_ N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a "don't care" in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS _N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS _N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x12460308 SPS_GSBI1_SPI_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

SPS_GSBI1_SPI_ERROR_FLAGS

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.

SPS_GSBI1_SPI_ERROR_FLAGS (cont.)

Bits	Name	Description
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x1246030C SPS_GSBI1_SPI_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0003

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

SPS_GSBI1_SPI_ERROR_FLAGS_EN

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x12460310 SPS_GSBI1_SPI_DEASSERT_WAIT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the de-assertion wait time of SPI_CS _N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

SPS_GSBI1_SPI_DEASSERT_WAIT

Bits	Name	Description
31:6	RESERVED	Reserved.

SPS_GSBI1_SPI_DEASSERT_WAIT (cont.)

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the de-asserted time of SPI_CS _N. Only applies to MASTER operation. For SLAVE operation, this field is a "don't care". A value of zero indicates SPI_CS _N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

20.37.5 I2C master mini-core registers

0x12460400 SPS_GSBI1_I2C_MASTER_CLK_CTL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_CLK_CTL register is a read/write register that controls clock divider values. This register should only be written to after it is confirmed that the I2C master mini-core is not longer in RESET state (QUP_STATE register).

SPS_GSBI1_I2C_MASTER_CLK_CTL

Bits	Name	Description
31:11	RESERVED	Reserved.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. The minimum value should be 3 hex (4 I2C_clk clocks per period) to ensure proper sampling of the bus. For a maximum high speed bit rate of 3.4 Mb/s (high speed mode), this would require a minimum 40.8 MHz I2C_clk clock. The maximum I2C_clk is 81.6 MHz. This register is reset to a maximum value of 7 hex. I2C_HS_CLK = I2C_CLK/(3*(HS_DIVIDER_VALUE+1)
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. The minimum value should be 3 hex to ensure proper sampling of the bus. For a maximum bit rate of 400 kb/s (fast mode), this would require a 4.8 MHz I2C_clk clock. For a maximum bit rate of 100 kb/s (standard mode), this would require a 1.2 MHz I2C_clk clock. Maximum I2C_clk for fast and standard modes are 206.4 MHz and 51.6 MHz respectively. This register is reset to a maximum value of 255 hex. I2C_FS_CLK = I2C_CLK/(2*(FS_DIVIDER_VALUE+3)

0x12460404 SPS_GSBI1_I2C_MASTER_STATUS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_STATUS is a status register. Writing a one clears the status bits.

SPS_GSBI1_I2C_MASTER_STATUS

Bits	Name	Description
31:26	RESERVED_1	Reserved.
25	INVALID_READ_SEQ	This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	This bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address).
23	INVALID_TAG	This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Reset, read_last_byte, mi_rec, dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: READ_LAST_BYTE_STATE Value 0x3: MI_REC_STATE Value 0x4: DEC_STATE Value 0x5: STORE_STATE
19:16	OUTPUT_FSM_STATE	This 4-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Reset, decode, send, mi_red, nop, nop_dec, invalid, invalid_dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: DECODE_STATE Value 0x3: SEND_STATE Value 0x4: MI_REC_STATE Value 0x5: NOP_STATE Value 0x6: INVALID_STATE Value 0x7: PEEK_STATE Value 0x8: SEND_R_STATE

SPS_GSBI1_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
15:13	CLK_STATE	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Reset_busidle, not_master, high, low, high_wait, forced_low, hs_addr_low or double_buffer_wait. Value 0x0: RESET_BUSIDLE_STATE Value 0x1: NOT_MASTER_STATE Value 0x2: HIGH_STATE Value 0x3: LOW_STATE Value 0x4: HIGH_WAIT_STATE Value 0x5: FORCED_LOW_STATE Value 0x6: HS_ADDR_LOW_STATE Value 0x7: DOUBLE_BUFFER_WAIT_STATE
12:10	DATA_STATE	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Reset, Tx addr, Tx HS addr, Tx 10-bit addr, Tx 2nd 10-bit addr byte, Tx data and Rx data. Value 0x0: RESET_WAIT_STATE Value 0x1: TX_ADDR_STATE Value 0x2: TX_DATA_STATE Value 0x3: TX_HS_ADDR_STATE Value 0x4: TX_10_BIT_ADDR_STATE Value 0x5: TX_2ND_BYTE_STATE Value 0x6: RX_DATA_STATE
9	BUS_MASTER	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.

SPS_GSBI1_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
4	ARB_LOST	This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.
3	PACKET_NACKED	This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1:0	RESERVED_2	Reserved.

20.38 SPS GSBI2 Registers (0x12480000 SPS_GSBI2_BASE)

This section contains Smart Peripheral System GSBI 2 registers.

20.38.1 GSBI CTRL Registers

0x12480000 SPS_GSBI2_GSBI_CTRL_REG

Type: Read/write
Clock: HCLK
Reset State: 0x00000000

SPS_GSBI2_GSBI_CTRL_REG

Bits	Name	Description
15:12	RESERVED	reserved
11:8	WRAPPER_CTRL	This field has no predefined use. When a wrapper is constructed around one or more GSBIs there may be a need to configure it. E.g., to select which of several GSBIs will be connected to a particular I2S block. All bits of this field emerge from GSBI as output ports which can be used for any such configuration task.
7	RESERVED_7	Reserved. The host can write and read this field, but its state has no effect on anything.
6:4	PROTOCOL_CODE	This field controls which protocol, if any, is applied to the GSBI's four I/O ports. Most codes assign a single protocol, but codes of "001" and "110" assigns I2C to two of the ports and UART (without flow control signals) or SIM to the other two. 0x0: Idle (null values are applied to all four GSBI I/Os) 0x1: I2C on 2 ports, SIM/R-UIM on other 2 0x2: I2C 0x3: SPI 0x4: UART with flow control (or IRDA) 0x5: SIM/R-UIM 0x6: I2C on 2 ports, UART (without HS flow ctrl on other 2) 0x7: Undefined
3:1	RESERVED_3_1	Reserved. The host can write and read this field, but its state has no effect on anything.
0	CRCI_MUX_CTRL	While this bit is low QUP CRCI ports are connected to the GSBI ports nominally for QUP and UART_DM CRCI ports are connected to the GSBI ports nominally for UART_DM. While this bit is high QUP CRCI ports are connected to the GSBI ports nominally for UART_DM and UART_DM CRCI ports are connected to nothing.

20.39 SPS GSBI2 UART DM Registers (0x12490000 SPS_UART2_DM_BASE)

This section contains Smart Peripheral System GSBI 2 UART DM registers.

UART_DM registers are accessible only by the ARM

This section contains the read and write registers for UART1.

20.39.1 Write and read/write registers

0x12490000 SPS_GSBI2_UART_DM_MR1

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_MR1 register is the UART mode register 1. It is used, along with UART_DM_MR2, to configure the operational mode of the UART.

SPS_GSBI2_UART_DM_MR1

Bits	Name	Description
31:8	AUTO_RFR_LEVEL1	These bits are used, along with bits 5:0 (AUTO_RFR_LEVEL0) to program the level in the receive FIFO at which the RFR_N signal is de-asserted, if programmed to do so (see RX_RDY_CTL field of this register). The level counts the number of words inside the RX FIFO. It doesn't count the character that is being received (shift register) or characters in the packing buffer. This value is programmed from 1 to 2^RAM_ADDR_WIDTH. The RFR_N signal is de-asserted when the RX FIFO level (the number of characters remaining in the RX FIFO) is greater than the level that is programmed into this register. · Only RAM_ADDR_WIDTH +1:8 bits are generated.
7	RX_RDY_CTL	Setting (1) this bit enables the automatic ready-for-receiving (RFR_N) control for the receiver. RFR_N is turned off, or set (1), when a valid start bit is received and the channel FIFO is at the level programmed in bits 4 through 0 of this mode register. When the FIFO level falls back to the programmed level, the RFR_N signal is turned on, or clear (0). When this feature is off, the RFR_N signal can be used by normal signal port bit manipulation (see UART_DM_CR register).

SPS_GSBI2_UART_DM_MR1 (cont.)

Bits	Name	Description
6	CTS_CTL	When this bit is set(1), the transmitter checks the CTS_N input to determine whether to begin transmission of a new character. If CTS_N is low, the character is sent. Otherwise the transmitter continues marking until CTS_N goes low, then the next character is transmitted. A change on CTS_N during the transmission of a character has no effect on that character. When this bit is clear(0), the CTS_N input for the channel has no effect on the transmitter.
5:0	AUTO_RFR_LEVEL0	See the description of bit 8 (AUTO_RFR_LEVEL1).

0x12490004 SPS_GSBI2_UART_DM_MR2

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI2_UART_DM_MR2

Bits	Name	Description
9	RX_ERROR_CHAR_OFF	When this bit is asserted, characters with parity or framing errors don't enter RX FIFO. Otherwise they enter RX FIFO.
8	RX_BREAK_ZERO_CHAR_OFF	When this bit is asserted, the zero character received at rx_break doesn't enter RX FIFO. Otherwise it enters RX FIFO.
7	LOOPBACK	Internal use only
6	ERROR_MODE	This bit controls the operation of the two FIFO status bits for the channel (parity or framing error and received break). · When clear (0), the UART operates in character mode and the status bits apply only to the character at the top of the FIFO. · When set (1), the UART operates in block mode and both bits are the "OR" of the status for all previously received characters arriving after the last `reset error status' command was issued (see CR register).
5:4	BITS_PER_CHAR	These bits determine how many bits are transmitted or received per character, not including the start, stop, and parity bits. 0x0: 5 bits 0x1: 6 bits 0x2: 7 bits 0x3: 8 bits

SPS_GSBI2_UART_DM_MR2 (cont.)

Bits	Name	Description
3:2	STOP_BIT_LEN	This field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 9/16, 1, 1+ 9/16, and 2 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. 0x0: 0.563 (9/16 bit times) 0x1: 1.000 bit time 0x2: 1.563 (1+9/16 bit times) 0x3: 2.000 bit times
1:0	PARITY_MODE	These bits determine which parity mode is used. The user can select between odd, even, space, or no parity. 0x0: no parity 0x1: odd parity 0x2: even parity 0x3: space parity

0x12490008 SPS_GSBI2_UART_DM_CSR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_CSR register is the UART clock selection register. This register is used in conjunction with the UART M/N counter registers to determine the bit rate for the transmitter and receiver. The transmitter and receiver can be clocked at different rates.

The rates below are based on a uart_dm_clk rate of 1.8432 MHz (115.2 * 16).

Table 20-13 lists the hexadecimal values for the clock select field and the corresponding data rates.

Table 20-13 Hexadecimal values for clock select field and corresponding data rates

CLK SEL value	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Bit rate (b/sec)	75	150	300	600	1200	2400	3600	4800	7200	9600	14.4k	19.2k	28.8k	38.4k	57.6k	115.2k

SPS_GSBI2_UART_DM_CSR

Bits	Name	Description
7:4	UART_RX_CLK_SEL	Use the CLK SEL values in Table 28-12 to select the appropriate receive and transmit bit rates.
3:0	UART_TX_CLK_SEL	

0x12490070 SPS_GSBI2_UART_DM_TF

Type: Write
Clock: AHB_CLK
Reset State: Undefined

In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM TX FIFO.

SPS_GSBI2_UART_DM_TF

Bits	Name	Description
31:0	UART_TF	The UART_TF register is the UART transmit FIFO register. This register is used to access the channel transmit FIFO. If the FIFO is full at the time of writing, the character is lost and an interrupt is generated (see UART_DM_IMR register).

0x12490074 SPS_GSBI2_UART_DM_TF_2

Type: Write
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_TF_2

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x12490078 SPS_GSBI2_UART_DM_TF_3

Type: Write
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_TF_3

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x1249007C SPS_GSBI2_UART_DM_TF_4

Type: Write
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_TF_4

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x12490010 SPS_GSBI2_UART_DM_CR

Type: Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_CR register is the UART command register. This register is used to issue specific commands to the UART subsystem. This register is updated asynchronously.

CAUTION Do not reset the transmitter and disable it at the same time. Do not reset the receiver and disable it at the same time.

