NOTE If more than one of these QOS Control registers are set to the same master port, unpredictable behavior will occur.

Set-up procedure:

1. Set the QOS enable bit.
2. Set the arbitration mode to Scheduled Access Time in the FABRIC arbitration configuration register FACR (See FABRIC_ARBITRATION_CONTROL_REG_n, n=[0..3]).
3. Configure the master port that needs to be set to Tier1.
4. Set the appropriate number of tokens/weight.
5. Set the MLT value (default is zero clock cycles).

NOTE Four of these registers are required for each slave segment supported by the FABRIC .

0x01503300+4*n DAY_CFG_FABRIC_MASTER_INTERFACE_REG_n, n=[0..2]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x4084

This register controls the following master port attributes:

- whether the master request priority signals are used by the internal arbiter
- the redirection of cacheable coherent requests
- write gathering on AXI
- write packing on AHB

This register also controls a particular master's halt interface and for AHB master interfaces, it enables write packing functionality for posted writes.

When the MHR bit is set, the FABRIC_MnHALTREQ signal is asserted. The MHA and MHI fields capture the state of the FABRIC_MnHALTACK and FABRIC_MnIDLE signals at every clock cycle.

NOTE A register is implemented for each master interface supported by the FABRIC .SW should disable OWGM bit for AXI ports .

DAY_CFG_FABRIC_MASTER_INTERFACE_REG_n

Bits	Name	Description
15	RESERVED_BIT_15	
14	OWGM	SW : RW Enable optimized write gathering mode
13	DBW	SW : RW Disable Bufferable writes. Treats Bufferable writes as Non Bufferable writes (AHB only)
12	PRIEN	SW : RW Enable Request Priority Lets the slave way arbiter consider the master request priority AREQPRIORITY[1:0] signal that is driven with each transaction
11	RCOSH	SW : RW Redirect Cacheable-outer-sharable Governs whether or not cacheable accesses that are outer-sharable are redirected to the Scorpion-MP L2 slave port
10	RCISH	SW : RW Redirect Cacheable-inner-sharable Governs whether or not cacheable accesses that are inner-sharable are redirected to the Scorpion-MP L2 slave port
9	RCNSH	SW : RW Redirect Cacheable-non-sharable Governs whether or not cacheable accesses that are non-sharable are redirected to the Scorpion-MP L2 slave port
8	CRE	SW : RW Enable redirection of cachable coherent requests
7	WGE	SW : RW Write Gathering Enable (AXI only)

DAY_CFG_FABRIC_MASTER_INTERFACE_REG_n (cont.)

Bits	Name	Description
6	WPE	SW : RW Write Packing Enable (AHB Only) When enabled, the master port will pack indeterminate INCR burst writes, if disabled, the master port will break indeterminate INCR burst writes into SINGLES. 0x1: Enable 0x0: Disable
5:4	IIIW	SW : RW Bufferable Indeterminate INCR WR packing (AHB only): 0x0: break into INCR4 0x1: break into INCR8 0x3: break into INCR16
3	MID	SW : RW Master Interface Disable. SW diable of Master interface.
2	MI	SW : R Master Idle. Indicates that the Master does not have any pending bus transactions. For AHB busses, this bit is set internally by the FABRIC AHB Master port. For AXI masters, this value is driven by the master that is connected to the port.
1	MHA	SW : R Master halt acknowledge. Only valid for AXI masters. This bit is 0 on AHB master ports.
0	MHR	SW : RW Master halt request. Only valid for AXI masters. Writing this bit has no effect for AHB masters.

0x01503430 DAY_CFG_FABRIC_SLAVE_ARBITRATION_REG

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register disables the arbiter on a particular slave segment. The arbiter stalls and stops granting requests to a slave until the arbiter is re-enabled. These registers allow for the slave way to be stalled while reconfiguring a slave device or frequency scaling the slave way.

DAY_CFG_FABRIC_SLAVE_ARBITRATION_REG

Bits	Name	Description
15	S15AD	SW : R Slave 15 Arbitration Disable 0x1: Disables slave segment arbiter 0x0: Enables slave segment arbiter

0x01503500 DAY_CFG_FABRIC_TEST_INTERFACE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls:

- the grouping of signals that are driven out on the test bus (FABRIC_TESTBUS[31:0])
- Selection of MISR slave way and channel input

MEN: Selects which MISR output is driven onto the test-bus. For example, setting MEN to 00010 selects the MISR in slave segment 2. The MEN bits are only valid when the testmode (TMODE) is set to 000000 and test-enable is set (TEN)

TMODE: Selects the various test-bus modes

TEN: Test-enable. Must be set for values to be driven onto the test-bus OR for MISR to be enabled.

Clock: FABRIC_CLOCK
Reset State: 0x0000

This register is used to enable the low power mode clock halt functionality within the FABRIC slave ways arbiter.

DAY_CFG_FABRIC_SLAVE_CLOCK_ON_CFG_REG_n

Bits	Name	Description
15:4	RESERVED_BITS_15_4	Reserved
3:0	COD	SW : RW AHB Slave Way Clock On Delay (in FCLK cycles)

0x015038F8 DAY_CFG_FABRIC_MONITOR_ENABLE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the trigger selection and enabling of event and cycle counters.

NOTE When PTRIG is set to use any of the external trigger signals, the external triggers incur a 2 cycle delay from the positive edge assertion of the signal to when the actual counters are enabled in the performance monitor. This allows synchronization of the external signals into the FABRIC clock domain.

DAY_CFG_FABRIC_MONITOR_ENABLE_REG

Bits	Name	Description
15:13	PTRIG	SW : RW 0x4: Int Trig/Ext Trig 0x3: Ext Trig 0x2: Ext Trig/CC expire 0x1: Int Trig/CC expire 0x0: Manual enable/CC expire (No trigger)

8:4	E6MPS	SW : RW Event counter 6 Master port selection 0x0: Selects Master 0 0x1: Selects Master 1 0x2: Selects Master 2 0x3: Selects Master 3 0x4: Selects Master 4 0x5: Selects Master 5 0x6: Selects Master 6 0x7: Selects Master 7 0x8: Selects Master 8 0x9: Selects Master 9 0xA: Selects Master 10 0xB: Selects Master 11 0xC: Selects Master 12 0xD: Selects Master 13 0xE: Selects Master 14 0xF: Selects Master 15 0x10: Selects Master 16 0x11: Selects Master 17 0x12: Selects Master 18 0x13: Selects Master 19 0x14: Selects Master 20 0x15: Selects Master 21 0x16: Selects Master 22 0x17: Selects Master 23 0x18: Selects Master 24 0x19: Selects Master 25 0x1A: Selects Master 26 0x1B: Selects Master 27 0x1C: Selects Master 28 0x1D: Selects Master 29 0x1E: Selects Master 30 0x1F: Selects Master 31

DAY_CFG_FABRIC_MONITOR_SELECTION_LOWER_REG6 (cont.)

Bits	Name	Description
3:0	E6SWS	SW : RW Event counter 6 Slave way selection 0x0: Selects Slave 0 0x1: Selects Slave 1 0x2: Selects Slave 2 0x3: Selects Slave 3 0x4: Selects Slave 4 0x5: Selects Slave 5 0x6: Selects Slave 6 0x7: Selects Slave 7 0x8: Selects Slave 8 0x9: Selects Slave 9 0xA: Selects Slave 10 0xB: Selects Slave 11 0xC: Selects Slave 12 0xD: Selects Slave 13 0xE: Selects Slave 14 0xF: Selects Slave 15

0x0150393C DAY_CFG_FABRIC_MONITOR_SELECTION_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for event counter 6.

DAY_CFG_FABRIC_MONITOR_SELECTION_UPPER_REG6

Bits	Name	Description
15:0	E6MID	SW : RW Event counter 6 MID selection (If MID filtering enabled)

0x01503940 DAY_CFG_FABRIC_MONITOR_SELECTION_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the event and port selection and filtering criteria for event counter 7.

DAY_CFG_FABRIC_MONITOR_SELECTION_LOWER_REG7

Bits	Name	Description
15:13	E7ES	SW : RW Event counter 7 event selection 0x0: Read burst 7 (Master/slave) 0x1: Write burst 7 (Master/slave) 0x2: Address transfer count 7 (Master/slave) 0x3: Read transfer count 7 (Master/slave) 0x4: Write transfer count 7 (Master/slave) 0x5: Write (bufferable burst 7 AHB Master only) 0x3: b110 ’ 3:b111: Reserved
12	RESERVED_BIT_12	Reserved
11	E7MIDFEN	SW : RW Event counter 7 MID Filtering enable 0x0: Disabled 0x1: Enabled
10	E7INDFEN	SW : RW Event counter 7 Instruction/Data Filtering enable 0x0: Disabled 0x1: Enabled
9	E7IND	SW : RW Event counter 7 Instruction/Data selection 0x0: Data 0x1: Instruction

DAY_CFG_FABRIC_MONITOR_SELECTION_LOWER_REG7 (cont.)

Bits	Name	Description
8:4	E7MPS	SW : RW Event counter 7 Master port selection 0x0: Selects Master 0 0x1: Selects Master 1 0x2: Selects Master 2 0x3: Selects Master 3 0x4: Selects Master 4 0x5: Selects Master 5 0x6: Selects Master 6 0x7: Selects Master 7 0x8: Selects Master 8 0x9: Selects Master 9 0xA: Selects Master 10 0xB: Selects Master 11 0xC: Selects Master 12 0xD: Selects Master 13 0xE: Selects Master 14 0xF: Selects Master 15 0x10: Selects Master 16 0x11: Selects Master 17 0x12: Selects Master 18 0x13: Selects Master 19 0x14: Selects Master 20 0x15: Selects Master 21 0x16: Selects Master 22 0x17: Selects Master 23 0x18: Selects Master 24 0x19: Selects Master 25 0x1A: Selects Master 26 0x1B: Selects Master 27 0x1C: Selects Master 28 0x1D: Selects Master 29 0x1E: Selects Master 30 0x1F: Selects Master 31

DAY_CFG_FABRIC_MONITOR_SELECTION_LOWER_REG7 (cont.)

Bits	Name	Description

0x01503944 DAY_CFG_FABRIC_MONITOR_SELECTION_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for event counter 7.

DAY_CFG_FABRIC_MONITOR_SELECTION_UPPER_REG7

Bits	Name	Description
15:0	E7MID	SW : RW Event counter 7 MID selection (If MID filtering enabled)

0x01503948 DAY_CFG_FABRIC_MONITOR_PICK_PORTS_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the main port and other port selection for the eight event counters. Due to a bug in the design, these fields should not be set for Smart Peripheral Subsystem Fabric.

DAY_CFG_FABRIC_MONITOR_PICK_PORTS_REG

Bits	Name	Description
15:14	E7PP	SW : RW Event counter 7 port combination selection 0x0: Master port selected by E7MPS, filtering based on slave port disabled 0x1: Master port selected by E7MPS, filtering based on slave way selected by E7SWS 0x2: Slave way selected by E7SWS, filtering based on master port disabled 0x3: Slave way selected by E7SWS, filtering based on master port selected by E7MPS
13:12	E6PP	SW : RW Event counter 6 port combination selection 0x0: Master port selected by E6MPS, filtering based on slave port disabled 0x1: Master port selected by E6MPS, filtering based on slave way selected by E6SWS 0x2: Slave way selected by E6SWS, filtering based on master port disabled 0x3: Slave way selected by E6SWS, filtering based on master port selected by E6MPS
11:10	E5PP	SW : RW Event counter 5 port combination selection 0x0: Master port selected by E5MPS, filtering based on slave port disabled 0x1: Master port selected by E5MPS, filtering based on slave way selected by E5SWS 0x2: Slave way selected by E5SWS, filtering based on master port disabled 0x3: Slave way selected by E5SWS, filtering based on master port selected by E5MPS
9:8	E4PP	SW : RW Event counter 4 port combination selection 0x0: Master port selected by E4MPS, filtering based on slave port disabled 0x1: Master port selected by E4MPS, filtering based on slave way selected by E4SWS 0x2: Slave way selected by E4SWS, filtering based on master port disabled 0x3: Slave way selected by E4SWS, filtering based on master port selected by E4MPS

DAY_CFG_FABRIC_MONITOR_PICK_PORTS_REG (cont.)

Bits	Name	Description
7:6	E3PP	SW : RW Event counter 3 port combination selection 0x0: Master port selected by E3MPS, filtering based on slave port disabled 0x1: Master port selected by E3MPS, filtering based on slave way selected by E3SWS 0x2: Slave way selected by E3SWS, filtering based on master port disabled 0x3: Slave way selected by E3SWS, filtering based on master port selected by E3MPS
5:4	E2PP	SW : RW Event counter 2 port combination selection 0x0: Master port selected by E2MPS, filtering based on slave port disabled 0x1: Master port selected by E2MPS, filtering based on slave way selected by E2SWS 0x2: Slave way selected by E2SWS, filtering based on master port disabled 0x3: Slave way selected by E2SWS, filtering based on master port selected by E2MPS

0x01503950 DAY_CFG_FABRIC_MONITOR_CYCLE_COUNT_UPPER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the performance monitor cycle counter.

DAY_CFG_FABRIC_MONITOR_CYCLE_COUNT_UPPER_REG

Bits	Name	Description
15:0	UCC	SW : RW MSB cycle count value The cycle count value is decremented once per FABRIC clock. The counter stops decrementing once the CC value equals 32:h0.

0x01503954 DAY_CFG_FABRIC_MONITOR_CYCLE_COUNT_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the performance monitor cycle counter. If SW requires that the values when read do not change, when it reads this register, the value for all 32 bits of the cycle counter is stored. This allows for SW to read the lower reg and have the value match the exact cycle in which the upper reg was read.

DAY_CFG_FABRIC_MONITOR_CYCLE_COUNT_LOWER_REG

Bits	Name	Description
15:0	LCC	SW : RW LSB cycle count value The cycle count value is decremented once per FABRIC clock. The counter stops decrementing once the CC value equals 32:h0.

0x01503958 DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 0. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG0

Bits	Name	Description
15:0	ECLT0	SW : RW Total events (lower 16-bit value)

0x0150395C DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 0. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG0

Bits	Name	Description
15:0	ECUT0	SW : RW Total events (upper 16-bit value)

0x01503960 DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 1. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG1

Bits	Name	Description
15:0	ECLT1	SW : RW Total events (lower 16-bit value)

0x01503964 DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 1. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG1

Bits	Name	Description
15:0	ECUT1	SW : RW Total events (upper 16-bit value)

0x01503968 DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 2. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG2

Bits	Name	Description
15:0	ECLT2	SW : RW Total events (lower 16-bit value)

0x0150396C DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 2. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG2

Bits	Name	Description
15:0	ECUT2	SW : RW Total events (upper 16-bit value)

0x01503970 DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 3. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG3

Bits	Name	Description
15:0	ECLT3	SW : RW Total events (lower 16-bit value)

0x01503974 DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 3. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG3

Bits	Name	Description
15:0	ECUT3	SW : RW Total events (upper 16-bit value)

0x01503978 DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 4. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG4

Bits	Name	Description
15:0	ECLT4	SW : RW Total events (lower 16-bit value)

0x0150397C DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 4. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG4

Bits	Name	Description
15:0	ECUT4	SW : RW Total events (upper 16-bit value)

0x01503980 DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 5. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG5

Bits	Name	Description
15:0	ECLT5	SW : RW Total events (lower 16-bit value)

0x01503984 DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 5. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG5

Bits	Name	Description
15:0	ECUT5	SW : RW Total events (upper 16-bit value)

0x01503988 DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 6. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG6

Bits	Name	Description
15:0	ECLT6	SW : RW Total events (lower 16-bit value)

0x0150398C DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 6. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG6

Bits	Name	Description
15:0	ECUT6	SW : RW Total events (upper 16-bit value)

0x01503990 DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 7. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_LOWER_REG7

Bits	Name	Description
15:0	ECLT7	SW : RW Total events (lower 16-bit value)

0x01503994 DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 7. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_UPPER_REG7

Bits	Name	Description
15:0	ECUT7	SW : RW Total events (upper 16-bit value)

0x015039A4 DAY_CFG_FABRIC_TRIGGER_CONFIGURATION_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register configures the interface in which the trigger comparison is done on the address channel.

TAMS: Selects one of the 32 interfaces from which the address channel transfer qualifiers are used to enable trigger matching.

DAY_CFG_FABRIC_TRIGGER_CONFIGURATION_REG

Bits	Name	Description
15:7	RESERVED_BITS15_6	

DAY_CFG_FABRIC_TRIGGER_CONFIGURATION_REG (cont.)

Bits	Name	Description
6	TRGEN	SW : RW Trigger enable 1'b0 -disabled 1'b1 - enabled
5:0	TAMS	SW : RW Trigger based on address channel on M/S Port : 0x0: Master Port 0 0x1: Master Port 1 0x2: Master Port 2 0x3: Master Port 3 0x4: Master Port 4 0x5: Master Port 5 0x6: Master Port 6 0x7: Master Port 7 0x8: Master Port 8 0x9: Master Port 9 0xA: Master Port 10 0xB: Master Port 11 0xC: Master Port 12 0xD: Master Port 13 0xE: Master Port 14 0xF: Master Port 15 0x10: Master Port 16 0x11: Master Port 17 0x12: Master Port 18 0x13: Master Port 19 0x14: Master Port 20 0x15: Master Port 21 0x16: Master Port 22 0x17: Master Port 23 0x18: Master Port 24 0x19: Master Port 25 0x1A: Master Port 26 0x1B: Master Port 27 0x1C: Master Port 28 0x1D: Master Port 29 0x1E: Master Port 30 0x1F: Master Port 31

DAY_CFG_FABRIC_TRIGGER_CONFIGURATION_REG (cont.)

Bits	Name	Description
5:0	TAMS	0x20: Slave Port 0 0x21: Slave Port 1 0x22: Slave Port 2 0x23: Slave Port 3 0x24: Slave Port 4 0x25: Slave Port 5 0x26: Slave Port 6 0x27: Slave Port 7 0x28: Slave Port 8 0x29: Slave Port 9 0x2A: Slave Port 10 0x2B: Slave Port 11 0x2C: Slave Port 12 0x2D: Slave Port 13 0x2E: Slave Port 14 0x2F: Slave Port 15

0x015039AC DAY_CFG_FABRIC_TRIGGER_REG_0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the upper address which is used as comparison for the trigger feature of the on-chip trace or performance monitor function. TUADDR[15:0] will be compared against Address[31:16].

DAY_CFG_FABRIC_TRIGGER_REG_0

Bits	Name	Description
15:0	TUADDR	SW : RW Address bits[31:16]

0x015039B0 DAY_CFG_FABRIC_TRIGGER_REG_1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the lower address which is used as comparison for the trigger feature of the performance monitor function. TLADDR[15:0] will be compared against Address[15:0].

DAY_CFG_FABRIC_TRIGGER_REG_1

Bits	Name	Description
15:0	TLADDR	SW : RW Address bits[15:0]

0x015039B4 DAY_CFG_FABRIC_TRIGGER_REG_2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the lower address which is used as comparison for the trigger feature of the performance monitor function..

DAY_CFG_FABRIC_TRIGGER_REG_2

Bits	Name	Description
15:0	AMID	SW : RW AMID / HMID

0x015039B8 DAY_CFG_FABRIC_TRIGGER_REG_3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the address channel transfer qualifiers which are used as comparison for the trigger feature of the performance monitor function.

DAY_CFG_FABRIC_TRIGGER_REG_3

Bits	Name	Description
15:12	RESERVED_BITS15_12	
11	AOOOWR	SW : RW Out-of-order write
10	AOOORD	SW : RW Out-of-order read
9:3	ATID	SW : RW Address TID (If ATID is less than 7 bits, the upper bits must be set to 0)
2	AFULL	SW : RW Full Transfer

DAY_CFG_FABRIC_TRIGGER_REG_3 (cont.)

Bits	Name	Description
1	RESERVED_BIT1	
0	APROTNS	SW : RW Protection level

0x015039BC DAY_CFG_FABRIC_TRIGGER_REG_4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the address channel transfer qualifiers which are used as comparison for the trigger feature of the performance monitor function.

DAY_CFG_FABRIC_TRIGGER_REG_4

Bits	Name	Description
15:12	ATYPE	SW : RW Memory type attributes
11:10	ALOCK	SW : RW Lock type
9	RESERVED_BITS9	
8	ABURST	SW : RW Burst type
7:5	ASIZE	Burst size
4:1	ALEN	Burst length
0	AWRITE	Burst direction

0x015039C0 DAY_CFG_FABRIC_TRIGGER_MASK_REG_0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR0.

Setting a mask bit to 1’b1 indicates that the selected field is not matched against the corresponding bit in FTTR0.

DAY_CFG_FABRIC_TRIGGER_MASK_REG_0

Bits	Name	Description
15:0	FTTR0_MASK	SW : RW Bit mask field for FTTR0 Enable: 1 Disable: 0

0x015039C4 DAY_CFG_FABRIC_TRIGGER_MASK_REG_1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR1.

DAY_CFG_FABRIC_TRIGGER_MASK_REG_1

Bits	Name	Description
15:0	FTTR1_MASK	SW : RW Bit mask field for FTTR1 Enable: 1 Disable: 0

0x015039C8 DAY_CFG_FABRIC_TRIGGER_MASK_REG_2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR2.

DAY_CFG_FABRIC_TRIGGER_MASK_REG_2

Bits	Name	Description
15:0	FTTR2_MASK	SW : RW Bit mask field for FTTR2 Enable: 1 Disable: 0

0x015039CC DAY_CFG_FABRIC_TRIGGER_MASK_REG_3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR3.

DAY_CFG_FABRIC_TRIGGER_MASK_REG_3

Bits	Name	Description
15:0	FTTR3_MASK	SW : RW Bit mask field for FTTR3 Enable: 1 Disable: 0

0x015039D0 DAY_CFG_FABRIC_TRIGGER_MASK_REG_4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR4.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR4.

DAY_CFG_FABRIC_TRIGGER_MASK_REG_4

Bits	Name	Description
15:0	FTTR4_MASK	SW : RW Bit mask field for FTTR4 Enable: 1 Disable: 0

0x015039D4 DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter0.

DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG0

Bits	Name	Description
15:0	E0AL	SW : RW LSB address value Event counter 0 address selection (if address range filtering enabled)

0x015039D8 DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter0.

DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG0

Bits	Name	Description
15:0	E0AU	SW : RW MSB address value Event counter 0 address selection (if address range filtering enabled)

0x015039DC DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter1.

DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG1

Bits	Name	Description
15:0	E1AL	SW : RW LSB address value Event counter 1address selection (if address range filtering enabled)

0x015039E0 DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter1.

DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG1

Bits	Name	Description
15:0	E1AU	SW : RW MSB address value Event counter 1address selection (if address range filtering enabled)

0x015039E4 DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter2

DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG2

Bits	Name	Description
15:0	E2AL	SW : RW LSB address value Event counter 2 address selection (if address range filtering enabled)

0x015039E8 DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter2.

DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG2

Bits	Name	Description
15:0	E2AU	SW : RW MSB address value Event counter 2 address selection (if address range filtering enabled)

0x015039EC DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter3

DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG3

Bits	Name	Description
15:0	E3AL	SW : RW LSB address value Event counter 3 address selection (if address range filtering enabled)

0x015039F0 DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter3.

DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG3

Bits	Name	Description
15:0	E3AU	SW : RW MSB address value Event counter 3 address selection (if address range filtering enabled)

0x015039F4 DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter4.

DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG4

Bits	Name	Description
15:0	E4AL	SW : RW LSB address value Event counter 4 address selection (if address range filtering enabled)

0x015039F8 DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter4.

DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG4

Bits	Name	Description
15:0	E4AU	SW : RW MSB address value Event counter 4address selection (if address range filtering enabled)

0x015039FC DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter5.

DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG5

Bits	Name	Description
15:0	E5AL	SW : RW LSB address value Event counter 5 address selection (if address range filtering enabled)

0x01503A00 DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter4.

DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG5

Bits	Name	Description
15:0	E5AU	SW : RW MSB address value Event counter 5 address selection (if address range filtering enabled)

0x01503A04 DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter 6.

DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG6

Bits	Name	Description
15:0	E6AL	SW : RW LSB address value Event counter 6 address selection (if address range filtering enabled)

0x01503A08 DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 6.

DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG6

Bits	Name	Description
15:0	E6AU	SW : RW MSB address value Event counter 6 address selection (if address range filtering enabled)

0x01503A0C DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter 7.

DAY_CFG_FABRIC_MONITOR_ADDRESS_LOWER_REG7

Bits	Name	Description
15:0	E7AL	SW : RW LSB address value Event counter 7 address selection (if address range filtering enabled)

0x01503A10 DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 7.

DAY_CFG_FABRIC_MONITOR_ADDRESS_UPPER_REG7

Bits	Name	Description
15:0	E7AU	SW : RW MSB address value Event counter 7 address selection (if address range filtering enabled)

0x01503A14 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR0.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG0

Bits	Name	Description
15:0	E0AML	SW : RW LSB address value Event counter 0 address mask

0x01503A18 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR0.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG0

Bits	Name	Description
15:0	E0AMU	SW : RW MSB address value Event counter 0 address mask

0x01503A1C DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR1.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG1

Bits	Name	Description
15:0	E1AML	SW : RW LSB address value Event counter 1 address mask

0x01503A20 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR1.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG1

Bits	Name	Description
15:0	E1AMU	SW : RW MSB address value Event counter address mask

0x01503A24 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR2.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG2

Bits	Name	Description
15:0	E2AML	SW : RW LSB address value Event counter 2 address mask

0x01503A28 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR2.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG2

Bits	Name	Description
15:0	E2AMU	SW : RW MSB address value Event counter 2 address mask

0x01503A2C DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR3.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG3

Bits	Name	Description
15:0	E3AML	SW : RW LSB address value Event counter 3 address mask

0x01503A30 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR3.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG3

Bits	Name	Description
15:0	E3AMU	SW : RW MSB address value Event counter 3 address mask

0x01503A34 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 4.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR4.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG4

Bits	Name	Description
15:0	E4AML	SW : RW LSB address value Event counter 4 address mask

0x01503A38 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 4.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR4.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG4

Bits	Name	Description
15:0	E4AMU	SW : RW MSB address value Event counter 4 address mask

0x01503A3C DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 5.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR5.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG5

Bits	Name	Description
15:0	E5AML	SW : RW LSB address value Event counter 5 address mask

0x01503A40 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 5.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR5.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG5

Bits	Name	Description
15:0	E5AMU	SW : RW MSB address value Event counter 5 address mask

0x01503A44 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 6.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR6.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG6

Bits	Name	Description
15:0	E6AML	SW : RW LSB address value Event counter 6 address mask

0x01503A48 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 6.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR6.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG6

Bits	Name	Description
15:0	E6AMU	SW : RW MSB address value Event counter 6 address mask

0x01503A4C DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 7.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR7.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG7

Bits	Name	Description
15:0	E7AML	SW : RW LSB address value Event counter 7 address mask

0x01503A50 DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 7.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR7.

DAY_CFG_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG7

Bits	Name	Description
15:0	E7AMU	SW : RW MSB address value Event counter 7 address mask

0x01503A70 DAY_CFG_FABRIC_MONITOR_MID_MASK_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 0

DAY_CFG_FABRIC_MONITOR_MID_MASK_REG0

Bits	Name	Description
15:0	E0MM	SW : RW MID Mask value for event counter 0

0x01503A74 DAY_CFG_FABRIC_MONITOR_MID_MASK_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 1

DAY_CFG_FABRIC_MONITOR_MID_MASK_REG1

Bits	Name	Description
15:0	E1MM	SW : RW MID Mask value for event counter 1

0x01503A78 DAY_CFG_FABRIC_MONITOR_MID_MASK_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 2

DAY_CFG_FABRIC_MONITOR_MID_MASK_REG2

Bits	Name	Description
15:0	E2MM	SW : RW MID Mask value for event counter 2

0x01503A7C DAY_CFG_FABRIC_MONITOR_MID_MASK_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 3

DAY_CFG_FABRIC_MONITOR_MID_MASK_REG3

Bits	Name	Description
15:0	E3MM	SW : RW MID Mask value for event counter 3

0x01503A80 DAY_CFG_FABRIC_MONITOR_MID_MASK_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 4

DAY_CFG_FABRIC_MONITOR_MID_MASK_REG4

Bits	Name	Description
15:0	E4MM	SW : RW MID Mask value for event counter 4

0x01503A84 DAY_CFG_FABRIC_MONITOR_MID_MASK_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 15

DAY_CFG_FABRIC_MONITOR_MID_MASK_REG5

Bits	Name	Description
15:0	E5MM	SW : RW MID Mask value for event counter 5

0x01503A88 DAY_CFG_FABRIC_MONITOR_MID_MASK_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 6

DAY_CFG_FABRIC_MONITOR_MID_MASK_REG6

Bits	Name	Description
15:0	E6MM	SW : RW MID Mask value for event counter 6

0x01503A8C DAY_CFG_FABRIC_MONITOR_MID_MASK_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 7

DAY_CFG_FABRIC_MONITOR_MID_MASK_REG7

Bits	Name	Description
15:0	E7MM	SW : RW MID Mask value for event counter 7

0x01503AA0 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG0

Bits	Name	Description
15:0	EBTL0	SW : RW Total beats (lower 16-bit value)

0x01503AA4 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG0

Bits	Name	Description
15:0	EBTM0	SW : RW Total beats (middle 16-bit value)

0x01503AA8 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG0

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU0	SW : RW Total beats (upper 4-bit value)

0x01503AAC DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG1

Bits	Name	Description
15:0	EBTL1	SW : RW Total beats (lower 16-bit value)

0x01503AB0 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG1

Bits	Name	Description
15:0	EBTM1	SW : RW Total beats (middle 16-bit value)

0x01503AB4 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG1

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU1	SW : RW Total beats (upper 4-bit value)

0x01503AB8 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write

Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG2

Bits	Name	Description
15:0	EBTL2	SW : RW Total beats (lower 16-bit value)

0x01503ABC DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG2

Bits	Name	Description
15:0	EBTM2	SW : RW Total beats (middle 16-bit value)

0x01503AC0 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG2

Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG5

Bits	Name	Description
15:0	EBTL5	SW : RW Total beats (lower 16-bit value)

0x01503AE0 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write

Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG5

Bits	Name	Description
15:0	EBTM5	SW : RW Total beats (middle 16-bit value)

0x01503AE4 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG5

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU5	SW : RW Total beats (upper 4-bit value)

0x01503AE8 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG6

Bits	Name	Description
15:0	EBTL6	SW : RW Total beats (lower 16-bit value)

0x01503AEC DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG6

Bits	Name	Description
15:0	EBTM6	SW : RW Total beats (middle 16-bit value)

0x01503AF0 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG6

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU6	SW : RW Total beats (upper 4-bit value)

0x01503AF4 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write

Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG7

Bits	Name	Description
15:0	EBTL7	SW : RW Total beats (lower 16-bit value)

0x01503AF8 DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_MID_REG7

Bits	Name	Description
15:0	EBTM7	SW : RW Total beats (middle 16-bit value)

0x01503AFC DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG7

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU7	SW : RW Total beats (upper 4-bit value)

0x01503B00 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG0

Bits	Name	Description
15:0	EBYL0	SW : RW Total bytes (lower 16-bit value)

0x01503B04 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG0

Bits	Name	Description
15:0	EBYM0	SW : RW Total bytes (middle 16-bit value)

0x01503B08 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG0

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU0	SW : RW Total bytes (upper 11-bit value)

0x01503B0C DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG1

Bits	Name	Description
15:0	EBYL1	SW : RW Total bytes (lower 16-bit value)

0x01503B10 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG1

Bits	Name	Description
15:0	EBYM1	SW : RW Total bytes (middle 16-bit value)

0x01503B14 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG1

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU1	SW : RW Total bytes (upper 11-bit value)

0x01503B18 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG2

Bits	Name	Description
15:0	EBYL2	SW : RW Total bytes (lower 16-bit value)

0x01503B1C DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG2

Bits	Name	Description
15:0	EBYM2	SW : RW Total bytes (middle 16-bit value)

0x01503B20 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG2

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU2	SW : RW Total bytes (upper 11-bit value)

0x01503B24 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG3

Bits	Name	Description
15:0	EBYL3	SW : RW Total bytes (lower 16-bit value)

0x01503B28 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG3

Bits	Name	Description
15:0	EBYM3	SW : RW Total bytes (middle 16-bit value)

0x01503B2C DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG3

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU3	SW : RW Total bytes (upper 11-bit value)

0x01503B30 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG4

Bits	Name	Description
15:0	EBYL4	SW : RW Total bytes (lower 16-bit value)

0x01503B34 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG4

Bits	Name	Description
15:0	EBYM4	SW : RW Total bytes (middle 16-bit value)

0x01503B38 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG4

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU4	SW : RW Total bytes (upper 11-bit value)

0x01503B3C DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG5

Bits	Name	Description
15:0	EBYL5	SW : RW Total bytes (lower 16-bit value)

0x01503B40 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG5

Bits	Name	Description
15:0	EBYM5	SW : RW Total bytes (middle 16-bit value)

0x01503B44 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG5

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU5	SW : RW Total bytes (upper 11-bit value)

0x01503B48 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG6

Bits	Name	Description
15:0	EBYL6	SW : RW Total bytes (lower 16-bit value)

0x01503B4C DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG6

Bits	Name	Description
15:0	EBYM6	SW : RW Total bytes (middle 16-bit value)

0x01503B50 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG6

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU6	SW : RW Total bytes (upper 11-bit value)

0x01503B54 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG7

Bits	Name	Description
15:0	EBYL7	SW : RW Total bytes (lower 16-bit value)

0x01503B58 DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_MID_REG7

Bits	Name	Description
15:0	EBYM7	SW : RW Total bytes (middle 16-bit value)

0x01503B5C DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

DAY_CFG_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG7

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU7	SW : RW Total bytes (upper 11-bit value)

0x01503B60 DAY_CFG_FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the tenure selection, port selection and filtering criteria for the performance monitor tenure counter 0.

DAY_CFG_FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG0

Bits	Name	Description
15:14	T0SR	SW : RW Tenure selection for tenure counter 0 0x0: Master addr hndshk interval 0x1: Slave addr hndshk interval 0x2: Bresp interval 0x3: Read data tenure

0x01503B7C DAY_CFG_FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for tenure counter 3.

DAY_CFG_FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG3

Bits	Name	Description
15:0	T3MID	SW : RW Tenure counter 3 MID selection (If MID filtering enabled)

0x01503B80 DAY_CFG_FABRIC_MONITOR_MIN_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains the minimum value of the tenure that is selected using FPTSLR0 and measured in tenure counter 0.

NOTE The reset value for this register is set to h'FFFF, equivalent to 65535 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'FFFF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

DAY_CFG_FABRIC_MONITOR_MIN_REG0

Bits	Name	Description
15:0	MIN0	SW : R Minimum value of tenure, in tenure counter 0

0x01503B84 DAY_CFG_FABRIC_MONITOR_MIN_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains the minimum value of the tenure that is selected using FPTSLR1 and measured in tenure counter 1.

NOTE The reset value for this register is set to h'FFFF, equivalent to 65535 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'FFFF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

DAY_CFG_FABRIC_MONITOR_MIN_REG1

Bits	Name	Description
15:0	MIN1	SW : R Minimum value of tenure, in tenure counter 1

0x01503B88 DAY_CFG_FABRIC_MONITOR_MIN_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains the minimum value of the tenure that is selected using FPTSLR2 and measured in tenure counter 2.

NOTE The reset value for this register is set to h'FFFF, equivalent to 65535 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'FFFF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

DAY_CFG_FABRIC_MONITOR_MIN_REG2

Bits	Name	Description
15:0	MIN2	SW : R Minimum value of tenure, in tenure counter 2

0x01503B8C DAY_CFG_FABRIC_MONITOR_MIN_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains the minimum value of the tenure that is selected using FPTSLR3 and measured in tenure counter 3.

NOTE The reset value for this register is set to h'FFFF, equivalent to 65535 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'FFFF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

DAY_CFG_FABRIC_MONITOR_MIN_REG3

Bits	Name	Description
15:0	MIN3	SW : R Minimum value of tenure, in tenure counter 3

0x01503B90 DAY_CFG_FABRIC_MONITOR_MAX_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR0 and measured in tenure counter 0.

NOTE The reset value for this register is set to h'0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be 'hFFFF.

DAY_CFG_FABRIC_MONITOR_MAX_REG0

Bits	Name	Description
15:0	MAX0	SW : R Maximum value of tenure, in tenure counter 0

0x01503B94 DAY_CFG_FABRIC_MONITOR_MAX_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR1and measured in tenure counter 1

NOTE The reset value for this register is set to h'0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be ’hFFFF.

DAY_CFG_FABRIC_MONITOR_MAX_REG1

Bits	Name	Description
15:0	MAX1	SW : R Maximum value of tenure, in tenure counter 1

0x01503B98 DAY_CFG_FABRIC_MONITOR_MAX_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR2 and measured in tenure counter 2

NOTE The reset value for this register is set to h’0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h’0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be ’hFFFF.

DAY_CFG_FABRIC_MONITOR_MAX_REG2

Bits	Name	Description
15:0	MAX2	SW : R Maximum value of tenure, in tenure counter 2

0x01503B9C DAY_CFG_FABRIC_MONITOR_MAX_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR3 and measured in tenure counter 3

NOTE The reset value for this register is set to h’0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h’0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be ’hFFFF.

DAY_CFG_FABRIC_MONITOR_MAX_REG3

Bits	Name	Description
15:0	MAX3	SW : R Maximum value of tenure, in tenure counter 3

0x01503BA0 DAY_CFG_FABRIC_MONITOR_TENURE_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

0x01505000+ 0x4*v DAY_CFG_M2VMT_M2VMRv_1, v=[0..7]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where v= NUM_M2VMT_ENTRIES from the design generics.

DAY_CFG_M2VMT_M2VMRv_1

Bits	Name	Description
31:5	RESERVED	v= NUM_M2VMT_ENTRIES from the design generic/parameter.
4:0	VMID	SW : RW Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRv address associations.

0x01505FF4 DAY_CFG_M2VMT_REV_1

Type: Read
Clock: FABRIC_CLOCK
Reset State: ’10000000’b

Reports the revision information for the M2VMT core and wrapper.

DAY_CFG_M2VMT_REV_1

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	SW : R Major variant field
3:0	MINOR	SW : R Minor variant field.

0x01505FF8 DAY_CFG_M2VMT_IDR_1

Type: Read
Clock: FABRIC_CLOCK
Reset State: M2VMTSIZE

Reports the size of the M2VMT table. It is a read-only register.

DAY_CFG_M2VMT_IDR_1

Bits	Name	Description
31:9	RESERVED	M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.

DAY_CFG_M2VMT_IDR_1 (cont.)

Bits	Name	Description
8:0	M2VMTSIZE	SW : R M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping.

Bits	Name	Description
31:4	RESERVED31_4	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresse) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set APU_ESR. APU_EAR and APU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set APU_ESR. APU_EAR and APU_ESYNR0 updated with address and syndrome of error.

DAY_CFG_APU0_CR (cont.)

Bits	Name	Description
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x01510F84 DAY_CFG_APU0_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

DAY_CFG_APU0_EAR

Bits	Name	Description
31:0	PA_31_0	The physical address of the errant request.

0x01510F88 DAY_CFG_APU0_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent

clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the APU_ESYNRn registers, which are merely the 'syndrome' of an error indicated by APU_ESR.

DAY_CFG_APU0_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) 'lock' upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x01510F8C DAY_CFG_APU0_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

DAY_CFG_APU0_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) 'lock' upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x01510F90 DAY_CFG_APU0_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

DAY_CFG_APU0_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x01510F94 DAY_CFG_APU0_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

DAY_CFG_APU0_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant reuqest

19	RESERVED19	Reserved

DAY_CFG_APU0_ESYNR1 (cont.)

Bits	Name	Description
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x01510FF4 DAY_CFG_APU0_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

DAY_CFG_APU0_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR_3_0	Major variant field
3:0	MINOR_3_0	Minor variant field

0x01510FF8 DAY_CFG_APU0_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x00001409

APU ID Register: Read-only register that defines various configuration attributes of the APU iinstance.

DAY_CFG_APU0_IDR

Bits	Name	Description
31:29	RESERVED31_29	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full acces vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only 'owner' VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit 'owner' VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.
9:8	RESERVED9_8	Reserved
7:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x01510FFC DAY_CFG_APU0_APU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

DAY_CFG_APU0_APU_ACR

Bits	Name	Description
31:0	RWE_31_0	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APUs (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

0x01520000+4*n DAY_CFG_APU1_RGn_ACR, n=[0..13]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 10, i.e, a multi-VMID full access vs. no access permission type APU. These registers include a single bit per VMID granting full access.

5:0	RESERVED_BITS_5_0	

0x05200004 FABRIC_ID_REVISION_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0001

This register contains the lower 16-bits of the core ID and revision number and contains the Core ID number.

FABRIC_ID_REVISION_REG1

Bits	Name	Description
15:8	RESERVED_BITS_3_2	
7:0	ID	SW : R Core ID 0x1: FABRIC

0x05200008 FABRIC_CONFIGURATION_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0002

This register defines the operating frequency, power down mode for the performance monitor, as well as the decode error and performance monitor cycle counter interrupts. It also has the control bit to globally disable redirection in Fabric.

The ISYND bits contain the interrupt syndrome. If more than one interrupt type occurs, more than one bit will be set. For example, if a decode error occurs and the performance monitor cycle-counter expires, the ISYND field will contain the value 3'b101. Performance monitor interrupts are only generated when the interrupt enable (PMIE) bit is set for the interrupt type.

If multiple decode errors occur, only the first error is recorded. If multiple decode errors occur at the same clock cycle, only a single error is considered, with Master 0 having the highest priority and Master 12 the lowest priority.

The determination of the time an error is recorded in the Fabric Error Status Register (FESR) is based on the following criteria:

For Reads: When Mn_RLAST is asserted.

For Writes: When Mn_BRESP is asserted.

Therefore, if two different masters make requests with invalid addresses to the FABRIC, the master which receives the RLAST or BRESP first for the invalid transaction, is recorded in the FESR. See FABRIC_ERROR_STATUS_REG_1 for information that is captured when a decode error occurs. The address of the request which caused a decode error is captured in the FABRIC_ERROR_UPPER_ADDR_REG and the FABRIC_ERROR_LOWER_ADDR_REG. If they happen simultaneously, the master priority is used to resolve which error is recorded in a fixed priority scheme. Master 0 has highest priority and Master 31 has the lowest priority.

NOTE If the master does not have RREADY or BREADY asserted by default (i.e., it is not able to receive all responses for outstanding requests and may throttle the FABRIC), the FABRIC_Interrupt generation may precede the return of the last read data beat or the write response.

To clear the interrupt, the ISYND bits are required to be written to 3'b000.

The performance monitor event/tenure overflow condition is indicated when the ISYND value is 010. An event overflow occurs when the event counter has reached its maximum value. A tenure overflow condition occurs:

When the tenure counter has reached its maximum value

OR

More than 16 tenures are outstanding, since the performance monitor implements only 16 counters for tenure tracking. Note that if the tenure overflows, values read from the performance monitors

for min/max/total/last tenure will no longer be valid as values recorded after the overflow will be incorrect.

FABRIC_CONFIGURATION_REG

Bits	Name	Description
15:7	RESERVED_BITS_15_7	Reserved Bits

0x05200100+4*n FABRIC_SEGMENT_UADDR_0_REG_n, n=[0..2]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Based on parameters passed

This register defines the upper and lower address ranges for a particular slave segment (n).If this slave segment (n) is a link then this register defines the first address range for the slave link.

NOTE A segmentation address register is required for each slave segment supported by the FABRIC.The reset values for each of these registers is set by top-level input ports which are strapped to a value determined from a configuration file

The address decode range is based on the value of the SEG_ADDR_DECODE_SHIFT & NUM_ADDR_DECODE_BITS parameters:

A request is generated to the slave segment if the address falls within the following range:

SLA[(NUM_ADDR_DEC_BITS-1):0]

<= ADDR[MSB-(SEG_ADDR_DECODE_SHIFT):MSB-((NUM_ADDR_DEC_BITS-1)+SEG_ADDR_DECODE_SHIFT)]

<= SUA[(NUM_ADDR_DEC_BITS-1):0]

and the slave segment enable (SSE) bit is set and the slave is present (Sn_NOTPRESENT = 0).

FABRIC_SEGMENT_UADDR_0_REG_n

Bits	Name	Description
15:10	RESERVED_15_10	
9:0	SUA	SW : RW Segment 'n' upper address (based on parameter- up to 10-bits)

0x05200200+4*n FABRIC_SEGMENT_LADDR_0_REG_n, n=[0..2]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Based on parameters passed

This register defines the upper and lower address ranges for a particular slave segment (n). If this slave segment (n) is a link then this register defines the first address range for the slave link.

NOTE A segmentation address register is required for each slave segment supported by the FABRIC.The reset values for each of these registers is set by top-level input ports which are strapped to a value determined from a configuration file

The address decode range is based on the value of the SEG_ADDR_DECODE_SHIFT & NUM_ADDR_DECODE_BITS parameters:

A request is generated to the slave segment if the address falls within the following range:

SLA[(NUM_ADDR_DEC_BITS-1):0]

<= ADDR[MSB-(SEG_ADDR_DECODE_SHIFT):MSB-((NUM_ADDR_DEC_BITS-1)+SEG_ADDR_DECODE_SHIFT)]

<= SUA[(NUM_ADDR_DEC_BITS-1):0]

and the slave segment enable (SSE) bit is set and the slave is present (Sn_NOTPRESENT = 0).

FABRIC_SEGMENT_LADDR_0_REG_n (cont.)

Bits	Name	Description
14	SSIE	SW : RW Slave segment "n" & "n+1" nterleave enable
13:10	RESERVED_13_10	
9:0	SLA	SW : RW Segment n lower address (based on parameter- up to 10-bits)

0x05200300+4*n FABRIC_SEGMENT_UADDR_1_REG_n, n=[0..2]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Based on parameters passed

This register defines the upper address for a particular slave link segment (n) if it's a link. A link segment can have up to two separate address ranges. This register defines the second address range for the slave link.

NOTE A link segmentation address register is required for each slave link segment supported by the FABRIC.The reset values for each of these registers is set by top-level input ports which are strapped to a value determined from a configuration file

The address decode range is based on the value of the SEG_ADDR_DECODE_SHIFT & NUM_ADDR_DECODE_BITS parameters:

A request is generated to the slave segment if the address falls within the following range:

SLA[(NUM_ADDR_DEC_BITS-1):0]

<= ADDR[MSB-(SEG_ADDR_DECODE_SHIFT):MSB-((NUM_ADDR_DEC_BITS-1)+SEG_ADDR_DECODE_SHIFT)]

<= SUA[(NUM_ADDR_DEC_BITS-1):0]

and the slave segment enable (SSE) bit is set and the slave is present (Sn_NOTPRESENT = 0).

FABRIC_SEGMENT_UADDR_1_REG_n

Bits	Name	Description

0x05201000+0x0100*n+4*m FABRIC_m_WEIGHTING_REG_n, m=[0..12], n=[0..2]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

The values programmed into this register determine the Tier 2 weight for each master under the Tier Based Arbitration Scheme.

NOTE This register is required for each master and each slave segment supported by the FABRIC .

FABRIC_m_WEIGHTING_REG_n

Bits	Name	Description
15:8	RESERVED_BITS_15_8	
7:0	M_M_W	SW : RW Master 'm' Weight

0x05202000+0x0100*n+4*m FABRIC_m_QOS_REG_n, m=[0..3], n=[0..2]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

The values programmed into this register determine the Tier 1 weight for each master under the Tier Based Arbitration Scheme. Only 4 master ports can be configured as Tier 1. The QMC bits are used to configure a master port as Tier 1.

NOTE If more than one of these QOS Control registers are set to the same master port, unpredictable behavior will occur.

Set-up procedure:

1. Set the QOS enable bit.
2. Set the arbitration mode to Scheduled Access Time in the FABRIC arbitration configuration register FACR (See FABRIC_ARBITRATION_CONTROL_REG_n=[0..2]).
3. Configure the master port that needs to be set to Tier1.
4. Set the appropriate number of tokens/weight.
5. Set the MLT value (default is zero clock cycles).

NOTE Four of these registers are required for each slave segment supported by the FABRIC .

FABRIC_m_QOS_REG_n

0x05203300+4*n FABRIC_MASTER_INTERFACE_REG_n, n=[0..12]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0084

This register controls the following master port attributes:

- whether the master request priority signals are used by the internal arbiter
- the redirection of cacheable coherent requests
- write gathering on AXI
- write packing on AHB

This register also controls a particular master's halt interface and for AHB master interfaces, it enables write packing functionality for posted writes.

When the MHR bit is set, the FABRIC_MnHALTREQ signal is asserted. The MHA and MHI fields capture the state of the FABRIC_MnHALTACK and FABRIC_MnIDLE signals at every clock cycle.

NOTE A register is implemented for each master interface supported by the FABRIC

FABRIC_MASTER_INTERFACE_REG_n

Bits	Name	Description
15	RESERVED_BIT_15	
14	OWGM	SW : RW Enable optimized write gathering mode. SW should disable for AXI Ports
13	DBW	SW : RW Disable Bufferable writes. Treats Bufferable writes as Non Bufferable writes (AHB only)
12	PRIEN	SW : RW Enable Request Priority Lets the slave way arbiter consider the master request priority AREQPRIORITY[1:0] signal that is driven with each transaction
11	RCOSH	SW : RW Redirect Cacheable-outer-sharable Governs whether or not cacheable accesses that are outer-sharable are redirected to the Scorpion-MP L2 slave port
10	RCISH	SW : RW Redirect Cacheable-inner-sharable Governs whether or not cacheable accesses that are inner-sharable are redirected to the Scorpion-MP L2 slave port
9	RCNSH	SW : RW Redirect Cacheable-non-sharable Governs whether or not cacheable accesses that are non-sharable are redirected to the Scorpion-MP L2 slave port
8	CRE	SW : RW Enable redirection of cachable coherent requests

FABRIC_MASTER_INTERFACE_REG_n (cont.)

Bits	Name	Description
7	WGE	SW : RW Write Gathering Enable (AXI only)
6	WPE	SW : RW Write Packing Enable (AHB Only) When enabled, the master port will pack indeterminate INCR burst writes, if disabled, the master port will break indeterminate INCR burst writes into SINGLES. 0x1: Enable 0x0: Disable
5:4	IIIW	SW : RW Bufferable Indeterminate INCR WR packing (AHB only): 0x0: break into INCR4 0x1: break into INCR8 0x3: break into INCR16
3	MID	SW : RW Master Interface Disable. SW diable of Master interface.
2	MI	SW : R Master Idle. Indicates that the Master does not have any pending bus transactions. For AHB busses, this bit is set internally by the FABRIC AHB Master port. For AXI masters, this value is driven by the master that is connected to the port.
1	MHA	SW : R Master halt acknowledge. Only valid for AXI masters. This bit is 0 on AHB master ports.
0	MHR	SW : RW Master halt request. Only valid for AXI masters. Writing this bit has no effect for AHB masters.

0x05203500 FABRIC_TEST_INTERFACE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls:

- the grouping of signals that are driven out on the test bus (FABRIC_TESTBUS[31:0])
- Selection of MISR slave way and channel input

MEN: Selects which MISR output is driven onto the test-bus. For example, setting MEN to 00010 selects the MISR in slave segment 2. The MEN bits are only valid when the testmode (TMODE) is set to 000000 and test-enable is set (TEN)

TMODE: Selects the various test-bus modes

TEN: Test-enable. Must be set for values to be driven onto the test-bus OR for MISR to be enabled.

0x05203600+4*n FABRIC_MASTER_CLOCK_HALT_REG_n, n=[0..12]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register is used to enable the low power mode clock halt & change functionality within the FABRIC master ports. To enable the clock halting functionality, the clock halt enable bit (CHTEN) needs to be set. The hysteresis timer value is a 10-bit timer (running on FCLK) value that is set using the CHTMR bits. The clock change and MODE bits are used to change the interface between sync/async/isosync modes.

NOTE A register is implemented for each master interface supported by the FABRIC .

FABRIC_MASTER_CLOCK_HALT_REG_n

Bits	Name	Description
15	CHTEN	SW : RW Clock halt enable. Enables clock halt functionality for this port.
14	CCDONE	SW : RW Clock mode change completed/done
13	CCACK	SW : R Clock mode change acknowledge
12	CCREQ	SW : RW Clock mode change request
11:10	MODE	SW : RW Master clock interface mode 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC port clk slower. 0x3: ISOSYNC port clk faster.
9:0	CHTMR	SW : RW Master clock halt timer: clock cycles of inactivity that should pass before clock is halted

0x05203800+4*n FABRIC_SLAVE_CLOCK_HALT_REG_n, n=[0..2]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register is used to enable the low power mode clock halt & change functionality within the FABRIC slave ways. To enable the clock halting functionality, the clock halt enable bit (CHTEN) needs to be set. The hysteresis timer value is a 10-bit timer (running on FCLK) value that is set using the CHTMR bits. The clock change and MODE bits are used to change the interface between sync/async/isosync modes.

NOTE A register is implemented for each slave interface supported by the FABRIC .

FABRIC_SLAVE_CLOCK_HALT_REG_n

Bits	Name	Description
15	CHTEN	SW : RW Clock halt enable. Enables clock halt functionality for this port.

FABRIC_SLAVE_CLOCK_HALT_REG_n (cont.)

Bits	Name	Description
14	CCDONE	SW : RW Cock mode change completed/done
13	CCACK	SW : RW Clock mode change acknowledge
12	CCREQ	SW : RW Clock mode change request
11:10	MODE	SW : RW Slave clock interface mode 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC port clk slower. 0x3: ISOSYNC port clk faster.
9:0	CHTMR	SW : RW Slave clock halt timer: clock cycles of inactivity that should pass before clock is halted

0x05203880 FABRIC_SLAVE_ARBITER_CLOCK_HALT_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register is used to enable the low power mode clock halt functionality within the FABRIC slave ways arbiter.

FABRIC_SLAVE_ARBITER_CLOCK_HALT_REG

Bits	Name	Description
15	S15CHTEN	SW : RW S15 Arbiter Clock halt enable.
14	S14CHTEN	SW : RW S14 Arbiter Clock halt enable.
13	S13CHTEN	SW : RW S13 Arbiter Clock halt enable.
12	S12CHTEN	SW : RW S12 Arbiter Clock halt enable.

FABRIC_SLAVE_ARBITER_CLOCK_HALT_REG (cont.)

Bits	Name	Description
11	S11CHTEN	SW : RW S11 Arbiter Clock halt enable.
10	S10CHTEN	SW : RW S10 Arbiter Clock halt enable.
9	S9CHTEN	SW : RW S9 Arbiter Clock halt enable.
8	S8CHTEN	SW : RW S8 Arbiter Clock halt enable.
7	S7CHTEN	SW : RW S7 Arbiter Clock halt enable.
6	S6CHTEN	SW : RW S6 Arbiter Clock halt enable.
5	S5CHTEN	SW : RW S5 Arbiter Clock halt enable.
4	S4CHTEN	SW : RW S4 Arbiter Clock halt enable.
3	S3CHTEN	SW : RW S3 Arbiter Clock halt enable.
2	S2CHTEN	SW : RW S2 Arbiter Clock halt enable.
1	S1CHTEN	SW : RW S1 Arbiter Clock halt enable.
0	S0CHTEN	SW : RW S0 Arbiter Clock halt enable.

0x05203884+4*n FABRIC_SLAVE_CLOCK_ON_CFG_REG_n, n=[0..2]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register is used to set wake-up timer values durin g HW clock gating functionality for the Fabric slave ways arbiter and AHB/AXI slaves connected to Fabric.

FABRIC_SLAVE_CLOCK_ON_CFG_REG_n

Bits	Name	Description
15:4	RESERVED_BITS_15_4	Reserved

FABRIC_SLAVE_CLOCK_ON_CFG_REG_n (cont.)

Bits	Name	Description
3:0	COD	SW : RW Slave Way Clock On Delay

0x052038F8 FABRIC_MONITOR_ENABLE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the trigger selection and enabling of event and cycle counters.

NOTE When PTRIG is set to use any of the external trigger signals, the external triggers incur a 2 cycle delay from the positive edge assertion of the signal to when the actual counters are enabled in the performance monitor. This allows synchronization of the external signals into the FABRIC clock domain.

FABRIC_MONITOR_ENABLE_REG

Bits	Name	Description
15:13	PTRIG	SW : RW 0x5: Manual Enable/ Manual Disable 0x4: Int Trig/Ext Trig 0x3: Ext Trig 0x2: Ext Trig/CC expire 0x1: Int Trig/CC expire 0x0: Manual enable/CC expire (No trigger)

Bits	Name	Description
0	REC0	SW : RW Reset event counter 0 (automatically resets the cycle-counter as well)

0x05203900 FABRIC_MONITOR_TENURE_ENABLE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the trigger selection and enabling of tenure counters.

NOTE When PTRIG is set to use any of the external trigger signals, the external triggers incur a 2 cycle delay from the positive edge assertion of the signal to when the actual counters are enabled in the performance monitor. This allows synchronization of the external signals into the FABRIC clock domain.

FABRIC_MONITOR_TENURE_ENABLE_REG

Bits	Name	Description
15:5	RESERVED_BITS_15_5	Reserved
4	ETTF	SW : RW Enable tenure table fix This bit, when set, enables a the following feature: The tenure table for each tenure counter will track atleast 16 tenures properly without overflowing
3	ETC3	SW : RW Enable tenure counter 3
2	ETC2	SW : RW Enable tenure counter 2
1	ETC1	SW : RW Enable tenure counter 1
0	ETC0	SW : RW Enable tenure counter 0

0x05203904 FABRIC_MONITOR_TENURE_RESET_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the resets for tenure counters and cycle counters.

FABRIC_MONITOR_SELECTION_LOWER_REG5 (cont.)

Bits	Name	Description
8:4	E5MPS	SW : RW Event counter 5 Master port selection 0x0: Selects Master 0 0x1: Selects Master 1 0x2: Selects Master 2 0x3: Selects Master 3 0x4: Selects Master 4 0x5: Selects Master 5 0x6: Selects Master 6 0x7: Selects Master 7 0x8: Selects Master 8 0x9: Selects Master 9 0xA: Selects Master 10 0xB: Selects Master 11 0xC: Selects Master 12 0xD: Selects Master 13 0xE: Selects Master 14 0xF: Selects Master 15 0x10: Selects Master 16 0x11: Selects Master 17 0x12: Selects Master 18 0x13: Selects Master 19 0x14: Selects Master 20 0x15: Selects Master 21 0x16: Selects Master 22 0x17: Selects Master 23 0x18: Selects Master 24 0x19: Selects Master 25 0x1A: Selects Master 26 0x1B: Selects Master 27 0x1C: Selects Master 28 0x1D: Selects Master 29 0x1E: Selects Master 30 0x1F: Selects Master 31

FABRIC_MONITOR_SELECTION_LOWER_REG5 (cont.)

Bits	Name	Description
3:0	E5SWS	SW : RW Event counter 5 Slave way selection 0x0: Selects Slave 0 0x1: Selects Slave 1 0x2: Selects Slave 2 0x3: Selects Slave 3 0x4: Selects Slave 4 0x5: Selects Slave 5 0x6: Selects Slave 6 0x7: Selects Slave 7 0x8: Selects Slave 8 0x9: Selects Slave 9 0xA: Selects Slave 10 0xB: Selects Slave 11 0xC: Selects Slave 12 0xD: Selects Slave 13 0xE: Selects Slave 14 0xF: Selects Slave 15

0x05203934 FABRIC_MONITOR_SELECTION_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for event counter 5.

FABRIC_MONITOR_SELECTION_UPPER_REG5

Bits	Name	Description
15:0	E5MID	SW : RW Event counter 5 MID selection (If MID filtering enabled)

0x05203938 FABRIC_MONITOR_SELECTION_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the event and port selection and filtering criteria for event counter 6.

FABRIC_MONITOR_SELECTION_LOWER_REG6

Bits	Name	Description
15:13	E6ES	SW : RW Event counter 6 event selection 0x0: Read burst 6 (Master/slave) 0x1: Write burst 6 (Master/slave) 0x2: Address transfer count 6 (Master/slave) 0x3: Read transfer count 6 (Master/slave) 0x4: Write transfer count 6 (Master/slave) 0x5: Write (bufferable burst 6 AHB Master only) 0x3: b110 ’ 3:b111: Reserved
12	SEL_SPDM_OUT2	SW : RW 0x0: Send total tenure overflow info (for tenure counter 2 to SPDM) 0x1: Send individual counter overflow info (for tenure counter 2 to SPDM)
11	E6MIDFEN	SW : RW Event counter 6 MID Filtering enable 0x0: Disabled 0x1: Enabled
10	E6INDFEN	SW : RW Event counter 6 Instruction/Data Filtering enable 0x0: Disabled 0x1: Enabled
9	E6IND	SW : RW Event counter 6 Instruction/Data selection 0x0: Data 0x1: Instruction

FABRIC_MONITOR_SELECTION_LOWER_REG6 (cont.)

Bits	Name	Description
8:4	E6MPS	SW : RW Event counter 6 Master port selection 0x0: Selects Master 0 0x1: Selects Master 1 0x2: Selects Master 2 0x3: Selects Master 3 0x4: Selects Master 4 0x5: Selects Master 5 0x6: Selects Master 6 0x7: Selects Master 7 0x8: Selects Master 8 0x9: Selects Master 9 0xA: Selects Master 10 0xB: Selects Master 11 0xC: Selects Master 12 0xD: Selects Master 13 0xE: Selects Master 14 0xF: Selects Master 15 0x10: Selects Master 16 0x11: Selects Master 17 0x12: Selects Master 18 0x13: Selects Master 19 0x14: Selects Master 20 0x15: Selects Master 21 0x16: Selects Master 22 0x17: Selects Master 23 0x18: Selects Master 24 0x19: Selects Master 25 0x1A: Selects Master 26 0x1B: Selects Master 27 0x1C: Selects Master 28 0x1D: Selects Master 29 0x1E: Selects Master 30 0x1F: Selects Master 31

FABRIC_MONITOR_SELECTION_LOWER_REG6 (cont.)

Bits	Name	Description
3:0	E6SWS	SW : RW Event counter 6 Slave way selection 0x0: Selects Slave 0 0x1: Selects Slave 1 0x2: Selects Slave 2 0x3: Selects Slave 3 0x4: Selects Slave 4 0x5: Selects Slave 5 0x6: Selects Slave 6 0x7: Selects Slave 7 0x8: Selects Slave 8 0x9: Selects Slave 9 0xA: Selects Slave 10 0xB: Selects Slave 11 0xC: Selects Slave 12 0xD: Selects Slave 13 0xE: Selects Slave 14 0xF: Selects Slave 15

0x0520393C FABRIC_MONITOR_SELECTION_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for event counter 6.

FABRIC_MONITOR_SELECTION_UPPER_REG6

Bits	Name	Description
15:0	E6MID	SW : RW Event counter 6 MID selection (If MID filtering enabled)

0x05203940 FABRIC_MONITOR_SELECTION_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the event and port selection and filtering criteria for event counter 7.

FABRIC_MONITOR_SELECTION_LOWER_REG7

Bits	Name	Description
15:13	E7ES	SW : RW Event counter 7 event selection 0x0: Read burst 7 (Master/slave) 0x1: Write burst 7 (Master/slave) 0x2: Address transfer count 7 (Master/slave) 0x3: Read transfer count 7 (Master/slave) 0x4: Write transfer count 7 (Master/slave) 0x5: Write (bufferable burst 7 AHB Master only) 0x3: b110 ’ 3:b111: Reserved
12	SEL_SPDM_OUT3	SW : RW 0x0: Send total tenure overflow info (for tenure counter 3 to SPDM) 0x1: Send individual counter overflow info (for tenure counter 3 to SPDM)
11	E7MIDFEN	SW : RW Event counter 7 MID Filtering enable 0x0: Disabled 0x1: Enabled
10	E7INDFEN	SW : RW Event counter 7 Instruction/Data Filtering enable 0x0: Disabled 0x1: Enabled
9	E7IND	SW : RW Event counter 7 Instruction/Data selection 0x0: Data 0x1: Instruction

FABRIC_MONITOR_SELECTION_LOWER_REG7 (cont.)

Bits	Name	Description
8:4	E7MPS	SW : RW Event counter 7 Master port selection 0x0: Selects Master 0 0x1: Selects Master 1 0x2: Selects Master 2 0x3: Selects Master 3 0x4: Selects Master 4 0x5: Selects Master 5 0x6: Selects Master 6 0x7: Selects Master 7 0x8: Selects Master 8 0x9: Selects Master 9 0xA: Selects Master 10 0xB: Selects Master 11 0xC: Selects Master 12 0xD: Selects Master 13 0xE: Selects Master 14 0xF: Selects Master 15 0x10: Selects Master 16 0x11: Selects Master 17 0x12: Selects Master 18 0x13: Selects Master 19 0x14: Selects Master 20 0x15: Selects Master 21 0x16: Selects Master 22 0x17: Selects Master 23 0x18: Selects Master 24 0x19: Selects Master 25 0x1A: Selects Master 26 0x1B: Selects Master 27 0x1C: Selects Master 28 0x1D: Selects Master 29 0x1E: Selects Master 30 0x1F: Selects Master 31

FABRIC_MONITOR_SELECTION_LOWER_REG7 (cont.)

Bits	Name	Description
3:0	E7SWS	SW : RW Event counter 7 Slave way selection 0x0: Selects Slave 0 0x1: Selects Slave 1 0x2: Selects Slave 2 0x3: Selects Slave 3 0x4: Selects Slave 4 0x5: Selects Slave 5 0x6: Selects Slave 6 0x7: Selects Slave 7 0x8: Selects Slave 8 0x9: Selects Slave 9 0xA: Selects Slave 10 0xB: Selects Slave 11 0xC: Selects Slave 12 0xD: Selects Slave 13 0xE: Selects Slave 14 0xF: Selects Slave 15

0x05203944 FABRIC_MONITOR_SELECTION_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for event counter 7.

FABRIC_MONITOR_SELECTION_UPPER_REG7

Bits	Name	Description
15:0	E7MID	SW : RW Event counter 7 MID selection (If MID filtering enabled)

0x05203948 FABRIC_MONITOR_PICK_PORTS_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the main port and other port selection for the 8 event counters.

FABRIC_MONITOR_PICK_PORTS_REG

Bits	Name	Description
15:14	E7PP	SW : RW Event counter 7 port combination selection 0x0: Master port selected by E7MPS, filtering based on slave port disabled 0x1: Master port selected by E7MPS, filtering based on slave way selected by E7SWS 0x2: Slave way selected by E7SWS, filtering based on master port disabled 0x3: Slave way selected by E7SWS, filtering based on master port selected by E7MPS
13:12	E6PP	SW : RW Event counter 6 port combination selection 0x0: Master port selected by E6MPS, filtering based on slave port disabled 0x1: Master port selected by E6MPS, filtering based on slave way selected by E6SWS 0x2: Slave way selected by E6SWS, filtering based on master port disabled 0x3: Slave way selected by E6SWS, filtering based on master port selected by E6MPS
11:10	E5PP	SW : RW Event counter 5 port combination selection 0x0: Master port selected by E5MPS, filtering based on slave port disabled 0x1: Master port selected by E5MPS, filtering based on slave way selected by E5SWS 0x2: Slave way selected by E5SWS, filtering based on master port disabled 0x3: Slave way selected by E5SWS, filtering based on master port selected by E5MPS
9:8	E4PP	SW : RW Event counter 4 port combination selection 0x0: Master port selected by E4MPS, filtering based on slave port disabled 0x1: Master port selected by E4MPS, filtering based on slave way selected by E4SWS 0x2: Slave way selected by E4SWS, filtering based on master port disabled 0x3: Slave way selected by E4SWS, filtering based on master port selected by E4MPS

FABRIC_MONITOR_PICK_PORTS_REG (cont.)

Bits	Name	Description
7:6	E3PP	SW : RW Event counter 3 port combination selection 0x0: Master port selected by E3MPS, filtering based on slave port disabled 0x1: Master port selected by E3MPS, filtering based on slave way selected by E3SWS 0x2: Slave way selected by E3SWS, filtering based on master port disabled 0x3: Slave way selected by E3SWS, filtering based on master port selected by E3MPS
5:4	E2PP	SW : RW Event counter 2 port combination selection 0x0: Master port selected by E2MPS, filtering based on slave port disabled 0x1: Master port selected by E2MPS, filtering based on slave way selected by E2SWS 0x2: Slave way selected by E2SWS, filtering based on master port disabled 0x3: Slave way selected by E2SWS, filtering based on master port selected by E2MPS
3:2	E1PP	SW : RW Event counter 1 port combination selection 0x0: Master port selected by E1MPS, filtering based on slave port disabled 0x1: Master port selected by E1MPS, filtering based on slave way selected by E1SWS 0x2: Slave way selected by E1SWS, filtering based on master port disabled 0x3: Slave way selected by E1SWS, filtering based on master port selected by E1MPS
1:0	E0PP	SW : RW Event counter 0 port combination selection 0x0: Master port selected by E0MPS, filtering based on slave port disabled 0x1: Master port selected by E0MPS, filtering based on slave way selected by E0SWS 0x2: Slave way selected by E0SWS, filtering based on master port disabled 0x3: Slave way selected by E0SWS, filtering based on master port selected by E0MPS

0x05203950 FABRIC_MONITOR_CYCLE_COUNT_UPPER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the performance monitor cycle counter.

FABRIC_MONITOR_CYCLE_COUNT_UPPER_REG

Bits	Name	Description
15:0	UCC	SW : RW MSB cycle count value The cycle count value is decremented once per FABRIC clock. The counter stops decrementing once the CC value equals 32:h0.

0x05203954 FABRIC_MONITOR_CYCLE_COUNT_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the performance monitor cycle counter. If SW requires that the values when read do not change, when it reads this register, the value for all 32 bits of the cycle counter is stored. This allows for SW to read the lower reg and have the value match the exact cycle in which the upper reg was read.

FABRIC_MONITOR_CYCLE_COUNT_LOWER_REG

Bits	Name	Description
15:0	LCC	SW : RW LSB cycle count value The cycle count value is decremented once per FABRIC clock. The counter stops decrementing once the CC value equals 32:h0.

0x05203958 FABRIC_MONITOR_EVENT_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 0. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_LOWER_REG0

Bits	Name	Description
15:0	ECLT0	SW : RW Total # events (lower 16-bit value)

0x0520395C FABRIC_MONITOR_EVENT_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 0. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_UPPER_REG0

Bits	Name	Description
15:0	ECUT0	SW : RW Total # events (upper 16-bit value)

0x05203960 FABRIC_MONITOR_EVENT_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 1. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_LOWER_REG1

Bits	Name	Description
15:0	ECLT1	SW : RW Total # events (lower 16-bit value)

0x05203964 FABRIC_MONITOR_EVENT_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 1. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_UPPER_REG1

Bits	Name	Description
15:0	ECUT1	SW : RW Total # events (upper 16-bit value)

0x05203968 FABRIC_MONITOR_EVENT_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 2. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_LOWER_REG2

Bits	Name	Description
15:0	ECLT2	SW : RW Total # events (lower 16-bit value)

0x0520396C FABRIC_MONITOR_EVENT_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 2. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_UPPER_REG2

Bits	Name	Description
15:0	ECUT2	SW : RW Total # events (upper 16-bit value)

0x05203970 FABRIC_MONITOR_EVENT_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 3. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_LOWER_REG3

Bits	Name	Description
15:0	ECLT3	SW : RW Total # events (lower 16-bit value)

0x05203974 FABRIC_MONITOR_EVENT_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 3. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_UPPER_REG3

Bits	Name	Description
15:0	ECUT3	SW : RW Total # events (upper 16-bit value)

0x05203978 FABRIC_MONITOR_EVENT_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 4. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_LOWER_REG4

Bits	Name	Description
15:0	ECLT4	SW : RW Total # events (lower 16-bit value)

0x0520397C FABRIC_MONITOR_EVENT_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 4. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_UPPER_REG4

Bits	Name	Description
15:0	ECUT4	SW : RW Total # events (upper 16-bit value)

0x05203980 FABRIC_MONITOR_EVENT_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 5. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_LOWER_REG5

Bits	Name	Description
15:0	ECLT5	SW : RW Total # events (lower 16-bit value)

0x05203984 FABRIC_MONITOR_EVENT_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 5. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_UPPER_REG5

Bits	Name	Description
15:0	ECUT5	SW : RW Total # events (upper 16-bit value)

0x05203988 FABRIC_MONITOR_EVENT_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 6. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_LOWER_REG6

Bits	Name	Description
15:0	ECLT6	SW : RW Total # events (lower 16-bit value)

0x0520398C FABRIC_MONITOR_EVENT_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 6. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_UPPER_REG6

Bits	Name	Description
15:0	ECUT6	SW : RW Total # events (upper 16-bit value)

0x05203990 FABRIC_MONITOR_EVENT_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 7. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_LOWER_REG7

Bits	Name	Description
15:0	ECLT7	SW : RW Total # events (lower 16-bit value)

0x05203994 FABRIC_MONITOR_EVENT_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 7. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_UPPER_REG7

Bits	Name	Description
15:0	ECUT7	SW : RW Total # events (upper 16-bit value)

0x052039A4 FABRIC_TRIGGER_CONFIGURATION_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register configures the interface in which the trigger comparison is done on the address channel.

TAMS: Selects one of the 32 interfaces from which the address channel transfer qualifiers are used to enable trigger matching.

FABRIC_TRIGGER_CONFIGURATION_REG

Bits	Name	Description
15:7	RESERVED_BITS15_6	

FABRIC_TRIGGER_CONFIGURATION_REG (cont.)

Bits	Name	Description
6	TRGEN	SW : RW Trigger enable 1'b0 -disabled 0x1: enabled

FABRIC_TRIGGER_CONFIGURATION_REG (cont.)

Bits	Name	Description
5:0	TAMS	SW : RW Trigger based on address channel on M/S Port #: 0x0: Master Port 0 0x1: Master Port 1 0x2: Master Port 2 0x3: Master Port 3 0x4: Master Port 4 0x5: Master Port 5 0x6: Master Port 6 0x7: Master Port 7 0x8: Master Port 8 0x9: Master Port 9 0xA: Master Port 10 0xB: Master Port 11 0xC: Master Port 12 0xD: Master Port 13 0xE: Master Port 14 0xF: Master Port 15 0x10: Master Port 16 0x11: Master Port 17 0x12: Master Port 18 0x13: Master Port 19 0x14: Master Port 20 0x15: Master Port 21 0x16: Master Port 22 0x17: Master Port 23 0x18: Master Port 24 0x19: Master Port 25 0x1A: Master Port 26 0x1B: Master Port 27 0x1C: Master Port 28 0x1D: Master Port 29 0x1E: Master Port 30 0x1F: Master Port 31 0x20: Slave Port 0 0x21: Slave Port 1 0x22: Slave Port 2 0x23: Slave Port 3 0x24: Slave Port 4 0x25: Slave Port 5 0x26: Slave Port 6 0x27: Slave Port 7 0x28: Slave Port 8 0x29: Slave Port 9 0x2A: Slave Port 10 0x2B: Slave Port 11 0x2C: Slave Port 12

FABRIC_TRIGGER_CONFIGURATION_REG (cont.)

Bits	Name	Description
5:0	TAMS (CONT'D)	0x2D: Slave Port 13 0x2E: Slave Port 14 0x2F: Slave Port 15

0x052039AC FABRIC_TRIGGER_REG_0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the upper address which is used as comparison for the trigger feature of the on-chip trace or performance monitor function. TUADDR[15:0] will be compared against Address[31:16].

FABRIC_TRIGGER_REG_0

Bits	Name	Description
15:0	TUADDR	SW : RW Address bits[31:16]

0x052039B0 FABRIC_TRIGGER_REG_1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the lower address which is used as comparison for the trigger feature of the performance monitor function. TLADDR[15:0] will be compared against Address[15:0].

FABRIC_TRIGGER_REG_1

Bits	Name	Description
15:0	TLADDR	SW : RW Address bits[15:0]

0x052039B4 FABRIC_TRIGGER_REG_2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the lower address which is used as comparison for the trigger feature of the performance monitor function..

FABRIC_TRIGGER_REG_2

Bits	Name	Description
15:0	AMID	SW : RW AMID / HMID

0x052039B8 FABRIC_TRIGGER_REG_3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the address channel transfer qualifiers which are used as comparison for the trigger feature of the performance monitor function.

FABRIC_TRIGGER_REG_3

Bits	Name	Description
15:12	RESERVED_BITS15_12	
11	AOOOWR	SW : RW Out-of-order write
10	AOOORD	SW : RW Out-of-order read
9:3	ATID	SW : RW Address TID (If ATID is less than 7 bits, the upper bits must be set to 0)
2	AFULL	SW : RW Full Transfer
1	RESERVED_BIT1	
0	APROTNS	SW : RW Protection level

0x052039BC FABRIC_TRIGGER_REG_4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the address channel transfer qualifiers which are used as comparison for the trigger feature of the performance monitor function.

FABRIC_TRIGGER_REG_4

Bits	Name	Description
15:12	ATYPE	SW : RW Memory type attributes
11:10	ALOCK	SW : RW Lock type
9	RESERVED_BITS9	
8	ABURST	SW : RW Burst type
7:5	ASIZE	Burst size
4:1	ALEN	Burst length
0	AWRITE	Burst direction

0x052039C0 FABRIC_TRIGGER_MASK_REG_0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR0.

FABRIC_TRIGGER_MASK_REG_0

Bits	Name	Description
15:0	FTTR0_MASK	SW : RW Bit mask field for FTTR0 Enable: 1 Disable: 0

0x052039C4 FABRIC_TRIGGER_MASK_REG_1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR1.

FABRIC_TRIGGER_MASK_REG_1

Bits	Name	Description
15:0	FTTR1_MASK	SW : RW Bit mask field for FTTR1 Enable: 1 Disable: 0

0x052039C8 FABRIC_TRIGGER_MASK_REG_2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR2.

FABRIC_TRIGGER_MASK_REG_2

Bits	Name	Description
15:0	FTTR2_MASK	SW : RW Bit mask field for FTTR2 Enable: 1 Disable: 0

0x052039CC FABRIC_TRIGGER_MASK_REG_3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR3.

FABRIC_TRIGGER_MASK_REG_3

Bits	Name	Description
15:0	FTTR3_MASK	SW : RW Bit mask field for FTTR3 Enable: 1 Disable: 0

0x052039D0 FABRIC_TRIGGER_MASK_REG_4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR4.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR4.

FABRIC_TRIGGER_MASK_REG_4

Bits	Name	Description
15:0	FTTR4_MASK	SW : RW Bit mask field for FTTR4 Enable: 1 Disable: 0

0x052039D4 FABRIC_MONITOR_ADDRESS_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter0.

FABRIC_MONITOR_ADDRESS_LOWER_REG0

Bits	Name	Description
15:0	E0AL	SW : RW LSB address value Event counter 0 address selection (if address range filtering enabled)

0x052039D8 FABRIC_MONITOR_ADDRESS_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter0.

FABRIC_MONITOR_ADDRESS_UPPER_REG0

Bits	Name	Description
15:0	E0AU	SW : RW MSB address value Event counter 0 address selection (if address range filtering enabled)

0x052039DC FABRIC_MONITOR_ADDRESS_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter1.

FABRIC_MONITOR_ADDRESS_LOWER_REG1

Bits	Name	Description
15:0	E1AL	SW : RW LSB address value Event counter 1address selection (if address range filtering enabled)

0x052039E0 FABRIC_MONITOR_ADDRESS_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter1.

FABRIC_MONITOR_ADDRESS_UPPER_REG1

Bits	Name	Description
15:0	E1AU	SW : RW MSB address value Event counter 1address selection (if address range filtering enabled)

0x052039E4 FABRIC_MONITOR_ADDRESS_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter2

FABRIC_MONITOR_ADDRESS_LOWER_REG2

Bits	Name	Description
15:0	E2AL	SW : RW LSB address value Event counter 2 address selection (if address range filtering enabled)

0x052039E8 FABRIC_MONITOR_ADDRESS_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter2.

FABRIC_MONITOR_ADDRESS_UPPER_REG2

Bits	Name	Description
15:0	E2AU	SW : RW MSB address value Event counter 2 address selection (if address range filtering enabled)

0x052039EC FABRIC_MONITOR_ADDRESS_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter3

FABRIC_MONITOR_ADDRESS_LOWER_REG3

Bits	Name	Description
15:0	E3AL	SW : RW LSB address value Event counter 3 address selection (if address range filtering enabled)

0x052039F0 FABRIC_MONITOR_ADDRESS_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter3.

FABRIC_MONITOR_ADDRESS_UPPER_REG3

Bits	Name	Description
15:0	E3AU	SW : RW MSB address value Event counter 3 address selection (if address range filtering enabled)

0x052039F4 FABRIC_MONITOR_ADDRESS_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter4.

FABRIC_MONITOR_ADDRESS_LOWER_REG4

Bits	Name	Description
15:0	E4AL	SW : RW LSB address value Event counter 4 address selection (if address range filtering enabled)

0x052039F8 FABRIC_MONITOR_ADDRESS_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter4.

FABRIC_MONITOR_ADDRESS_UPPER_REG4

Bits	Name	Description
15:0	E4AU	SW : RW MSB address value Event counter 4address selection (if address range filtering enabled)

0x052039FC FABRIC_MONITOR_ADDRESS_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter5.

FABRIC_MONITOR_ADDRESS_LOWER_REG5

Bits	Name	Description
15:0	E5AL	SW : RW LSB address value Event counter 5 address selection (if address range filtering enabled)

0x05203A00 FABRIC_MONITOR_ADDRESS_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter4.

FABRIC_MONITOR_ADDRESS_UPPER_REG5

Bits	Name	Description
15:0	E5AU	SW : RW MSB address value Event counter 5 address selection (if address range filtering enabled)

0x05203A04 FABRIC_MONITOR_ADDRESS_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter 6.

FABRIC_MONITOR_ADDRESS_LOWER_REG6

Bits	Name	Description
15:0	E6AL	SW : RW LSB address value Event counter 6 address selection (if address range filtering enabled)

0x05203A08 FABRIC_MONITOR_ADDRESS_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 6.

FABRIC_MONITOR_ADDRESS_UPPER_REG6

Bits	Name	Description
15:0	E6AU	SW : RW MSB address value Event counter 6 address selection (if address range filtering enabled)

0x05203A0C FABRIC_MONITOR_ADDRESS_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter 7.

FABRIC_MONITOR_ADDRESS_LOWER_REG7

Bits	Name	Description
15:0	E7AL	SW : RW LSB address value Event counter 7 address selection (if address range filtering enabled)

0x05203A10 FABRIC_MONITOR_ADDRESS_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 7.

FABRIC_MONITOR_ADDRESS_UPPER_REG7

Bits	Name	Description
15:0	E7AU	SW : RW MSB address value Event counter 7 address selection (if address range filtering enabled)

0x05203A14 FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR0.

FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG0

Bits	Name	Description
15:0	E0AML	SW : RW LSB address value Event counter 0 address mask

0x05203A18 FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR0.

FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG0

Bits	Name	Description
15:0	E0AMU	SW : RW MSB address value Event counter 0 address mask

0x05203A1C FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR1.

FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG1

Bits	Name	Description
15:0	E1AML	SW : RW LSB address value Event counter 1 address mask

0x05203A20 FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR1.

FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG1

Bits	Name	Description
15:0	E1AMU	SW : RW MSB address value Event counter address mask

0x05203A24 FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR2.

FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG2

Bits	Name	Description
15:0	E2AML	SW : RW LSB address value Event counter 2 address mask

0x05203A28 FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR2.

FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG2

Bits	Name	Description
15:0	E2AMU	SW : RW MSB address value Event counter 2 address mask

0x05203A2C FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR3.

FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG3

Bits	Name	Description
15:0	E3AML	SW : RW LSB address value Event counter 3 address mask

0x05203A30 FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR3.

FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG3

Bits	Name	Description
15:0	E3AMU	SW : RW MSB address value Event counter 3 address mask

0x05203A34 FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 4.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR4.

FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG4

Bits	Name	Description
15:0	E4AML	SW : RW LSB address value Event counter 4 address mask

0x05203A38 FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 4.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR4.

FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG4

Bits	Name	Description
15:0	E4AMU	SW : RW MSB address value Event counter 4 address mask

0x05203A3C FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 5.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR5.

FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG5

Bits	Name	Description
15:0	E5AML	SW : RW LSB address value Event counter 5 address mask

0x05203A40 FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 5.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR5.

FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG5

Bits	Name	Description
15:0	E5AMU	SW : RW MSB address value Event counter 5 address mask

0x05203A44 FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 6.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR6.

FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG6

Bits	Name	Description
15:0	E6AML	SW : RW LSB address value Event counter 6 address mask

0x05203A48 FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 6.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR6.

FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG6

Bits	Name	Description
15:0	E6AMU	SW : RW MSB address value Event counter 6 address mask

0x05203A4C FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 7.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR7.

FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG7

Bits	Name	Description
15:0	E7AML	SW : RW LSB address value Event counter 7 address mask

0x05203A50 FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 7.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR7.

FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG7

Bits	Name	Description
15:0	E7AMU	SW : RW MSB address value Event counter 7 address mask

0x05203A70 FABRIC_MONITOR_MID_MASK_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 0

FABRIC_MONITOR_MID_MASK_REG0

Bits	Name	Description
15:0	E0MM	SW : RW MID Mask value for event counter 0

0x05203A74 FABRIC_MONITOR_MID_MASK_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 1

FABRIC_MONITOR_MID_MASK_REG1

Bits	Name	Description
15:0	E1MM	SW : RW MID Mask value for event counter 1

0x05203A78 FABRIC_MONITOR_MID_MASK_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 2

FABRIC_MONITOR_MID_MASK_REG2

Bits	Name	Description
15:0	E2MM	SW : RW MID Mask value for event counter 2

0x05203A7C FABRIC_MONITOR_MID_MASK_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 3

FABRIC_MONITOR_MID_MASK_REG3

Bits	Name	Description
15:0	E3MM	SW : RW MID Mask value for event counter 3

0x05203A80 FABRIC_MONITOR_MID_MASK_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 4

FABRIC_MONITOR_MID_MASK_REG4

Bits	Name	Description
15:0	E4MM	SW : RW MID Mask value for event counter 4

0x05203A84 FABRIC_MONITOR_MID_MASK_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 15

FABRIC_MONITOR_MID_MASK_REG5

Bits	Name	Description
15:0	E5MM	SW : RW MID Mask value for event counter 5

0x05203A88 FABRIC_MONITOR_MID_MASK_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 6

FABRIC_MONITOR_MID_MASK_REG6

Bits	Name	Description
15:0	E6MM	SW : RW MID Mask value for event counter 6

0x05203A8C FABRIC_MONITOR_MID_MASK_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 7

FABRIC_MONITOR_MID_MASK_REG7

Bits	Name	Description
15:0	E7MM	SW : RW MID Mask value for event counter 7

0x05203AA0 FABRIC_MONITOR_EVENT_BEATS_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_LOWER_REG0

Bits	Name	Description
15:0	EBTL0	SW : RW Total # beats (lower 16-bit value)

0x05203AA4 FABRIC_MONITOR_EVENT_BEATS_MID_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_MID_REG0

Bits	Name	Description
15:0	EBTM0	SW : RW Total # beats (middle 16-bit value)

0x05203AA8 FABRIC_MONITOR_EVENT_BEATS_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_UPPER_REG0

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU0	SW : RW Total # beats (upper 4-bit value)

0x05203AAC FABRIC_MONITOR_EVENT_BEATS_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_LOWER_REG1

Bits	Name	Description
15:0	EBTL1	SW : RW Total # beats (lower 16-bit value)

0x05203AB0 FABRIC_MONITOR_EVENT_BEATS_MID_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_MID_REG1

Bits	Name	Description
15:0	EBTM1	SW : RW Total # beats (middle 16-bit value)

0x05203AB4 FABRIC_MONITOR_EVENT_BEATS_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_UPPER_REG1

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU1	SW : RW Total # beats (upper 4-bit value)

0x05203AB8 FABRIC_MONITOR_EVENT_BEATS_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_LOWER_REG2

Bits	Name	Description
15:0	EBTL2	SW : RW Total # beats (lower 16-bit value)

0x05203ABC FABRIC_MONITOR_EVENT_BEATS_MID_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_MID_REG2

Bits	Name	Description
15:0	EBTM2	SW : RW Total # beats (middle 16-bit value)

0x05203AC0 FABRIC_MONITOR_EVENT_BEATS_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_UPPER_REG2

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU2	SW : RW Total # beats (upper 4-bit value)

0x05203AC4 FABRIC_MONITOR_EVENT_BEATS_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_LOWER_REG3

Bits	Name	Description
15:0	EBTL3	SW : RW Total # beats (lower 16-bit value)

0x05203AC8 FABRIC_MONITOR_EVENT_BEATS_MID_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write

Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_MID_REG3

Bits	Name	Description
15:0	EBTM3	SW : RW Total # beats (middle 16-bit value)

0x05203ACC FABRIC_MONITOR_EVENT_BEATS_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_UPPER_REG3

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU3	SW : RW Total # beats (upper 4-bit value)

0x05203AD0 FABRIC_MONITOR_EVENT_BEATS_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_LOWER_REG4

Bits	Name	Description
15:0	EBTL4	SW : RW Total # beats (lower 16-bit value)

0x05203AD4 FABRIC_MONITOR_EVENT_BEATS_MID_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_MID_REG4

Bits	Name	Description
15:0	EBTM4	SW : RW Total # beats (middle 16-bit value)

0x05203AD8 FABRIC_MONITOR_EVENT_BEATS_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_UPPER_REG4

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU4	SW : RW Total # beats (upper 4-bit value)

0x05203ADC FABRIC_MONITOR_EVENT_BEATS_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write

Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_LOWER_REG5

Bits	Name	Description
15:0	EBTL5	SW : RW Total # beats (lower 16-bit value)

0x05203AE0 FABRIC_MONITOR_EVENT_BEATS_MID_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_MID_REG5

Bits	Name	Description
15:0	EBTM5	SW : RW Total # beats (middle 16-bit value)

0x05203AE4 FABRIC_MONITOR_EVENT_BEATS_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_UPPER_REG5

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU5	SW : RW Total # beats (upper 4-bit value)

0x05203AE8 FABRIC_MONITOR_EVENT_BEATS_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_LOWER_REG6

Bits	Name	Description
15:0	EBTL6	SW : RW Total # beats (lower 16-bit value)

0x05203AEC FABRIC_MONITOR_EVENT_BEATS_MID_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_MID_REG6

Bits	Name	Description
15:0	EBTM6	SW : RW Total # beats (middle 16-bit value)

0x05203AF0 FABRIC_MONITOR_EVENT_BEATS_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_UPPER_REG6

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU6	SW : RW Total # beats (upper 4-bit value)

0x05203AF4 FABRIC_MONITOR_EVENT_BEATS_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_LOWER_REG7

Bits	Name	Description
15:0	EBTL7	SW : RW Total # beats (lower 16-bit value)

0x05203AF8 FABRIC_MONITOR_EVENT_BEATS_MID_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_MID_REG7

Bits	Name	Description
15:0	EBTM7	SW : RW Total # beats (middle 16-bit value)

0x05203AFC FABRIC_MONITOR_EVENT_BEATS_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BEATS_UPPER_REG7

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU7	SW : RW Total # beats (upper 4-bit value)

0x05203B00 FABRIC_MONITOR_EVENT_BYTES_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_LOWER_REG0

Bits	Name	Description
15:0	EBYL0	SW : RW Total bytes (lower 16-bit value)

0x05203B04 FABRIC_MONITOR_EVENT_BYTES_MID_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_MID_REG0

Bits	Name	Description
15:0	EBYM0	SW : RW Total bytes (middle 16-bit value)

0x05203B08 FABRIC_MONITOR_EVENT_BYTES_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_UPPER_REG0

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU0	SW : RW Total bytes (upper 11-bit value)

0x05203B0C FABRIC_MONITOR_EVENT_BYTES_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_LOWER_REG1

Bits	Name	Description
15:0	EBYL1	SW : RW Total bytes (lower 16-bit value)

0x05203B10 FABRIC_MONITOR_EVENT_BYTES_MID_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_MID_REG1

Bits	Name	Description
15:0	EBYM1	SW : RW Total bytes (middle 16-bit value)

0x05203B14 FABRIC_MONITOR_EVENT_BYTES_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_UPPER_REG1

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU1	SW : RW Total bytes (upper 11-bit value)

0x05203B18 FABRIC_MONITOR_EVENT_BYTES_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_LOWER_REG2

Bits	Name	Description
15:0	EBYL2	SW : RW Total bytes (lower 16-bit value)

0x05203B1C FABRIC_MONITOR_EVENT_BYTES_MID_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_MID_REG2

Bits	Name	Description
15:0	EBYM2	SW : RW Total bytes (middle 16-bit value)

0x05203B20 FABRIC_MONITOR_EVENT_BYTES_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_UPPER_REG2

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU2	SW : RW Total bytes (upper 11-bit value)

0x05203B24 FABRIC_MONITOR_EVENT_BYTES_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_LOWER_REG3

Bits	Name	Description
15:0	EBYL3	SW : RW Total bytes (lower 16-bit value)

0x05203B28 FABRIC_MONITOR_EVENT_BYTES_MID_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_MID_REG3

Bits	Name	Description
15:0	EBYM3	SW : RW Total bytes (middle 16-bit value)

0x05203B2C FABRIC_MONITOR_EVENT_BYTES_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_UPPER_REG3

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU3	SW : RW Total bytes (upper 11-bit value)

0x05203B30 FABRIC_MONITOR_EVENT_BYTES_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_LOWER_REG4

Bits	Name	Description
15:0	EBYL4	SW : RW Total bytes (lower 16-bit value)

0x05203B34 FABRIC_MONITOR_EVENT_BYTES_MID_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_MID_REG4

Bits	Name	Description
15:0	EBYM4	SW : RW Total bytes (middle 16-bit value)

0x05203B38 FABRIC_MONITOR_EVENT_BYTES_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_UPPER_REG4

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU4	SW : RW Total bytes (upper 11-bit value)

0x05203B3C FABRIC_MONITOR_EVENT_BYTES_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_LOWER_REG5

Bits	Name	Description
15:0	EBYL5	SW : RW Total bytes (lower 16-bit value)

0x05203B40 FABRIC_MONITOR_EVENT_BYTES_MID_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_MID_REG5

Bits	Name	Description
15:0	EBYM5	SW : RW Total bytes (middle 16-bit value)

0x05203B44 FABRIC_MONITOR_EVENT_BYTES_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_UPPER_REG5

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU5	SW : RW Total bytes (upper 11-bit value)

0x05203B48 FABRIC_MONITOR_EVENT_BYTES_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_LOWER_REG6

Bits	Name	Description
15:0	EBYL6	SW : RW Total bytes (lower 16-bit value)

0x05203B4C FABRIC_MONITOR_EVENT_BYTES_MID_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

FABRIC_MONITOR_EVENT_BYTES_MID_REG6

Bits	Name	Description

Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for tenure counter 1.

FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG1

Bits	Name	Description
15:0	T1MID	SW : RW Tenure counter 1MID selection (If MID filtering enabled)

0x05203B70 FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the tenure selection, port selection and filtering criteria for the performance monitor tenure counter 2.

FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG2

Bits	Name	Description
15:14	T2SR	SW : RW Tenure selection for tenure counter 2 0x0: Master addr hndshk interval 0x1: Slave addr hndshk interval 0x2: Bresp interval 0x3: Read data tenure
13:12	RESERVED_BITS_13_12	Reserved
11	T2MIDFEN	SW : RW Tenure counter 2 MID Filtering enable 0x0: Disabled 0x1: Enabled
10	T2INDFEN	SW : RW Tenure counter 2 Instruction/Data Filtering enable 0x0: Disabled 0x1: Enabled
9	T2IND	SW : RW Tenure counter 2 Instruction/Data selection 0x0: Data 0x1: Instruction

FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG2 (cont.)

Bits	Name	Description
8:4	T2MP	SW : RW Tenure master port selection register for tenure counter 2 0x0: Selects Master 0 0x1: Selects Master 1 0x2: Selects Master 2 0x3: Selects Master 3 0x4: Selects Master 4 0x5: Selects Master 5 0x6: Selects Master 6 0x7: Selects Master 7 0x8: Selects Master 8 0x9: Selects Master 9 0xA: Selects Master 10 0xB: Selects Master 11 0xC: Selects Master 12 0xD: Selects Master 13 0xE: Selects Master 14 0xF: Selects Master 15 0x10: Selects Master 16 0x11: Selects Master 17 0x12: Selects Master 18 0x13: Selects Master 19 0x14: Selects Master 20 0x15: Selects Master 21 0x16: Selects Master 22 0x17: Selects Master 23 0x18: Selects Master 24 0x19: Selects Master 25 0x1A: Selects Master 26 0x1B: Selects Master 27 0x1C: Selects Master 28 0x1D: Selects Master 29 0x1E: Selects Master 30 0x1F: Selects Master 31

FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG2 (cont.)

Bits	Name	Description
3:0	T2SW	SW : RW Tenure slave way selection register for tenure counter 2 0x0: Selects Slave 0 0x1: Selects Slave 1 0x2: Selects Slave 2 0x3: Selects Slave 3 0x4: Selects Slave 4 0x5: Selects Slave 5 0x6: Selects Slave 6 0x7: Selects Slave 7 0x8: Selects Slave 8 0x9: Selects Slave 9 0xA: Selects Slave 10 0xB: Selects Slave 11 0xC: Selects Slave 12 0xD: Selects Slave 13 0xE: Selects Slave 14 0xF: Selects Slave 15

0x05203B74 FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for tenure counter 2.

FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG2

Bits	Name	Description
15:0	T2MID	SW : RW Tenure counter 2 MID selection (If MID filtering enabled)

0x05203B78 FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the tenure selection, port selection and filtering criteria for the performance monitor tenure counter 3.

FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG3

Bits	Name	Description
15:14	T3SR	SW : RW Tenure selection for tenure counter 3 0x0: Master addr hndshk interval 0x1: Slave addr hndshk interval 0x2: Bresp interval 0x3: Read data tenure

8:4	T3MP	SW : RW Tenure master port selection register for tenure counter 3 0x0: Selects Master 0 0x1: Selects Master 1 0x2: Selects Master 2 0x3: Selects Master 3 0x4: Selects Master 4 0x5: Selects Master 5 0x6: Selects Master 6 0x7: Selects Master 7 0x8: Selects Master 8 0x9: Selects Master 9 0xA: Selects Master 10 0xB: Selects Master 11 0xC: Selects Master 12 0xD: Selects Master 13 0xE: Selects Master 14 0xF: Selects Master 15 0x10: Selects Master 16 0x11: Selects Master 17 0x12: Selects Master 18 0x13: Selects Master 19 0x14: Selects Master 20 0x15: Selects Master 21 0x16: Selects Master 22 0x17: Selects Master 23 0x18: Selects Master 24 0x19: Selects Master 25 0x1A: Selects Master 26 0x1B: Selects Master 27 0x1C: Selects Master 28 0x1D: Selects Master 29 0x1E: Selects Master 30 0x1F: Selects Master 31

FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG3 (cont.)

Bits	Name	Description
3:0	T3SW	SW : RW Tenure slave way selection register for tenure counter 3 0x0: Selects Slave 0 0x1: Selects Slave 1 0x2: Selects Slave 2 0x3: Selects Slave 3 0x4: Selects Slave 4 0x5: Selects Slave 5 0x6: Selects Slave 6 0x7: Selects Slave 7 0x8: Selects Slave 8 0x9: Selects Slave 9 0xA: Selects Slave 10 0xB: Selects Slave 11 0xC: Selects Slave 12 0xD: Selects Slave 13 0xE: Selects Slave 14 0xF: Selects Slave 15

0x05203B7C FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for tenure counter 3.

FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG3

Bits	Name	Description
15:0	T3MID	SW : RW Tenure counter 3 MID selection (If MID filtering enabled)

0x05203B80 FABRIC_MONITOR_MIN_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR0 and measured in tenure counter 0.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

FABRIC_MONITOR_MIN_REG0

Bits	Name	Description
15:0	MIN0	SW : R Minimum value of tenure, in tenure counter 0

0x05203B84 FABRIC_MONITOR_MIN_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR1 and measured in tenure counter 1.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

FABRIC_MONITOR_MIN_REG1

Bits	Name	Description
15:0	MIN1	SW : R Minimum value of tenure, in tenure counter 1

0x05203B88 FABRIC_MONITOR_MIN_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR2 and measured in tenure counter 2.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

FABRIC_MONITOR_MIN_REG2

Bits	Name	Description
15:0	MIN2	SW : R Minimum value of tenure, in tenure counter 2

0x05203B8C FABRIC_MONITOR_MIN_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR3 and measured in tenure counter 3.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

FABRIC_MONITOR_MIN_REG3

Bits	Name	Description
15:0	MIN3	SW : R Minimum value of tenure, in tenure counter 3

0x05203B90 FABRIC_MONITOR_MAX_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR0 and measured in tenure counter 0.

NOTE The reset value for this register is set to h'0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be 'hFFFF.

FABRIC_MONITOR_MAX_REG0

Bits	Name	Description
15:0	MAX0	SW : R Maximum value of tenure, in tenure counter 0

0x05203B94 FABRIC_MONITOR_MAX_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR1and measured in tenure counter 1

NOTE The reset value for this register is set to h'0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be 'hFFFF.

FABRIC_MONITOR_MAX_REG1

Bits	Name	Description
15:0	MAX1	SW : R Maximum value of tenure, in tenure counter 1

0x05203B98 FABRIC_MONITOR_MAX_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR2 and measured in tenure counter 2

NOTE The reset value for this register is set to h'0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be 'hFFFF.

FABRIC_MONITOR_MAX_REG2

Bits	Name	Description
15:0	MAX2	SW : R Maximum value of tenure, in tenure counter 2

0x05203B9C FABRIC_MONITOR_MAX_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR3 and measured in tenure counter 3

NOTE The reset value for this register is set to h'0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be 'hFFFF.

FABRIC_MONITOR_MAX_REG3

Bits	Name	Description
15:0	MAX3	SW : R Maximum value of tenure, in tenure counter 3

0x05203BA0 FABRIC_MONITOR_TENURE_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure in tenure counter 0

FABRIC_MONITOR_TENURE_LOWER_REG0

Bits	Name	Description
15:0	LTOT0	SW : RW LSB total value of tenure, in tenure counter 0

0x05203BA4 FABRIC_MONITOR_TENURE_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure in tenure counter 0.

FABRIC_MONITOR_TENURE_UPPER_REG0

Bits	Name	Description
15:0	UTOT0	SW : RW MSB total value of tenure, in tenure counter 0

0x05203BA8 FABRIC_MONITOR_TENURE_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure in tenure counter 1

FABRIC_MONITOR_TENURE_LOWER_REG1

Bits	Name	Description
15:0	LTOT1	SW : RW LSB total value of tenure, in tenure counter 1

0x05203BAC FABRIC_MONITOR_TENURE_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure in tenure counter 1.

FABRIC_MONITOR_TENURE_UPPER_REG1

Bits	Name	Description
15:0	UTOT1	SW : RW MSB total value of tenure, in tenure counter 1

0x05203BB0 FABRIC_MONITOR_TENURE_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure in tenure counter 2

FABRIC_MONITOR_TENURE_LOWER_REG2

Bits	Name	Description
15:0	LTOT2	SW : RW LSB total value of tenure, in tenure counter 2

0x05203BB4 FABRIC_MONITOR_TENURE_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure in tenure counter 2.

FABRIC_MONITOR_TENURE_UPPER_REG2

Bits	Name	Description
15:0	UTOT2	SW : RW MSB total value of tenure, in tenure counter 2

0x05203BB8 FABRIC_MONITOR_TENURE_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure in tenure counter 3

FABRIC_MONITOR_TENURE_LOWER_REG3

Bits	Name	Description
15:0	LTOT3	SW : RW LSB total value of tenure, in tenure counter 3

0x05203BBC FABRIC_MONITOR_TENURE_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure in tenure counter 3.

FABRIC_MONITOR_TENURE_UPPER_REG3

Bits	Name	Description
15:0	UTOT3	SW : RW MSB total value of tenure, in tenure counter 3

0x05203BC0 FABRIC_MONITOR_LAST_TENURE_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the value of the last tenure in tenure counter 0

FABRIC_MONITOR_LAST_TENURE_REG0

Bits	Name	Description
15:0	LASTT0	SW : R Last tenure value in tenure counter 0

0x05203BC4 FABRIC_MONITOR_LAST_TENURE_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the value of the last tenure in tenure counter 1

FABRIC_MONITOR_LAST_TENURE_REG1

Bits	Name	Description
15:0	LASTT1	SW : R Last tenure value in tenure counter 1

0x05203BC8 FABRIC_MONITOR_LAST_TENURE_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the value of the last tenure in tenure counter 2

FABRIC_MONITOR_LAST_TENURE_REG2

Bits	Name	Description
15:0	LASTT2	SW : R Last tenure value in tenure counter 2

0x05203BCC FABRIC_MONITOR_LAST_TENURE_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the value of the last tenure in tenure counter 3

FABRIC_MONITOR_LAST_TENURE_REG3

Bits	Name	Description
15:0	LASTT0	SW : R Last tenure value in tenure counter 3

0x05203BD0 FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 0.

FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG0

Bits	Name	Description
15:0	T0AL	SW : RW LSB address value Tenure counter 0 address mask

0x05203BD4 FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 0.

FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG0

Bits	Name	Description
15:0	T0AU	SW : RW MSB address value Tenure counter 0 address mask

0x05203BD8 FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 1.

FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG1

Bits	Name	Description
15:0	T1AL	SW : RW LSB address value Tenure counter 1 address mask

0x05203BDC FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 1.

FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG1

Bits	Name	Description
15:0	T1AU	SW : RW MSB address value Tenure counter 1 address mask

0x05203BE0 FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 2.

FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG2

Bits	Name	Description
15:0	T2AL	SW : RW LSB address value Tenure counter 2 address mask

0x05203BE4 FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 2.

FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG2

Bits	Name	Description
15:0	T2AU	SW : RW MSB address value Tenure counter 2 address mask

0x05203BE8 FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 3.

FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG3

Bits	Name	Description
15:0	T3AL	SW : RW LSB address value Tenure counter 3 address mask

0x05203BEC FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 3.

FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG3

Bits	Name	Description
15:0	T3AU	SW : RW MSB address value Tenure counter 3 address mask

0x05203BF0 FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 0

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR0.

FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG0

Bits	Name	Description
15:0	T0AML	SW : RW LSB address value Tenure counter 0 address mask

0x05203BF4 FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 0

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR0.

FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG0

Bits	Name	Description
15:0	T0AMU	SW : RW MSB address mask value Tenure counter 0 address mask

0x05203BF8 FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 1

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR1.

FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG1

Bits	Name	Description
15:0	T1AML	SW : RW LSB address value Tenure counter 1 address mask

0x05203BFC FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 1

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR1.

FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG1

Bits	Name	Description
15:0	T1AMU	SW : RW MSB address mask value Tenure counter 1 address mask

0x05203C00 FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 2

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR2.

FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG2

Bits	Name	Description
15:0	T2AML	SW : RW LSB address value Tenure counter 2 address mask

0x05203C04 FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 2

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR2.

FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG2

Bits	Name	Description
15:0	T2AMU	SW : RW MSB address mask value Tenure counter 2 address mask

0x05203C08 FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 3

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR3.

FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG3

Bits	Name	Description
15:0	T3AML	SW : RW LSB address value Tenure counter 3 address mask

0x05203C0C FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 3

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR3.

FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG3

Bits	Name	Description
15:0	T3AMU	SW : RW MSB address mask value Tenure counter 3 address mask

0x05203C10 FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 0 that were longer than the specified threshold for tenure counter 0

FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG0

Bits	Name	Description
15:0	T0ATCL	SW : R LSB count value

0x05203C14 FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 0 that were longer than the specified threshold for tenure counter 0

FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG0

Bits	Name	Description
15:0	T0ATCU	SW : R MSB count value

0x05203C18 FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 1 that were longer than the specified threshold for tenure counter 1

FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG1

Bits	Name	Description
15:0	T1ATCL	SW : R LSB count value

0x05203C1C FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 1 that were longer than the specified threshold for tenure counter 1

FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG1

Bits	Name	Description
15:0	T1ATCU	SW : R MSB count value

0x05203C20 FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 2 that were longer than the specified threshold for tenure counter 2

FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG2

Bits	Name	Description
15:0	T2ATCL	SW : R LSB count value

0x05203C24 FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 2 that were longer than the specified threshold for tenure counter 2

FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG2

Bits	Name	Description
15:0	T2ATCU	SW : R MSB count value

0x05203C28 FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 3 that were longer than the specified threshold for tenure counter 3

FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG3

Bits	Name	Description
15:0	T3ATCL	SW : R LSB count value

0x05203C2C FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 3 that were longer than the specified threshold for tenure counter 3

FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG3

Bits	Name	Description
15:0	T3ATCU	SW : R MSB count value

0x05203C30 FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 0 are measured.

FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG0

Bits	Name	Description
12:0	T0TV	SW : RW Tenure counter 0 threshold value

0x05203C34 FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 1 are measured.

FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG1

Bits	Name	Description
12:0	T1TV	SW : RW Tenure counter 1 threshold value

0x05203C38 FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 2 are measured.

FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG2

Bits	Name	Description
12:0	T2TV	SW : RW Tenure counter 2 threshold value

0x05203C3C FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 3 are measured.

FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG3

Bits	Name	Description
12:0	T3TV	SW : RW Tenure counter 3 threshold value

0x05203C40 FABRIC_MONITOR_TENURE_MID_MASK_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 0

FABRIC_MONITOR_TENURE_MID_MASK_REG0

Bits	Name	Description
15:0	T0MM	SW : RW MID Mask value

0x05203C44 FABRIC_MONITOR_TENURE_MID_MASK_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 1

FABRIC_MONITOR_TENURE_MID_MASK_REG1

Bits	Name	Description
15:0	T1MM	SW : RW MID Mask value

0x05203C48 FABRIC_MONITOR_TENURE_MID_MASK_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 2

FABRIC_MONITOR_TENURE_MID_MASK_REG2

Bits	Name	Description
15:0	T2MM	SW : RW MID Mask value

0x05203C4C FABRIC_MONITOR_TENURE_MID_MASK_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 3

FABRIC_MONITOR_TENURE_MID_MASK_REG3

Bits	Name	Description
15:0	T3MM	SW : RW MID Mask value

0x05203C50 FABRIC_MONITOR_TENURE_COUNT_LOWER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure0 register.

FABRIC_MONITOR_TENURE_COUNT_LOWER_REG0

Bits	Name	Description
15:0	TLC0	SW : R LSB count value Incremented every time a tenure under observation completes in tenure counter 0

0x05203C54 FABRIC_MONITOR_TENURE_COUNT_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure0 register.

FABRIC_MONITOR_TENURE_COUNT_UPPER_REG0

Bits	Name	Description
15:0	TUC0	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 0

0x05203C58 FABRIC_MONITOR_TENURE_COUNT_LOWER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure1 register.

FABRIC_MONITOR_TENURE_COUNT_LOWER_REG1

Bits	Name	Description

0x05203C5C FABRIC_MONITOR_TENURE_COUNT_UPPER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure1 register.

FABRIC_MONITOR_TENURE_COUNT_UPPER_REG1

Bits	Name	Description
15:0	TUC1	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 1

0x05203C60 FABRIC_MONITOR_TENURE_COUNT_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure2 register.

FABRIC_MONITOR_TENURE_COUNT_LOWER_REG2

Bits	Name	Description
15:0	TLC2	SW : R LSB count value Incremented every time a tenure under observation completes in tenure counter 2

0x05203C64 FABRIC_MONITOR_TENURE_COUNT_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure2 register.

FABRIC_MONITOR_TENURE_COUNT_UPPER_REG2

Bits	Name	Description
15:0	TUC2	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 2

0x05203C68 FABRIC_MONITOR_TENURE_COUNT_LOWER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure3 register.

FABRIC_MONITOR_TENURE_COUNT_LOWER_REG3

Bits	Name	Description
15:0	TLC3	SW : R LSB count value Incremented every time a tenure under observation completes in tenure counter 3

0x05203C6C FABRIC_MONITOR_TENURE_COUNT_UPPER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure3 register.

FABRIC_MONITOR_TENURE_COUNT_UPPER_REG3

Bits	Name	Description
15:0	TUC3	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 3

0x05203C70 FABRIC_MONITOR_TENURE_PICK_PORTS_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the main port and other port selection for the 4 event counters.

FABRIC_MONITOR_TENURE_PICK_PORTS_REG

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3	T3PP	SW : RW Tenure counter 3 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T3MP or T3SW
2	T2PP	SW : RW Tenure counter 2 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T2MP or T2SW
1	T1PP	SW : RW Tenure counter 1 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T1MP or T1SW
0	T0PP	SW : RW Tenure counter 0 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T0MP or T0SW

0x05203C80 FABRIC_MONITOR_TENURE_UNION_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 0

FABRIC_MONITOR_TENURE_UNION_LOWER_REG0

Bits	Name	Description
15:0	LTOTU0	SW : RW LSB total union value of tenure, in tenure counter 0

0x05203C84 FABRIC_MONITOR_TENURE_UNION_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 0.

FABRIC_MONITOR_TENURE_UNION_UPPER_REG0

Bits	Name	Description
15:0	UTOTU0	SW : RW MSB total union value of tenure, in tenure counter 0

0x05203C88 FABRIC_MONITOR_TENURE_UNION_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 1

FABRIC_MONITOR_TENURE_UNION_LOWER_REG1

Bits	Name	Description
15:0	LTOTU1	SW : RW LSB total union value of tenure, in tenure counter 1

0x05203C8C FABRIC_MONITOR_TENURE_UNION_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 1.

FABRIC_MONITOR_TENURE_UNION_UPPER_REG1

Bits	Name	Description
15:0	UTOTU1	SW : RW MSB total union value of tenure, in tenure counter 1

0x05203C90 FABRIC_MONITOR_TENURE_UNION_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 2

FABRIC_MONITOR_TENURE_UNION_LOWER_REG2

Bits	Name	Description
15:0	LTOTU2	SW : RW LSB total union value of tenure, in tenure counter 2

0x05203C94 FABRIC_MONITOR_TENURE_UNION_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 2.

FABRIC_MONITOR_TENURE_UNION_UPPER_REG2

Bits	Name	Description
15:0	UTOTU2	SW : RW MSB total union value of tenure, in tenure counter 2

0x05203C98 FABRIC_MONITOR_TENURE_UNION_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 3

FABRIC_MONITOR_TENURE_UNION_LOWER_REG3

Bits	Name	Description
15:0	LTOTU3	SW : RW LSB total union value of tenure, in tenure counter 3

0x05203C9C FABRIC_MONITOR_TENURE_UNION_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 3.

FABRIC_MONITOR_TENURE_UNION_UPPER_REG3

Bits	Name	Description
15:0	UTOTU3	SW : RW MSB total union value of tenure, in tenure counter 3

0x05203CA0 FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures measured in tenure counter 0, that were pipelined.

FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG0

Bits	Name	Description

0x05203CA4 FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures measured in tenure counter 0, that were pipelined.

FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG0

Bits	Name	Description
15:0	TUCP0	SW : R MSB count value TUCP0,TLCP0 value incremented every time a pipelined tenure completes in tenure counter 0

0x05203CA8 FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures measured in tenure counter 1, that were pipelined.

FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG1

Bits	Name	Description

0x05203CAC FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures measured in tenure counter 1, that were pipelined.

FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG1

Bits	Name	Description
15:0	TUCP1	SW : R MSB count value TUCP1,TLCP1 value incremented every time a pipelined tenure completes in tenure counter 1

0x05203CB0 FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures measured in tenure counter 2, that were pipelined.

FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG2

Bits	Name	Description

0x05203CB4 FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures measured in tenure counter 2, that were pipelined.

FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG2

Bits	Name	Description
15:0	TUCP2	SW : R MSB count value TUCP1,TLCP1 value incremented every time a pipelined tenure completes in tenure counter 2

0x05203CB8 FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures measured in tenure counter 3, that were pipelined.

FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG3

Bits	Name	Description

0x05203CBC FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures measured in tenure counter 3, that were pipelined.

FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG3

Bits	Name	Description
15:0	TUCP3	SW : R MSB count value TUCP3,TLCP3 value incremented every time a pipelined tenure completes in tenure counter 3

0x05203CC0 FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the max number of tenures pipelined at any point during the monitoring window for tenure counter 0

FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG0

Bits	Name	Description
15:0	TMCP0	SW : R This is the maximum number of tenures pipelined at the same time in tenure counter 0

0x05203CC4 FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the max number of tenures pipelined at any point during the monitoring window for tenure counter 1

FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG1

Bits	Name	Description
15:0	TMCP1	SW : R This is the maximum number of tenures pipelined at the same time in tenure counter 1

0x05203CC8 FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the max number of tenures pipelined at any point during the monitoring window for tenure counter 2

FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG2

Bits	Name	Description
15:0	TMCP2	SW : R This is the maximum number of tenures pipelined at the same time in tenure counter 2

0x05203CCC FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the max number of tenures pipelined at any point during the monitoring window for tenure counter 3

FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG3

Bits	Name	Description
15:0	TMCP3	SW : R This is the maximum number of tenures pipelined at the same time in tenure counter 3

0x05203CD0 FABRIC_MONITOR_INFLIGHT_TENURE_CORRECTION_MODE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the facility to correlate a particular event counter to a tenure counter. When the tenure results of a counter are reset during a monitoring window (to account for errors due to starting the monitor in the middle of traffic), the event counters too get reset if the correlation between them is enabled.

NOTE PCORR bit (bit 0) should not be set for APQ8064.

FABRIC_MONITOR_INFLIGHT_TENURE_CORRECTION_MODE_REG

Bits	Name	Description
15:9	RESERVED_15_9	Reserved Bits
8	EC7COR	SW : RW 0x1: Link Event Counter 7 to Tenure Counter 3 0x0: Event Counter 7 is independent
7	EC6COR	SW : RW 0x1: Link Event Counter 6 to Tenure Counter 2 0x0: Event Counter 6 is independent
6	EC5COR	SW : RW 0x1: Link Event Counter 5 to Tenure Counter 1 0x0: Event Counter 5 is independent
5	EC4COR	SW : RW 0x1: Link Event Counter 4 to Tenure Counter 0 0x0: Event Counter 4 is independent
4	EC3COR	SW : RW 0x1: Link Event Counter 3 to Tenure Counter 3 0x0: Event Counter 3 is independent
3	EC2COR	SW : RW 0x1: Link Event Counter 2 to Tenure Counter 2 0x0: Event Counter 2 is independent
2	EC1COR	SW : RW 0x1: Link Event Counter 1 to Tenure Counter 1 0x0: Event Counter 1 is independent
1	EC0COR	SW : RW 0x1: Link Event Counter 0 to Tenure Counter 0 0x0: Event Counter 0 is independent
0	PCORR	SW : RW This is the enable for tenure correction mode This bit SHOULD NOT be set for APQ8064.

0x05203CE0 FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 0 that correspond to out-of-order transactions.

FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG0

Bits	Name	Description
15:0	TOLC0	SW : R LSB count value Incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 0

0x05203CE4 FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 0 that correspond to out-of-order transactions

FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG0

Bits	Name	Description
15:0	TOUC0	SW : R MSB count value TOUC,TOLC value incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 0

0x05203CE8 FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 1 that correspond to out-of-order transactions.

FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG1

Bits	Name	Description
15:0	TOLC1	SW : R LSB count value Incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 1

0x05203CEC FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 1 that correspond to out-of-order transactions

FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG1

Bits	Name	Description
15:0	TOUC1	SW : R MSB count value TOUC,TOLC value incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 1

0x05203CF0 FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 2 that correspond to out-of-order transactions.

FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG2

Bits	Name	Description
15:0	TOLC2	SW : R LSB count value Incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 2

0x05203CF4 FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 2 that correspond to out-of-order transactions

FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG2

Bits	Name	Description
15:0	TOUC2	SW : R MSB count value TOUC,TOLC value incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 2

0x05203CF8 FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 3 that correspond to out-of-order transactions.

FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG3

Bits	Name	Description
15:0	TOLC3	SW : R LSB count value Incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 3

0x05203CFC FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 3 that correspond to out-of-order transactions

FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG3

Bits	Name	Description
15:0	TOUC3	SW : R MSB count value TOUC,TOLC value incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 3

0x05203D00 FABRIC_MONITOR_RTR_STATUS_REG

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains 4 status bits (one for each performance monitor tenure counter). Each bit indicates whether the monitoring results pertaining to the associated tenure counter have been reset (to account for errors due to starting the monitor in the middle of traffic) or not.

FABRIC_MONITOR_RTR_STATUS_REG

Bits	Name	Description
15:4	RESERVED15_4	Reserved
3	TC3_RESET	SW: R When set, this bit indicates that tenure counter 3 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic
2	TC2_RESET	SW: R When set, this bit indicates that tenure counter 2 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic
1	TC1_RESET	SW: R When set, this bit indicates that tenure counter 1 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic
0	TC0_RESET	SW: R When set, this bit indicates that tenure counter 0 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic

0x05203D04 FABRIC_MONITOR_IDLE_INTERNAL_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 0 to Master 15). A value of 1 indicates that the internally generated idle status is to be used to determine when to reset the performance monitor tenure counter results (resetting the tenure counter results is needed to compensate for errors due to enabling the tenure counters in the middle of traffic). A value of 0 will indicate that the primary idle input is to be used instead.

NOTE These settings will have an effect only in case of AXI master ports.

FABRIC_MONITOR_IDLE_INTERNAL_LOWER_REG

Bits	Name	Description
15	M15_PII	SW : RW 0x1: The internally generated idle status for Master 15 will be used by the performance monitor 0x0: Primary input I_AXI_M15_IDLE is used by the performance monitor
14	M14_PII	SW : RW 0x1: The internally generated idle status for Master 14 will be used by the performance monitor 0x0: Primary input I_AXI_M14_IDLE is used by the performance monitor
13	M13_PII	SW : RW 0x1: The internally generated idle status for Master 13 will be used by the performance monitor 0x0: Primary input I_AXI_M13_IDLE is used by the performance monitor
12	M12_PII	SW : RW 0x1: The internally generated idle status for Master 12 will be used by the performance monitor 0x0: Primary input I_AXI_M12_IDLE is used by the performance monitor
11	M11_PII	SW : RW 0x1: The internally generated idle status for Master 11 will be used by the performance monitor 0x0: Primary input I_AXI_M11_IDLE is used by the performance monitor
10	M10_PII	SW : RW 0x1: The internally generated idle status for Master 10 will be used by the performance monitor 0x0: Primary input I_AXI_M10_IDLE is used by the performance monitor
9	M9_PII	SW : RW 0x1: The internally generated idle status for Master 9 will be used by the performance monitor 0x0: Primary input I_AXI_M9_IDLE is used by the performance monitor

FABRIC_MONITOR_IDLE_INTERNAL_LOWER_REG (cont.)

Bits	Name	Description
8	M8_PII	SW : RW 0x1: The internally generated idle status for Master 8 will be used by the performance monitor 0x0: Primary input I_AXI_M8_IDLE is used by the performance monitor
7	M7_PII	SW : RW 0x1: The internally generated idle status for Master 7 will be used by the performance monitor 0x0: Primary input I_AXI_M7_IDLE is used by the performance monitor
6	M6_PII	SW : RW 0x1: The internally generated idle status for Master 6 will be used by the performance monitor 0x0: Primary input I_AXI_M6_IDLE is used by the performance monitor
5	M5_PII	SW : RW 0x1: The internally generated idle status for Master 5 will be used by the performance monitor 0x0: Primary input I_AXI_M5_IDLE is used by the performance monitor
4	M4_PII	SW : RW 0x1: The internally generated idle status for Master 4 will be used by the performance monitor 0x0: Primary input I_AXI_M4_IDLE is used by the performance monitor
3	M3_PII	SW : RW 0x1: The internally generated idle status for Master 3 will be used by the performance monitor 0x0: Primary input I_AXI_M3_IDLE is used by the performance monitor
2	M2_PII	SW : RW 0x1: The internally generated idle status for Master 2 will be used by the performance monitor 0x0: Primary input I_AXI_M2_IDLE is used by the performance monitor

0x05203D08 FABRIC_MONITOR_IDLE_INTERNAL_UPPER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 16 to Master 31). A value of 1 indicates that the internally generated idle status is to be used to determine when to reset the performance monitor tenure counter results (resetting the tenure counter results is needed to compensate for errors due to enabling the tenure counters in the middle of traffic). A value of 0 will indicate that the primary idle input is to be used instead.

NOTE These settings will have an effect only in case of AXI master ports.

FABRIC_MONITOR_IDLE_INTERNAL_UPPER_REG

Bits	Name	Description
31	M31_PII	SW : RW 0x1: The internally generated idle status for Master 31 will be used by the performance monitor 0x0: Primary input I_AXI_M31_IDLE is used by the performance monitor
30	M30_PII	SW : RW 0x1: The internally generated idle status for Master 30 will be used by the performance monitor 0x0: Primary input I_AXI_M30_IDLE is used by the performance monitor
29	M29_PII	SW : RW 0x1: The internally generated idle status for Master 29 will be used by the performance monitor 0x0: Primary input I_AXI_M29_IDLE is used by the performance monitor
28	M28_PII	SW : RW 0x1: The internally generated idle status for Master 28 will be used by the performance monitor 0x0: Primary input I_AXI_M28_IDLE is used by the performance monitor
27	M27_PII	SW : RW 0x1: The internally generated idle status for Master 27 will be used by the performance monitor 0x0: Primary input I_AXI_M27_IDLE is used by the performance monitor
26	M26_PII	SW : RW 0x1: The internally generated idle status for Master 26 will be used by the performance monitor 0x0: Primary input I_AXI_M26_IDLE is used by the performance monitor

FABRIC_MONITOR_IDLE_INTERNAL_UPPER_REG (cont.)

Bits	Name	Description
25	M25_PII	SW : RW 0x1: The internally generated idle status for Master 25 will be used by the performance monitor 0x0: Primary input I_AXI_M25_IDLE is used by the performance monitor
24	M24_PII	SW : RW 0x1: The internally generated idle status for Master 24 will be used by the performance monitor 0x0: Primary input I_AXI_M24_IDLE is used by the performance monitor
23	M23_PII	SW : RW 0x1: The internally generated idle status for Master 23 will be used by the performance monitor 0x0: Primary input I_AXI_M23_IDLE is used by the performance monitor
22	M22_PII	SW : RW 0x1: The internally generated idle status for Master 22 will be used by the performance monitor 0x0: Primary input I_AXI_M22_IDLE is used by the performance monitor
21	M21_PII	SW : RW 0x1: The internally generated idle status for Master 21 will be used by the performance monitor 0x0: Primary input I_AXI_M21_IDLE is used by the performance monitor

FABRIC_MONITOR_IDLE_INTERNAL_UPPER_REG (cont.)

Bits	Name	Description
16	M16_PII	SW : RW 0x1: The internally generated idle status for Master 16 will be used by the performance monitor 0x0: Primary input I_AXI_M16_IDLE is used by the performance monitor

0x05203D0C FABRIC_MONITOR_RTR_MASK_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains 1 bit for each of the tenure counters that controls the RTR assertion and clearing of the monitoring results pertaining to the associated tenure counter to account for errors due to starting the monitor in the middle of traffic. A value of 1 indicates that RTR will not be asserted.

FABRIC_MONITOR_RTR_MASK_REG

Bits	Name	Description
31:4	RESERVED_31_4	Reserved
3	RTR_MASK_3	SW : RW 0x1: No RTR will be asserted for Tenure Counter 3 0x0: The design is allowed to assert RTR for Tenure Counter 3
2	RTR_MASK_2	SW : RW 0x1: No RTR will be asserted for Tenure Counter 2 0x0: The design is allowed to assert RTR for Tenure Counter 2
1	RTR_MASK_1	SW : RW 0x1: No RTR will be asserted for Tenure Counter 1 0x0: The design is allowed to assert RTR for Tenure Counter 1
0	RTR_MASK_0	SW : RW 0x1: No RTR will be asserted for Tenure Counter 0 0x0: The design is allowed to assert RTR for Tenure Counter 0

0x05203D10 FABRIC_MASTER_SELECT_HYST_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 0 to Master 15). A value of 1 indicates that the hysteresis timer value is used to keep the master segmented clock on. A value of 0 indicates that the hysteresis timer will not be used in the master segmented clock on.

FABRIC_MASTER_SELECT_HYST_LOWER_REG

Bits	Name	Description
15	M15_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
14	M14_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
13	M13_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
12	M12_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
11	M11_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
10	M10_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
9	M9_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
8	M8_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
7	M7_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
6	M6_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.

FABRIC_MASTER_SELECT_HYST_LOWER_REG (cont.)

Bits	Name	Description
5	M5_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
4	M4_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
3	M3_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
2	M2_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
1	M1_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
0	M0_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.

0x05203D14 FABRIC_MASTER_SELECT_HYST_UPPER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 16to Master 31). A value of 1 indicates that the hysteresis timer value is used to keep the master segmented clock on. A value of 0 indicates that the hysteresis timer will not be used in the master segmented clock on.

FABRIC_MASTER_SELECT_HYST_UPPER_REG

Bits	Name	Description
15	M31_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.

FABRIC_MASTER_SELECT_HYST_UPPER_REG (cont.)

Bits	Name	Description
14	M30_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
13	M29_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
12	M28_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
11	M27_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
10	M26_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
9	M25_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
8	M24_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
7	M23_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.

1	M17_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
0	M16_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.

0x05203D18 FABRIC_MASTER_USE_CG_DISABLE_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 0 to Master 15). A value of 1 indicates that the FMCHR bit 15 can be used to always keep the master segmented clock on, hence disabling HW dynamic clock gating. A value of 0 indicates that the FMCHR bit cannot be used to disable HW dynamic clock gating.

FABRIC_MASTER_USE_CG_DISABLE_LOWER_REG

Bits	Name	Description
15	M15_USE_CG_DISABLE	SW : RW 0x1: FMCHR bit can be used to disable HW dynamic clock gating for master 15 0x0: FMCHR bit cannot be used to disable HW dynamic clock gating

FABRIC_MASTER_USE_CG_DISABLE_LOWER_REG (cont.)

Bits	Name	Description
14	M14_USE_CG_DISABLE	SW : RW 0x1: FMCHR bit can be used to disable HW dynamic clock gating for master 14 0x0: FMCHR bit cannot be used to disable HW dynamic clock gating
13	M13_USE_CG_DISABLE	SW : RW 0x1: FMCHR bit can be used to disable HW dynamic clock gating for master 13 0x0: FMCHR bit cannot be used to disable HW dynamic clock gating

0x05203D20 FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter0.

FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG0

Bits	Name	Description
15:0	RTENL0	SW : RW Contains the LSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked bytenure counter 0

0x05203D24 FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter0.

FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG0

Bits	Name	Description
15:0	RTENU0	SW : RW Contains the MSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 0

0x05203D28 FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter1.

FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG1

Bits	Name	Description
15:0	RTENL1	SW : RW Contains the LSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 1

0x05203D2C FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter1.

FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG1

Bits	Name	Description
15:0	RTENU1	SW : RW Contains the MSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 1

0x05203D30 FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter2.

FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG2

Bits	Name	Description
15:0	RTENL2	SW : RW Contains the LSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 2

0x05203D34 FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter2.

FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG2

Bits	Name	Description
15:0	RTENU2	SW : RW Contains the MSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 2

0x05203D38 FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter3.

FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG3

Bits	Name	Description
15:0	RTENL3	SW : RW Contains the LSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 3

0x05203D3C FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter3.

FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG3

Bits	Name	Description
15:0	RTENU3	SW : RW Contains the MSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 3

9.2 GSBI3 Registers (0x16200000 GSBI3_BASE)

This section contains the GSBI3 registers.

9.2.1 GSBI CTRL Registers

0x16200000 GSBI3_GSBI_CTRL_REG

Type: Read/write
Clock: HCLK
Reset State: 0x00000000

GSBI3_GSBI_CTRL_REG

Bits	Name	Description
15:12	RESERVED	reserved
11:8	WRAPPER_CTRL	This field has no predefined use. When a wrapper is constructed around one or more GSBIs there may be a need to configure it. E.g., to select which of several GSBIs will be connected to a particular I2S block. All bits of this field emerge from GSBI as output ports which can be used for any such configuration task.
7	RESERVED_7	Reserved. The host can write and read this field, but its state has no effect on anything.
6:4	PROTOCOL_CODE	This field controls which protocol, if any, is applied to the GSBI's four I/O ports Most codes assign a single protocol, but codes of "001" and "110" assigns I2C to two of the ports and UART (without flow control signals) or SIM to the other two. 0x0: Idle (null values are applied to all four GSBI I/Os) 0x1: I2C on 2 ports, SIM/R-UIM on other 2 0x2: I2C 0x3: SPI 0x4: UART with flow control (or IRDA) 0x5: SIM/R-UIM 0x6: I2C on 2 ports, UART (without HS flow ctrl on other 2) 0x7: Undefined
3:1	RESERVED_3_1	Reserved. The host can write and read this field, but its state has no effect on anything.
0	CRCI_MUX_CTRL	While this bit is low QUP CRCI ports are connected to the GSBI ports nominally for QUP and UART_DM CRCI ports are connected to the GSBI ports nominally for UART_DM. While this bit is high QUP CRCI ports are connected to the GSBI ports nominally for UART_DM and UART_DM CRCI ports are connected to nothing.

0x16200004 GSBI3_GSBI_DBG0_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI3_GSBI_DBG0_REG

Bits	Name	Description
1:0	GSBI_PLAY0	This field has no function beyond the fact that the ARM can write to it and read from it.

0x16200008 GSBI3_GSBI_DBG1_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI3_GSBI_DBG1_REG

Bits	Name	Description
1:0	GSBI_PLAY1	This field has no function beyond the fact that the ARM can write to it and read from it.

0x1620000C GSBI3_GSBI_DBG2_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI3_GSBI_DBG2_REG

Bits	Name	Description
1:0	GSBI_PLAY2	This field has no function beyond the fact that the ARM can write to it and read from it.

0x16200010 GSBI3_GSBI_DBG3_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI3_GSBI_DBG3_REG

1:0	GSBI_PLAY3	This field has no function beyond the fact that the ARM can write to it and read from it.

9.3 GSBI3 UART DM Registers (0x16240000 GSBI3_UART_DM_BASE)

This section contains the GSBI3 UART DM registers.

9.3.1 Write and read/write registers

0x16240000 GSBI3_UART_DM_MR1

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_MR1 register is the UART mode register 1. It is used, along with UART_DM_MR2, to configure the operational mode of the UART.

.

GSBI3_UART_DM_MR1

Bits	Name	Description
31:8	AUTO_RFR_LEVEL1	These bits are used, along with bits 5:0 (AUTO_RFR_LEVEL0) to program the level in the receive FIFO at which the RFR_N signal is de-asserted, if programmed to do so (see RX_RDY_CTL field of this register). The level counts the number of words inside the RX FIFO. It doesn't count the character that is being received (shift register) or characters in the packing buffer. This value is programmed from 1 to 2^RAM_ADDR_WIDTH. The RFR_N signal is de-asserted when the RX FIFO level (the number of characters remaining in the RX FIFO) is greater than the level that is programmed into this register. · Only RAM_ADDR_WIDTH +1:8 bits are generated.
7	RX_RDY_CTL	Setting (1) this bit enables the automatic ready-for-receiving (RFR_N) control for the receiver. RFR_N is turned off, or set (1), when a valid start bit is received and the channel FIFO is at the level programmed in bits 4 through 0 of this mode register. When the FIFO level falls back to the programmed level, the RFR_N signal is turned on, or clear (0). When this feature is off, the RFR_N signal can be used by normal signal port bit manipulation (see UART_DM_CR register).
6	CTS_CTL	When this bit is set(1), the transmitter checks the CTS_N input to determine whether to begin transmission of a new character. If CTS_N is low, the character is sent. Otherwise the transmitter continues marking until CTS_N goes low, then the next character is transmitted. A change on CTS_N during the transmission of a character has no effect on that character. When this bit is clear(0), the CTS_N input for the channel has no effect on the transmitter.

GSBI3_UART_DM_MR1 (cont.)

Bits	Name	Description
5:0	AUTO_RFR_LEVEL0	See the description of bit 8 (AUTO_RFR_LEVEL1).

0x16240004 GSBI3_UART_DM_MR2

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI3_UART_DM_MR2

Bits	Name	Description
9	RX_ERROR_CHAR_OFF	When this bit is asserted, characters with parity or framing errors don't enter RX FIFO. Otherwise they enter RX FIFO.
8	RX_BREAK_ZERO_CHAR_OFF	When this bit is asserted, the zero character received at rx_break doesn't enter RX FIFO. Otherwise it enters RX FIFO.
7	LOOPBACK	Internal use only
6	ERROR_MODE	This bit controls the operation of the two FIFO status bits for the channel (parity or framing error and received break). • When clear (0), the UART operates in character mode and the status bits apply only to the character at the top of the FIFO. • When set (1), the UART operates in block mode and both bits are the "OR" of the status for all previously received characters arriving after the last `reset error status' command was issued (see CR register).
5:4	BITS_PER_CHAR	These bits determine how many bits are transmitted or received per character, not including the start, stop, and parity bits. 0x0: 5 bits 0x1: 6 bits 0x2: 7 bits 0x3: 8 bits
3:2	STOP_BIT_LEN	This field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 9/16, 1, 1+ 9/16, and 2 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. 0x0: 0.563 (9/16 bit times) 0x1: 1.000 bit time 0x2: 1.563 (1+9/16 bit times) 0x3: 2.000 bit times

GSBI3_UART_DM_MR2 (cont.)

Bits	Name	Description
1:0	PARITY_MODE	These bits determine which parity mode is used. The user can select between odd, even, space, or no parity. 0x0: no parity 0x1: odd parity 0x2: even parity 0x3: space parity

0x16240008 GSBI3_UART_DM_CSR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_CSR register is the UART clock selection register. This register is used in conjunction with the UART M/N counter registers to determine the bit rate for the transmitter and receiver. The transmitter and receiver can be clocked at different rates.

The rates below are based on a uart_dm_clk rate of 1.8432 MHz (115.2 * 16).

Table 9-2 lists the hexadecimal values for the clock select field and the corresponding data rates.

Table 9-2 Hexadecimal values and data rates for clock select field

CLK SEL value	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Bit rate (b/sec)	75	150	300	600	1200	2400	3600	4800	7200	9600	14.4k	19.2k	28.8k	38.4k	57.6k	115.2k

GSBI3_UART_DM_CSR

Bits	Name	Description
7:4	UART_RX_CLK_SEL	Use the CLK SEL values in Table 28-12 to select the appropriate receive and transmit bit rates.
3:0	UART_TX_CLK_SEL	

0x16240070 GSBI3_UART_DM_TF

Type: Write
Clock: AHB_CLK
Reset State: Undefined

In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM TX FIFO.

GSBI3_UART_DM_TF

Bits	Name	Description
31:0	UART_TF	The UART_TF register is the UART transmit FIFO register. This register is used to access the channel transmit FIFO. If the FIFO is full at the time of writing, the character is lost and an interrupt is generated (see UART_DM_IMR register).

0x16240074 GSBI3_UART_DM_TF_2

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_TF_2

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x16240078 GSBI3_UART_DM_TF_3

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_TF_3

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x1624007C GSBI3_UART_DM_TF_4

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_TF_4

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x16240010 GSBI3_UART_DM_CR

Type: Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_CR register is the UART command register. This register is used to issue specific commands to the UART subsystem. This register is updated asynchronously.

CAUTION Do not reset the transmitter and disable it at the same time. Do not reset the receiver and disable it at the same time.

Table 9-3 UART DM commands

Value	Description	Result
0	Null command	Does nothing.
1	Reset receiver	Resets the receiver as if a hardware reset were issued. The receiver is disabled and the FIFO, packing buffer and shift registers are flushed.
2	Reset transmitter	Resets the transmitter as if a hardware reset were issued. The transmitter signal goes high (marking) and the FIFO, unpacking register and shift register are flushed.
3	Reset error status	Clears the overrun error and hunt char received status bits in both the character and block error modes. In the block error mode, it clears the error status and received break.
4	Reset break change interrupt	Clears the break change interrupt status bit.
5	Start break	Forces the transmitter signal low. The transmitter must be enabled. If the transmitter is busy, the break is started when all characters in the transmit FIFO and the transmit shift register have been completely sent.
6	Stop break	If executed while channel is breaking, this command causes the transmitter signal to go high. The signal remains high for at least one bit time before sending out a new character.
7	Reset CTS_N	Clears ISR bit 5.
8	Reset stale interrupt	Clears the stale interrupt.
9	Packet mode	Turns on the sample data mode, which causes the receiver to sample the receive data stream at 16 times the programmed baud rate. The data is sampled with the start of the start bit, or the first data bit, and continued until the marking state. To exit this state, write 1100 in the command field.
A	test_parity_on	Internal use only.
B	test_frame_on	Internal use only.
C	Mode reset	Turns off the sample data mode.
D	Set RFR_N	Asserts the ready for receiving signal (active low).
E	Reset RFR_N	De-asserts the ready for receiving signal.
F	uart_reset_int	Internal use only.

Table 9-3 UART DM commands

Value	Description	Result
10	Reset TX_ERROR	Clears TX_ERROR
11	Clear TX_DONE	Clears the TX_DONE interrupt (ISR bit 9)
12	Reset break start interrupt	Clears the break start interrupt status bit.
13	Reset break end interrupt	Clears the break end interrupt status bit.
14	Reset par_frame_err interrupt	Clears the par_frame_err interrupt status bit.

Table 9-4 UART DM commands

Value	Description	Result
0	Null command	Does nothing.
1	CR Protection Enable	Enables CR HW protection. When two consecutive writes to the CR are detected, the second write is delayed until the command of the first write is finished. The delay is done by de-asserting the AHB ready and this ensures that the first command completes and the second one will be executed right afterward.
2	CR Protection Disable	Disables CR HW protection. SW is responsible for managing delay between writes to the CR register.
3	Reset TX-Ready interrupt	Clears the TX_READY interrupt.
5	Enable Stale Event	Enables the `stale event' mechanism. .
6	Disable Stale Event	Disables the `stale event' mechanism.
4	SW Force Stale	Causes a `stale event' (even if `stale event' is disabled).
7	RESERVED	

GSBI3_UART_DM_CR

Bits	Name	Description
11	CHANNEL_COMMAND_MSB	This is the msb of the CHANNEL_COMMAND bit field.
10:8	GENERAL_COMMAND	Writing the appropriate value to these bits executes the commands that are listed in Table.
7:4	CHANNEL_COMMAND_LSB	Writing the appropriate value to these bits along with bit 11,executes the commands that are listed in Table 28-13.
3	UART_TX_DISABLE	This command terminates the operation of the transmitter after any character in the transmit shift register is sent.
2	UART_TX_EN	This command enables the operation of the transmitter.
1	UART_RX_DISABLE	This command immediately terminates the operation of the channel receiver and any incoming characters are lost. None of the receiver status bits are affected by this command and characters that are already in the receive FIFO remain there.

GSBI3_UART_DM_CR (cont.)

Bits	Name	Description
0	UART_RX_EN	This command enables the channel receiver.

0x16240014 GSBI3_UART_DM_IMR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IMR register is the UART interrupt mask register. This register is used to enable the corresponding functions in the UART_DM_ISR register. Setting (1) a bit in the UART_DM_IMR register causes an interrupt to be generated, if the corresponding bit in the UART_DM_ISR register is set. Clearing (0) a bit in the UART_DM_IMR register causes the setting of the corresponding bit in the UART_DM_ISR register to have no effect on the interrupt signal.

Bit 6 of the UART_DM_IMR register, CURRENT_CTS, is slightly different. If the current value of the CTS is one (1), no interrupt is generated. However, the user can use bit 6 in this register to mask the CTS value when reading the UART_DM_MISR register or as a general-purpose bit.

GSBI3_UART_DM_IMR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	This bit is asserted in the same condition at which PAR_FRAME_ERR status bit is asserted. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x14.
11	RXBREAK_END	This bit is set (1) if the end of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x13.
10	RXBREAK_START	This bit is set (1) if the start of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x12.
9	TX_DONE	This bit is used only in UIM/SIM_IF mode. Set (1) this bit when the last byte in the transmitter has been sent. This bit is generated only when SIM_GLUE_GEN generic equals 1.
8	TX_ERROR	Only used in UIM_IF mode. Set (1) this bit to indicate that there has been parity error during transmission. To clear the detection logic associated with this function, write CR[11;7:4]=0x10. This bit is generated only when SIM_GLUE_GEN generic equals 1.