Table 20-14 UART DM command values

Value	Description	Result
0	Null command	Does nothing.
1	Reset receiver	Resets the receiver as if a hardware reset were issued. The receiver is disabled and the FIFO, packing buffer and shift registers are flushed.
2	Reset transmitter	Resets the transmitter as if a hardware reset were issued. The transmitter signal goes high (marking) and the FIFO, unpacking register and shift register are flushed.
3	Reset error status	Clears the overrun error and hunt char received status bits in both the character and block error modes. In the block error mode, it clears the error status and received break.
4	Reset break change interrupt	Clears the break change interrupt status bit.
5	Start break	Forces the transmitter signal low. The transmitter must be enabled. If the transmitter is busy, the break is started when all characters in the transmit FIFO and the transmit shift register have been completely sent.
6	Stop break	If executed while channel is breaking, this command causes the transmitter signal to go high. The signal remains high for at least one bit time before sending out a new character.
7	Reset CTS_N	Clears ISR bit 5.
8	Reset stale interrupt	Clears the stale interrupt.

Table 20-14 UART DM command values

Value	Description	Result
9	Packet mode	Turns on the sample data mode, which causes the receiver to sample the receive data stream at 16 times the programmed baud rate. The data is sampled with the start of the start bit, or the first data bit, and continued until the marking state. To exit this state, write 1100 in the command field.
A	test_parity_on	Internal use only.
B	test_frame_on	Internal use only.
C	Mode reset	Turns off the sample data mode.
D	Set RFR_N	Asserts the ready for receiving signal (active low).
E	Reset RFR_N	De-asserts the ready for receiving signal.
F	uart_reset_int	Internal use only.
10	Reset TX_ERROR	Clears TX_ERROR
11	Clear TX_DONE	Clears the TX_DONE interrupt (ISR bit 9)
12	Reset break start interrupt	Clears the break start interrupt status bit.
13	Reset break end interrupt	Clears the break end interrupt status bit.
14	Reset par_frame_err interrupt	Clears the par_frame_err interrupt status bit.

Table 20-15 UART DM command values

Value	Description	Result
0	Null command	Does nothing.
1	CR Protection Enable	Enables CR HW protection. When two consecutive writes to the CR are detected, the second write is delayed until the command of the first write is finished. The delay is done by de-asserting the AHB ready and this ensures that the first command completes and the second one will be executed right afterward.
2	CR Protection Disable	Disables CR HW protection. SW is responsible for managing delay between writes to the CR register.
3	Reset TX-Ready interrupt	Clears the TX_READY interrupt.
5	Enable Stale Event	Enables the `stale event' mechanism. See Software Procedures.
6	Disable Stale Event	Disables the `stale event' mechanism. See Software Procedures.
4	SW Force Stale	Causes a `stale event' (even if `stale event' is disabled). See Software Procedures.
7	RESERVED	

SPS_GSBI2_UART_DM_CR

Bits	Name	Description
11	CHANNEL_COMMAND_MSB	This is the msb of the CHANNEL_COMMAND bit field.
10:8	GENERAL_COMMAND	Writing the appropriate value to these bits executes the commands that are listed in Table.
7:4	CHANNEL_COMMAND_LSB	Writing the appropriate value to these bits along with bit 11,executes the commands that are listed in Table 28-13.
3	UART_TX_DISABLE	This command terminates the operation of the transmitter after any character in the transmit shift register is sent.
2	UART_TX_EN	This command enables the operation of the transmitter.
1	UART_RX_DISABLE	This command immediately terminates the operation of the channel receiver and any incoming characters are lost. None of the receiver status bits are affected by this command and characters that are already in the receive FIFO remain there.
0	UART_RX_EN	This command enables the channel receiver.

0x12490014 SPS_GSBI2_UART_DM_IMR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IMR register is the UART interrupt mask register. This register is used to enable the corresponding functions in the UART_DM_ISR register. Setting (1) a bit in the UART_DM_IMR register causes an interrupt to be generated, if the corresponding bit in the UART_DM_ISR register is set. Clearing (0) a bit in the UART_DM_IMR register causes the setting of the corresponding bit in the UART_DM_ISR register to have no effect on the interrupt signal.

Bit 6 of the UART_DM_IMR register, CURRENT_CTS, is slightly different. If the current value of the CTS is one (1), no interrupt is generated. However, the user can use bit 6 in this register to mask the CTS value when reading the UART_DM_MISR register or as a general-purpose bit.

SPS_GSBI2_UART_DM_IMR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	This bit is asserted in the same condition at which PAR_FRAME_ERR status bit is asserted. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x14.
11	RXBREAK_END	This bit is set (1) if the end of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x13.

SPS_GSBI2_UART_DM_IMR (cont.)

Bits	Name	Description
10	RXBREAK_START	This bit is set (1) if the start of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x12.
9	TX_DONE	This bit is used only in UIM/SIM_IF mode. Set (1) this bit when the last byte in the transmitter has been sent. · This bit is generated only when SIM_GLUE_GEN generic equals 1.
8	TX_ERROR	Only used in UIM_IF mode. Set (1) this bit to indicate that there has been parity error during transmission. To clear the detection logic associated with this function, write CR[11;7:4]=0x10. · This bit is generated only when SIM_GLUE_GEN generic equals 1.
7	TX_READY	This bit, when set(1), indicates that: 1. TX FIFO is empty. 2. The value written in NO_CHARS_FOR_TX register equals the number of bytes written to the TX FIFO since the register was updated. Note: There may be characters in the unpack buffer or in the shift register. This bit is cleared by issuing `clear TX ready' command (see UART_DM_CR register).
6	CURRENT_CTS	This bit indicates the current state of the CTS input. It never generates an interrupt.
5	DELTA_CTS	This bit, when set (1), indicates that the CTS input has changed states. To clear the detection logic associated with this function, write CR[7:4]=0x7.
4	RXLEV	This bit is set when a character is loaded into the receive FIFO that brings the total number of characters in the FIFO above the programmed watermark level in the FIFO watermark register (RFWR). This bit is cleared after enough characters have been read to bring the level equal to or below the programmed watermark level.
3	RXSTALE	This bit indicates that a `stale event' occurred. See Software procedures for the exact timing of this interrupt. It is cleared by issuing a reset-stale command (see CR register).
2	RXBREAK_CHANGE	This bit is set (1) if the start or end of a break condition is detected. The logic associated with this condition is cleared (0) by writing CR[7:4]=0x4. A detected break is defined as an all-zeros character with an invalid stop bit AND LOW PARITY. The end of a break is defined as a mark condition (1) at least 1/2 bit width. A detected break occupies one position in the Rx FIFO.
1	RXHUNT	This bit is set (1) when an incoming character matches the value programmed into the UART_DM_HCR register. This condition is cleared (0) by issuing a reset error status command (CR[7:4]=0x3).

SPS_GSBI2_UART_DM_IMR (cont.)

Bits	Name	Description
0	TXLEV	This bit is set (1) when a character which is transferred from the transmit FIFO to the transmit shift register brings the total number of characters in the FIFO below or equal to the programmed watermark level in the UART_DM_TFWR register. This bit is cleared (0) after enough characters have been written to the FIFO to bring the level above the programmed watermark level.

0x12490018 SPS_GSBI2_UART_DM_IPR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0xffffff9f

The UART_DM_IPR register is the UART interrupt programming register.

SPS_GSBI2_UART_DM_IPR

Bits	Name	Description
31:7	STALE_TIMEOUT_MSB	These bits are the STALE_TIMEOUT bit field. The stale character time-out duration field contains a number from 1 to 2^30 -1. This number determines how many character times must elapse before a `stale event' is generated. This character time is defined as 10 times the bit rate. It is reset whenever a data bit is received. Do not clear (0) this register if the stale character time-out interrupt is enabled. Note the discontinuity in the bit assignments.
6	SAMPLE_DATA	Setting (1) this bit enables the new sample data mode, which means that the start bit is sampled as well as the rest, when in sample data mode. See the CR register, CHANNEL_COMMAND bit for more information.
5	RESERVED	
4:0	STALE_TIMEOUT_LSB	This bit field is the LSbits of the STALE_TIMEOUT bit field.

0x1249001C SPS_GSBI2_UART_DM_TFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_TFWR register is the UART transmit FIFO watermark register.

SPS_GSBI2_UART_DM_TFWR

Bits	Name	Description
31:0	TFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the transmit FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of TX words in the FIFO) is less than or equal to the value in TFWR. See UART_DM_IMR register. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x12490020 SPS_GSBI2_UART_DM_RFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RFWR register is the UART receive FIFO watermark register.

SPS_GSBI2_UART_DM_RFWR

Bits	Name	Description
31:0	RFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the receive FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of words in the RX FIFO) is greater than the value in RFWR. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x12490024 SPS_GSBI2_UART_DM_HCR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI2_UART_DM_HCR

Bits	Name	Description
7:0	DATA	The UART_DM_HCR register is the UART hunt character register, which contains the character for which the receiver looks to assert a hunt character received interrupt.

0x12490034 SPS_GSBI2_UART_DM_DMRX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI2_UART_DM_DMRX

Bits	Name	Description
24:0	RX_DM_CRCI_CHARS	In the DM mode, the number of chars in the Rx FIFO that are used for CRCI handshake with the DM. The written value of RX_DM_CRCI_ CHARS must be a multiple of 16(bits [3:0] are treated as 0x0). After a value is written, the UART will generate CRCI requests as long as RX_DM_CRCI_CHARS is non zero. Read of DMRX register gives the number of characters that were received since the end of the last transfer. It is reset at the end of each Rx transfer Also is used by the software to indicate `transfer initialization'. See Software procedures.

0x12490038 SPS_GSBI2_UART_DM_IRDA

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IRDA register enables the IRDA function, selects a loopback, and allows inversion of RX and TX data. This register also controls the IRDA transceiver that optionally interfaces between the UART and the DP_RX_DATA and DP_TX_DATA pins.

The UART proper is a standard RX/TX configuration that converts the serial pin input and output lines to 8-bit data for the microprocessor. The configuration contains receive and transmit blocks, a control block, a bit rate generator for RX and TX, and FIFO interfaces with the microprocessor data bus. The IRDA register provides the means of switching IRDA circuits into the serial I/O lines and the IRDA function is normally switched out. The IRDA modulator/demodulator may be enabled or disabled under microprocessor control. When enabled, the RX and TX data paths have individual inversion select bits, so external true or inverted drivers may be used in the signal path.

- The register is generated only when IRDA_IFC_GEN generic equals 1.

SPS_GSBI2_UART_DM_IRDA

Bits	Name	Description
4	MEDIUM_RATE_EN	· Set (1) for 1/4 bit-time pulse length (Medium rate) · Clear (0) for 3/16 bit-time pulse length (Low rate)
3	IRDA_LOOPBACK	· This bit loops the IRDA modulated TX line back into the IRDA RX line. The normal UART loopback mode must be off in order to see this effect.

SPS_GSBI2_UART_DM_IRDA (cont.)

Bits	Name	Description
2	INVERT_IRDA_TX	This bit inverts the polarity of the IRDA modulated signal on the DP_TX_DATA pin. · Set (1) this bit for an inverted polarity. · Clear (0) this bit for a non-inverted polarity.
1	INVERT_IRDA_RX	This bit inverts the polarity of the IRDA received signal on the DP_RX_DATA pin. · Set (1) this bit for inverted the polarity. · Clear (0) this bit for non-inverted polarity.
0	IRDA_EN	· Set (1) this bit to enable the IRDA transceiver. · Clear (0) this bit to bypass the IRDA transceiver and ignore the other bits of this register.

0x1249003C SPS_GSBI2_UART_DM_DMEN

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_DMEN register indicates if Data Mover is enabled for TX and RX channels.

SPS_GSBI2_UART_DM_DMEN

Bits	Name	Description
1	RX_DM_EN	· Set (1) this bit to enable RX DM interface. · Clear (0) this bit to disable RX DM interface. Clearing this bit requires resetting the receiver (see UART_DM_CR register).
0	TX_DM_EN	Set (1) this bit to enable TX DM interface. Clear (0) this bit to disable TX DM interface.

0x12490040 SPS_GSBI2_UART_DM_NO_CHARS_FOR_TX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI2_UART_DM_NO_CHARS_FOR_TX

Bits	Name	Description
23:0	TX_TOTAL_TRANS_LEN	The total number of characters for transmission. Before writing a new value, the TX FIFO must be empty (as indicated by TX_READY interrupt in IMR register or after a reset). It is used by the transmitter to calculate how many characters to transmit in the last word. In DM mode, it is also used for the CRCI mechanism. Any additional writes to the TX FIFO above TX_TOTAL_TRANS_LEN will be discarded. A TX_READY interrupt is triggered after TX_TOTAL_TRANS_LEN number of characters were moved from the TX FIFO to the unpacking register (not all may have been sent).

0x12490044 SPS_GSBI2_UART_DM_BADR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_BADR

Bits	Name	Description
31:2	RX_BASE_ADDR	RX FIFO base address. Both FIFOs use the same RAM (2^RAM_ADDR_WIDTH, 32-bit entries). This register controls the division of the memory to the RX and TX FIFOs. The division is a multiple of 4 entries, since the DM's burst length is 4. The size of the TX FIFO equals RX_BASE_ADDR. The size of the RX FIFO is 2^RAM_ADDR_WIDTH - RX_BASE_ADDR. ® The default is RX_BASE_ADDR = 2^(RAM_ADDR_WIDTH - 1) ® Only RAM_ADDR_WIDTH -1:2 bits are generated.
1:0	UNUSED

Bits	Name	Description
31:1	RESERVED	unused.
0	EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., what is the result of the muxing of all the input data streams with <BLOCK>_TEST_MODE) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x1249006C SPS_GSBI2_UART_DM_MISR_VAL

Type: Read
Clock: WR_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_MISR_VAL

Bits	Name	Description
9:0	VAL	Current MISR state

0x12490080 SPS_GSBI2_UART_DM_SIM_CFG

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_SIM_CFG register is used to configure the SIM interface for the UART.

- The register is generated only when SIM_GLUE_GEN generic equals 1.

SPS_GSBI2_UART_DM_SIM_CFG

Bits	Name	Description
17	UIM_TX_MODE	When this bit is set (1), the transmission portion of the SIM interface operates in block mode (T=1). When clear (0), the transmission portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
16	UIM_RX_MODE	When this bit is set (1), the receive portion of the SIM interface operates in block mode (T=1). When clear (0), the receive portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
15:8	SIM_STOP_BIT_LEN	In UIM_IF mode, this field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 1 to 254 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. ..... 11 111110: 254 bit times 0x1: 1 bit times 0x2: 2 bit times
7	SIM_CLK_ON	When this bit is set(1), the UIM_CLK is turned on at either the TD8 or TD4 frequency, as indicated by bit6(UIM_CLK_TD8_SEL). When this bit is cleared, the UIM_CLK is stopped either LOW or HIGH, as indicated by bit 5(UIM_CLK_STOP_HIGH).

SPS_GSBI2_UART_DM_SIM_CFG (cont.)

Bits	Name	Description
6	SIM_CLK_TD8_SEL	This bit selects the UIM_CLK frequency at which the UIM_CLK is turned on. 0x1: TD8 (the UIM_CLK runs at the TD8 frequency) 0x0: TD4 (the UIM_CLK runs at the TD4 frequency)
5	SIM_CLK_STOP_HIGH	This bit indicates at what point - high or low - the UIM_CLK will stop. 0x1: high 0x0: low
4	SIM_CLK_SEL	unused
3	MASK_RX	Setting (1) this bit masks off any 0 on the RX line, which prevents the receiver from seeing the START bit. Set (1) this bit if you do not want to receive the data you transmit.
2	SWAP_D	Setting (1) this bit causes the UIM_IF to swap the 8 data bits (making MSB into LSB, bit 6 into bit1, and so on) before it is read by the microprocessor.
1	INV_D	Set (1) this bit to cause the UIM_IF to invert the 8 data bit before it is read by the microprocessor.
0	SIM_SEL	Set (1) this bit to designate the UIM_IF mode of operation.

0x12490084 SPS_GSBI2_UART_DM_TEST_WR_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI2_UART_DM_TEST_WR_ADDR

Bits	Name	Description
31:0	TEST_WR_ADDR	RAM address at which to write the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x12490088 SPS_GSBI2_UART_DM_TEST_WR_DATA

Type: Write
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_TEST_WR_DATA

Bits	Name	Description
31:0	TEST_WR_DATA	The test data to be written to the RAM. Write to this register triggers the write to the RAM, to TEST_WR_ADDR address.

0x1249008C SPS_GSBI2_UART_DM_TEST_RD_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI2_UART_DM_TEST_RD_ADDR

Bits	Name	Description
31:0	TEST_RD_ADDR	RAM address from which to read the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

20.39.2 Read registers

NOTE The addresses of the read-only registers are mapped into the same addresses of the four write-only registers in the section above this one. They are: UART_DM_CSR, UART_DM_TF, UART_DM_CR, and UART_DM_IMR, respectively.

0x12490008 SPS_GSBI2_UART_DM_SR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_SR register is the UART status register. This register is used to obtain the current state of the UART subsystem. This register is updated asynchronously.

SPS_GSBI2_UART_DM_SR

Bits	Name	Description
8	RX_BREAK_START_LAST	When break start is detected, this bit is set (1). When break end was detected, this bit is reset (0).
7	HUNT_CHAR	When set (1), this bit indicates that the programmed character in the UART_DM_HCR register was received. If programmed, this condition causes the RXHUNT bit to be set (1) in the UART_DM_ISR register. This bit is cleared by issuing a reset error status command.
6	RX_BREAK	When set (1), this bit indicates that an all-zero character of the programmed length was received without a stop bit. If a break begins in the middle of a character, it is detected if the condition remains until the end of the next character time. Only one all zero character is written into the FIFO upon receiving the break. After the RX input returns high for at least half a bit time, then more characters are accepted by the receiver. Whenever the break condition starts or stops as defined above, the RXBREAK bit is set (1) in the UART_DM_ISR register. This bit is appended to the character in the receive FIFO.

SPS_GSBI2_UART_DM_SR (cont.)

Bits	Name	Description
5	PAR_FRAME_ERR	A parity error occurs if parity is programmed to be checked and an incoming character is received with incorrect parity. A framing error occurs when the RX input is low while the stop bit is being sampled. This bit is sampled in the middle of the first stop bit position, regardless of the programmed length of the stop bit. This error bit is appended to the character in the receive FIFO.
4	UART_OVERRUN	An overrun error occurs if one or more incoming characters are lost. This happens when the receive FIFO is full, the packing buffer is full and another character has been received in the shift register. The character in the receive shift register is lost. Upon overrun, this status bit remains high until cleared by a reset error status command.
3	TXEMT	This bit is set (1) when the transmitter under-runs. It is set after the transmission of the stop bit at the end of a character, if there are no characters waiting to be sent. It is reset when a character is written to the transmit FIFO.
2	TXRDY	This bit indicates that the transmit FIFO has space in it. It is reset when the FIFO becomes full and set when space becomes available again. Any characters that are written to the FIFO while this bit is low is lost.
1	RXFULL	This bit is set (1) when the receive FIFO becomes full. It is reset when the CPU reads a word.
0	RXRDY	This bit is set (1) when there is a word in the receive FIFO waiting to be read. It is reset when the last word currently stored in the FIFO is read.

0x12490070 SPS_GSBI2_UART_DM_RF

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RF register is the UART receive FIFO register, which is used to access the channel receive FIFO. In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM RX FIFO.

SPS_GSBI2_UART_DM_RF

Bits	Name	Description
31:0	UART_RF	This register returns the next value in the receive FIFO. After the read is completed, the FIFO read pointer is updated to make the next character available.

0x12490074 SPS_GSBI2_UART_DM_RF_2

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_RF_2

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x12490078 SPS_GSBI2_UART_DM_RF_3

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_RF_3

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x1249007C SPS_GSBI2_UART_DM_RF_4

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_RF_4

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x12490010 SPS_GSBI2_UART_DM_MISR

Type: Read
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI2_UART_DM_MISR

Bits	Name	Description
12:0	UART_MISR	The UART_DM_MISR register is the masked interrupt status register. A read from this register returns the "AND" of the UART_DM_ISR and the UART_DM_IMR registers. This register is updated asynchronously. This bit field is misr <= (isr(12 DOWNTO 7) AND imr(12 DOWNTO 7)) & '0' & (isr(5 DOWNTO 0) AND imr(5 DOWNTO 0)).

0x12490014 SPS_GSBI2_UART_DM_ISR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_ISR register is the UART interrupt status register. This register provides the current status of the possible interrupt conditions. If one of these bits is set (1), and the corresponding bit in the UART_DM_IMR register is set (1), an interrupt is generated (with the exception of bit 6, CURRENT_CTS - see the description of the UART_DM_IMR register). If the corresponding bit in the UART_DM_IMR register is clear (0), setting one of these bits has no effect on the UART interrupt request signal. This register is updated asynchronously.

SPS_GSBI2_UART_DM_ISR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	· See UART_DM_IMR on page 28-9
11	RXBREAK_END	· See UART_DM_IMR on page 28-9
10	RXBREAK_START	· See UART_DM_IMR on page 28-9
9	TX_DONE	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
8	TX_ERROR	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
7	TX_READY	See UART_DM_IMR for descriptions of the UART_DM_ISR bits.
6	CURRENT_CTS	
5	DELTA_CTS	
4	RXLEV	
3	RXSTALE	
2	RXBREAK	

SPS_GSBI2_UART_DM_ISR (cont.)

Bits	Name	Description
1	RXHUNT	
0	TXLEV	

0x12490038 SPS_GSBI2_UART_DM_RX_TOTAL_SNAP

Type: Read
Clock: AHB_CLK
Reset State: 0x0

SPS_GSBI2_UART_DM_RX_TOTAL_SNAP

Bits	Name	Description
23:0	RX_TOTAL_BYTES	'RX_TOTAL_SNAP register holds the number of characters received since the end of last Rx transfer. It is updated at the end of an Rx transfer (see Software procedures). Rx transfer ends when one of the conditions is met: · The number of characters which were received since the end of the previous transfer equals the value which was written to DMRX at "Transfer initialization". · A stale event occurred (flush operation already performed if was needed).

0x1249004C SPS_GSBI2_UART_DM_TXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_TXFS

Bits	Name	Description
31:14	TX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bit field. · Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	TX_ASYNC_FIFO_STATE	TX asynchronous fifo status - number of characters in the TX asynchronous FIFO.
9:7	TX_BUFFER_STATE	TX unpacking buffer status - number of bytes in the unpacking buffer
6:0	TX_FIFO_STATE_LSB	TX FIFO status - number of words in the TX FIFO

0x12490050 SPS_GSBI2_UART_DM_RXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_RXFS

Bits	Name	Description
31:14	RX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bit field. Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	RX_ASYNC_FIFO_STATE	RX asynchronous fifo status - number of characters in the RX asynchronous FIFO.
9:7	RX_BUFFER_STATE	RX packing buffer status - number of bytes in the packing buffer
6:0	RX_FIFO_STATE_LSB	The number of entries in the RX FIFO that have at least one valid character. It is incremented each time a word is moved from the packing register to the RX FIFO. It is decremented each time a word is read from the RX FIFO. Note: The Uart does not keep track of non-valid characters in each word. (See Software procedures).

0x12490090 SPS_GSBI2_UART_DM_TEST_RD_DATA

Type: Read
Clock: AHB_CLK
Reset State: Undefined

SPS_GSBI2_UART_DM_TEST_RD_DATA

Bits	Name	Description
31:0	TEST_RD_DATA	Read from this register triggers the read from the RAM. The register will hold, after read access, data which is found at TEST_RD_ADDR address in the RAM.

20.40 SPS GSBI2 QUP Registers (0x124A0000 SPS_QUP2_BASE)

This section contain Smart Peripheral System GBSI 2 QUP registers.

20.40.1 QUP core registers

0x124A0000 SPS_GSBI2_QUP_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).

b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:

- N equals 8 or less - shift 24
- N equals 16 to 9 - shift 16
- N equals 24 to 17 - shift 8
- N equals 32 to 25 - no shift

The MINI_CORE clock selected is as follows:

Null: cc_qup_core_clk

SPI: cc_spi_master_clk

SPS_GSBI2_QUP_CONFIG

Bits	Name	Description
31:14	RESERVED_1	reserved
13	CORE_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).
12	APP_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).

SPS_GSBI2_QUP_CONFIG (cont.)

Bits	Name	Description
11:8	MINI_CORE	value: 0000 Null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 I2C slave controller value: 0100 Reserved (I2C master & slave for loop back operation) value: 0101 Reserved (map to null core) value: 0110 Reserved (map to null core value: 0111 Reserved (map to null core) See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a "don't care". The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS _N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	RESERVED_2	Reserved.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x124A0004 SPS_GSBI2_QUP_STATE

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000000XX100

SPS_GSBI2_QUP_STATE

Bits	Name	Description
31:5	RESERVED	reserved.
4	I2C_MAST_GEN	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.

SPS_GSBI2_QUP_STATE (cont.)