GSBI3_UART_DM_IMR (cont.)

Bits	Name	Description
7	TX_READY	This bit, when set(1), indicates that: 1. TX FIFO is empty. 2. The value written in NO_CHARS_FOR_TX register equals the number of bytes written to the TX FIFO since the register was updated. **NOTE** There may be characters in the unpack buffer or in the shift register. This bit is cleared by issuing `clear TX ready' command (see UART_DM_CR register).
6	CURRENT_CTS	This bit indicates the current state of the CTS input. It never generates an interrupt.
5	DELTA_CTS	This bit, when set (1), indicates that the CTS input has changed states. To clear the detection logic associated with this function, write CR[7:4]=0x7.
4	RXLEV	This bit is set when a character is loaded into the receive FIFO that brings the total number of characters in the FIFO above the programmed watermark level in the FIFO watermark register (RFWR). This bit is cleared after enough characters have been read to bring the level equal to or below the programmed watermark level.
3	RXSTALE	This bit indicates that a `stale event' occurred. It is cleared by issuing a reset-stale command (see CR register).
2	RXBREAK_CHANGE	This bit is set (1) if the start or end of a break condition is detected. The logic associated with this condition is cleared (0) by writing CR[7:4]=0x4. A detected break is defined as an all-zeros character with an invalid stop bit AND LOW PARITY. The end of a break is defined as a mark condition (1) at least 1/2 bit width. A detected break occupies one position in the Rx FIFO.
1	RXHUNT	This bit is set (1) when an incoming character matches the value programmed into the UART_DM_HCR register. This condition is cleared (0) by issuing a reset error status command (CR[7:4]=0x3).
0	TXLEV	This bit is set (1) when a character which is transferred from the transmit FIFO to the transmit shift register brings the total number of characters in the FIFO below or equal to the programmed watermark level in the UART_DM_TFWR register. This bit is cleared (0) after enough characters have been written to the FIFO to bring the level above the programmed watermark level.

0x16240018 GSBI3_UART_DM_IPR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0xffffff9f

The UART_DM_IPR register is the UART interrupt programming register.

GSBI3_UART_DM_IPR

Bits	Name	Description
31:7	STALE_TIMEOUT_MSB	These bits are the STALE_TIMEOUT bit field. The stale character time-out duration field contains a number from 1 to 2^30 -1. This number determines how many character times must elapse before a `stale event' is generated. This character time is defined as 10 times the bit rate. It is reset whenever a data bit is received. Do not clear (0) this register if the stale character time-out interrupt is enabled. Note the discontinuity in the bit assignments.
6	SAMPLE_DATA	Setting (1) this bit enables the new sample data mode, which means that the start bit is sampled as well as the rest, when in sample data mode. See the CR register, CHANNEL_COMMAND bit for more information.
5	RESERVED	
4:0	STALE_TIMEOUT_LSB	This bit field is the LSbits of the STALE_TIMEOUT bitfield.

0x1624001C GSBI3_UART_DM_TFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_TFWR register is the UART transmit FIFO watermark register.

GSBI3_UART_DM_TFWR

Bits	Name	Description
31:0	TFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the transmit FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of TX words in the FIFO) is less than or equal to the value in TFWR. See UART_DM_IMR register. Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16240020 GSBI3_UART_DM_RFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RFWR register is the UART receive FIFO watermark register.

GSBI3_UART_DM_RFWR

Bits	Name	Description
31:0	RFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the receive FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of words in the RX FIFO) is greater than the value in RFWR. Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16240024 GSBI3_UART_DM_HCR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI3_UART_DM_HCR

Bits	Name	Description
7:0	DATA	The UART_DM_HCR register is the UART hunt character register, which contains the character for which the receiver looks to assert a hunt character received interrupt.

0x16240034 GSBI3_UART_DM_DMRX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI3_UART_DM_DMRX

Bits	Name	Description
24:0	RX_DM_CRCI_CHARS	In the DM mode, the number of chars in the Rx FIFO that are used for CRCI handshake with the DM. The written value of RX_DM_CRCI_ CHARS must be a multiple of 16(bits [3:0] are treated as 0x0). After a value is written, the UART will generate CRCI requests as long as RX_DM_CRCI_CHARS is non zero. Read of DMRX register gives the number of characters that were received since the end of the last transfer. It is reset at the end of each Rx transfer Also is used by the software to indicate `transfer initialization'.

0x16240038 GSBI3_UART_DM_IRDA

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IRDA register enables the IRDA function, selects a loopback, and allows inversion of RX and TX data. This register also controls the IRDA transceiver that optionally interfaces between the UART and the DP_RX_DATA and DP_TX_DATA pins.

The UART proper is a standard RX/TX configuration that converts the serial pin input and output lines to 8-bit data for the microprocessor. The configuration contains receive and transmit blocks, a control block, a bit rate generator for RX and TX, and FIFO interfaces with the microprocessor data bus. The IRDA register provides the means of switching IRDA circuits into the serial I/O lines and the IRDA function is normally switched out. The IRDA modulator/demodulator may be enabled or disabled under microprocessor control. When enabled, the RX and TX data pathis have individual inversion select bits, so external true or inverted drivers may be used in the signal path.

- The register is generated only when IRDA_IFC_GEN generic equals 1.

GSBI3_UART_DM_IRDA

Bits	Name	Description
4	MEDIUM_RATE_EN	• Set (1) for 1/4 bit-time pulse length (Medium rate) • Clear (0) for 3/16 bit-time pulse length (Low rate)
3	IRDA_LOOPBACK	This bit loops the IRDA modulated TX line back into the IRDA RX line. The normal UART loopback mode must be off in order to see this effect.
2	INVERT_IRDA_TX	This bit inverts the polarity of the IRDA modulated signal on the DP_TX_DATA pin. • Set (1) this bit for an inverted polarity. • Clear (0) this bit for a non-inverted polarity.
1	INVERT_IRDA_RX	This bit inverts the polarity of the IRDA received signal on the DP_RX_DATA pin. • Set (1) this bit for inverted the polarity. • Clear (0) this bit for non-inverted polarity.
0	IRDA_EN	• Set (1) this bit to enable the IRDA transceiver. • Clear (0) this bit to bypass the IRDA transceiver and ignore the other bits of this register.

0x1624003C GSBI3_UART_DM_DMEN

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_DMEN register indicates if Data Mover is enabled for TX and RX channels.

GSBI3_UART_DM_DMEN

Bits	Name	Description
1	RX_DM_EN	· Set (1) this bit to enable RX DM interface. · Clear (0) this bit to disable RX DM interface. Clearing this bit requires resetting the receiver (see UART_DM_CR register).
0	TX_DM_EN	Set (1) this bit to enable TX DM interface. Clear (0) this bit to disable TX DM interface.

0x16240040 GSBI3_UART_DM_NO_CHARS_FOR_TX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI3_UART_DM_NO_CHARS_FOR_TX

Bits	Name	Description
23:0	TX_TOTAL_TRANS_LEN	The total number of characters for transmission. Before writing a new value, the TX FIFO must be empty (as indicated by TX_READY interrupt in IMR register or after a reset). It is used by the transmitter to calculate how many characters to transmit in the last word. In DM mode, it is also used for the CRCI mechanism. Any additional writes to the TX FIFO above TX_TOTAL_TRANS_LEN will be discarded. A TX_READY interrupt is triggered after TX_TOTAL_TRANS_LEN number of characters were moved from the TX FIFO to the unpacking register (not all may have been sent).

0x16240044 GSBI3_UART_DM_BADR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_BADR

Bits	Name	Description
31:2	RX_BASE_ADDR	RX FIFO base address. Both FIFOs use the same RAM (2^RAM_ADDR_WIDTH, 32-bit entries). This register controls the division of the memory to the RX and TX FIFOs. The division is a multiple of 4 entries, since the DM's burst length is 4. The size of the TX FIFO equals RX_BASE_ADDR. The size of the RX FIFO is 2^RAM_ADDR_WIDTH - RX_BASE_ADDR. ® The default is RX_BASE_ADDR = 2^(RAM_ADDR_WIDTH - 1) ® Only RAM_ADDR_WIDTH -1:2 bits are generated.
1:0	UNUSED	

0x16240048 GSBI3_UART_DM_TESTSL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI3_UART_DM_TESTSL

Bits	Name	Description
4	TEST_EN	Test bus enable
3:0	TEST_SEL	Test bus selector

0x16240060 GSBI3_UART_DM_MISR_MODE

Type: Read/Write
Clock: WR_CLK

GSBI3_UART_DM_MISR_MODE

Bits	Name	Description
31:2	RESERVED	unused.
1:0	MODE	0x0: Disabled 0x1: Enabled,TX test 0x2: Enabled, RX test

0x16240064 GSBI3_UART_DM_MISR_RESET

Type: Write
Clock: WR_CLK
Reset State: Undefined

GSBI3_UART_DM_MISR_RESET

Bits	Name	Description
31:1	RESERVED	unused.
0	RESET	

0x16240068 GSBI3_UART_DM_MISR_EXPORT

Type: Read/Write
Clock: WR_CLK
Reset State: Undefined

GSBI3_UART_DM_MISR_EXPORT

Bits	Name	Description
31:1	RESERVED	unused.
0	EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., what is the result of the muxing of all the input data streams with <BLOCK>_TEST_MODE) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x1624006C GSBI3_UART_DM_MISR_VAL

Type: Read
Clock: WR_CLK
Reset State: Undefined

GSBI3_UART_DM_MISR_VAL

Bits	Name	Description
9:0	VAL	Current MISR state

0x16240080 GSBI3_UART_DM_SIM_CFG

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_SIM_CFG register is used to configure the SIM interface for the UART.

- The register is generated only when SIM_GLUE_GEN generic equals 1.

GSBI3_UART_DM_SIM_CFG

Bits	Name	Description
17	UIM_TX_MODE	When this bit is set (1), the transmission portion of the SIM interface operates in block mode (T=1). When clear (0), the transmission portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
16	UIM_RX_MODE	When this bit is set (1), the receive portion of the SIM interface operates in block mode (T=1). When clear (0), the receive portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
15:8	SIM_STOP_BIT_LEN	In UIM_IF mode, this field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 1 to 254 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. ..... 11 111110: 254 bit times 0x1: 1 bit times 0x2: 2 bit times
7	SIM_CLK_ON	When this bit is set(1), the UIM_CLK is turned on at either the TD8 or TD4 frequency, as indicated by bit6(UIM_CLK_TD8_SEL). When this bit is cleared, the UIM_CLK is stopped either LOW or HIGH, as indicated by bit 5(UIM_CLK_STOP_HIGH).
6	SIM_CLK_TD8_SEL	This bit selects the UIM_CLK frequency at which the UIM_CLK is turned on. 0x1: TD8 (the UIM_CLK runs at the TD8 frequency) 0x0: TD4 (the UIM_CLK runs at the TD4 frequency)
5	SIM_CLK_STOP_HIGH	This bit indicates at what point - high or low - the UIM_CLK will stop. 0x1: high 0x0: low
4	SIM_CLK_SEL	unused
3	MASK_RX	Setting (1) this bit masks off any 0 on the RX line, which prevents the receiver from seeing the START bit. Set (1) this bit if you do not want to receive the data you transmit.
2	SWAP_D	Setting (1) this bit causes the UIM_IF to swap the 8 data bits (making MSB into LSB, bit 6 into bit1, and so on) before it is read by the microprocessor.
1	INV_D	Set (1) this bit to cause the UIM_IF to invert the 8 data bit before it is read by the microprocessor.
0	SIM_SEL	Set (1) this bit to designate the UIM_IF mode of operation.

0x16240084 GSBI3_UART_DM_TEST_WR_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI3_UART_DM_TEST_WR_ADDR

Bits	Name	Description
31:0	TEST_WR_ADDR	RAM address at which to write the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16240088 GSBI3_UART_DM_TEST_WR_DATA

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_TEST_WR_DATA

Bits	Name	Description
31:0	TEST_WR_DATA	The test data to be written to the RAM. Write to this register triggers the write to the RAM, to TEST_WR_ADDR address.

0x1624008C GSBI3_UART_DM_TEST_RD_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI3_UART_DM_TEST_RD_ADDR

Bits	Name	Description
31:0	TEST_RD_ADDR	RAM address from which to read the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

9.3.2 Read registers

NOTE The addresses of the read-only registers are mapped into the same addresses of the four write-only registers in the section above this one. They are: UART_DM_CSR, UART_DM_TF, UART_DM_CR, and UART_DM_IMR, respectively.

0x16240008 GSBI3_UART_DM_SR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_SR register is the UART status register. This register is used to obtain the current state of the UART subsystem. This register is updated asynchronously.

GSBI3_UART_DM_SR

Bits	Name	Description
8	RX_BREAK_START_LAST	When break start is detected, this bit is set (1). When break end was detected, this bit is reset (0).
7	HUNT_CHAR	When set (1), this bit indicates that the programmed character in the UART_DM_HCR register was received. If programmed, this condition causes the RXHUNT bit to be set (1) in the UART_DM_ISR register. This bit is cleared by issuing a reset error status command.
6	RX_BREAK	When set (1), this bit indicates that an all-zero character of the programmed length was received without a stop bit. If a break begins in the middle of a character, it is detected if the condition remains until the end of the next character time. Only one all zero character is written into the FIFO upon receiving the break. After the RX input returns high for at least half a bit time, then more characters are accepted by the receiver. Whenever the break condition starts or stops as defined above, the RXBREAK bit is set (1) in the UART_DM_ISR register. This bit is appended to the character in the receive FIFO.
5	PAR_FRAME_ERR	A parity error occurs if parity is programmed to be checked and an incoming character is received with incorrect parity. A framing error occurs when the RX input is low while the stop bit is being sampled. This bit is sampled in the middle of the first stop bit position, regardless of the programmed length of the stop bit. This error bit is appended to the character in the receive FIFO.
4	UART_OVERRUN	An overrun error occurs if one or more incoming characters are lost. This happens when the receive FIFO is full, the packing buffer is full and another character has been received in the shift register. The character in the receive shift register is lost. Upon overrun, this status bit remains high until cleared by a reset error status command.
3	TXEMT	This bit is set (1) when the transmitter under-runs. It is set after the transmission of the stop bit at the end of a character, if there are no characters waiting to be sent. It is reset when a character is written to the transmit FIFO.
2	TXRDY	This bit indicates that the transmit FIFO has space in it. It is reset when the FIFO becomes full and set when space becomes available again. Any characters that are written to the FIFO while this bit is low is lost.

GSBI3_UART_DM_SR (cont.)

Bits	Name	Description
1	RXFULL	This bit is set (1) when the receive FIFO becomes full. It is reset when the CPU reads a word.
0	RXRDY	This bit is set (1) when there is a word in the receive FIFO waiting to be read. It is reset when the last word currently stored in the FIFO is read.

0x16240070 GSBI3_UART_DM_RF

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RF register is the UART receive FIFO register, which is used to access the channel receive FIFO. In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM RX FIFO.

GSBI3_UART_DM_RF

Bits	Name	Description
31:0	UART_RF	This register returns the next value in the receive FIFO. After the read is completed, the FIFO read pointer is updated to make the next character available.

0x16240074 GSBI3_UART_DM_RF_2

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_RF_2

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x16240078 GSBI3_UART_DM_RF_3

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_RF_3

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x1624007C GSBI3_UART_DM_RF_4

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_RF_4

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x16240010 GSBI3_UART_DM_MISR

Type: Read
Clock: AHB_CLK
Reset State: 0x0

GSBI3_UART_DM_MISR

Bits	Name	Description
12:0	UART_MISR	The UART_DM_MISR register is the masked interrupt status register. A read from this register returns the "AND" of the UART_DM_ISR and the UART_DM_IMR registers. This register is updated asynchronously. This bit field is misr <= (isr(12 DOWNTO 7) AND imr(12 DOWNTO 7)) & '0' & (isr(5 DOWNTO 0) AND imr(5 DOWNTO 0)).

0x16240014 GSBI3_UART_DM_ISR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_ISR register is the UART interrupt status register. This register provides the current status of the possible interrupt conditions. If one of these bits is set (1), and the corresponding bit in the UART_DM_IMR register is set (1), an interrupt is generated (with the exception of bit 6, CURRENT_CTS - see the description of the UART_DM_IMR register). If the corresponding bit in the UART_DM_IMR register is clear (0), setting one of these bits has no effect on the UART interrupt request signal. This register is updated asynchronously.

GSBI3_UART_DM_ISR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	See UART_DM_IMR on page 28-9
11	RXBREAK_END	See UART_DM_IMR on page 28-9
10	RXBREAK_START	See UART_DM_IMR on page 28-9
9	TX_DONE	Bit 9 generated only when SIM_GLUE_GEN generic equals 1
8	TX_ERROR	Bit 9 generated only when SIM_GLUE_GEN generic equals 1
7	TX_READY	See UART_DM_IMR on page 28-9, for descriptions of the UART_DM_ISR bits.
6	CURRENT_CTS	
5	DELTA_CTS	
4	RXLEV	
3	RXSTALE	
2	RXBREAK	
1	RXHUNT	
0	TXLEV	

0x16240038 GSBI3_UART_DM_RX_TOTAL_SNAP

Type: Read
Clock: AHB_CLK
Reset State: 0x0

GSBI3_UART_DM_RX_TOTAL_SNAP

Bits	Name	Description
23:0	RX_TOTAL_BYTES	'RX_TOTAL_SNAP register holds the number of characters received since the end of last Rx transfer. It is updated at the end of an Rx transfer. Rx transfer ends when one of the conditions is met: · The number of characters which were received since the end of the previous transfer equals the value which was written to DMRX at "Transfer initialization". · A stale event occurred (flush operation already performed if was needed).

0x1624004C GSBI3_UART_DM_TXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_TXFS

Bits	Name	Description
31:14	TX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bit field. · Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	TX_ASYNC_FIFO_STATE	TX asynchronous fifo status - number of characters in the TX asynchronous FIFO.
9:7	TX_BUFFER_STATE	TX unpacking buffer status - number of bytes in the unpacking buffer
6:0	TX_FIFO_STATE_LSB	TX FIFO status - number of words in the TX FIFO

0x16240050 GSBI3_UART_DM_RXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_RXFS

Bits	Name	Description
31:14	RX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bit field. Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	RX_ASYNC_FIFO_STATE	RX asynchronous fifo status - number of characters in the RX asynchronous FIFO.
9:7	RX_BUFFER_STATE	RX packing buffer status - number of bytes in the packing buffer
6:0	RX_FIFO_STATE_LSB	The number of entries in the RX FIFO that have at least one valid character. It is incremented each time a word is moved from the packing register to the RX FIFO. It is decremented each time a word is read from the RX FIFO. **NOTE** The Uart does not keep track of non-valid characters in each word.

0x16240090 GSBI3_UART_DM_TEST_RD_DATA

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI3_UART_DM_TEST_RD_DATA

Bits	Name	Description
31:0	TEST_RD_DATA	Read from this register triggers the read from the RAM. The register will hold, after read access, data which is found at TEST_RD_ADDR address in the RAM.

9.4 GSBI3 QUP Registers (0x16280000 QUP3_BASE)

This section contains the GSBI3 QUP registers.

0x16280000 GSBI3_QUP_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).

b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:

- N equals 8 or less - shift 24
- N equals 16 to 9 - shift 16
- N equals 24 to 17 - shift 8
- N equals 32 to 25 - no shift

The MINI_CORE clock selected is as follows:

Null: cc_qup_core_clk

SPI: cc_spi_master_clk

I2C: cc_I2C_clk		

GSBI3_QUP_CONFIG

Bits	Name	Description
31:14	RESERVED_1	reserved
13	CORE_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).
12	APP_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).

GSBI3_QUP_CONFIG (cont.)

Bits	Name	Description
11:8	MINI_CORE	value: 0000 Null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 I2C slave controller value: 0100 Reserved (I2C master & slave for loop back operation) value: 0101 Reserved (map to null core) value: 0110 Reserved (map to null core value: 0111 Reserved (map to null core) See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a "don't care". The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS _N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	RESERVED_2	Reserved.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x16280004 GSBI3_QUP_STATE

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000000XX100

GSBI3_QUP_STATE

Bits	Name	Description
31:5	RESERVED	reserved.
4	I2C_MAST_GEN	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.

GSBI3_QUP_STATE (cont.)

Bits	Name	Description
1:0	STATE	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to "01", the mini-core and related logic is released from reset and enters the RUN_STATE. When set to "11", the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete. See notes 1 and 2. Note 1: SPI - the "next appropriate point in time" is the next time SPI_CS _N de-asserts. If SPI_CS _N is not asserted when the PAUSE_STATE is entered, the SPI_CS _N is maintained in the not asserted state. The PAUSE_STATE is not available for SLAVE operation. Note 2: I2C -

0x16280008 GSBI3_QUP_IO_MODES

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b000000000000000_00000000XXXXXXXX

Unless otherwise stated, register bits written return the value when read.

Notes:

a. "Packing" occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. "Un-Packing" occurs as follows:

- N equals 8 or less - unpack four values from each QUP output FIFO word.
- N equals 16 to 9 - unpack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

GSBI3_QUP_IO_MODES

Bits	Name	Description
31:17	RESERVED	reserved
16	OUTPUT_BIT_SHIFT_EN	If set, enables the QUP output FIFO block to do bit shifting on the output data.

GSBI3_QUP_IO_MODES (cont.)

Bits	Name	Description
15	PACK_EN	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 6x BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode and Data_Mover_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16 BLOCK_SIZE
1:0	OUTPUT_BLOCK_SIZE	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x1628000C GSBI3_QUP_SW_RESET

Type: Write/cmd
Clock: CRIF_CLK
Reset State: 0x0000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero.

GSBI3_QUP_SW_RESET

Bits	Name	Description
31:0	RESERVED	NA

0x16280010 GSBI3_QUP_TIME_OUT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies if the QUP_MX_OUTPUT_COUNT register and/or QUP_MX_INPUT_COUNT register are enabled. Additionally, this register only applies to Block_Mode and Data_Mover_Mode. The timer starts "ticking" when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The timer pauses for the PAUSE_STATE. If the timer expires before the QUP_MX_OUTPUT_COUNT and/or QUP_MX_INPUT_COUNT are exhausted, then the TIME_OUT_ERR flag is set in the QUP_ERROR_FLAGS register and the interrupt gsbi_qup_irq may be asserted.

GSBI3_QUP_TIME_OUT

Bits	Name	Description
15:0	TIME_OUT_VALUE	Specifies time out value in units of cc_qup_app clock ticks. A value of zero indicates the timer function is not enabled for use. See QUP_CONFIG register for information on clocks.

0x16280014 GSBI3_QUP_TIME_OUT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI3_QUP_TIME_OUT_CURRENT

Bits	Name	Description
31:0	TIME_OUT_CURRENT	Current value of time-out counter.

0x16280018 GSBI3_QUP_OPERATIONAL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0080

GSBI3_QUP_OPERATIONAL

Bits	Name	Description
31:10	RESERVED_1	reserved.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Data_Mover_Mode.
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Data_Mover_Mode.
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowleges software has or will read the data. Valid only in all modes.
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowledges software has or will read the data. Valid only in all modes.
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.
3:0	RESERVED_2	reserved.

0x1628001C GSBI3_QUP_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

GSBI3_QUP_ERROR_FLAGS

Bits	Name	Description
31:7	RESERVED_1	reserved.
6	TIME_OUT_ERR	The time out limit for a given transfer has been reached.
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ER R	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.
1:0	RESERVED_2	reserved

0x16280020 GSBI3_QUP_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x007C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of gsbi_qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

GSBI3_QUP_ERROR_FLAGS_EN

Bits	Name	Description
31:7	RESERVED_1	reserved
6	TIME_OUT_ERR_EN	If set, enables time out error generation.
5	OUTPUT_OVER_RUN_ERR _EN	If set, enables output over run error generation.

GSBI3_QUP_ERROR_FLAGS_EN (cont.)

Bits	Name	Description
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.
1:0	RESERVED_2	reserved

0x16280024 GSBI3_QUP_TEST_CTRL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register enables QUP test bus to be actively driven by QUP core signals.

GSBI3_QUP_TEST_CTRL

Bits	Name	Description
31:1	RESERVED	reserved
0	QUP_TEST_BUS_EN	If set, enables QUP core to actively drive test bus. If zero, the core drives the test bus to all zeros.

9.4.1 QUP output FIFO registers

0x16280100 GSBI3_QUP_MX_OUTPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not effect the count.

Notes:

a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

GSBI3_QUP_MX_OUTPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_COUNT	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x16280104 GSBI3_QUP_MX_OUTPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI3_QUP_MX_OUTPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x16280108 GSBI3_QUP_OUTPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

This register holds the output data hanging out of the QUP output FIFO ready be loaded into the mini-core for the next load operation. This corresponds to signal qup_data_out going into the mini-core block.

GSBI3_QUP_OUTPUT_DEBUG

Bits	Name	Description
31:0	OUTPUT_DEBUG_DATA	Value waiting at the exit of output FIFO.

0x1628010C GSBI3_QUP_OUTPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the

value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

GSBI3_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	OUTPUT_FIFO_WORD_CNT	Number of words in the output FIFO.

0x16280110+4*c GSBI3_QUP_OUTPUT_FIFOc, c=[0..15]

Type: Write
Clock: CRIF_CLK
Reset State: 0x0000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

GSBI3_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x16280150 GSBI3_QUP_MX_WRITE_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the gsbi_qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

GSBI3_QUP_MX_WRITE_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_COUNT	The number of "writes" of size N. This is used only if the core is in FIFO_Mode.

0x16280154 GSBI3_QUP_MX_WRITE_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI3_QUP_MX_WRITE_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

9.4.2 QUP input FIFO registers

0x16280200 GSBI3_QUP_MX_INPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

GSBI3_QUP_MX_INPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_COUNT	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x16280204 GSBI3_QUP_MX_INPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI3_QUP_MX_INPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x16280208 GSBI3_QUP_MX_READ_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

GSBI3_QUP_MX_READ_COUNT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_COUNT	The number of "reads" of size N. This is used only if the core is in FIFO_Mode.

0x1628020C GSBI3_QUP_MX_READ_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI3_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x16280210 GSBI3_QUP_INPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the value of the last loaded in known-good-data into the QUP input FIFO. May be different from what the actual read of input FIFO will return because of packing enabled at the input side. This corresponds to signal qup_data_in coming from the mini-core block synchronized to the crif_clk.

GSBI3_QUP_INPUT_DEBUG

Bits	Name	Description
31:0	INPUT_DEBUG_DATA	Last known good value shifted into the input FIFO.

0x16280214 GSBI3_QUP_INPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

GSBI3_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

0x16280218+4*c GSBI3_QUP_INPUT_FIFOc, c=[0..15]

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

Consecutive reads to this address reads the input FIFO contents on a FIFO basis.The max address to read the input FIFO is 0x254.

GSBI3_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

9.4.3 SPI mini-core registers

0x16280300 GSBI3_SPI_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

GSBI3_SPI_CONFIG

Bits	Name	Description
31:11	RESERVED_1	Reserved.
10	HS_MODE	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
7:6	RESERVED_2	Reserved.
5	SLAVE_OPERATION	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.
4:0	RESERVED	Reserved.

0x16280304 GSBI3_SPI_IO_CONTROL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

GSBI3_SPI_IO_CONTROL

Bits	Name	Description
31:11	RESERVED	Reserved.
10	CLK_IDLE_HIGH	Use SPI_CLK_IDLE_HIGH when set.
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS _N respectively. Setting any of this bit to '1', makes the associated SPI_CS _N active HIGH. This field is a "don't care" in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_ N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a "don't care" in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS _N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS _N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x16280308 GSBI3_SPI_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

GSBI3_SPI_ERROR_FLAGS

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.

GSBI3_SPI_ERROR_FLAGS (cont.)

Bits	Name	Description
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x1628030C GSBI3_SPI_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0003

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

GSBI3_SPI_ERROR_FLAGS_EN

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x16280310 GSBI3_SPI_DEASSERT_WAIT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the de-assertion wait time of SPI_CS _N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

GSBI3_SPI_DEASSERT_WAIT

Bits	Name	Description
31:6	RESERVED	Reserved.

GSBI3_SPI_DEASSERT_WAIT (cont.)

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the de-asserted time of SPI_CS _N. Only applies to MASTER operation. For SLAVE operation, this field is a "don't care". A value of zero indicates SPI_CS _N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

9.4.4 I2C master mini-core registers

0x16280400 GSBI3_I2C_MASTER_CLK_CTL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_CLK_CTL register is a read/write register that controls clock divider values. This register should only be written to after it is confirmed that the I2C master mini-core is not longer in RESET state (QUP_STATE register).

GSBI3_I2C_MASTER_CLK_CTL

Bits	Name	Description
31:11	RESERVED	Reserved.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. The minimum value should be 3 hex (4 I2C_clk clocks per period) to ensure proper sampling of the bus. For a maximum high speed bit rate of 3.4 Mb/s (high speed mode), this would require a minimum 40.8 MHz I2C_clk clock. The maximum I2C_clk is 81.6 MHz. This register is reset to a maximum value of 7 hex. I2C_HS_CLK = I2C_CLK/(3*(HS_DIVIDER_VALUE+1)
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. The minimum value should be 3 hex to ensure proper sampling of the bus. For a maximum bit rate of 400 kb/s (fast mode), this would require a 4.8 MHz I2C_clk clock. For a maximum bit rate of 100 kb/s (standard mode), this would require a 1.2 MHz I2C_clk clock. Maximum I2C_clk for fast and standard modes are 206.4 MHz and 51.6 MHz respectively. This register is reset to a maximum value of 255 hex. I2C_FS_CLK = I2C_CLK/(2*(FS_DIVIDER_VALUE+3)

0x16280404 GSBI3_I2C_MASTER_STATUS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_STATUS is a status register. Writing a one clears the status bits.

GSBI3_I2C_MASTER_STATUS

Bits	Name	Description
31:26	RESERVED_1	Reserved.
25	INVALID_READ_SEQ	This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	This bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address).
23	INVALID_TAG	This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Reset, read_last_byte, mi_rec, dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: READ_LAST_BYTE_STATE Value 0x3: MI_REC_STATE Value 0x4: DEC_STATE Value 0x5: STORE_STATE
19:16	OUTPUT_FSM_STATE	This 4-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Reset, decode, send, mi_red, nop, nop_dec, invalid, invalid_dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: DECODE_STATE Value 0x3: SEND_STATE Value 0x4: MI_REC_STATE Value 0x5: NOP_STATE Value 0x6: INVALID_STATE Value 0x7: PEEK_STATE Value 0x8: SEND_R_STATE

GSBI3_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
15:13	CLK_STATE	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Reset_busidle, not_master, high, low, high_wait, forced_low, hs_addr_low or double_buffer_wait. Value 0x0: RESET_BUSIDLE_STATE Value 0x1: NOT_MASTER_STATE Value 0x2: HIGH_STATE Value 0x3: LOW_STATE Value 0x4: HIGH_WAIT_STATE Value 0x5: FORCED_LOW_STATE Value 0x6: HS_ADDR_LOW_STATE Value 0x7: DOUBLE_BUFFER_WAIT_STATE
12:10	DATA_STATE	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Reset, Tx addr, Tx HS addr, Tx 10-bit addr, Tx 2nd 10-bit addr byte, Tx data and Rx data. Value 0x0: RESET_WAIT_STATE Value 0x1: TX_ADDR_STATE Value 0x2: TX_DATA_STATE Value 0x3: TX_HS_ADDR_STATE Value 0x4: TX_10_BIT_ADDR_STATE Value 0x5: TX_2ND_BYTE_STATE Value 0x6: RX_DATA_STATE
9	BUS_MASTER	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.

GSBI3_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
4	ARB_LOST	This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.
3	PACKET_NACKED	This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1:0	RESERVED_2	Reserved.

9.5 GSBI4 Registers (0x16300000 GSBI4_BASE)

This section contains the GSBI4 registers.

9.5.1 GSBI CTRL Registers

0x16300000 GSBI4_GSBI_CTRL_REG

Type: Read/write
Clock: HCLK
Reset State: 0x00000000

GSBI4_GSBI_CTRL_REG

Bits	Name	Description
15:12	RESERVED	reserved
11:8	WRAPPER_CTRL	This field has no predefined use. When a wrapper is constructed around one or more GSBIs there may be a need to configure it. E.g., to select which of several GSBIs will be connected to a particular I2S block. All bits of this field emerge from GSBI as output ports which can be used for any such configuration task.
7	RESERVED_7	Reserved. The host can write and read this field, but its state has no effect on anything.
6:4	PROTOCOL_CODE	This field controls which protocol, if any, is applied to the GSBI's four I/O ports. Most codes assign a single protocol, but codes of "001" and "110" assigns I2C to two of the ports and UART (without flow control signals) or SIM to the other two. 0x0: Idle (null values are applied to all four GSBI I/Os) 0x1: I2C on 2 ports, SIM/R-UIM on other 2 0x2: I2C 0x3: SPI 0x4: UART with flow control (or IRDA) 0x5: SIM/R-UIM 0x6: I2C on 2 ports, UART (without HS flow ctrl on other 2) 0x7: Undefined
3:1	RESERVED_3_1	Reserved. The host can write and read this field, but its state has no effect on anything.
0	CRCI_MUX_CTRL	While this bit is low QUP CRCI ports are connected to the GSBI ports nominally for QUP and UART_DM CRCI ports are connected to the GSBI ports nominally for UART_DM. While this bit is high QUP CRCI ports are connected to the GSBI ports nominally for UART_DM and UART_DM CRCI ports are connected to nothing.

0x16300004 GSBI4_GSBI_DBG0_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI4_GSBI_DBG0_REG

Bits	Name	Description
1:0	GSBI_PLAY0	This field has no function beyond the fact that the ARM can write to it and read from it.

0x16300008 GSBI4_GSBI_DBG1_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI4_GSBI_DBG1_REG

Bits	Name	Description
1:0	GSBI_PLAY1	This field has no function beyond the fact that the ARM can write to it and read from it.

0x1630000C GSBI4_GSBI_DBG2_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI4_GSBI_DBG2_REG

Bits	Name	Description
1:0	GSBI_PLAY2	This field has no function beyond the fact that the ARM can write to it and read from it.

0x16300010 GSBI4_GSBI_DBG3_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI4_GSBI_DBG3_REG

Bits	Name	Description
1:0	GSBI_PLAY3	This field has no function beyond the fact that the ARM can write to it and read from it.

9.6 GSBI4 UART DM Registers (0x16340000 GSBI4_UART_DM_BASE)

This section contains the GSBI4 UART DM registers.

9.6.1 UART_DM registers

This section contains the read and write registers for UART1.

9.6.1.1 Write and read/write registers

0x16340000 GSBI4_UART_DM_MR1

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_MR1 register is the UART mode register 1. It is used, along with UART_DM_MR2, to configure the operational mode of the UART.

GSBI4_UART_DM_MR1

Bits	Name	Description
31:8	AUTO_RFR_LEVEL1	These bits are used, along with bits 5:0 (AUTO_RFR_LEVEL0) to program the level in the receive FIFO at which the RFR_N signal is de-asserted, if programmed to do so (see RX_RDY_CTL field of this register). The level counts the number of words inside the RX FIFO. It doesn't count the character that is being received (shift register) or characters in the packing buffer. This value is programmed from 1 to 2^RAM_ADDR_WIDTH. The RFR_N signal is de-asserted when the RX FIFO level (the number of characters remaining in the RX FIFO) is greater than the level that is programmed into this register. · Only RAM_ADDR_WIDTH +1:8 bits are generated.
7	RX_RDY_CTL	Setting (1) this bit enables the automatic ready-for-receiving (RFR_N) control for the receiver. RFR_N is turned off, or set (1), when a valid start bit is received and the channel FIFO is at the level programmed in bits 4 through 0 of this mode register. When the FIFO level falls back to the programmed level, the RFR_N signal is turned on, or clear (0). When this feature is off, the RFR_N signal can be used by normal signal port bit manipulation (see UART_DM_CR register).

GSBI4_UART_DM_MR1 (cont.)

Bits	Name	Description
6	CTS_CTL	When this bit is set(1), the transmitter checks the CTS_N input to determine whether to begin transmission of a new character. If CTS_N is low, the character is sent. Otherwise the transmitter continues marking until CTS_N goes low, then the next character is transmitted. A change on CTS_N during the transmission of a character has no effect on that character. When this bit is clear(0), the CTS_N input for the channel has no effect on the transmitter.
5:0	AUTO_RFR_LEVEL0	See the description of bit 8 (AUTO_RFR_LEVEL1).

0x16340004 GSBI4_UART_DM_MR2

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI4_UART_DM_MR2

Bits	Name	Description
9	RX_ERROR_CHAR_OFF	When this bit is asserted, characters with parity or framing errors don't enter RX FIFO. Otherwise they enter RX FIFO.
8	RX_BREAK_ZERO_CHAR_OFF	When this bit is asserted, the zero character received at rx_break doesn't enter RX FIFO. Otherwise it enters RX FIFO.
7	LOOPBACK	Internal use only
6	ERROR_MODE	This bit controls the operation of the two FIFO status bits for the channel (parity or framing error and received break). · When clear (0), the UART operates in character mode and the status bits apply only to the character at the top of the FIFO. · When set (1), the UART operates in block mode and both bits are the "OR" of the status for all previously received characters arriving after the last `reset error status' command was issued (see CR register).
5:4	BITS_PER_CHAR	These bits determine how many bits are transmitted or received per character, not including the start, stop, and parity bits. 0x0: 5 bits 0x1: 6 bits 0x2: 7 bits 0x3: 8 bits

GSBI4_UART_DM_MR2 (cont.)

Bits	Name	Description
3:2	STOP_BIT_LEN	This field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 9/16, 1, 1+ 9/16, and 2 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. 0x0: 0.563 (9/16 bit times) 0x1: 1.000 bit time 0x2: 1.563 (1+9/16 bit times) 0x3: 2.000 bit times
1:0	PARITY_MODE	These bits determine which parity mode is used. The user can select between odd, even, space, or no parity. 0x0: no parity 0x1: odd parity 0x2: even parity 0x3: space parity

0x16340008 GSBI4_UART_DM_CSR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_CSR register is the UART clock selection register. This register is used in conjunction with the UART M/N counter registers to determine the bit rate for the transmitter and receiver. The transmitter and receiver can be clocked at different rates.

The rates below are based on a uart_dm_clk rate of 1.8432 MHz (115.2 * 16).

Table 9-5 lists the hexadecimal values for the clock select field and the corresponding data rates.

Table 9-5 Hexadecimal values and data rates for clock select field

CLK SEL value	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Bit rate (b/sec)	75	150	300	600	1200	2400	3600	4800	7200	9600	14.4k	19.2k	28.8k	38.4k	57.6k	115.2k

GSBI4_UART_DM_CSR

Bits	Name	Description
7:4	UART_RX_CLK_SEL	Use the CLK SEL values in Table 28-12 to select the appropriate receive and transmit bit rates.
3:0	UART_TX_CLK_SEL	

0x16340070 GSBI4_UART_DM_TF

Type: Write
Clock: AHB_CLK
Reset State: Undefined

In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM TX FIFO.

GSBI4_UART_DM_TF

Bits	Name	Description
31:0	UART_TF	The UART_TF register is the UART transmit FIFO register. This register is used to access the channel transmit FIFO. If the FIFO is full at the time of writing, the character is lost and an interrupt is generated (see UART_DM_IMR register).

0x16340074 GSBI4_UART_DM_TF_2

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_TF_2

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x16340078 GSBI4_UART_DM_TF_3

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_TF_3

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x1634007C GSBI4_UART_DM_TF_4

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_TF_4

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x16340010 GSBI4_UART_DM_CR

Type: Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_CR register is the UART command register. This register is used to issue specific commands to the UART subsystem. This register is updated asynchronously.

CAUTION Do not reset the transmitter and disable it at the same time. Do not reset the receiver and disable it at the same time.

Table 9-6 UART DM commands

Value	Description	Result
0	Null command	Does nothing.
1	Reset receiver	Resets the receiver as if a hardware reset were issued. The receiver is disabled and the FIFO, packing buffer and shift registers are flushed.
2	Reset transmitter	Resets the transmitter as if a hardware reset were issued. The transmitter signal goes high (marking) and the FIFO, unpacking register and shift register are flushed.
3	Reset error status	Clears the overrun error and hunt char received status bits in both the character and block error modes. In the block error mode, it clears the error status and received break.
4	Reset break change interrupt	Clears the break change interrupt status bit.
5	Start break	Forces the transmitter signal low. The transmitter must be enabled. If the transmitter is busy, the break is started when all characters in the transmit FIFO and the transmit shift register have been completely sent.
6	Stop break	If executed while channel is breaking, this command causes the transmitter signal to go high. The signal remains high for at least one bit time before sending out a new character.
7	Reset CTS_N	Clears ISR bit 5.
8	Reset stale interrupt	Clears the stale interrupt.
9	Packet mode	Turns on the sample data mode, which causes the receiver to sample the receive data stream at 16 times the programmed baud rate. The data is sampled with the start of the start bit, or the first data bit, and continued until the marking state. To exit this state, write 1100 in the command field.
A	test_parity_on	Internal use only.

Table 9-6 UART DM commands

Value	Description	Result
B	test_frame_on	Internal use only.
C	Mode reset	Turns off the sample data mode.
D	Set RFR_N	Asserts the ready for receiving signal (active low).
E	Reset RFR_N	De-asserts the ready for receiving signal.
F	uart_reset_int	Internal use only.
10	Reset TX_ERROR	Clears TX_ERROR
11	Clear TX_DONE	Clears the TX_DONE interrupt (ISR bit 9)
12	Reset break start interrupt	Clears the break start interrupt status bit.
13	Reset break end interrupt	Clears the break end interrupt status bit.
14	Reset par_frame_err interrupt	Clears the par_frame_err interrupt status bit.

Table 9-7 UART DM command values

Value	Description	Result
0	Null command	Does nothing.
1	CR Protection Enable	Enables CR HW protection. When two consecutive writes to the CR are detected, the second write is delayed until the command of the first write is finished. The delay is done by de-asserting the AHB ready and this ensures that the first command completes and the second one will be executed right afterward.
2	CR Protection Disable	Disables CR HW protection. SW is responsible for managing delay between writes to the CR register.
3	Reset TX-Ready interrupt	Clears the TX_READY interrupt.
5	Enable Stale Event	Enables the `stale event' mechanism. See Software Procedures.
6	Disable Stale Event	Disables the `stale event' mechanism. See Software Procedures.
4	SW Force Stale	Causes a `stale event' (even if `stale event' is disabled). See Software Procedures.
7	RESERVED	

GSBI4_UART_DM_CR

Bits	Name	Description
11	CHANNEL_COMMAND_MSB	This is the msb of the CHANNEL_COMMAND bitfield.
10:8	GENERAL_COMMAND	Writing the appropriate value to these bits executes the commands that are listed in Table .
7:4	CHANNEL_COMMAND_LSB	Writing the appropriate value to these bits along with bit 11,executes the commands that are listed in Table 28-13.
3	UART_TX_DISABLE	This command terminates the operation of the transmitter after any character in the transmit shift register is sent.

GSBI4_UART_DM_CR (cont.)

Bits	Name	Description
2	UART_TX_EN	This command enables the operation of the transmitter.
1	UART_RX_DISABLE	This command immediately terminates the operation of the channel receiver and any incoming characters are lost. None of the receiver status bits are affected by this command and characters that are already in the receive FIFO remain there.
0	UART_RX_EN	This command enables the channel receiver.

0x16340014 GSBI4_UART_DM_IMR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IMR register is the UART interrupt mask register. This register is used to enable the corresponding functions in the UART_DM_ISR register. Setting (1) a bit in the UART_DM_IMR register causes an interrupt to be generated, if the corresponding bit in the UART_DM_ISR register is set. Clearing (0) a bit in the UART_DM_IMR register causes the setting of the corresponding bit in the UART_DM_ISR register to have no effect on the interrupt signal.

Bit 6 of the UART_DM_IMR register, CURRENT_CTS, is slightly different. If the current value of the CTS is one (1), no interrupt is generated. However, the user can use bit 6 in this register to mask the CTS value when reading the UART_DM_MISR register or as a general-purpose bit.

GSBI4_UART_DM_IMR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	This bit is asserted in the same condition at which PAR_FRAME_ERR status bit is asserted. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x14.
11	RXBREAK_END	This bit is set (1) if the end of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x13.
10	RXBREAK_START	This bit is set (1) if the start of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x12.
9	TX_DONE	This bit is used only in UIM/SIM_IF mode. Set (1) this bit when the last byte in the transmitter has been sent. This bit is generated only when SIM_GLUE_GEN generic equals 1.

GSBI4_UART_DM_IMR (cont.)

Bits	Name	Description
8	TX_ERROR	Only used in UIM_IF mode. Set (1) this bit to indicate that there has been parity error during transmission. To clear the detection logic associated with this function, write CR[11;7:4]=0x10. This bit is generated only when SIM_GLUE_GEN generic equals 1.
7	TX_READY	This bit, when set(1), indicates that: 1. TX FIFO is empty. 2. The value written in NO_CHARS_FOR_TX register equals the number of bytes written to the TX FIFO since the register was updated. **NOTE** There may be characters in the unpack buffer or in the shift register. This bit is cleared by issuing `clear TX ready' command (see UART_DM_CR register).
6	CURRENT_CTS	This bit indicates the current state of the CTS input. It never generates an interrupt.
5	DELTA_CTS	This bit, when set (1), indicates that the CTS input has changed states. To clear the detection logic associated with this function, write CR[7:4]=0x7.
4	RXLEV	This bit is set when a character is loaded into the receive FIFO that brings the total number of characters in the FIFO above the programmed watermark level in the FIFO watermark register (RFWR). This bit is cleared after enough characters have been read to bring the level equal to or below the programmed watermark level.
3	RXSTALE	This bit indicates that a `stale event' occurred. See Software procedures for the exact timing of this interrupt. It is cleared by issuing a reset-stale command (see CR register).
2	RXBREAK_CHANGE	This bit is set (1) if the start or end of a break condition is detected. The logic associated with this condition is cleared (0) by writing CR[7:4]=0x4. A detected break is defined as an all-zeros character with an invalid stop bit AND LOW PARITY. The end of a break is defined as a mark condition (1) at least 1/2 bit width. A detected break occupies one position in the Rx FIFO.
1	RXHUNT	This bit is set (1) when an incoming character matches the value programmed into the UART_DM_HCR register. This condition is cleared (0) by issuing a reset error status command (CR[7:4]=0x3).
0	TXLEV	This bit is set (1) when a character which is transferred from the transmit FIFO to the transmit shift register brings the total number of characters in the FIFO below or equal to the programmed watermark level in the UART_DM_TFWR register. This bit is cleared (0) after enough characters have been written to the FIFO to bring the level above the programmed watermark level.

0x16340018 GSBI4_UART_DM_IPR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0xffffff9f

The UART_DM_IPR register is the UART interrupt programming register.

GSBI4_UART_DM_IPR

Bits	Name	Description
31:7	STALE_TIMEOUT_MSB	These bits are the STALE_TIMEOUT bitfield. The stale character time-out duration field contains a number from 1 to 2^30 -1. This number determines how many character times must elapse before a `stale event' is generated. This character time is defined as 10 times the bit rate. It is reset whenever a data bit is received. Do not clear (0) this register if the stale character time-out interrupt is enabled. Note the discontinuity in the bit assignments.
6	SAMPLE_DATA	Setting (1) this bit enables the new sample data mode, which means that the start bit is sampled as well as the rest, when in sample data mode. See the CR register, CHANNEL_COMMAND bit for more information.
5	RESERVED	
4:0	STALE_TIMEOUT_LSB	This bitfield is the LSbits of the STALE_TIMEOUT bitfield.

0x1634001C GSBI4_UART_DM_TFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_TFWR register is the UART transmit FIFO watermark register.

GSBI4_UART_DM_TFWR

Bits	Name	Description
31:0	TFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the transmit FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of TX words in the FIFO) is less than or equal to the value in TFWR. See UART_DM_IMR register. Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16340020 GSBI4_UART_DM_RFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RFWR register is the UART receive FIFO watermark register.

GSBI4_UART_DM_RFWR

Bits	Name	Description
31:0	RFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the receive FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of words in the RX FIFO) is greater than the value in RFWR. Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16340024 GSBI4_UART_DM_HCR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI4_UART_DM_HCR

Bits	Name	Description
7:0	DATA	The UART_DM_HCR register is the UART hunt character register, which contains the character for which the receiver looks to assert a hunt character received interrupt.

0x16340034 GSBI4_UART_DM_DMRX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI4_UART_DM_DMRX

Bits	Name	Description
24:0	RX_DM_CRCI_CHARS	In the DM mode, the number of chars in the Rx FIFO that are used for CRCI handshake with the DM. The written value of RX_DM_CRCI_ CHARS must be a multiple of 16(bits [3:0] are treated as 0x0). After a value is written, the UART will generate CRCI requests as long as RX_DM_CRCI_CHARS is non zero. Read of DMRX register gives the number of characters that were received since the end of the last transfer. It is reset at the end of each Rx transfer Also is used by the software to indicate `transfer initialization'. See Software procedures.

0x16340038 GSBI4_UART_DM_IRDA

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IRDA register enables the IRDA function, selects a loopback, and allows inversion of RX and TX data. This register also controls the IRDA transceiver that optionally interfaces between the UART and the DP_RX_DATA and DP_TX_DATA pins.

The UART proper is a standard RX/TX configuration that converts the serial pin input and output lines to 8-bit data for the microprocessor. The configuration contains receive and transmit blocks, a control block, a bit rate generator for RX and TX, and FIFO interfaces with the microprocessor data bus. The IRDA register provides the means of switching IRDA circuits into the serial I/O lines and the IRDA function is normally switched out. The IRDA modulator/demodulator may be enabled or disabled under microprocessor control. When enabled, the RX and TX data pathis have individual inversion select bits, so external true or inverted drivers may be used in the signal path.

- The register is generated only when IRDA_IFC_GEN generic equals 1.

GSBI4_UART_DM_IRDA

Bits	Name	Description
4	MEDIUM_RATE_EN	Set (1) for 1/4 bit-time pulse length (Medium rate) Clear (0) for 3/16 bit-time pulse length (Low rate)
3	IRDA_LOOPBACK	This bit loops the IRDA modulated TX line back into the IRDA RX line. The normal UART loopback mode must be off in order to see this effect.
2	INVERT_IRDA_TX	This bit inverts the polarity of the IRDA modulated signal on the DP_TX_DATA pin. - Set (1) this bit for an inverted polarity. - Clear (0) this bit for a non-inverted polarity.

GSBI4_UART_DM_IRDA (cont.)

Bits	Name	Description
1	INVERT_IRDA_RX	This bit inverts the polarity of the IRDA received signal on the DP_RX_DATA pin. nSet (1) this bit for inverted the polarity. nClear (0) this bit for non-inverted polarity.
0	IRDA_EN	Set (1) this bit to enable the IRDA transceiver. Clear (0) this bit to bypass the IRDA transceiver and ignore the other bits of this register.

0x1634003C GSBI4_UART_DM_DMEN

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_DMEN register indicates if Data Mover is enabled for TX and RX channels.

GSBI4_UART_DM_DMEN

Bits	Name	Description
1	RX_DM_EN	Set (1) this bit to enable RX DM interface. Clear (0) this bit to disable RX DM interface. Clearing this bit requires resetting the receiver (see UART_DM_CR register).
0	TX_DM_EN	Set (1) this bit to enable TX DM interface. Clear (0) this bit to disable TX DM interface.

0x16340040 GSBI4_UART_DM_NO_CHARS_FOR_TX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI4_UART_DM_NO_CHARS_FOR_TX

Bits	Name	Description
23:0	TX_TOTAL_TRANS_LEN	The total number of characters for transmission. Before writing a new value, the TX FIFO must be empty (as indicated by TX_READY interrupt in IMR register or after a reset). It is used by the transmitter to calculate how many characters to transmit in the last word. In DM mode, it is also used for the CRCI mechanism. Any additional writes to the TX FIFO above TX_TOTAL_TRANS_LEN will be discarded. A TX_READY interrupt is triggered after TX_TOTAL_TRANS_LEN number of characters were moved from the TX FIFO to the unpacking register (not all may have been sent).

0x16340044 GSBI4_UART_DM_BADR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_BADR

Bits	Name	Description
31:2	RX_BASE_ADDR	RX FIFO base address. Both FIFOs use the same RAM (2^RAM_ADDR_WIDTH, 32-bit entries). This register controls the division of the memory to the RX and TX FIFOs. The division is a multiple of 4 entries, since the DM's burst length is 4. The size of the TX FIFO equals RX_BASE_ADDR. The size of the RX FIFO is 2^RAM_ADDR_WIDTH - RX_BASE_ADDR. ® The default is RX_BASE_ADDR = 2^(RAM_ADDR_WIDTH - 1) ® Only RAM_ADDR_WIDTH -1:2 bits are generated.
1:0	UNUSED	

0x16340048 GSBI4_UART_DM_TESTSL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI4_UART_DM_TESTSL

Bits	Name	Description
4	TEST_EN	Test bus enable
3:0	TEST_SEL	Test bus selector

0x16340060 GSBI4_UART_DM_MISR_MODE

Type: Read/Write
Clock: WR_CLK

GSBI4_UART_DM_MISR_MODE

Bits	Name	Description
31:2	RESERVED	unused.
1:0	MODE	0x0: Disabled 0x1: Enabled,TX test 0x2: Enabled, RX test

0x16340064 GSBI4_UART_DM_MISR_RESET

Type: Write
Clock: WR_CLK
Reset State: Undefined

GSBI4_UART_DM_MISR_RESET

Bits	Name	Description
31:1	RESERVED	unused.
0	RESET	

0x16340068 GSBI4_UART_DM_MISR_EXPORT

Type: Read/Write
Clock: WR_CLK
Reset State: Undefined

GSBI4_UART_DM_MISR_EXPORT

Bits	Name	Description
31:1	RESERVED	unused.
0	EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., what is the result of the muxing of all the input data streams with <BLOCK>_TEST_MODE) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x1634006C GSBI4_UART_DM_MISR_VAL

Type: Read
Clock: WR_CLK
Reset State: Undefined

GSBI4_UART_DM_MISR_VAL

Bits	Name	Description
9:0	VAL	Current MISR state

0x16340080 GSBI4_UART_DM_SIM_CFG

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_SIM_CFG register is used to configure the SIM interface for the UART.

- The register is generated only when SIM_GLUE_GEN generic equals 1.

GSBI4_UART_DM_SIM_CFG

Bits	Name	Description
17	UIM_TX_MODE	When this bit is set (1), the transmission portion of the SIM interface operates in block mode (T=1). When clear (0), the transmission portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
16	UIM_RX_MODE	When this bit is set (1), the receive portion of the SIM interface operates in block mode (T=1). When clear (0), the receive portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
15:8	SIM_STOP_BIT_LEN	In UIM_IF mode, this field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 1 to 254 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. ..... 11 111110: 254 bit times 0x1: 1 bit times 0x2: 2 bit times
7	SIM_CLK_ON	When this bit is set(1), the UIM_CLK is turned on at either the TD8 or TD4 frequency, as indicated by bit6(UIM_CLK_TD8_SEL). When this bit is cleared, the UIM_CLK is stopped either LOW or HIGH, as indicated by bit 5(UIM_CLK_STOP_HIGH).

GSBI4_UART_DM_SIM_CFG (cont.)

Bits	Name	Description
6	SIM_CLK_TD8_SEL	This bit selects the UIM_CLK frequency at which the UIM_CLK is turned on. 0x1: TD8 (the UIM_CLK runs at the TD8 frequency) 0x0: TD4 (the UIM_CLK runs at the TD4 frequency)
5	SIM_CLK_STOP_HIGH	This bit indicates at what point - high or low - the UIM_CLK will stop. 0x1: high 0x0: low
4	SIM_CLK_SEL	unused
3	MASK_RX	Setting (1) this bit masks off any 0 on the RX line, which prevents the receiver from seeing the START bit. Set (1) this bit if you do not want to receive the data you transmit.
2	SWAP_D	Setting (1) this bit causes the UIM_IF to swap the 8 data bits (making MSB into LSB, bit 6 into bit1, and so on) before it is read by the microprocessor.
1	INV_D	Set (1) this bit to cause the UIM_IF to invert the 8 data bit before it is read by the microprocessor.
0	SIM_SEL	Set (1) this bit to designate the UIM_IF mode of operation.

0x16340084 GSBI4_UART_DM_TEST_WR_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI4_UART_DM_TEST_WR_ADDR

Bits	Name	Description
31:0	TEST_WR_ADDR	RAM address at which to write the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16340088 GSBI4_UART_DM_TEST_WR_DATA

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_TEST_WR_DATA

Bits	Name	Description
31:0	TEST_WR_DATA	The test data to be written to the RAM. Write to this register triggers the write to the RAM, to TEST_WR_ADDR address.

0x1634008C GSBI4_UART_DM_TEST_RD_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI4_UART_DM_TEST_RD_ADDR

Bits	Name	Description
31:0	TEST_RD_ADDR	RAM address from which to read the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

9.6.1.2 Read registers

NOTE The addresses of the read-only registers are mapped into the same addresses of the four write-only registers in the section above this one. They are: UART_DM_CSR, UART_DM_TF, UART_DM_CR, and UART_DM_IMR, respectively.

0x16340008 GSBI4_UART_DM_SR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_SR register is the UART status register. This register is used to obtain the current state of the UART subsystem. This register is updated asynchronously.

GSBI4_UART_DM_SR

Bits	Name	Description
8	RX_BREAK_START_LAST	When break start is detected, this bit is set (1). When break end was detected, this bit is reset (0).
7	HUNT_CHAR	When set (1), this bit indicates that the programmed character in the UART_DM_HCR register was received. If programmed, this condition causes the RXHUNT bit to be set (1) in the UART_DM_ISR register. This bit is cleared by issuing a reset error status command.
6	RX_BREAK	When set (1), this bit indicates that an all-zero character of the programmed length was received without a stop bit. If a break begins in the middle of a character, it is detected if the condition remains until the end of the next character time. Only one all zero character is written into the FIFO upon receiving the break. After the RX input returns high for at least half a bit time, then more characters are accepted by the receiver. Whenever the break condition starts or stops as defined above, the RXBREAK bit is set (1) in the UART_DM_ISR register. This bit is appended to the character in the receive FIFO.

GSBI4_UART_DM_SR (cont.)

Bits	Name	Description
5	PAR_FRAME_ERR	A parity error occurs if parity is programmed to be checked and an incoming character is received with incorrect parity. A framing error occurs when the RX input is low while the stop bit is being sampled. This bit is sampled in the middle of the first stop bit position, regardless of the programmed length of the stop bit. This error bit is appended to the character in the receive FIFO.
4	UART_OVERRUN	An overrun error occurs if one or more incoming characters are lost. This happens when the receive FIFO is full, the packing buffer is full and another character has been received in the shift register. The character in the receive shift register is lost. Upon overrun, this status bit remains high until cleared by a reset error status command.
3	TXEMT	This bit is set (1) when the transmitter under-runs. It is set after the transmission of the stop bit at the end of a character, if there are no characters waiting to be sent. It is reset when a character is written to the transmit FIFO.
2	TXRDY	This bit indicates that the transmit FIFO has space in it. It is reset when the FIFO becomes full and set when space becomes available again. Any characters that are written to the FIFO while this bit is low is lost.
1	RXFULL	This bit is set (1) when the receive FIFO becomes full. It is reset when the CPU reads a word.
0	RXRDY	This bit is set (1) when there is a word in the receive FIFO waiting to be read. It is reset when the last word currently stored in the FIFO is read.

0x16340070 GSBI4_UART_DM_RF

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RF register is the UART receive FIFO register, which is used to access the channel receive FIFO. In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM RX FIFO.

GSBI4_UART_DM_RF

Bits	Name	Description
31:0	UART_RF	This register returns the next value in the receive FIFO. After the read is completed, the FIFO read pointer is updated to make the next character available.

0x16340074 GSBI4_UART_DM_RF_2

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_RF_2

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x16340078 GSBI4_UART_DM_RF_3

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_RF_3

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x1634007C GSBI4_UART_DM_RF_4

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_RF_4

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x16340010 GSBI4_UART_DM_MISR

Type: Read
Clock: AHB_CLK
Reset State: 0x0

GSBI4_UART_DM_MISR

Bits	Name	Description
12:0	UART_MISR	The UART_DM_MISR register is the masked interrupt status register. A read from this register returns the "AND" of the UART_DM_ISR and the UART_DM_IMR registers. This register is updated asynchronously. This bit field is misr <= (isr(12 DOWNTO 7) AND imr(12 DOWNTO 7)) & '0' & (isr(5 DOWNTO 0) AND imr(5 DOWNTO 0)).

0x16340014 GSBI4_UART_DM_ISR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_ISR register is the UART interrupt status register. This register provides the current status of the possible interrupt conditions. If one of these bits is set (1), and the corresponding bit in the UART_DM_IMR register is set (1), an interrupt is generated (with the exception of bit 6, CURRENT_CTS - see the description of the UART_DM_IMR register). If the corresponding bit in the UART_DM_IMR register is clear (0), setting one of these bits has no effect on the UART interrupt request signal. This register is updated asynchronously.

GSBI4_UART_DM_ISR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	· See UART_DM_IMR on page 28-9
11	RXBREAK_END	· See UART_DM_IMR on page 28-9
10	RXBREAK_START	· See UART_DM_IMR on page 28-9
9	TX_DONE	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
8	TX_ERROR	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
7	TX_READY	See UART_DM_IMR on page 28-9, for descriptions of the UART_DM_ISR bits.

3	RXSTALE	
2	RXBREAK	
1	RXHUNT	
0	TXLEV	

0x16340038 GSBI4_UART_DM_RX_TOTAL_SNAP

Type: Read
Clock: AHB_CLK
Reset State: 0x0

GSBI4_UART_DM_RX_TOTAL_SNAP

Bits	Name	Description
23:0	RX_TOTAL_BYTES	'RX_TOTAL_SNAP register holds the number of characters received since the end of last Rx transfer. It is updated at the end of an Rx transfer (see Software procedures). Rx transfer ends when one of the conditions is met: · The number of characters which were received since the end of the previous transfer equals the value which was written to DMRX at "Transfer initialization". · A stale event occurred (flush operation already performed if was needed).

0x1634004C GSBI4_UART_DM_TXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_TXFS

Bits	Name	Description
31:14	TX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. · Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	TX_ASYNC_FIFO_STATE	TX asynchronous fifo status - number of characters in the TX asynchronous FIFO.
9:7	TX_BUFFER_STATE	TX unpacking buffer status - number of bytes in the unpacking buffer
6:0	TX_FIFO_STATE_LSB	TX FIFO status - number of words in the TX FIFO

0x16340050 GSBI4_UART_DM_RXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_RXFS

Bits	Name	Description
31:14	RX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	RX_ASYNC_FIFO_STATE	RX asynchronous fifo status - number of characters in the RX asynchronous FIFO.
9:7	RX_BUFFER_STATE	RX packing buffer status - number of bytes in the packing buffer
6:0	RX_FIFO_STATE_LSB	The number of entries in the RX FIFO that have at least one valid character. It is incremented each time a word is moved from the packing register to the RX FIFO. It is decremented each time a word is read from the RX FIFO. **NOTE** The Uart does not keep track of non-valid characters in each word. (See Software procedures).

0x16340090 GSBI4_UART_DM_TEST_RD_DATA

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI4_UART_DM_TEST_RD_DATA

Bits	Name	Description
31:0	TEST_RD_DATA	Read from this register triggers the read from the RAM. The register will hold, after read access, data which is found at TEST_RD_ADDR address in the RAM.

9.7 GSBI4 QUP Registers (0x16380000 QUP4_BASE)

This section contains the GSBI4 QUP registers.

0x16380000 GSBI4_QUP_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).

b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:

- N equals 8 or less - shift 24
- N equals 16 to 9 - shift 16
- N equals 24 to 17 - shift 8
- N equals 32 to 25 - no shift

The MINI_CORE clock selected is as follows:

Null: cc_qup_core_clk

SPI: cc_spi_master_clk

I2C: cc_I2C_clk		

GSBI4_QUP_CONFIG

Bits	Name	Description
31:14	RESERVED_1	reserved
13	CORE_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).
12	APP_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).

GSBI4_QUP_CONFIG (cont.)

Bits	Name	Description
11:8	MINI_CORE	value: 0000 Null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 I2C slave controller value: 0100 Reserved (I2C master & slave for loop back operation) value: 0101 Reserved (map to null core) value: 0110 Reserved (map to null core value: 0111 Reserved (map to null core) See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a "don't care". The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS _N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	RESERVED_2	Reserved.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x16380004 GSBI4_QUP_STATE

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000000XX100

GSBI4_QUP_STATE

Bits	Name	Description
31:5	RESERVED	reserved.
4	I2C_MAST_GEN	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.

GSBI4_QUP_STATE (cont.)

Bits	Name	Description
1:0	STATE	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to "01", the mini-core and related logic is released from reset and enters the RUN_STATE. When set to "11", the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete. . See notes 1 and 2. Note 1: SPI - the "next appropriate point in time" is the next time SPI_CS _N de-asserts. If SPI_CS _N is not asserted when the PAUSE_STATE is entered, the SPI_CS _N is maintained in the not asserted state. The PAUSE_STATE is not available for SLAVE operation. Note 2: I2C -

0x16380008 GSBI4_QUP_IO_MODES

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b000000000000000_00000000XXXXXXXX

Unless otherwise stated, register bits written return the value when read.

Notes:

a. "Packing" occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. "Un-Packing" occurs as follows:

- N equals 8 or less - un-pack four values from each QUP output FIFO word.
- N equals 16 to 9 - un-pack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

GSBI4_QUP_IO_MODES

Bits	Name	Description
31:17	RESERVED	reserved
16	OUTPUT_BIT_SHIFT_EN	If set, enables the QUP output FIFO block to do bit shifting on the output data.

GSBI4_QUP_IO_MODES (cont.)

Bits	Name	Description
15	PACK_EN	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 6x BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode and Data_Mover_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16 BLOCK_SIZE
1:0	OUTPUT_BLOCK_SIZE	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x1638000C GSBI4_QUP_SW_RESET

Type: Write/cmd
Clock: CRIF_CLK
Reset State: 0x0000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero.

GSBI4_QUP_SW_RESET

Bits	Name	Description
31:0	RESERVED	NA

0x16380010 GSBI4_QUP_TIME_OUT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies if the QUP_MX_OUTPUT_COUNT register and/or QUP_MX_INPUT_COUNT register are enabled. Additionally, this register only applies to Block_Mode and Data_Mover_Mode. The timer starts "ticking" when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The timer pauses for the PAUSE_STATE. If the timer expires before the QUP_MX_OUTPUT_COUNT and/or QUP_MX_INPUT_COUNT are exhausted, then the TIME_OUT_ERR flag is set in the QUP_ERROR_FLAGS register and the interrupt gsbi_qup_irq may be asserted.

GSBI4_QUP_TIME_OUT

Bits	Name	Description
15:0	TIME_OUT_VALUE	Specifies time out value in units of cc_qup_app clock ticks. A value of zero indicates the timer function is not enabled for use. See QUP_CONFIG register for information on clocks.

0x16380014 GSBI4_QUP_TIME_OUT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI4_QUP_TIME_OUT_CURRENT

Bits	Name	Description
31:0	TIME_OUT_CURRENT	Current value of time-out counter.

0x16380018 GSBI4_QUP_OPERATIONAL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0080

GSBI4_QUP_OPERATIONAL

Bits	Name	Description
31:10	RESERVED_1	reserved.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Data_Mover_Mode.
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Data_Mover_Mode.
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowleges software has or will read the data. Valid only in all modes.
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowledges software has or will read the data. Valid only in all modes.
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.
3:0	RESERVED_2	reserved.

0x1638001C GSBI4_QUP_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

GSBI4_QUP_ERROR_FLAGS

Bits	Name	Description
31:7	RESERVED_1	reserved.
6	TIME_OUT_ERR	The time out limit for a given transfer has been reached.
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ER R	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.
1:0	RESERVED_2	reserved

0x16380020 GSBI4_QUP_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x007C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of gsbi_qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

GSBI4_QUP_ERROR_FLAGS_EN

Bits	Name	Description
31:7	RESERVED_1	reserved
6	TIME_OUT_ERR_EN	If set, enables time out error generation.
5	OUTPUT_OVER_RUN_ERR _EN	If set, enables output over run error generation.

GSBI4_QUP_ERROR_FLAGS_EN (cont.)

Bits	Name	Description
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.
1:0	RESERVED_2	reserved

0x16380024 GSBI4_QUP_TEST_CTRL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register enables QUP test bus to be actively driven by QUP core signals.

GSBI4_QUP_TEST_CTRL

Bits	Name	Description
31:1	RESERVED	reserved
0	QUP_TEST_BUS_EN	If set, enables QUP core to actively drive test bus. If zero, the core drives the test bus to all zeros.

9.7.1 QUP output FIFO registers

0x16380100 GSBI4_QUP_MX_OUTPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not effect the count.

Notes:

a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

GSBI4_QUP_MX_OUTPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_COUNT	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x16380104 GSBI4_QUP_MX_OUTPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI4_QUP_MX_OUTPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x16380108 GSBI4_QUP_OUTPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

This register holds the output data hanging out of the QUP output FIFO ready be loaded into the mini-core for the next load operation. This corresponds to signal qup_data_out going into the mini-core block.

GSBI4_QUP_OUTPUT_DEBUG

Bits	Name	Description
31:0	OUTPUT_DEBUG_DATA	Value waiting at the exit of output FIFO.

0x1638010C GSBI4_QUP_OUTPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the

value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

GSBI4_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	OUTPUT_FIFO_WORD_CNT	Number of words in the output FIFO.

0x16380110+4*c GSBI4_QUP_OUTPUT_FIFOc, c=[0..15]

Type: Write
Clock: CRIF_CLK
Reset State: 0x0000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

GSBI4_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x16380150 GSBI4_QUP_MX_WRITE_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the gsbi_qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

GSBI4_QUP_MX_WRITE_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_COUNT	The number of "writes" of size N. This is used only if the core is in FIFO_Mode.

0x16380154 GSBI4_QUP_MX_WRITE_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI4_QUP_MX_WRITE_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

9.7.2 QUP input FIFO registers

0x16380200 GSBI4_QUP_MX_INPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

GSBI4_QUP_MX_INPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_COUNT	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x16380204 GSBI4_QUP_MX_INPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI4_QUP_MX_INPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x16380208 GSBI4_QUP_MX_READ_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

GSBI4_QUP_MX_READ_COUNT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_COUNT	The number of "reads" of size N. This is used only if the core is in FIFO_Mode.

0x1638020C GSBI4_QUP_MX_READ_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI4_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x16380210 GSBI4_QUP_INPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the value of the last loaded in known-good-data into the QUP input FIFO. May be different from what the actual read of input FIFO will return because of packing enabled at the input side. This corresponds to signal qup_data_in coming from the mini-core block synchronized to the crif_clk.

GSBI4_QUP_INPUT_DEBUG

Bits	Name	Description
31:0	INPUT_DEBUG_DATA	Last known good value shifted into the input FIFO.

0x16380214 GSBI4_QUP_INPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

GSBI4_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

0x16380218+4*c GSBI4_QUP_INPUT_FIFOc, c=[0..15]

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

Consecutive reads to this address reads the input FIFO contents on a FIFO basis.The max address to read the input FIFO is 0x254.

GSBI4_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

9.7.3 SPI mini-core registers

0x16380300 GSBI4_SPI_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

GSBI4_SPI_CONFIG

Bits	Name	Description
31:11	RESERVED_1	Reserved.
10	HS_MODE	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
7:6	RESERVED_2	Reserved.
5	SLAVE_OPERATION	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.
4:0	RESERVED	Reserved.

0x16380304 GSBI4_SPI_IO_CONTROL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

GSBI4_SPI_IO_CONTROL

Bits	Name	Description
31:11	RESERVED	Reserved.
10	CLK_IDLE_HIGH	Use SPI_CLK_IDLE_HIGH when set.
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS _N respectively. Setting any of this bit to '1', makes the associated SPI_CS _N active HIGH. This field is a "don't care" in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_ N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a "don't care" in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS _N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS _N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x16380308 GSBI4_SPI_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

GSBI4_SPI_ERROR_FLAGS

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.