Bits	Name	Description
1:0	STATE	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to "01", the mini-core and related logic is released from reset and enters the RUN_STATE. When set to "11", the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete. See notes 1 and 2. Note 1: SPI - the "next appropriate point in time" is the next time SPI_CS _N de-asserts. If SPI_CS _N is not asserted when the PAUSE_STATE is entered, the SPI_CS _N is maintained in the not asserted state. The PAUSE_STATE is not available for SLAVE operation. Note 2: I2C -

0x124A0008 SPS_GSBI2_QUP_IO_MODES

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000XXXXXXXX

Unless otherwise stated, register bits written return the value when read.

Notes:

a. "Packing" occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. "UnPacking" occurs as follows:

- N equals 8 or less - unpack four values from each QUP output FIFO word.
- N equals 16 to 9 - unpack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

SPS_GSBI2_QUP_IO_MODES

Bits	Name	Description
31:17	RESERVED	reserved
16	OUTPUT_BIT_SHIFT_EN	If set, enables the QUP output FIFO block to do bit shifting on the output data.

SPS_GSBI2_QUP_IO_MODES (cont.)

Bits	Name	Description
15	PACK_EN	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 6x BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode and Data_Mover_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16 BLOCK_SIZE
1:0	OUTPUT_BLOCK_SIZE	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x124A000C SPS_GSBI2_QUP_SW_RESET

Type: Write/cmd
Clock: CRIF_CLK
Reset State: 0x0000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero.

SPS_GSBI2_QUP_SW_RESET

Bits	Name	Description
31:0	RESERVED	NA

0x124A0010 SPS_GSBI2_QUP_TIME_OUT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies if the QUP_MX_OUTPUT_COUNT register and/or QUP_MX_INPUT_COUNT register are enabled. Additionally, this register only applies to Block_Mode and Data_Mover_Mode. The timer starts "ticking" when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The timer pauses for the PAUSE_STATE. If the timer expires before the QUP_MX_OUTPUT_COUNT and/or QUP_MX_INPUT_COUNT are exhausted, then the TIME_OUT_ERR flag is set in the QUP_ERROR_FLAGS register and the interrupt gsbi_qup_irq may be asserted.

SPS_GSBI2_QUP_TIME_OUT

Bits	Name	Description
15:0	TIME_OUT_VALUE	Specifies time out value in units of cc_qup_app clock ticks. A value of zero indicates the timer function is not enabled for use. See QUP_CONFIG register for information on clocks.

0x124A0014 SPS_GSBI2_QUP_TIME_OUT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

SPS_GSBI2_QUP_TIME_OUT_CURRENT

Bits	Name	Description
31:0	TIME_OUT_CURRENT	Current value of time-out counter.

0x124A0018 SPS_GSBI2_QUP_OPERATIONAL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0080

SPS_GSBI2_QUP_OPERATIONAL

Bits	Name	Description
31:10	RESERVED_1	reserved.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Data_Mover_Mode.
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Data_Mover_Mode.
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowledges software has or will read the data. Valid only in all modes.
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowledges software has or will read the data. Valid only in all modes.
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.
3:0	RESERVED_2	reserved.

0x124A001C SPS_GSBI2_QUP_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

SPS_GSBI2_QUP_ERROR_FLAGS

Bits	Name	Description
31:7	RESERVED_1	reserved.
6	TIME_OUT_ERR	The time out limit for a given transfer has been reached.
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ER R	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.
1:0	RESERVED_2	reserved

0x124A0020 SPS_GSBI2_QUP_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x007C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of gsbi_qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

SPS_GSBI2_QUP_ERROR_FLAGS_EN

Bits	Name	Description
31:7	RESERVED_1	reserved
6	TIME_OUT_ERR_EN	If set, enables time out error generation.
5	OUTPUT_OVER_RUN_ERR _EN	If set, enables output over run error generation.

SPS_GSBI2_QUP_ERROR_FLAGS_EN (cont.)

Bits	Name	Description
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.
1:0	RESERVED_2	reserved

0x124A0024 SPS_GSBI2_QUP_TEST_CTRL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register enables QUP test bus to be actively driven by QUP core signals.

SPS_GSBI2_QUP_TEST_CTRL

Bits	Name	Description
31:1	RESERVED	reserved
0	QUP_TEST_BUS_EN	If set, enables QUP core to actively drive test bus. If zero, the core drives the test bus to all zeros.

20.40.2 QUP output FIFO registers

0x124A0100 SPS_GSBI2_QUP_MX_OUTPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not effect the count.

Notes:

a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

SPS_GSBI2_QUP_MX_OUTPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_COUNT	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x124A0104 SPS_GSBI2_QUP_MX_OUTPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

SPS_GSBI2_QUP_MX_OUTPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x124A0108 SPS_GSBI2_QUP_OUTPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

This register holds the output data hanging out of the QUP output FIFO ready be loaded into the mini-core for the next load operation. This corresponds to signal qup_data_out going into the mini-core block.

SPS_GSBI2_QUP_OUTPUT_DEBUG

Bits	Name	Description
31:0	OUTPUT_DEBUG_DATA	Value waiting at the exit of output FIFO.

0x124A010C SPS_GSBI2_QUP_OUTPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the

value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

SPS_GSBI2_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	OUTPUT_FIFO_WORD_CNT	Number of words in the output FIFO.

0x124A0110+4*c SPS_GSBI2_QUP_OUTPUT_FIFOc, c=[0..15]

Type: Write
Clock: CRIF_CLK
Reset State: 0x0000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

SPS_GSBI2_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x124A0150 SPS_GSBI2_QUP_MX_WRITE_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the gsbi_qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

SPS_GSBI2_QUP_MX_WRITE_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_COUNT	The number of "writes" of size N. This is used only if the core is in FIFO_Mode.

0x124A0154 SPS_GSBI2_QUP_MX_WRITE_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

SPS_GSBI2_QUP_MX_WRITE_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

20.40.3 QUP input FIFO registers

0x124A0200 SPS_GSBI2_QUP_MX_INPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

SPS_GSBI2_QUP_MX_INPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_COUNT	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x124A0204 SPS_GSBI2_QUP_MX_INPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

SPS_GSBI2_QUP_MX_INPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x124A0208 SPS_GSBI2_QUP_MX_READ_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

SPS_GSBI2_QUP_MX_READ_COUNT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_COUNT	The number of "reads" of size N. This is used only if the core is in FIFO_Mode.

0x124A020C SPS_GSBI2_QUP_MX_READ_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

SPS_GSBI2_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x124A0210 SPS_GSBI2_QUP_INPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the value of the last loaded in known-good-data into the QUP input FIFO. May be different from what the actual read of input FIFO will return because of packing enabled at the input side. This corresponds to signal qup_data_in coming from the mini-core block synchronized to the crif_clk.

SPS_GSBI2_QUP_INPUT_DEBUG

Bits	Name	Description
31:0	INPUT_DEBUG_DATA	Last known good value shifted into the input FIFO.

0x124A0214 SPS_GSBI2_QUP_INPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

SPS_GSBI2_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

0x124A0218+4*c SPS_GSBI2_QUP_INPUT_FIFOc, c=[0..15]

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

Consecutive reads to this address reads the input FIFO contents on a FIFO basis.The max address to read the input FIFO is 0x254.

SPS_GSBI2_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

20.40.4 SPI mini-core registers

0x124A0300 SPS_GSBI2_SPI_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

SPS_GSBI2_SPI_CONFIG

Bits	Name	Description
31:11	RESERVED_1	Reserved.
10	HS_MODE	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
7:6	RESERVED_2	Reserved.
5	SLAVE_OPERATION	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.
4:0	RESERVED	Reserved.

0x124A0304 SPS_GSBI2_SPI_IO_CONTROL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The contents of this register should only be changed when in the RESET_STATE.

Unless otherwise stated, register bits written return the value when read.

SPS_GSBI2_SPI_IO_CONTROL

Bits	Name	Description
31:11	RESERVED	Reserved.
10	CLK_IDLE_HIGH	Use SPI_CLK_IDLE_HIGH when set.
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS _N respectively. Setting any of this bit to '1', makes the associated SPI_CS _N active HIGH. This field is a "don't care" in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_ N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a "don't care" in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS _N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS _N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x124A0308 SPS_GSBI2_SPI_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

SPS_GSBI2_SPI_ERROR_FLAGS

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.

SPS_GSBI2_SPI_ERROR_FLAGS (cont.)

Bits	Name	Description
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x124A030C SPS_GSBI2_SPI_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0003

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

SPS_GSBI2_SPI_ERROR_FLAGS_EN

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x124A0310 SPS_GSBI2_SPI_DEASSERT_WAIT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the de-assertion wait time of SPI_CS _N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

SPS_GSBI2_SPI_DEASSERT_WAIT

Bits	Name	Description
31:6	RESERVED	Reserved.

SPS_GSBI2_SPI_DEASSERT_WAIT (cont.)

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the de-asserted time of SPI_CS _N. Only applies to MASTER operation. For SLAVE operation, this field is a "don't care". A value of zero indicates SPI_CS _N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

20.40.5 I2C master mini-core registers

0x124A0400 SPS_GSBI2_I2C_MASTER_CLK_CTL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_CLK_CTL register is a read/write register that controls clock divider values. This register should only be written to after it is confirmed that the I2C master mini-core is not longer in RESET state (QUP_STATE register).

SPS_GSBI2_I2C_MASTER_CLK_CTL

Bits	Name	Description
31:11	RESERVED	Reserved.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. The minimum value should be 3 hex (4 I2C_clk clocks per period) to ensure proper sampling of the bus. For a maximum high speed bit rate of 3.4 Mb/s (high speed mode), this would require a minimum 40.8 MHz I2C_clk clock. The maximum I2C_clk is 81.6 MHz. This register is reset to a maximum value of 7 hex. I2C_HS_CLK = I2C_CLK/(3*(HS_DIVIDER_VALUE+1)
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. The minimum value should be 3 hex to ensure proper sampling of the bus. For a maximum bit rate of 400 kb/s (fast mode), this would require a 4.8 MHz I2C_clk clock. For a maximum bit rate of 100 kb/s (standard mode), this would require a 1.2 MHz I2C_clk clock. Maximum I2C_clk for fast and standard modes are 206.4 MHz and 51.6 MHz respectively. This register is reset to a maximum value of 255 hex. I2C_FS_CLK = I2C_CLK/(2*(FS_DIVIDER_VALUE+3)

0x124A0404 SPS_GSBI2_I2C_MASTER_STATUS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_STATUS is a status register. Writing a one clears the status bits.

SPS_GSBI2_I2C_MASTER_STATUS

Bits	Name	Description
31:26	RESERVED_1	Reserved.
25	INVALID_READ_SEQ	This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	This bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address).
23	INVALID_TAG	This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Reset, read_last_byte, mi_rec, dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: READ_LAST_BYTE_STATE Value 0x3: MI_REC_STATE Value 0x4: DEC_STATE Value 0x5: STORE_STATE
19:16	OUTPUT_FSM_STATE	This 4-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Reset, decode, send, mi_red, nop, nop_dec, invalid, invalid_dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: DECODE_STATE Value 0x3: SEND_STATE Value 0x4: MI_REC_STATE Value 0x5: NOP_STATE Value 0x6: INVALID_STATE Value 0x7: PEEK_STATE Value 0x8: SEND_R_STATE

SPS_GSBI2_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
15:13	CLK_STATE	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Reset_busidle, not_master, high, low, high_wait, forced_low, hs_addr_low or double_buffer_wait. Value 0x0: RESET_BUSIDLE_STATE Value 0x1: NOT_MASTER_STATE Value 0x2: HIGH_STATE Value 0x3: LOW_STATE Value 0x4: HIGH_WAIT_STATE Value 0x5: FORCED_LOW_STATE Value 0x6: HS_ADDR_LOW_STATE Value 0x7: DOUBLE_BUFFER_WAIT_STATE
12:10	DATA_STATE	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Reset, Tx addr, Tx HS addr, Tx 10-bit addr, Tx 2nd 10-bit addr byte, Tx data and Rx data. Value 0x0: RESET_WAIT_STATE Value 0x1: TX_ADDR_STATE Value 0x2: TX_DATA_STATE Value 0x3: TX_HS_ADDR_STATE Value 0x4: TX_10_BIT_ADDR_STATE Value 0x5: TX_2ND_BYTE_STATE Value 0x6: RX_DATA_STATE
9	BUS_MASTER	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.

SPS_GSBI2_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
4	ARB_LOST	This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.
3	PACKET_NACKED	This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1:0	RESERVED_2	Reserved.

20.41 PP SS Interrupt Controller Registers (0x12080000 PPSS_BASE)

This section contains Peripheral Process Subsystem (PPSS) Interrupt Controller registers.

-- The interrupt sources (irq/fiq_source) are defined as:

-- intsource(15) is controlled by a software register within the interrupt controller.

intsource(14 DOWNTO 12) <=

ppss_int_cntl; -- PPSS top-level inputs

intsource(11 DOWNTO 0) <=

'0' & -- Spare input bit 11

rpm_dsps_gp_high_irq & -- RPM bit 10

rpm_dsps_gp_med_irq & -- RPM bit 9

rpm_dsps_gp_low_irq & -- RPM bit 8

rpm_dsps_wakeup_irq & -- RPM bit 7

ppss_wdog_bark_irq_loc & -- Watchdog bit 6

int_gp1 & -- General Purpose Outputs bit 5

int_gp0 & -- General Purpose Inputs bit 4

ppss_tmr11_irq & -- Sleep Timer 1 bit 3

ppss_tmr00_irq; -- XO Timer O bit 0

0x12080000 IRQSTATUSA

Type: Read
Clock: PPSS_PCLK
Reset State: 0x0000

IRQSTATUSA

Bits	Name	Description
15:0	STATUS	Returns the state of the interrupt sources after they have been masked by the bits stored in the IRQENABLESETA register. IRQSTATUSA <= IRQRAWSTATUSA AND IRQENABLESETA

0x12080004 IRQRAWSTATUSA

Type: Read
Clock: PPSS_PCLK
Reset State: 0x0000

IRQRAWSTATUSA

Bits	Name	Description
15:0	RAWSTATUS	Returns the state of the internal IRQSOFTA register bit concatenated with the 15 interrupt inputs. IRQRAWSTATUSA <= IRQSOFTA & irq_source

0x12080008 IRQENABLESETA

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0000

16 interrupts are formed by concatenating the internal IRQSOFTA register bit with the 15 interrupt inputs listed at the start of this section.

irq_interrupts <= IRQSOFTA & irq_source(14 DOWNTO 0).

By default all 16 interrupts are masked out. To enable a particular interrupt, the corresponding bit within the IRQENABLESETA register must be set to logic `1'. Writing 0xFFFF to this register enables all irq_interrupts.

Each input bit of this register is ORed with the corresponding register output bit.

This is done so that the state of any set bit is automatically maintained and does not need to be rewritten. This saves processor time as it prevents the software from having to perform a read modify write cycle when updating this register.

Once an interrupt bit has been enabled, it cannot be disabled by writing a `0' to this register due to the ORed feedback connections. To disable an interrupt, the IRQENABLECLEARA register must be used, i.e., writing to the IRQENABLESETA address sets bits within the interrupt enable register while writing to the IRQENABLECLEARA address clears them.

After the 16 irq_interrupts have been masked they are NORed together and output as a single internal active low interrupt request (irq_n).

IRQENABLESETA

Bits	Name	Description
15:0	ENABLESET	To enable an interrupt, set the corresponding bit within this register to a `1'. Writing zeros to this address does not change the state of the register output. Write to the IRQENABLECLEARA address to clear bits within this register

0x1208000C IRQENABLECLEARA

Type: Write
Clock: PPSS_PCLK
Reset State: 0x0000

IRQENABLECLEARA

Bits	Name	Description
15:0	ENABLECLEAR	To understand the function of the ENABLECLEAR bits, the IRQENABLESETA register description must be read first. Writing a logic `1' to any of the 16 data bits at this address clears the corresponding data bit within the IRQENABLESETA register. Writing 0xFFFF to this address clears the entire IRQENABLESETA register and thereby masks all irq_interrupts.

0x12080010 IRQSOFTA

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0

IRQSOFTA

Bits	Name	Description
0	SOFT	Software programmable test interrupt. Sets the upper irq_interrupt bit, i.e., bit 15.

0x12080100 FIQSTATUSA

Type: Read
Clock: PPSS_PCLK
Reset State: 0x0000

FIQSTATUSA

Bits	Name	Description
15:0	STATUS	Returns the state of the interrupt sources after they have been masked by the bits stored in the FIQENABLESETA register. FIQSTATUSA <= FIQRAWSTATUSA AND FIQENABLESETA

0x12080104 FIQRAWSTATUSA

Type: Read
Clock: PPSS_PCLK
Reset State: 0x0000

FIQRAWSTATUSA

Bits	Name	Description
15:0	RAWSTATUS	Returns the state of the internal FIQSOFTA register bit concatenated with the 15 interrupt inputs. FIQRAWSTATUSA <= FIQSOFTA & fiq_source

0x12080108 FIQENABLESETA

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0000

16 interrupts are formed by concatenating the internal FIQSOFTA register bit with the 15 interrupt inputs listed at the start of this section.

fiq_interrupts <= FIQSOFTA & fiq_source(14 DOWNTO 0).

By default all 16 interrupts are masked out. To enable a particular interrupt, the corresponding bit within this register must be set to logic `1'. Writing 0xFFFF to this register enables all fiq_interrupts.

Each input bit of this register is ORed with the corresponding register output bit.

This is done so that the state of any set bit is automatically maintained and does not need to be rewritten. This saves processor time as it prevents the software from having to perform a read modify write cycle when updating this register.

Once an interrupt bit has been enabled, it cannot be disabled by writing a `0' to this register due to the ORed feedback connections. To disable an interrupt the FIQENABLECLEARA register must

be used, i.e., writing to the FIQENABLESETA address sets bits within the interrupt enable register while writing to the IRQENABLECLEARA address clears them.

After the 16 fiq_interrupts have been masked they are NORed together and output as a single internal active low interrupt request (fiq_n).

FIQENABLESETA

Bits	Name	Description
15:0	ENABLESET	To enable an interrupt, set the corresponding bit within this register to a `1'. Writing zeros to this address does not change the state of the register output. Write to the FIQENABLECLEARA address to clear bits within this register..

0x1208010C FIQENABLECLEARA

Type: Write
Clock: PPSS_PCLK
Reset State: 0x0000

FIQENABLECLEARA

Bits	Name	Description
15:0	ENABLECLEAR	To understand the function of the ENABLECLEAR bits, the FIQENABLESETA register description must be read first. Writing logic `1' to any of the 16 data bits at this address clears the corresponding data bit within the FIQENABLESETA register. Writing 0xFFFF to this address clears the entire FIQENABLESETA register and thereby masks all fiq_interrupts.

0x12080110 FIQSOFTA

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0

FIQSOFTA

Bits	Name	Description
0	SOFT	Software programmable test interrupt. Sets the upper fiq_interrupt bit, i.e., bit 15.

20.42 PP SS Timer Registers (0x12080000 PPSS_BASE)

This section contains Peripheral Process Subsystem (PPSS) Timer registers.

The Timer Blocks run at different frequencies. Timer Block 0 is clocked by a XO (approximately 20MHz), whilst Timer Block 1 is clocked at 32KHz (referred to as SLP (sleep) in the register name prefixes). Hence, there are a total of 4 counters available in the PPSS, with 2 counters running at the Timer Block 0 frequency and another 2 counters running at the Timer Block 1 frequency.

Each of the two PPSS Timers Blocks have two duplicate sets of registers, one for each of the two 32-bit counters. Rather than repeat identical descriptions for each entry, the following list uses notation that defines the register as belonging to TMRn, where n represents either 0 or 1.

0x12080800+ 0x18*n XO_TMRn_MATCH_VAL, n=[0..1]

Type: Read/Write
Clock: PPSS_TIMER0_CLK_24_576_OR_27MHZ_
Reset State: 0x00000000

XO_TMRn_MATCH_VAL

Bits	Name	Description
31:0	MATCH_VAL	An interrupt is generated when the counter output equals the value stored in the match value register Reading this register returns the value of the Match register located in the APB clock domain rather than the XO clock domain..

0x12080804+ 0x18*n XO_TMRn_COUNT_VAL, n=[0..1]

Type: Read/Write
Clock: PPSS_TIMER0_CLK_24_576_OR_27MHZ_
Reset State: 0x00000000

Count Write

The count value is writable as a test/debug only feature. The value written to this address is loaded into the XO_TMRn_MATCH_VAL register due to HW reuse. The procedure for writing the XO_TMRn_COUNT_VAL is as follows:

1. Write to the XO_TMRn_CONTROL register to set the required mode and pre-scale counter frequency.
2. Set the timer ON/OFF control bit 5 to `1' and prevent the timer from counting by setting the timer enable (EN) bit 4 to `0'.

The XO_TMRn_STATUS register bit 2 (CONTROL_UPDATE) returns low once the data written to the control register has been synchronized to the XO clock domain.

3. Read this status bit and do not proceed until it is low.
4. Write the required counter value to the XO_TMRn_COUNT_VAL address.

NOTE This value is loaded into the XO_TMRn_MATCH register.

XO_TMRn_STATUS register bit 3(COUNT_UPDATE) returns low once the written value has been loaded into the counter.

5. If required the original Match value can now be restored by writing directly to the XO_TMRn_MATCH_VAL address.

Count Read

The counter increments at the pre-scaled timer clock rate set within the XO_TMRn_Control register. The AHB clock is used to detect the rising edge of the slower pre-scaled XO clock. Each time a rising edge is detected, the XO counter output is copied to a 32-bit register within the APB clock domain. Constantly updating this register ensures that the processor does not have to be stalled each time the counter value is read, i.e., the synchronization delay is eliminated. The disadvantage of this synchronization technique is that it takes time for the counter value to be synchronized when the timer is initially enabled. In addition, if the AHB clock is switched off to save power the counter value becomes stale or invalid when the AHB clock is first restored. To overcome these limitations the software must either allow time for the counter value to be synchronized or take repeated readings and wait for the counter value to be updated.

XO_TMRn_COUNT_VAL

Bits	Name	Description
31:0	COUNT	The current counter value.

0x12080808+ 0x18*n XO_TMRn_CONTROL, n=[0..1]

Type: Read/Write
Clock: PPSS_TIMER0_CLK_24_576_OR_27MHZ_
Reset State: 0x00

The software should not write to the CONTROL register while the CONTROL_UPDATE status register bit is set. If this occur, the XO timer circuitry delays the second write cycle until the first write has completed. The insertion of wait states ensures that the control register cannot be updated while the contents are being copied from the APB to XO clock domain.

Three modes of operation are provided. The mode of operation determines how the timer behaves once the counter reaches the value stored in the match register:

- FREE_RUN - the counter continues counting. Once the up-counter reaches the maximum value the counter resets to zero and counting then continues.
- ONE_SHOT - the counter resets to zero and stops counting.

- PERIODIC - the counter resets to zero and counting then continues. This periodic process continues until the timer register settings are changed. When using this mode, the match value register must not be loaded with too low a value as it is impossible to clear the interrupt output before the next interrupt is generated.

Reading this register returns the value of the Control register located in the APB clock domain rather than the XO clock domain.

NOTE Due to the synchronization scheme used in the XO timers, the prescale counter must be set so that the timer clock always runs at least 4x slower than the AHB clock. The prescale clock frequency must be set and the timer switched ON before any of the other registers associated with the timer can be used.

XO_TMRn_CONTROL

Bits	Name	Description
5	ON	Timer ON/OFF When the timer is not in use, it should be switched OFF. This holds the prescale counter in reset which stops the clock and saves power. 0x0: OFF 0x1: ON
4	EN	Timer Enable, When set to (1) the timer counts at the prescale clock rate. 0x0: Disable 0x1: Enable
3:2	MODE	Timer Mode, 0x0: FREE_RUN 0x1: ONE_SHOT 0x2: PERIODIC 0x3: RESERVED
1:0	PRESCALE	Pre_scale clock frequency The division ratio must be set so that the pre-scale clock frequency is always at least 4x slower than the AHB clock frequency. Unless greater timer accuracy is required the division ratio should be left at the default setting of DIV32 as this saves power. 0x0: DIV32 0x1: DIV8 0x2: DIV4 0x3: DIV2

0x1208080C+ 0x18*n XO_TMRn_CLEAR_INT, n=[0..1]

Type: Write (command)
Clock: PPSS_TIMER0_CLK_24_576_OR_27MHZ_
Reset State: 0x0

XO_TMRn_CLEAR_INT

Bits	Name	Description
0	CLEAR_INT	This register is a one-shot command register that, when written with any value, resets the interrupt.