GSBI4_SPI_ERROR_FLAGS (cont.)

Bits	Name	Description
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x1638030C GSBI4_SPI_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0003

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

GSBI4_SPI_ERROR_FLAGS_EN

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x16380310 GSBI4_SPI_DEASSERT_WAIT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the de-assertion wait time of SPI_CS _N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

GSBI4_SPI_DEASSERT_WAIT

Bits	Name	Description
31:6	RESERVED	Reserved.

GSBI4_SPI_DEASSERT_WAIT (cont.)

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the de-asserted time of SPI_CS _N. Only applies to MASTER operation. For SLAVE operation, this field is a "don't care". A value of zero indicates SPI_CS _N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

9.7.4 I2C master mini-core registers

0x16380400 GSBI4_I2C_MASTER_CLK_CTL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_CLK_CTL register is a read/write register that controls clock divider values. This register should only be written to after it is confirmed that the I2C master mini-core is not longer in RESET state (QUP_STATE register).

GSBI4_I2C_MASTER_CLK_CTL

Bits	Name	Description
31:11	RESERVED	Reserved.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. The minimum value should be 3 hex (4 I2C_clk clocks per period) to ensure proper sampling of the bus. For a maximum high speed bit rate of 3.4 Mb/s (high speed mode), this would require a minimum 40.8 MHz I2C_clk clock. The maximum I2C_clk is 81.6 MHz. This register is reset to a maximum value of 7 hex. I2C_HS_CLK = I2C_CLK/(3*(HS_DIVIDER_VALUE+1)
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. The minimum value should be 3 hex to ensure proper sampling of the bus. For a maximum bit rate of 400 kb/s (fast mode), this would require a 4.8 MHz I2C_clk clock. For a maximum bit rate of 100 kb/s (standard mode), this would require a 1.2 MHz I2C_clk clock. Maximum I2C_clk for fast and standard modes are 206.4 MHz and 51.6 MHz respectively. This register is reset to a maximum value of 255 hex. I2C_FS_CLK = I2C_CLK/(2*(FS_DIVIDER_VALUE+3)

0x16380404 GSBI4_I2C_MASTER_STATUS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_STATUS is a status register. Writing a one clears the status bits.

GSBI4_I2C_MASTER_STATUS

Bits	Name	Description
31:26	RESERVED_1	Reserved.
25	INVALID_READ_SEQ	This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	This bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address).
23	INVALID_TAG	This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Reset, read_last_byte, mi_rec, dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: READ_LAST_BYTE_STATE Value 0x3: MI_REC_STATE Value 0x4: DEC_STATE Value 0x5: STORE_STATE
19:16	OUTPUT_FSM_STATE	This 4-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Reset, decode, send, mi_red, nop, nop_dec, invalid, invalid_dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: DECODE_STATE Value 0x3: SEND_STATE Value 0x4: MI_REC_STATE Value 0x5: NOP_STATE Value 0x6: INVALID_STATE Value 0x7: PEEK_STATE Value 0x8: SEND_R_STATE

GSBI4_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
15:13	CLK_STATE	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Reset_busidle, not_master, high, low, high_wait, forced_low, hs_addr_low or double_buffer_wait. Value 0x0: RESET_BUSIDLE_STATE Value 0x1: NOT_MASTER_STATE Value 0x2: HIGH_STATE Value 0x3: LOW_STATE Value 0x4: HIGH_WAIT_STATE Value 0x5: FORCED_LOW_STATE Value 0x6: HS_ADDR_LOW_STATE Value 0x7: DOUBLE_BUFFER_WAIT_STATE
12:10	DATA_STATE	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Reset, Tx addr, Tx HS addr, Tx 10-bit addr, Tx 2nd 10-bit addr byte, Tx data and Rx data. Value 0x0: RESET_WAIT_STATE Value 0x1: TX_ADDR_STATE Value 0x2: TX_DATA_STATE Value 0x3: TX_HS_ADDR_STATE Value 0x4: TX_10_BIT_ADDR_STATE Value 0x5: TX_2ND_BYTE_STATE Value 0x6: RX_DATA_STATE
9	BUS_MASTER	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.

GSBI4_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
4	ARB_LOST	This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.
3	PACKET_NACKED	This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1:0	RESERVED_2	Reserved.

9.8 GSBI5 Registers (0x1A200000 GSBI5_BASE)

This section contains the GSBI5 registers.

9.8.1 GSBI CTRL Registers

0x1A200000 GSBI5_GSBI_CTRL_REG

Type: Read/write
Clock: HCLK
Reset State: 0x00000000

GSBI5_GSBI_CTRL_REG

Bits	Name	Description
15:12	RESERVED	reserved
11:8	WRAPPER_CTRL	This field has no predefined use. When a wrapper is constructed around one or more GSBIs there may be a need to configure it. E.g., to select which of several GSBIs will be connected to a particular I2S block. All bits of this field emerge from GSBI as output ports which can be used for any such configuration task.
7	RESERVED_7	Reserved. The host can write and read this field, but its state has no effect on anything.
6:4	PROTOCOL_CODE	This field controls which protocol, if any, is applied to the GSBI's four I/O ports. Most codes assign a single protocol, but codes of "001" and "110" assigns I2C to two of the ports and UART (without flow control signals) or SIM to the other two. 0x0: Idle (null values are applied to all four GSBI I/Os) 0x1: I2C on 2 ports, SIM/R-UIM on other 2 0x2: I2C 0x3: SPI 0x4: UART with flow control (or IRDA) 0x5: SIM/R-UIM 0x6: I2C on 2 ports, UART (without HS flow ctrl on other 2) 0x7: Undefined
3:1	RESERVED_3_1	Reserved. The host can write and read this field, but its state has no effect on anything.
0	CRCI_MUX_CTRL	While this bit is low QUP CRCI ports are connected to the GSBI ports nominally for QUP and UART_DM CRCI ports are connected to the GSBI ports nominally for UART_DM. While this bit is high QUP CRCI ports are connected to the GSBI ports nominally for UART_DM and UART_DM CRCI ports are connected to nothing.

0x1A200004 GSBI5_GSBI_DBG0_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI5_GSBI_DBG0_REG

Bits	Name	Description
1:0	GSBI_PLAY0	This field has no function beyond the fact that the ARM can write to it and read from it.

0x1A200008 GSBI5_GSBI_DBG1_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI5_GSBI_DBG1_REG

Bits	Name	Description
1:0	GSBI_PLAY1	This field has no function beyond the fact that the ARM can write to it and read from it.

0x1A20000C GSBI5_GSBI_DBG2_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI5_GSBI_DBG2_REG

Bits	Name	Description
1:0	GSBI_PLAY2	This field has no function beyond the fact that the ARM can write to it and read from it.

0x1A200010 GSBI5_GSBI_DBG3_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI5_GSBI_DBG3_REG

Bits	Name	Description
1:0	GSBI_PLAY3	This field has no function beyond the fact that the ARM can write to it and read from it.

9.9 GSBI5 UART DM Registers (0x1A240000 GSBI5_UART_DM_BASE)

This section contains the GSBI5 UART DM registers.

9.9.1 Write and read/write registers

0x1A240000 GSBI5_UART_DM_MR1

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_MR1 register is the UART mode register 1. It is used, along with UART_DM_MR2, to configure the operational mode of the UART.

GSBI5_UART_DM_MR1

Bits	Name	Description
31:8	AUTO_RFR_LEVEL1	These bits are used, along with bits 5:0 (AUTO_RFR_LEVEL0) to program the level in the receive FIFO at which the RFR_N signal is de-asserted, if programmed to do so (see RX_RDY_CTL field of this register). The level counts the number of words inside the RX FIFO. It doesn't count the character that is being received (shift register) or characters in the packing buffer. This value is programmed from 1 to 2^RAM_ADDR_WIDTH. The RFR_N signal is de-asserted when the RX FIFO level (the number of characters remaining in the RX FIFO) is greater than the level that is programmed into this register. · Only RAM_ADDR_WIDTH +1:8 bits are generated.
7	RX_RDY_CTL	Setting (1) this bit enables the automatic ready-for-receiving (RFR_N) control for the receiver. RFR_N is turned off, or set (1), when a valid start bit is received and the channel FIFO is at the level programmed in bits 4 through 0 of this mode register. When the FIFO level falls back to the programmed level, the RFR_N signal is turned on, or clear (0). When this feature is off, the RFR_N signal can be used by normal signal port bit manipulation (see UART_DM_CR register).
6	CTS_CTL	When this bit is set(1), the transmitter checks the CTS_N input to determine whether to begin transmission of a new character. If CTS_N is low, the character is sent. Otherwise the transmitter continues marking until CTS_N goes low, then the next character is transmitted. A change on CTS_N during the transmission of a character has no effect on that character. When this bit is clear(0), the CTS_N input for the channel has no effect on the transmitter.
5:0	AUTO_RFR_LEVEL0	See the description of bit 8 (AUTO_RFR_LEVEL1).

0x1A240004 GSBI5_UART_DM_MR2

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI5_UART_DM_MR2

Bits	Name	Description
9	RX_ERROR_CHAR_OFF	When this bit is asserted, characters with parity or framing errors don't enter RX FIFO. Otherwise they enter RX FIFO.
8	RX_BREAK_ZERO_CHAR_OFF	When this bit is asserted, the zero character received at rx_break doesn't enter RX FIFO. Otherwise it enters RX FIFO.
7	LOOPBACK	Internal use only
6	ERROR_MODE	This bit controls the operation of the two FIFO status bits for the channel (parity or framing error and received break). · When clear (0), the UART operates in character mode and the status bits apply only to the character at the top of the FIFO. · When set (1), the UART operates in block mode and both bits are the "OR" of the status for all previously received characters arriving after the last `reset error status' command was issued (see CR register).
5:4	BITS_PER_CHAR	These bits determine how many bits are transmitted or received per character, not including the start, stop, and parity bits. 0x0: 5 bits 0x1: 6 bits 0x2: 7 bits 0x3: 8 bits
3:2	STOP_BIT_LEN	This field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 9/16, 1, 1+ 9/16, and 2 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. 0x0: 0.563 (9/16 bit times) 0x1: 1.000 bit time 0x2: 1.563 (1+9/16 bit times) 0x3: 2.000 bit times
1:0	PARITY_MODE	These bits determine which parity mode is used. The user can select between odd, even, space, or no parity. 0x0: no parity 0x1: odd parity 0x2: even parity 0x3: space parity

0x1A240008 GSBI5_UART_DM_CSR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_CSR register is the UART clock selection register. This register is used in conjunction with the UART M/N counter registers to determine the bit rate for the transmitter and receiver. The transmitter and receiver can be clocked at different rates.

The rates below are based on a uart_dm_clk rate of 1.8432 MHz (115.2 * 16).

Table 9-8 lists the hexadecimal values for the clock select field and the corresponding data rates.

Table 9-8 Hexadecimal values and data rates for clock select field

CLK SEL value	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Bit rate (b/sec)	75	150	300	600	1200	2400	3600	4800	7200	9600	14.4k	19.2k	28.8k	38.4k	57.6k	115.2k

GSBI5_UART_DM_CSR

Bits	Name	Description
7:4	UART_RX_CLK_SEL	Use the CLK SEL values to select the appropriate receive and transmit bit rates.
3:0	UART_TX_CLK_SEL	

0x1A240070 GSBI5_UART_DM_TF

Type: Write
Clock: AHB_CLK
Reset State: Undefined

In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM TX FIFO.

GSBI5_UART_DM_TF

Bits	Name	Description
31:0	UART_TF	The UART_TF register is the UART transmit FIFO register. This register is used to access the channel transmit FIFO. If the FIFO is full at the time of writing, the character is lost and an interrupt is generated (see UART_DM_IMR register).

0x1A240074 GSBI5_UART_DM_TF_2

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_TF_2

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x1A240078 GSBI5_UART_DM_TF_3

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_TF_3

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x1A24007C GSBI5_UART_DM_TF_4

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_TF_4

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x1A240010 GSBI5_UART_DM_CR

Type: Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_CR register is the UART command register. This register is used to issue specific commands to the UART subsystem. This register is updated asynchronously.

CAUTION Do not reset the transmitter and disable it at the same time. Do not reset the receiver and disable it at the same time.

Table 9-9 UART DM commands

Value	Description	Result
0	Null command	Does nothing.
1	Reset receiver	Resets the receiver as if a hardware reset were issued. The receiver is disabled and the FIFO, packing buffer and shift registers are flushed.
2	Reset transmitter	Resets the transmitter as if a hardware reset were issued. The transmitter signal goes high (marking) and the FIFO, unpacking register and shift register are flushed.
3	Reset error status	Clears the overrun error and hunt char received status bits in both the character and block error modes. In the block error mode, it clears the error status and received break.
4	Reset break change interrupt	Clears the break change interrupt status bit.
5	Start break	Forces the transmitter signal low. The transmitter must be enabled. If the transmitter is busy, the break is started when all characters in the transmit FIFO and the transmit shift register have been completely sent.
6	Stop break	If executed while channel is breaking, this command causes the transmitter signal to go high. The signal remains high for at least one bit time before sending out a new character.
7	Reset CTS_N	Clears ISR bit 5.
8	Reset stale interrupt	Clears the stale interrupt.
9	Packet mode	Turns on the sample data mode, which causes the receiver to sample the receive data stream at 16 times the programmed baud rate. The data is sampled with the start of the start bit, or the first data bit, and continued until the marking state. To exit this state, write 1100 in the command field.
A	test_parity_on	Internal use only.
B	test_frame_on	Internal use only.
C	Mode reset	Turns off the sample data mode.
D	Set RFR_N	Asserts the ready for receiving signal (active low).
E	Reset RFR_N	De-asserts the ready for receiving signal.
F	uart_reset_int	Internal use only.
10	Reset TX_ERROR	Clears TX_ERROR
11	Clear TX_DONE	Clears the TX_DONE interrupt (ISR bit 9)
12	Reset break start interrupt	Clears the break start interrupt status bit.
13	Reset break end interrupt	Clears the break end interrupt status bit.
14	Reset par_frame_err interrupt	Clears the par_frame_err interrupt status bit.

Table 9-10 UART DM commands

Value	Description	Result
0	Null command	Does nothing.
1	CR Protection Enable	Enables CR HW protection. When two consecutive writes to the CR are detected, the second write is delayed until the command of the first write is finished. The delay is done by de-asserting the AHB ready and this ensures that the first command completes and the second one will be executed right afterward.
2	CR Protection Disable	Disables CR HW protection. SW is responsible for managing delay between writes to the CR register.
3	Reset TX-Ready interrupt	Clears the TX_READY interrupt.
5	Enable Stale Event	Enables the `stale event' mechanism. See Software Procedures.
6	Disable Stale Event	Disables the `stale event' mechanism. See Software Procedures.
4	SW Force Stale	Causes a `stale event' (even if `stale event' is disabled). See Software Procedures.
7	RESERVED	

GSBI5_UART_DM_CR

Bits	Name	Description
11	CHANNEL_COMMAND_MSB	This is the msb of the CHANNEL_COMMAND bitfield.
10:8	GENERAL_COMMAND	Writing the appropriate value to these bits executes the commands that are listed in the table.
7:4	CHANNEL_COMMAND_LSB	Writing the appropriate value to these bits, along with bit 11, executes the commands that are listed in the table.
3	UART_TX_DISABLE	This command terminates the operation of the transmitter after any character in the transmit shift register is sent.
2	UART_TX_EN	This command enables the operation of the transmitter.
1	UART_RX_DISABLE	This command immediately terminates the operation of the channel receiver and any incoming characters are lost. None of the receiver status bits are affected by this command and characters that are already in the receive FIFO remain there.
0	UART_RX_EN	This command enables the channel receiver.

0x1A240014 GSBI5_UART_DM_IMR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IMR register is the UART interrupt mask register. This register is used to enable the corresponding functions in the UART_DM_ISR register. Setting (1) a bit in the UART_DM_IMR register causes an interrupt to be generated, if the corresponding bit in the UART_DM_ISR register is set. Clearing (0) a bit in the UART_DM_IMR register causes the setting of the corresponding bit in the UART_DM_ISR register to have no effect on the interrupt signal.

Bit 6 of the UART_DM_IMR register, CURRENT_CTS, is slightly different. If the current value of the CTS is one (1), no interrupt is generated. However, the user can use bit 6 in this register to mask the CTS value when reading the UART_DM_MISR register or as a general-purpose bit.

GSBI5_UART_DM_IMR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	This bit is asserted in the same condition at which PAR_FRAME_ERR status bit is asserted. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x14.
11	RXBREAK_END	This bit is set (1) if the end of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x13.
10	RXBREAK_START	This bit is set (1) if the start of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x12.
9	TX_DONE	This bit is used only in UIM/SIM_IF mode. Set (1) this bit when the last byte in the transmitter has been sent. · This bit is generated only when SIM_GLUE_GEN generic equals 1.
8	TX_ERROR	Only used in UIM_IF mode. Set (1) this bit to indicate that there has been parity error during transmission. To clear the detection logic associated with this function, write CR[11;7:4]=0x10. · This bit is generated only when SIM_GLUE_GEN generic equals 1.
7	TX_READY	This bit, when set(1), indicates that: 1. TX FIFO is empty. 2. The value written in NO_CHARS_FOR_TX register equals the number of bytes written to the TX FIFO since the register was updated. **NOTE** There may be characters in the unpack buffer or in the shift register. This bit is cleared by issuing `clear TX ready' command (see UART_DM_CR register).

GSBI5_UART_DM_IMR (cont.)

Bits	Name	Description
6	CURRENT_CTS	This bit indicates the current state of the CTS input. It never generates an interrupt.
5	DELTA_CTS	This bit, when set (1), indicates that the CTS input has changed states. To clear the detection logic associated with this function, write CR[7:4]=0x7.
4	RXLEV	This bit is set when a character is loaded into the receive FIFO that brings the total number of characters in the FIFO above the programmed watermark level in the FIFO watermark register (RFWR). This bit is cleared after enough characters have been read to bring the level equal to or below the programmed watermark level.
3	RXSTALE	This bit indicates that a `stale event' occurred. See Software procedures for the exact timing of this interrupt. It is cleared by issuing a reset-stale command (see CR register).
2	RXBREAK_CHANGE	This bit is set (1) if the start or end of a break condition is detected. The logic associated with this condition is cleared (0) by writing CR[7:4]=0x4. A detected break is defined as an all-zeros character with an invalid stop bit AND LOW PARITY. The end of a break is defined as a mark condition (1) at least 1/2 bit width. A detected break occupies one position in the Rx FIFO.
1	RXHUNT	This bit is set (1) when an incoming character matches the value programmed into the UART_DM_HCR register. This condition is cleared (0) by issuing a reset error status command (CR[7:4]=0x3).
0	TXLEV	This bit is set (1) when a character which is transferred from the transmit FIFO to the transmit shift register brings the total number of characters in the FIFO below or equal to the programmed watermark level in the UART_DM_TFWR register. This bit is cleared (0) after enough characters have been written to the FIFO to bring the level above the programmed watermark level.

0x1A240018 GSBI5_UART_DM_IPR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0xffffff9f

The UART_DM_IPR register is the UART interrupt programming register.

GSBI5_UART_DM_IPR

Bits	Name	Description
31:7	STALE_TIMEOUT_MSB	These bits are the STALE_TIMEOUT bitfield. The stale character time-out duration field contains a number from 1 to 2^30 -1. This number determines how many character times must elapse before a `stale event' is generated. This character time is defined as 10 times the bit rate. It is reset whenever a data bit is received. Do not clear (0) this register if the stale character time-out interrupt is enabled. Note the discontinuity in the bit assignments.
6	SAMPLE_DATA	Setting (1) this bit enables the new sample data mode, which means that the start bit is sampled as well as the rest, when in sample data mode. See the CR register, CHANNEL_COMMAND bit for more information.
5	RESERVED	
4:0	STALE_TIMEOUT_LSB	This bitfield is the LSbits of the STALE_TIMEOUT bitfield.

0x1A24001C GSBI5_UART_DM_TFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_TFWR register is the UART transmit FIFO watermark register.

GSBI5_UART_DM_TFWR

Bits	Name	Description
31:0	TFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the transmit FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of TX words in the FIFO) is less than or equal to the value in TFWR. See UART_DM_IMR register. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x1A240020 GSBI5_UART_DM_RFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RFWR register is the UART receive FIFO watermark register.

GSBI5_UART_DM_RFWR

Bits	Name	Description
31:0	RFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the receive FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of words in the RX FIFO) is greater than the value in RFWR. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x1A240024 GSBI5_UART_DM_HCR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI5_UART_DM_HCR

Bits	Name	Description
7:0	DATA	The UART_DM_HCR register is the UART hunt character register, which contains the character for which the receiver looks to assert a hunt character received interrupt.

0x1A240034 GSBI5_UART_DM_DMRX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI5_UART_DM_DMRX

Bits	Name	Description
24:0	RX_DM_CRCI_CHARS	In the DM mode, the number of chars in the Rx FIFO that are used for CRCI handshake with the DM. The written value of RX_DM_CRCI_ CHARS must be a multiple of 16(bits [3:0] are treated as 0x0). After a value is written, the UART will generate CRCI requests as long as RX_DM_CRCI_CHARS is non zero. Read of DMRX register gives the number of characters that were received since the end of the last transfer. It is reset at the end of each Rx transfer Also is used by the software to indicate `transfer initialization'. See Software procedures.

0x1A240038 GSBI5_UART_DM_IRDA

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IRDA register enables the IRDA function, selects a loopback, and allows inversion of RX and TX data. This register also controls the IRDA transceiver that optionally interfaces between the UART and the DP_RX_DATA and DP_TX_DATA pins.

The UART proper is a standard RX/TX configuration that converts the serial pin input and output lines to 8-bit data for the microprocessor. The configuration contains receive and transmit blocks, a control block, a bit rate generator for RX and TX, and FIFO interfaces with the microprocessor data bus. The IRDA register provides the means of switching IRDA circuits into the serial I/O lines and the IRDA function is normally switched out. The IRDA modulator/demodulator may be enabled or disabled under microprocessor control. When enabled, the RX and TX data pathis have individual inversion select bits, so external true or inverted drivers may be used in the signal path.

n The register is generated only when IRDA_IFC_GEN generic equals 1.

GSBI5_UART_DM_IRDA

Bits	Name	Description
4	MEDIUM_RATE_EN	· Set (1) for 1/4 bit-time pulse length (Medium rate) · Clear (0) for 3/16 bit-time pulse length (Low rate)
3	IRDA_LOOPBACK	· This bit loops the IRDA modulated TX line back into the IRDA RX line. The normal UART loopback mode must be off in order to see this effect.
2	INVERT_IRDA_TX	This bit inverts the polarity of the IRDA modulated signal on the DP_TX_DATA pin. · Set (1) this bit for an inverted polarity. · Clear (0) this bit for a non-inverted polarity.
1	INVERT_IRDA_RX	This bit inverts the polarity of the IRDA received signal on the DP_RX_DATA pin. · Set (1) this bit for inverted the polarity. · Clear (0) this bit for non-inverted polarity.
0	IRDA_EN	· Set (1) this bit to enable the IRDA transceiver. · Clear (0) this bit to bypass the IRDA transceiver and ignore the other bits of this register.

0x1A24003C GSBI5_UART_DM_DMEN

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_DMEN register indicates if Data Mover is enabled for TX and RX channels.

GSBI5_UART_DM_DMEN

Bits	Name	Description
1	RX_DM_EN	· Set (1) this bit to enable RX DM interface. · Clear (0) this bit to disable RX DM interface. Clearing this bit requires resetting the receiver (see UART_DM_CR register).
0	TX_DM_EN	Set (1) this bit to enable TX DM interface. Clear (0) this bit to disable TX DM interface.

0x1A240040 GSBI5_UART_DM_NO_CHARS_FOR_TX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI5_UART_DM_NO_CHARS_FOR_TX

Bits	Name	Description
23:0	TX_TOTAL_TRANS_LEN	The total number of characters for transmission. Before writing a new value, the TX FIFO must be empty (as indicated by TX_READY interrupt in IMR register or after a reset). It is used by the transmitter to calculate how many characters to transmit in the last word. In DM mode, it is also used for the CRCI mechanism. Any additional writes to the TX FIFO above TX_TOTAL_TRANS_LEN will be discarded. A TX_READY interrupt is triggered after TX_TOTAL_TRANS_LEN number of characters were moved from the TX FIFO to the unpacking register (not all may have been sent).

0x1A240044 GSBI5_UART_DM_BADR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_BADR

Bits	Name	Description
31:2	RX_BASE_ADDR	RX FIFO base address. Both FIFOs use the same RAM (2^RAM_ADDR_WIDTH, 32-bit entries). This register controls the division of the memory to the RX and TX FIFOs. The division is a multiple of 4 entries, since the DM's burst length is 4. The size of the TX FIFO equals RX_BASE_ADDR. The size of the RX FIFO is 2^RAM_ADDR_WIDTH - RX_BASE_ADDR. ® The default is RX_BASE_ADDR = 2^(RAM_ADDR_WIDTH - 1) ® Only RAM_ADDR_WIDTH -1:2 bits are generated.
1:0	UNUSED	

0x1A240048 GSBI5_UART_DM_TESTSL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI5_UART_DM_TESTSL

Bits	Name	Description
4	TEST_EN	Test bus enable
3:0	TEST_SEL	Test bus selector

0x1A240060 GSBI5_UART_DM_MISR_MODE

Type: Read/Write
Clock: WR_CLK

GSBI5_UART_DM_MISR_MODE

Bits	Name	Description
31:2	RESERVED	unused.
1:0	MODE	0x0: Disabled 0x1: Enabled,TX test 0x2: Enabled, RX test

0x1A240064 GSBI5_UART_DM_MISR_RESET

Type: Write
Clock: WR_CLK
Reset State: Undefined

GSBI5_UART_DM_MISR_RESET

Bits	Name	Description
31:1	RESERVED	unused.
0	RESET	

0x1A240068 GSBI5_UART_DM_MISR_EXPORT

Type: Read/Write
Clock: WR_CLK
Reset State: Undefined

GSBI5_UART_DM_MISR_EXPORT

Bits	Name	Description
31:1	RESERVED	unused.
0	EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., what is the result of the muxing of all the input data streams with <BLOCK>_TEST_MODE) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x1A24006C GSBI5_UART_DM_MISR_VAL

Type: Read
Clock: WR_CLK
Reset State: Undefined

GSBI5_UART_DM_MISR_VAL

Bits	Name	Description
9:0	VAL	Current MISR state

0x1A240080 GSBI5_UART_DM_SIM_CFG

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_SIM_CFG register is used to configure the SIM interface for the UART.

- The register is generated only when SIM_GLUE_GEN generic equals 1.

GSBI5_UART_DM_SIM_CFG

Bits	Name	Description
17	UIM_TX_MODE	When this bit is set (1), the transmission portion of the SIM interface operates in block mode (T=1). When clear (0), the transmission portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
16	UIM_RX_MODE	When this bit is set (1), the receive portion of the SIM interface operates in block mode (T=1). When clear (0), the receive portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.

GSBI5_UART_DM_SIM_CFG (cont.)

Bits	Name	Description
15:8	SIM_STOP_BIT_LEN	In UIM_IF mode, this field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 1 to 254 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. ..... 11 111110: 254 bit times 0x1: 1 bit times 0x2: 2 bit times
7	SIM_CLK_ON	When this bit is set(1), the UIM_CLK is turned on at either the TD8 or TD4 frequency, as indicated by bit6(UIM_CLK_TD8_SEL). When this bit is cleared, the UIM_CLK is stopped either LOW or HIGH, as indicated by bit 5(UIM_CLK_STOP_HIGH).
6	SIM_CLK_TD8_SEL	This bit selects the UIM_CLK frequency at which the UIM_CLK is turned on. 0x1: TD8 (the UIM_CLK runs at the TD8 frequency) 0x0: TD4 (the UIM_CLK runs at the TD4 frequency)
5	SIM_CLK_STOP_HIGH	This bit indicates at what point - high or low - the UIM_CLK will stop. 0x1: high 0x0: low
4	SIM_CLK_SEL	unused
3	MASK_RX	Setting (1) this bit masks off any 0 on the RX line, which prevents the receiver from seeing the START bit. Set (1) this bit if you do not want to receive the data you transmit.
2	SWAP_D	Setting (1) this bit causes the UIM_IF to swap the 8 data bits (making MSB into LSB, bit 6 into bit1, and so on) before it is read by the microprocessor.
1	INV_D	Set (1) this bit to cause the UIM_IF to invert the 8 data bit before it is read by the microprocessor.
0	SIM_SEL	Set (1) this bit to designate the UIM_IF mode of operation.

0x1A240084 GSBI5_UART_DM_TEST_WR_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI5_UART_DM_TEST_WR_ADDR

Bits	Name	Description
31:0	TEST_WR_ADDR	RAM address at which to write the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x1A240088 GSBI5_UART_DM_TEST_WR_DATA

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_TEST_WR_DATA

Bits	Name	Description
31:0	TEST_WR_DATA	The test data to be written to the RAM. Write to this register triggers the write to the RAM, to TEST_WR_ADDR address.

0x1A24008C GSBI5_UART_DM_TEST_RD_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI5_UART_DM_TEST_RD_ADDR

Bits	Name	Description
31:0	TEST_RD_ADDR	RAM address from which to read the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

9.9.2 Read registers

NOTE The addresses of the read-only registers are mapped into the same addresses of the four write-only registers in the section above this one. They are: UART_DM_CSR, UART_DM_TF, UART_DM_CR, and UART_DM_IMR, respectively.

0x1A240008 GSBI5_UART_DM_SR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_SR register is the UART status register. This register is used to obtain the current state of the UART subsystem. This register is updated asynchronously.

GSBI5_UART_DM_SR

Bits	Name	Description
8	RX_BREAK_START_LAST	When break start is detected, this bit is set (1). When break end was detected, this bit is reset (0).

GSBI5_UART_DM_SR (cont.)

Bits	Name	Description
7	HUNT_CHAR	When set (1), this bit indicates that the programmed character in the UART_DM_HCR register was received. If programmed, this condition causes the RXHUNT bit to be set (1) in the UART_DM_ISR register. This bit is cleared by issuing a reset error status command.
6	RX_BREAK	When set (1), this bit indicates that an all-zero character of the programmed length was received without a stop bit. If a break begins in the middle of a character, it is detected if the condition remains until the end of the next character time. Only one all zero character is written into the FIFO upon receiving the break. After the RX input returns high for at least half a bit time, then more characters are accepted by the receiver. Whenever the break condition starts or stops as defined above, the RXBREAK bit is set (1) in the UART_DM_ISR register. This bit is appended to the character in the receive FIFO.
5	PAR_FRAME_ERR	A parity error occurs if parity is programmed to be checked and an incoming character is received with incorrect parity. A framing error occurs when the RX input is low while the stop bit is being sampled. This bit is sampled in the middle of the first stop bit position, regardless of the programmed length of the stop bit. This error bit is appended to the character in the receive FIFO.
4	UART_OVERRUN	An overrun error occurs if one or more incoming characters are lost. This happens when the receive FIFO is full, the packing buffer is full and another character has been received in the shift register. The character in the receive shift register is lost. Upon overrun, this status bit remains high until cleared by a reset error status command.
3	TXEMT	This bit is set (1) when the transmitter under-runs. It is set after the transmission of the stop bit at the end of a character, if there are no characters waiting to be sent. It is reset when a character is written to the transmit FIFO.
2	TXRDY	This bit indicates that the transmit FIFO has space in it. It is reset when the FIFO becomes full and set when space becomes available again. Any characters that are written to the FIFO while this bit is low is lost.
1	RXFULL	This bit is set (1) when the receive FIFO becomes full. It is reset when the CPU reads a word.
0	RXRDY	This bit is set (1) when there is a word in the receive FIFO waiting to be read. It is reset when the last word currently stored in the FIFO is read.

0x1A240070 GSBI5_UART_DM_RF

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RF register is the UART receive FIFO register, which is used to access the channel receive FIFO. In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM RX FIFO.

GSBI5_UART_DM_RF

Bits	Name	Description
31:0	UART_RF	This register returns the next value in the receive FIFO. After the read is completed, the FIFO read pointer is updated to make the next character available.

0x1A240074 GSBI5_UART_DM_RF_2

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_RF_2

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x1A240078 GSBI5_UART_DM_RF_3

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_RF_3

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x1A24007C GSBI5_UART_DM_RF_4

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_RF_4

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x1A240010 GSBI5_UART_DM_MISR

Type: Read
Clock: AHB_CLK
Reset State: 0x0

GSBI5_UART_DM_MISR

Bits	Name	Description
12:0	UART_MISR	The UART_DM_MISR register is the masked interrupt status register. A read from this register returns the "AND" of the UART_DM_ISR and the UART_DM_IMR registers. This register is updated asynchronously. This bit field is misr <= (isr(12 DOWNTO 7) AND imr(12 DOWNTO 7)) & '0' & (isr(5 DOWNTO 0) AND imr(5 DOWNTO 0)).

0x1A240014 GSBI5_UART_DM_ISR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_ISR register is the UART interrupt status register. This register provides the current status of the possible interrupt conditions. If one of these bits is set (1), and the corresponding bit in the UART_DM_IMR register is set (1), an interrupt is generated (with the exception of bit 6, CURRENT_CTS - see the description of the UART_DM_IMR register). If the corresponding bit in the UART_DM_IMR register is clear (0), setting one of these bits has no effect on the UART interrupt request signal. This register is updated asynchronously.

GSBI5_UART_DM_ISR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	· See UART_DM_IMR on page 28-9
11	RXBREAK_END	· See UART_DM_IMR on page 28-9
10	RXBREAK_START	· See UART_DM_IMR on page 28-9
9	TX_DONE	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
8	TX_ERROR	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
7	TX_READY	See UART_DM_IMR on page 28-9, for descriptions of the UART_DM_ISR bits.
6	CURRENT_CTS	
5	DELTA_CTS	
4	RXLEV	
3	RXSTALE	

GSBI5_UART_DM_ISR (cont.)

Bits	Name	Description
2	RXBREAK	
1	RXHUNT	
0	TXLEV	

0x1A240038 GSBI5_UART_DM_RX_TOTAL_SNAP

Type: Read
Clock: AHB_CLK
Reset State: 0x0

GSBI5_UART_DM_RX_TOTAL_SNAP

Bits	Name	Description
23:0	RX_TOTAL_BYTES	'RX_TOTAL_SNAP register holds the number of characters received since the end of last Rx transfer. It is updated at the end of an Rx transfer (see Software procedures). Rx transfer ends when one of the conditions is met: · The number of characters which were received since the end of the previous transfer equals the value which was written to DMRX at "Transfer initialization". · A stale event occurred (flush operation already performed if was needed).

0x1A24004C GSBI5_UART_DM_TXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_TXFS

Bits	Name	Description
31:14	TX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. · Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	TX_ASYNC_FIFO_STATE	TX asynchronous fifo status - number of characters in the TX asynchronous FIFO.
9:7	TX_BUFFER_STATE	TX unpacking buffer status - number of bytes in the unpacking buffer
6:0	TX_FIFO_STATE_LSB	TX FIFO status - number of words in the TX FIFO

0x1A240050 GSBI5_UART_DM_RXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_RXFS

Bits	Name	Description
31:14	RX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	RX_ASYNC_FIFO_STATE	RX asynchronous fifo status - number of characters in the RX asynchronous FIFO.
9:7	RX_BUFFER_STATE	RX packing buffer status - number of bytes in the packing buffer
6:0	RX_FIFO_STATE_LSB	The number of entries in the RX FIFO that have at least one valid character. It is incremented each time a word is moved from the packing register to the RX FIFO. It is decremented each time a word is read from the RX FIFO. **NOTE** The Uart does not keep track of non-valid characters in each word. (See Software procedures).

0x1A240090 GSBI5_UART_DM_TEST_RD_DATA

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI5_UART_DM_TEST_RD_DATA

Bits	Name	Description
31:0	TEST_RD_DATA	Read from this register triggers the read from the RAM. The register will hold, after read access, data which is found at TEST_RD_ADDR address in the RAM.

9.10 GSBI5 QUP Registers (0x1A280000 QUP5_BASE)

This section contains the GSBI5 QUP registers.

0x1A280000 GSBI5_QUP_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).

b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:

- N equals 8 or less - shift 24
- N equals 16 to 9 - shift 16
- N equals 24 to 17 - shift 8
- N equals 32 to 25 - no shift

The MINI_CORE clock selected is as follows:

Null: cc_qup_core_clk

SPI: cc_spi_master_clk

I2C: cc_I2C_clk		

GSBI5_QUP_CONFIG

Bits	Name	Description
31:14	RESERVED_1	reserved
13	CORE_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).
12	APP_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).

GSBI5_QUP_CONFIG (cont.)

Bits	Name	Description
11:8	MINI_CORE	value: 0000 Null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 I2C slave controller value: 0100 Reserved (I2C master & slave for loop back operation) value: 0101 Reserved (map to null core) value: 0110 Reserved (map to null core value: 0111 Reserved (map to null core) See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a "don't care". The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS _N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	RESERVED_2	Reserved.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x1A280004 GSBI5_QUP_STATE

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000000XX100

GSBI5_QUP_STATE

Bits	Name	Description
31:5	RESERVED	reserved.
4	I2C_MAST_GEN	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.

GSBI5_QUP_STATE (cont.)

Bits	Name	Description
1:0	STATE	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to "01", the mini-core and related logic is released from reset and enters the RUN_STATE. When set to "11", the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete. See notes 1 and 2. Note 1: SPI - the "next appropriate point in time" is the next time SPI_CS _N de-asserts. If SPI_CS _N is not asserted when the PAUSE_STATE is entered, the SPI_CS _N is maintained in the not asserted state. The PAUSE_STATE is not available for SLAVE operation. Note 2: I2C -

0x1A280008 GSBI5_QUP_IO_MODES

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000XXXXXXXX

Unless otherwise stated, register bits written return the value when read.

Notes:

a. "Packing" occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. "Un-Packing" occurs as follows:

- N equals 8 or less - un-pack four values from each QUP output FIFO word.
- N equals 16 to 9 - un-pack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

GSBI5_QUP_IO_MODES

Bits	Name	Description
31:17	RESERVED	reserved
16	OUTPUT_BIT_SHIFT_EN	If set, enables the QUP output FIFO block to do bit shifting on the output data.

GSBI5_QUP_IO_MODES (cont.)

Bits	Name	Description
15	PACK_EN	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 6x BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode and Data_Mover_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16 BLOCK_SIZE
1:0	OUTPUT_BLOCK_SIZE	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x1A28000C GSBI5_QUP_SW_RESET

Type: Write/cmd
Clock: CRIF_CLK
Reset State: 0x0000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero.

GSBI5_QUP_SW_RESET

Bits	Name	Description
31:0	RESERVED	NA

0x1A280010 GSBI5_QUP_TIME_OUT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies if the QUP_MX_OUTPUT_COUNT register and/or QUP_MX_INPUT_COUNT register are enabled. Additionally, this register only applies to Block_Mode and Data_Mover_Mode. The timer starts "ticking" when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The timer pauses for the PAUSE_STATE. If the timer expires before the QUP_MX_OUTPUT_COUNT and/or QUP_MX_INPUT_COUNT are exhausted, then the TIME_OUT_ERR flag is set in the QUP_ERROR_FLAGS register and the interrupt gsbi_qup_irq may be asserted.

GSBI5_QUP_TIME_OUT

Bits	Name	Description
15:0	TIME_OUT_VALUE	Specifies time out value in units of cc_qup_app clock ticks. A value of zero indicates the timer function is not enabled for use. See QUP_CONFIG register for information on clocks.

0x1A280014 GSBI5_QUP_TIME_OUT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI5_QUP_TIME_OUT_CURRENT

Bits	Name	Description
31:0	TIME_OUT_CURRENT	Current value of time-out counter.

0x1A280018 GSBI5_QUP_OPERATIONAL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0080

GSBI5_QUP_OPERATIONAL

Bits	Name	Description
31:10	RESERVED_1	reserved.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Data_Mover_Mode.
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Data_Mover_Mode.
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowleges software has or will read the data. Valid only in all modes.
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowledges software has or will read the data. Valid only in all modes.
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.
3:0	RESERVED_2	reserved.

0x1A28001C GSBI5_QUP_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

GSBI5_QUP_ERROR_FLAGS

Bits	Name	Description
31:7	RESERVED_1	reserved.
6	TIME_OUT_ERR	The time out limit for a given transfer has been reached.
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ER R	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.
1:0	RESERVED_2	reserved

0x1A280020 GSBI5_QUP_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x007C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of gsbi_qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

GSBI5_QUP_ERROR_FLAGS_EN

Bits	Name	Description
31:7	RESERVED_1	reserved
6	TIME_OUT_ERR_EN	If set, enables time out error generation.
5	OUTPUT_OVER_RUN_ERR _EN	If set, enables output over run error generation.

GSBI5_QUP_ERROR_FLAGS_EN (cont.)

Bits	Name	Description
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.
1:0	RESERVED_2	reserved

0x1A280024 GSBI5_QUP_TEST_CTRL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register enables QUP test bus to be actively driven by QUP core signals.

GSBI5_QUP_TEST_CTRL

Bits	Name	Description
31:1	RESERVED	reserved
0	QUP_TEST_BUS_EN	If set, enables QUP core to actively drive test bus. If zero, the core drives the test bus to all zeros.

9.10.1 QUP output FIFO registers

0x1A280100 GSBI5_QUP_MX_OUTPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not effect the count.

Notes:

a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

GSBI5_QUP_MX_OUTPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_COUNT	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x1A280104 GSBI5_QUP_MX_OUTPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI5_QUP_MX_OUTPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x1A280108 GSBI5_QUP_OUTPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

This register holds the output data hanging out of the QUP output FIFO ready be loaded into the mini-core for the next load operation. This corresponds to signal qup_data_out going into the mini-core block.

GSBI5_QUP_OUTPUT_DEBUG

Bits	Name	Description
31:0	OUTPUT_DEBUG_DATA	Value waiting at the exit of output FIFO.

0x1A28010C GSBI5_QUP_OUTPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the

value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

GSBI5_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	OUTPUT_FIFO_WORD_CNT	Number of words in the output FIFO.

0x1A280110+4*c GSBI5_QUP_OUTPUT_FIFOc, c=[0..15]

Type: Write
Clock: CRIF_CLK
Reset State: 0x0000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

GSBI5_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x1A280150 GSBI5_QUP_MX_WRITE_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the gsbi_qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

GSBI5_QUP_MX_WRITE_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_COUNT	The number of "writes" of size N. This is used only if the core is in FIFO_Mode.

0x1A280154 GSBI5_QUP_MX_WRITE_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI5_QUP_MX_WRITE_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

9.10.2 QUP input FIFO registers

0x1A280200 GSBI5_QUP_MX_INPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

GSBI5_QUP_MX_INPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_COUNT	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x1A280204 GSBI5_QUP_MX_INPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI5_QUP_MX_INPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x1A280208 GSBI5_QUP_MX_READ_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

GSBI5_QUP_MX_READ_COUNT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_COUNT	The number of "reads" of size N. This is used only if the core is in FIFO_Mode.

0x1A28020C GSBI5_QUP_MX_READ_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI5_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x1A280210 GSBI5_QUP_INPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the value of the last loaded in known-good-data into the QUP input FIFO. May be different from what the actual read of input FIFO will return because of packing enabled at the input side. This corresponds to signal qup_data_in coming from the mini-core block synchronized to the crif_clk.

GSBI5_QUP_INPUT_DEBUG

Bits	Name	Description
31:0	INPUT_DEBUG_DATA	Last known good value shifted into the input FIFO.

0x1A280214 GSBI5_QUP_INPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

GSBI5_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

0x1A280218+4*c GSBI5_QUP_INPUT_FIFOc, c=[0..15]

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

Consecutive reads to this address reads the input FIFO contents on a FIFO basis.The max address to read the input FIFO is 0x254.

GSBI5_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

9.10.3 SPI mini-core registers

0x1A280300 GSBI5_SPI_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

GSBI5_SPI_CONFIG

Bits	Name	Description
31:11	RESERVED_1	Reserved.
10	HS_MODE	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
7:6	RESERVED_2	Reserved.
5	SLAVE_OPERATION	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.
4:0	RESERVED	Reserved.

0x1A280304 GSBI5_SPI_IO_CONTROL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

GSBI5_SPI_IO_CONTROL

Bits	Name	Description
31:11	RESERVED	Reserved.
10	CLK_IDLE_HIGH	Use SPI_CLK_IDLE_HIGH when set.
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS _N respectively. Setting any of this bit to '1', makes the associated SPI_CS _N active HIGH. This field is a "don't care" in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_ N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a "don't care" in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS _N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS _N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x1A280308 GSBI5_SPI_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

GSBI5_SPI_ERROR_FLAGS

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.

GSBI5_SPI_ERROR_FLAGS (cont.)

Bits	Name	Description
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x1A28030C GSBI5_SPI_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0003

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

GSBI5_SPI_ERROR_FLAGS_EN

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x1A280310 GSBI5_SPI_DEASSERT_WAIT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the de-assertion wait time of SPI_CS _N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

GSBI5_SPI_DEASSERT_WAIT

Bits	Name	Description
31:6	RESERVED	Reserved.

GSBI5_SPI_DEASSERT_WAIT (cont.)

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the de-asserted time of SPI_CS _N. Only applies to MASTER operation. For SLAVE operation, this field is a "don't care". A value of zero indicates SPI_CS _N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

9.10.4 I2C master mini-core registers

0x1A280400 GSBI5_I2C_MASTER_CLK_CTL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_CLK_CTL register is a read/write register that controls clock divider values. This register should only be written to after it is confirmed that the I2C master mini-core is not longer in RESET state (QUP_STATE register).

GSBI5_I2C_MASTER_CLK_CTL

Bits	Name	Description
31:11	RESERVED	Reserved.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. The minimum value should be 3 hex (4 I2C_clk clocks per period) to ensure proper sampling of the bus. For a maximum high speed bit rate of 3.4 Mb/s (high speed mode), this would require a minimum 40.8 MHz I2C_clk clock. The maximum I2C_clk is 81.6 MHz. This register is reset to a maximum value of 7 hex. I2C_HS_CLK = I2C_CLK/(3*(HS_DIVIDER_VALUE+1)
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. The minimum value should be 3 hex to ensure proper sampling of the bus. For a maximum bit rate of 400 kb/s (fast mode), this would require a 4.8 MHz I2C_clk clock. For a maximum bit rate of 100 kb/s (standard mode), this would require a 1.2 MHz I2C_clk clock. Maximum I2C_clk for fast and standard modes are 206.4 MHz and 51.6 MHz respectively. This register is reset to a maximum value of 255 hex. I2C_FS_CLK = I2C_CLK/(2*(FS_DIVIDER_VALUE+3)

0x1A280404 GSBI5_I2C_MASTER_STATUS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_STATUS is a status register. Writing a one clears the status bits.

GSBI5_I2C_MASTER_STATUS

Bits	Name	Description
31:26	RESERVED_1	Reserved.
25	INVALID_READ_SEQ	This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	This bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address).
23	INVALID_TAG	This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Reset, read_last_byte, mi_rec, dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: READ_LAST_BYTE_STATE Value 0x3: MI_REC_STATE Value 0x4: DEC_STATE Value 0x5: STORE_STATE
19:16	OUTPUT_FSM_STATE	This 4-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Reset, decode, send, mi_red, nop, nop_dec, invalid, invalid_dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: DECODE_STATE Value 0x3: SEND_STATE Value 0x4: MI_REC_STATE Value 0x5: NOP_STATE Value 0x6: INVALID_STATE Value 0x7: PEEK_STATE Value 0x8: SEND_R_STATE

GSBI5_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
15:13	CLK_STATE	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Reset_busidle, not_master, high, low, high_wait, forced_low, hs_addr_low or double_buffer_wait. Value 0x0: RESET_BUSIDLE_STATE Value 0x1: NOT_MASTER_STATE Value 0x2: HIGH_STATE Value 0x3: LOW_STATE Value 0x4: HIGH_WAIT_STATE Value 0x5: FORCED_LOW_STATE Value 0x6: HS_ADDR_LOW_STATE Value 0x7: DOUBLE_BUFFER_WAIT_STATE
12:10	DATA_STATE	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Reset, Tx addr, Tx HS addr, Tx 10-bit addr, Tx 2nd 10-bit addr byte, Tx data and Rx data. Value 0x0: RESET_WAIT_STATE Value 0x1: TX_ADDR_STATE Value 0x2: TX_DATA_STATE Value 0x3: TX_HS_ADDR_STATE Value 0x4: TX_10_BIT_ADDR_STATE Value 0x5: TX_2ND_BYTE_STATE Value 0x6: RX_DATA_STATE
9	BUS_MASTER	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.

GSBI5_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
4	ARB_LOST	This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.
3	PACKET_NACKED	This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1:0	RESERVED_2	Reserved.

9.11 GSBI6 Registers (0x16500000 GSBI6_BASE)

This section contains the GSBI6 registers.

9.11.1 GSBI CTRL Registers

0x16500000 GSBI6_GSBI_CTRL_REG

Type: Read/write
Clock: HCLK
Reset State: 0x00000000

GSBI6_GSBI_CTRL_REG

Bits	Name	Description
15:12	RESERVED	reserved
11:8	WRAPPER_CTRL	This field has no predefined use. When a wrapper is constructed around one or more GSBIs there may be a need to configure it. For example, to select which of several GSBIs will be connected to a particular I2S block. All bits of this field emerge from GSBI as output ports which can be used for any such configuration task.
7	RESERVED_7	Reserved. The host can write and read this field, but its state has no effect on anything.
6:4	PROTOCOL_CODE	This field controls which protocol, if any, is applied to the GSBI's four I/O ports. Most codes assign a single protocol, but codes of "001" and "110" assigns I2C to two of the ports and UART (without flow control signals) or SIM to the other two. 0x0: Idle (null values are applied to all four GSBI I/Os) 0x1: I2C on 2 ports, SIM/R-UIM on other 2 0x2: I2C 0x3: SPI 0x4: UART with flow control (or IRDA) 0x5: SIM/R-UIM 0x6: I2C on 2 ports, UART (without HS flow ctrl on other 2) 0x7: Undefined
3:1	RESERVED_3_1	Reserved. The host can write and read this field, but its state has no effect on anything.
0	CRCI_MUX_CTRL	While this bit is low QUP CRCI ports are connected to the GSBI ports nominally for QUP and UART_DM CRCI ports are connected to the GSBI ports nominally for UART_DM. While this bit is high QUP CRCI ports are connected to the GSBI ports nominally for UART_DM and UART_DM CRCI ports are connected to nothing.

0x16500004 GSBI6_GSBI_DBG0_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI6_GSBI_DBG0_REG

Bits	Name	Description
1:0	GSBI_PLAY0	This field has no function beyond the fact that the ARM can write to it and read from it.

9.12 GSBI6 UART DM Registers (0x16540000 GSBI6_UART_DM_BASE)

This section contains the GSBI6 UART DM registers.

9.12.1 Write and read/write registers

0x16540000 GSBI6_UART_DM_MR1

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_MR1 register is the UART mode register 1. It is used, along with UART_DM_MR2, to configure the operational mode of the UART.

GSBI6_UART_DM_MR1

Bits	Name	Description
31:8	AUTO_RFR_LEVEL1	These bits are used, along with bits 5:0 (AUTO_RFR_LEVEL0) to program the level in the receive FIFO at which the RFR_N signal is de-asserted, if programmed to do so (see RX_RDY_CTL field of this register). The level counts the number of words inside the RX FIFO. It doesn't count the character that is being received (shift register) or characters in the packing buffer. This value is programmed from 1 to 2^RAM_ADDR_WIDTH. The RFR_N signal is de-asserted when the RX FIFO level (the number of characters remaining in the RX FIFO) is greater than the level that is programmed into this register. · Only RAM_ADDR_WIDTH +1:8 bits are generated.
7	RX_RDY_CTL	Setting (1) this bit enables the automatic ready-for-receiving (RFR_N) control for the receiver. RFR_N is turned off, or set (1), when a valid start bit is received and the channel FIFO is at the level programmed in bits 4 through 0 of this mode register. When the FIFO level falls back to the programmed level, the RFR_N signal is turned on, or clear (0). When this feature is off, the RFR_N signal can be used by normal signal port bit manipulation (see UART_DM_CR register).
6	CTS_CTL	When this bit is set(1), the transmitter checks the CTS_N input to determine whether to begin transmission of a new character. If CTS_N is low, the character is sent. Otherwise the transmitter continues marking until CTS_N goes low, then the next character is transmitted. A change on CTS_N during the transmission of a character has no effect on that character. When this bit is clear(0), the CTS_N input for the channel has no effect on the transmitter.
5:0	AUTO_RFR_LEVEL0	See the description of bit 8 (AUTO_RFR_LEVEL1).

0x16540004 GSBI6_UART_DM_MR2

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI6_UART_DM_MR2

Bits	Name	Description
9	RX_ERROR_CHAR_OFF	When this bit is asserted, characters with parity or framing errors don't enter RX FIFO. Otherwise they enter RX FIFO.
8	RX_BREAK_ZERO_CHAR_OFF	When this bit is asserted, the zero character received at rx_break doesn't enter RX FIFO. Otherwise it enters RX FIFO.
7	LOOPBACK	Internal use only
6	ERROR_MODE	This bit controls the operation of the two FIFO status bits for the channel (parity or framing error and received break). · When clear (0), the UART operates in character mode and the status bits apply only to the character at the top of the FIFO. · When set (1), the UART operates in block mode and both bits are the "OR" of the status for all previously received characters arriving after the last `reset error status' command was issued (see CR register).
5:4	BITS_PER_CHAR	These bits determine how many bits are transmitted or received per character, not including the start, stop, and parity bits. 0x0: 5 bits 0x1: 6 bits 0x2: 7 bits 0x3: 8 bits
3:2	STOP_BIT_LEN	This field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 9/16, 1, 1+ 9/16, and 2 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. 0x0: 0.563 (9/16 bit times) 0x1: 1.000 bit time 0x2: 1.563 (1+9/16 bit times) 0x3: 2.000 bit times
1:0	PARITY_MODE	These bits determine which parity mode is used. The user can select between odd, even, space, or no parity. 0x0: no parity 0x1: odd parity 0x2: even parity 0x3: space parity

0x16540008 GSBI6_UART_DM_CSR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_CSR register is the UART clock selection register. This register is used in conjunction with the UART M/N counter registers to determine the bit rate for the transmitter and receiver. The transmitter and receiver can be clocked at different rates.

The rates below are based on a uart_dm_clk rate of 1.8432 MHz (115.2 * 16).

Table 9-11 lists the hexadecimal values for the clock select field and the corresponding data rates.

Table 9-11 Hexidecimal values and data rates for the clock select field

CLK SEL value	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Bit rate (b/sec)	75	150	300	600	1200	2400	3600	4800	7200	9600	14.4k	19.2k	28.8k	38.4k	57.6k	115.2k

GSBI6_UART_DM_CSR

Bits	Name	Description
7:4	UART_RX_CLK_SEL	Use the CLK SEL values in Table 28-12 to select the appropriate receive and transmit bit rates.
3:0	UART_TX_CLK_SEL	

0x16540070 GSBI6_UART_DM_TF

Type: Write
Clock: AHB_CLK
Reset State: Undefined

In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM TX FIFO.

GSBI6_UART_DM_TF

Bits	Name	Description
31:0	UART_TF	The UART_TF register is the UART transmit FIFO register. This register is used to access the channel transmit FIFO. If the FIFO is full at the time of writing, the character is lost and an interrupt is generated (see UART_DM_IMR register).

0x16540074 GSBI6_UART_DM_TF_2

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_TF_2

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x16540078 GSBI6_UART_DM_TF_3

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_TF_3

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x1654007C GSBI6_UART_DM_TF_4

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_TF_4

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x16540010 GSBI6_UART_DM_CR

Type: Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_CR register is the UART command register. This register is used to issue specific commands to the UART subsystem. This register is updated asynchronously.

CAUTION Do not reset the transmitter and disable it at the same time. Do not reset the receiver and disable it at the same time.

Table 9-12 UART DM commands

Value	Description	Result
0	Null command	Does nothing.
1	Reset receiver	Resets the receiver as if a hardware reset were issued. The receiver is disabled and the FIFO, packing buffer and shift registers are flushed.
2	Reset transmitter	Resets the transmitter as if a hardware reset were issued. The transmitter signal goes high (marking) and the FIFO, unpacking register and shift register are flushed.
3	Reset error status	Clears the overrun error and hunt char received status bits in both the character and block error modes. In the block error mode, it clears the error status and received break.
4	Reset break change interrupt	Clears the break change interrupt status bit.
5	Start break	Forces the transmitter signal low. The transmitter must be enabled. If the transmitter is busy, the break is started when all characters in the transmit FIFO and the transmit shift register have been completely sent.
6	Stop break	If executed while channel is breaking, this command causes the transmitter signal to go high. The signal remains high for at least one bit time before sending out a new character.
7	Reset CTS_N	Clears ISR bit 5.
8	Reset stale interrupt	Clears the stale interrupt.
9	Packet mode	Turns on the sample data mode, which causes the receiver to sample the receive data stream at 16 times the programmed baud rate. The data is sampled with the start of the start bit, or the first data bit, and continued until the marking state. To exit this state, write 1100 in the command field.
A	test_parity_on	Internal use only.
B	test_frame_on	Internal use only.
C	Mode reset	Turns off the sample data mode.
D	Set RFR_N	Asserts the ready for receiving signal (active low).
E	Reset RFR_N	De-asserts the ready for receiving signal.
F	uart_reset_int	Internal use only.
10	Reset TX_ERROR	Clears TX_ERROR
11	Clear TX_DONE	Clears the TX_DONE interrupt (ISR bit 9)
12	Reset break start interrupt	Clears the break start interrupt status bit.
13	Reset break end interrupt	Clears the break end interrupt status bit.
14	Reset par_frame_err interrupt	Clears the par_frame_err interrupt status bit.

Table 9-13 UART DM commands

Value	Description	Result
0	Null command	Does nothing.
1	CR Protection Enable	Enables CR HW protection. When two consecutive writes to the CR are detected, the second write is delayed until the command of the first write is finished. The delay is done by de-asserting the AHB ready and this ensures that the first command completes and the second one will be executed right afterward.
2	CR Protection Disable	Disables CR HW protection. SW is responsible for managing delay between writes to the CR register.
3	Reset TX-Ready interrupt	Clears the TX_READY interrupt.
5	Enable Stale Event	Enables the `stale event' mechanism. See Software Procedures.
6	Disable Stale Event	Disables the `stale event' mechanism. See Software Procedures.
4	SW Force Stale	Causes a `stale event' (even if `stale event' is disabled). See Software Procedures.
7	RESERVED	

GSBI6_UART_DM_CR

Bits	Name	Description
11	CHANNEL_COMMAND_MSB	This is the msb of the CHANNEL_COMMAND bitfield.
10:8	GENERAL_COMMAND	Writing the appropriate value to these bits executes the commands that are listed in Table .
7:4	CHANNEL_COMMAND_LSB	Writing the appropriate value to these bits along with bit 11,executes the commands that are listed in Table 28-13.
3	UART_TX_DISABLE	This command terminates the operation of the transmitter after any character in the transmit shift register is sent.
2	UART_TX_EN	This command enables the operation of the transmitter.
1	UART_RX_DISABLE	This command immediately terminates the operation of the channel receiver and any incoming characters are lost. None of the receiver status bits are affected by this command and characters that are already in the receive FIFO remain there.
0	UART_RX_EN	This command enables the channel receiver.

0x16540014 GSBI6_UART_DM_IMR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IMR register is the UART interrupt mask register. This register is used to enable the corresponding functions in the UART_DM_ISR register. Setting (1) a bit in the UART_DM_IMR register causes an interrupt to be generated, if the corresponding bit in the UART_DM_ISR register is set. Clearing (0) a bit in the UART_DM_IMR register causes the setting of the corresponding bit in the UART_DM_ISR register to have no effect on the interrupt signal.

Bit 6 of the UART_DM_IMR register, CURRENT_CTS, is slightly different. If the current value of the CTS is one (1), no interrupt is generated. However, the user can use bit 6 in this register to mask the CTS value when reading the UART_DM_MISR register or as a general-purpose bit.

GSBI6_UART_DM_IMR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	This bit is asserted in the same condition at which PAR_FRAME_ERR status bit is asserted. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x14.
11	RXBREAK_END	This bit is set (1) if the end of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x13.
10	RXBREAK_START	This bit is set (1) if the start of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x12.
9	TX_DONE	This bit is used only in UIM/SIM_IF mode. Set (1) this bit when the last byte in the transmitter has been sent. This bit is generated only when SIM_GLUE_GEN generic equals 1.
8	TX_ERROR	Only used in UIM_IF mode. Set (1) this bit to indicate that there has been parity error during transmission. To clear the detection logic associated with this function, write CR[11;7:4]=0x10. This bit is generated only when SIM_GLUE_GEN generic equals 1.
7	TX_READY	This bit, when set(1), indicates that: 1. TX FIFO is empty. 2. The value written in NO_CHARS_FOR_TX register equals the number of bytes written to the TX FIFO since the register was updated. **NOTE** There may be characters in the unpack buffer or in the shift register. This bit is cleared by issuing `clear TX ready' command (see UART_DM_CR register).

GSBI6_UART_DM_IMR (cont.)

Bits	Name	Description
6	CURRENT_CTS	This bit indicates the current state of the CTS input. It never generates an interrupt.
5	DELTA_CTS	This bit, when set (1), indicates that the CTS input has changed states. To clear the detection logic associated with this function, write CR[7:4]=0x7.
4	RXLEV	This bit is set when a character is loaded into the receive FIFO that brings the total number of characters in the FIFO above the programmed watermark level in the FIFO watermark register (RFWR). This bit is cleared after enough characters have been read to bring the level equal to or below the programmed watermark level.
3	RXSTALE	This bit indicates that a `stale event' occurred. See Software procedures for the exact timing of this interrupt. It is cleared by issuing a reset-stale command (see CR register).
2	RXBREAK_CHANGE	This bit is set (1) if the start or end of a break condition is detected. The logic associated with this condition is cleared (0) by writing CR[7:4]=0x4. A detected break is defined as an all-zeros character with an invalid stop bit AND LOW PARITY. The end of a break is defined as a mark condition (1) at least 1/2 bit width. A detected break occupies one position in the Rx FIFO.
1	RXHUNT	This bit is set (1) when an incoming character matches the value programmed into the UART_DM_HCR register. This condition is cleared (0) by issuing a reset error status command (CR[7:4]=0x3).
0	TXLEV	This bit is set (1) when a character which is transferred from the transmit FIFO to the transmit shift register brings the total number of characters in the FIFO below or equal to the programmed watermark level in the UART_DM_TFWR register. This bit is cleared (0) after enough characters have been written to the FIFO to bring the level above the programmed watermark level.

0x16540018 GSBI6_UART_DM_IPR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0xffffff9f

The UART_DM_IPR register is the UART interrupt programming register.

GSBI6_UART_DM_IPR

Bits	Name	Description
31:7	STALE_TIMEOUT_MSB	These bits are the STALE_TIMEOUT bitfield. The stale character time-out duration field contains a number from 1 to 2^30 -1. This number determines how many character times must elapse before a `stale event' is generated. This character time is defined as 10 times the bit rate. It is reset whenever a data bit is received. Do not clear (0) this register if the stale character time-out interrupt is enabled. Note the discontinuity in the bit assignments.
6	SAMPLE_DATA	Setting (1) this bit enables the new sample data mode, which means that the start bit is sampled as well as the rest, when in sample data mode. See the CR register, CHANNEL_COMMAND bit for more information.
5	RESERVED	
4:0	STALE_TIMEOUT_LSB	This bitfield is the LSbits of the STALE_TIMEOUT bitfield.

0x1654001C GSBI6_UART_DM_TFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_TFWR register is the UART transmit FIFO watermark register.

GSBI6_UART_DM_TFWR

Bits	Name	Description
31:0	TFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the transmit FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of TX words in the FIFO) is less than or equal to the value in TFWR. See UART_DM_IMR register. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16540020 GSBI6_UART_DM_RFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RFWR register is the UART receive FIFO watermark register.

GSBI6_UART_DM_RFWR

Bits	Name	Description
31:0	RFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the receive FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of words in the RX FIFO) is greater than the value in RFWR. nOnly RAM_ADDR_WIDTH -1:0 bits are generated.

0x16540024 GSBI6_UART_DM_HCR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI6_UART_DM_HCR

Bits	Name	Description
7:0	DATA	The UART_DM_HCR register is the UART hunt character register, which contains the character for which the receiver looks to assert a hunt character received interrupt.

0x16540034 GSBI6_UART_DM_DMRX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI6_UART_DM_DMRX

Bits	Name	Description
24:0	RX_DM_CRCI_CHARS	In the DM mode, the number of chars in the Rx FIFO that are used for CRCI handshake with the DM. The written value of RX_DM_CRCI_ CHARS must be a multiple of 16(bits [3:0] are treated as 0x0). After a value is written, the UART will generate CRCI requests as long as RX_DM_CRCI_CHARS is non zero. Read of DMRX register gives the number of characters that were received since the end of the last transfer. It is reset at the end of each Rx transfer Also is used by the software to indicate `transfer initialization'. See Software procedures.

0x16540038 GSBI6_UART_DM_IRDA

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IRDA register enables the IRDA function, selects a loopback, and allows inversion of RX and TX data. This register also controls the IRDA transceiver that optionally interfaces between the UART and the DP_RX_DATA and DP_TX_DATA pins.

The UART proper is a standard RX/TX configuration that converts the serial pin input and output lines to 8-bit data for the microprocessor. The configuration contains receive and transmit blocks, a control block, a bit rate generator for RX and TX, and FIFO interfaces with the microprocessor data bus. The IRDA register provides the means of switching IRDA circuits into the serial I/O lines and the IRDA function is normally switched out. The IRDA modulator/demodulator may be enabled or disabled under microprocessor control. When enabled, the RX and TX data pathis have individual inversion select bits, so external true or inverted drivers may be used in the signal path.

- The register is generated only when IRDA_IFC_GEN generic equals 1.

GSBI6_UART_DM_IRDA

Bits	Name	Description
4	MEDIUM_RATE_EN	· Set (1) for 1/4 bit-time pulse length (Medium rate) · Clear (0) for 3/16 bit-time pulse length (Low rate)
3	IRDA_LOOPBACK	· This bit loops the IRDA modulated TX line back into the IRDA RX line. The normal UART loopback mode must be off in order to see this effect.
2	INVERT_IRDA_TX	This bit inverts the polarity of the IRDA modulated signal on the DP_TX_DATA pin. · Set (1) this bit for an inverted polarity. · Clear (0) this bit for a non-inverted polarity.
1	INVERT_IRDA_RX	This bit inverts the polarity of the IRDA received signal on the DP_RX_DATA pin. · Set (1) this bit for inverted the polarity. · Clear (0) this bit for non-inverted polarity.
0	IRDA_EN	· Set (1) this bit to enable the IRDA transceiver. · Clear (0) this bit to bypass the IRDA transceiver and ignore the other bits of this register.

0x1654003C GSBI6_UART_DM_DMEN

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_DMEN register indicates if Data Mover is enabled for TX and RX channels.

GSBI6_UART_DM_DMEN

Bits	Name	Description
1	RX_DM_EN	· Set (1) this bit to enable RX DM interface. · Clear (0) this bit to disable RX DM interface. Clearing this bit requires resetting the receiver (see UART_DM_CR register).
0	TX_DM_EN	Set (1) this bit to enable TX DM interface. Clear (0) this bit to disable TX DM interface.

0x16540040 GSBI6_UART_DM_NO_CHARS_FOR_TX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI6_UART_DM_NO_CHARS_FOR_TX

Bits	Name	Description
23:0	TX_TOTAL_TRANS_LEN	The total number of characters for transmission. Before writing a new value, the TX FIFO must be empty (as indicated by TX_READY interrupt in IMR register or after a reset). It is used by the transmitter to calculate how many characters to transmit in the last word. In DM mode, it is also used for the CRCI mechanism. Any additional writes to the TX FIFO above TX_TOTAL_TRANS_LEN will be discarded. A TX_READY interrupt is triggered after TX_TOTAL_TRANS_LEN number of characters were moved from the TX FIFO to the unpacking register (not all may have been sent).

0x16540044 GSBI6_UART_DM_BADR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_BADR

Bits	Name	Description
31:2	RX_BASE_ADDR	RX FIFO base address. Both FIFOs use the same RAM (2^RAM_ADDR_WIDTH, 32-bit entries). This register controls the division of the memory to the RX and TX FIFOs. The division is a multiple of 4 entries, since the DM's burst length is 4. The size of the TX FIFO equals RX_BASE_ADDR. The size of the RX FIFO is 2^RAM_ADDR_WIDTH - RX_BASE_ADDR. ® The default is RX_BASE_ADDR = 2^(RAM_ADDR_WIDTH - 1) ® Only RAM_ADDR_WIDTH -1:2 bits are generated.
1:0	UNUSED	

0x16540048 GSBI6_UART_DM_TESTSL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI6_UART_DM_TESTSL

Bits	Name	Description
4	TEST_EN	Test bus enable
3:0	TEST_SEL	Test bus selector

0x16540060 GSBI6_UART_DM_MISR_MODE

Type: Read/Write
Clock: WR_CLK

GSBI6_UART_DM_MISR_MODE

Bits	Name	Description
31:2	RESERVED	unused.
1:0	MODE	0x0: Disabled 0x1: Enabled,TX test 0x2: Enabled, RX test

0x16540064 GSBI6_UART_DM_MISR_RESET

Type: Write
Clock: WR_CLK
Reset State: Undefined

GSBI6_UART_DM_MISR_RESET

Bits	Name	Description
31:1	RESERVED	unused.
0	RESET	

0x16540068 GSBI6_UART_DM_MISR_EXPORT

Type: Read/Write
Clock: WR_CLK
Reset State: Undefined

GSBI6_UART_DM_MISR_EXPORT

Bits	Name	Description
31:1	RESERVED	unused.
0	EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., what is the result of the muxing of all the input data streams with <BLOCK>_TEST_MODE) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x1654006C GSBI6_UART_DM_MISR_VAL

Type: Read
Clock: WR_CLK
Reset State: Undefined

GSBI6_UART_DM_MISR_VAL

Bits	Name	Description
9:0	VAL	Current MISR state

0x16540080 GSBI6_UART_DM_SIM_CFG

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_SIM_CFG register is used to configure the SIM interface for the UART.

- The register is generated only when SIM_GLUE_GEN generic equals 1.

GSBI6_UART_DM_SIM_CFG

Bits	Name	Description
17	UIM_TX_MODE	When this bit is set (1), the transmission portion of the SIM interface operates in block mode (T=1). When clear (0), the transmission portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
16	UIM_RX_MODE	When this bit is set (1), the receive portion of the SIM interface operates in block mode (T=1). When clear (0), the receive portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.

GSBI6_UART_DM_SIM_CFG (cont.)

Bits	Name	Description
15:8	SIM_STOP_BIT_LEN	In UIM_IF mode, this field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 1 to 254 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. ..... 11 111110: 254 bit times 0x1: 1 bit times 0x2: 2 bit times
7	SIM_CLK_ON	When this bit is set(1), the UIM_CLK is turned on at either the TD8 or TD4 frequency, as indicated by bit6(UIM_CLK_TD8_SEL). When this bit is cleared, the UIM_CLK is stopped either LOW or HIGH, as indicated by bit 5(UIM_CLK_STOP_HIGH).
6	SIM_CLK_TD8_SEL	This bit selects the UIM_CLK frequency at which the UIM_CLK is turned on. 0x1: TD8 (the UIM_CLK runs at the TD8 frequency) 0x0: TD4 (the UIM_CLK runs at the TD4 frequency)
5	SIM_CLK_STOP_HIGH	This bit indicates at what point - high or low - the UIM_CLK will stop. 0x1: high 0x0: low
4	SIM_CLK_SEL	unused
3	MASK_RX	Setting (1) this bit masks off any 0 on the RX line, which prevents the receiver from seeing the START bit. Set (1) this bit if you do not want to receive the data you transmit.
2	SWAP_D	Setting (1) this bit causes the UIM_IF to swap the 8 data bits (making MSB into LSB, bit 6 into bit1, and so on) before it is read by the microprocessor.
1	INV_D	Set (1) this bit to cause the UIM_IF to invert the 8 data bit before it is read by the microprocessor.
0	SIM_SEL	Set (1) this bit to designate the UIM_IF mode of operation.

0x16540084 GSBI6_UART_DM_TEST_WR_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI6_UART_DM_TEST_WR_ADDR

Bits	Name	Description
31:0	TEST_WR_ADDR	RAM address at which to write the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16540088 GSBI6_UART_DM_TEST_WR_DATA

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_TEST_WR_DATA

Bits	Name	Description
31:0	TEST_WR_DATA	The test data to be written to the RAM. Write to this register triggers the write to the RAM, to TEST_WR_ADDR address.

0x1654008C GSBI6_UART_DM_TEST_RD_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI6_UART_DM_TEST_RD_ADDR

Bits	Name	Description
31:0	TEST_RD_ADDR	RAM address from which to read the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

9.12.1.1 Read registers

NOTE The addresses of the read-only registers are mapped into the same addresses of the four write-only registers in the section above this one. They are: UART_DM_CSR, UART_DM_TF, UART_DM_CR, and UART_DM_IMR, respectively.

0x16540008 GSBI6_UART_DM_SR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_SR register is the UART status register. This register is used to obtain the current state of the UART subsystem. This register is updated asynchronously.

GSBI6_UART_DM_SR

Bits	Name	Description
8	RX_BREAK_START_LAST	When break start is detected, this bit is set (1). When break end was detected, this bit is reset (0).

GSBI6_UART_DM_SR (cont.)

Bits	Name	Description
7	HUNT_CHAR	When set (1), this bit indicates that the programmed character in the UART_DM_HCR register was received. If programmed, this condition causes the RXHUNT bit to be set (1) in the UART_DM_ISR register. This bit is cleared by issuing a reset error status command.
6	RX_BREAK	When set (1), this bit indicates that an all-zero character of the programmed length was received without a stop bit. If a break begins in the middle of a character, it is detected if the condition remains until the end of the next character time. Only one all zero character is written into the FIFO upon receiving the break. After the RX input returns high for at least half a bit time, then more characters are accepted by the receiver. Whenever the break condition starts or stops as defined above, the RXBREAK bit is set (1) in the UART_DM_ISR register. This bit is appended to the character in the receive FIFO.
5	PAR_FRAME_ERR	A parity error occurs if parity is programmed to be checked and an incoming character is received with incorrect parity. A framing error occurs when the RX input is low while the stop bit is being sampled. This bit is sampled in the middle of the first stop bit position, regardless of the programmed length of the stop bit. This error bit is appended to the character in the receive FIFO.
4	UART_OVERRUN	An overrun error occurs if one or more incoming characters are lost. This happens when the receive FIFO is full, the packing buffer is full and another character has been received in the shift register. The character in the receive shift register is lost. Upon overrun, this status bit remains high until cleared by a reset error status command.
3	TXEMT	This bit is set (1) when the transmitter under-runs. It is set after the transmission of the stop bit at the end of a character, if there are no characters waiting to be sent. It is reset when a character is written to the transmit FIFO.
2	TXRDY	This bit indicates that the transmit FIFO has space in it. It is reset when the FIFO becomes full and set when space becomes available again. Any characters that are written to the FIFO while this bit is low is lost.
1	RXFULL	This bit is set (1) when the receive FIFO becomes full. It is reset when the CPU reads a word.
0	RXRDY	This bit is set (1) when there is a word in the receive FIFO waiting to be read. It is reset when the last word currently stored in the FIFO is read.

0x16540070 GSBI6_UART_DM_RF

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RF register is the UART receive FIFO register, which is used to access the channel receive FIFO. In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM RX FIFO.

GSBI6_UART_DM_RF

Bits	Name	Description
31:0	UART_RF	This register returns the next value in the receive FIFO. After the read is completed, the FIFO read pointer is updated to make the next character available.

0x16540074 GSBI6_UART_DM_RF_2

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_RF_2

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x16540078 GSBI6_UART_DM_RF_3

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_RF_3

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x1654007C GSBI6_UART_DM_RF_4

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_RF_4

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x16540010 GSBI6_UART_DM_MISR

Type: Read
Clock: AHB_CLK
Reset State: 0x0

GSBI6_UART_DM_MISR

Bits	Name	Description
12:0	UART_MISR	The UART_DM_MISR register is the masked interrupt status register. A read from this register returns the "AND" of the UART_DM_ISR and the UART_DM_IMR registers. This register is updated asynchronously. This bit field is misr <= (isr(12 DOWNTO 7) AND imr(12 DOWNTO 7)) & '0' & (isr(5 DOWNTO 0) AND imr(5 DOWNTO 0)).

0x16540014 GSBI6_UART_DM_ISR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_ISR register is the UART interrupt status register. This register provides the current status of the possible interrupt conditions. If one of these bits is set (1), and the corresponding bit in the UART_DM_IMR register is set (1), an interrupt is generated (with the exception of bit 6, CURRENT_CTS - see the description of the UART_DM_IMR register). If the corresponding bit in the UART_DM_IMR register is clear (0), setting one of these bits has no effect on the UART interrupt request signal. This register is updated asynchronously.

GSBI6_UART_DM_ISR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	· See UART_DM_IMR on page 28-9
11	RXBREAK_END	· See UART_DM_IMR on page 28-9
10	RXBREAK_START	· See UART_DM_IMR on page 28-9
9	TX_DONE	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
8	TX_ERROR	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
7	TX_READY	See UART_DM_IMR on page 28-9, for descriptions of the UART_DM_ISR bits.
6	CURRENT_CTS	
5	DELTA_CTS	
4	RXLEV	
3	RXSTALE	

GSBI6_UART_DM_ISR (cont.)

Bits	Name	Description
2	RXBREAK	
1	RXHUNT	
0	TXLEV	

0x16540038 GSBI6_UART_DM_RX_TOTAL_SNAP

Type: Read
Clock: AHB_CLK
Reset State: 0x0

GSBI6_UART_DM_RX_TOTAL_SNAP

Bits	Name	Description
23:0	RX_TOTAL_BYTES	'RX_TOTAL_SNAP register holds the number of characters received since the end of last Rx transfer. It is updated at the end of an Rx transfer (see Software procedures). Rx transfer ends when one of the conditions is met: · The number of characters which were received since the end of the previous transfer equals the value which was written to DMRX at "Transfer initialization". · A stale event occurred (flush operation already performed if was needed).

0x1654004C GSBI6_UART_DM_TXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_TXFS

Bits	Name	Description
31:14	TX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. · Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	TX_ASYNC_FIFO_STATE	TX asynchronous fifo status - number of characters in the TX asynchronous FIFO.
9:7	TX_BUFFER_STATE	TX unpacking buffer status - number of bytes in the unpacking buffer
6:0	TX_FIFO_STATE_LSB	TX FIFO status - number of words in the TX FIFO

0x16540050 GSBI6_UART_DM_RXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_RXFS

Bits	Name	Description
31:14	RX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	RX_ASYNC_FIFO_STATE	RX asynchronous fifo status - number of characters in the RX asynchronous FIFO.
9:7	RX_BUFFER_STATE	RX packing buffer status - number of bytes in the packing buffer
6:0	RX_FIFO_STATE_LSB	The number of entries in the RX FIFO that have at least one valid character. It is incremented each time a word is moved from the packing register to the RX FIFO. It is decremented each time a word is read from the RX FIFO. **NOTE** The Uart does not keep track of non-valid characters in each word. (See Software procedures).

0x16540090 GSBI6_UART_DM_TEST_RD_DATA

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI6_UART_DM_TEST_RD_DATA

Bits	Name	Description
31:0	TEST_RD_DATA	Read from this register triggers the read from the RAM. The register will hold, after read access, data which is found at TEST_RD_ADDR address in the RAM.

9.13 GSBI6 QUP Registers (0x16580000 QUP6_BASE)

This section contains the GSBI6 QUP registers.

0x16580000 GSBI6_QUP_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).

b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:

- N equals 8 or less - shift 24
- N equals 16 to 9 - shift 16
- N equals 24 to 17 - shift 8
- N equals 32 to 25 - no shift

The MINI_CORE clock selected is as follows:

Null: cc_qup_core_clk

SPI: cc_spi_master_clk

I2C: cc_I2C_clk		

GSBI6_QUP_CONFIG

Bits	Name	Description
31:14	RESERVED_1	reserved
13	CORE_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).
12	APP_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).

GSBI6_QUP_CONFIG (cont.)

Bits	Name	Description
11:8	MINI_CORE	value: 0000 Null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 I2C slave controller value: 0100 Reserved (I2C master & slave for loop back operation) value: 0101 Reserved (map to null core) value: 0110 Reserved (map to null core value: 0111 Reserved (map to null core) See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a "don't care". The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS _N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	RESERVED_2	Reserved.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x16580004 GSBI6_QUP_STATE

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000000XX100

GSBI6_QUP_STATE

Bits	Name	Description
31:5	RESERVED	reserved.
4	I2C_MAST_GEN	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.

GSBI6_QUP_STATE (cont.)

Bits	Name	Description
1:0	STATE	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to "01", the mini-core and related logic is released from reset and enters the RUN_STATE. When set to "11", the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete. See notes 1 and 2. Note 1: SPI - the "next appropriate point in time" is the next time SPI_CS _N de-asserts. If SPI_CS _N is not asserted when the PAUSE_STATE is entered, the SPI_CS _N is maintained in the not asserted state. The PAUSE_STATE is not available for SLAVE operation. Note 2: I2C -

0x16580008 GSBI6_QUP_IO_MODES

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000XXXXXXXX

Unless otherwise stated, register bits written return the value when read.

Notes:

a. "Packing" occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. "UnPacking" occurs as follows:

- N equals 8 or less - unpack four values from each QUP output FIFO word.
- N equals 16 to 9 - unpack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

GSBI6_QUP_IO_MODES

Bits	Name	Description
31:17	RESERVED	reserved
16	OUTPUT_BIT_SHIFT_EN	If set, enables the QUP output FIFO block to do bit shifting on the output data.

GSBI6_QUP_IO_MODES (cont.)

Bits	Name	Description
15	PACK_EN	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 6x BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode and Data_Mover_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16 BLOCK_SIZE
1:0	OUTPUT_BLOCK_SIZE	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x1658000C GSBI6_QUP_SW_RESET

Type: Write/cmd
Clock: CRIF_CLK
Reset State: 0x0000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero.

GSBI6_QUP_SW_RESET

Bits	Name	Description
31:0	RESERVED	NA

0x16580010 GSBI6_QUP_TIME_OUT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies if the QUP_MX_OUTPUT_COUNT register and/or QUP_MX_INPUT_COUNT register are enabled. Additionally, this register only applies to Block_Mode and Data_Mover_Mode. The timer starts "ticking" when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The timer pauses for the PAUSE_STATE. If the timer expires before the QUP_MX_OUTPUT_COUNT and/or QUP_MX_INPUT_COUNT are exhausted, then the TIME_OUT_ERR flag is set in the QUP_ERROR_FLAGS register and the interrupt gsbi_qup_irq may be asserted.

GSBI6_QUP_TIME_OUT

Bits	Name	Description
15:0	TIME_OUT_VALUE	Specifies time out value in units of cc_qup_app clock ticks. A value of zero indicates the timer function is not enabled for use. See QUP_CONFIG register for information on clocks.

0x16580014 GSBI6_QUP_TIME_OUT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI6_QUP_TIME_OUT_CURRENT

Bits	Name	Description
31:0	TIME_OUT_CURRENT	Current value of time-out counter.

0x16580018 GSBI6_QUP_OPERATIONAL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0080

GSBI6_QUP_OPERATIONAL

Bits	Name	Description
31:10	RESERVED_1	reserved.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Data_Mover_Mode.
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Data_Mover_Mode.
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowleges software has or will read the data. Valid only in all modes.
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowledges software has or will read the data. Valid only in all modes.
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.
3:0	RESERVED_2	reserved.

0x1658001C GSBI6_QUP_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

GSBI6_QUP_ERROR_FLAGS

Bits	Name	Description
31:7	RESERVED_1	reserved.
6	TIME_OUT_ERR	The time out limit for a given transfer has been reached.
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ER R	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.
1:0	RESERVED_2	reserved

0x16580020 GSBI6_QUP_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x007C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of gsbi_qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

GSBI6_QUP_ERROR_FLAGS_EN

Bits	Name	Description
31:7	RESERVED_1	reserved
6	TIME_OUT_ERR_EN	If set, enables time out error generation.
5	OUTPUT_OVER_RUN_ERR _EN	If set, enables output over run error generation.

GSBI6_QUP_ERROR_FLAGS_EN (cont.)

Bits	Name	Description
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.
1:0	RESERVED_2	reserved

0x16580024 GSBI6_QUP_TEST_CTRL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register enables QUP test bus to be actively driven by QUP core signals.

GSBI6_QUP_TEST_CTRL

Bits	Name	Description
31:1	RESERVED	reserved
0	QUP_TEST_BUS_EN	If set, enables QUP core to actively drive test bus. If zero, the core drives the test bus to all zeros.

9.13.1 QUP output FIFO registers

0x16580100 GSBI6_QUP_MX_OUTPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not effect the count.

Notes:

a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

GSBI6_QUP_MX_OUTPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_COUNT	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x16580104 GSBI6_QUP_MX_OUTPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI6_QUP_MX_OUTPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x16580108 GSBI6_QUP_OUTPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

This register holds the output data hanging out of the QUP output FIFO ready be loaded into the mini-core for the next load operation. This corresponds to signal qup_data_out going into the mini-core block.

GSBI6_QUP_OUTPUT_DEBUG

Bits	Name	Description
31:0	OUTPUT_DEBUG_DATA	Value waiting at the exit of output FIFO.

0x1658010C GSBI6_QUP_OUTPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the

value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

GSBI6_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	OUTPUT_FIFO_WORD_CNT	Number of words in the output FIFO.

0x16580110+4*c GSBI6_QUP_OUTPUT_FIFOc, c=[0..15]

Type: Write
Clock: CRIF_CLK
Reset State: 0x0000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

GSBI6_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x16580150 GSBI6_QUP_MX_WRITE_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the gsbi_qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

GSBI6_QUP_MX_WRITE_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_COUNT	The number of "writes" of size N. This is used only if the core is in FIFO_Mode.

0x16580154 GSBI6_QUP_MX_WRITE_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI6_QUP_MX_WRITE_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

9.13.2 QUP input FIFO registers

0x16580200 GSBI6_QUP_MX_INPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

GSBI6_QUP_MX_INPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_COUNT	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x16580204 GSBI6_QUP_MX_INPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI6_QUP_MX_INPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x16580208 GSBI6_QUP_MX_READ_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

GSBI6_QUP_MX_READ_COUNT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_COUNT	The number of "reads" of size N. This is used only if the core is in FIFO_Mode.

0x1658020C GSBI6_QUP_MX_READ_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI6_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x16580210 GSBI6_QUP_INPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the value of the last loaded in known-good-data into the QUP input FIFO. May be different from what the actual read of input FIFO will return because of packing enabled at the input side. This corresponds to signal qup_data_in coming from the mini-core block synchronized to the crif_clk.

GSBI6_QUP_INPUT_DEBUG

Bits	Name	Description
31:0	INPUT_DEBUG_DATA	Last known good value shifted into the input FIFO.

0x16580214 GSBI6_QUP_INPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

GSBI6_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

0x16580218+4*c GSBI6_QUP_INPUT_FIFOc, c=[0..15]

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

Consecutive reads to this address reads the input FIFO contents on a FIFO basis.The max address to read the input FIFO is 0x254.

GSBI6_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

9.13.3 SPI mini-core registers

0x16580300 GSBI6_SPI_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

GSBI6_SPI_CONFIG

Bits	Name	Description
31:11	RESERVED_1	Reserved.
10	HS_MODE	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
7:6	RESERVED_2	Reserved.
5	SLAVE_OPERATION	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.
4:0	RESERVED	Reserved.

0x16580304 GSBI6_SPI_IO_CONTROL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

GSBI6_SPI_IO_CONTROL

Bits	Name	Description
31:11	RESERVED	Reserved.
10	CLK_IDLE_HIGH	Use SPI_CLK_IDLE_HIGH when set.
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS _N respectively. Setting any of this bit to '1', makes the associated SPI_CS _N active HIGH. This field is a "don't care" in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_ N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a "don't care" in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS _N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS _N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x16580308 GSBI6_SPI_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

GSBI6_SPI_ERROR_FLAGS

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.

GSBI6_SPI_ERROR_FLAGS (cont.)

Bits	Name	Description
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x1658030C GSBI6_SPI_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0003

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

GSBI6_SPI_ERROR_FLAGS_EN

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x16580310 GSBI6_SPI_DEASSERT_WAIT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the de-assertion wait time of SPI_CS _N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

GSBI6_SPI_DEASSERT_WAIT

Bits	Name	Description
31:6	RESERVED	Reserved.

GSBI6_SPI_DEASSERT_WAIT (cont.)

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the de-asserted time of SPI_CS _N. Only applies to MASTER operation. For SLAVE operation, this field is a "don't care". A value of zero indicates SPI_CS _N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

9.13.4 I2C master mini-core registers

0x16580400 GSBI6_I2C_MASTER_CLK_CTL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_CLK_CTL register is a read/write register that controls clock divider values. This register should only be written to after it is confirmed that the I2C master mini-core is not longer in RESET state (QUP_STATE register).

GSBI6_I2C_MASTER_CLK_CTL

Bits	Name	Description
31:11	RESERVED	Reserved.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. The minimum value should be 3 hex (4 I2C_clk clocks per period) to ensure proper sampling of the bus. For a maximum high speed bit rate of 3.4 Mb/s (high speed mode), this would require a minimum 40.8 MHz I2C_clk clock. The maximum I2C_clk is 81.6 MHz. This register is reset to a maximum value of 7 hex. I2C_HS_CLK = I2C_CLK/(3*(HS_DIVIDER_VALUE+1)
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. The minimum value should be 3 hex to ensure proper sampling of the bus. For a maximum bit rate of 400 kb/s (fast mode), this would require a 4.8 MHz I2C_clk clock. For a maximum bit rate of 100 kb/s (standard mode), this would require a 1.2 MHz I2C_clk clock. Maximum I2C_clk for fast and standard modes are 206.4 MHz and 51.6 MHz respectively. This register is reset to a maximum value of 255 hex. I2C_FS_CLK = I2C_CLK/(2*(FS_DIVIDER_VALUE+3)

0x16580404 GSBI6_I2C_MASTER_STATUS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_STATUS is a status register. Writing a one clears the status bits.

GSBI6_I2C_MASTER_STATUS

Bits	Name	Description
31:26	RESERVED_1	Reserved.
25	INVALID_READ_SEQ	This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	This bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address).
23	INVALID_TAG	This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Reset, read_last_byte, mi_rec, dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: READ_LAST_BYTE_STATE Value 0x3: MI_REC_STATE Value 0x4: DEC_STATE Value 0x5: STORE_STATE
19:16	OUTPUT_FSM_STATE	This 4-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Reset, decode, send, mi_red, nop, nop_dec, invalid, invalid_dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: DECODE_STATE Value 0x3: SEND_STATE Value 0x4: MI_REC_STATE Value 0x5: NOP_STATE Value 0x6: INVALID_STATE Value 0x7: PEEK_STATE Value 0x8: SEND_R_STATE

GSBI6_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
15:13	CLK_STATE	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Reset_busidle, not_master, high, low, high_wait, forced_low, hs_addr_low or double_buffer_wait. Value 0x0: RESET_BUSIDLE_STATE Value 0x1: NOT_MASTER_STATE Value 0x2: HIGH_STATE Value 0x3: LOW_STATE Value 0x4: HIGH_WAIT_STATE Value 0x5: FORCED_LOW_STATE Value 0x6: HS_ADDR_LOW_STATE Value 0x7: DOUBLE_BUFFER_WAIT_STATE
12:10	DATA_STATE	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Reset, Tx addr, Tx HS addr, Tx 10-bit addr, Tx 2nd 10-bit addr byte, Tx data and Rx data. Value 0x0: RESET_WAIT_STATE Value 0x1: TX_ADDR_STATE Value 0x2: TX_DATA_STATE Value 0x3: TX_HS_ADDR_STATE Value 0x4: TX_10_BIT_ADDR_STATE Value 0x5: TX_2ND_BYTE_STATE Value 0x6: RX_DATA_STATE
9	BUS_MASTER	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.

GSBI6_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
4	ARB_LOST	This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.
3	PACKET_NACKED	This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1:0	RESERVED_2	Reserved.

9.14 GSBI7 Registers (0x16600000 GSBI7_BASE)

This section contains the GSBI7 registers.

9.14.1 GSBI CTRL Registers

0x16600000 GSBI7_GSBI_CTRL_REG

Type: Read/write
Clock: HCLK
Reset State: 0x00000000

GSBI7_GSBI_CTRL_REG

Bits	Name	Description
15:12	RESERVED	reserved
11:8	WRAPPER_CTRL	This field has no predefined use. When a wrapper is constructed around one or more GSBIs there may be a need to configure it. E.g., to select which of several GSBIs will be connected to a particular I2S block. All bits of this field emerge from GSBI as output ports which can be used for any such configuration task.
7	RESERVED_7	Reserved. The host can write and read this field, but its state has no effect on anything.
6:4	PROTOCOL_CODE	This field controls which protocol, if any, is applied to the GSBI's four I/O ports. Most codes assign a single protocol, but codes of "001" and "110" assigns I2C to two of the ports and UART (without flow control signals) or SIM to the other two. 0x0: Idle (null values are applied to all four GSBI I/Os) 0x1: I2C on 2 ports, SIM/R-UIM on other 2 0x2: I2C 0x3: SPI 0x4: UART with flow control (or IRDA) 0x5: SIM/R-UIM 0x6: I2C on 2 ports, UART (without HS flow ctrl on other 2) 0x7: Undefined
3:1	RESERVED_3_1	Reserved. The host can write and read this field, but its state has no effect on anything.
0	CRCI_MUX_CTRL	While this bit is low QUP CRCI ports are connected to the GSBI ports nominally for QUP and UART_DM CRCI ports are connected to the GSBI ports nominally for UART_DM. While this bit is high QUP CRCI ports are connected to the GSBI ports nominally for UART_DM and UART_DM CRCI ports are connected to nothing.

0x16600004 GSBI7_GSBI_DBG0_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI7_GSBI_DBG0_REG

Bits	Name	Description
1:0	GSBI_PLAY0	This field has no function beyond the fact that the ARM can write to it and read from it.

0x16600008 GSBI7_GSBI_DBG1_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI7_GSBI_DBG1_REG

Bits	Name	Description
1:0	GSBI_PLAY1	This field has no function beyond the fact that the ARM can write to it and read from it.

0x1660000C GSBI7_GSBI_DBG2_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI7_GSBI_DBG2_REG

Bits	Name	Description
1:0	GSBI_PLAY2	This field has no function beyond the fact that the ARM can write to it and read from it.

0x16600010 GSBI7_GSBI_DBG3_REG

Type: Read/write
Clock: HCLK
Reset State: 0x0

GSBI7_GSBI_DBG3_REG

Bits	Name	Description
1:0	GSBI_PLAY3	This field has no function beyond the fact that the ARM can write to it and read from it.

9.15 GSBI7 UART DM Registers (0x16640000 GSBI7_UART_DM_BASE)

This section contains GSBI7 UART DM registers.

9.15.1 Write and read/write registers

0x16640000 GSBI7_UART_DM_MR1

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_MR1 register is the UART mode register 1. It is used, along with UART_DM_MR2, to configure the operational mode of the UART.

GSBI7_UART_DM_MR1

Bits	Name	Description
31:8	AUTO_RFR_LEVEL1	These bits are used, along with bits 5:0 (AUTO_RFR_LEVEL0) to program the level in the receive FIFO at which the RFR_N signal is de-asserted, if programmed to do so (see RX_RDY_CTL field of this register). The level counts the number of words inside the RX FIFO. It doesn't count the character that is being received (shift register) or characters in the packing buffer. This value is programmed from 1 to 2^RAM_ADDR_WIDTH. The RFR_N signal is de-asserted when the RX FIFO level (the number of characters remaining in the RX FIFO) is greater than the level that is programmed into this register. · Only RAM_ADDR_WIDTH +1:8 bits are generated.
7	RX_RDY_CTL	Setting (1) this bit enables the automatic ready-for-receiving (RFR_N) control for the receiver. RFR_N is turned off, or set (1), when a valid start bit is received and the channel FIFO is at the level programmed in bits 4 through 0 of this mode register. When the FIFO level falls back to the programmed level, the RFR_N signal is turned on, or clear (0). When this feature is off, the RFR_N signal can be used by normal signal port bit manipulation (see UART_DM_CR register).
6	CTS_CTL	When this bit is set(1), the transmitter checks the CTS_N input to determine whether to begin transmission of a new character. If CTS_N is low, the character is sent. Otherwise the transmitter continues marking until CTS_N goes low, then the next character is transmitted. A change on CTS_N during the transmission of a character has no effect on that character. When this bit is clear(0), the CTS_N input for the channel has no effect on the transmitter.
5:0	AUTO_RFR_LEVEL0	See the description of bit 8 (AUTO_RFR_LEVEL1).

0x16640004 GSBI7_UART_DM_MR2

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI7_UART_DM_MR2

Bits	Name	Description
9	RX_ERROR_CHAR_OFF	When this bit is asserted, characters with parity or framing errors don't enter RX FIFO. Otherwise they enter RX FIFO.
8	RX_BREAK_ZERO_CHAR_OFF	When this bit is asserted, the zero character received at rx_break doesn't enter RX FIFO. Otherwise it enters RX FIFO.
7	LOOPBACK	Internal use only
6	ERROR_MODE	This bit controls the operation of the two FIFO status bits for the channel (parity or framing error and received break). · When clear (0), the UART operates in character mode and the status bits apply only to the character at the top of the FIFO. · When set (1), the UART operates in block mode and both bits are the "OR" of the status for all previously received characters arriving after the last `reset error status' command was issued (see CR register).
5:4	BITS_PER_CHAR	These bits determine how many bits are transmitted or received per character, not including the start, stop, and parity bits. 0x0: 5 bits 0x1: 6 bits 0x2: 7 bits 0x3: 8 bits
3:2	STOP_BIT_LEN	This field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 9/16, 1, 1+ 9/16, and 2 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. 0x0: 0.563 (9/16 bit times) 0x1: 1.000 bit time 0x2: 1.563 (1+9/16 bit times) 0x3: 2.000 bit times
1:0	PARITY_MODE	These bits determine which parity mode is used. The user can select between odd, even, space, or no parity. 0x0: no parity 0x1: odd parity 0x2: even parity 0x3: space parity

0x16640008 GSBI7_UART_DM_CSR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_CSR register is the UART clock selection register. This register is used in conjunction with the UART M/N counter registers to determine the bit rate for the transmitter and receiver. The transmitter and receiver can be clocked at different rates.

The rates below are based on a uart_dm_clk rate of 1.8432 MHz (115.2 * 16).

Table 9-14 lists the hexadecimal values for the clock select field and the corresponding data rates.

Table 9-14 Hexadecimal values and data rates for the clock select field

CLK SEL value	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Bit rate (b/sec)	75	150	300	600	1200	2400	3600	4800	7200	9600	14.4k	19.2k	28.8k	38.4k	57.6k	115.2k

GSBI7_UART_DM_CSR

Bits	Name	Description
7:4	UART_RX_CLK_SEL	Use the CLK SEL values in Table 28-12 to select the appropriate receive and transmit bit rates.
3:0	UART_TX_CLK_SEL	

0x16640070 GSBI7_UART_DM_TF

Type: Write
Clock: AHB_CLK
Reset State: Undefined

In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM TX FIFO.

GSBI7_UART_DM_TF

Bits	Name	Description
31:0	UART_TF	The UART_TF register is the UART transmit FIFO register. This register is used to access the channel transmit FIFO. If the FIFO is full at the time of writing, the character is lost and an interrupt is generated (see UART_DM_IMR register).

0x16640074 GSBI7_UART_DM_TF_2

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_TF_2

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x16640078 GSBI7_UART_DM_TF_3

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_TF_3

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x1664007C GSBI7_UART_DM_TF_4

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_TF_4

Bits	Name	Description
31:0	UART_TF	See UART_DM_TF register.

0x16640010 GSBI7_UART_DM_CR

Type: Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_CR register is the UART command register. This register is used to issue specific commands to the UART subsystem. This register is updated asynchronously.

CAUTION Do not reset the transmitter and disable it at the same time. Do not reset the receiver and disable it at the same time.

Table 9-15 UART DM commands

Value	Description	Result
0	Null command	Does nothing.
1	Reset receiver	Resets the receiver as if a hardware reset were issued. The receiver is disabled and the FIFO, packing buffer and shift registers are flushed.
2	Reset transmitter	Resets the transmitter as if a hardware reset were issued. The transmitter signal goes high (marking) and the FIFO, unpacking register and shift register are flushed.
3	Reset error status	Clears the overrun error and hunt char received status bits in both the character and block error modes. In the block error mode, it clears the error status and received break.
4	Reset break change interrupt	Clears the break change interrupt status bit.
5	Start break	Forces the transmitter signal low. The transmitter must be enabled. If the transmitter is busy, the break is started when all characters in the transmit FIFO and the transmit shift register have been completely sent.
6	Stop break	If executed while channel is breaking, this command causes the transmitter signal to go high. The signal remains high for at least one bit time before sending out a new character.
7	Reset CTS_N	Clears ISR bit 5.
8	Reset stale interrupt	Clears the stale interrupt.
9	Packet mode	Turns on the sample data mode, which causes the receiver to sample the receive data stream at 16 times the programmed baud rate. The data is sampled with the start of the start bit, or the first data bit, and continued until the marking state. To exit this state, write 1100 in the command field.
A	test_parity_on	Internal use only.
B	test_frame_on	Internal use only.
C	Mode reset	Turns off the sample data mode.
D	Set RFR_N	Asserts the ready for receiving signal (active low).
E	Reset RFR_N	De-asserts the ready for receiving signal.
F	uart_reset_int	Internal use only.
10	Reset TX_ERROR	Clears TX_ERROR
11	Clear TX_DONE	Clears the TX_DONE interrupt (ISR bit 9)
12	Reset break start interrupt	Clears the break start interrupt status bit.
13	Reset break end interrupt	Clears the break end interrupt status bit.
14	Reset par_frame_err interrupt	Clears the par_frame_err interrupt status bit.

Table 9-16 UART DM commands

Value	Description	Result
0	Null command	Does nothing.
1	CR Protection Enable	Enables CR HW protection. When two consecutive writes to the CR are detected, the second write is delayed until the command of the first write is finished. The delay is done by de-asserting the AHB ready and this ensures that the first command completes and the second one will be executed right afterward.
2	CR Protection Disable	Disables CR HW protection. SW is responsible for managing delay between writes to the CR register.
3	Reset TX-Ready interrupt	Clears the TX_READY interrupt.
5	Enable Stale Event	Enables the `stale event' mechanism. See Software Procedures.
6	Disable Stale Event	Disables the `stale event' mechanism. See Software Procedures.
4	SW Force Stale	Causes a `stale event' (even if `stale event' is disabled). See Software Procedures.
7	RESERVED	

GSBI7_UART_DM_CR

Bits	Name	Description
11	CHANNEL_COMMAND_MSB	This is the msb of the CHANNEL_COMMAND bitfield.
10:8	GENERAL_COMMAND	Writing the appropriate value to these bits executes the commands that are listed in Table .
7:4	CHANNEL_COMMAND_LSB	Writing the appropriate value to these bits along with bit 11,executes the commands that are listed in Table 28-13.
3	UART_TX_DISABLE	This command terminates the operation of the transmitter after any character in the transmit shift register is sent.
2	UART_TX_EN	This command enables the operation of the transmitter.
1	UART_RX_DISABLE	This command immediately terminates the operation of the channel receiver and any incoming characters are lost. None of the receiver status bits are affected by this command and characters that are already in the receive FIFO remain there.
0	UART_RX_EN	This command enables the channel receiver.

0x16640014 GSBI7_UART_DM_IMR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IMR register is the UART interrupt mask register. This register is used to enable the corresponding functions in the UART_DM_ISR register. Setting (1) a bit in the

UART_DM_IMR register causes an interrupt to be generated, if the corresponding bit in the UART_DM_ISR register is set. Clearing (0) a bit in the UART_DM_IMR register causes the setting of the corresponding bit in the UART_DM_ISR register to have no effect on the interrupt signal.

Bit 6 of the UART_DM_IMR register, CURRENT_CTS, is slightly different. If the current value of the CTS is one (1), no interrupt is generated. However, the user can use bit 6 in this register to mask the CTS value when reading the UART_DM_MISR register or as a general-purpose bit.

GSBI7_UART_DM_IMR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	This bit is asserted in the same condition at which PAR_FRAME_ERR status bit is asserted. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x14.
11	RXBREAK_END	This bit is set (1) if the end of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x13.
10	RXBREAK_START	This bit is set (1) if the start of a break condition is detected. The logic associated with this condition is cleared (0) by issuing CHANNEL_COMMAN = 0x12.
9	TX_DONE	This bit is used only in UIM/SIM_IF mode. Set (1) this bit when the last byte in the transmitter has been sent. This bit is generated only when SIM_GLUE_GEN generic equals 1.
8	TX_ERROR	Only used in UIM_IF mode. Set (1) this bit to indicate that there has been parity error during transmission. To clear the detection logic associated with this function, write CR[11;7:4]=0x10. This bit is generated only when SIM_GLUE_GEN generic equals 1.
7	TX_READY	This bit, when set(1), indicates that: 1. TX FIFO is empty. 2. The value written in NO_CHARS_FOR_TX register equals the number of bytes written to the TX FIFO since the register was updated. **NOTE** There may be characters in the unpack buffer or in the shift register. This bit is cleared by issuing `clear TX ready' command (see UART_DM_CR register).
6	CURRENT_CTS	This bit indicates the current state of the CTS input. It never generates an interrupt.
5	DELTA_CTS	This bit, when set (1), indicates that the CTS input has changed states. To clear the detection logic associated with this function, write CR[7:4]=0x7.

GSBI7_UART_DM_IMR (cont.)

Bits	Name	Description
4	RXLEV	This bit is set when a character is loaded into the receive FIFO that brings the total number of characters in the FIFO above the programmed watermark level in the FIFO watermark register (RFWR). This bit is cleared after enough characters have been read to bring the level equal to or below the programmed watermark level.
3	RXSTALE	This bit indicates that a `stale event' occurred. See Software procedures for the exact timing of this interrupt. It is cleared by issuing a reset-stale command (see CR register).
2	RXBREAK_CHANGE	This bit is set (1) if the start or end of a break condition is detected. The logic associated with this condition is cleared (0) by writing CR[7:4]=0x4. A detected break is defined as an all-zeros character with an invalid stop bit AND LOW PARITY. The end of a break is defined as a mark condition (1) at least 1/2 bit width. A detected break occupies one position in the Rx FIFO.
1	RXHUNT	This bit is set (1) when an incoming character matches the value programmed into the UART_DM_HCR register. This condition is cleared (0) by issuing a reset error status command (CR[7:4]=0x3).
0	TXLEV	This bit is set (1) when a character which is transferred from the transmit FIFO to the transmit shift register brings the total number of characters in the FIFO below or equal to the programmed watermark level in the UART_DM_TFWR register. This bit is cleared (0) after enough characters have been written to the FIFO to bring the level above the programmed watermark level.

0x16640018 GSBI7_UART_DM_IPR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0xffffff9f

The UART_DM_IPR register is the UART interrupt programming register.

GSBI7_UART_DM_IPR

Bits	Name	Description
31:7	STALE_TIMEOUT_MSB	These bits are the STALE_TIMEOUT bitfield. The stale character time-out duration field contains a number from 1 to 2^30 -1. This number determines how many character times must elapse before a `stale event' is generated. This character time is defined as 10 times the bit rate. It is reset whenever a data bit is received. Do not clear (0) this register if the stale character time-out interrupt is enabled. Note the discontinuity in the bit assignments.

GSBI7_UART_DM_IPR (cont.)

Bits	Name	Description
6	SAMPLE_DATA	Setting (1) this bit enables the new sample data mode, which means that the start bit is sampled as well as the rest, when in sample data mode. See the CR register, CHANNEL_COMMAND bit for more information.
5	RESERVED	
4:0	STALE_TIMEOUT_LSB	This bitfield is the LSbits of the STALE_TIMEOUT bitfield.

0x1664001C GSBI7_UART_DM_TFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_TFWR register is the UART transmit FIFO watermark register.

GSBI7_UART_DM_TFWR

Bits	Name	Description
31:0	TFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the transmit FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of TX words in the FIFO) is less than or equal to the value in TFWR. See UART_DM_IMR register. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16640020 GSBI7_UART_DM_RFWR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RFWR register is the UART receive FIFO watermark register.

GSBI7_UART_DM_RFWR

Bits	Name	Description
31:0	RFW	These bits contain a number, between 0 and 2^RAM_ADDR_WIDTH - 1, that determines the level of the receive FIFO at which an interrupt is generated. The interrupt is generated when the FIFO level (number of words in the RX FIFO) is greater than the value in RFWR. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16640024 GSBI7_UART_DM_HCR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI7_UART_DM_HCR

Bits	Name	Description
7:0	DATA	The UART_DM_HCR register is the UART hunt character register, which contains the character for which the receiver looks to assert a hunt character received interrupt.

0x16640034 GSBI7_UART_DM_DMRX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI7_UART_DM_DMRX

Bits	Name	Description
24:0	RX_DM_CRCI_CHARS	In the DM mode, the number of chars in the Rx FIFO that are used for CRCI handshake with the DM. The written value of RX_DM_CRCI_ CHARS must be a multiple of 16(bits [3:0] are treated as 0x0). After a value is written, the UART will generate CRCI requests as long as RX_DM_CRCI_CHARS is non zero. Read of DMRX register gives the number of characters that were received since the end of the last transfer. It is reset at the end of each Rx transfer Also is used by the software to indicate `transfer initialization'. See Software procedures.

0x16640038 GSBI7_UART_DM_IRDA

Type: Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_IRDA register enables the IRDA function, selects a loopback, and allows inversion of RX and TX data. This register also controls the IRDA transceiver that optionally interfaces between the UART and the DP_RX_DATA and DP_TX_DATA pins.

The UART proper is a standard RX/TX configuration that converts the serial pin input and output lines to 8-bit data for the microprocessor. The configuration contains receive and transmit blocks, a control block, a bit rate generator for RX and TX, and FIFO interfaces with the microprocessor data bus. The IRDA register provides the means of switching IRDA circuits into the serial I/O lines and the IRDA function is normally switched out. The IRDA modulator/demodulator may be

enabled or disabled under microprocessor control. When enabled, the RX and TX data pathis have individual inversion select bits, so external true or inverted drivers may be used in the signal path.

n The register is generated only when IRDA_IFC_GEN generic equals 1.

GSBI7_UART_DM_IRDA

Bits	Name	Description
4	MEDIUM_RATE_EN	· Set (1) for 1/4 bit-time pulse length (Medium rate) · Clear (0) for 3/16 bit-time pulse length (Low rate)
3	IRDA_LOOPBACK	· This bit loops the IRDA modulated TX line back into the IRDA RX line. The normal UART loopback mode must be off in order to see this effect.
2	INVERT_IRDA_TX	This bit inverts the polarity of the IRDA modulated signal on the DP_TX_DATA pin. · Set (1) this bit for an inverted polarity. · Clear (0) this bit for a non-inverted polarity.
1	INVERT_IRDA_RX	This bit inverts the polarity of the IRDA received signal on the DP_RX_DATA pin. · Set (1) this bit for inverted the polarity. · Clear (0) this bit for non-inverted polarity.
0	IRDA_EN	· Set (1) this bit to enable the IRDA transceiver. · Clear (0) this bit to bypass the IRDA transceiver and ignore the other bits of this register.

0x1664003C GSBI7_UART_DM_DMEN

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_DMEN register indicates if Data Mover is enabled for TX and RX channels.

GSBI7_UART_DM_DMEN

Bits	Name	Description
1	RX_DM_EN	· Set (1) this bit to enable RX DM interface. · Clear (0) this bit to disable RX DM interface. Clearing this bit requires resetting the receiver (see UART_DM_CR register).
0	TX_DM_EN	Set (1) this bit to enable TX DM interface. Clear (0) this bit to disable TX DM interface.

0x16640040 GSBI7_UART_DM_NO_CHARS_FOR_TX

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI7_UART_DM_NO_CHARS_FOR_TX

Bits	Name	Description
23:0	TX_TOTAL_TRANS_LEN	The total number of characters for transmission. Before writing a new value, the TX FIFO must be empty (as indicated by TX_READY interrupt in IMR register or after a reset). It is used by the transmitter to calculate how many characters to transmit in the last word. In DM mode, it is also used for the CRCI mechanism. Any additional writes to the TX FIFO above TX_TOTAL_TRANS_LEN will be discarded. A TX_READY interrupt is triggered after TX_TOTAL_TRANS_LEN number of characters were moved from the TX FIFO to the unpacking register (not all may have been sent).

0x16640044 GSBI7_UART_DM_BADR

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_BADR

Bits	Name	Description
31:2	RX_BASE_ADDR	RX FIFO base address. Both FIFOs use the same RAM (2^RAM_ADDR_WIDTH, 32-bit entries). This register controls the division of the memory to the RX and TX FIFOs. The division is a multiple of 4 entries, since the DM's burst length is 4. The size of the TX FIFO equals RX_BASE_ADDR. The size of the RX FIFO is 2^RAM_ADDR_WIDTH - RX_BASE_ADDR. ® The default is RX_BASE_ADDR = 2^(RAM_ADDR_WIDTH - 1) ® Only RAM_ADDR_WIDTH -1:2 bits are generated.
1:0	UNUSED	

0x16640048 GSBI7_UART_DM_TESTSL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI7_UART_DM_TESTSL

Bits	Name	Description
4	TEST_EN	Test bus enable
3:0	TEST_SEL	Test bus selector

0x16640060 GSBI7_UART_DM_MISR_MODE

Type: Read/Write
Clock: WR_CLK

GSBI7_UART_DM_MISR_MODE

Bits	Name	Description
31:2	RESERVED	unused.
1:0	MODE	0x0: Disabled 0x1: Enabled,TX test 0x2: Enabled, RX test

0x16640064 GSBI7_UART_DM_MISR_RESET

Type: Write
Clock: WR_CLK
Reset State: Undefined

GSBI7_UART_DM_MISR_RESET

Bits	Name	Description
31:1	RESERVED	unused.
0	RESET	

0x16640068 GSBI7_UART_DM_MISR_EXPORT

Type: Read/Write
Clock: WR_CLK
Reset State: Undefined

GSBI7_UART_DM_MISR_EXPORT

Bits	Name	Description
31:1	RESERVED	unused.

GSBI7_UART_DM_MISR_EXPORT (cont.)

Bits	Name	Description
0	EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., what is the result of the muxing of all the input data streams with <BLOCK>_TEST_MODE) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x1664006C GSBI7_UART_DM_MISR_VAL

Type: Read
Clock: WR_CLK
Reset State: Undefined

GSBI7_UART_DM_MISR_VAL

Bits	Name	Description
9:0	VAL	Current MISR state

0x16640080 GSBI7_UART_DM_SIM_CFG

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The UART_DM_SIM_CFG register is used to configure the SIM interface for the UART.

- The register is generated only when SIM_GLUE_GEN generic equals 1.

GSBI7_UART_DM_SIM_CFG

Bits	Name	Description
17	UIM_TX_MODE	When this bit is set (1), the transmission portion of the SIM interface operates in block mode (T=1). When clear (0), the transmission portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.
16	UIM_RX_MODE	When this bit is set (1), the receive portion of the SIM interface operates in block mode (T=1). When clear (0), the receive portion of the SIM interface operates in asynchronous transfer mode (T=0). Note that the operation of this function is conditional upon UART_SIM_CFG[0] being set (1) to designate the UIM_IF mode of operation.

GSBI7_UART_DM_SIM_CFG (cont.)

Bits	Name	Description
15:8	SIM_STOP_BIT_LEN	In UIM_IF mode, this field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 1 to 254 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. ..... 11 111110: 254 bit times 0x1: 1 bit times 0x2: 2 bit times
7	SIM_CLK_ON	When this bit is set(1), the UIM_CLK is turned on at either the TD8 or TD4 frequency, as indicated by bit6(UIM_CLK_TD8_SEL). When this bit is cleared, the UIM_CLK is stopped either LOW or HIGH, as indicated by bit 5(UIM_CLK_STOP_HIGH).
6	SIM_CLK_TD8_SEL	This bit selects the UIM_CLK frequency at which the UIM_CLK is turned on. 0x1: TD8 (the UIM_CLK runs at the TD8 frequency) 0x0: TD4 (the UIM_CLK runs at the TD4 frequency)
5	SIM_CLK_STOP_HIGH	This bit indicates at what point - high or low - the UIM_CLK will stop. 0x1: high 0x0: low
4	SIM_CLK_SEL	unused
3	MASK_RX	Setting (1) this bit masks off any 0 on the RX line, which prevents the receiver from seeing the START bit. Set (1) this bit if you do not want to receive the data you transmit.
2	SWAP_D	Setting (1) this bit causes the UIM_IF to swap the 8 data bits (making MSB into LSB, bit 6 into bit1, and so on) before it is read by the microprocessor.
1	INV_D	Set (1) this bit to cause the UIM_IF to invert the 8 data bit before it is read by the microprocessor.
0	SIM_SEL	Set (1) this bit to designate the UIM_IF mode of operation.

0x16640084 GSBI7_UART_DM_TEST_WR_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI7_UART_DM_TEST_WR_ADDR

Bits	Name	Description
31:0	TEST_WR_ADDR	RAM address at which to write the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x16640088 GSBI7_UART_DM_TEST_WR_DATA

Type: Write
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_TEST_WR_DATA

Bits	Name	Description
31:0	TEST_WR_DATA	The test data to be written to the RAM. Write to this register triggers the write to the RAM, to TEST_WR_ADDR address.

0x1664008C GSBI7_UART_DM_TEST_RD_ADDR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

GSBI7_UART_DM_TEST_RD_ADDR

Bits	Name	Description
31:0	TEST_RD_ADDR	RAM address from which to read the test data. · Only RAM_ADDR_WIDTH -1:0 bits are generated.

9.15.2 Read registers

NOTE The addresses of the read-only registers are mapped into the same addresses of the four write-only registers in the section above this one. They are: UART_DM_CSR, UART_DM_TF, UART_DM_CR, and UART_DM_IMR, respectively.

0x16640008 GSBI7_UART_DM_SR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_SR register is the UART status register. This register is used to obtain the current state of the UART subsystem. This register is updated asynchronously.

GSBI7_UART_DM_SR

Bits	Name	Description
8	RX_BREAK_START_LAST	When break start is detected, this bit is set (1). When break end was detected, this bit is reset (0).

GSBI7_UART_DM_SR (cont.)

Bits	Name	Description
7	HUNT_CHAR	When set (1), this bit indicates that the programmed character in the UART_DM_HCR register was received. If programmed, this condition causes the RXHUNT bit to be set (1) in the UART_DM_ISR register. This bit is cleared by issuing a reset error status command.
6	RX_BREAK	When set (1), this bit indicates that an all-zero character of the programmed length was received without a stop bit. If a break begins in the middle of a character, it is detected if the condition remains until the end of the next character time. Only one all zero character is written into the FIFO upon receiving the break. After the RX input returns high for at least half a bit time, then more characters are accepted by the receiver. Whenever the break condition starts or stops as defined above, the RXBREAK bit is set (1) in the UART_DM_ISR register. This bit is appended to the character in the receive FIFO.
5	PAR_FRAME_ERR	A parity error occurs if parity is programmed to be checked and an incoming character is received with incorrect parity. A framing error occurs when the RX input is low while the stop bit is being sampled. This bit is sampled in the middle of the first stop bit position, regardless of the programmed length of the stop bit. This error bit is appended to the character in the receive FIFO.
4	UART_OVERRUN	An overrun error occurs if one or more incoming characters are lost. This happens when the receive FIFO is full, the packing buffer is full and another character has been received in the shift register. The character in the receive shift register is lost. Upon overrun, this status bit remains high until cleared by a reset error status command.
3	TXEMT	This bit is set (1) when the transmitter under-runs. It is set after the transmission of the stop bit at the end of a character, if there are no characters waiting to be sent. It is reset when a character is written to the transmit FIFO.
2	TXRDY	This bit indicates that the transmit FIFO has space in it. It is reset when the FIFO becomes full and set when space becomes available again. Any characters that are written to the FIFO while this bit is low is lost.
1	RXFULL	This bit is set (1) when the receive FIFO becomes full. It is reset when the CPU reads a word.
0	RXRDY	This bit is set (1) when there is a word in the receive FIFO waiting to be read. It is reset when the last word currently stored in the FIFO is read.

0x16640070 GSBI7_UART_DM_RF

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_RF register is the UART receive FIFO register, which is used to access the channel receive FIFO. In order to support bursts of 4, 0x70-0x7C address space is reserved for the UART_DM RX FIFO.

GSBI7_UART_DM_RF

Bits	Name	Description
31:0	UART_RF	This register returns the next value in the receive FIFO. After the read is completed, the FIFO read pointer is updated to make the next character available.

0x16640074 GSBI7_UART_DM_RF_2

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_RF_2

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x16640078 GSBI7_UART_DM_RF_3

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_RF_3

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x1664007C GSBI7_UART_DM_RF_4

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_RF_4

Bits	Name	Description
31:0	UART_RF	see UART_DM_RF register.

0x16640010 GSBI7_UART_DM_MISR

Type: Read
Clock: AHB_CLK
Reset State: 0x0

GSBI7_UART_DM_MISR

Bits	Name	Description
12:0	UART_MISR	The UART_DM_MISR register is the masked interrupt status register. A read from this register returns the "AND" of the UART_DM_ISR and the UART_DM_IMR registers. This register is updated asynchronously. This bit field is misr <= (isr(12 DOWNTO 7) AND imr(12 DOWNTO 7)) & '0' & (isr(5 DOWNTO 0) AND imr(5 DOWNTO 0)).

0x16640014 GSBI7_UART_DM_ISR

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The UART_DM_ISR register is the UART interrupt status register. This register provides the current status of the possible interrupt conditions. If one of these bits is set (1), and the corresponding bit in the UART_DM_IMR register is set (1), an interrupt is generated (with the exception of bit 6, CURRENT_CTS - see the description of the UART_DM_IMR register). If the corresponding bit in the UART_DM_IMR register is clear (0), setting one of these bits has no effect on the UART interrupt request signal. This register is updated asynchronously.

GSBI7_UART_DM_ISR

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	· See UART_DM_IMR on page 28-9
11	RXBREAK_END	· See UART_DM_IMR on page 28-9
10	RXBREAK_START	· See UART_DM_IMR on page 28-9
9	TX_DONE	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
8	TX_ERROR	· Bit 9 generated only when SIM_GLUE_GEN generic equals 1
7	TX_READY	See UART_DM_IMR on page 28-9, for descriptions of the UART_DM_ISR bits.
6	CURRENT_CTS	
5	DELTA_CTS	
4	RXLEV	
3	RXSTALE	

GSBI7_UART_DM_ISR (cont.)

Bits	Name	Description
2	RXBREAK	
1	RXHUNT	
0	TXLEV	

0x16640038 GSBI7_UART_DM_RX_TOTAL_SNAP

Type: Read
Clock: AHB_CLK
Reset State: 0x0

GSBI7_UART_DM_RX_TOTAL_SNAP

Bits	Name	Description
23:0	RX_TOTAL_BYTES	'RX_TOTAL_SNAP register holds the number of characters received since the end of last Rx transfer. It is updated at the end of an Rx transfer (see Software procedures). Rx transfer ends when one of the conditions is met: · The number of characters which were received since the end of the previous transfer equals the value which was written to DMRX at "Transfer initialization". · A stale event occurred (flush operation already performed if was needed).

0x1664004C GSBI7_UART_DM_TXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_TXFS

Bits	Name	Description
31:14	TX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. · Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	TX_ASYNC_FIFO_STATE	TX asynchronous fifo status - number of characters in the TX asynchronous FIFO.
9:7	TX_BUFFER_STATE	TX unpacking buffer status - number of bytes in the unpacking buffer
6:0	TX_FIFO_STATE_LSB	TX FIFO status - number of words in the TX FIFO

0x16640050 GSBI7_UART_DM_RXFS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_RXFS

Bits	Name	Description
31:14	RX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	RX_ASYNC_FIFO_STATE	RX asynchronous fifo status - number of characters in the RX asynchronous FIFO.
9:7	RX_BUFFER_STATE	RX packing buffer status - number of bytes in the packing buffer
6:0	RX_FIFO_STATE_LSB	The number of entries in the RX FIFO that have at least one valid character. It is incremented each time a word is moved from the packing register to the RX FIFO. It is decremented each time a word is read from the RX FIFO. **NOTE** The Uart does not keep track of non-valid characters in each word. (See Software procedures).

0x16640090 GSBI7_UART_DM_TEST_RD_DATA

Type: Read
Clock: AHB_CLK
Reset State: Undefined

GSBI7_UART_DM_TEST_RD_DATA

Bits	Name	Description
31:0	TEST_RD_DATA	Read from this register triggers the read from the RAM. The register will hold, after read access, data which is found at TEST_RD_ADDR address in the RAM.

9.16 GSBI7 QUP Registers (0x16680000 QUP7_BASE)

This section contains the GSBI7 QUP registers.

0x16680000 GSBI7_QUP_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).

b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:

- N equals 8 or less - shift 24
- N equals 16 to 9 - shift 16
- N equals 24 to 17 - shift 8
- N equals 32 to 25 - no shift

The MINI_CORE clock selected is as follows:

Null: cc_qup_core_clk

SPI: cc_spi_master_clk

I2C: cc_I2C_clk		

GSBI7_QUP_CONFIG

Bits	Name	Description
31:14	RESERVED_1	reserved
13	CORE_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).
12	APP_CLK_ON_EN	When set to 0, clock on is turned off and driven high unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally (not applicable for Halcyon).

GSBI7_QUP_CONFIG (cont.)

Bits	Name	Description
11:8	MINI_CORE	value: 0000 Null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 I2C slave controller value: 0100 Reserved (I2C master & slave for loop back operation) value: 0101 Reserved (map to null core) value: 0110 Reserved (map to null core value: 0111 Reserved (map to null core) See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a "don't care". The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS _N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	RESERVED_2	Reserved.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x16680004 GSBI7_QUP_STATE

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b0000000000000000_00000000000XX100

GSBI7_QUP_STATE

Bits	Name	Description
31:5	RESERVED	reserved.
4	I2C_MAST_GEN	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.

GSBI7_QUP_STATE (cont.)

Bits	Name	Description
1:0	STATE	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to "01", the mini-core and related logic is released from reset and enters the RUN_STATE. When set to "11", the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete. See notes 1 and 2. Note 1: SPI - the "next appropriate point in time" is the next time SPI_CS _N de-asserts. If SPI_CS _N is not asserted when the PAUSE_STATE is entered, the SPI_CS _N is maintained in the not asserted state. The PAUSE_STATE is not available for SLAVE operation. Note 2: I2C -

0x16680008 GSBI7_QUP_IO_MODES

Type: Read/write
Clock: CRIF_CLK
Reset State: 0b000000000000000_00000000XXXXXXXX

Unless otherwise stated, register bits written return the value when read.

Notes:

a. "Packing" occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. "UnPacking" occurs as follows:

- N equals 8 or less - unpack four values from each QUP output FIFO word.
- N equals 16 to 9 - unpack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

GSBI7_QUP_IO_MODES

Bits	Name	Description
31:17	RESERVED	reserved
16	OUTPUT_BIT_SHIFT_EN	If set, enables the QUP output FIFO block to do bit shifting on the output data.

GSBI7_QUP_IO_MODES (cont.)

Bits	Name	Description
15	PACK_EN	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Data_Mover_Mode Value 11: Reserved (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 6x BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode and Data_Mover_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16 BLOCK_SIZE
1:0	OUTPUT_BLOCK_SIZE	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x1668000C GSBI7_QUP_SW_RESET

Type: Write/cmd
Clock: CRIF_CLK
Reset State: 0x0000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero.

GSBI7_QUP_SW_RESET

Bits	Name	Description
31:0	RESERVED	NA

0x16680010 GSBI7_QUP_TIME_OUT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies if the QUP_MX_OUTPUT_COUNT register and/or QUP_MX_INPUT_COUNT register are enabled. Additionally, this register only applies to Block_Mode and Data_Mover_Mode. The timer starts "ticking" when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The timer pauses for the PAUSE_STATE. If the timer expires before the QUP_MX_OUTPUT_COUNT and/or QUP_MX_INPUT_COUNT are exhausted, then the TIME_OUT_ERR flag is set in the QUP_ERROR_FLAGS register and the interrupt gsbi_qup_irq may be asserted.

GSBI7_QUP_TIME_OUT

Bits	Name	Description
15:0	TIME_OUT_VALUE	Specifies time out value in units of cc_qup_app clock ticks. A value of zero indicates the timer function is not enabled for use. See QUP_CONFIG register for information on clocks.

0x16680014 GSBI7_QUP_TIME_OUT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI7_QUP_TIME_OUT_CURRENT

Bits	Name	Description
31:0	TIME_OUT_CURRENT	Current value of time-out counter.

0x16680018 GSBI7_QUP_OPERATIONAL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0080

GSBI7_QUP_OPERATIONAL

Bits	Name	Description
31:10	RESERVED_1	reserved.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Data_Mover_Mode.
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Data_Mover_Mode.
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowleges software has or will read the data. Valid only in all modes.
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_gsbi_irq. Writing a "zero" to this bit does nothing. Writing a "one" to this bit clears it and acknowledges software has or will read the data. Valid only in all modes.
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.
3:0	RESERVED_2	reserved.

0x1668001C GSBI7_QUP_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

GSBI7_QUP_ERROR_FLAGS

Bits	Name	Description
31:7	RESERVED_1	reserved.
6	TIME_OUT_ERR	The time out limit for a given transfer has been reached.
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ER R	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.
1:0	RESERVED_2	reserved

0x16680020 GSBI7_QUP_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x007C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of gsbi_qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

GSBI7_QUP_ERROR_FLAGS_EN

Bits	Name	Description
31:7	RESERVED_1	reserved
6	TIME_OUT_ERR_EN	If set, enables time out error generation.
5	OUTPUT_OVER_RUN_ERR _EN	If set, enables output over run error generation.

GSBI7_QUP_ERROR_FLAGS_EN (cont.)

Bits	Name	Description
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.
1:0	RESERVED_2	reserved

0x16680024 GSBI7_QUP_TEST_CTRL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register enables QUP test bus to be actively driven by QUP core signals.

GSBI7_QUP_TEST_CTRL

Bits	Name	Description
31:1	RESERVED	reserved
0	QUP_TEST_BUS_EN	If set, enables QUP core to actively drive test bus. If zero, the core drives the test bus to all zeros.

9.16.1 QUP output FIFO registers

0x16680100 GSBI7_QUP_MX_OUTPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not effect the count.

Notes:

a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

GSBI7_QUP_MX_OUTPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_COUNT	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x16680104 GSBI7_QUP_MX_OUTPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI7_QUP_MX_OUTPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x16680108 GSBI7_QUP_OUTPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

This register holds the output data hanging out of the QUP output FIFO ready be loaded into the mini-core for the next load operation. This corresponds to signal qup_data_out going into the mini-core block.

GSBI7_QUP_OUTPUT_DEBUG

Bits	Name	Description
31:0	OUTPUT_DEBUG_DATA	Value waiting at the exit of output FIFO.

0x1668010C GSBI7_QUP_OUTPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the

value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

GSBI7_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	OUTPUT_FIFO_WORD_CNT	Number of words in the output FIFO.

0x16680110+4*c GSBI7_QUP_OUTPUT_FIFOc, c=[0..15]

Type: Write
Clock: CRIF_CLK
Reset State: 0x0000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

GSBI7_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x16680150 GSBI7_QUP_MX_WRITE_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the gsbi_qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

GSBI7_QUP_MX_WRITE_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_COUNT	The number of "writes" of size N. This is used only if the core is in FIFO_Mode.

0x16680154 GSBI7_QUP_MX_WRITE_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI7_QUP_MX_WRITE_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

9.16.2 QUP input FIFO registers

0x16680200 GSBI7_QUP_MX_INPUT_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Data_Mover_Mode. The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE doe not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

GSBI7_QUP_MX_INPUT_COUNT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_COUNT	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x16680204 GSBI7_QUP_MX_INPUT_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI7_QUP_MX_INPUT_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved.
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x16680208 GSBI7_QUP_MX_READ_COUNT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Data_Mover_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the "actual depth" of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

GSBI7_QUP_MX_READ_COUNT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_COUNT	The number of "reads" of size N. This is used only if the core is in FIFO_Mode.

0x1668020C GSBI7_QUP_MX_READ_CNT_CURRENT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

GSBI7_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
31:16	RESERVED	reserved
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x16680210 GSBI7_QUP_INPUT_DEBUG

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the value of the last loaded in known-good-data into the QUP input FIFO. May be different from what the actual read of input FIFO will return because of packing enabled at the input side. This corresponds to signal qup_data_in coming from the mini-core block synchronized to the crif_clk.

GSBI7_QUP_INPUT_DEBUG

Bits	Name	Description
31:0	INPUT_DEBUG_DATA	Last known good value shifted into the input FIFO.

0x16680214 GSBI7_QUP_INPUT_FIFO_WORD_CNT

Type: Read
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

GSBI7_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
31:9	RESERVED	reserved
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

0x16680218+4*c GSBI7_QUP_INPUT_FIFOc, c=[0..15]

Type: Read
Clock: CRIF_CLK
Reset State: 0xXXXX

Consecutive reads to this address reads the input FIFO contents on a FIFO basis.The max address to read the input FIFO is 0x254.

GSBI7_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

9.16.3 SPI mini-core registers

0x16680300 GSBI7_SPI_CONFIG

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

GSBI7_SPI_CONFIG

Bits	Name	Description
31:11	RESERVED_1	Reserved.
10	HS_MODE	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
7:6	RESERVED_2	Reserved.
5	SLAVE_OPERATION	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.
4:0	RESERVED	Reserved.

0x16680304 GSBI7_SPI_IO_CONTROL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

GSBI7_SPI_IO_CONTROL

Bits	Name	Description
31:11	RESERVED	Reserved.
10	CLK_IDLE_HIGH	Use SPI_CLK_IDLE_HIGH when set.
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS _N respectively. Setting any of this bit to '1', makes the associated SPI_CS _N active HIGH. This field is a "don't care" in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_ N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a "don't care" in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS _N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS _N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x16680308 GSBI7_SPI_ERROR_FLAGS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

All bits in this register are set by hardware and remain set until cleared by software. Writing a "one" to a bit clears it while writing a "zero" leaves the bit unchanged.

GSBI7_SPI_ERROR_FLAGS

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.

GSBI7_SPI_ERROR_FLAGS (cont.)

Bits	Name	Description
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS _N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x1668030C GSBI7_SPI_ERROR_FLAGS_EN

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0003

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to `1'.

GSBI7_SPI_ERROR_FLAGS_EN

Bits	Name	Description
31:2	RESERVED	Reserved. Writes are a "don't care" but by convention always write zero. Reads always return the value zero.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x16680310 GSBI7_SPI_DEASSERT_WAIT

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

This register holds the de-assertion wait time of SPI_CS _N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

GSBI7_SPI_DEASSERT_WAIT

Bits	Name	Description
31:6	RESERVED	Reserved.

GSBI7_SPI_DEASSERT_WAIT (cont.)

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the de-asserted time of SPI_CS _N. Only applies to MASTER operation. For SLAVE operation, this field is a "don't care". A value of zero indicates SPI_CS _N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

9.16.4 I2C master mini-core registers

0x16680400 GSBI7_I2C_MASTER_CLK_CTL

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_CLK_CTL register is a read/write register that controls clock divider values. This register should only be written to after it is confirmed that the I2C master mini-core is not longer in RESET state (QUP_STATE register).

GSBI7_I2C_MASTER_CLK_CTL

Bits	Name	Description
31:11	RESERVED	Reserved.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. The minimum value should be 3 hex (4 I2C_clk clocks per period) to ensure proper sampling of the bus. For a maximum high speed bit rate of 3.4 Mb/s (high speed mode), this would require a minimum 40.8 MHz I2C_clk clock. The maximum I2C_clk is 81.6 MHz. This register is reset to a maximum value of 7 hex. I2C_HS_CLK = I2C_CLK/(3*(HS_DIVIDER_VALUE+1)
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. The minimum value should be 3 hex to ensure proper sampling of the bus. For a maximum bit rate of 400 kb/s (fast mode), this would require a 4.8 MHz I2C_clk clock. For a maximum bit rate of 100 kb/s (standard mode), this would require a 1.2 MHz I2C_clk clock. Maximum I2C_clk for fast and standard modes are 206.4 MHz and 51.6 MHz respectively. This register is reset to a maximum value of 255 hex. I2C_FS_CLK = I2C_CLK/(2*(FS_DIVIDER_VALUE+3)

0x16680404 GSBI7_I2C_MASTER_STATUS

Type: Read/write
Clock: CRIF_CLK
Reset State: 0x0000

The I2C_STATUS is a status register. Writing a one clears the status bits.

GSBI7_I2C_MASTER_STATUS

Bits	Name	Description
31:26	RESERVED_1	Reserved.
25	INVALID_READ_SEQ	This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	This bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address).
23	INVALID_TAG	This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Reset, read_last_byte, mi_rec, dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: READ_LAST_BYTE_STATE Value 0x3: MI_REC_STATE Value 0x4: DEC_STATE Value 0x5: STORE_STATE
19:16	OUTPUT_FSM_STATE	This 4-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Reset, decode, send, mi_red, nop, nop_dec, invalid, invalid_dec. Value 0x0: RESET_STATE Value 0x1: IDLE_STATE Value 0x2: DECODE_STATE Value 0x3: SEND_STATE Value 0x4: MI_REC_STATE Value 0x5: NOP_STATE Value 0x6: INVALID_STATE Value 0x7: PEEK_STATE Value 0x8: SEND_R_STATE

GSBI7_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
15:13	CLK_STATE	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Reset_busidle, not_master, high, low, high_wait, forced_low, hs_addr_low or double_buffer_wait. Value 0x0: RESET_BUSIDLE_STATE Value 0x1: NOT_MASTER_STATE Value 0x2: HIGH_STATE Value 0x3: LOW_STATE Value 0x4: HIGH_WAIT_STATE Value 0x5: FORCED_LOW_STATE Value 0x6: HS_ADDR_LOW_STATE Value 0x7: DOUBLE_BUFFER_WAIT_STATE
12:10	DATA_STATE	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Reset, Tx addr, Tx HS addr, Tx 10-bit addr, Tx 2nd 10-bit addr byte, Tx data and Rx data. Value 0x0: RESET_WAIT_STATE Value 0x1: TX_ADDR_STATE Value 0x2: TX_DATA_STATE Value 0x3: TX_HS_ADDR_STATE Value 0x4: TX_10_BIT_ADDR_STATE Value 0x5: TX_2ND_BYTE_STATE Value 0x6: RX_DATA_STATE
9	BUS_MASTER	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.

GSBI7_I2C_MASTER_STATUS (cont.)

Bits	Name	Description
4	ARB_LOST	This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.
3	PACKET_NACKED	This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1:0	RESERVED_2	Reserved.

10 GSS Registers

10.1 Overview

Table 10-1 GSS Bases

Base Name	Parent	Address
NAV_BASE2	NAV_BASE	0x10100000
GSS_A5_CSR_AHB_CLK_SEL	GSS_A5_CSR_BASE	0x10000000
GSS_A5_SAW2_SECURE	GSS_A5_SPM_BASE	0x10001000
GSS_A5_GICD_CTLR	GSS_A5_QGIC2_BASE	0x10008000
GSS_A5_GICH_HCR	GSS_A5_QGIC2_BASE	0x10008000
GSS_A5_GICC_CTLR	GSS_A5_QGIC2_BASE	0x10008000
GSS_A5_GICV_CTLR	GSS_A5_QGIC2_BASE	0x10008000
GSS_A5_APCS_TMRSECURE	GSS_A5_TIMERS_BASE	0x10002000
SSBI_ENABLE	GSS_A5_SSBI_BASE	0x10003000

10.2 GSS Command Registers

This section defines the Global Navigation Subsystem (GSS) command registers and memories that are accessible from the system bus, the typical bus used by the host processor.

10.2.1 Receiver Control Command Registers

NOTE All command register settings take effect immediately unless otherwise noted.

0x10100000 RC_CONTROL

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

RC_CONTROL

Bits	Name	Description
31:5	RESERVED_BITS	
4	RC_DM_WAIT_ABORT	This bit is used to abort the wait for RTC command that was initiated by the Data Mover. See DM1_RTC_WAIT. Write a logic '1' to this bit to generate the abort, and then write logic '0' to enable the wait function for the next initiation. 0x0: NO 0x1: YES
3	RC_CP_RESET	Reset for Correlation Processor. This command is similar to the RC_SW_RESET, but it only effects the CP module. It allows resetting only the CP while the other modules of the Nav Core are active. 0x0: NO 0x1: YES
2	RC_CCP_RESETN	Reset for CCP. Suggestion is to hold CCP in reset while the microcode program memory is being loaded, and then release reset. Note CCP will be in reset state after main hardware or software reset is applied. 0x0: YES 0x1: NO
1	RC_INIT	Initializes internal registers for millisecond frame count and BP time transfer status registers. The value must be held set until next frame start. The initialization will occur at beginning of next frame. 0x0: NO 0x1: YES
0	RC_SW_RESET	Software controlled reset. When this bit is set, all registers within nav core will be reset (except command registers). All clocks (except wr_clk) will be forced on during the reset phase. When the reset command bit is later cleared, then the command registers will be reset. It is suggested to write a logic 1, then immediately logic 0 to this register. This control has the same effect as the hardware reset in the Modem Clock Block.

0x10100004 RC_CONFIG

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

RC_CONFIG

Bits	Name	Description
31:23	RESERVED_BITS	
22	RC_GACC_CLKEN	Clock enable for GACC
21	RC_ARS_CLKEN	Clock enable for ARS command logic
20	RC_SL_IRQ_EN	Enable interrupt from AD Sample Log (includes Spectrum Analyzer).
19:16	RC_DM_IRQ_EN	Enables Data Mover interrupts from each of the 4 security domains. The 4 bits correspond to SD3, SD2, SD1, SD0, with SD0 being the lowest bit. For each bit, 1 = enable interrupt. 0 = disable interrupt.
15:13	RC_DM_CLKEN_SEL	These bits control the Data Mover clock as follows: 0x0: OFF 0x1: DIV1 (main clock rate) 0x2: DIV2 (main clock div 2) 0x3: DIV4 (main clock div 4) 0x4: DIV8 (main clock div 8) 0x5: DIV16 (main clock div 16) 0x6: DIV32 (main clock div 32) 0x7: DIV64 (main clock div 64)
12:11	RC_XFER_SRC	Specifies the time transfer options for the GNSS RTC. The time transfer strobe can occur every 1 ms based on GNSS frame start (rc_frame_start), or by host processor writing to command bit RC_TT, or by external signal (CDMA). The sample phase and counter states for all 4 BPs are saved after time transfer occurs. See RC_BP _COUNT/PHASE. To enable the STB option, also set RC_FRAME_TT_ENABLE. 0x0: OFF 0x1: FRAME (every 1 ms frame based on GNSS RTC) 0x2: STB (re-sync'ed 1ms frame start, strobe from host processor, or CDMA) 0x3: OFF2
10:9	RC_SYNC_MASTER	Defines the BP sub-ms time base that is used as the master time base. Suggestion is to use the BP with lowest sample as the master. 0x0: BP 1 0x1: BP 2 0x2: BP 3 0x3: BP 4
8	RC_MEM_CLKEN	Clock enable for all memories and sample memory interface logic.

RC_CONFIG (cont.)

Bits	Name	Description
7	RC_CCP_CLKEN	Clock enable for Channel Control Processor
6	RC_CP_CLKEN	Clock enable for Correlation Processor
5	RC_BP4_CLKEN	Clock enable for Baseband Processor 4
4	RC_BP3_CLKEN	Clock enable for Baseband Processor 3
3	RC_BP2_CLKEN	Clock enable for Baseband Processor 2
2	RC_BP1_CLKEN	Clock enable for Baseband Processor 1 and ADC Processor
1	RC_TSG_CLKEN	Clock enable for Test Signal Generator
0	RC_RC_CLKEN	Clock enable for Receiver Control. All clock enables are force to 1 during hardware or software reset.