0x12080810+ 0x18*n XO_TMRn_CLEAR_CNT, n=[0..1]

Type: Write (command)
Clock: PPSS_TIMER0_CLK_24_576_OR_27MHZ_
Reset State: 0x0

XO_TMRn_CLEAR_CNT

Bits	Name	Description
0	CLEAR_CNT	This register is a one-shot command register that, when written with any value, resets the COUNT_VAL to 0. This occurs regardless of the state of the EN bit within the TMR0/1_CONTROL register.

0x12080814+ 0x18*n XO_TMRn_STATUS, n=[0..1]

Type: Read
Clock: PPSS_TIMER0_CLK_24_576_27MHZ_
Reset State: 0x00

As the advanced peripheral bus (APB) runs at a different clock frequency to the XO timers, it takes time to synchronize data between the two clock domains. The actual synchronization delay depends on the pre-scale timer setting. The TMRn_STATUS register allows the software to track the progress of each synchronized write command.

The XO Control register can synchronize faster than the other registers so it is important that the software checks this status information to ensure the timer registers are written in the correct sequence. Note that if the Match or Control registers are read, the values are returned from the registers located within the APB clock domain rather than the sleep clock domain. As a result, the status register must be used to determine when the Match or Control registers within the sleep clock domain have been updated.

XO_TMRn_STATUS

Bits	Name	Description
4	MATCH_UPDATE	0x0: Register write completed 0x1: Register updating
3	COUNT_UPDATE	0x0: Register write completed 0x1: Register updating
2	CONTROL_UPDATE	0x0: Register write completed 0x1: Register updating
1	CLR_INT_UPDATE	0x0: Register write completed 0x1: Register updating
0	CLR_CNT_UPDATE	0x0: Register write completed 0x1: Register updating

0x12081000+ 0x18*n SLP_TMRn_MATCH_VAL, n=[0..1]

Type: Read/Write
Clock: PPSS_TIMER1_CLK_32KHZ_
Reset State: 0x00000000

SLP_TMRn_MATCH_VAL

Bits	Name	Description
31:0	MATCH_VAL	An interrupt is generated when the counter output equals the value stored in the match value register. Reading this register returns the value of the Match register located in the APB clock domain rather than the sleep clock domain.

0x12081004+ 0x18*n SLP_TMRn_COUNT_VAL, n=[0..1]

Type: Read/Write
Clock: PPSS_TIMER1_CLK_32KHZ_
Reset State: 0x00000000

Count Write

The count value is writable as a test/debug only feature. The value written to this address is loaded into the SLP_TMRn_MATCH_VAL register due to HW reuse. The procedure for writing the TMRn_COUNT_VAL is as follows:

1. Disable the timer by clearing the EN bit within the SLP_TMRn_CONTROL register.

The SLP_TMRn_STATUS register bit 2 (CONTROL_UPDATE) returns low once the data written to the control register has been synchronized to the SLP clock domain.

2. Read this status bit and do not proceed until it is low.
3. Write the required counter value to the SLP_TMRn_COUNT_VAL address.

Note that this value is loaded into the SLP_TMRn_MATCH register.

SLP_TMRn_STATUS register bit 3 (COUNT_UPDATE) returns low once the written value has been loaded into the counter.

4. If required the original Match value can now be restored by writing directly to the SLP_TMRn_MATCH_VAL register.

Count Read

The counter increments at the sleep clock rate. The AHB clock is used to detect the falling edge of the slower sleep clock. Each time a falling edge is detected, the SLP counter output is copied to a 32-bit register within the APB clock domain. Constantly updating this register ensures that the processor does not have to be stalled each time the counter value is read, i.e., the synchronization delay is eliminated. The disadvantage of this synchronization technique is that it takes time for the counter value to be synchronized when the timer is initially enabled. In addition, if the AHB clock is switched off to save power, the counter value becomes stale or invalid when the AHB clock is first restored. To overcome these limitations, the software must either allow time for the counter value to be synchronized or take repeated readings and wait for the counter value to be updated.

SLP_TMRn_COUNT_VAL

Bits	Name	Description
31:0	COUNT	The current counter value.

0x12081008+ 0x18*n SLP_TMRn_CONTROL, n=[0..1]

Type: Read/Write
Clock: PPSS_TIMER1_CLK_32KHZ_
Reset State: 0x00

Three modes of operation are provided. The mode of operation determines how the timer behaves once the counter reaches the value stored in the match register:

- FREE_RUN - the counter continues counting.

Once the up-counter reaches the maximum value, the count resets to zero and counting then continues.

- ONE_SHOT - the counter resets to zero and stops counting.
- PERIODIC - the count resets to zero and counting then continues.

This periodic process continues until the timer register settings are changed. When using this mode, the match value register must not be loaded with too low a value as it is impossible to clear the interrupt output before the next interrupt is generated.

Reading this register returns the value of the Control register located in the APB clock domain rather than the sleep clock domain.

SLP_TMRn_CONTROL

Bits	Name	Description
4	EN	Timer Enable, 0x0: Disable 0x1: Enable
3:2	MODE	Timer Mode, 0x0: FREE_RUN 0x1: ONE_SHOT 0x2: PERIODIC 0x3: RESERVE
1:0	RESERVED_2	The sleep timers do not provide a pre-scale counter facility.

0x1208100C+ 0x18*n SLP_TMRn_CLEAR_INT, n=[0..1]

Type: Write (command)
Clock: PPSS_TIMER1_CLK_32KHZ_
Reset State: 0x0

SLP_TMRn_CLEAR_INT

Bits	Name	Description
0	CLEAR_INT	This register is a one-shot command register that, when written with any value, resets the interrupt.

0x12081010+ 0x18*n SLP_TMRn_CLEAR_CNT, n=[0..1]

Type: Write (command)
Clock: PPSS_TIMER1_CLK_32KHZ_
Reset State: 0x0

SLP_TMRn_CLEAR_CNT

Bits	Name	Description
0	CLEAR_CNT	This register is a one-shot command register that, when written with any value, resets the COUNT_VAL to 0. This occurs regardless of the state of the EN bit within the SLP_TMRn_CONTROL register.

0x12081014+0x18*n SLP_TMRn_STATUS, n=[0..1]

Type: Read
Clock: PPSS_TIMER1_CLK_32KHZ_
Reset State: 0x00

As the advanced peripheral bus (APB) runs at a different clock frequency to the sleep timers ,it takes time to synchronize data between the two clock domains. The actual synchronization delay depends on which register is being synchronized (refer to the HDD for timing details). The SLP_TMRn_STATUS register allows the software to track the progress of each synchronized write command. Note that if the Match or Control registers are read, the values are returned from the registers located within the APB clock domain rather than the sleep clock domain. As a result the status register must be used to determine when the Match or Control registers within the sleep clock domain have been updated.

SLP_TMRn_STATUS

Bits	Name	Description
4	MATCH_UPDATE	0x0: Register write completed 0x1: Register updating
3	COUNT_UPDATE	0x0: Register write completed 0x1: Register updating
2	CONTROL_UPDATE	0x0: Register write completed 0x1: Register updating
1	CLR_INT_UPDATE	0x0: Register write completed 0x1: Register updating
0	CLR_CNT_UPDATE	0x0: Register write completed 0x1: Register updating

0x12081800 PPSS_WDOG_RESET

Type: Write
Clock: PPSS_PCLK
Reset State: 0x0

The PPSS_WDOG_RESET register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset watchdog. This command register also disables the watchdog freeze.

PPSS_WDOG_RESET

Bits	Name	Description
0	WDOG_RESET	This bit generates the WDOG_STB during the non-sleep mode. A pulse is generated on WDOG_STB when this bit is written with a `1'.

0x12081804 PPSS_WDOG_FREEZE

Type: Write/Command
Clock: PPSS_PCLK
Reset State: 0x0

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

The PPSS_WDOG_FREEZE register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the PPSS_WDOG_RESET register.

PPSS_WDOG_FREEZE

Bits	Name	Description
0	WDOG_FREEZE	This bit is used to freeze the watchdog timer at count 0. To enable the watchdog timer auto-kicker, write a '1'.

0x12081808 PPSS_WDOG_UNMASKED_INT_EN

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0

The PPSS_WDOG_UNMASKED_INT_EN register enables unmasked IRQs and FIQs to enable the watch dog.

PPSS_WDOG_UNMASKED_INT_EN

Bits	Name	Description
1	ENABLE	Enable wdog timer Do not enable wdog timer 0x1: enable 0x0: don't enable
0	UNMASKED_INT_ENABLE	Unmasked IRQ or FIQ enables wdog timer Unmasked IRQ or FIQ does not enable wdog timer 0x1: enable 0x0: don't enable

0x1208180C PPSS_WDOG_STATUS

Type: Read
Clock: PPSS_PCLK
Reset State: 0x4

The PPSS_WDOG_STATUS register is the watchdog status register.

PPSS_WDOG_STATUS

Bits	Name	Description
16:3	WDOG_COUNT	Counter value [13:0] of watch dog counter. NOTE The sleep counter value is synchronized to the APB clock domain by transferring data on the falling edge of the sleep clock.
2	WDOG_CNT_RESET_STATUS	Show the status of wdog_res signal (for test).
1	WDOG_FROZEN	This bit indicates whether wdog is frozen at count `0'. 0x1: frozen 0x0: not frozen
0	WDOG_EXPIRED_STATUS	Watchdog timer has expired. Wdog timer has not expired. 0x1: expired 0x0: not expired

0x12081810 PPSS_WDOG_EXPIRED_WIDTH

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0xC7C

The PPSS_WDOG_EXPIRED_WIDTH register defines the width of the wdog_expired pulse in the number of sleep_clk cycles. The default value is 0x0C7C = 3196.

PPSS_WDOG_EXPIRED_WIDTH

Bits	Name	Description
14	SYNC_STATUS	When set (1), the wdog expired width data is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STATUS bit is clear (0). This bit is read only.
13:0	DATA	Wdog counter value to de-assert the wdog_expired pulse. The wdog counter is14 bits.

0x12081814 PPSS_WDOG_BARK_TIME

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x3FFF

The PPSS_WDOG_BARK_TIME register defines the time in sleep_clk when to assert the watchdog ("bark") interrupts. The value can be between 1and 12787 (the time when the watchdog times out). The default value is 0x3FFF, which is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog ("bark") interrupt.

NOTE A bark time of 0x0 is not allowed.

PPSS_WDOG_BARK_TIME

Bits	Name	Description
14	SYNC_STATUS	When set (1), the wdog bark time is synchronizing to the SLEEP_CLK. The data value is not guaranteed until the SYNC_STATUS bit is clear (0). This bit is read only.
13:0	DATA	The wdog counter value on which to trigger the bark interrupt

0x12081818 PPSS_WDOG_TEST_LOAD_STATUS

Type: Read
Reset State: 0x0

The PPSS_WDOG_TEST_LOAD_STATUS register indicates when the watchdog test load is synchronizing to sleep_clk

PPSS_WDOG_TEST_LOAD_STATUS

Bits	Name	Description
0	SYNC_STATUS	When set (1) wdog test load is synchronizing to SLEEP_XTAL_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x1208181C PPSS_WDOG_TEST_LOAD

Type: Write (Command)
Clock: PPSS_PCLK
Reset State: 0x0

The PPSS_WDOG_TEST_LOAD register loads the PPSS_WDOG_TEST register value into the watchdog counter. Any write to this register, irrespective of the value written, creates a load pulse.

The watchdog counter must be enabled before the counter can be loaded. A watchdog counter load has a lower priority than a reset condition.

PPSS_WDOG_TEST_LOAD

Bits	Name	Description
0	LOAD	

0x12081820 PPSS_WDOG_TEST

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0

The PPSS_WDOG_TEST register indicates that the watchdog test is synchronizing to sleep_clk and contains the watchdog counter test load value.

PPSS_WDOG_TEST

Bits	Name	Description
14	SYNC_STATUS	When set (1), the watchdog test is synchronizing to SLEEP_ XTAL_CLK. The data value is not guaranteed until the SYNC_STATUS bit is clear (0).
13:0	LOAD_VALUE	The watchdog counter test load value [13:0]. The watchdog counter is 14 bits.

0x12081824 TIMER_CLK_CNTL

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0000_0000

The TIMER_CLK_CNTL register provides a means of saving power by turning off the clocks to the Sleep and Watchdog timers when they are not in use.

TIMER_CLK_CNTL

Bits	Name	Description
1	WDOG_TIMER_CLK_ON	When the watchdog timer is not in use, the clock should be switched OFF to save power. 0x0: Clock OFF 0x1: Clock ON

TIMER_CLK_CNTL (cont.)