0x10100008 RC_LPM_RTC_CONTROL

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

RC_LPM_RTC_CONTROL

Bits	Name	Description
31:6	RESERVED_BITS_1	
5	RC_CDMA_TT_ENABLE	When RC_CDMA_TT_ENABLE = 1, the current LPM_RTC count will be captured into RC_CDMA_LPM_TT_CNT register when a CDMA time transfer request in received.
4	RC_FRAME_TT_ENABLE	When RC_FRAME_TT_ENABLE = 1, the current LPM_RTC count will be captured into RC_NAV_LPM_TT_CNT register at every 1ms frame start.
3	RESERVED_BITS_2	
2	RC_PPSO_POLARITY	When RC_PPSO_POLARITY = 0, PPS_OUT will be positive pulse, else it will be a negative pulse
1	RC_PPSO_ENABLE	When RC_PPSO_ENABLE = 1, PPS_OUT will be asserted when LPM_RTC count equals to RC_PPSO_ASSERT_RTC, and will be de-asserted when LPM_RTC count equals to RC_PPSO_DEASSERT_RTC
0	RC_PPSI_ENABLE	When RC_PPSI_ENABLE = 1, the LPM_RTC count value will be captured at the synchronized rising edge of the PPS_IN signal.

0x1010000C RC_PPSO_ASSERT

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

RC_PPSO_ASSERT

Bits	Name	Description
31:0	RC_PPSO_ASSERT	When LPM RTC reaches this command value then PPS out will be asserted. RC_PPSO_ENABLE must be set.

0x10100010 RC_PPSO_DEASSERT

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

RC_PPSO_DEASSERT

Bits	Name	Description
31:0	RC_PPSO_DEASSERT	When LPM RTC reaches this command value then PPS out will be de-asserted. RC_PPSO_ENABLE must be set.

0x10100014 RC_GPS_ON

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

RC_GPS_ON

Bits	Name	Description
31:0	RC_GPS_ON	For every write to this register, one interrupt will be generated when the LPM_RTC count value equals RC_LPM_RTC_ON. The comparison begins after the command is written and stops after the interrupt is generated.

0x10100018 RC_TIME_TRANSFER

Type: Read/Write
Clock: WR_CLK
Reset State: 0x0

RC_TIME_TRANSFER

Bits	Name	Description
31:1	RESERVED_BITS	
0	RC_TT	A write to this register will initiate a time transfer. The current LPM RTC count will be captured into RC_NAV_LPM_TT_CNT and strobe signals are generated to capture GNSS_RTC and CDMA_RTC. Reading this register will return all 0. The suggested process is to write this bit and then wait until RC_TT_ACTIVE status is zero. Then it is okay to read the time transfer status registers.

0x1010001C RC_GNSS_RTC_STATUS

Type: Read
Clock: RC_CLK
Reset State: 0x0

RC_GNSS_RTC_STATUS

Bits	Name	Description
31:17	RC_FRAME_COUNT	Current value of GNSS ms frame counter. The RC_SYNC_MASTER command specifies which BP to use for chip count, sample count and frame start. The frame start is used to increment this frame count. The frame counter is modulo 215.
16:7	RC_CHIP_COUNT	Current value of GNSS chip counter. For BP 1, BP 2 and BP 4, the chip counter range is 0 to 1022. For BP 3 (Glonass) the chip counter range is 0 to 510. For BP 3 this status register also includes the upper bit of the sample counter (bp3_chip_count[8:0], bp3_sample_count[7]).
6:0	RC_SAMPLE_COUNT	Current value of GNSS sample counter. For BP 1, BP 2 and BP 4, the sample counter ranges are 0 to 79, 0 to 39, and 0 to 19 for full, half and quarter rates, respectively. See BP _RATE command. For BP 3 (Glonass) this status register contains only the lower 7 bits of the sample counter (bp3_sample_count[6:0]). The sample counter ranges are 0 to 159 and 0 to 79 for full and half rates. See BP3_RATE command.

0x10100020 RC_BP1_COUNT_STATUS

Type: Read
Clock: BP1_CLK
Reset State: 0x0

RC_BP1_COUNT_STATUS

Bits	Name	Description
31:20	RESERVED_BITS	
19:0	RC_BP1_COUNT	BP 1 counter states after time transfer occurred. {bp1_frame_count[1:0], bp1_chip_count[9:0], bp1_sample_count[6:0], bp1_sample_skip}

0x10100024 RC_BP1_PHASE_STATUS

Type: Read
Clock: BP1_CLK
Reset State: 0x0

RC_BP1_PHASE_STATUS

Bits	Name	Description
31:0	RC_BP1_PHASE	BP 1 sample phase state after time transfer occurred.

0x10100028 RC_BP2_COUNT_STATUS

Type: Read
Clock: BP2_CLK
Reset State: 0x0

RC_BP2_COUNT_STATUS

Bits	Name	Description
31:20	RESERVED_BITS	
19:0	RC_BP2_COUNT	BP 2 counter states after time transfer occurred. {bp2_frame_count[1:0], bp2_chip_count[9:0], bp2_sample_count[6:0], bp2_sample_skip}

0x1010002C RC_BP2_PHASE_STATUS

Type: Read
Clock: BP2_CLK
Reset State: 0x0

RC_BP2_PHASE_STATUS

Bits	Name	Description
31:0	RC_BP2_PHASE	BP 2 sample phase state after time transfer occurred.

0x10100030 RC_BP3_COUNT_STATUS

Type: Read
Clock: BP3_CLK
Reset State: 0x0

RC_BP3_COUNT_STATUS

Bits	Name	Description
31:20	RESERVED_BITS	
19:0	RC_BP3_COUNT	BP 3 counter states after time transfer occurred. {bp3_frame_count[1:0], bp3_chip_count[8:0], bp3_sample_count[7:0], bp3_sample_skip}

0x10100034 RC_BP3_PHASE_STATUS

Type: Read
Clock: BP3_CLK
Reset State: 0x0

RC_BP3_PHASE_STATUS

Bits	Name	Description
31:0	RC_BP3_PHASE	BP 3 sample phase state after time transfer occurred.

0x10100038 RC_BP4_COUNT_STATUS

Type: Read
Clock: BP4_CLK
Reset State: 0x0

RC_BP4_COUNT_STATUS

Bits	Name	Description
31:20	RESERVED_BITS	
19:0	RC_BP4_COUNT	BP 4 counter states after time transfer occurred. {bp4_frame_count[1:0], bp4_chip_count[9:0], bp4_sample_count[6:0], bp4_sample_skip}

0x1010003C RC_BP4_PHASE_STATUS

Type: Read
Clock: BP4_CLK
Reset State: 0x0

RC_BP4_PHASE_STATUS

Bits	Name	Description
31:0	RC_BP4_PHASE	BP 4 sample phase state after time transfer occurred.

0x10100040 RC_TT_STATUS

Type: Read
Clock: RC_CLK
Reset State: 0x0

RC_TT_STATUS

Bits	Name	Description
31:1	RESERVED_BITS	
0	RC_TT_ACTIVE	This register indicates the status of the GPS software initiated time transfer command. When the register RC_TT is written, this status register will get set and it will be cleared once the LPM RTC is captured into RC_NAV_TT_RTC

0x10100044 RC_IRQ_STATUS

Type: Read
Clock: RC_CLK
Reset State: 0x04000000

RC_IRQ_STATUS

Bits	Name	Description
31:24	NAV_VERSION	Hardware version number. Set to 0x04 for version 4 of Nav.

RC_IRQ_STATUS (cont.)

Bits	Name	Description
23:4	RESERVED_BITS	
3:0	RC_IRQ	This register keep track of the interrupts asserted. There are 4 sources of interrupts: GPS IDLE to GPS_ON state transition, PPS out assertion, PPS in detection and Sample Log capture done. Anytime an interrupt is asserted it is captured in the status resighter. This register is cleared on read. Bit 3 is for Sample Log done, bit 2 is GPS_IDLE to GPS_ON state transition, bit 1 is PPS out assertion and bit 0 is PPS in detection.

0x10100048 RC_PPSI_RTC

Type: Read
Clock: RC_CLK
Reset State: 0x0

RC_PPSI_RTC

Bits	Name	Description
31:0	RC_PPSI_RTC	This register holds the captured value of the LPM RTC count when the last PPS in event occurred.

0x1010004C RC_NAV_TT_RTC

Type: Read
Clock: RC_CLK
Reset State: 0x0

RC_NAV_TT_RTC

Bits	Name	Description
31:0	RC_NAV_TT_RTC	This register holds the captured value of the LPM RTC count for the last GPS software initiated time transfer or the last frame start initiated time transfer.

0x10100050 RC_CDMA_TT_RTC

Type: Read
Clock: RC_CLK
Reset State: 0x0

RC_CDMA_TT_RTC

Bits	Name	Description
31:0	RC_CDMA_TT_RTC	This register holds the captured value of the LPM RTC count for the last Modem initiated time transfer. The source of this signal can CDMA, WCDMA, GSM or other RTCs.

0x10100054 RC_GNSS_TT_CNT

Type: Read
Clock: RC_CLK
Reset State: 0x0

RC_GNSS_TT_CNT

Bits	Name	Description
31:0	RC_GNSS_TT_RTC	This register holds the captured value of the GNSS RTC count for the last GPS software initiated time transfer or the last frame start initiated time transfer.

0x10100058 RC_NAV_TEST_BUS

Type: Read
Clock: RC_CLK
Reset State: 0x0

RC_NAV_TEST_BUS

Bits	Name	Description
31:0	RC_NAV_TEST_BUS	The Nav Core test bus output is accessible from this register location. Note the data rate may be much higher than the host processor access rate. This mainly serve as a debug feature (e.g., determining if signal pathis are active and capturing samples at unknown or irregular rates for creating histograms).

10.2.2 ADC Processor Command Registers

NOTE All command register settings take effect at the next frame start from the master BP or AD_UPDATE command unless otherwise noted.

0x10100080 AD_MODE

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

AD_MODE

Bits	Name	Description
31:18	RESERVED_BITS	
17:16	AD_TESTINSEL	When AD_TESTINSEL[0] = 1, the ADC signals are connected to test bus input instead of normal inputs. {2'b00, adc2_in_i[5:0], 2'b00, adc2_in_q[5:0], 2'b00, adc1_in_i[5:0], 2'b00, adc1_in_q[5:0]} = test_bus_in[31:0]. When AD_TESTINSEL[1] = 1, the blank signals are connected to test bus input instead of normal inputs. blank_signal[3] = test_bus_in[31] blank_signal[2] = test_bus_in[23] blank_signal[1] = test_bus_in[15] blank_signal[0] = test_bus_in[7]
15	AD_TESTSEL	When = 1, these module outputs are connected to ad test bus out: {rc_frame_start, ad1_rate_en, ad2_rate_en, 1'b0, ad2_out_i[6:0], ad2_out_q[6:0], ad1_out_i[6:0], ad1_out_q[6:0]}
14:13	AD_SAMPLELOG_MODE	Sample log mode. Option of continuous circular buffer or single vector capture. The buffer and vector lengthis are specified by AD_SAMPLELOG_DEPTH. Note register takes effect at next frame start. 0x0: OFF 0x1: VECTOR 0x2: CIRCULAR 0x3: FRAME (single vector starting at next frame start.)
12	AD_SAMPLELOG_START	Sample log start control for single vector capture modes (VECTOR or FRAME). Writing a 0 to 1 pattern to this bit will start the vector capture immediately or at next frame start (assuming AD_SAMPLELOG_MODE previously set to VECTOR or FRAME). The capture will continue until the specified vector length is reached (see AD_SAMPLELOG_DEPTH). The status bit AD_SAMPLELOG_DONE and interrupt bit RC_INTR_STATUS[3] indicate when the capture is completed. The interrupt must be enabled with RC_SA_IRQ_EN.

AD_MODE (cont.)

Bits	Name	Description
11:8	AD_SAMPLELOG_SRC	Sample log signal source. For 1010 to 1110 setting the input is fixed to zero. * Not supported if RX1 is async to RX2. ** Due to high bandwidth these modes may not be supported concurrently with BP3 and/or BP4. This limitation also applies if Spectrum Analyzer is set to BYPASS mode. 0x0: RX1IQ1 (1-bit complex samples from receiver 1) 0x1: RX1IQ2 (2-bit complex samples from receiver 1) 0x2: RX1IQ3 (3-bit complex samples from receiver 1) 0x3: RX2IQ1 (1-bit complex samples from receiver 2) 0x4: RX2IQ2 (2-bit complex samples from receiver 2) 0x5: RX2IQ3 (3-bit complex samples from receiver 2) 0x6: RX12IQ1 (1-bit complex samples from rec 1 & 2*) 0x7: RX12IQ2 (2-bit complex samples from receiver 1 & 2*) 0x8: RX1IQ6 (6-bit complex samples from receiver 1 **) 0x9: RX2IQ6 (6-bit complex samples from receiver 2 **) 0xF: SAIQ8 (8-bit complex samples from Spec Analyzer**)
7:5	AD_SAMPLELOG_DEPTH	Number of words (32-bits) to store into sample memory. Each word contains more than one sample. When the range is exceeded in circular buffer mode, then the index starts over (modulo index). 0x0: N512 0x1: N1K 0x2: N2K 0x3: N4K 0x4: N8K 0x5: N16K 0x6: N32K 0x7: NMAX (all of sample memory)
4:3	AD_MEAS_PERIOD	Specifies the measurement period for the preliminary mean and amplitude estimators. 0x0: OFF 0x1: PROG1 (prog by AD_MEAS_ENABLE & RX1 blank) 0x2: PROG2 (prog by AD_MEAS_ENABLE & RX2 blank) 0x3: FRAME (fixed at 1 ms frame period)

AD_MODE (cont.)

Bits	Name	Description
2	AD_MEAS_ENABLE	This command bit controls the immediate start and stop of the measurement interval for the preliminary mean and amplitude estimators. This is only for AD_MEAS_PERIOD = PROG modes. Normally this bit should be at logic 0, the disabled state. When it is set to logic 1, the measurement interval is started, and then when it is cleared the measurement interval is stopped. During the measurement interval the amplitude & mean integrators are active and an interval sample counter (AD_MEAS_LENGTH) is incremented. When blanking occurs then nothing is added to the integrator and the interval sample counter is not incremented. After the measurement interval is completed, the mean/amplitude estimators are saved into the status registers (AD_RX _MEANMONI/Q, AD_RX _AMPLMONI/Q, BP _PREAMPLMONI/Q). The mean and amplitude estimation values can be normalized with the interval length.
1	AD_UPDATE	Normally, command register settings take effect at the frame start. This command bit allows all command registers to take effect immediately. When a logic 0 to 1 transition is written to this bit, then the command registers take effect.
0	AD_INIT	Initializes the internal registers at start of next ms frame. Command registers are not effected. Command registers can only be initialized by the hardware reset signal from the Modem clock block. AD_INIT can still be done when AD1 and AD2 are disabled. 0x0: NO 0x1: YES

0x10100084 AD_RX1_CONFIG

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

AD_RX1_CONFIG

Bits	Name	Description
31:19	RESERVED_BITS	
18:17	AD_RX1_QUANTSEL	Quantizer type select. Also see AD_RX1_QUANTMAP 0x0: OFF (power saving) 0x1: SDM (1,2 or 3-bit sigma delta) 0x2: LINEAR (6-bit ADC) 0x3: LIMITER (1-bit hard limiter of 6-bit ADC)

AD_RX1_CONFIG (cont.)

Bits	Name	Description
16	AD_RX1_BLANKSIG	Software blank signal command. This command bit is ORed with the hardware blank signal inputs to the core, and thus allows software to blank the receiver at any time. This is also useful for testing the blanking feature. Note this bit takes effect immediately. It is not depended on state of AD_RX1_BLANKPOL or AD_RX1_BLANKEN . Receiver 1 and 2 have independent software blank controls.
15	AD_RX1_BLANKPOL3	Polarity for blanking signal 3. See AD_RX1_BLANKPOL0
14	AD_RX1_BLANKEN3	Enable for blanking signal 3. See AD_RX1_BLANKEN0
13	AD_RX1_BLANKPOL2	Polarity for blanking signal 2. See AD_RX1_BLANKPOL0
12	AD_RX1_BLANKEN2	Enable for blanking signal 2. See AD_RX1_BLANKEN0
11	AD_RX1_BLANKPOL1	Polarity for blanking signal 1. See AD_RX1_BLANKPOL0
10	AD_RX1_BLANKEN1	Enable for blanking signal 1. See AD_RX1_BLANKEN0
9	AD_RX1_BLANKPOL0	Signal polarity for blanking signal 0. 0x0: POS (Active high) 0x1: NEG (Active low)
8	AD_RX1_BLANKEN0	Enable for blanking signal 0. If blanking enable command is set to ON and blank signal is active (AD_RX1_BLANKSIG OR blank_signal[0] input), then the inverse quantizer outputs are forced to zero (no contribution to mean estimation), and the blank counter is incremented for every sample that is blanked. 0x0: OFF 0x1: ON
7	AD_RX1_NULLQ	Null the Q component input. Only for test. 0x0: NO 0x1: YES
6	AD_RX1_NULLI	Null the I component input. Only for test. 0x0: NO 0x1: YES
5	AD_RX1_SIGNINVQ	Invert polarity of Q component input. Normally not used and should be left at default setting of zero. Only recommended when polarity of Q component is accidently inverted somewhere in the receiver signal path. 0x0: NO 0x1: YES
4	AD_RX1_SIGNINVI	Invert polarity of I component input. Normally not used and should be left at default setting of zero. Only recommended when polarity of I component is accidently inverted somewhere in the receiver signal path. 0x0: NO 0x1: YES

AD_RX1_CONFIG (cont.)

Bits	Name	Description
3	AD_RX1_SWAPIQ	Swap I and Q component inputs. Normally not used and should be left at default setting of zero. Only recommended when I and Q components or local oscillator phases are accidently switched somewhere in the receiver signal path. 0x0: NO 0x1: YES
2	AD_RX1_SRCSEL	Input source selection 0x0: TSG (Test Signal Generator) 0x1: ADC (receiver)
1:0	AD_RX1_RATE	ADC 1 sample rate 0x0: OFF (disable AD 1) 0x1: FULL (main clock rate) 0x2: HALF (half of main clock rate) 0x3: QTR (quarter of main clock rate)

0x1010008C AD_RX1_QUANTMAP

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

AD_RX1_QUANTMAP

Bits	Name	Description
31:0	AD_RX1_QUANTMAP	ADC 1 quantization map. Only used for SDM and LIMITER type quantizers (see AD_RX1_QUANTSEL). Converts the eight possible 3-bit binary values into 4-bit signed values. The inverse quantizer output is set to a 4-bit sub-vector of the 32-bit command word, based on the input value (the ADC output). For input values of 0, 1, ...7, the output is set to sub-vector [3:0], [7:4], ... [31:28]. Suggested settings are 0xFDB97531 for GNSS SDM 8-levels 0x000026EA for Astra SDM 4-levels 0x0000004C for Astra SDM 2-levels or hard-limiter

AD_RX2_QUANTMAP

Bits	Name	Description
31:0	AD_RX2_QUANTMAP	ADC 2 quantization map. See AD_RX1_QUANTMAP.

0x10100094 AD_MEAS_STATUS

Type: Read
Clock: BP1_CLK
Reset State: 0x0

AD_MEAS_STATUS

Bits	Name	Description
31:18	RESERVED_BITS	
17	AD_RX2_MEAS_BLANK	See AD_RX1_MEAS_BLANK
16	AD_RX1_MEAS_BLANK	This bit indicates if receiver 1 was blanked during the last measurement period. For AD_MEAS_PERIOD = PROG or FRAME mode, this flag is updated after the end of the measurement period.
15:0	AD_MEAS_LENGTH	Status value that indicates the number of valid (non-blanked RX) ADC samples included in the last measurement period of the preliminary mean and amplitude estimators. This is only for AD_MEAS_PERIOD = PROG modes. The measurement period is controlled by the AD_MEAS_ENABLE command and when there is no blanking active on selected RX . This is implemented with a 16-bit counter operating at 4.092 MHz rate, which provides up to a 16 ms range. If the count range is exceeded, the counter will wrap around.

0x10100098 AD_RX1_MEAN_MON

Type: Read
Clock: BP1_CLK
Reset State: 0x0

AD_RX1_MEAN_MON

Bits	Name	Description
31:16	AD_RX1_MEANMONQ	Mean estimator for Q component of receiver 1. See AD_RX1_MEANMONI
15:0	AD_RX1_MEANMONI	Mean estimator for I component of receiver 1. Measures the mean (DC offset) of the signal over a 1 ms or programmable interval. The result is read by software and use to determine DC correction values for the RF device. The measurement period is specified by the AD_MEAS_PERIOD and AD_MEAS_ENABLE commands. If the measurement period is programmable, then the mean estimation values can be normalized with the interval length (see AD_MEAS_LENGTH). If the measurement period is 1 ms, then the estimation value is normalized by 1/4096. If blanking occurs during the 1 ms fixed interval mode, then the preliminary mean estimators are not updated. See AD_RX1_MEAS_BLANK. The mean estimator is implemented with a 23-bit integrator. The 7-bit samples are added to the integrator over the measurement period. At the period end, the result is scaled by 7-bits to fit into a 16-bit status register. The integrator must not be allowed to overflow, which can occur after 16 ms with a full scale input.

0x101000A0 AD_RX1_BLANK_MONITOR

Type: Read
Clock: BP1_CLK
Reset State: 0x0

AD_RX1_BLANK_MONITOR

Bits	Name	Description
31:18	RESERVED_BITS	
17:0	AD_RX1_BLANKMON	Status value that indicates the number of ADC samples that were blanked. The blank signal state is checked at a rate of 4.092 MHz. An internal 18-bit counter is advanced for every blank case (thus a range of 64 ms of continuous blanking). The counter wraps around after 218-1. On every 1 ms frame start, the counter value is saved in this status register. Software can read this status and the GNSS RTC at any time, and then compare to the values to the previous read. This information can be used to determine the duration of time and the number of blanked samples in the last interval. When AD_RX1_BLANKEN are disabled, this register is unchanged. Register is cleared to zero after AD_INIT or RC_SW_RESET or hardware reset

AD_SPEC_ANALYZER_STATUS

Bits	Name	Description
31:14	RESERVED_BITS	
13:0	AD_SA_BLANKMON	Spectrum analyzer blanking counter. Indicates the number of logged samples that were captured while blanking was active.

10.2.3 Baseband Processor 1 Command Registers

NOTE All command register settings take effect at the next frame start from the master BP or BP1_UPDATE command unless otherwise noted.

0x10100200 BP1_CONFIG

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP1_CONFIG

Bits	Name	Description
31:30	RESERVED_BITS	
29:28	BP1_SA_PROBE	BP1 probe points for the spectrum analyzer or bypass SA to go directly to sample log. All probes select the 8 MSBs from each I and Q component. Unbiased rounding is performed. 0x0: P1 (pre-notch filter input) 0x1: P2 (pre-notch filter output) 0x2: P3 (first notch filter input or test bus input) 0x3: P4 (last notch filter output)
27	BP1_TESTINSEL	When BP1_TESTINSEL[0] = 1, the notch filter is connected to test bus input instead of normal inputs. Can also be routed to the spectrum analyzer. {nf_i[8:0], nf_q[8:0]} = test_bus_in[17:0]
26:24	BP1_TESTSEL	Specifies the probe point to send to the BP1 test bus output 0x0: OFF (zero out) 0x1: P1 (linear interpolator input) 0x2: P2 (linear interpolator output) 0x3: P3 (decimate by 5 output) 0x4: P4 (baseband frequency converter output) 0x5: P5 (unused, zero out) 0x6: P6 (sub-ch 2 final quantizer input) 0x7: P7 (sub-ch 3 final quantizer input)
23	BP1_PREAMPLMON_EN	Enable for preliminary amplitude estimator (see BP1_PREAMPLMONI/Q) 0x0: OFF 0x1: ON
22:19	BP1_GAINSTEP	Fixed 3 dB gain steps. The setting is predetermined based on receiver configuration or testing with typical RF receivers. Ideally for optimum performance the output RMS level of the gain step should be within the range of 16 to 64 over the possible range of RF & ADC gain variation. The signal width after gain step is limited to only 9-bits, so setting an optimal level is important. See BP1_PREAMPLMONI for description of RMS estimation at the gain step input. 0x0: G0 (gain = 1, default) 0x1: G3 (gain = 3/4) 0x2: G6 (gain = 1/2) 0x3: G9 (gain = 3/8) 0x4: G12 (gain = 1/4) 0x5: G15 (gain = 3/16) 0x6: G18 (gain = 1/8) 0x7: G21 (gain = 3/32) 0x8: G24 (gain = 1/16) 0x9: G27 (gain = 3/64)

BP1_CONFIG (cont.)

Bits	Name	Description
18:16	BP1_DCNOTCHPOLE	DC notch filter pole magnitude. Controls the notch bandwidth. Range of 0 to 7. See BP1_NOTCHPOLE1 for frequency response for each pole magnitude.
15	BP1_GAINALIGN	Automatic-alignment mode for final quantizer threshold. When enabled, the gain control is done in hardware. When disabled, the software must control the threshold settings (see BP1_SCH _THRESHI/Q). 0x0: OFF 0x1: ON
14:13	BP1_MEANMONMODE	Control the type of mean estimation. The estimate result is accessible from status register BP1_MEANMONI/Q and is used when in automatic alignment mode BP1_DCALIGN. 0x0: OFF (power savings) 0x1: INT (integrate-hold estimator for 1 ms) 0x2: IIR (IIR LPF estimator) 0x3: OFF2 (power savings)
12	BP1_DCALIGN	Automatic-alignment mode for DC offset. When enabled, the DC offset control is done in hardware. When disabled, the software must control DC offset (see BP1_OFFSETI/Q). 0x0: OFF (manual alignment) 0x1: ON (automatic)
11	BP1_AAF_EN	Option to bypass the anti-alias filter (for low resampling frequency ratio) 0x0: OFF 0x1: ON
10	BP1_RS_EN	Enable resampler operation, or bypass linear interpolator and disable resampler phase accumulator. 0x0: OFF 0x1: ON
9	BP1_RS_LOAD	Option to load the resampler phase accumulator with BP1_RSPHASE at next ms interval. This will also reset the sample, chip and 4 ms frame counters. 0x0: NO 0x1: YES
8	BP1_IF_TYPE	Receiver IF Type 0x0: ZIF (bypass digital IF down converter) 0x1: LIF (use digital IF down converter)
7	BP1_AUXSEL	BP 1 auxiliary source selection 0x0: NO 0x1: YES

BP1_CONFIG (cont.)

Bits	Name	Description
6	BP1_ADCSEL	BP 1 input source selection This also selects the blank input source and the measurement control for the preliminary amplitude estimator. 0x0: AD1 (receiver 1) 0x1: AD2 (receiver 2)
5	BP1_SCH3_EN	Enable sub-channel 3 output. The BOC(1,1) at 4 spc. 0x0: OFF 0x1: ON
4	BP1_SCH2_EN	Enable sub-channel 2 output. The BPSK at 2 spc. Note, if both sub-channel enables are set to off, then all processing in BP1 will be disabled. However, it is still possible to keep the time base running with the BP1_RATE command. 0x0: OFF 0x1: ON
3:2	BP1_RATE	BP 1 sample rate. Note this command takes effect at next frame start or BP1_UPDATE. It should match the rate specified for the ADC processor that is the source for this BP. See AD _RATE. 0x0: OFF (disable BP 1 time base) 0x1: FULL (main clock rate) 0x2: HALF (half of main clock rate) 0x3: QTR (quarter of main clock rate)
1	BP1_UPDATE	Normally, command register settings take effect at the frame start. This command bit allows all command registers to take effect immediately. When a logic 0 to 1 transition is written to this bit, then the command registers take effect. Note that this may cause problems with some command that depend on exact frame interval, such as anything related to resampler, mean and amplitude estimators. If the update command is issued, then all amplitude and mean estimators are not updated at the next frame start because they are potentially invalid.
0	BP1_INIT	Initializes the internal registers at start of next ms frame. Command registers are not effected. Command registers can only be initialized by the hardware reset signal from the Modem clock block. BP1_INIT can still be done when BP1 is off. 0x0: NO 0x1: YES

0x10100204 BP1_IF_FREQ

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP1_IF_FREQ

Bits	Name	Description
31:25	RESERVED_BITS	
24:22	BP1_INTDELAY	Group delay compensation, integer part. Number of unit sample delays added to the signal path. The range is 0 to 6 sample delays at 20.46 MHz sample rate, which is equivalent to range of 0 to 293 ns with steps of 48.9 ns.
21:16	BP1_FRACDELAY	Group delay compensation, fraction part. Fraction of unit sample delay added to the signal path. The command range of 0 to 63 is assigned to sample delays from 0 to 63/64 in steps of 1/64 sample period, which is equivalent to 0.76 ns steps.
15:0	BP1_IFFREQ	Digital IF down converter frequency. Represented as signed fractional value (i.e., negative values are for down-conversion). BP1_IFFREQ = fc / fs *216 where fc is the down converter frequency, and fs is the ADC sample rate, which could be higher than 81.84, 40.92 or 20.46 MHz when the resampler is used.

0x10100208 BP1_RS_RATE

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP1_RS_RATE

Bits	Name	Description
31:0	BP1_RSRATE	Resampler rate command. An unsigned 32-bit fraction (U0.32) that is added to the sample phase accumulator on ever valid RS output sample. The command is based on the ratio of output sample rate to input sample rate. BP1_RSRATE = (fs / fo -1) * 232 where fs is the ADC sample rate, and fo is the resampler output rate of 81.84, 40.92 or 20.46 MHz based on BP1_RATE. The ratio of fs / fo must be greater than 1 but less than 1.5.

0x1010020C BP1_OFFSET

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP1_OFFSET

Bits	Name	Description
31:16	BP1_OFFSETQ	DC offset setting for Q component. Performs the same function as the I component.
15:0	BP1_OFFSETI	DC offset setting for I component. In manual-alignment mode (BP1_DCALIGN), this register is directly subtracted from the received signal. In automatic-alignment mode, this register is ignored and the mean estimate (BP1_MEANNONI) calculated in the previous millisecond frame is directly subtracted from the signal. The result is the output signal has a zero mean. When the DC error is over the recommended range, than coarse DC adjustments must be made in the RF down converter.

0x10100210 BP1_NOTCH1

Type: Write/Read
Clock: WR_CLK

0x10100230 BP1_FREQ

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP1_FREQ

Bits	Name	Description
31:0	BP1_FREQ	Fine frequency adjustment. Represented as signed fractional value. Used to compensate for residual frequency offset. BP1_FREQ = fc / 4.092 MHz * 232

0x10100234 BP1_THRESH

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP1_THRESH

Bits	Name	Description
31:24	BP1_SCH3_THRESHQ	See BP1_SCH2_THRESHI
23:16	BP1_SCH3_THRESHI	See BP1_SCH2_THRESHI
15:8	BP1_SCH2_THRESHQ	Final quantizer threshold for the Q component of sub-channel 2. Performs the same function as the I component.

BP1_THRESH (cont.)

Bits	Name	Description
7:0	BP1_SCH2_THRESHI	Final quantizer threshold for the I component of sub-ch 2. In manual-alignment mode (BP1_GAINALIGN=OFF), this register specifies the first threshold of the 16-level quantizer. The higher thresholds are linearly scaled from this value (that is, the quantizer is linear and symmetrical). For a 16-level quantizer, the optimum threshold equals 0.3352 times the signal RMS value. The RMS value is sqrt(p/2) times the mean-magnitude estimate (BP1_SCH2_AMPLMONI). Thus the threshold should be set to 0.427 times the mean-magnitude estimate. In automatic-alignment mode, this register is ignored, and the amplitude estimate measured in the previous millisecond frame is used to determine the optimum threshold setting. The optimum threshold is approximated by 7/16 * BP1_SCH2_AMPLMONI.

0x1010023C BP1_RS_PHASE

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP1_RS_PHASE

Bits	Name	Description
31:0	BP1_RSPHASE	Resampler initial phase command. An unsigned 32-bit fraction (U0.32) that is applied to the sample phase accumulator at the beginning of a frame when BP1_RS_LOAD is set. Suggested value is 0x80000000.

0x10100240 BP1_PRE_AMPL_MON

Type: Read
Clock: BP1_CLK
Reset State: 0x0

BP1_PRE_AMPL_MON

Bits	Name	Description
31:16	BP1_PREAMPLMONQ	Preliminary amplitude estimator for the Q component. See BP1_PREAMPLMONI
15:0	BP1_PREAMPLMONI	Preliminary amplitude estimator for the I component. Measures the mean-magnitude of the signal over a 1 ms or programmable interval. The result is read by software and use to determine optimum gain settings for the RF device. The measurement period is specified by the AD_MEAS_PERIOD and AD_MEAS_ENABLE commands. If the measurement period is programmable, then the mean estimation values can be normalized with the interval length (see AD_MEAS_LENGTH). In 1 ms frame interval mode, if blanking occurs or the BP1_UPDATE command occurs during the measurement period, the estimate is consider invalid and this register is not updated. See AD_RX _MEAS_BLANK. The amplitude estimate is done on the 11-bit signal at the input to the gain step after mean is subtracted. It is performed by integrating the signal magnitude over the measurement period. The 26-bit accumulator result is normalized by 10-bits to fit into the 16-bit range of this status register. The estimate is done with 4092 samples/ms. Thus the actual mean-magnitude of the signal is 210 / 4092 = 0.25 times the estimate result per ms interval. The RMS value is sqrt(p/2) times the mean-magnitude value.

0x10100244 BP1_MEAN_MON

Type: Read
Clock: BP1_CLK
Reset State: 0x0

BP1_MEAN_MON

Bits	Name	Description
31:16	BP1_MEANMONQ	Signal mean estimate for the Q component. The estimate is performed by the same method as for the I component.

BP1_MEAN_MON (cont.)

Bits	Name	Description
15:0	BP1_MEANMONI	Signal mean estimate for the I component. The mean estimate is done on the 16-bit signal at the input to the offset subtractor (see BP1_OFFSETI). It is performed by either a IIR LPF or an integrator. The integration is done over a 1 ms period, which contains 4092 samples. The result is approximately normalized by dividing by 4096 and rounding. If the blank signal or the BP1_UPDATE command occurs during the measurement period, the estimate is consider invalid and this register is not updated. When the DC error is over the recommended range, than coarse DC adjustments must be made in the RF down converter.

0x10100248 BP1_SCH2_AMPL_MON

Type: Read
Clock: BP1_CLK
Reset State: 0x0

BP1_SCH2_AMPL_MON

Bits	Name	Description
31:22	RESERVED_BITS	
21:11	BP1_SCH2_AMPLMONQ	Signal amplitude estimate for the Q component of sub-channel 2.
10:0	BP1_SCH2_AMPLMONI	Signal amplitude estimate for the I component of sub-channel 2. The amplitude estimate is done on the 12-bit signal at the input to the final quantizer. It is performed by integrating the signal magnitude over a 1 ms period, which contains 2046 samples. The result is approximately normalized by dividing by 2048 (that is, the result is shifted right by 11 positions). This provides a mean-magnitude estimate of the signal, which can be converted to RMS by multiplying by sqrt(p/2). If the blank signal or the BP1_UPDATE command occurs during the measurement period, the estimate is consider invalid and this register is not updated.

0x1010024C BP1_SCH3_AMPL_MON

Type: Read
Clock: BP1_CLK
Reset State: 0x0

BP1_SCH3_AMPL_MON

Bits	Name	Description
31:22	RESERVED_BITS	
21:11	BP1_SCH3_AMPLMONQ	Signal amplitude estimate for the Q component of sub-channel 3.

BP1_SCH3_AMPL_MON (cont.)

Bits	Name	Description
10:0	BP1_SCH3_AMPLMONI	Signal amplitude estimate for the I component of sub-channel 3. The estimate is performed by the same method as sub-channel 2, except the estimation interval contains 4092 samples and is approximately normalized by dividing by 4096.

10.2.4 Baseband Processor 2 Command Registers

NOTE All command register settings take effect at the next frame start from the master BP or BP2_UPDATE command unless otherwise noted.

0x10100404 BP3_IF_FREQ

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP3_IF_FREQ

Bits	Name	Description
31:25	RESERVED_BITS	
24:22	BP3_INTDELAY	Group delay compensation, integer part. Number of unit sample delays added to the signal path. The range is 0 to 6 sample delays at 10.22 MHz sample rate, which is equivalent to range of 0 to 587 ns with steps of 97.8 ns.
21:16	BP3_FRACDELAY	Group delay compensation, fraction part. Fraction of unit sample delay added to the signal path. The command range of 0 to 63 is assigned to sample delays from 0 to 63/64 in steps of 1/64 sample period, which is equivalent to 1.53 ns steps.
15:0	BP3_IFFREQ	Digital IF down converter frequency. Represented as signed fractional value (i.e., negative values are for down-conversion). BP3_IFFREQ = fc / fs *216 where fc is the down converter frequency, and fs is the ADC sample rate, which are equal or higher than 81.84 or 40.92 when the resampler is used (default case when processing GPS simultaneously).

0x10100408 BP3_RS_RATE

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP3_RS_RATE

Bits	Name	Description
31:0	BP3_RSRATE	Resampler rate command. An unsigned 32-bit fraction (U0.32) that is added to the sample phase accumulator on ever valid RS output sample. The command is based on the ratio of output sample rate to input sample rate. BP3_RSRATE = (fs / fo -1) * 232 where fs is the ADC sample rate, and fo is the resampler output rate of 81.76 or 40.88 MHz based on BP3_RATE. The ratio of fs / fo must be greater than 1 but less than 1.5.

0x1010047C BP3_PRE_AMPL_MON

Type: Read
Clock: BP3_CLK
Reset State: 0x0

BP3_PRE_AMPL_MON

Bits	Name	Description
31:16	BP3_PREAMPLMONQ	Preliminary amplitude estimator for the Q component. See BP3_PREAMPLMONI
15:0	BP3_PREAMPLMONI	Similar to BP1_PREAMPLMONI, except the accumulator is 32-bits and it is normalized by 16-bits to fit into the 16-bit range of this status register. The amplitude estimate is done on the 16-bit signal at the input to the gain step after mean is subtracted. It is performed by integrating the signal magnitude over the measurement period. The estimate is done with 10220 samples/ms. Thus the actual mean-magnitude of the signal is either 216 / 10220 = 6.413 times the estimate result per ms interval. The RMS value is 4/p times the mean-magnitude value.

0x10100480 BP3_MEAN_MON

Type: Read
Clock: BP3_CLK
Reset State: 0x0

BP3_MEAN_MON

Bits	Name	Description
31:16	BP3_MEANMONQ	Signal mean estimate for the Q component. The estimate is performed by the same method as for the I component.
15:0	BP3_MEANMONI	Signal mean estimate for the I component. The mean estimate is done on the 16-bit signal at the input to the offset subtractor (see BP3_OFFSETI). It is performed by integrating the signal over a 1 ms period, which contains 10220 samples. The result is approximately normalized by dividing by 2048 and 5 (divide by 5 is approximated as 205/1024). If the blank signal or the BP3_UPDATE command occurs during the measurement period, the estimate is consider invalid and this register is not updated. When the DC error is over the recommended range, than coarse DC adjustments must be made in the RF down converter.

0x10100484 BP3_SCH1_AMPL_MON

Type: Read
Clock: BP3_CLK
Reset State: 0x0

BP3_SCH1_AMPL_MON

Bits	Name	Description
31:22	RESERVED_BITS	
21:11	BP3_SCH1_AMPLMONQ	Signal amplitude estimate for the Q component of sub-channel 1. The estimate is performed by the same method as for the I component.
10:0	BP3_SCH1_AMPLMONI	Signal amplitude estimate for the I component of sub-channel 1. The amplitude estimate is done on the 12-bit signal at the input to the final quantizer. It is performed by integrating the signal magnitude over a 1 ms period, which contains 1022 samples. The result is approximately normalized by dividing by 1024 (that is, the result is shifted right by 10 positions). This provides a mean-magnitude estimate of the signal, which can be converted to RMS by multiplying by 4/p. If the blank signal or the BP3_UPDATE command occurs during the measurement period, the estimate is consider invalid and this register is not updated.

0x10100508 BP4_RS_RATE

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP4_RS_RATE

Bits	Name	Description
31:0	BP4_RSRATE	Resampler rate command. An unsigned 32-bit fraction (U0.32) that is added to the sample phase accumulator on ever valid RS output sample. The command is based on the ratio of output sample rate to input sample rate. BP4_RSRATE = (fs / fo -1) * 232 where fs is the ADC sample rate which is greater or equal to 81.84 MHz, and fo is the resampler output rate of 81.84 or 73.656 MHz based on BP4_RATE. The ratio of fs / fo must be greater than 1 but less than 1.5.

BP4_THRESH

Bits	Name	Description
31:16	RESERVED_BITS	
15:8	BP4_THRESHQ	Final quantizer threshold for the Q component of sub-channel. Performs the same function as the I component.

BP4_THRESH (cont.)

Bits	Name	Description
7:0	BP4_THRESHI	Final quantizer threshold for the I component of sub-channel. In manual-alignment mode (BP4_GAINALIGN = OFF), this register specifies the first threshold of the 16-level quantizer. The higher thresholds are linearly scaled from this value (that is, the quantizer is linear and symmetrical). For a 16-level quantizer, the optimum threshold equals 0.3352 times the signal RMS value. The RMS value is sqrt(p/2) times the mean-magnitude estimate. The threshold should be set to 0.342 or 0.285 times the mean-magnitude estimate (BP4_AMPLMONI) based on the BP4_RATE command of R80 or R72, respectively (See description in BP4_AMPLMONI). In automatic-alignment mode this register is ignored, and the amplitude estimate measured in the previous millisecond frame is used to determine the optimum threshold setting. The optimum threshold is approximated by 11/32 or 9/32 times the BP4_AMPLMONI.

BP4_PRE_AMPL_MON (cont.)

Bits	Name	Description
15:0	BP4_PREAMPLMONI	Similar to BP1_PREAMPLMONI, except the accumulator is 33-bits and it is normalized by 17-bits to fit into the 16-bit range of this status register. The amplitude estimate is done on the 16-bit signal at the input to the gain step after mean is subtracted. It is performed by integrating the signal magnitude over the measurement period. The estimate is done with either 20460 or 24552 samples/ms based on the BP4_RATE command. Thus the actual mean-magnitude of the signal is either 217 / 20460 = 6.406 or 217 / 24552 = 5.339 times the estimate result per ms interval. The RMS value is 4/p times the mean-magnitude value. Update for prog mode!!!

0x10100540 BP4_MEAN_MON

Type: Read
Clock: BP4_CLK
Reset State: 0x0

BP4_MEAN_MON

Bits	Name	Description
31:16	BP4_MEANMONQ	Signal mean estimate for the Q component. The estimate is performed by the same method as for the I component.
15:0	BP4_MEANMONI	Signal mean estimate for the I component. The mean estimate is done on the 16-bit signal at the input to the offset subtractor (see BP4_OFFSETI). It is performed by integrating the signal over a 1 ms period, which contains either 20460 or 24552 samples (see BP4_RATE). The result is approximately normalized by dividing by 4096 and 5 or 6 based on sample rate. The divide by 5 and 6 are approximated as 205/1024 and 171/1024, respectively. If the blank signal or the BP4_UPDATE command occurs during the measurement period, the estimate is consider invalid and this register is not updated. When the DC error is over the recommended range, than coarse DC adjustments must be made in the RF down converter.

0x10100544 BP4_AMPL_MON

Type: Read
Clock: BP4_CLK
Reset State: 0x0

BP4_AMPL_MON

Bits	Name	Description
31:22	RESERVED_BITS	

BP4_AMPL_MON (cont.)

Bits	Name	Description
21:11	BP4_AMPLMONQ	Signal amplitude estimate for the Q component of sub-channel. The estimate is performed by the same method as for the I component.
10:0	BP4_AMPLMONI	Signal amplitude estimate for the I component of sub-channel. The amplitude estimate is done on the 12-bit signal at the input to the final quantizer. It is performed by integrating the signal magnitude over a 1 ms period, which contains either 20460 or 24552 samples (see BP4_RATE). The result is scaled by dividing by 16384 (the result is shifted right by 14 positions). There is still a residual scale factor of

0x10100548 BP4_PRE_NOTCH

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

BP4_PRE_NOTCH

Bits	Name	Description
31:24	RESERVED_BITS	
23	BP4_PRENOTCHMODE	See BP1_NOTCHMODE1
22:20	BP4_PRENOTCHPOLE	See BP1_NOTCHPOLE1
19:0	BP4_PRENOTCHFREQ	See BP1_NOTCHFREQ1

10.2.7 Test Signal Generator Command Registers

NOTE All command register settings take effect at the next frame start from the master BP unless otherwise noted.

0x10100100 TSG_CMD0

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

TSG_CMD0

Bits	Name	Description
31:4	RESERVED_BITS	

TSG_CMD0 (cont.)

Bits	Name	Description
3:1	TSG_TESTSEL	Specifies the probe point to send to the TSG test bus output 0x0: OFF (zero out) 0x1: P1 (RX1 signal + noise sum) 0x2: P2 (RX2 signal + noise sum) 0x3: P3 (RX1 SDM output) 0x4: P4 (RX2 SDM output) 0x5: P5 (unused) 0x6: P6 (unused) 0x7: P7 (unused)
0	TSG_INIT	Initializes the TSG and synchronizes it to the receiver time base. After the frame start pulse from the receiver control module, the TSG frame, chip and cycle counters are set to command values, the carrier phase accumulator is set to command, the up-sample phase is set to zero, the seed values for the code and noise generators are loaded, and the data sequence generator is restarted. Command registers are not effected. Command registers can only be initialized by the hardware reset signal from the Modem clock block. 0x0: NO 0x1: YES

0x10100104 TSG_CH1_CONFIG

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

TSG_CH1_CONFIG

Bits	Name	Description
31:19	RESERVED_BITS	
18:16	TSG_CH1_SNR	Ratio of infinite BW signal to noise in 1MHz BW. For var = 0 to 6, SNR (dB) = -46.25 + 6.02 * var If var = 7, then the signal is set to the maximum level (24 dB above case for var = 6) which may be too strong for SDM (TBD). The SNR values will be scaled based on sample rate (TBD)
15:13	TSG_CH1_MODLEV	Amplitude of I and Q modulated signals before frequency conversion. Range is 1 to 7. Note that the code generator output is modulo-2 added with data generator output to produce a composite output (with convention 1=positive value, 0=negative value), and then the result is scaled by mod level command.
12	TSG_CH1_PILOTBIT	Channel 1 pilot sub-channel data bit. Takes effect at start of 20 ms period.
11	TSG_CH1_DATABIT	Channel 1 data sub-channel data bit. Takes effect based on TSG_CH1_DATATYPE.

TSG_CH1_CONFIG (cont.)

Bits	Name	Description
10	TSG_CH1_MEANDER	Option to enable meander (Manchester) encoding of the data sequence before modulation. For the first 10 ms of 20 ms period the data bit is not effected. For the second 10 ms the data bit is inverted.
9:8	TSG_CH1_DATATYPE	Channel 1 data bit type The data bit sequence is restarted after TSG_INIT command. The random sequence is 63 bits (list it here) 0x0: PROG1 (update data bit every 1 ms) 0x1: PROG20 (update data bit every 20 ms) 0x2: TOGGLE (toggle data bit every 20 ms) 0x3: RANDOM (random data bit every 20 ms)
7:6	TSG_CH1_CONSTCODE	Channel 1 code source select. 0x0: NO (non-constant from code generator) 0x1: ONE (constant logic one for CW) 0x2: ZERO (constant logic zero for CW) 0x3: NO2 (non-constant from code generator)
5	TSG_CH1_RS_EN	Channel 1 up-sampler enable (see TSG_CH1_RSRATE) 0x0: OFF 0x1: ON
4:3	TSG_CH1_RATE	Channel 1 sample rate 0x0: OFF (disable CH 1 time base) 0x1: FULL (main clock rate) 0x2: HALF (half of main clock rate) 0x3: QTR (quarter of main clock rate)
2:0	TSG_CH1_MODE	Channel 1 signal mode Note, L1C, L2C, L5 and E5A modes may not be fully functional. E1 mode is not implemented on version 1. 0x0: OFF (disable CH 1) 0x1: L1 (GPS L1-C/A) 0x2: R1 (Glonass R1) 0x3: L1C (GPS L1C) 0x4: L2C (GPS L2C) 0x5: L5 (GPS L5) 0x6: E1 (Galileo E1) 0x7: E5A (Galileo E5A)

0x10100108 TSG_CH1_RS_RATE

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

TSG_CH1_RS_RATE

Bits	Name	Description
31:0	TSG_CH1_RSRATE	Up-sampling rate for code generator. Ratio of code generator sample rate (fs,gen) to TSG output sample rate (fs,out), represented as 32-bit unsigned fractional value. TSG_CH1_RSRATE = fs,gen / fs,out * 232

0x1010010C TSG_CH1_INIT_COUNT

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

TSG_CH1_INIT_COUNT

Bits	Name	Description
31:22	RESERVED_BITS	
21:17	TSG_CH1_INITFRAME	Initial value of 20 ms frame counter in channel 1 time base. This takes effect at the next RC frame start when the TSG_INIT command is set during the previous millisecond. Setting the frame/chip/sample counters to values other than zero allows the TSG to have a constant time offset with respect to the BPs or other TSG channel.
16:7	TSG_CH1_INITCHIP	Initial value of chip counter in channel 1 time base. Takes effect at same time as TSG_CH1_INITFRAME. For R1 mode the valid range is 0 to 510, and for all other modes the valid range is 0 to 1022.
6:0	TSG_CH1_INITSAMPLE	Initial value of sample counter in channel 1 time base. Takes effect at same time as TSG_CH1_INITFRAME. For R1 mode, the valid range is 0 to 159 or 79 or 39 for full, half or quarter rates. For all other modes, the valid range is 0 to 79 or 39 or 19 for full, half or quarter rates.

0x10100110 TSG_CH1_FREQ

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

TSG_CH1_FREQ

Bits	Name	Description
31:24	TSG_CH1_PHASE	Carrier phase. Represented as a fraction of a cycle. Only takes effect after TSG_INIT.

TSG_CH1_FREQ (cont.)

Bits	Name	Description
23:0	TSG_CH1_FREQ	Carrier frequency. Represented as signed fractional value. TSG_CH1_FREQ = fc / fs * 224 where fc is the carrier frequency and fs is the ADC sample rate, which could be higher than 81.84, 40.92 or 20.46 MHz when the up-sampler is used.

0x10100114 TSG_CH1_DATA_SEED

Type: Write/Read
Clock: WR_CLK

Clock: WR_CLK
Reset State: 0x0

SMI_BASEADDR3C

Bits	Name	Description
31:24	SMI_BASEADDR3_12	Sample memory base address for BP 3 sub-channel 12
23:16	SMI_BASEADDR3_11	Sample memory base address for BP 3 sub-channel 11
15:8	SMI_BASEADDR3_10	Sample memory base address for BP 3 sub-channel 10
7:0	SMI_BASEADDR3_9	Sample memory base address for BP 3 sub-channel 9

0x10100618 SMI_BASEADDR4

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

SMI_BASEADDR4

Bits	Name	Description
31:16	RESERVED_BITS	
15:8	SMI_BASEADDR_SL	Sample memory base address for Sample Log vectors
7:0	SMI_BASEADDR4_1	Sample memory base address for BP 4

10.2.9 Correlation Processor Command Registers

All registers become active after the start control flag.

0x10100700 CP_START

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_START

Bits	Name	Description
31:5	RESERVED_BITS	

CP_START (cont.)

Bits	Name	Description
4	CP_MEM_B_LOCK	Selects the destination memory to be locked for the correlation results. When this bit is logic 1, DM is not allowed access to Memory block B. Upon reset both of the memories are unlocked
3	CP_MEM_A_LOCK	Selects the destination memory to be locked for the correlation results. When this bit is logic 1, DM is not allowed access to Memory block A. Upon reset both of the memories are unlocked.
2	CP_BLANK	When this bit is logic 1, the correlation results are forced to zero before they are entered into result memory. This feature is typically used when an error condition is detected and the next tasks may have corrupted sample set, thus the results are blanked. The CP will operate as specified by the other command registers, but only the results are blanked.
1	CP_DISABLE	When this bit is set to logic 1, the Data Mover is not prohibited from freely accessing CP result memories A/B and all results are forced to zeros. This feature is used when the CCP has detected an error condition and the DM must quickly flush the results to catch up.
0	CP_START	Start control flag. When this bit transitions from logic 0 to logic 1, the CP task is started. It is suggested to write a pattern of logic 1 then logic 0 to this bit.

0x10100704 CP_CONFIG1

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_CONFIG1

Bits	Name	Description
31:27	RESERVED_BITS	
26:21	CP_NR_CORRS	Specifies the number of correlations, K, to perform during the current task. K = 4 * (CP_NR_CORRS+1). Thus, the range is 4 to 256 with resolution of 4.
20	CP_DATA_BIT	Data channel bit. This bit is modulo-2 added with the data channel code generator.
19	CP_PILOT_BIT	Pilot channel bit. This bit is modulo-2 added with the pilot channel code generator.
18	CP_RESULT_MEM	Selects the destination memory for the correlation results. When block A is selected it is locked by the CP and block B is unlocked, and vice versa. One block is always locked while the other is unlocked. This register setting must match CP_MEM_A_LOCK and CP_MEM_B_LOCK registers. 0x0: A (Memory block A) 0x1: B (Memory block B)

CP_CONFIG1 (cont.)

Bits	Name	Description
17	CP_RESULT_BITS	Specifies the number of bits to store the correlation result (per I and Q component). 0x0: FOUR 0x1: EIGHT
16	CP_SAT_BITS	Specifies the signal range of the correlation result (per I and Q component) Note the correlation result may be saturated to a 4-bit range and still stored as a 8-bit value. 0x0: FOUR (saturate to +/- 7) 0x1: EIGHT (saturate to +/- 127)
15:12	CP_SCALE	The scale factor for scaling the 20-bit correlation accumulator into an 8 or 4-bit result. The final correlation result is produced by an arithmetic shift right of the accumulator. The CP_SCALE command specifies a right shift range of 4 to 15 bit positions. If values 0 to 3 are specified then default scaling is 16 positions. Each step is 6 dB.
11	CP_FINE_SCALE	When logic 1, the correlation accumulator is scaled by 3 or + 9.5 dB, otherwise no scaling is performed. This could be followed with an addition shift of 2 positions for CP_SCALE such that the total scale amount is 0.75 or -2.5 dB.
10:7	CP_SUBCH	Specifies the sub-channel number. Other values are not valid and will produce incorrect results. For BP 1 and BP 2 only N1, N2 and N3 are available For BP 3 N1 to N12 are available For BP 4 only N1 is available 0x1: N1 0x2: N2 0x3: N3 0x4: N4 0x5: N5 0x6: N6 0x7: N7 0x8: N8 0x9: N9 0xA: N10 0xB: N11 0xC: N12
6:5	CP_CH	Specifies the channel number 0x0: N1 (Baseband Processor 1) 0x1: N2 (Baseband Processor 2) 0x2: N3 (Baseband Processor 3) 0x3: N4 (Baseband Processor 4)

CP_CONFIG1 (cont.)

Bits	Name	Description
4:0	CP_MODE	Correlation mode. Other values are reserved. 0x0: OFF (need to change to binary vector) 0x1: L1_1 0x2: L1_2 0x3: L1_20 0x4: L1_NU4_20 0x5: L1_NU8_20 0x6: R1_1 0x7: R1_2 0x0: L1C_D_4 0x0: L1C_P_4 0x0: L1C_DP_4 0x0: L1C_P_24 0x0: E1_B_4 0x0: E1_C_4 0x0: E1_BC_4 0x0: E1_B_24 0xA: E1_C_24 0xB: L2C_M_2 0xC: L2C_L_2 0xD: L2C_ML_2 0xE: L5_I_2 0xF: L5_Q_2 0x10: E5A_I_2 0x11: E5A_Q_2

0x10100708 CP_CONFIG2

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_CONFIG2

Bits	Name	Description
31:19	RESERVED_BITS	
18	CP_SI_CONSTCOEF	Allows a fixed coefficient set for the CP sample interpolator instead of programmable set specified in CP_H0 to CP_H23. This feature is for power savings. 0x0: NO (programmable coef) 0x1: YES (fixed coef)

CP_CONFIG2 (cont.)

Bits	Name	Description
17:16	CP_TESTSEL	Specifies the probe point to send to the test bus output 0x0: OFF (zero out) 0x1: P1 (sample interpolator I outputs) 0x2: P2 (sample interpolator Q outputs) 0x3: P3 (TBD)
15	CP_SI_BYPASS	Bypass option for CP sample interpolator. 0x0: NO 0x1: YES (sample delay is zero)
14	CP_FC_BYPASS	Bypass option for CP frequency converter 0x0: NO 0x1: YES
13:12	CP_CONSTCODE	Control to override the code generator output and force the code sequence to a constant value for the duration of correlation interval. 0x0: NO (normal operation) 0x1: ONE (constant logic 1 for the code sequence) 0x2: ZERO (constant logic 0 for the code sequence) 0x3: NO2 (normal operation)
11:10	CP_ALPHA	Specifies the required phase shift of the pilot channel to phase align it with the data channel before coherent sum. This feature is only supported for the correlation modes of L1C_DP_4 and E1_BC_4. 0x0: POS1 (a = +1) 0x1: NEG1 (a = -1) 0x2: POSJ (a = +j) 0x3: NEGJ (a = -j)
9	CP_L2EVEN	Specifies an even/odd frame segment for the L2 correlation modes. The correlation length for even segments is 512 chips and for odd segments it is 511 chips. 0x0: EVEN 0x1: ODD
8	CP_CD_ENABLE	Enable for the optional data channel correlator that will operate concurrently with pilot channel correlators. This feature is only supported for correlation modes L2C_M_2, L1C_P_4, E1_C_4, L5_Q_2 and E5A_Q_2 0x0: NO 0x1: YES
7:2	CP_CD_TIME_OFFSET	Time offset of the optional data channel correlator. The valid command values are 0 to 63.
1:0	CP_CD_SAMP_PHS	Sample phase for the optional data channel correlator. The valid command values are 0 to 3.

0x1010070C CP_SAMPLE_INDEX

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_SAMPLE_INDEX

Bits	Name	Description
31:19	RESERVED_BITS	
18:2	CP_FIRST_INDEX	First sample index within sample memory. The 2 lower bits are the column index and the upper bits are the row index. The number of rows is based on the mode.
1:0	CP_DELAY	Interpolator delay of 2, 2.25, 2.5 and 2.75 samples from CP_FIRST_INDEX for CP_DELAY command settings of 0, 1, 2 and 3, respectively.

0x10100710 CP_PHASE

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_PHASE

Bits	Name	Description
31:24	RESERVED_BITS	
23:0	CP_PHASE	Initial phase of the frequency converter - represented as signed fractional value. phase = p * CP_PHASE * 2-23 radians CP_PHASE = round(phase/p * 223) CP_PHASE = round(phase/2p * 224)

0x10100714 CP_FREQ

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_FREQ

Bits	Name	Description
31:24	RESERVED_BITS	

CP_FREQ (cont.)

Bits	Name	Description
23:0	CP_FREQ	frequency converter - represented as signed fractional value frequency = sample rate/2 * CP_FREQ * 2-23 CP_FREQ = round(frequency/sample_rate * 224)

0x10100718 CP_DATA_SEED

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_DATA_SEED

Bits	Name	Description
31:27	RESERVED_BITS	
26:0	CP_DATA_SEED	Data channel, code generator seed value. For L1-C/A the seed value is CP_DATA_SEED[9:0] For L2C the seed value is CP_DATA_SEED[26:0] For L5 the seed value is CP_DATA_SEED[12:0] For E5A the seed value is CP_DATA_SEED[13:0] For L1C the insertion index is CP_DATA_SEED[13:0] and the Weil index is CP_DATA_SEED[26:14]

0x1010071C CP_PILOT_SEED

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_PILOT_SEED

Bits	Name	Description
31:27	RESERVED_BITS	
26:0	CP_PILOT_SEED	Pilot channel, code generator seed value. For L2C the seed value is CP_PILOT_SEED[26:0] For L5 the seed value is CP_PILOT_SEED[12:0] For E5A the seed value is CP_PILOT_SEED[13:0] For L1C the insertion index is CP_PILOT_SEED[13:0] and the Weil index is CP_PILOT_SEED[26:14]

0x10100720 CP_CODE_INDEX

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_CODE_INDEX

Bits	Name	Description
31:16	RESERVED_BITS	
15:0	CP_FIRST_CODE	Index of first code bit. Only used for L1C and E1. For L1C the first code bit index is CP_FIRST_CODE[13:0] For E1 the code sequence number (SV) is CP_FIRST_CODE[15:12], and code bit number (0 to 4091) is CP_FIRST_CODE[11:0]. The code bit number has typically values of 0, 1023, 2046 and 3069. In version 4, the E1 code memory was reduced to support only 1 SV (only used for evaluation). The CP_FIRST_CODE[15:12] bits are ignored.

0x10100724 CP_COEF1

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_COEF1

Bits	Name	Description
31:24	CP_H3	Interpolation coefficients.
23:16	CP_H2	
15:8	CP_H1	
7:0	CP_H0	

0x10100728 CP_COEF2

Type: Write/Read
Clock: CP_CLK

CP_COEF2

Bits	Name	Description
31:24	CP_H7	Interpolation coefficients.
23:16	CP_H6	

CP_COEF2 (cont.)

Bits	Name	Description
15:8	CP_H5	
7:0	CP_H4	

0x1010072C CP_COEF3

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_COEF3

Bits	Name	Description
31:24	CP_H11	Interpolation coefficients.
23:16	CP_H10	
15:8	CP_H9	
7:0	CP_H8	

0x10100730 CP_COEF4

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_COEF4

Bits	Name	Description
31:24	CP_H15	Interpolation coefficients.
23:16	CP_H14	
15:8	CP_H13	
7:0	CP_H12	

0x10100734 CP_COEF5

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_COEF5

Bits	Name	Description
31:24	CP_H19	Interpolation coefficients.
23:16	CP_H18	
15:8	CP_H17	
7:0	CP_H16	

0x10100738 CP_COEF6

Type: Write/Read
Clock: CP_CLK
Reset State: 0x0

CP_COEF6

Bits	Name	Description
31:24	CP_H23	Interpolation coefficients.
23:16	CP_H22	
15:8	CP_H21	
7:0	CP_H20	

0x1010073C CP_STATUS

Type: Read
Clock: CP_CLK
Reset State: 0x1A

CP_STATUS

Bits	Name	Description
31:30	RESERVED_BITS	
29:6	CP_STALL_CNT	Current value of the stall counter.
5	CP_STALL	Stall state status bit.
4	CP_MEMB_EMPTY	Indicates that correlation result memory B is empty. The CP monitors the number of values written to memory and sets this flag when all values have been fully read by Data Mover.
3	CP_MEMA_EMPTY	Indicates that correlation result memory A is empty.
2	CP_ACTIVE	When logic 1, the CP is actively processing a task.
1	CP_READY	Indicates CP is ready for next start command.

CP_STATUS (cont.)

Bits	Name	Description
0	CP_ERROR	Current value of the error flag. The error flag is set when Data Mover tries to read more correlation results then were stored by CP.

10.2.10 Channel Control Processor Registers

0x10100800 CCP_BREAKPOINT

Type: Read/Write
Clock: CCP_CLK

CCP_BREAKPOINT

Bits	Name	Description
31:21	RESERVED_BITS	
20	CCP_BRKPNT_SET	Writing logic 1 to this register bit will start the next break point check. Writing logic 0 to this register bit will disable break points (CCP will free-run).
19:16	CCP_BRKPNT_SELECT	Select the register to check for target value. 0x0: PC (program counter, 10 bits) 0x1: PS (program status flags, 4-bits or 8-bits) 0x2: G0 0x3: G1 0x4: G2 0x5: G3 0x6: G4 0x7: G5 0x8: G6 0x9: G7 0xA: P0 0xB: P1 0xC: P2 0xD: unused1 0xE: unused2 0xF: unused3
15:0	CCP_BRKPNT_VALUE	Target value for selected register

0x10100804 CCP_BREAK_STATE

Type: Read
Clock: CCP_CLK

CCP_BREAK_STATE

Bits	Name	Description
31:1	RESERVED_BITS	
0	CCP_BREAK_STATE	This register is set when a new break point is set (see CCP_BRKPNT_SET) and cleared after the break point is reached.

0x10100808 CCP_PROG_STATUS

Type: Read
Clock: CCP_CLK

CCP_PROG_STATUS

Bits	Name	Description
31:20	RESERVED_BITS	
19	CCP_FLAG_V	CCP overflow flag
18	CCP_FLAG_N	CCP negative flag
17	CCP_FLAG_C	CCP carry flag
16	CCP_FLAG_Z	CCP zero flag
15:10	RESERVED_BITS2	read all zeros
9:0	CCP_PC	CCP program counter register contents

0x1010080C CCP_G10_STATUS

Type: Read
Clock: CCP_CLK

CCP_G10_STATUS

Bits	Name	Description
31:16	CCP_G1	CCP G1 register contents
15:0	CCP_G0	CCP G0 register contents

0x10100810 CCP_G32_STATUS

Type: Read
Clock: CCP_CLK

CCP_G32_STATUS

Bits	Name	Description
31:16	CCP_G3	CCP G3 register contents

CCP_G32_STATUS (cont.)

Bits	Name	Description
15:0	CCP_G2	CCP G2 register contents

0x10100814 CCP_G54_STATUS

Type: Read
Clock: CCP_CLK

CCP_G54_STATUS

Bits	Name	Description
31:16	CCP_G5	CCP G5 register contents
15:0	CCP_G4	CCP G4 register contents

0x10100818 CCP_G76_STATUS

Type: Read
Clock: CCP_CLK

CCP_G76_STATUS

Bits	Name	Description
31:16	CCP_G7	CCP G7 register contents
15:0	CCP_G6	CCP G6 register contents

0x1010081C CCP_P10_STATUS

Type: Read
Clock: CCP_CLK

CCP_P10_STATUS

Bits	Name	Description
31:16	CCP_P1	CCP P1register contents
15:0	CCP_P0	CCP P0 register contents

0x10100820 CCP_P2_STATUS

Type: Read
Clock: CCP_CLK

CCP_P2_STATUS

Bits	Name	Description
31:16	RESERVED_BITS	
15:0	CCP_P2	CCP P2 register contents

10.2.11 Sample Memory

Bits	Name	Description
31:0	RESERVED_BITS	

Channel Control Processor Command Words

The structure of command words is as follow:

- The first word in memory must be the start command (CCM_START_CMD). General information that is common to all channels is specified here.
- Next are 5 command words per channel (CCM_WORD1_CMD to CCM_WORD5_CMD). The command words are placed into consecutive addresses in memory. There is sufficient memory for up to 100 channels. Note that command words 6 and 7 are currently not implemented in the microcode. They are reserved for the future.

- The last entry in memory is indicated by the end command (CCM_END_CMD). The CCP will parse all the channel commands and store into variable memory until the end command is reached.

0x10115000 CCM_START_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_START_CMD

Bits	Name	Description
31	RESERVED_BITS	
30	CCM_FIRST_MEMORY	This bit sets which memory gets the results of the first channel commands. 0 = memory A, 1 = memory B. The memory set here will stay in effect until CCP gets a channel command with the toggle bit set.
29:10	CCM_WAIT_RTC	This command is compared to the GNSS RTC. The CCP will start processing the channel command set after the count value is reached. Allocate 15-bits for ms count and 5-bits for sub-ms count (upper 5-bits of chip counter).
9:5	CCM_NR_MS	Number of milliseconds for the channel command set. The CCP will continue processing the command set for specified number of ms. It will expect a new command set before the number of ms is reached.
4:0	CCM_MODE	Must be set to 30 for the start command. This command word indicates the start of the channel command set. It is assumed to always be at the first memory address.

0x10115004 CCM_WORD1_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_WORD1_CMD

Bits	Name	Description
31	CCM_SEGMENT_TYPE	Specifies if the processing interval is the full duration of the channel command set (equal to CCM_NR_MS) or only partial duration (less than CCM_NR_MS). 0x0: FULL 0x1: PART
30	CCM_SEGMENT_TERM	Specifies if the segment number (CCM_SEGMENT_NR) is the beginning or ending of processing interval. This command is only valid when CCM_SEGMENT_TYPE = PART. 0x0: BEGIN 0x1: END

CCM_WORD1_CMD (cont.)

Bits	Name	Description
29:21	CCM_NR_CORRS	See CP_NR_CORRS. The command is expanded to handle up to 2048 correlations per channel. If more than 256 correlations are specified, the CCP will allocate additional CP tasks.
20	CCM_BIT1	See CP_PILOT_BIT and CP_DATA_BIT. This command bit may specify the first data (or pilot) channel bit. It is active while current ms is less than CCM_SEGMENT_NR. This is interpreted as a data or pilot channel based on CCM_MODE command.
19	CCM_BIT2	This command bit specifies the second data (or pilot) channel bit. It is active while current ms is greater than (or equal to) CCM_SEGMENT_NR, until the last millisecond (see CCM_NR_MS).
18	CCM_TOGGLE_MEMORY	This bit tells CCP to toggle the current memory from A to B or from B to A. The current memory is where all CP results will be stored. The current memory will stay in effect for all CP tasks until CCP gets a command with the toggle bit set.
17	CCM_RESULT_BITS	See CP_RESULT_BITS
16	CCM_SAT_BITS	See CP_SAT_BITS
15:12	CCM_SCALE	See CP_SCALE
11	CCM_FINE_SCALE	See CP_FINE_SCALE
10:7	CCM_SUBCH	See CP_SUBCH
6:5	CCM_CH	See CP_CH
4:0	CCM_MODE	See CP_MODE

0x10115008 CCM_WORD2_CMD

Type: Write/Read
Clock: MEM_CLK
Reset State: 0x0

CCM_WORD2_CMD

Bits	Name	Description
31:24	CCM_PHASE	This is the upper 8-bits of the CP_PHASE command. The CCP calculates the CP_PHASE value on every ms.
23:0	CCM_FREQ	See CP_FREQ

0x1011500C CCM_WORD3_CMD

Type: Write/Read
Clock: MEM_CLK
Reset State: 0x0

CCM_WORD3_CMD

Bits	Name	Description
31:24	RESERVED_BITS	
23:0	CCM_TIME_INDEX	The time index, modulo 4 ms, for the sample memory index. The upper bits are the integer sample index, which are directly assigned to the CP_FIRST_INDEX command on the first 1 ms interval. The lower bits are fractional sample delay. The 2 most significant fraction bits are directly assigned to the CP_DELAY command. The remaining fraction bits define the fraction of a quarter sample delay. The number of integer and fraction bits is mode dependent. The number format ranges from U17.7 for wideband modes down to U11.13 for Glonass R1_1 mode. For MBOC and wideband L1/L5 the time resolutions are 0.38 ns and 0.32 ns. In all other modes the resolution is 0.24 ns.

0x10115010 CCM_WORD4_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_WORD4_CMD

Bits	Name	Description
31:27	CCM_SEGMENT_NR	Specifies the millisecond segment relative to data/pilot bit transition or the overlay code sequence. The range is typically 0 to 19. Note, the CP_L2EVEN command is derived from the segment number. Note, for L1C and E1 modes the CCP multiples the CCM_SEGMENT_NR by 1023 to determine the CP_FIRST_CODE value.
26:0	CCM_CODE_SEED	See CP_DATA_SEED and CP_PILOT_SEED. This is interpreted as a data or pilot channel seed based on CCM_MODE command. For Glonass R1 modes, CCM_CODE_SEED [19:0] specifies a 20-bit overlay code, 1 bit per ms for 20 ms, with bit 0 as the first bit. For E1 the code sequence number (SV) is CCM_CODE_SEED[3:0]. This specifies one of 16 possible memory codes. The CP_ALPHA command is CCM_CODE_SEED[9:8]

0x10115014 CCM_WORD5_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_WORD5_CMD

Bits	Name	Description
31:24	RESERVED_BITS	
23:22	CCM_CONSTCODE	See CP_CONSTCODE
21:12	CCM_TIME_RESIDUAL	Accumulated time offset in fractions of one-quarter sample index. The sample index resolution is CP mode dependent. This value is used to maintain the sample phase dithering process over multiple command sets.
11:0	CCM_TIME_DOP	Time Doppler offset. This command is an additional time offset that is added (or subtracted) to the time index on every 1 ms interval. This is a signed number. The resolution is 1/32 of the CCM_TIME_INDEX.

0x10115018 CCM_WORD6_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_WORD6_CMD

Bits	Name	Description
31:9	RESERVED_BITS	Note, word 6 is optional. It is only required for modes that have 1 data channel correlator operating concurrently with pilot channel correlators. This option is available on L2C, L1C, L5, E1, E5A pilot channel correlation modes.
8	CCM_CD_ENABLE	See CP_CD_ENABLE
7:2	CCM_CD_TIME_OFFSET	See CP_CD_TIME_OFFSET
1:0	CCM_CD_SAMP_PHS	See CP_CD_SAMP_PHS

0x1011501C CCM_WORD7_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_WORD7_CMD

Bits	Name	Description
31:29	RESERVED_BITS	This command word is only used for L1C, L2C and E5A modes that have concurrent/coherent processing of pilot and data channels. For other modes the data channel seed is added to Word 4. Note word 7 may be used together with word 6 in some modes and separate in other modes (TBD). Thus in some cases word 7 may be the 6th command word.
30:29	CCM_ALPHA	See CP_ALPHA command. This command is specified here for the L1C_DP_4 mode (for E1 it's located in word 4)
28	CCM_DATA_BIT1	This command bit may specify the first data channel bit. It is active until the segment number is reached (see CCM_SEGMENT_NR).
27	CCM_DATA_BIT2	This command bit may specify the second data channel bit. It is active after the segment number is reached and until the last millisecond (see CCM_NR_MS).
26:0	CCM_DATA_SEED	Code generator seed for concurrent data channel. See CCM_SEED and CP_DATA_SEED.

0x10115020 CCM_END_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_END_CMD

Bits	Name	Description
31:5	RESERVED_BITS	
4:0	CCM_MODE	Must be set to 31 for the end command. This command word indicates the end of the channel command set. It should be located in the word following the last channel command.

0x101157DC CCM_STOP_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_STOP_CMD

Bits	Name	Description
31:1	RESERVED_BITS	
0	CCM_STOP	Terminates CCP execution until next load command.

0x101157E0 CCM_LOAD_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_LOAD_CMD

Bits	Name	Description
31:1	RESERVED_BITS	
0	CCM_LOAD	Indicates that a new set of commands has been written to CCM memory. When CCP see this bit set to logic 1, it begins processing the latest command set. After CCP finishes consuming all commands, then it clears this bit and increments the command sequence number. After the specified number of milliseconds is completed, the CCP will again wait for the load command.

0x101157E4 CCM_ERROR_CLEAR_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_ERROR_CLEAR_CMD

Bits	Name	Description
31:1	RESERVED_BITS	
0	CCM_ERROR_CLEAR	After the CCP detects an error, it will go into a wait loop. It will stay in this state until the error clear command is sent (or the CCP is reset). When CCP see this bit set to logic 1, it will immediately clear this bit, error status bits and CP_DISABLE. Then CCP will wait for the next CCM_LOAD command.

0x101157E8 CCM_TIME_MARGIN_CMD

Type: Write/Read
Clock: MEM_CLK

CCM_TIME_MARGIN_CMD

Bits	Name	Description
31:7	RESERVED_BITS	
6:0	CCM_TIME_MARGIN	Specifies the amount of time that a CP task start can be delay before an error condition occurs. See CCM_LATE_TASK_ERROR for usage. This variable is defined as a U2.5 type with unit of millisecond. The typical value is slightly greater than 1. The value could be adjusted based on expected CP utilization for the next command set.

0x101157EC CCM_LATE_TASK_ERROR_STATUS

Type: Read
Clock: MEM_CLK

CCM_LATE_TASK_ERROR_STATUS

Bits	Name	Description
31:1	RESERVED_BITS	
0	CCM_LATE_TASK_ERROR	An error condition occurs when a CP task is started later then the specified time margin. A CP task can be delayed due to commands arriving too late (CCM_LOAD) or Data Mover transfers occurring too late (causing significant stalling). This error bit is set when current RTC is greater than sum of CCM_WAIT_RTC + CCM_TIME_MARGIN + ms_count, where ms_count is from 0 to CCM_NR_MS-1. All variables have unit of millisecond with 5-bit fraction. When the error condition occurs, the CCP will go into a wait loop (see CCM_ERROR_CLEAR) and the CP_DISABLE command will be set.

0x101157F0 CCM_OVERRUN_ERROR_STATUS

Type: Read
Clock: MEM_CLK

CCM_OVERRUN_ERROR_STATUS

Bits	Name	Description
31:1	RESERVED_BITS	
0	CCM_OVERRUN_ERROR	An error condition is set when the Data Mover reads more correlation results than the CP stored. This is considered a catastrophic software error. The error flag is generated by the CP, and can only be cleared by a software reset (RC_SW_RESET) or hardware reset. Before the beginning of each CP task, the CCP transfers the error flag to this memory location. When the error condition occurs, the CCP will go into a wait loop and the CP_DISABLE command will be set.

0x101157F4 CCM_SEQ_NUMBER_STATUS

Type: Read
Clock: MEM_CLK

CCM_SEQ_NUMBER_STATUS

Bits	Name	Description
31:0	CCM_SEQ_NUMBER	Indicates the command set sequence number. After CCP detects the CCM_LOAD command and consumes the command set, it increments the sequence number. This is a modulo 32-bit counter.

0x101157F8 CCM_DONE_RTC_STATUS

Type: Read
Clock: MEM_CLK

CCM_DONE_RTC_STATUS

Bits	Name	Description
31:0	CCM_DONE_RTC	Records the GNSS real time counter state after the last CP task of the millisecond is completed. This is mainly meant for diagnostic purpose. The 32-bit GNSS RTC is composed of {frame_count[15], chip_count[10], sample_count[7]}. Since this value is updated every 1 ms, one should schedule a Data Mover transfer after the correlation results are transferred.

0x101157FC CCM_STALL_COUNT_STATUS

Type: Read
Clock: MEM_CLK

CCM_STALL_COUNT_STATUS

Bits	Name	Description
31:0	CCM_STALL_COUNT	Indicates the approximate number of clock cycles that the CP was stalled due to Data Mover late transfer of correlation result memory. This is mainly meant for diagnostic purpose. Some amount of stalling is tolerable as long as the tasks are not delayed too much. This is a modulo 32-bit counter.

10.2.14 Test Signal Generator Memories

0x10120000 TPM_ADDR_BEGIN

Type: Read/Write
Clock: MEM_CLK

TPM_ADDR_BEGIN

Bits	Name	Description
31:0	RESERVED_BITS	TSG pilot code memory

0x101201FC TPM_ADDR_END

Type: Read/Write
Clock: MEM_CLK

TPM_ADDR_END

Bits	Name	Description
31:0	RESERVED_BITS	

0x10124000 TDM_ADDR_BEGIN

Type: Read/Write
Clock: MEM_CLK

TDM_ADDR_BEGIN

Bits	Name	Description
31:0	RESERVED_BITS	TSG data code memory

0x101241FC TDM_ADDR_END

Type: Read/Write
Clock: MEM_CLK

TDM_ADDR_END

Bits	Name	Description
31:0	RESERVED_BITS	

10.2.15 GNSS Tracking Memory

0x10180000 GTM_ADDR_BEGIN

Type: Read/Write
Clock: MEM_CLK

GTM_ADDR_BEGIN

Bits	Name	Description
31:0	RESERVED_BITS	GTM begin address

0x1019FFFC GTM_ADDR_END

Type: Read/Write
Clock: MEM_CLK

GTM_ADDR_END

Bits	Name	Description
31:0	RESERVED_BITS	GTM end address

10.2.16 Async Resample Command Registers

NOTE all registers in ARS group take effect immediately.

0x10100900 ARS_CONFIG

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

ARS_CONFIG

Bits	Name	Description
31:23	RESERVED_BITS	
22:21	ARS_TESTINSEL	When ARS_TESTINSEL[0] = 1, the ADC signals are connected to test bus input instead of normal inputs. adc_in_i = test_bus_in[5:4] adc_in_q = test_bus_in[1:0] When ARS_TESTINSEL[1] = 1, the input to the async resampler block is driven from the test bus input instead of normal inputs. ars_test_i = test_bus_in[9:0] ars_test_q = test_bus_in[19:10]
20:19	ARS_TESTSEL	Specifies the probe point to send to the ARS test bus output 0x0: OFF (zero out) 0x1: P1 (resampler input from AAF) 0x2: P2 (resampler output) 0x3: P3 (ARS_SOFTWARE_DEBUG register)
19:16	ARS_FLOOR_CNT_VAL	Set this register = floor(ref_clk_freq/adc_clk_freq)-1. The hardware compares the latched end count value with this register to determine which phase mapping to select.
15:14	ARS_SAMPLELOG_MODE	See AD_SAMPLELOG_MODE
13	ARS_SAMPLELOG_START	See AD_SAMPLELOG_START
12:10	ARS_SAMPLELOG_DEPTH	See AD_SAMPLELOG_DEPTH
9	ARS_RATE	Resampler output sampling rate with respect to main clock. Used for output clock generation. 0x0: HALF (main clock divided by 2) 0x1: QTR (main clock divided by 4)
8	ARS_AAF_EN	See BP1_AAF_EN

ARS_CONFIG (cont.)

Bits	Name	Description
7	ARS_IF_TYPE	See BP1_IF_TYPE
6	ARS_NULLQ	See AD_RX1_NULLQ
5	ARS_NULLI	See AD_RX1_NULLI
4	ARS_SIGNINVQ	See AD_RX1_SIGNINVQ
3	ARS_SIGNINVI	See AD_RX1_SIGNINVI
2	ARS_SWAPIQ	See AD_RX1_SWAPIQ
1	ARS_SRCSEL	See AD_RX1_SRCSEL
0	ARS_EN	Set to logic 1 to enable the ARS module

0x10100904 ARS_QUANT_MAP

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

ARS_QUANT_MAP

Bits	Name	Description
31:16	RESERVED_BITS	
15:0	ARS_DRX_QUANTMAP	See AD_RX1_QUANTMAP, but only lower 4 values are specified.

0x10100908 ARS_IF_FREQ

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

NOTE ARS_PHASE_MAP_L registers hold the mapping values when the hardware phase counter end value is equal to floor(ref_clk_freq/adc_clk_freq) - 1.
ARS_PHASE_MAP_H registers hold the mapping values when the hardware phase counter end value is greater than floor(ref_clk_freq/adc_clk_freq) - 1.

ARS_IF_FREQ

Bits	Name	Description
31:16	RESERVED_BITS	
15:0	ARS_IFFREQ	See BP1_IFFREQ. fs = ADC sample rate

0x1010090C ARS_PHASE_MAP_L0

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

ARS_PHASE_MAP_L0

Bits	Name	Description
31:28	ARS_PHASE_MAP_L7	The mapped phase when HW generated phase = “0111”
27:24	ARS_PHASE_MAP_L6	The mapped phase when HW generated phase = “0110”
23:20	ARS_PHASE_MAP_L5	The mapped phase when HW generated phase = “0101”
19:16	ARS_PHASE_MAP_L4	The mapped phase when HW generated phase = “0100”
15:12	ARS_PHASE_MAP_L3	The mapped phase when HW generated phase = “0011”
11:8	ARS_PHASE_MAP_L2	The mapped phase when HW generated phase = “0010”
7:4	ARS_PHASE_MAP_L1	The mapped phase when HW generated phase = “0001”
3:0	ARS_PHASE_MAP_L0	The mapped phase when HW generated phase = “0000”

0x10100910 ARS_PHASE_MAP_L8

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

ARS_PHASE_MAP_L8

Bits	Name	Description
31:28	ARS_PHASE_MAP_L15	The mapped phase when HW generated phase = “1111”
27:24	ARS_PHASE_MAP_L14	The mapped phase when HW generated phase = “1110”
23:20	ARS_PHASE_MAP_L13	The mapped phase when HW generated phase = “1101”
19:16	ARS_PHASE_MAP_L12	The mapped phase when HW generated phase = “1100”
15:12	ARS_PHASE_MAP_L11	The mapped phase when HW generated phase = “1011”
11:8	ARS_PHASE_MAP_L10	The mapped phase when HW generated phase = “1010”
7:4	ARS_PHASE_MAP_L9	The mapped phase when HW generated phase = “1001”
3:0	ARS_PHASE_MAP_L8	The mapped phase when HW generated phase = “1000”

0x10100914 ARS_PHASE_MAP_H0

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

ARS_PHASE_MAP_H0

Bits	Name	Description
31:28	ARS_PHASE_MAP_H7	The mapped phase when HW generated phase = “0111”
27:24	ARS_PHASE_MAP_H6	The mapped phase when HW generated phase = “0110”
23:20	ARS_PHASE_MAP_H5	The mapped phase when HW generated phase = “0101”
19:16	ARS_PHASE_MAP_H4	The mapped phase when HW generated phase = “0100”
15:12	ARS_PHASE_MAP_H3	The mapped phase when HW generated phase = “0011”
11:8	ARS_PHASE_MAP_H2	The mapped phase when HW generated phase = “0010”
7:4	ARS_PHASE_MAP_H1	The mapped phase when HW generated phase = “0001”
3:0	ARS_PHASE_MAP_H0	The mapped phase when HW generated phase = “0000”

0x10100918 ARS_PHASE_MAP_H8

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

ARS_PHASE_MAP_H8

Bits	Name	Description
31:28	ARS_PHASE_MAP_H15	The mapped phase when HW generated phase = “1111”
27:24	ARS_PHASE_MAP_H14	The mapped phase when HW generated phase = “1110”
23:20	ARS_PHASE_MAP_H13	The mapped phase when HW generated phase = “1101”
19:16	ARS_PHASE_MAP_H12	The mapped phase when HW generated phase = “1100”
15:12	ARS_PHASE_MAP_H11	The mapped phase when HW generated phase = “1011”
11:8	ARS_PHASE_MAP_H10	The mapped phase when HW generated phase = “1010”
7:4	ARS_PHASE_MAP_H9	The mapped phase when HW generated phase = “1001”
3:0	ARS_PHASE_MAP_H8	The mapped phase when HW generated phase = “1000”

0x1010091C ARS_SW_DEBUG

Type: Write/Read
Clock: WR_CLK
Reset State: 0x0

ARS_SW_DEBUG

Bits	Name	Description
31:0	ARS_SOFTWARE_DEBUG	Software debug & report status register. Values written to this register will appear on the test bus out. See ARS_TESTSEL to configure. Note, test bus out may not be routed off-chip so this feature may not useful.

0x10100920 ARS_MEAN_MON

Type: Read
Clock: MAIN_CLK
Reset State: 0x0

ARS_MEAN_MON

Bits	Name	Description
31:16	ARS_MEANMONQ	
15:0	ARS_MEANMONI	See AD_RX1_PREMEANMONI. fs = ADC sample rate

0x10100924 ARS_AMPL_MON

Type: Read
Clock: MAIN_CLK
Reset State: 0x0

Bits	Name	Description
31:16	ARS_AMPLMONQ	
15:0	ARS_AMPLMONI	See AD_RX1_AMPLMONI. fs = ADC sample rate

0x10100928 ARS_SAMPLE_LOG

Type: Read
Clock: MAIN_CLK
Reset State: 0x0

ARS_SAMPLE_LOG

Bits	Name	Description
31:17	RESERVED_BITS	
16	ARS_SAMPLELOG_DONE	See AD_SAMPLELOG_DONE
15:0	ARS_SAMPLELOG_INDEX	See AD_SL_INDEX. fs = ADC sample rate

10.2.17 GPS Accelerator Command Registers

The writable registers occupy sequential addresses so that the host processor or Data Mover can program all of them with one block transfer. If the GPS accelerator is active, any write to these registers will not be acknowledged until it is inactive. Also, the read-only registers occupy sequential addresses so they can be moved with one block transfer.

0x10100A00 GACC_CLK_CTL

Type: Write/Read
Clock: GACC_WR_CLK
Reset State: 0x0

GACC_CLK_CTL

Bits	Name	Description
31:4	RESERVED_BITS	
3	GACC_TEST_BUS_EN	Enable for test bus output. Set to logic 1 to enable. When logic 0 the bus will be forced to zero.
2	GACC_HW_LCG_EN	Enables dynamic HW clock gating scheme. When logic 1, the GACC can control the clock depending on the FSM state. This allows power savings. When logic 0, the software can control the state of the clock with the GACC_MICRO_CLK_EN register.
1	GACC_SW_CLK_EN	Controls the on/off of the logic clocks associated with core interfaces.
0	GACC_CLK_EN	When GACC_HW_LCG_EN = 0, this bit takes over the clock gating. This controls clocks related to core functions.

0x10100A04 GACC_RTC_WAIT

Type: Write/Read
Clock: GACC_WR_CLK
Reset State: 0

GACC_RTC_WAIT

Bits	Name	Description
31:26	RESERVED_BITS	
25:24	GACC_RTC_SELECT	Determines which RTC input to use for the GACC_PAUSE, GACC_DONE, and GACC_RTC commands. 0x0: GPS 0x1: CDMA 0x2: HDR 0x3: Reserved
23:0	GACC_RTC_WAIT	GACC operation is paused until the subtraction of START_RTC from selected RTC[23:0] results in 0 for bit number 23. After the condition is met, the GACC will send an acknowledge for the write to this register. This effectively holds any bus transfer until a specified time.

0x10100A08 GACC_START_ADDR

Type: Write/Read
Clock: GACC_WR_CLK
Reset State: 0

GACC_START_ADDR

Bits	Name	Description
31:22	RESERVED_BITS	
21:11	GACC_ENERGY_ADDR	Starting address for values within energy memory.
10:0	GACC_SAMPLE_ADDR	Starting address for values within sample memory.

0x10100A0C GACC_COUNT

Type: Write/Read
Clock: GACC_WR_CLK
Reset State: 0

GACC_COUNT

Bits	Name	Description
31:25	GACC_ENERGY_ITER	Specifies the number of coherent integrations for each energy.
24:15	GACC_HYP_ITER	Specifies the number of time hypotheses.
14:8	GACC_SAMP_ITER	Specifies the number of accumulation for each set of samples.
7:0	GACC_FREQ_ITER	Specifies the iterations of frequency loop.

0x10100A10 GACC_INCR

Type: Write/Read
Clock: GACC_WR_CLK
Reset State: 0

GACC_INCR

Bits	Name	Description
31:22	GACC_SAMP_INCR_SAMP	Unsigned increment of the starting sample address after all frequency integrations of a sample offset of a hypothesis. An advance sample pointer to the next sample offset.
21:11	GACC_SAMP_INCR_TIME	Signed increment of the starting sample address after all sample offset integrations of a hypothesis. An advance sample pointer to the next hypothesis.
10:0	GACC_SAMP_INCR_ENERGY	Unsigned increment of the starting sample address after all hypotheses. An advance sample pointer to the samples for the next set of coherent integrations.

0x10100A14 GACC_FREQ

Type: Write/Read
Clock: GACC_WR_CLK
Reset State: 0

GACC_FREQ

Bits	Name	Description
31:16	GACC_FIRST_FREQ	Signed phase step for the first frequency.
15:0	GACC_FREQ_INCR	Signed phase step increment between frequencies.

0x10100A18 GACC_CONFIG

Type: Write/Read
Clock: GACC_WR_CLK
Reset State: 0

GACC_CONFIG

Bits	Name	Description
31:24	RESERVED_BITS	

GACC_CONFIG (cont.)

Bits	Name	Description
23	GACC_ENERGY_MEM_BANK	Specifies the memory bank connections. 0x0: bank 0 is connected to GPS accelerator, bank 1 is connected to Data Mover. 0x1: bank1 is connected to GPS accelerator, bank 0 is connected Data Mover.
22	GACC_SAMPLE_MEM_BANK	Specifies the memory bank connections. 0x0: bank 0 is connected to GPS accelerator, bank 1 is connected to Data Mover. 0x1: bank1 is connected to GPS accelerator, bank 0 is connected Data Mover.
21	GACC_START	Set this bit to 1 to start the GPS accelerator.
20	GACC_COHERENT_OUT	Specifies the format result: 0x0: update energy grid 0x1: output coherent sums
19	GACC_FIRST_ENERGY	Set this bit to 1 to erase the energy sum before adding the first energy.
18:16	GACC_LAST_NFREQ	Specifies the frequency bins in the last iteration of the frequency iteration.
15:5	GACC_COHERENT_LEN	Specifies the coherent integration length.
4:2	GACC_SUM_TRUNC	Specifies the I/Q sum truncation; the maximum is 5.
1:0	GACC_ENERGY_TRUNC	Specifies the energy sum truncation before adding to sum; the maximum is 3.

0x10100A1C GACC_PEAK

Type: Read
Clock: GACC_WR_CLK
Reset State: 0

GACC_PEAK

Bits	Name	Description
31:27	RESERVED_BITS	
26:16	GACC_MAX_INDEX	Specifies the index to the maximum energy grid value.
15:0	GACC_MAX_ENERGY	Specifies the maximum energy grid value.

0x10100A20 GACC_DONE

Type: Read
Clock: GACC_WR_CLK
Reset State: 0

GACC_DONE

Bits	Name	Description
31:24	RESERVED_BITS	
23:0	GACC_DONE_RTC	RTC value when the previous computation completed. When the state machine is in the all_done state, the current RTC is saved in this register. The RTC type is specified in the most recent GACC_PAUSE command.

0x10100A24 GACC_RTC

Type: Read
Clock: GACC_WR_CLK
Reset State: 0

GACC_RTC

Bits	Name	Description
31:24	RESERVED_BITS	
23:0	GACC_CURRENT_RTC	Current RTC value. The RTC type is specified in the most recent GACC_PAUSE command.

0x10100A28 GACC_TEST_BUS_OUT

Type: Read
Reset State: 0xA0

GACC_TEST_BUS_OUT

Bits	Name	Description
31:8	RESERVED_BITS	
7	GACC_AHB2HB_IDLE	Set to 1 when the AHB2AHB bridge is in the idle state.
6	GACC_WAIT_FOR_RTC	Set to 1 when the interface is waiting for the RTC to hit the target value
5	GACC_INTF_IDLE_STATE	Set to 1 when in INTF_IDLE_STATE of interface state machine
4	GACC_READ_PEAK_WAIT_STATE	Set to 1 when in READ_PEAK_WAIT_STATE of interface state machine

GACC_TEST_BUS_OUT (cont.)

Bits	Name	Description
3:1	GACC_SP_CURRENT_STATE	The current state of the signal processing state machine
0	GACC_CLK_IS_ON	Indicates clock activity. Logic 1 means this clock is on.

10.2.18 GACC Memories

0x10128000 GACC_SAMPLE_MEM_START_ADDR

Type: Write/Read
Clock: MEM_CLK

GACC_SAMPLE_MEM_START_ADDR

Bits	Name	Description
31:0	GACC_SAMPLE_MEM	First address of sample memory. The memory is physically partitioned into 2 banks, called bank 0 and 1, each of size 1280 by 16-bits. From the software perspective, this memory appears as 640 by 32-bits with 2 consecutive locations accessed for each 32-bit transfer. The memory bank is selected by SAMPLE_MEM_BANK of the GACC_CONFIG register.

0x101289FC GACC_SAMPLE_MEM_END_ADDR

Type: Write/Read
Clock: MEM_CLK

GACC_SAMPLE_MEM_END_ADDR

Bits	Name	Description
31:0	GACC_SAMPLE_MEM	Last address of sample memory. The memory is physically partitioned into 2 banks, called bank 0 and 1, each of size 1280 by 16-bits. From the software perspective, this memory appears as 640 by 32-bits with 2 consecutive locations accessed for each 32-bit transfer. The memory bank is selected by SAMPLE_MEM_BANK of the GACC_CONFIG register.

0x1012C000 GACC_ENERGY_MEM_START_ADDR

Type: Write/Read
Clock: MEM_CLK

GACC_ENERGY_MEM_START_ADDR

Bits	Name	Description
31:0	GACC_ENERGY_MEM	First address of energy memory.The memory is physically partitioned into 2 banks, called bank 0 and 1, each of size 1280 by 16-bits. From the software perspective, this memory appears as 640 by 32-bits with 2 consecutive locations accessed for each 32-bit transfer. The memory bank is selected by ENERGY_MEM_BANK of the GACC_CONFIG register.

0x1012C9FC GACC_ENERGY_MEM_END_ADDR

Type: Write/Read
Clock: MEM_CLK

GACC_ENERGY_MEM_END_ADDR

Bits	Name	Description
31:0	GACC_ENERGY_MEM	Last address of energy memory.The memory is physically partitioned into 2 banks, called bank 0 and 1, each of size 1280 by 16-bits. From the software perspective, this memory appears as 640 by 32-bits with 2 consecutive locations accessed for each 32-bit transfer. The memory bank is selected by ENERGY_MEM_BANK of the GACC_CONFIG register.

10.2.19 Data Mover Host Command Registers

10.2.19.0.1 Channel programming registers

NOTE Suggestion to use only security domain 0. Thus s = 0 in all register sets.

0x10100B00+4*n HI0_CHn_CMD_PTR_SDs, n=[0..7], s=[0..3]

Type: Read/Write
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

The HI0_CHn_CMD_PTR_SDs register is used to supply the top-level programming structure pointer to the N'th DM2 channel. This register is implemented as a FIFO that can accept two top-level pointers in addition to a third that is executing.

HI0_CHn_CMD_PTR_SDs

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:0	ADDR	Address (in double words) of the command structure

0x10100B40+ 4*n HI0_CHn_RSLT_SDs, n=[0..7], s=[0..3]

Type: Read
Clock: DM2_CORE
Reset State: V(alid) bit=0, all other bits X

The HI0_CHn_RSLT_SDs register is used to read the results produced by N'th DM2 channel.

NOTE Reading this register pops one item from the 3-deep result FIFO. The combined depth of the result FIFO and the top-level pointer FIFO is only allowed to be two deep unless there isn't already a top-level pointer executing in which case the combined depth can be three.

There almost always is a one-to-one correspondence between the top-level pointers and the results. The only exception is when an error occurs (as indicated by ERR). In this case, all queued top-level pointers will be discarded, but only one result will be created.

HI0_CHn_RSLT_SDs

Bits	Name	Description
31	V	Valid - the result is valid If this bit is cleared (0), it indicates that the host has emptied the result FIFO.
3	ERR	Error - The result was generated because of an error
2	F	Flush - The result was generated because of a flush operation
1	TPD	Top pointer done - The result was generated because of the completion of the last command in the top-level programming structure
0	RESERVED_BIT0	

0x10100B80+ 4*n HI0_CHn_FLUSH_STATE0_SDs, n=[0..7], s=[0..3]

Type: Read/Write
Clock: DM2_CORE
Reset State: V(alid) bit = 1, all other bits X

Writing to the HI0_CHn_FLUSH_STATE0_SDs register clears (0) the V bit, which then causes the channel to begin a flush operation. When writing to this register, bit 31 should be set to the desired flush type (discard or graceful). Upon completion of the flush state assembly (as indicated by a set V flag), this and the other five FLUSH_STATE registers will contain the state of the channel at the time of the flush. The DM2 may also initiate a channel flush operation internally when the channel encounters an error.

NOTE If a flush is already underway for a given channel and a result from this flush has not yet been generated, then a subsequent flush to the same channel will have no impact and will not generate a second result. This can be determined by the CH_STATE after

a flush request. If set to FLUSH_WAIT then this indicates that a flush is already in progress and the subsequent flush was ignored.

Also, if the NO_DATA_XFER field is set, then the flush occurred prior any data transfers occurring for the top-level pointer, and thus all other flush state registers will not contain valid data.

If the LAST_CPLE_MPU field is set then the last command list entry processed was an MPU command. As such, all other flush state registers will not contain valid data, except for the PTR_NUM field in the FLUSH_STATE5 register. In this case, PTR_NUM will point to the next CLE entry AFTER the MPU command.

If the NO_INB_INSTR field is set, then the flush occurred at a point where no INB instruction was loaded or being processed. In this case the DPH_CMD_TYPE field of FLUSH_STATE0, the SRC_REM_LEN field of FLUSH_STATE3, and the SRC_DSCR_NUM field of the FLUSH_STATE4 register provide information on the last INB operation to fully complete. This can happen between commands, between scatter/gather indices, or between scatter/gather descriptors.

If the NO_OTB_INSTR field is set, then the flush occurred at a point where no OTB instruction was loaded or being processed. In this case the DST_REM_LEN field of FLUSH_STATE3 and the DST_DSCR_NUM field of the FLUSH_STATE4 register provide information on the last OTB operation to fully complete. This can happen between commands, between scatter/gather indices, or between scatter/gather descriptors.

Also, if both the NO_INB_INSTR and NO_OTB_INSTR fields are set then the flush occurred at a time when no instructions (INB or OTB) were loaded for the channel. This can happen between commands, between scatter/gather indices, or between scatter/gather descriptors. In this case all flush state registers provide information on what just completed rather than what was next to be processed.

When following the requirement that only the FLUSH_STATE1 register, and the PTR_NUM and DSCR_INDX_NUM fields of the FLUSH_STATE5 register are used in conjunction with NO_DATA_XFER, CH_STATE, and LAST_CPLE_MPU to resubmit flushed commands, the NO_INB_INSTR and NO_OTB_INSTR fields can be ignored and are provided for debug purposes only.

Host initiated flush operations only terminate the top-level pointer that is currently being executed. If a second top-level pointer is valid, it will not be affected by the flush.. On the other hand, a flush due to an error condition will flush all top-level pointers.

HI0_CHn_FLUSH_STATE0_SDs

Bits	Name	Description
31	FLUSH_TYPE	Notes: 1. FLUSH_TYPE=1 is only supported for single and box mode commands. It currently is not supported for commands that are zero length, and should not be attempted on commands of zero length or unpredictable results may occur. 2. On reads, this bit indicates the type of flush that occurred based on the command type being processed at the time that the flush was requested. 3. If a graceful flush is requested just as one command is completing and another is about to start, the FLUSH_TYPE may not agree with the DPH_CMD_TYPE. This is because the FLUSH_TYPE is based on the command that is completing, while the DPH_CMD_TYPE will be based on the command that is about to start (assuming another command is loaded). This only occurs under the condition that the flush had no impact on the command completing. For example FLUSH_TYPE = 1 and DPH_CMD_TYPE = SG indicates that a single or box mode command was finishing at the time that a graceful flush was requested, but the next command is of type SG and thus only the SG command was affected by the flush. In this case graceful flush and discard flush are equivalent, since no data is buffered. 0x0: Flush should discard any data already read into data buffer 0x1: Flush should write all INB data received or requested prior to terminating the top-level command
30:21	RESERVED_BITS30_21	
20	CMD_ERR	Indicates that an error occurred when parsing a command. For example if ADDR_MODE=2 (reserved) in the first word of the command. This type of error is imprecise in that the DPH_CMD_TYPE field as well as the FLUSH_STATE1-5 registers provide details of the command that is currently in the data phase (or the last command to complete data phase processing if no commands are in the data phase) at the time that the error occurs. This is because the discard flush is applied as soon as the error is detected. The command that is in the data phase may or may not be the command to cause this type of error since up to two commands are processed at a time (one in data phase and one in command phase).
19	LAST_CPLE_MPU	The last command pointer list entry to be processed was an MPU command. As such, the DPH_CMD_TYPE field, as well as all of the other flush state registers will not contain valid data. The one exception is the PTR_NUM field in FLUSH_STATE5 which is valid.
18	NO_OTB_INSTR	Flush occurred at a time when no OTB instructions were loaded. See above for details.
17	NO_INB_INSTR	Flush occurred at a time when no INB instructions were loaded. See above for details.

HI0_CHn_FLUSH_STATE0_SDs (cont.)

Bits	Name	Description
16	NO_DATA_XFER	The channel had begun to process the top-level pointer for this channel, but no data transfers for the top-level pointer had yet begun. As such, all other flush state registers will not be valid. A result will be generated for this top-level pointer.
15:14	DPH_CMD_TYPE	Specifies the type of command that has been flushed (only valid if CH_STATE is not idle, NO_DATA_XFER is not set (1), and LAST_CPLE_MPU is not set (1)): 0x0: Single 0x1: Scatter/gather 0x2: Reserved_programming 0x3: Box
13	PTR_NUM_OVRFLW	Indicates that the PTR_NUM field in FLUSH_STATE5 has overflowed and is not valid (this is only a status indication, it is not a cause for a flush)
12	DSCR_INDX_OVRFLW	Indicates that the DSCR_INDX_NUM field in FLUSH_STATE5 has overflowed and is not valid (this is only a status indication, it is not a cause for a flush)
11	LEN_ERROR	A flush was triggered internally because a box mode or scatter/gather command encountered a length error.
10	MPU_ERROR	A flush was triggered internally because a command encountered an internal MPU error.
9	DPH_BUS_ERROR	A flush was triggered internally because a command encountered a bus error from one of the data transfer requests.
8	CPH_BUS_ERROR	A flush was triggered internally because a command encountered a bus error from one of the command fetch requests. This type of error is imprecise in that the DPH_CMD_TYPE field as well as the FLUSH_STATE1-5 registers provide details of the command that is currently in the data phase (or the last command to complete data phase processing if no commands are in the data phase) at the time that the error occurs. This is because the discard flush is applied as soon as the error is detected. The command that is in the data phase may or may not be the command to cause this type of error since up to two commands are processed at a time (one in data phase and one in command phase).
7:3	RESERVED_BITS7_3	

HI0_CHn_FLUSH_STATE0_SDs (cont.)

Bits	Name	Description
2:1	CH_STATE	Specifies the processing state of the channel at the time that the flush was requested The channel was completely idle at the time of a flush and thus the flush has been ignored and has no impact. In this case a result will not be generated for this flush request. In this case all of the other flush state registers will not update. They will continue to provide the state of the last flush (if any). The channel was processing a command at the time of the flush. A result will be generated if the flush is due to an error condition, or if flush results are enabled. The channel was already processing a flush (either host initiated or due to an error) at the time that the latest flush was requested. As such, the latest flush request will be ignored. Other flush state registers do not update and continue to correspond to the initial flush. No result will be generated for the latest flush. 0x0: IDLE 0x1: PROCESS 0x3: FLUSH_WAIT
0	V	Indicates that the flush state is now valid. If an error occurs on a top-pointer after the previous top-pointer was flushed, this bit will go low while the DM2 core gathers the flush state for the error. In this case the flush state from the previous top-pointer will be lost if it has not already been read by the host.

0x10100BC0+4*n HI0_CHn_FLUSH_STATE1_SDs, n=[0..7], s=[0..3]

Type: Read
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

The HI0_CHn_FLUSH_STATE1_SDs register is only meaningful if CH_STATE is not idle (00), NO_DATA_XFER is not set (1), and LAST_CPLE_MPU is not set (1).

HI0_CHn_FLUSH_STATE1_SDs

Bits	Name	Description
31:0	CMD_ADDR	Address of the command being processed by the data phase at the time of flush operation.

0x10100C00+4*n HI0_CHn_FLUSH_STATE2_SDs, n=[0..7], s=[0..3]

Type: Read
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

The HI0_CHn_FLUSH_STATE2_SDs register is reserved.

HI0_CHn_FLUSH_STATE2_SDs

Bits	Name	Description
31:0	RESERVED_BITS31_0	

0x10100C40+ 4*n HI0_CHn_FLUSH_STATE3_SDs, n=[0..7], s=[0..3]

Type: Read
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

The HI0_CHn_FLUSH_STATE3_SDs register is only meaningful if CH_STATE is not idle (00), NO_DATA_XFER is not set (1), and LAST_CPLE_MPU is not set (1). This register is intended for debug purposes and should not be relied upon by software.

HI0_CHn_FLUSH_STATE3_SDs

Bits	Name	Description
31:16	DST_REM_LEN	Specifies the number of bytes yet to be written to the command's current destination buffer (assuming all outstanding bus requests have completed). In the case of box mode commands, this is the number of bytes remaining for the current line.
15:0	SRC_REM_LEN	Specifies the number of bytes yet to be read from the command's current source buffer (assuming all outstanding bus requests have completed). In the case of box mode commands, this is the number of bytes remaining for the current line.

0x10100C80+ 4*n HI0_CHn_FLUSH_STATE4_SDs, n=[0..7], s=[0..3]

Type: Read
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

The HI0_CHn_FLUSH_STATE4_SDs register is only meaningful if CH_STATE is not idle (00), NO_DATA_XFER is not set (1), and LAST_CPLE_MPU is not set (1). This register is intended only for debug purposes and should not be relied upon for software.

HI0_CHn_FLUSH_STATE4_SDs

Bits	Name	Description
31:16	DST_DSCR_NUM	Box mode commands: Specifies the number of remaining destination lines for the command, including the current line (assuming all outstanding requests completed) Scatter/gather commands: Specifies the scatter/gather command's current destination descriptor position in the descriptor list (assuming all outstanding requests completed)
15:0	SRC_DSCR_NUM	Box mode commands: Specifies the number of remaining source lines for the command, including the current line (assuming all outstanding requests completed) Scatter/gather commands: Specifies the scatter/gather command's current source descriptor position in the descriptor list (assuming all outstanding requests completed)

0x10100CC0+4*n HI0_CHn_FLUSH_STATE5_SDs, n=[0..7], s=[0..3]

Type: Read
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

The HI0_CHn_FLUSH_STATE5_SDs register is only meaningful if CH_STATE is not idle (00), and NO_DATA_XFER is not set (1). If LAST_CPLE_MPU is set (1), then only the PTR_NUM field in this register is valid. In this case PTR_NUM points to the command list entry AFTER the MPU command.

HI0_CHn_FLUSH_STATE5_SDs

Bits	Name	Description
31:24	PTR_NUM	Specifies the current command's list pointer position in the pointer list (assuming all outstanding requests completed).
23:16	DSCR_INDX_NUM	Specifies the indirect scatter/gather command's current descriptor index position in the descriptor index list (assuming all outstanding requests completed).
15:8	BUFFERED_LEN	Specifies the number of data bytes read from the source but not written to the destination (assuming all outstanding requests complete). This field is intended for debug purposes only and should not be relied upon by software.
2:0	RESERVED_BITS2_0	

Interrupt status registers

0x10100E80 HI0_SEC_DOMAIN_IRQ_STATUS_SDS, s=[0..3]

Type: Read
Clock: DM2_CORE
Reset State: 0x00000000

The HI0_SEC_DOMAIN_IRQ_STATUS_SDs register is the N'th security domain's interrupt status register, which reflects the state of only those channels that belong to the N'th security domain. The other IRQ bits are always cleared (0). Reading the N'th security domain's interrupt status register clears (0) all of the interrupt requests from the channels belonging to the N'th security domain. The other channel interrupt requests are not affected.

HI0_SEC_DOMAIN_IRQ_STATUS_SDS

Bits	Name	Description
15	CH_15_IRQ	Indicates a pending interrupt request from channel 15
14	CH_14_IRQ	Indicates a pending interrupt request from channel 14
13	CH_13_IRQ	Indicates a pending interrupt request from channel 13
12	CH_12_IRQ	Indicates a pending interrupt request from channel 12
11	CH_11_IRQ	Indicates a pending interrupt request from channel 11
10	CH_10_IRQ	Indicates a pending interrupt request from channel 10
9	CH_9_IRQ	Indicates a pending interrupt request from channel 9
8	CH_8_IRQ	Indicates a pending interrupt request from channel 8
7	CH_7_IRQ	Indicates a pending interrupt request from channel 7
6	CH_6_IRQ	Indicates a pending interrupt request from channel 6
5	CH_5_IRQ	Indicates a pending interrupt request from channel 5
4	CH_4_IRQ	Indicates a pending interrupt request from channel 4
3	CH_3_IRQ	Indicates a pending interrupt request from channel 3
2	CH_2_IRQ	Indicates a pending interrupt request from channel 2
1	CH_1_IRQ	Indicates a pending interrupt request from channel 1
0	CH_0_IRQ	Indicates a pending interrupt request from channel 0

10.2.19.0.2 Channel status and configuration registers accessible to all security domains

0x10100E00+4*n HI0_CHn_RSLT_CONF_SDs, n=[0..7], s=[0..3]

Type: Read/Write
Clock: DM2_CORE
Reset State: 0x00000002

The HI0_CHn_RSLT_CONF_SDs register provides the interrupt configuration status of the indicated channel.

HI0_CHn_RSLT_CONF_SDs

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	FLUSH_RSLT_EN	When set (1), a result will be generated for each top-level pointer that is flushed due to a host initiated flush. Note that all top-level pointers that either fully complete or that generate an error always produce a result. This bit should be set for normal operation, since it results in a one-to-one correspondence between top-pointers and results (with the only exception being that if a top-pointer causes an error, any top pointers that are queued are discarded without a result)
0	IRQ_EN	Indicates that an interrupt should be generated when the result FIFO becomes not empty, i.e., transition from 0 valid entry to 1 valid entry.

0x10100D00+4*n HI0_CHn_STATUS_SDs, n=[0..7], s=[0..3]

Type: Read
Clock: DM2_CORE
Reset State: 0x00000001

The HI0_CHn_STATUS_SDs register provides the channel status of the indicated channel.

HI0_CHn_STATUS_SDs

Bits	Name	Description
31:29	RSLT_FIFO_CNTR	Number of valid entries in the result FIFO. 0-3 are supported.
28:27	CMD_PTR_FIFO_CNTR	Number of valid entries in the command pointer FIFO. Note that there may also be a command pointer already being processed.
26	CMD_IN_PROGRESS	Indicates that a top-level pointer is currently being processed.
1	RSLT_VLD	At least one valid result may be dequeued from the result FIFO
0	CMD_PTR_RDY	At least one command pointer may be enqueued to the command pointer FIFO. This will only assert if all of the following are true: 1. CMD_PTR_FIFO_CNTR < 2 2. (CMD_PTR_FIFO_CNTR + RSLT_FIFO_CNTR < 2) OR ((CMD_PTR_FIFO_CNTR + RSLT_FIFO_CNTR < 3) AND CMD_IN_PROGRESS = 0)

10.2.19.0.3 Security domain 0 channel configuration and debug registers

0x10100D40+4*n HI0_CHn_CONF, n=[0..7]

Type: Read/Write
Clock: DM2_CORE
Reset State: 0x00000081

The HI0_CHn_CONF register provides the configuration status of the indicated channel and accessible through the security domain 0 only.

HI0_CHn_CONF

Bits	Name	Description
31:16	OTHER_CH_BLK_MASK	Each set (1) bit specifies that the corresponding channel is controlled by this channel via the OCU and OCB control field.
12	RSLT_CONF_SHADOW_EN	If set (1), the CH_CONF field IRQ_EN and FLUSH_RSLT_EN fields are set through register CHn_RSLT_CONF_SDs. During subsequent writes to CHn_CONF, writes to those fields are ignored. If clear, access to CHn_RSLT_CONF_SDs is ignored.
11	MPU_DISABLE	Disables MPU error detection
10	RESERVED_BIT10	
9	PERM_MPU_CONF	Indicates that the MPU configuration structure pointed to by the top-level pointer will be executed. If this bit is cleared (0), all MPU structures will be silently ignored.
8	RESERVED_BIT8	
7	FLUSH_RSLT_EN	When set (1), a result will be generated for each top-level pointer that is flushed due to a host initiated flush. Note that all top-level pointers that either fully complete or that generate an error always produce a result. This bit should be set for normal operation, since it results in a one-to-one correspondence between top-pointers and results (with the only exception being that if a top-pointer causes an error, any top pointers that are queued are discarded without a result)
6	IRQ_EN	Indicates that an interrupt should be generated when the result FIFO becomes not empty, i.e., transition from 0 valid entry to 1 valid entry. if RSLT_CONF_SHADOW_EN is set (1), writes to this field will be ignored.
5:4	SEC_DOMAIN	Specifies the channel security domain (controls channel programming and status register aliasing, and selects which of the four interrupts should be used by the channel)

HI0_CHn_CONF (cont.)

Bits	Name	Description
3:0	PRIORITY	Specifies channel priority, in which 0 is the highest priority. This is the weight to the arbitration scheme. Note that assigning a channel's priority value to 0 causes the channel to stay at the highest priority, i.e., the channel will always be granted whenever there's a command to be executed, as the accumulator value is never incremented (incremented with 0). The priority can be viewed as the period between service intervals, such that a weight of 1 will be serviced twice as often as a weight of 2. Though arbitration occurs for each client interface separately, a channel's priority is common to all client interfaces. If multiple channels are configured for the same priority and are ready for access to the same client interface, round-robin servicing will be provided between these channels. The only exception to this is if more than one channel is configured as priority 0. In this case the zero-priority channel with the lowest number is always given preference.

0x10100D80+4*n HI0_CHn_DBG_0, n=[0..7]

Type: Read/Write
Clock: DM2_CORE
Reset State: 0x00000000

The HI0_CHn_DBG_0 register is used for debugging purposes for the indicated channel and accessible through the security domain 0 only.

HI0_CHn_DBG_0

Bits	Name	Description
3	REQ_ENG_HALT	When set (1), prevents the channel from being chosen by the arbiter for data transfers. The current operation on the channel (if already selected) will complete.
2	CMD_ENG_HALT	When set (1), prevents the channel from being chosen by the arbiter for command transfers. The current operation on the channel (if already selected) will complete.
1	CMD_PTR_FIFO_HALT	When set (1), prevents the command pointer FIFO from accepting any new command pointers from hosts. The writes to the command pointer register will be ignored.
0	ERROR	When set (1), indicates that the channel has encountered an error and is now in the stalled state. Specific error information may be obtained by reading the channel flush state registers (see Error handling section). The software must clear (0) this bit before the channel may be used again. This bit can only be cleared by S/W; it cannot be set to 1 by S/W.

0x10100DC0+4*n HI0_CHn_DBG_1, n=[0..7]

Type: Read
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

The HI0_CHn_DBG_1 register is used for additional debugging purposes for the indicated channel and accessible through the security domain 0 only.

HI0_CHn_DBG_1

Bits	Name	Description
31:0	DBG_STATE	TBD

10.2.19.0.4 Global configuration, and debug registers

0x10100E90+4*n HI0_CIn_CONF, n=[0..7]

Type: Read/Write
Clock: DM2_CORE
Reset State: 0x00010001

The HI0_CIn_CONF register is the CI configuration register for the indicated client interface.

It is possible to configure two or more client interfaces to have overlapping address regions. In this case accesses to the overlapping region will be sent to the highest numbered client interface. CI0 is the default client interface, and receives accesses to addresses that have not been assigned to any client interface. Setting RANGE_END < RANGE_START will disable the client interface, with the exception of CI0. On reset only CI0 is enabled. While the CI0 RANGE_START and RANGE_END parameters can be written and read, they do not have an impact on the address decode.

HI0_CIn_CONF

Bits	Name	Description
31:24	RANGE_END	Specifies the end of the N'th CI address range in 16-MB blocks. Note that this is the last block within the client interface region. For example setting RANGE_START=0x00 and RANGE_END=0x00 specifies that the client interface supports the address range 0x00000000-0x00FFFFFF. APQ 7200/7500: For CI 1 (SMI), the upper bit of this field must not be set. Any addresses in the range 0x80000000-0xFFFFFFFF must go to CI 0 if unused.
23:16	RANGE_START	Specifies the start of the N'th CI address range in 16-MB blocks

HI0_CIn_CONF (cont.)

Bits	Name	Description
5:4	CI_WEIGHT	Specifies the relative weight that the client interface receives when arbitrating for access to the channel buffer memory. Normally this can be left at 0 for all client interfaces, which means that each CI gets 25% of the channel buffer memory BW when all client interfaces are requesting (more BW is available if not all of the client interfaces are busy). At 133MHz the channel buffer memory has a half-duplex capacity of 500MB/sec. Assuming that each client interface is performing 32-byte bursts, a weight of 0 guarantees at least 125MB/sec of half duplex channel buffer memory BW to each CI. If the CI is doing 16 byte bursts while all other client interfaces are doing 32-byte bursts, then that CI is guaranteed at least 83.3 MB/sec of half duplex BW. If more than this amount of half-duplex BW is required on a single client interface, the CI weight parameter allows for a redistribution of the channel buffer memory BW. The minimum BW that the channel buffer memory will supply to a given CIn is determined by multiplying the following ratio by the BW capacity of the channel buffer memory (500MB/sec at 133MHz) (CI_WEIGHT(CIn)+1)*MAX_BURST_LEN(CIn) --- Sum for i=0 to 3 of ((CI_WEIGHT(CIi)+1)*MAX_BURST_LEN(CIi) Assuming that all bursts are 32-bytes long, then CI_WEIGHT does not need to be set to more than 1. Setting CI_WEIGHT to 1 for a high BW CI and to 0 for the remaining three CIs will result in the channel buffer memory supporting a minimum of 200MB/sec of half-duplex BW to the high BW CI, and 100 MB/sec to each of the remaining 3 low-BW CIs. With a maximum requirement of 100MB/sec full-duplex (200MB/sec half-duplex) across all 4 CIs, this is more than sufficient. Note that this parameter only distributes the BW of the channel buffer memory. It does not ensure that the client interfaces or the command processing can keep up with these rates.
3:0	MAX_BURST_LEN	Specifies the maximum burst length in 32-bit words. Only values of 1, 4, and 8 are currently supported, which specify 1, 4, or 8 word bursts. The following are the limitations of each client interface: AHB client interfaces (CI2, CI3): 1, 4, 8 AXI client interfaces (CI0, CI1): 4, 8 The AXI client interfaces will also work with a setting of 1, but not all bursts are limited to 1 word. It is recommended that AXI client interfaces be set to 8 word bursts and AHB client interfaces be set to at least 4 word bursts for optimal system performance.

0x10100EB0+4*n HI0_CIn_DBG_ERR, n=[0..7]

Type: Read
Clock: DM2_CORE
Reset State: 0x00000000

The HI0_CIn_DBG_ERR register is the CI debug register for the indicated client interface.

HI0_CIn_DBG_ERR

Bits	Name	Description
31:16	DATA_BUS_ERR	The N'th bit in the mask becomes set (1) when the N'th channel data transfer traffic causes a bus error on this interface. By clearing the ERROR bit in the HI0_CHn_DBG_0 register, the bit corresponding to the channel will be cleared in this register.
15:0	CMD_BUS_ERR	The N'th bit in the mask becomes set (1) when the N'th channel command fetch traffic causes a bus error on this interface. By clearing the ERROR bit in the HI0_CHn_DBG_0 register, the bit corresponding to the channel will be cleared in this register.

0x10100ED0 HI0_CRCI_DBG

Type: Read/Write
Clock: DM2_CORE
Reset State: 0x0000FFFF

The HI0_CRCI_DBG register is the CRCI debug register for the indicated CRCI.

HI0_CRCI_DBG

Bits	Name	Description
15:0	CRCI_RST	When set (1), this bit resets the corresponding CRCI and keeps it in the reset state. When cleared (0), this bit re-enables the CRCI. This field becomes all '1' after reset.

0x10100ED4 HI0_CRCI_STATUS

Type: Read
Clock: DM2_CORE
Reset State: 0x00000001

The HI0_CRCI_STATUS register provides the CRCI status.

HI0_CRCI_STATUS

Bits	Name	Description
15:0	CRCI_RDY	Each bit set (1) in this register indicates that the corresponding CRCI has at least one token for sending data or a command

0x10100ED8 HI0_GP_CTL

Type: Read/Write
Clock: DM2_CORE
Reset State: 0x00000000

The HI0_GP_CTL register is a general purpose control register intended for DM2 instance specific control functions.

HI0_GP_CTL

Bits	Name	Description
31:0	GP_CTL	These bits are defined as necessary for DM2 instance specific functions.

0x10100EDC HI0_GP_STATUS

Type: Read
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

The HI0_GP_STATUS register is a general purpose status register intended for DM2 instance specific status information.

HI0_GP_STATUS

Bits	Name	Description
31:0	GP_STATUS	These bits are defined as necessary for DM2 instance specific functions.

0x10100EE0 HI0_GLBL_DBG_CMD_ENG

Type: Read/Write
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

HI0_GLBL_DBG_CMD_ENG

Bits	Name	Description
31:0	DBG_STATE	TBD

0x10100EE4 HI0_GLBL_DBG_REQ_ENG

Type: Read/Write
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

HI0_GLBL_DBG_REQ_ENG

Bits	Name	Description
31:0	DBG_STATE	TBD

0x10100EE8 HI0_GLBL_DBG_XFR_ENG

Type: Read/Write
Clock: DM2_CORE
Reset State: 0xXXXXXXXX

HI0_GLBL_DBG_XFR_ENG

Bits	Name	Description
31:0	DBG_STATE	TBD

0x10100EEC HI0_GLBL_DBG_CHAN_BLK

Type: Read
Clock: DM2_CORE
Reset State: 0x00000000

HI0_GLBL_DBG_CHAN_BLK

Bits	Name	Description
15:0	CHAN_BLK_MASK	Indicates which channel(s) are currently blocked (see other channel block or this channel block command arguments)

0x10100EF0 HI0_GLBL_DBG_CHAN_BLK_CLR

Type: Read/Write
Clock: DM2_CORE
Reset State: 0x00000000

HI0_GLBL_DBG_CHAN_BLK_CLR

Bits	Name	Description
3:0	CHAN_BLK_CLR_CHAN_NNUM	Writing to this register causes the bit, corresponding to the channel number written, in GLBL_DBG_CHAN_BLK register to clear. This allows hosts to selectively clear channel block bits without relying on read-modify-write of GLBL_DBG_CHAN_BLK which would cause race-condition.

0x10100EF4 HI0_GLBL_DBG_TEST_SEL

Type: Read/Write
Clock: DM2_CORE
Reset State: 0x00000000

HI0_GLBL_DBG_TEST_SEL

Bits	Name	Description
5:0	TEST_BUS_SEL	This signal selects the signals to show on the DM2 testbus. The encoding for each set of test signal is as follows: 11xxxx Reserved_programming 0x0: None (output is all zeros) 0x1: Reserved_programming_1 0x2: Reserved_programming_2 0x3: Reserved_programming_3 0x4: Command engine 0x8: Request engine 0xC: Transfer engine 0x10: Reserved_programming_4 0x20: CI0 0x24: CI1 0x28: CI2 0x2C: CI3

10.2.20 Nav Clock Command Registers

0x101F8000 NAV_CLK_ENABLE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

NAV_CLK_ENABLE

Bits	Name	Description
31:5	RESERVED_BITS	
4	NC_RSREF_CLK_ENABLE	Resample reference clock enable
3	NC_ADC2_CLK_ENABLE	Diversity ADC clock enable
2	NC_ADC1_CLK_ENABLE	Primary ADC clock enable
1	NC_MAIN_CLK_ENABLE	Main clock enable
0	NC_XO_CLK_ENABLE	Crystal oscillator clock enable. These enables control the CXCs. During power-up reset, the XO clock source is routed to the other clocks, which allows initialization of all internal registers. After power-up reset, all clocks are disabled. Software must configure dividers and mux's and then enable clocks as needed.

0x101F8004 NAV_CLK_RESET

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

NAV_CLK_RESET

Bits	Name	Description
31:5	RESERVED_BITS	
4	NC_RSREF_CLK_RESET	Resample reference clock domain reset
3	NC_ADC2_CLK_RESET	Diversity ADC clock domain reset
2	NC_ADC1_CLK_RESET	Primary ADC clock domain reset
1	NC_MAIN_CLK_RESET	Main clock domain reset
0	NC_XO_CLK_RESET	Crystal oscillator clock domain reset Software resets for each clock domain. It is required to write a logic 1 to a register bit to engage reset followed by a logic 0 to disengage reset. When a reset is activated, the clock will be activated to initialize all internal registers (even if the clock enable command bit is disabled).

0x101F8008 NAV_CLK_CTL

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register selects which strobe is used to update the Nav M/N:D divider settings.

0 : HOST (Host processor write to NC_FRAC _UPDATE register)

NAV_CLK_CTL

Bits	Name	Description
31:22	RESERVED_BITS	
21	NC_MEMORY_RETAIN	When this bit is set, the contents of all memories will be retained during power down. Note there is a power penalty.
20	NC_HS_DBG_CLK_SEL	Higher speed clock select for test out 0x0: OFF 0x1: RSREF
19:18	NC_LS_DBG_CLK_SEL	Lower speed clock select for test out 0x0: OFF 0x1: MAIN 0x2: ADC1 0x3: ADC2
17:16	NC_SRC_CLK_DIV	Clock divider on selected PLL source (NC_CLK_SRC_SEL), before M/N:D dividers. Potential power savings in down stream dividers if selected PLL clock is very high (e.g. > 600 MHz). 0x0: BYPASS 0x1: DIV2 0x2: DIV3 0x3: DIV4
15	NC_FRAC_UPDATE_SEL	
14	NC_FRAC8_RESET	
13	NC_FRAC8_DUAL_MODE	
12	NC_FRAC8_ENABLE	
11	NC_FRAC31_RESET	
10	NC_FRAC31_DUAL_MODE	
9	NC_FRAC31_ENABLE	
8:7	NC_RSREF_CLK_DIV	00: BYPASS 01: DIV2 10: DIV3 11: DIV4

NAV_CLK_CTL (cont.)

Bits	Name	Description
6:5	NC_ADC1_CLK_DIV	00: BYPASS 01: DIV2 10: DIV3 (not functional, do not use) 11: DIV4
4:3	NC_MAIN_CLK_DIV	00: BYPASS 01: FRAC8 10: FRAC31 11: BYPASS2
2:0	NC_CLK_SRC_SEL	000: XO 001: PLL0 010: PLL1 011: PLL2 100: EXTCLK 101: GND1 110: GND2 111: GND3

0x101F800C NAV_CLK_FRAC31_M

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

NAV_CLK_FRAC31_M

Bits	Name	Description
31	RESERVED_BITS	
30:0	NC_FRAC31_M	

0x101F8010 NAV_CLK_FRAC31_NOT_2D

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

NAV_CLK_FRAC31_NOT_2D

Bits	Name	Description
31	RESERVED_BITS	
30:0	NC_FRAC31_NOT_2D	

0x101F8014 NAV_CLK_FRAC31_NOT_N_MINUS_M

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

NAV_CLK_FRAC31_NOT_N_MINUS_M

Bits	Name	Description
31	RESERVED_BITS	
30:0	NC_FRAC31_NOT_N_MINUS_M	

0x101F8018 NAV_CLK_FRAC31_UPDATE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

NAV_CLK_FRAC31_UPDATE

Bits	Name	Description
31:1	RESERVED_BITS	
0	NC_FRAC31_UPDATE	When NC_FRAC_UPDATE_SEL = HOST, then writing a 1 then 0 pattern to this register will cause an immediate update to FRAC31 divider settings.

0x101F801C NAV_CLK_FRAC8

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

NAV_CLK_FRAC8

Bits	Name	Description
31:27	RESERVED_BITS	
26:18	NC_FRAC8_M	
17:9	NC_FRAC8_NOT_2D	
8:0	NC_FRAC8_NOT_N_MINUS_M	

0x101F8020 NAV_CLK_FRAC8_UPDATE

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

NAV_CLK_FRAC8_UPDATE

Bits	Name	Description
31:1	RESERVED_BITS	
0	NC_FRAC8_UPDATE	When NC_FRAC_UPDATE_SEL = HOST, then writing a 1 then 0 pattern to this register will cause an immediate update to FRAC8 divider settings.

10.2.21 ADC Command Registers

0x101F0000 GNSS_ADC_CMD0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

GNSS_ADC_CMD0

Bits	Name	Description
31:24	ADC_REG4	
23:16	ADC_REG3	
15:8	ADC_REG2	
7:0	ADC_REG1	See GNSS ADC SWI document

0x101F0004 GNSS_ADC_CMD1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

GNSS_ADC_CMD1

Bits	Name	Description
31:24	ADC_REG8	
23:16	ADC_REG7	
15:8	ADC_REG6	
7:0	ADC_REG5	

0x101F0008 GNSS_ADC_CMD2

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

GNSS_ADC_CMD2

Bits	Name	Description
31:24	ADC_REG12	
23:16	ADC_REG11	
15:8	ADC_REG10	
7:0	ADC_REG9	

0x101F000C GNSS_ADC_CMD3

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

GNSS_ADC_CMD3

Bits	Name	Description
31:24	ADC_REG16	
23:16	ADC_REG15	
15:8	ADC_REG14	
7:0	ADC_REG13	

0x101F0010 GNSS_ADC_IDDQ

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

GNSS_ADC_IDDQ

Bits	Name	Description
31:30	RESERVED_BITS	
0	ADC_IDDQ	Quiescent current test enable. Active low control. This register bit directly drive the gnss_adc_iddq_n signal. After reset the test mode is enabled. SW must set to logic 1 to enable the ADC for normal operation.

10.2.22 Data Mover Client One

10.2.22.1 Command Registers

0x10100000 DM1_RTC_WAIT

Type: Read/Write
Clock: MEM_CLK

DM1_RTC_WAIT

Bits	Name	Description
31:0	RESERVED_BITS	RTC wait.

10.2.22.2 Nav Core Memories

0x1010C000 DM1_CMA_ADDR_BEGIN

Type: Read/Write
Clock: MEM_CLK

DM1_CMA_ADDR_BEGIN

Bits	Name	Description
31:0	RESERVED_BITS	Correlation results memory - A block

0x1010EDFC DM1_CMA_ADDR_END

Type: Read/Write
Clock: MEM_CLK

DM1_CMA_ADDR_END

Bits	Name	Description
31:0	RESERVED_BITS	

0x10110000 DM1_CMB_ADDR_BEGIN

Type: Read/Write
Clock: MEM_CLK

DM1_CMB_ADDR_BEGIN

Bits	Name	Description
31:0	RESERVED_BITS	Correlation results memory - B block

0x101120FC DM1_CMB_ADDR_END

Type: Read/Write
Clock: MEM_CLK

DM1_CMB_ADDR_END

Bits	Name	Description
31:0	RESERVED_BITS	

0x10114000 DM1_CCM_ADDR_BEGIN

Type: Read/Write
Clock: MEM_CLK

DM1_CCM_ADDR_BEGIN

Bits	Name	Description
31:0	RESERVED_BITS	Channel command memory

0x101147FC DM1_CCM_ADDR_END

Type: Read/Write
Clock: MEM_CLK

DM1_CCM_ADDR_END

Bits	Name	Description
31:0	RESERVED_BITS	

0x10140000 DM1_SM_ADDR_BEGIN

Type: Read/Write
Clock: MEM_CLK

DM1_SM_ADDR_BEGIN

Bits	Name	Description
31:0	RESERVED_BITS	Sample memory begin address

0x10164FFC DM1_SM_ADDR_END

Type: Read/Write
Clock: MEM_CLK

DM1_SM_ADDR_END

Bits	Name	Description
31:0	RESERVED_BITS	Sample memory end address

10.2.23 Data Mover Client Two

10.2.23.1 Command Registers

0x10100000 DM2_RTC_WAIT

Type: Read/Write
Clock: MEM_CLK

DM2_RTC_WAIT

Bits	Name	Description
31:0	RESERVED_BITS	RTC wait.

10.2.23.2 GNSS Tracking Memory

0x10180000 DM2_GTM_ADDR_BEGIN

Type: Read/Write
Clock: MEM_CLK

DM2_GTM_ADDR_BEGIN

Bits	Name	Description
31:0	RESERVED_BITS	GTM begin address

0x1019FFFC DM2_GTM_ADDR_END

Type: Read/Write
Clock: MEM_CLK

DM2_GTM_ADDR_END

Bits	Name	Description
31:0	RESERVED_BITS	GTM end address

10.2.24 Data Mover Client Three

Data Mover client interface 3 is a dedicated connection to the GPS Accelerator (GACC). Because the Data Mover and the host processor have access to the same registers in the GACC, the registers below are a duplicate of the GACC registers described in the System Bus section of this document. The register names and fields are repeated here.

10.2.24.1 GPS Accelerator Command Registers

0x10100A00 DM3_GACC_CLK_CTL

Type: Write/Read
Clock: GACC_CLK_
Reset State: 0x0

The writable registers occupy sequential addresses so that the Data Mover can program all of them with one block transfer. If the GPS accelerator is active, any write to these registers will not be acknowledged until it is inactive. Also, the read-only registers occupy sequential addresses so they can be moved with one block transfer.

DM3_GACC_CLK_CTL

Bits	Name	Description
31:4	RESERVED_BITS	
3	GACC_TEST_BUS_EN	Enable for test bus output. Set to logic 1 to enable. When logic 0 the bus will be forced to zero.
2	GACC_HW_LCG_EN	Enables dynamic HW clock gating scheme. When logic 1, the GACC can control the clock depending on the FSM state. This allows power savings. When logic 0, the software can control the state of the clock with the GACC_MICRO_CLK_EN register.
1	GACC_SW_CLK_EN	Controls the on/off of the logic clocks associated with core interfaces.
0	GACC_CLK_EN	When GACC_HW_LCG_EN = 0, this bit takes over the clock gating. This controls clocks related to core functions.

0x10100A04 DM3_GACC_RTC_WAIT

Type: Write/Read
Clock: GACC_CLK
Reset State: 0

DM3_GACC_RTC_WAIT

Bits	Name	Description
31:26	RESERVED_BITS	

DM3_GACC_RTC_WAIT (cont.)

Bits	Name	Description
25:24	GACC_RTC_SELECT	Determines which RTC input to use for the GACC_PAUSE, GACC_DONE, and GACC_RTC commands. 0x0: GPS 0x1: CDMA 0x2: HDR 0x3: Reserved
23:0	GACC_RTC_WAIT	GACC operation is paused until the subtraction of START_RTC from selected RTC[23:0] results in 0 for bit number 23. After the condition is met, the GACC will send an acknowledge for the write to this register. This effectively holds any bus transfer until a specified time.

0x10100A08 DM3_GACC_START_ADDR

Type: Write/Read
Clock: GACC_CLK
Reset State: 0

DM3_GACC_START_ADDR

Bits	Name	Description
31:22	RESERVED_BITS	
21:11	GACC_ENERGY_ADDR	Starting address for values within sample memory.
10:0	GACC_SAMPLE_ADDR	Starting address for values within sample memory.

0x10100A0C DM3_GACC_COUNT

Type: Write/Read
Clock: GACC_CLK
Reset State: 0

DM3_GACC_COUNT

Bits	Name	Description
31:25	GACC_ENERGY_ITER	Specifies the number of coherent integrations for each energy.
24:15	GACC_HYP_ITER	Specifies the number of time hypotheses.
14:8	GACC_SAMP_ITER	Specifies the number of accumulation for each set of samples.
7:0	GACC_FREQ_ITER	Specifies the iterations of frequency loop.

0x10100A10 DM3_GACC_INCR

Type: Write/Read
Clock: GACC_CLK
Reset State: 0

DM3_GACC_INCR

Bits	Name	Description
31:22	GACC_SAMP_INCR_SAMP	Unsigned increment of the starting sample address after all frequency integrations of a sample offset of a hypothesis. An advance sample pointer to the next sample offset.
21:11	GACC_SAMP_INCR_TIME	Signed increment of the starting sample address after all sample offset integrations of a hypothesis. An advance sample pointer to the next hypothesis.
10:0	GACC_SAMP_INCR_ENERGY	Unsigned increment of the starting sample address after all hypotheses. An advance sample pointer to the samples for the next set of coherent integrations.

0x10100A14 DM3_GACC_FREQ

Type: Write/Read
Clock: GACC_CLK
Reset State: 0

DM3_GACC_FREQ

Bits	Name	Description
31:16	GACC_FIRST_FREQ	Signed phase step for the first frequency.
15:0	GACC_FREQ_INCR	Signed phase step increment between frequencies.

0x10100A18 DM3_GACC_CONFIG

Type: Write/Read
Clock: GACC_CLK
Reset State: 0

DM3_GACC_CONFIG

Bits	Name	Description
31:24	RESERVED_BITS	
23	GACC_ENERGY_MEM_BANK	Specifies the memory bank connections. 0x0: bank 0 is connected to GPS accelerator, bank 1 is connected to Data Mover. 0x1: bank1 is connected to GPS accelerator, bank 0 is connected Data Mover.

DM3_GACC_CONFIG (cont.)

Bits	Name	Description
22	GACC_SAMPLE_MEM_BANK	Specifies the memory bank connections. 0x0: bank 0 is connected to GPS accelerator, bank 1 is connected to Data Mover. 0x1: bank1 is connected to GPS accelerator, bank 0 is connected Data Mover.
21	GACC_START	Set this bit to 1 to start the GPS accelerator.
20	GACC_COHERENT_OUT	Specifies the format result: 0x0: update energy grid 0x1: output coherent sums
19	GACC_FIRST_ENERGY	Set this bit to 1 to erase the energy sum before adding the first energy.
18:16	GACC_LAST_NFREQ	Specifies the frequency bins in the last iteration of the frequency iteration.
15:5	GACC_COHERENT_LEN	Specifies the coherent integration length.
4:2	GACC_SUM_TRUNC	Specifies the I/Q sum truncation; the maximum is 5.
1:0	GACC_ENERGY_TRUNC	Specifies the energy sum truncation before adding to sum; the maximum is 3.

0x10100A1C DM3_GACC_PEAK

Type: Read
Clock: GACC_CLK
Reset State: 0

DM3_GACC_PEAK

Bits	Name	Description
31:27	RESERVED_BITS	
26:16	GACC_MAX_INDEX	Specifies the index to the maximum energy grid value.
15:0	GACC_MAX_ENERGY	Specifies the maximum energy grid value.

0x10100A20 DM3_GACC_DONE

Type: Read
Clock: GACC_CLK
Reset State: 0

DM3_GACC_DONE

Bits	Name	Description
31:24	RESERVED_BITS	

DM3_GACC_DONE (cont.)

Bits	Name	Description
23:0	GACC_DONE_RTC	RTC value when the previous computation completed. When the state machine is in the all_done state, the current RTC is saved in this register. The RTC type is specified in the most recent GACC_PAUSE command.

0x10100A24 DM3_GACC_RTC

Type: Read
Clock: GACC_CLK
Reset State: 0

DM3_GACC_RTC

Bits	Name	Description
31:24	RESERVED_BITS	
23:0	GACC_CURRENT_RTC	

0x10100A28 DM3_GACC_TEST_BUS_OUT

Type: Read
Clock: GACC_CLK
Reset State: 0xA0

DM3_GACC_TEST_BUS_OUT

Bits	Name	Description
31:8	RESERVED_BITS	
7	GACC_AHB2HB_IDLE	Current RTC value. The RTC type is specified in the most recent GACC_PAUSE command.
6	GACC_WAIT_FOR_RTC	Set to 1 when the interface is waiting for the RTC to hit the target value
5	GACC_INTF_IDLE_STATE	Set to 1 when in INTF_IDLE_STATE of interface state machine
4	GACC_READ_PEAK_WAIT_STATE	Set to 1 when in READ_PEAK_WAIT_STATE of interface state machine
3:1	GACC_SP_CURRENT_STATE	The current state of the signal processing state machine
0	GACC_CLK_IS_ON	Indicates clock activity. Logic 1 means this clock is on.

10.2.24.2 GACC Memories

0x10128000 DM3_GACC_SAMPLE_MEM_START_ADDR

Type: Write/Read
Clock: GACC_CLK

DM3_GACC_SAMPLE_MEM_START_ADDR

Bits	Name	Description
31:0	GACC_SAMPLE_MEM	First address of sample memory. The memory is physically partitioned into 2 banks, called bank 0 and 1, each of size 1280 by 16-bits. From the software perspective, this memory appears as 640 by 32-bits with 2 consecutive locations accessed for each 32-bit transfer. The memory bank is selected by SAMPLE_MEM_BANK of the GACC_CONFIG register.

0x101289FC DM3_GACC_SAMPLE_MEM_END_ADDR

Type: Write/Read
Clock: GACC_CLK

DM3_GACC_SAMPLE_MEM_END_ADDR

Bits	Name	Description
31:0	GACC_SAMPLE_MEM	Last address of sample memory. The memory is physically partitioned into 2 banks, called bank 0 and 1, each of size 1280 by 16-bits. From the software perspective, this memory appears as 640 by 32-bits with 2 consecutive locations accessed for each 32-bit transfer. The memory bank is selected by SAMPLE_MEM_BANK of the GACC_CONFIG register.

0x1012C000 DM3_GACC_ENERGY_MEM_START_ADDR

Type: Write/Read
Clock: GACC_CLK

DM3_GACC_ENERGY_MEM_START_ADDR

Bits	Name	Description
31:0	GACC_ENERGY_MEM	First address of energy memory.The memory is physically partitioned into 2 banks, called bank 0 and 1, each of size 1280 by 16-bits. From the software perspective, this memory appears as 640 by 32-bits with 2 consecutive locations accessed for each 32-bit transfer. The memory bank is selected by ENERGY_MEM_BANK of the GACC_CONFIG register.