Bits	Name	Description
0	SLP_TIMER_CLKS_ON	When both sleep timers are not in use, the clocks should be switched OFF to save power. 0x0: Clocks OFF 0x1: Clocks ON

20.43 PPS SS Master Controller Registers (0x12080000 PPSS_BASE)

This section contains Peripheral Process Subsystem (PPSS) Master Controller registers.

0x12082004 PAUSE

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0

PAUSE

Bits	Name	Description
0	PAUSE	Signal to halt the ARM7 clock Note that negative edge or active low interrupt will not cause the PPSS Processor to automatically wake-up. 0x0: Do not halt 0x1: Halt

0x1208200C PROC_TYPE

Type: Read
Clock: PPSS_PCLK
Reset State: 0x1

PROC_TYPE

Bits	Name	Description
2:0	PROC_TYPE	The type of CPU in PPSS. Default is ARM7. 0x0: No CPU 0x1: ARM7 0x2: IO Proc 0x3: Reserved_1 0x4: Reserved_2 0x5: Reserved_3 0x6: Reserved_4 0x7: Reserved_5

0x12082010 RAM_SIZE

Type: Read
Clock: PPSS_PCLK
Reset State: 0x30

RAM_SIZE

Bits	Name	Description
7:0	RAM_SIZE	This 8-bit register output gives the size of the PPSS Code RAM in 16 kilobytes multiples, e.g., RAM_SIZE of 0xA0 is equivalent to 160 kilobytes (16 x A), where the lower nibble is ignored. The memory size may be configured by setting a generic where the PPSS core is instantiated.

0x12082014 BUFFER_SIZE

Type: Read
Clock: PPSS_PCLK
Reset State: 0x10

BUFFER_SIZE

Bits	Name	Description
7:0	BUFFER_SIZE	This 8-bit register output gives the size of the PPSS Buffer RAM in 16 kilobytes multiples, e.g., BUFFER_SIZE of x10 is equivalent to 16 kilobytes (16 x 1), where the lower nibble is ignored. The memory size may be configured by setting a generic where the PPSS core is instantiated.

0x12082018 ROM_SIZE

Type: Read
Clock: PPSS_PCLK
Reset State: 0x00

ROM_SIZE

Bits	Name	Description
7:0	ROM_SIZE	Size of the ROM in kilobytes 0x0: No ROM

0x1208201C RAM_SHORTCUT_ENABLE

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x1

RAM_SHORTCUT_ENABLE

Bits	Name	Description
0	RAM_SHORTCUT_ENABLE	PPSS Code RAM Shortcut Enable. The PPSS processor (ARM7) can have a direct connection, via the PPSS Code RAM Shortcut, to the PPSS Code RAM bank, mapping the memory to address 0x0000_0000 to support the ARM7 exception vectors. The direct connection also provides single-cycle access time, which is critical as the ARM7 has no internal cache. On power-up, the PPSS Code RAM shortcut is enabled. It is recommended to leave the shortcut enabled unless the PPSS Processor needs to access the lower end of the chip address space (0x0000_0000 to RAM_SIZE*16*1024 - 4). If it is necessary to access PPSS Code RAM while the Code RAM Shortcut is disabled, the memory address must be modified by SW to reflect the PPSS Memory Map (i.e., PPSS HW does not automatically modify the address). 0x0: Disable Code RAM shortcut 0x1: Enable Code RAM shortcut

0x12082020 BUFFER_SHORTCUT_ENABLE

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x1

BUFFER_SHORTCUT_ENABLE

Bits	Name	Description
0	BUFFER_SHORTCUT_ENABLE	PPSS Buffer RAM Shortcut Enable. The PPSS processor (ARM7) can have a direct connection, via the PPSS Buffer RAM Shortcut, to the PPSS Buffer RAM bank, mapping the memory (to address RAM_SIZE*16*1024) to be contiguous with Code RAM and thus supporting instruction storage in Buffer RAM. The direct connection also provides single-cycle access time. On power-up, the PPSS Buffer RAM shortcut is enabled. It is recommended to leave the shortcut enabled unless the PPSS processor needs to access the lower end of the chip address space (RAM_SIZE*16*1024 to ((RAM_SIZE + BUFFER_SIZE)*16*1024 - 4)). If it is necessary to access PPSS Buffer RAM while the Buffer RAM Shortcut is disabled, the memory address must be modified by SW to reflect the PPSS Memory Map (i.e., PPSS HW does not automatically modify the address). 0x0: Disable Buffer RAM shortcut 0x1: Enable Buffer RAM shortcut

0x12082024 PERIPHERAL_SHORTCUT_ENABLE

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x1

PERIPHERAL_SHORTCUT_ENABLE

Bits	Name	Description
0	PERIPHERAL_SHORTCUT_ENABLE	PPSS Peripheral shortcut enable. The PPSS processor (ARM7) can have a direct connection, via the PPSS Peripheral shortcut, to the PPSS Peripheral Block bypassing the Fabric thus providing a low latency path, to PPSS Interrupt, GPI, GPO, Timers, and watchdog registers. On power-up, the PPSS Peripheral shortcut is enabled, and it is recommended to leave the shortcut enabled. 0x0: Disable Peripheral shortcut 0x1: Enable Peripheral shortcut

0x12082028 INTERRUPT_MODE

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x00

The INTERRUPT_MODE register controls the source of IRQ and FIQ within PPSS to be from either the internal Interrupt Controller within PPSS or from an external Secondary Interrupt Controller (SIC) at chip level.

INTERRUPT_MODE

Bits	Name	Description
1:0	INTERRUPT_MODE	Defines the PPSS interrupt mode 0x0: IRQ External and FIQ External 0x1: IRQ External and FIQ Internal 0x2: IRQ Internal and FIQ External 0x3: IRQ Internal and FIQ Internal

0x1208202C PPSS_RAM_ARB_CFG

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x1

The PPSS_RAM_ARB_CFG register controls the selection of the arbitration mode for the PPSS RAM slave arbiter: fair round robin or programmable priority. It is also used to set the priority level for each master for programmable priority mode.

NOTE the default arbitration mode is set to fair round robin mode and SHOULD NOT BE CHANGED.

The programmable priority mode is for future use ONLY.

PPSS_RAM_ARB_CFG

Bits	Name	Description
1	PRIORITY_0	SW: RW, HW: R First priority level (highest) Note that there is no need for a PRIORITY_1 register bit because Priority 1 is simply the opposite binary bit to the Priority 0 value in a two master arbiter system such as this one. Therefore, Priority 1 is calculated in the RTL code. Power-up value is 0 (ARM7). It is recommended to leave ARM7 as the high priority master. 0x0: ARM7 0x1: FABRIC AHB
0	ARB_TYPE	Stores arbiter type: Power-up value is 1 (fair round robin mode) and SHOULD NOT BE CHANGED. Programmable priority mode is for future use ONLY. 0x1: Fair Round Robin Mode

0x12082030 PPSS_BUFFER_ARB_CFG

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x1

The PPSS_BUFFER_ARB_CFG register controls the selection of the arbitration mode for the PPSS buffer slave arbiter: fair round robin or programmable priority. It is also used to set the priority level for each master for programmable priority mode.

NOTE the default arbitration mode is set to fair round robin mode and SHOULD NOT BE CHANGED.

The programmable priority mode is for future use ONLY.

PPSS_BUFFER_ARB_CFG

Bits	Name	Description
1	PRIORITY_0	SW: RW, HW: R First priority level (highest) The PRIORITY_0 bit is used in the design whether the ARB_TYPE bit is set as programmable priority or round robin mode. Note that there is no need for a PRIORITY_1 register bit because Priority 1 is simply the opposite binary bit to the Priority 0 value in a two master arbiter system such as this one. Therefore, Priority 1 is calculated in the RTL code. Power-up value is 0 (ARM7). It is recommended to leave ARM7 as the high priority master. 0x0: ARM7 0x1: FABRIC AHB
0	ARB_TYPE	Stores arbiter type: Power-up value is 1 (fair round robin mode) and SHOULD NOT BE CHANGED. Programmable priority mode is for future use ONLY 0x1: Fair Round Robin Mode

0x12082034 PPSS_DEBUG_BUS_SEL

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0

PPSS_DEBUG_BUS_SEL

Bits	Name	Description
3:0	SEL	Select value for the PPSS Debug Bus MUX. When the value in this register is zero, the output on the PPSS Debug Bus will be a 32-bit zero vector. The MUX select values and associated signal group outputs on the debug bus are: 0000 --> 32-bit zero vector 0001 --> Clock and reset signals 0010 --> Slave 0 (S0) AHB and internal APB signals 0011 --> Slave 0 (S0) AHB 0100 --> Internal APB signals 0101 --> Slave 1 (S1) AHB signals 0110 --> PPSS Code RAM signals 0111 --> Slave 2 (S2) AHB signals 1000 --> PPSS Buffer RAM signals 1001 --> Master (PPSS Processor) signals 1010 --> JTAG and PPSS Processor debug signals 1011 --> Interrupts and 8-bit GPIO output 1100 --> PPSS Code Memory and AHB Subsystem selected ports and internal signals 1101 --> PPSS Buffer Memory and AHB Subsystem selected ports and internal signals 1110 --> Unused 1111 --> Unused

0x12082038 PPSS_CLZ_IN

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x00000000

PPSS_CLZ_IN

Bits	Name	Description
31:0	PPSS_CLZ_IN	32-bit input to the HW Count Leading Zeros (CLZ) functionality of the PPSS master control block. The result of the HW CLZ functionality appears as the contents of the PPSS_CLZ_OUT register.

0x1208203C PPSS_CLZ_OUT

Type: Read
Clock: PPSS_PCLK
Reset State: 0x00

PPSS_CLZ_OUT

Bits	Name	Description
5:0	PPSS_CLZ_OUT	6-bit output of the HW Count Leading Zeros (CLZ) functionality of the PPSS master control block. The input to the HW CLZ functionality should be specified via the PPSS_CLZ_IN register.

0x12082040 PPSS_ACC

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0

PPSS_ACC

Bits	Name	Description
31:0	RESERVED	

0x12082044 PPSS_RPM_SPM_BYPASS

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x0

PPSS_RPM_SPM_BYPASS

Bits	Name	Description
0	PPSS_RPM_SPM_BYPASS	Selects control of processor bring up from halt state to be either dependent on the RPM SPM or not. When RPM_SPM_BYPASS is enabled, processor bring up from halt is only dependent on PAUSE register setting. When RPM_SPM_BYPASS is disabled, processor bring up from halt is dependent on status of the PAUSE register and the RPM SPM bringup_ack signal. If the bringup_ack is low the processor will be halted, even if the PAUSE register is cleared. 0x0: RPM_SPM_BYPASS_ENABLE 0x1: RPM_SPM_BYPASS_DISABLE

0x12082048 PPSS_RPM_SPM_HANDSHAKE

Type: Read
Clock: PPSS_PCLK
Reset State: 0xA

The PPSS_RPM_SPM_HANDSHAKE register shows the RPM_SPM handshake signals.

PPSS_RPM_SPM_HANDSHAKE

Bits	Name	Description
3	BRINGUP_REQ	bringup request sent from PPSS to RPM
2	SHUTDOWN_REQ	shutdown request sent from PPSS to RPM
1	BRINGUP_ACK	bringup acknowledgement returned by RPM
0	SHUTDOWN_ACK	shutdown acknowledgement returned by RPM

0x1208204C PPSS_RPM_SPM_FSM_RESET

Type: Write
Clock: PPSS_PCLK
Reset State: 0x0

PPSS_RPM_SPM_FSM_RESET

Bits	Name	Description
0	PPSS_RPM_SPM_FSM_RESET	Any write to this resgister will reset the RPM_SPM FSM to default state

20.44 PP SS GPIO Registers (0x12080000 PPSS_BASE)

This section contains Peripheral Process Subsystem (PPSS) GPIO registers.

The following section describes the GPIO settings.

The notation n is used to differentiate between the two GPIO blocks.