0x1012C9FC DM3_GACC_ENERGY_MEM_END_ADDR

Type: Write/Read
Clock: GACC_CLK

DM3_GACC_ENERGY_MEM_END_ADDR

Bits	Name	Description
31:0	GACC_ENERGY_MEM	Last address of energy memory.The memory is physically partitioned into 2 banks, called bank 0 and 1, each of size 1280 by 16-bits. From the software perspective, this memory appears as 640 by 32-bits with 2 consecutive locations accessed for each 32-bit transfer. The memory bank is selected by ENERGY_MEM_BANK of the GACC_CONFIG register.

10.3 GSS A5 Wrapper Registers (0x10000000 GSS_A5_CSR_BASE)

This section contains the Global Navigation Subsystem (GSS) A5 Wrapper registers.

10.3.1 A5 Wrapper Config/Status Registers (CSR)

NOTE All command register settings take effect immediately unless otherwise noted

All registers are initialized with power_on_reset excepted CSR_AHB_CLK_SEL and CSR_RESET registers with power_on_reset or warm_reset

0x10000000 GSS_A5_CSR_AHB_CLK_SEL

Type: Write/Read
Clock: GSS_AHB_HCLK
Reset State: 0x0

GSS_A5_CSR_AHB_CLK_SEL

Bits	Name	Description
31:1	RESERVED_BITS	
0	CSR_GSS_AHB_CLK_SEL	Select the source clock for the Fabric AHB Async Slave Port 0x0: XO clock 0x1: AHB clock

0x10000004 GSS_A5_CSR_RESET

Type: Write/Read
Clock: GSS_AHB_HCLK
Reset State: 0x1

GSS_A5_CSR_RESET

Bits	Name	Description
31:7	RESERVED_BITS	
6	CSR_SPM_RESET	Reset of SPM module
5	CSR_TIMERS_SLEEP_RESET	Reset of 2 GP timers and 1 watch dog timer at sleep clock
4	CSR_TIMERS_XO_RESET	Reset of 1 debug timer at XO clock
3	CSR_QGIC2_RESET	Reset of GIC2 module
2	CSR_AHB_RESET	Reset of AHB bus
1	CSR_AXI_RESET	Reset of AXI bus

GSS_A5_CSR_RESET (cont.)

Bits	Name	Description
0	CSR_A5_RESET	Reset of A5 CPU

0x10000008 GSS_A5_CSR_CLK_BLK_CONFIG

Type: Write/Read
Clock: GSS_AHB_HCLK
Reset State: 0x0

GSS_A5_CSR_CLK_BLK_CONFIG

Bits	Name	Description
31:18	RESERVED_BITS	
17:16	AHB_CLK_DIV_OVERRIDE	Real integer divider of source clock for AHB bus (Integer - 1). Reading only.
15:14	AXI_CLK_DIV_OVERRIDE	Real integer divider of source clock for AXI bus (Integer - 1). Reading only.
13:12	CSR_DEBUG_LS_CLK_SEL	Select the debug clock 0x0: OFF 0x1: GSS_AHB_CLK 0x2: XO_CLK 0x3: SLEEP_CLK
11:10	CSR_DEBUG_HS_CLK_SEL	Select the debug clock 0x0: OFF 0x1: A5_CLK 0x2: AXI_CLK 0x3: LOC_AHB_CLK
9:8	CSR_AHB_DIV	Integer divider of source clock for AHB bus (Integer - 1). The source clock rate divided by (CSR_A5_DIV+1) then divided by (CSR_AHB_DIV+1) has to be less than 72MHz.
7:6	CSR_AXI_DIV	Integer divider of source clock for AXI bus (Integer - 1). The source clock rate divided by (CSR_A5_DIV+1) then divided by (CSR_AXI_DIV+1) has to be less than 144MHz.
5:2	CSR_A5_DIV	Integer divider (by 1, 2, ..., 16) of source clock for A5 CPU (Integer - 1)
1:0	CSR_CLK_SRC_SEL	Select the PLL source clock between the source and test input 0x0: OFF 0x1: PLL_SCR_CLK 0x2: PLL_TEST_CLK 0x3: XO_SRC_CLK

0x1000000C GSS_A5_CSR_CLK_ENABLE

Type: Write/Read
Clock: GSS_AHB_HCLK
Reset State: 0x0

GSS_A5_CSR_CLK_ENABLE

Bits	Name	Description
31:7	RESERVED_BITS	
6	CSR_SPM_SYSTEM_CLK_EN	When set to 1, then SPM has control of the system/PLL clock on request signal. Otherwise SPM has no control. The AP should set this bit during boot up. For testing there is an option to disable SPM control.
5	CSR_SPM_FORCE_CLK_EN	When set to 1, then SPM has control of the A5, AXI, AHB clock enables. Otherwise SPM has no control. The AP should set this bit during boot up. For testing there is an option to disable SPM control.
4	CSR_SLEEP_CLK_ENABLE	Clock enable for Sleep clock
3	CSR_XO_CLK_ENABLE	Clock enable for XO clock
2	CSR_AHB_CLK_ENABLE	Clock enable for AHB bus
1	CSR_AXI_CLK_ENABLE	Clock enable for AXI bus
0	CSR_A5_CLK_ENABLE	Clock enable for A5 CPU

0x10000010 GSS_A5_CSR_A5_CONTROL

Type: Write/Read
Clock: LOC_AHB_HCLK
Reset State: 0x0

GSS_A5_CSR_A5_CONTROL

Bits	Name	Description
31:5	RESERVED_BITS	
5	CSR_A5_EVENTO	Reading only
4	CSR_A5_EVENTI	
3	CSR_L1RSTDISABLE	Disable invalidate entire data cache, instruction cache and TLB at reset
2	CSR_CP15SDISABLE	Disables write access to some system control processor registers.
1	CSR_TEINIT	Default exception handling state (0 = ARM)
0	CSR_VINITHI	Comes up in High-Vecs model

0x10000014 GSS_A5_CSR_BOOT_REMAP

Type: Write/Read
Clock: LOC_AHB_HCLK
Reset State: 0x0

GSS_A5_CSR_BOOT_REMAP

Bits	Name	Description
31:17	RESERVED_BITS	
16	CSR_BOOT_REMAP_EN	Enable of boot remapper.
15:0	CSR_BOOT_REMAP_ADDRESS	Bit [31: 16] for the boot remapper address

0x10000018 GSS_A5_CSR_POWER_UP_DOWN

Type: Write/Read
Clock: LOC_AHB_HCLK
Reset State: 0x0

GSS_A5_CSR_POWER_UP_DOWN

Bits	Name	Description
31:6	RESERVED_BITS	
5	CSR_NAV_PWRON	Power on status. Reading only
4	CSR_A5_PWRON	Power on status. Reading only
3	CSR_SPM_A5_PWRUP_EN	When set to 1, then SPM has control of the A5 power sequencer. Otherwise SPM has no control. The AP should set this bit during boot up. For testing there is an option to disable SPM control.
2	CSR_MEMORY_RETAIN	Memory retention 0x0: NO 0x1: YES
1	CSR_NAV_PWRUP	Power up the Nav Core 0x0: NO 0x1: YES
0	CSR_A5_PWRUP	Power up the A5 0x0: NO 0x1: YES

0x1000001C GSS_A5_CSR_PRIORITY_ARBITER

Type: Write/Read
Clock: LOC_AHB_HCLK
Reset State: 0x0

GSS_A5_CSR_PRIORITY_ARBITER

Bits	Name	Description
31:4	RESERVED_BITS	
3:2	CSR_DM_AXI_PRIORITY	Priority level of DM for 2 masters AXI to AXI arbitration bridge
1:0	CSR_A5_AXI_PRIORITY	Priority level of A5 CPU for 2 masters AXI to AXI arbitration bridge

0x10000020 GSS_A5_CSR_A5_IRQ

Type: Write/Read
Clock: LOC_AHB_HCLK
Reset State: 0x0

GSS_A5_CSR_A5_IRQ

Bits	Name	Description
31:22	RESERVED_BITS	
21:0	CSR_A5_IRQ	22 interrupts

0x10000024 GSS_A5_CSR_DBGROM

Type: Write/Read

Bits	Name	Description
31:13	RESERVED_BITS	
12	CSR_SO_DISABLE	To disable Strongly Order hardware support in axi_spliter
11:9	CSR_GSS_A5_TESTBUS_SEL	Debug test bus output selection in GSS_A5_WRAPPER 0x0: 0FF; 0x1: axi2ahb_testbus_out 0x2: timers_testbus_out 0x3: saw2_testbus_out 0x4: data_packer_tb 0x5: data_unpacker_tb 0x6: axi_spliter_tb 0x7: OFF
8:6	CSR_MAXI2AXI_TESTBUS_SEL	Debug test bus output selection for Data Mover Master AXI and A5 AXI into GSS AXI for Fabric bridge
5:3	CSR_AHB2AXI_TESTBUS_SEL	Debug test bus output selection for Data Mover Master AHB to AXI bridge
2:0	CSR_AXI2AHB_TESTBUS_SEL	Debug test bus output selection for AXI to AHB bridge for A5 access to peripheral

0x10000038 GSS_A5_CSR_SPM_STATUS

Type: Read
Clock: LOC_AHB_HCLK
Reset State: 0x0

GSS_A5_CSR_SPM_STATUS

Bits	Name	Description
31:9	RESERVED_BITS	
8	SPM_CPU_WAIT_ACK	SPM executing programmed power management sequence
7	SPM_SYS_SLEEP_STATE	Indicate CPU is in programmed sleep state
6:0	SPM_SYS_START_ADDR	Start address of SPM command array

10.4 GSS A5 SAW2 Registers (0x10001000 GSS_A5_SPM_BASE)

This section contains the Global Navigation Subsystem (GSS) A5 SAW2 registers.

The SAW2 (SPM and AVS. Wrapper2) design is an AHB slave that contains both SPM and AVS. CSRs.

0x10001000 GSS_A5_SAW2_SECURE

Type: Read/write
Clock: SYS_REF_CLK
Reset State: {3{CFGNSINIT}}

Security Treatment: Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to ‘0’, the state of the SAW2_SECURE register is not considered; a secure transaction is always allowed. When ahb_saw_hprotns is set to ‘1’, the SAW2_SECURE register security treatment bit of that register must be ‘1’ for access to be granted. If the security treatment bit of the register is set to ’0’, the non-secure (ahb_saw_hprotns = ‘1’) transactions are denied. When access is denied, a write is ignored, and a read will return ‘0’. No error is signaled.

When reading the SAW2_SECURE register, non secure agents will always read ‘0’. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

GSS_A5_SAW2_SECURE

Bits	Name	Description
31:3	RESERVED	
2	SAW_CTL	Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST 0x1: NSEC 0x0: SEC
1	PWR_CTL	Controls security treatment for SPM registers: SAW2_SPM_CTL, SAW2_SPM_PMIC_DLY, SAW2_SPM_PMIC_DATA_0, SAW2_SPM_PMIC_DATA_1, SAW2_SPM_SLP_SEQ_ENTRY_n, SAW2_SPM_DLY 0x1: NSEC 0x0: SEC
0	VLT_CTL	Controls security treatment for the AVS. registers: SAW2_AVS_CTL, SAW2_VLVL, SAW2_AVS_HYSTERESIS 0x1: NSEC 0x0: SEC

0x10001004 GSS_A5_SAW2_ID

Type: Read
Clock: SYS_REF_CLK
Reset State: Undefined

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register reports the revision and parameter information for the SAW2 core.

GSS_A5_SAW2_ID

Bits	Name	Description
31	RESERVED_BITS31	
30:25	NUM_SPM_ENTRY	SAW2 parameter: Indicates number of SAW2_SPM_SLP_SEQ_ENTRY register implemented. Value can range from 1 - 32
24:20	NUM_PWR_CTL	SAW2 parameter: Indicates number of power control implemented. Value can range from 2 - 16
19	RESERVED_BITS19	
18	PMIC_ARB_INTF	SAW2 parameter: Indicates PMIC Arbiter Interface function is implemented
17	AVS_PRESENT	SAW2 parameter: Indicates AVS. function is implemented
16	SPM_PRESENT	SAW2 parameter: Indicates SPM function is implemented
15:12	MAJOR	Major variant
11:0	MINOR	Minor variant

0x10001008 GSS_A5_SAW2_CFG

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_CFG register is used to configure the common control between AVS. and SPM.system.

GSS_A5_SAW2_CFG

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON.
11:8	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port.

GSS_A5_SAW2_CFG (cont.)

Bits	Name	Description
7:6	RESERVED_BITS7_6	
5	PMIC_MODE	PMIC Handshake 0x0: 8K_PMIC (only DONE signal) 0x1: 7K_PMIC (both ACK and DONE signals)
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period. ..... For sys_ref_clk = 20 MHz (53ns) The timer tick range 53 ns to 1.6us. 0x0: Timer Tick every sys_ref_clk 0x1F: Timer Tick every 128 sys_ref_clk.

0x1000100C GSS_A5_SAW2_STS_0

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

GSS_A5_SAW2_STS_0

Bits	Name	Description
15	SHTDWN_REQ	This bit reflects the shutdown request from the SPM(spm_rpm_shutdown_req) to RPM.
14	SHTDWN_ACK	This bit reflects the shutdown acknowledgement from the RPM(rpm_spm_shutdown_ack) to SPM.
13	BRNGUP_REQ	This bit reflects the bringup request from the SPM(spm_rpm_bringup_req) to RPM.
12	BRNGUP_ACK	This bit reflects the bringup acknowledgement from the RPM(rpm_spm_bringup_ack) to SPM.
11:10	PMIC_STATE	State of the PMIC FSM: transitions back to IDLE) transitions back to IDLE) 0x0: IDLE (waiting for PMIC transaction from AVS. or SPM) 0x1: ACK (waiting for ACK from PMIC Arb) 0x2: DONE (waiting for DONE form PMIC Arb before) 0x3: DELAY (waiting for delay count termination before)

GSS_A5_SAW2_STS_0 (cont.)

Bits	Name	Description
9:8	RPM_STATE	State of the RPM FSM: 0x0: RUN (waiting for SPM request) 0x1: STDNACK (waiting for shutdown ACK from RPM) 0x2: WAKEUP (waiting for wakeup interrupt) 0x3: BGUPACK (waiting for bringup ACK from RPM)
7	AVS_STATE	State of the AVS. FSM: indication) 0x0: IDLE (waiting to be enabled or for next UP/DOWN) 0x1: REQ (waiting for PMIC FSM to transition to IDLE)
6:0	SPM_CMD_ADDR	Last SPM command executed.

0x10001010 GSS_A5_SAW2_STS_1

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

GSS_A5_SAW2_STS_1

Bits	Name	Description
31	RESERVED1	
30	SW_WR_PEND	This bit reflects the VLVL state of the request from the SAW2_VCTL write is pending.
29	CPU_UP	This bit reflects the VLVL state of the request from the CPU (avs_saw_up) to raise the VLVL.
28	CPU_DN	This bit reflects the VLVL state of the request from the CPU (avs_saw_down) to lower the VLVL.
27	MAX_INT	IRQ status bit, AVS. controller detected that raising the VLVL by AVS_CTL[VLVL_STEP] would result in a value greater than AVS_CTL[MAX_VLVL]. If AVS_CTL[IRQ_MAX_EN] is set, an interrupt is issued. NOTE that SW can set MAX_VLVL lower than current VLVL creating a condition where VLVL is higher than MAX_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MAX.

GSS_A5_SAW2_STS_1 (cont.)

Bits	Name	Description
26	MIN_INT	IRQ status bit, AVS. controller detected that lowering the VLVL by SAW2_AVS_CTL[VLVL_STEP] would result in a value less than SAW2_AVS_CTL[MIN_VLVL]. If SAW2_AVS_CTL[IRQ_MIN_EN] is set, an interrupt is issued. NOTE that SW can set MIN_VLVL higher than current VLVL creating a condition where VLVL is lower than MIN_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MIN.
25:16	CURR_DLY	VLVL value of the counter used to calculate the time until the next AVS. controller request for a new VLVL.

0x10001014 GSS_A5_SAW2_VCTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

Though this register is read/writable, it also causes a command pulse to the PMIC FSM. Writing this register results in a transaction to the PMIC with SAW2_VCTL being sent to the PMIC. SAW2 support both 8901 and 8058 regulator.

GSS_A5_SAW2_VCTL

Bits	Name	Description
31:16	RESERVED_BITS31_16	

0x10001018 GSS_A5_SAW2_AVS_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_CTL register is used to control the Adaptive Voltage Scaling (AVS) system.

GSS_A5_SAW2_AVS_CTL

Bits	Name	Description
31	RESERVED	

GSS_A5_SAW2_AVS_CTL (cont.)

Bits	Name	Description
30	VLVL_WIDTH	Defines the VLVL field of PMIC data. SAW2 at minimum supports 8901 and 8058 regulator. See PMIC document for details. 0x0: 5 bits VLVL (8058 regulator) 0x1: 6 bits VLVL (8901 regulator)
29:28	VLVL_STEP	Controls the step size of each request to PMIC Arbiter. SW may use values from 0 to 3. Note that the value 0 will result in no change - that is if the CPU requests UP or DOWN, the CURR_PVLVL will be sent to the PMIC Arbiter. This may be useful for debug. If an increment or decrement operation would cause the current VLVL to transition above or below the MAX_VLVL or MIN_VLVL, the current VLVL will not be changed. An interrupt will be signaled if IRQ_MAX/MIN_EN is 1
27	EN	AVS. Enable. **NOTE** Setting to 0 does not disable any pending interrupts. **NOTE** AVS. FSM and SPM FSM are mutually exclusive. Only one FSM is active at a time. SW does not have to disable AVS. before going to sleep. 0x0: Disable AVS 0x1: Enable AVS
26	SW_DONE_INT_EN	Set to 1 to turn on AVS. interrupt for when a SW initiated voltage change has completed. Set to 0 to mask it (turn it off). ASSERTION: This interrupt is asserted only after a SW write to SAW2_AVS_VLVL. Specifically, after the AVS. FSM traverses through all its states and transitions back to IDLE, the interrupt line is pulsed. The interrupt controller should be set to edge capture to receive this interrupt. CLEARING: None. This interrupt is a pulse, SW does not need to clear it (aside from requirements of the interrupt controller).
25	MAX_INT_EN	Set to 1 to turn on AVS. interrupt for MAX_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be greater than MAX_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit.
24	MIN_INT_EN	Set to 1 to turn on AVS. interrupt for MIN_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be smaller than MIN_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit
23	RESERVED_23	

GSS_A5_SAW2_AVS_CTL (cont.)

Bits	Name	Description
22:17	MAX_VLVL	Control maximum value of AVS. controller's VLVL. When current VLVL reaches this value it may not grow any larger. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level higher, an interrupt is issued. This value may be updated at anytime. Setting to a value lower than MIN_VLVL is not supported, and unpredictable results may occur.
16	RESERVED_16	
15:10	MIN_VLVL	Control the minimum value of AVS. controller's VLVL. When the current VLVL reaches this level it may not shrink any smaller. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level lower, an interrupt is issued. This value may be updated at anytime. Setting to a value higher than MAX_VLVL is not supported, and unpredictable results may occur.
9:0	AVS_DELAY	Control the time between AVS. controller's requests to change the VLVL

0x1000101C GSS_A5_SAW2_AVS_HYSTERESIS

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_HYSTERESIS register is used to delay the AVS. UP/DN signal to AVS. FSM. This is used to prevent the false PMIC step due to PDN noise.

GSS_A5_SAW2_AVS_HYSTERESIS

Bits	Name	Description
31:24	RESERVED31_24	
23:16	DN_COUNT	HYSTERESIS DN COUNT. Delays of PMIC DN step operation.
15:8	RESERVED15_8	
7:0	UP_COUNT	HYSTERESIS UP COUNT. Delays of PMIC UP step operation.

0x10001020 GSS_A5_SAW2_SPM_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

GSS_A5_SAW2_SPM_CTL

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	SPM_START_ADR	Start address for the SPM sequence.
3	ISAR	Inhibit Start Address Reset 0x0: End of program reset the SPM_START_ADR to zero. 0x1: Inhibit End of program to reset SPM_START_ADR
2:1	WAKEUP_CONFIG	Wakeup Configuration 0x0: sys_spm_wakeup 0x1: sys_spm_wakeup or !cpu_spm_wait_req 0x2: sys_spm_wakeup or rising edge of sys_spm_dbg_nopwrdwn 0x3: sys_spm_wakeup or !cpu_spm_wait_req or rising edge of sys_spm_dbg_nopwrdwn
0	SPM_EN	SPM En.

0x10001024 GSS_A5_SAW2_SPM_PMIC_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC delay values after SPM FSM PMIC transaction. SPM wait for the programmed delay before executing the next SPM command.

GSS_A5_SAW2_SPM_PMIC_DLY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:24	DATA_1_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
23:19	RESERVED_BITS23_19	
18:16	DATA_1_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
15:11	RESERVED_BITS15_11	

GSS_A5_SAW2_SPM_PMIC_DLY (cont.)

Bits	Name	Description
10:8	DATA_0_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
7:3	RESERVED_BITS7_3	
2:0	DATA_0_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms

0x10001028 GSS_A5_SAW2_SPM_PMIC_DATA_0

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

GSS_A5_SAW2_SPM_PMIC_DATA_0

Bits	Name	Description

0x1000102C GSS_A5_SAW2_SPM_PMIC_DATA_1

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

GSS_A5_SAW2_SPM_PMIC_DATA_1

Bits	Name	Description

0x10001030 GSS_A5_SAW2_RST

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_RST register is used to reset the SAW logic. This register clear itself. It does not reset any SAW2 CSR's. It reset AVS. and SPM FSM and control registers. This is use to clear any hang condition.

GSS_A5_SAW2_RST

Bits	Name	Description
31:1	RESERVED31_1	
0	RST	Reset AVS. and SPM FSM and control registers.

0x10001034 GSS_A5_SAW2_SPM_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the delay values for SPM Delay command. SPM wait for the programmed delay before executing the next SPM command.

GSS_A5_SAW2_SPM_DLY

Bits	Name	Description
31:30	RESERVED_BITS31_30	
29:20	DLY3	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
19:10	DLY2	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
9:0	DLY1	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

0x10001080+4*n GSS_A5_SAW2_SPM_SLP_SEQ_ENTRY_n

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter.

GSS_A5_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description

10.5 GSS A5 GIC2 Registers (0x10008000 GSS_A5_QGIC2_BASE)

This section contains the Global Navigation Subsystem (GSS) A5 GIC GICD registers.

The Generic Interrupt Controller 2 (GIC2) is a reusable configurable soft core. This GIC2 specification conforms to ARM's Generic Interrupt Controller architecture specification. Where differences exist, either additional features have been added or this document must change to conform to ARM's specified architecture. Where additional features were added, they will be clearly marked. The GIC2 design supports ARM's TrustZone architecture with two security zones: secure and non-secure.

The GIC2 is made of two parts: the Distributor and CPU Interfaces (up to eight). Each of these interfaces contains a CRIF slave interface. There must be at least one CPU Interface in the design.

In this manual, addresses are offsets from zero. When constants are exported, they are re-assigned to the appropriate base address.

Half-word and Byte access is supported by a subset of the registers.

Security treatment of registers in the GIC2 is divided into four types of registers. These are:

- "Common" indicates that both secure and non-secure software have full access to the register.
- "NS-int Dependent" indicates that state belonging to both secure and non-secure interrupts may be present in the register, depending on the value set in the Interrupt Security Register. Secure accesses to such a register are able to access all of the register's state, regardless of the Interrupt Security Register setting. Non-secure accesses may only access state belonging to non-secure interrupts. For non-secure accesses to state belonging to secure interrupts, writes are ignored and reads return zero.
- "Banked" indicates that the register exhibits different functionality according to whether it is accessed with a secure or non-secure request.
- "Restricted" indicates that only secure requests may access this register. If non-secure accesses are attempted, writes are ignored and reads return zero.

The type of register is specified for each register individual. Table 10-2 explains security treatment for register bits.

Table 10-2 Register security treatment

bus NS bit	SECURITY BIT	ALLOW Access
0	0	1
0	1	1
1	0	0
1	1	1

Glossary:

CPU Interface: That part of the GIC2 responsible for receiving the next interrupt from the Distributor and, if the interrupt has sufficient priority, asserting an interrupt indication to the CPU.

CPU MID: The Master ID of a CPU interface (as in AXI's AMID). The CPU MID reaching the Distributor must match the CPU Interface connected to that master.

Distributor: That part of the GIC2 responsible for detecting, disabling, prioritizing, and directing interrupts to CPU(s). The Distributor also accepts requests from and signals software interrupts to the CPU(s).

FABRIC: Flexible Advanced Buses & Reusable Interconnect Cores

NS-int: Security status of a particular interrupt ID. The value 0x0 is "secure", 0x1 is "non-secure".

NS-prot: Security status of the a bus transaction (read or write) according to the NS bit.

PPI: Private Peripheral Interrupt, interrupt from a peripheral whose interrupt line is destined to a particular CPU and can't be physically connected/directed to any other.

SGI: Software Generated Interrupt, interrupt from one CPU (or thread) to another.

SPI: Shared Peripheral Interrupt, interrupt from a peripheral whose interrupt line's CPU target is programmable to one or more CPU interface by the Distributor.

10.5.1 GIC2 Distributor

Table 10-3 GIC2 Distributor Register Summary

Address	Name	Type	Reset	Security Treatment	Description

10.5.2 GIC2 distributor registers

0x10008000 GSS_A5_GICD_CTLR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICD_CTLR register controls if the Distributor responds to external interrupt stimulus changes.

Non-secure access: Distributor provides access to the enable_ns register in bit 0.

Secure access: Distributor provides access to the enable_s register in bit 0, and the enable_ns register in bit 1.

GSS_A5_GICD_CTLR

Bits	Name	Description
31:2	RESERVED	
1	ENABLE_NS	This bit is an alias of the enable_ns bit. This bit is only usable by Secure software. 0x0: CLR 0x1: SET
0	ENABLE	This bit is the enable bit for both Secure and Non-secure software. Secure software accesses enable_s at this location. Non-secure software accesses enable_ns. 0x0: CLR 0x1: SET

0x10008004 GSS_A5_GICD_TYPER

Type: Read
Clock: CLK
Reset State: Unknown

Security Treatment: Common

The GICD_TYPER register provides information about the configuration of the GIC2.

GSS_A5_GICD_TYPER

Bits	Name	Description
31:16	RESERVED	
15:11	LSPI	Returns the number of Lockable Shared Peripheral Interrupts (LSPIs) that the GIC2 contains. GIC2 does not support lockable SPIs, always reads back 0x0.
10	TZ	TrustZone support. GIC2 supports TrustZone, always reads back 0x1.
9:8	RESERVED_BITS9_TO_8	

GSS_A5_GICD_TYPER (cont.)

Bits	Name	Description
7:5	CPU_NUM	Returns the number of CPU interfaces that the GIC provides. The GIC provides either: 0b 000 = one CPU interface 0b 001 = two CPU interfaces 0b 010 = three CPU interfaces 0b 011 = four CPU interfaces 0b 100 = five CPU interfaces 0b 101 = six CPU interfaces 0b 110 = seven CPU interfaces 0b 111 = eight CPU interfaces.
4:0	IT_LINES	Returns the number of INTIDs, to the nearest 32, that the Distributor provides. Read as: 0b 00000 = the Distributor is configured for up to 32 INTIDs 0b 00001 = the Distributor is configured for up to 64 INTIDs 0b 00010 = the Distributor is configured for up to 96 INTIDs 0b 00011 = the Distributor is configured for up to 128 INTIDs . . . 0b 11110 = the Distributor is configured for up to 992 INTIDs 0b 11111 = the Distributor is configured for up to 1020 INTIDs.

0x10008008 GSS_A5_GICD_IIDR

Type: Read
Clock: CLK
Reset State: 0x00001070

Security Treatment: Common

The GICD_IIDR register provides the implementor of the Distributor and the revision of the Distributor.

GSS_A5_GICD_IIDR

Bits	Name	Description
31:24	RESERVED	
15:12	REVISION	Returns the revision number of the Distributor, 0x1
11:0	IMPLEMENTOR	Returns JEP106 ID number, 0b 01110000

0x10008020 GSS_A5_GICD_ANSACR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Restricted

The auxiliary non-secure access control register (GICD_ANSACR) is used to control non-secure access to GICD_CGCR.

GSS_A5_GICD_ANSACR

Bits	Name	Description
31:1	RESERVED	
0	GICD_CGCR	0x0: SEC (Dis-allows non-secure access.) 0x1: NS (Allows non-secure access.)

0x10008024 GSS_A5_GICD_CGCR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Restricted

The clock gate control register (GICD_CGCR) is used to control localized clock gating over-ride logic. Setting bits in GICD_CGCR disables the corresponding local clock gating logic. The local clock gating logic normally turns off a local (small subset) clock tree automatically if there is no need for the clock. If any error is found in the gating logic, these bits can be used to over-ride it.

GSS_A5_GICD_CGCR

Bits	Name	Description
31:17	RESERVED_31_TO_17	
16	TOP	Controls the top level clock gate (which gates entire GIC2). 0x1: DISABLE 0x0: ENABLE
15:4	RESERVED_15_TO_4	
3	DI_SGI_STATE	Controls the clock gate for Distributor interrupt state data base registers for SGI interrupts. 0x1: DISABLE 0x0: ENABLE
2	DI_PPI_SPI_STATE	Controls the clock gate for Distributor interrupt state data base registers for PPI and SPI interrupts. 0x1: DISABLE 0x0: ENABLE

GSS_A5_GICD_CGCR (cont.)

Bits	Name	Description
1	DI_DEMET	Controls the clock gate for Distributor interrupt input demet registers. 0x1: DISABLE 0x0: ENABLE
0	DI_RD	Controls the clock gate for Distributor CRIF Read Data. 0x1: DISABLE 0x0: ENABLE

0x10008080+4*n GSS_A5_GICD_ISRn, n=[0..8]

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Restricted

Each bit in an GICD_ISR register controls the security state of an interrupt, to be either secure or non-secure. You can only access these registers with secure read or secure write accesses.

NOTE The GICD_ISR register at address offset 0x0080 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

GSS_A5_GICD_ISRn

Bits	Name	Description
31:0	INT_NS	0x0: SEC (Assigns INTID N to the Secure state.) 0x1: NS (Assigns INTID N to the Non-secure state.)

0x10008100+4*n GSS_A5_GICD_ISENABLERn, n=[0..8]

Type: Write (command - readable)
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ISENABLER register controls the enabling of an interrupt.

Reading this register returns the currently enabled interrupts subject to NS-int dependent access rules.

NOTE The GICD_ISENABLER register at address offset 0x0100 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

GSS_A5_GICD_ISENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ICENABLER register.) 0x1: SET (Enables INTID N.)

0x10008180+ 4*n GSS_A5_GICD_ICENABLERn, n=[0..8]

Type: Write (command - readable)
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ICENABLER register controls the disabling of an interrupt.

Reading this register returns the currently enabled interrupts subject to NS-int dependent access rules.

NOTE The GICD_ICENABLER register at address offset 0x0180 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

GSS_A5_GICD_ICENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ISENABLER register.) 0x1: CLR (Enables INTID N.)

0x10008200+ 4*n GSS_A5_GICD_ISPENDRn, n=[0..8]

Type: Write (command - readable)
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ISPENDR register controls the enabling of an interrupt.

Reading this register returns the currently pending interrupts subject to NS-int dependent access rules.

NOTE The GICD_ISPENDR register at address offset 0x0200 is repeated once per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

GSS_A5_GICD_ISPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ICPENDR register.) 0x1: SET (Sets INTID N to the Pending state.)

0x10008280+ 4*n GSS_A5_GICD_ICPENDRn, n=[0..8]

Type: Write (command - readable)
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ICPENDR register controls the disabling of an interrupt.

Reading this register returns the currently pending interrupts subject to NS-int dependent access rules.

NOTE The GICD_ICPENDR register at address offset 0x0280 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

GSS_A5_GICD_ICPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ISPENDR register.) 0x1: CLR (Clears INTID N. from the pending state.)

0x10008300+ 4*n GSS_A5_GICD_ISACTIVERn, n=[0..8]

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in the GICD_ISACTIVER register provides the active status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt to the Active (or Active and Pending) state

NOTE The GICD_ISACTIVER register at address offset 0x0300 is repeated once per CPU Interface. It is only accessible from the designated CPU and provides information for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

GSS_A5_GICD_ISACTIVERn

Bits	Name	Description
31:0	INT	0x0: DO NOTHING 0x1: SET

0x10008380+4*n GSS_A5_GICD_ICACTIVERn, n=[0..8]

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in the GICD_ICACTIVER register provides the active status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt out of the Active (or Active and Pending) state

NOTE The GICD_ICACTIVER register at address offset 0x0300 is repeated once per CPU Interface. It is only accessible from the designated CPU and provides information for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

GSS_A5_GICD_ICACTIVERn

Bits	Name	Description
31:0	INT	0x1: CLR 0x0: DO NOTHING

0x10008400+4*n GSS_A5_GICD_IPRIORITYRn, n=[0..71]

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each field in the GICD_IPRIORITYR registers controls the priority level of an interrupt.

NOTE The GICD_IPRIORITYR registers at address offsets 0x0400 to 0x41C are repeated once per CPU Interface. These are only accessible from the designated CPU and control the priority levels for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupt priority levels.

NOTE This register is byte addressable.

The GICD_IPRIORITYR register behaves differently depending on the security setting of interrupt associated with the address written (NS-int) and the security of the bus transaction (NS-prot).

GSS_A5_GICD_IPRIORITYRn

Bits	Name	Description
31:27	INT3	
26:24	RESERVED_1	
23:19	INT2	
18:16	RESERVED_2	
15:11	INT1	
10:8	RESERVED_3	
7:3	INT0	All bits cleared (0x0) is the highest priority. All bits set (5'b11111) is the lowest priority. For non-secure write access, the MSB is always set (1). For non-secure read access, the MSB is always clear (0). Non-secure entities can't use the highest priorities without secure software setting such a priority. The highest priorities are typically reserved for secure software. On the other hand, secure software can, if needed, write and read the MSB. Secure entities have access to all priorities. Secure interrupts can use priority numbers 5'b10000-5'b11111 (the lower half of the priority spectrum) if needed. Due to strict "less than" comparisons used in the CPU interface, setting an interrupt's priority to 5'b11111 effectively disables that interrupt. The number of priorities actually supported is 32. Software can determine this number by writing 0xFF and reading back the result.
2:0	RESERVED_4	

0x10008800+4*n GSS_A5_GICD_ITARGETSRn, n=[0..71]

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each field in the GICD_ITARGETSR registers controls the destination CPU(s) of an interrupt.

NOTE The GICD_ITARGETSR registers at address offsets 0x0800 to 0x81C are not actually implemented. These are place holders PPI and SGI interrupts. PPI interrupts, being private, only have one destination CPU. SGI interrupts are generated by the

GIC2_DI_SOFT_INT register only. The remaining registers control the SPI interrupt destinations.

NOTE This register is byte addressable.

GSS_A5_GICD_ITARGETSRn

Bits	Name	Description
31:24	INT3	
23:16	INT2	
15:8	INT1	
7:0	INT0	Each bit represents one of 8 CPUs. Bit 0 represents the zeroth CPU, bit 7 represents the seventh CPU. Setting this field to 0 will disable the interrupt as no CPU will see it set. For INTIDs < 32 (the SGI and PPI), reads return the bit corresponding to the CPU performing the read (i.e., CPU 0 reads back 0x01010101). Writes are ignored. The number of CPUs actually supported is determined by NUM_CPU generic. Software can determine this number by writing 0xFF and reading back the result.

0x10008C00+4*n GSS_A5_GICD_ICFGRn, n=[0..17]

Type: Read/write
Clock: CLK
Reset State: 0x55555555

Security Treatment: NS-int dependent

Each field in the GICD_ICFGR registers allows:

- control of type of an SPI:
- level-sensitive
- edge-sensitive
- reading the type of PPIs and SGIs

NOTE The GICD_ICFGR registers at address offsets 0x0C00 to 0xC04 are repeated once per CPU Interface. These are only accessible from the designated CPU and allow read access for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

NOTE PPI(0) is the maintenance interrupt and must be configured as level type.

NOTE This register is not byte addressable, interrupts should be disabled before configuring their type.

NOTE Reset state for GICD_ICFGR0 is 0xaaaaaaaa.

GSS_A5_GICD_ICFGRn

Bits	Name	Description

9:8	INT4	
7:6	INT3	
5:4	INT2	
3:2	INT1	
1:0	INT0	These bits behave differently for each of the three interrupt types as follows: ' For SGI, read back as 0b10 - SGI interrupts are edge-sensitive and use the N-N model. ' For PPI/SPI, read/writable as 0b01 or 0b11 - PPI/SPI interrupts can be edge or level sensitive and use the 1-N model. 0x0: LVL N to N 0x1: LVL 1 to N 0x2: EDGE N to N 0x3: EDGE 1 to N

0x10008F00 GSS_A5_GICD_SGIR

Type: Write (command)
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICD_SGIR register provides the method by which software may cause interrupts to become pending for designated target CPU(s). The GIC2 maintains an internal database of all outstanding software interrupt requests pended to each CPU Interface and rotates through them in Round Robin fashion. Signaling the same interrupt a second time before it is serviced will result in only one interrupt from the source CPU to the target CPU(s).

Table 10-4 Security status

Security status of the write event to the GICD_SGIR register (the state of the NS bit)	SATT Value	Interrupt's security status as set by GICD_ISR	Requested Interrupt set as pending on the target CPU
Secure	0	Secure	YES
Secure	0	Non-secure	NO
Secure	1	Secure	NO
Secure	1	Non-secure	YES
Non-secure	X	Secure	NO
Non-secure	X	Non-secure	YES

GSS_A5_GICD_SGIR

Bits	Name	Description

10.6 GSS A5 GIC2 GICH Registers (0x10008000 GSS_A5_QGIC2_BASE)

This section contains the Global Navigation Subsystem (GSS) A5 GIC2 GICH registers.

The Generic Interrupt Controller 2 (GIC2) is a reusable configurable soft core. This GIC2 specification conforms to ARM's Generic Interrupt Controller architecture specification. Where differences exist, either additional features have been added or this document must change to conform to ARM's specified architecture. Where additional features were added, they will be clearly marked. The GIC2 design supports ARM's TrustZone architecture with two security zones: secure and non-secure.

The GIC2 is made of two parts: the Distributor and CPU Interfaces (up to eight). Each of these interfaces contains a CRIF slave interface . There must be at least one CPU Interface in the design.

In this manual, addresses are offsets from zero. When constants are exported, they are re-assigned to the appropriate base address.

Half-word and Byte access is supported by a subset of the registers.

Security treatment of registers in the GIC2 is divided into four types of registers. These are:

- "Common" indicates that both secure and non-secure software have full access to the register.
- "NS-int Dependent" indicates that state belonging to both secure and non-secure interrupts may be present in the register, depending on the value set in the Interrupt Security Register. Secure accesses to such a register are able to access all of the register's state, regardless of the Interrupt Security Register setting. Non-secure accesses may only access state belonging to non-secure interrupts. For non-secure accesses to state belonging to secure interrupts, writes are ignored and reads return zero.
- "Banked" indicates that the register exhibits different functionality according to whether it is accessed with a secure or non-secure request.
- "Restricted" indicates that only secure requests may access this register. If non-secure accesses are attempted, writes are ignored and reads return zero.

The type of register is specified for each register individual. Table 10-5 explains security treatment for register bits.

Table 10-5 Register security treatment

bus NS bit	SECURITY BIT	ALLOW Access
0	0	1
0	1	1
1	0	0
1	1	1

Glossary:

CPU Interface: That part of the GIC2 responsible for receiving the next interrupt from the Distributor and, if the interrupt has sufficient priority, asserting an interrupt indication to the CPU.

CPU MID: The Master ID of a CPU interface (as in AXI's AMID). The CPU MID reaching the Distributor must match the CPU Interface connected to that master.

Distributor: That part of the GIC2 responsible for detecting, disabling, prioritizing, and directing interrupts to CPU(s). The Distributor also accepts requests from and signals software interrupts to the CPU(s).

FABRIC: Flexible Advanced Buses & Reusable Interconnect Cores

NS-int: Security status of a particular interrupt ID. The value 0x0 is "secure", 0x1 is "non-secure".

NS-prot: Security status of the a bus transaction (read or write) according to the NS bit.

PPI: Private Peripheral Interrupt, interrupt from a peripheral whose interrupt line is destined to a particular CPU and can't be physically connected/directed to any other.

SGI: Software Generated Interrupt, interrupt from one CPU (or thread) to another.

SPI: Shared Peripheral Interrupt, interrupt from a peripheral whose interrupt line's CPU target is programmable to one or more CPU interface by the Distributor.

10.6.1 GIC2 Hypervisor Interface

Table 10-6 GIC2 Hypervisor Interface Register Summary

Address	Name	Type	Reset	Security Treatment	Description
0x1000	GICH_HCR	RW	0x0000_0000	Common	general Hypervisor control
0x1004	GICH_VTR	R	0x9000_0003	Common	hypervisor implementation - type register
0x1008	GICH_VMCR	R/W	0x004C_0000	Common	virtual machine control register
0x1010	GICH_MISR	R	0x0000_0000	Common	Maintenance interrupt syndrome
0x1020	GICH_EISR	R	0x0000_0000	Common	List registers' EOI status
0x1030	GICH_ELRSR	R	0x0000_000F	Common	List registers' empty status
0x10F0	GICH_APR	R/W	0x0000_0000	Common	Active Priority in hypervisor
0x1100 + 4n	GICH_LRn	R/W	0x0000_0000	Common	List registers

10.6.1.1 GIC2 Hypervisor interface registers

0x10009000 GSS_A5_GICH_HCR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICH_HCR configures the GIC2 Hypervisor interface.

GSS_A5_GICH_HCR

Bits	Name	Description
31:27	EOICOUNT	Counts the number of EOIs which have been received without a corresponding entry being found among the list registers. Incremented automatically by the CPU Interface when such an EOI is received. EOIs which do not clear a bit in the Active Priorities register do not cause an increment. The maintenance interrupt is asserted whenever this field is non-zero and the SKIDIE bit is set (see below).
26:8	RESERVED	
7	VDG1IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnableG1] is cleared. 0x0: CLR 0x1: SET
6	VEG1IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnableG1] is set. 0x0: CLR 0x1: SET
5	VDG0IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnalbeG0] is cleared. 0x0: CLR 0x1: SET
4	VEG0IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnableG0] is set. 0x0: CLR 0x1: SET
3	NPIE	No Pending Interrupt Maintenance Interrupt Enable. If this bit is set, the maintenance interrupt will be asserted whenever no list registers contain an interrupt in PENDING state. 0x0: CLR 0x1: SET

GSS_A5_GICH_HCR (cont.)

Bits	Name	Description
2	SKIDIE	SKID Maintenance Interrupt Enable. If this bit is set, the maintenance interrupt will be asserted whenever GICH_HCR[EOICount] is non-zero. 0x0: CLR 0x1: SET
1	UIE	Underflow Maintenance Interrupt Enable. If this bit is set, the maintenance interrupt will be asserted whenever zero or one of the list entries are marked as valid. 0x0: CLR 0x1: SET
0	EN	Enable or Disable maintenance and by proxy Virtual CPU interface Interrupts 0x0: CLR 0x1: SET

0x10009004 GSS_A5_GICH_VTR

Type: Read
Clock: CLK
Reset State: 0x90000003

Security Treatment: Common

The GICH_VTR provides information about the configuration of the Hypervisor Interface (virtual generic interrupt controller type register).

GSS_A5_GICH_VTR

Bits	Name	Description
31:29	PRIBITS	Indicates the number of priority bits implemented, minus one. For this version of the specification the only acceptable value is 100, indicating 5 bits of priority (32 levels)
28:26	PREBITS	Indicates the number of preemption bits implemented, minus one. For this version of the specification the only acceptable value is 100, indicating 5 bits of preemption (32 levels)
25:6	RESERVED	
5:0	LISTREGS	Indicates the number of implemented List Registers, minus one. GIC2 has 4 list registers. This is set to 0x3

0x10009008 GSS_A5_GICH_VMCR

Type: Read/write
Clock: CLK
Reset State: 0x004C0000

Security Treatment: Common

The GICH_VMCR contains read/write aliases of all the Virtual Machine accessible state (aliases from the GICV_* registers). This alias allows the Hypervisor to easily save and restore this state with a single read or write, and without needing to map in the Virtual Machine registers.

NOTE Various bits of this register include the terms group 0 or group 1in their names. This is purely for compatibility with the physical generic interrupt controller interface and does not pertain to actual TrustZone security.

GSS_A5_GICH_VMCR

Bits	Name	Description
31:27	VMPMR	Alias of the GICV_PMR bits 7:3 in GICV
26:24	RESERVED_1	
23:21	VMG0BP	Alias of the group0 GICV_BPR bit in GICV
20:18	VMG1BP	Alias of the group1 GICV_ABPR bit in GICV
17:10	RESERVED_2	
9	VEM	Alias of the GICV_CTLR[EOIMode] bit in GICV
8:5	RESERVED	
4	VMGBPR	Alias of the GICV_CTLR[GBPR] bit in GICV
3	VMFIQEN	Alias of the GICV_CTLR[FIQen] bit in GICV.
2	VMACKCTL	Alias of the GICV_CTLR[ActCtl] bit in GICV.
1	VMENABLE_G1	Alias of the GICV_CTLR[ENABLE_G1] bit in GICV.
0	VMENABLE_G0	Alias of the GICV_CTLR[ENABLE_G0] bit in GICV.

0x10009010 GSS_A5_GICH_MISR

Type: Read
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICH_MISR is the Maintenance interrupt syndrome register in the Hypervisor Interface. This register indicates which Maintenance Interrupts are currently asserted. This takes into account the individual Maintenance Interrupt Enable bits in GICH_HCR. However, the global enable in

GICH_HCR (EN) is not factored in to these bits. Therefore the maintenance interrupt is asserted if and only if at least one bit is set in this register and the EN bit in GICH_HCR is set.

GSS_A5_GICH_MISR

Bits	Name	Description
31:8	RESERVED	
7	VDNSI	
6	VENSI	
5	VDSI	
4	VESI	
3	NPI	
2	SKIDI	
1	UI	
0	EI	

0x10009020 GSS_A5_GICH_EISR

Type: Read
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICH_EISR provides EOI interrupt status in the Hypervisor Interface - which Software interrupts in the LRn registers that have EI set and are currently in the Invalid state.

GSS_A5_GICH_EISR

Bits	Name	Description
25:5	RESERVED	
3:0	LR	0x0: NOT_EOI 0x1: EOI

0x10009030 GSS_A5_GICH_ELRSR

Type: Read
Clock: CLK
Reset State: 0x0000000F

Security Treatment: Common

The GICH_ELRSR provides Empty List Register Status in the Hypervisor Interface.

GSS_A5_GICH_ELRSR

Bits	Name	Description
31:5	RESERVED	
3:0	LR	0x0: NOT EMPTY 0x1: EMPTY

0x100090F0 GSS_A5_GICH_APR

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICH_APR provides information about the priorities currently active in the Hypervisor Interface.

GSS_A5_GICH_APR

Bits	Name	Description
31:0	PRI	0x0: INACTIVE 0x1: ACTIVE

0x10009100+4*n GSS_A5_GICH_LRn, n=[0..3]

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICH_LRn provides access to each of the list registers in the Hypervisor Interface.

GSS_A5_GICH_LRn

Bits	Name	Description
31	HW	Indicates that this is a Hardware interrupt. When this bit is set, bits 19:10 contain the Physical interrupt number, and when this interrupt is subject to an EOI request, a Deactivate Interrupt request will be sent to the Interrupt Distributor.

GSS_A5_GICH_LRn (cont.)

Bits	Name	Description
30	GRP	Indicates that this interrupt should be treated as Group1. This means that the interrupt will present as an IRQ if GICV_CTLR[EnableG1] bit is set. If the GRP bit is clear, the interrupt is put into Group0 and will present as either IRQ or FIQ depending on the setting of the GICV_CTLR[FIQen] but only if GICV_CTLR[EnableG0] bit is also set. This bit is also used with GICV_CTLR[CBPR] to determine which Binary Point register is used in GICV for preemption calculations.
29:28	STATE	**NOTE** For hardware interrupts, the PENDING+ACTIVE state is held in the physical Distributor rather than the VCPUIF. The PENDING+ACTIVE state (11) should only be used for software originated interrupts (Virtual Devices) or SGIs. 0x0: IDL (INVALID) 0x1: PNA (PENDING, NOT ACTIVE) 0x2: A (ACTIVE) 0x3: PA (PENDING and ACTIVE)
27:23	PRI	Indicates the priority of this interrupt. This is converted to a traditional 8-bit generic interrupt controller priority value by appending three zero bits.
22:20	RESERVED	
19:10	PHY_ID	The physical ID of the interrupt (which SGI/PPI/SPI it is). When the HW bit is set this field indicates the physical interrupt ID, which is forwarded to the Distributor when this interrupt is subject to an EOI request. See below for details when the HW bit is clear. If the Physical ID is between 16 and 31 inclusive (PPI space), the Deactivation will apply to the PPI associated with the same physical CPU as the VCPUIF making the request. If the Physical ID is between 0 and 15 inclusive (SGI space), the Deactivation will still apply to SGI associated with the same physical CPU as the VCPUIF making the request but it is expected that the HW bit and Physical ID will NOT be used for SGIs.
9:0	VIRTL_ID	Indicates the Virtual ID. This ID is returned to the Guest OS when this interrupt is acknowledged via the GICV_IAR (Interrupt Acknowledge register).

0x10009120 GSS_A5_GICH_SW_LR

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

This register is not a real physical register or address in the design. It is placed here in the Software Manual to describe the alternate meanings for bits 19:10 in the LRn registers. Adding it here allows SW to pick up defines for these alternate meanings and use them in LRn accesses.

The HW uses these alternate definitions when bit 31 (HW) is set to 0, indicating a (a pure virtual interrupt) written directly to this Hypervisor interface or an interrupt generated due to an SGI that originated in the Distributor. Bits 31:20 and 9:0 retain the normal GICH_LRn meanings.

GSS_A5_GICH_SW_LR

Bits	Name	Description
19	EI	Indicates that this interrupt should trigger an EOI Interrupt. When this bit is set, a maintenance interrupt will be asserted whenever this interrupt becomes INVALID.
18:13	RESERVED	
12:10	CPUID	If this interrupt is an SGI, indicates the requesting CPU ID. This will appear in the relevant field of the VM Interrupt Acknowledge register. If the interrupt is not an SGI, software must set this field to 0.

10.7 GSS A5 GIC2 GICC Registers (0x10008000 GSS_A5_QGIC2_BASE)

This section contains the Global Navigation Subsystem (GSS) A5 GIC2 GICC registers.

The Generic Interrupt Controller 2 (GIC2) is a reusable configurable soft core. This GIC2 specification conforms to ARM's Generic Interrupt Controller architecture specification. Where differences exist, either additional features have been added or this document must change to conform to ARM's specified architecture. Where additional features were added, they will be clearly marked. The GIC2 design supports ARM's TrustZone architecture with two security zones: secure and non-secure.

The GIC2 is made of two parts: the Distributor and CPU Interfaces (up to eight). Each of these interfaces contains a CRIF slave interface. There must be at least one CPU Interface in the design.

In this manual, addresses are offsets from zero. When constants are exported, they are re-assigned to the appropriate base address.

Half-word and Byte access is supported by a subset of the registers.

Security treatment of registers in the GIC2 is divided into four types of registers. These are:

- "Common" indicates that both secure and non-secure software have full access to the register.
- "NS-int Dependent" indicates that state belonging to both secure and non-secure interrupts may be present in the register, depending on the value set in the Interrupt Security Register. Secure accesses to such a register are able to access all of the register's state, regardless of the Interrupt Security Register setting. Non-secure accesses may only access state belonging to non-secure interrupts. For non-secure accesses to state belonging to secure interrupts, writes are ignored and reads return zero.
- "Banked" indicates that the register exhibits different functionality according to whether it is accessed with a secure or non-secure request.
- "Restricted" indicates that only secure requests may access this register. If non-secure accesses are attempted, writes are ignored and reads return zero.

The type of register is specified for each register individual. Table 10-7 explains security treatment for register bits.

Table 10-7 Register security treatment

bus NS bit	SECURITY BIT	ALLOW Access
0	0	1
0	1	1
1	0	0
1	1	1

Glossary:

CPU Interface: That part of the GIC2 responsible for receiving the next interrupt from the Distributor and, if the interrupt has sufficient priority, asserting an interrupt indication to the CPU.

CPU MID: The Master ID of a CPU interface (as in AXI's AMID). The CPU MID reaching the Distributor must match the CPU Interface connected to that master.

Distributor: That part of the GIC2 responsible for detecting, disabling, prioritizing, and directing interrupts to CPU(s). The Distributor also accepts requests from and signals software interrupts to the CPU(s).

FABRIC: Flexible Advanced Buses & Reusable Interconnect Cores

NS-int: Security status of a particular interrupt ID. The value 0x0 is "secure", 0x1 is "non-secure".

NS-prot: Security status of the a bus transaction (read or write) according to the NS bit.

PPI: Private Peripheral Interrupt, interrupt from a peripheral whose interrupt line is destined to a particular CPU and can't be physically connected/directed to any other.

SGI: Software Generated Interrupt, interrupt from one CPU (or thread) to another.

SPI: Shared Peripheral Interrupt, interrupt from a peripheral whose interrupt line's CPU target is programmable to one or more CPU interface by the Distributor.

10.7.1.1 GIC2 CPU interface registers

0x1000A000 GSS_A5_GICC_CTLR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_CTLR configures the GIC2 CPU interface.

Non-secure access: Access is granted only to bits 0, 5,6 and 9.

Secure access: Access is granted to all register bits. Non-secure bits 0,5,6, and 9 are aliased into bits 1, 7, 8, and 10 for access by secure software.Modifying these aliased bits will modify the non-secure settings. Bits 0, 5, 6, 9 are physically banked into Secure and Non-secure space.

GSS_A5_GICC_CTLR

Bits	Name	Description
31:11	RESERVED	
10	EOIMODENS	For secure software, a read/writable alias of Non-Secure EOImode.
9	EOIMODE	For secure software, controls the behavior of secure access to GICC_EOI and GICC_DIR. For non-secure software, controls the behavior of non-secure access to GICC_EOI and GICC_DIR. 0x0: PD_AND_DI (Both Priority Drop and Deactivate Interrupt, GICC_DIR does not function) 0x1: PD (GICC_EOI performs Priority Drop, GICC_DIR performs deactivate interrupt function)

GSS_A5_GICC_CTLR (cont.)

Bits	Name	Description
8	IRQBYPDISABLENS	For secure software, a read/writable alias of Non-secure version of IRQBypDisable.
7	FIQBYPDISABLENS	For secure software, a read/writable alias of Non-secure version of FIQBypDisable
6	IRQBYPDISABLE	For Non-secure software, when CPU Interface is disabled, prevents the legacy bypass IRQ signal from being forwarded to the CPU (if IRQ is under Non-secure control). For secure software, prevents bypass if FIQ is under secure control. 0x0: CLR 0x1: SET
5	FIQBYPDISABLE	For Non-secure software, when CPU Interface is disabled, prevents the legacy bypass FIQ signal from being forwarded to the CPU (if FIQ is under Non-secure control). For secure software, prevents bypass if FIQ is under secure control. 0x0: CLR 0x1: SET
4	SBPR	Controls which binary point register is used to calculate preemption. 0x0: BANKED (secure interrupts use the secure Binary Point Register, non-secure interrupts use the non-secure Binary Point Register) 0x1: RESTRICTED (all interrupts use the secure Binary Point Register)
3	S_DEST	Controls destination of secure interrupts. 0x0: IRQ 0x1: FIQ
2	ACKCTL	Controls the side effect behavior of a secure read request to the Interrupt Acknowledge Register in the case where the highest priority pending interrupt is non-secure. If AckCtl is set to 0, a secure read request to the Interrupt Acknowledge Register returns an Interrupt ID value of 1022, and the read request does not cause the interrupt to be acknowledged (that is the Pending status of the interrupt remains unchanged). If AckCtl is set to 1, a secure read request to the Interrupt Acknowledge Register returns the Interrupt ID value of the non-secure interrupt, and causes the interrupt to be acknowledged (that is the interrupt becomes Active, or Active and Pending). 0x0: DISABLE ACK OF NS PENDING 0x1: ENABLE ACK OF NS PENDING

GSS_A5_GICC_CTLR (cont.)

Bits	Name	Description
1	ENABLE_NS	For secure software, a read/writable alias of non secure software's enable bit (bit 0 of this same register in non secure space). 0x0: CLR 0x1: SET
0	ENABLE	For non-secure software, this bit enables/disables non secure interrupts. For secure software, this bit enables/disables secure interrupts. 0x0: CLR 0x1: SET

0x1000A004 GSS_A5_GICC_PMR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_PMR register configures the GIC2 CPU interface Priority Mask. The Priority Mask can be used to limit the interrupts that can cause an interrupt request to the CPU based on priority levels.

Non-secure access: Write access is granted only if bit 7 is 0x1, writes are ignored otherwise. Reads are always granted, however, bit 7 is always set in the data returned. Bit 0 is always zero.

Secure access: Access is granted to all register bits.

GSS_A5_GICC_PMR

Bits	Name	Description
31:8	RESERVED_1	
7:3	LEVEL	Set the Priority Mask Level. The CPU interface asserts an interrupt request to CPU if the priority of the highest Pending interrupt sent by the interrupt Distributor is strictly higher than at least the mask set in Priority Mask Register.
2:0	RESERVED_2	

0x1000A008 GSS_A5_GICC_BPR

Type: Read/write
Clock: CLK
Reset State: 0x00000002

Security Treatment: Banked

The GICC_BPR register configures the GIC2 CPU interface Binary Point. The Binary Point is used to limit interrupts that can cause an interrupt request to the CPU based on the interrupt's priority and the interrupt priority that currently being serviced by the CPU (if there is one). If the CPU is not servicing an interrupt, the Binary Point register is not used.

Non-secure: access Provides access to the non-secure Binary Point register.

Secure access: Provides access to the secure Binary Point register. Secure software may access the non-secure Binary Point register at offset 0x001C.

Table 10-9 Interpretation of Binary Point Register value

Register value	Priority bits used to determine preemption for secure interrupts	Priority bits used to determine preemption for non-secure interrupts (Bit 7 is always 0x1)
0	7:1	7:0
1	7:2	7:1
2	7:3	7:2
3	7:4	7:3
4	7:5	7:4
5	7:6	7:5
6	7	7:6
7	No preemption	No preemption

GSS_A5_GICC_BPR

Bits	Name	Description
31:3	RESERVED	
2:0	VAL	The VAL setting is used to determine the priority bits used for preemption according to Table 10-9, Interpretation of Binary Point Register value.

0x1000A00C GSS_A5_GICC_IAR

Type: Read (Command)
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Banked

The GICC_IAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn.

Performing this read has the side effect of causing the Distributor to change the interrupt from the Pending state to the Active or Active and Pending state according the description below:

Using three bits defined by AHB bus security state (1=non-secure), security of the HPPI (1=non-secure) and the value of GICC_CTLR[AckCtl]:

- 00x ’ respond with the true interrupt number, transitioning to active (secure request to secure interrupt, ACKCTL is don't care)
- 010 ’ respond with 1022 (secure request to non-secure interrupt but ACKCTL=0 disabling secure handling of non-secure interrupts)
- 011 ’ respond with the true interrupt number, transitioning to active (secure request to non-secure interrupt with ACKCTL=1)
- 10x ’ respond with 1023 (non-secure request to secure interrupt)
- 11x ’ respond with the true interrupt number, transitioning to active (non-secure request to non-secure interrupt)

GSS_A5_GICC_IAR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, the security state of any outstanding interrupts, the value of GICC_CTLR[AckCtl] as defined in the description above.

0x1000A010 GSS_A5_GICC_EOIR

Type: Write (Command)
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

Unlike GIC1, GICC_EOIR (End Of Interrupt) register has two possible behaviors. By default it acts as it did in GIC1, that is, it can be written to indicate when software has finished handling an interrupt.

In GIC2, if GICC_CTLR[EOImode] is set (1), writing this register has the "priority drop" (PD) effect. The PD effect is when the active priority bit for the highest priority active interrupt is cleared. The key difference, when EOImode is one, is that the Distributor is not notified that this happened - that is, the interrupt itself does not become inactive.

When EOImode is zero, writing to this register will, in addition to the PD effect described above, set the interrupt to Inactive or Pending (if prior to writing to this register, the interrupt was both Active and Pending it becomes just pending) in the Distributor.

In either case, the value written must be the interrupt ID, and the CPU Source ID for SGIs, of the interrupt that is being completed.

The security status of the write to this register (NS-prot) must match the security status (NS-int) of the interrupt ID, according to Table 10-10 for the interrupt to be successfully cleared.

Non-secure access: See Table 10-10.

Secure access: See Table 10-10.

Table 10-10 GICC_EOIR Priority Drop Effect Definition

[AckCtl]	Security status of the write request	Highest Priority Active interrupt security value	Effect
x	Non-secure	Non-secure	Clear the highest active Non-secure priority level
x	Non-secure	Secure	Clear the highest active Non-secure priority level
0	Secure	X	Clear the highest active Secure priority level
1	Secure	X	Clears the highest active priority level.

GSS_A5_GICC_EOIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. As described in Table 17-9 (GICC_EIOR security (and source CPU) match definition), the CPU Source ID must match an active interrupt in order for the GICC_EOIR to take effect. The CPU_ID is written must match that delivered to software when GICC_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICC_IAR register. If the security settings match (see Table 17-9) a write will cause the priority drop effect and if EOImode=0, the Active state in the Distributor for the corresponding interrupt will also be cleared.

0x1000A014 GSS_A5_GICC_RPR

Type: Read
Clock: CLK
Reset State: 0x000000F8

Security Treatment: Banked

The GICC_RPR (Running Priority) register provides access to the highest priority of all the Active interrupts on this CPU. The priority value returned is sensitive to the security status (NS-int) of the interrupt currently running and the NS-prot

Non-secure access: If the currently interrupt is secure (NS-int = 0), and a non-secure read of the Running Priority register is attempted (NS-prot = 1), then the value 0 (maximum priority) is returned.

Secure access: Returns the true value in the register.

GSS_A5_GICC_RPR

Bits	Name	Description
31:8	RESERVED_1	
7:3	VAL	Running Priority
2:0	RESERVED_2	

0x1000A018 GSS_A5_GICC_HPPIR

Type: Read
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Banked

The GICC_HPPIR register provides access to the highest priority pending interrupt to the CPU Interface.

NOTE Interrupts that are Active and Pending in the Distributor are not considered candidates to become the highest priority pending interrupt.

Using three bits defined by AHB bus security state (1=non-secure), security of the HPPI(1=non-secure) and the value of GICC_CTLR[AckCtl]:

00x ’ respond with the true interrupt number (secure request to secure interrupt, ACKCTL is don't care)

010 ’ respond with 1022 (secure request to non-secure interrupt but ACKCTL=0 disabling secure handling of non-secure interrupts)

011 ’ respond with the true interrupt number (secure request to non-secure interrupt with ACKCTL=1)

10x ’ respond with 1023 (non-secure request to secure interrupt)

11x ’ respond with the true interrupt number (non-secure request to non-secure interrupt)

GSS_A5_GICC_HPPIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, and the security state of any outstanding interrupts, as described above.

0x1000A01C GSS_A5_GICC_ABPR

Type: Read/write
Clock: CLK
Reset State: 0x00000003

Security Treatment: Restricted

The GICC_ABPR register provides a copy of the non-secure binary point register for use by secure software. See the definition of the GICC_BPR register for details on the use of this register.

Non-secure access: No access.

Secure access: Access granted, updates are reflected to non-secure software at the GICC_BPR register at address offset 0x08.

GSS_A5_GICC_ABPR

Bits	Name	Description
31:3	RESERVED	
2:0	VAL	Same as the GICC_BPR register - affects only non-secure interrupts.

0x1000A020 GSS_A5_GICC_AIAR

Type: Read (Command)
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Restricted

The GICC_AIAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn. This is a secure only register used to read non-secure interrupts by Secure Software.

Performing this read has the side effect of causing the Distributor to change the interrupt from the Pending state to the Active or Active and Pending state.

Non-secure access: No access. Read as zero.

Secure access: See description below.

Based on the 2 bits defined by the AHB Security of the request (1=non-secure) and the security of the interrupt (1=non-secure):

00 ’ respond with 1023 (secure request that behaves as if it is a non-secure request, to secure interrupt)

01 ’ respond with the true interrupt number, transitioning to active (secure request that behaves as if it is a non-secure request, to non-secure interrupt)

1x ’ RAZ/WI (non-secure request cannot access this register)

GSS_A5_GICC_AIAR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier..

0x1000A024 GSS_A5_GICC_AEOIR

Type: Write (Command)
Clock: CLK
Reset State: 0x00000000

Security Treatment: Restricted

A secure write to this register has an identical effect to a non-secure write to GICC_EOIR, with the exception of the EOImode bit; the value of the secure EOImode bit (bit 9) in GICC_CTLR is used to determine whether the interrupt is deactivated or just priority dropped rather than the non-secure EOImode bit (bit 10).

This register must be used by secure software to signal completion of non-secure interrupts when GICC_CTLR AckCtl bit is set to 0; GICC_EOIR cannot be used for this purpose since it would affect GICC_APRn rather than GICC_NSAPRn.

Non-secure access: ignored

Secure access: signal completion of non-secure interrupt

GSS_A5_GICC_AEOIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. The CPU Source ID must match an active interrupt in order for the GICC_AEOIR to take effect. The CPU_ID is written must match that delivered to software when GICC_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICC_IAR register. Interrupt Identifier. A write will cause the priority drop effect and if EOImode=0, the Active state in the Distributor for the corresponding interrupt will also be cleared.

0x1000A028 GSS_A5_GICC_AHPPIR

Type: Read
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Restricted

This is a Secure-Only register.

A read from this register has an identical effect to a Non-Secure read from GICC_HPPIR. It can therefore be used to check for a pending Non-Secure interrupt without the possibility of returning a Secure Interrupt ID value.

Interrupts that are Active and Pending in the Distributor are not considered candidates to become the highest priority pending interrupt.

Non-secure access: No access. Read as zero.

Secure access: See description below.

NOTE

Using three bits defined by AHB bus security state (1=non-secure), security of the HPPI(1=non-secure)and the value of GICC_CTLR[AckCtl]:

00x ’ respond with 1023 (hppi is a secure interrupt)

01x ’ respond with the true interrupt number (hppi is a non-secure interrupt)

1xx ’ RAZ/WI (non-secure request cannot access this register)

.GSS_A5_GICC_APR

GSS_A5_GICC_AHPPIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, and the security state of any outstanding interrupts, as described above.

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

Each bit in the GICC_APR register provides the active status of priorities in the CPU Interface.

Non-secure access: Bits 15-0 represent priorities 31 to 16 of the non-secure active priorities.

Secure access: Bits 31-0 represent priorities 31 to 0 of the active secure priorities.

GSS_A5_GICC_APR

Bits	Name	Description
31:0	PRI	0x1: A (ACTIVE) 0x0: NA (NOT ACTIVE)

0x1000A0E0 GSS_A5_GICC_NSAPR

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Restricted

Each bit in the GICC_NSAPR register provides the active status of non-secure priorities in the CPU Interface.

Non-secure access: None - write ignore, read-as-zero.

Secure access: Bits 31-0 represent priorities 31 to 0 of teh active non-secure priorities.

GSS_A5_GICC_NSAPR

Bits	Name	Description

0x1000A0FC GSS_A5_GICC_IIDR

Type: Read
Clock: CLK
Reset State: 0x00020070

Security Treatment: Common

The GICC_IIDR register provides information about the GIC2 CPU Interface version and device implementor information.

GSS_A5_GICC_IIDR

Bits	Name	Description
31:20	PART_NUM	Part Number: 0x0
19:16	ARCH_VERSION	Architecture Version : 0x2
15:12	REVISION	Revision number: 0x0
11:0	IMPLEMENTOR	Bits[11:8] contain the implementor's JEP106 continuation code, 0x0 Bit[7] is always 0 Bits[6:0] contain bits [6:0] of the implementor's JEP106 code,

0x1000B000 GSS_A5_GICC_DIR

Type: Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_DIR register provides the mechanism by which Software can Deactivate a specific interrupt.

Secure writes can deactivate secure and non-secure interrupts.

Non-secure writes can only deactivate non-secure interrupts..

Note that unlike GICC_EOIR and GICC_IAR, there is no restriction of the Deactivation of Non-Secure interrupts with Secure accesses. The AckCtl bit does not affect the behaviour of GICC_DIR. This is because unlike GICC_IAR there is no chance of the access affecting an

interrupt from an unexpected security state, and unlike GICC_EOIR there is no effect on GICC_APRn or GICC_NSAPRn, so there is no need to indicate which register should be affected.

GSS_A5_GICC_DIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. INT_ID written should match value returned from GICC_IAR read.

10.8 GSS A5 GIC2 GICV Registers (0x10008000 GSS_A5_QGIC2_BASE)

This section contains the Global Navigation Subsystem (GSS) A5 GIC2 GICV registers.

The Generic Interrupt Controller 2 (GIC2) is a reusable configurable soft core. This GIC2 specification conforms to ARM's Generic Interrupt Controller architecture specification. Where differences exist, either additional features have been added or this document must change to conform to ARM's specified architecture. Where additional features were added, they will be clearly marked. The GIC2 design supports ARM's TrustZone architecture, with two security zones: secure and non-secure.

The GIC2 is made of two parts: the Distributor and up to eight CPU Interfaces. Each of these interfaces contains a CRIF slave interface. There must be at least one CPU Interface in the design.

In this manual, addresses are offsets from zero. When constants are exported, they are re-assigned to the appropriate base address.

Half-word and Byte access is supported by a subset of the registers.

Security treatment of registers in the GIC2 is divided into four types of registers. These are:

- "Common" indicates that both secure and non-secure software have full access to the register.
- "NS-int Dependent" indicates that state belonging to both secure and non-secure interrupts may be present in the register, depending on the value set in the Interrupt Security Register. Secure accesses to such a register are able to access all of the register's state, regardless of the Interrupt Security Register setting. Non-secure accesses may only access state belonging to non-secure interrupts. For non-secure accesses to state belonging to secure interrupts, writes are ignored and reads return zero.
- "Banked" indicates that the register exhibits different functionality according to whether it is accessed with a secure or non-secure request.
- "Restricted" indicates that only secure requests may access this register. If non-secure accesses are attempted, writes are ignored and reads return zero.

The type of register is specified for each register individual. Table 10-11 explains security treatment for register bits.

Table 10-11 Register security treatment

bus NS bit	SECURITY BIT	ALLOW Access
0	0	1
0	1	1
1	0	0
1	1	1

Glossary:

CPU Interface: That part of the GIC2 responsible for receiving the next interrupt from the Distributor and, if the interrupt has sufficient priority, asserting an interrupt indication to the CPU.

CPU MID: The Master ID of a CPU interface (as in AXI's AMID). The CPU MID reaching the Distributor must match the CPU Interface connected to that master.

Distributor: That part of the GIC2 responsible for detecting, disabling, prioritizing, and directing interrupts to CPU(s). The Distributor also accepts requests from and signals software interrupts to the CPU(s).

FABRIC: Flexible Advanced Buses & Reusable Interconnect Cores

NS-int: Security status of a particular interrupt ID. The value 0x0 is "secure", 0x1 is "non-secure".

NS-prot: Security status of the a bus transaction (read or write) according to the NS bit.

PPI: Private Peripheral Interrupt, interrupt from a peripheral whose interrupt line is destined to a particular CPU and can't be physically connected/directed to any other.

SGI: Software Generated Interrupt, interrupt from one CPU (or thread) to another.

SPI: Shared Peripheral Interrupt, interrupt from a peripheral whose interrupt line's CPU target is programmable to one or more CPU interface by the Distributor.

0	ENABLE_G0	This bit enables Group 0 interrupts. 0x0: CLR 0x1: SET

0x1000C004 GSS_A5_GICV_PMR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICV_PMR register configures the GIC2 Virtual CPU interface Priority Mask. The Priority Mask can be used to limit the interrupts that can cause an interrupt request to the CPU based on priority levels.

GSS_A5_GICV_PMR

Bits	Name	