0x12082800+ 0x800*n GPIO_n_DIR, n=[0..1]

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_DIR

Bits	Name	Description
7:0	DIR	Direction Register: Each bit within this register controls the corresponding bit within the GPIO block. The Direction register is used to select whether the internal GPIO logic monitors the eight external input lines or the outputs from the internal WDATA register. NOTE In GPIO_1 the WDATA register outputs are permanently connected to the external inputs so this register is not required. 0x0: External input 0x1: Internal input

0x12082804+ 0x800*n GPIO_n_IS, n=[0..1]

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_IS

Bits	Name	Description
7:0	IS	Interrupt Sense Register: Each bit within this register controls the corresponding bit within the GPIO block. 0x0: Edge detection 0x1: Level detection

0x12082808+ 0x800*n GPIO_n_IBE, n=[0..1]

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_IBE

Bits	Name	Description
7:0	IBE	Interrupt Both Edge Register: Each bit within this register controls the corresponding bit within the GPIO block. If Single edge detection is selected, the IEV register determines whether a rising or falling edge is required. If Both edge detection is selected, the circuit triggers on both a rising and falling edge. 0x0: Single edge detection 0x1: Both edge detection

0x1208280C+ 0x800*n GPIO_n_IEV, n=[0..1]

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_IEV

Bits	Name	Description
7:0	IEV	Interrupt Event Register: Each bit within this register controls the corresponding bit within the GPIO block. The Interrupt Event Register performs two different functions depending upon whether the corresponding bit within the Interrupt Sense Register has been set for edge or logic level detection. Low selects a falling edge or logic '0' detection High selects a rising edge or logic '1' detection 0x0: Neg edge or low level 0x1: Pos edge or high level

0x12082810+ 0x800*n GPIO_n_IE, n=[0..1]

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_IE

Bits	Name	Description
7:0	IE	Interrupt Enable Register: Each bit within this register controls the corresponding bit within the GPIO block. 0x0: Interrupt disabled 0x1: Interrupt enabled

0x12082814+ 0x800*n GPIO_n_RIS, n=[0..1]

Type: Read
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_RIS

Bits	Name	Description
7:0	RIS	Raw Interrupt Status Register: Allows the output state of each of the eight edge/ level interrupt detection circuits to be read.

0x12082818+ 0x800*n GPIO_n_MIS, n=[0..1]

Type: Read
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_MIS

Bits	Name	Description
7:0	MIS	Masked Interrupt Status Register: Performs an identical function to the Raw Interrupt Status Register except the inputs to this register are ANDed with the outputs from the Interrupt Enable Register, i.e., only the status of the bits that can cause an interrupt are read.

0x1208281C+ 0x800*n GPIO_n_IC, n=[0..1]

Type: Write
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_IC

Bits	Name	Description
7:0	IC	Interrupt Clear: Each bit controls the corresponding bit within the GPIO block. Note: logic level interrupts are not latched and, therefore, cannot be cleared by means of this register. 0x0: Do not clear 0x1: Clear edge triggered interrupt

0x12082820+ 0x800*n GPIO_n_WDATA, n=[0..1]

Type: Read/Write
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_WDATA

Bits	Name	Description
7:0	WDATA	Write Data Register: The outputs of this register connect to the eight GPIO data output lines. Only the output lines from GPIO block 1 are used. GPIO Block 1 Output Connections: The upper 5 bits are routed to the PPSS top level for general use. The top level signal names are ppss_gp1_out, i.e., ppss_gp1_out (4:0) <= ppss_gpio_out(7:3) The lower 3 bits are routed to the PPSS top level and externally routed to the RPM interrupt inputs listed below: dsps_rpm_gp_high_irq <= ppss_gpio_out(2) dsps_rpm_gp_medium_irq <= ppss_gpio_out(1) dsps_rpm_gp_low_irq <= ppss_gpio_out(0)

0x12082824+ 0x800*n GPIO_n_WDSET, n=[0..1]

Type: Write
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_WDSET

Bits	Name	Description
7:0	WDSET	Write Data Set: Each bit sets the corresponding bit within the Write Data Register. Note that writing a zero has no effect. 0x0: Do not set 0x1: Set

0x12082828+ 0x800*n GPIO_n_WDCLR, n=[0..1]

Type: Write
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_WDCLR

Bits	Name	Description
7:0	WDCLR	Write Data Clear: Each bit clears the corresponding bit within the Write Data Register. 0x0: Do not clear 0x1: Clear

0x1208282C+ 0x800*n GPIO_n_RPIND, n=[0..1]

Type: Read
Clock: PPSS_PCLK
Reset State: 0x00

GPIO_n_RPIND

Bits	Name	Description
7:0	RRPIND	Read Pin Data: The data applied to each of the eight external inputs is fed through a two stage synchronization circuit clocked at the PCLK frequency. RPIND returns the value of the data as it appears at the output of the synchronization circuits.

Index of Registers

A Exhibit 1

PLEASE READ THIS LICENSE AGREEMENT (“AGREEMENT”) CAREFULLY. THIS AGREEMENT IS A BINDING LEGAL AGREEMENT ENTERED INTO BY AND BETWEEN YOU (OR IF YOU ARE ENTERING INTO THIS AGREEMENT ON BEHALF OF AN ENTITY, THEN THE ENTITY THAT YOU REPRESENT) AND QUALCOMM TECHNOLOGIES, INC. (“QTI” “WE” “OUR” OR “US”). THIS IS THE AGREEMENT THAT APPLIES TO YOUR USE OF THE DESIGNATED AND/OR ATTACHED DOCUMENTATION AND ANY UPDATES OR IMPROVEMENTS THEREOF (COLLECTIVELY, “MATERIALS”). BY USING OR COMPLETING THE INSTALLATION OF THE MATERIALS, YOU ARE ACCEPTING THIS AGREEMENT AND YOU AGREE TO BE BOUND BY ITS TERMS AND CONDITIONS. IF YOU DO NOT AGREE TO THESE TERMS, QTI IS UNWILLING TO AND DOES NOT LICENSE THE MATERIALS TO YOU. IF YOU DO NOT AGREE TO THESE TERMS YOU MUST DISCONTINUE AND YOU MAY NOT USE THE MATERIALS OR RETAIN ANY COPIES OF THE MATERIALS. ANY USE OR POSSESSION OF THE MATERIALS BY YOU IS SUBJECT TO THE TERMS AND CONDITIONS SET FORTH IN THIS AGREEMENT.

1.1 **License**. Subject to the terms and conditions of this Agreement, including, without limitation, the restrictions, conditions, limitations and exclusions set forth in this Agreement, Qualcomm Technologies, Inc. (“QTI”) hereby grants to you a nonexclusive, limited license under QTI’s copyrights to use the attached Materials; and to reproduce and redistribute a reasonable number of copies of the Materials. You may not use Qualcomm Technologies or its affiliates or subsidiaries name, logo or trademarks; and copyright, trademark, patent and any other notices that appear on the Materials may not be removed or obscured. QTI shall be free to use suggestions, feedback or other information received from You, without obligation of any kind to You. QTI may immediately terminate this Agreement upon your breach. Upon termination of this Agreement, Sections 1.2-4 shall survive.

1.2 **Indemnification**. You agree to indemnify and hold harmless QTI and its officers, directors, employees and successors and assigns against any and all third party claims, demands, causes of action, losses, liabilities, damages, costs and expenses, incurred by QTI (including but not limited to costs of defense, investigation and reasonable attorney’s fees) arising out of, resulting from or related to: (i) any breach of this Agreement by You; and (ii) your acts, omissions, products and services. If requested by QTI, You agree to defend QTI in connection with any third party claims, demands, or causes of action resulting from, arising out of or in connection with any of the foregoing.

1.3 **Ownership**. QTI (or its licensors) shall retain title and all ownership rights in and to the Materials and all copies thereof, and nothing herein shall be deemed to grant any right to You under any of QTI's or its affiliates’ patents. You shall not subject the Materials to any third party license terms (e.g., open source license terms). You shall not use the Materials for the purpose of identifying or providing evidence to support any potential patent infringement claim against QTI, its affiliates, or any of QTI’s or QTI’s affiliates’ suppliers and/or direct or indirect customers. QTI hereby reserves all rights not expressly granted herein.

1.4 **WARRANTY DISCLAIMER**. YOU EXPRESSLY ACKNOWLEDGE AND AGREE THAT THE USE OF THE MATERIALS IS AT YOUR SOLE RISK. THE MATERIALS AND TECHNICAL SUPPORT, IF ANY, ARE PROVIDED "AS IS" AND WITHOUT WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED. QTI ITS LICENSORS AND AFFILIATES MAKE NO WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THE MATERIALS OR ANY OTHER INFORMATION OR DOCUMENTATION PROVIDED UNDER THIS AGREEMENT, INCLUDING BUT NOT LIMITED TO ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR AGAINST INFRINGEMENT, OR ANY EXPRESS OR IMPLIED WARRANTY ARISING OUT OF TRADE USAGE OR OUT OF A COURSE OF DEALING OR COURSE OF PERFORMANCE. NOTHING CONTAINED IN THIS AGREEMENT SHALL BE CONSTRUED AS (I) A WARRANTY OR REPRESENTATION BY QTI, ITS LICENSORS OR AFFILIATES AS TO THE VALIDITY OR SCOPE OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT OR (II) A WARRANTY OR REPRESENTATION BY QTI THAT ANY MANUFACTURE OR USE WILL BE FREE FROM INFRINGEMENT OF PATENTS, COPYRIGHTS OR OTHER INTELLECTUAL PROPERTY RIGHTS OF OTHERS, AND IT SHALL BE THE SOLE RESPONSIBILITY OF YOU TO MAKE SUCH DETERMINATION AS IS NECESSARY WITH RESPECT TO THE ACQUISITION OF LICENSES UNDER PATENTS AND OTHER INTELLECTUAL PROPERTY OF THIRD PARTIES.

1.5 **LIMITATION OF LIABILITY**. IN NO EVENT SHALL QTI, QTI’S AFFILIATES OR ITS LICENSORS BE LIABLE TO YOU FOR ANY INCIDENTAL, CONSEQUENTIAL OR SPECIAL DAMAGES, INCLUDING BUT NOT LIMITED TO ANY LOST PROFITS, LOST SAVINGS, OR OTHER INCIDENTAL DAMAGES, ARISING OUT OF THE USE OR INABILITY TO USE, OR THE DELIVERY OR FAILURE TO DELIVER, ANY OF THE MATERIALS, OR ANY BREACH OF ANY OBLIGATION UNDER THIS AGREEMENT, EVEN IF QTI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. THE FOREGOING LIMITATION OF LIABILITY SHALL REMAIN IN FULL FORCE AND EFFECT REGARDLESS OF WHETHER YOUR REMEDIES HEREUNDER ARE DETERMINED TO HAVE FAILED OF THEIR ESSENTIAL PURPOSE. THE ENTIRE LIABILITY OF QTI, QTI’s AFFILIATES AND ITS LICENSORS, AND THE SOLE AND EXCLUSIVE REMEDY OF YOU, FOR ANY CLAIM OR CAUSE OF ACTION ARISING HEREUNDER (WHETHER IN CONTRACT, TORT, OR OTHERWISE) SHALL NOT EXCEED US$10.

2. **COMPLIANCE WITH LAWS; APPLICABLE LAW**. You agree to comply with all applicable local, international and national laws and regulations and with U.S. Export Administration Regulations, as they apply to the subject matter of this Agreement. This Agreement is governed by the laws of the State of California, excluding California's choice of law rules.

3. C**ONTRACTING PARTIES**. If the Materials are downloaded on any computer owned by a corporation or other legal entity, then this Agreement is formed by and between QTI and such entity. The individual accepting the terms of this Agreement represents and warrants to QTI that they have the authority to bind such entity to the terms and conditions of this Agreement.

4. **MISCELLANEOUS PROVISIONS**. This Agreement, together with all exhibits attached hereto, which are incorporated herein by this reference, constitutes the entire agreement between QTI and You and supersedes all prior negotiations, representations and agreements between the parties with respect to the subject matter hereof. No addition or modification of this Agreement shall be effective unless made in writing and signed by the respective representatives of QTI and You. The restrictions, limitations, exclusions and conditions set forth in this Agreement shall apply even if QTI or any of its affiliates becomes aware of or fails to act in a manner to address any violation or failure to comply therewith. You hereby acknowledge and agree that the restrictions, limitations, conditions and exclusions imposed in this Agreement on the rights granted in this Agreement are not a derogation of the benefits of such rights. You further acknowledges that, in the absence of such restrictions, limitations, conditions and exclusions, QTI would not have entered into this Agreement with You. Each party shall be responsible for and shall bear its own expenses in connection with this Agreement. If any of the provisions of this Agreement are determined to be invalid, illegal, or otherwise unenforceable, the remaining provisions shall remain in full force and effect. This Agreement is entered into solely in the English language, and if for any reason any other language version is prepared by any party, it shall be solely for convenience and the English version shall govern and control all aspects. If You are located in the province of Quebec, Canada, the following applies: The Parties hereby confirm they have requested this Agreement and all related documents be prepared in English.
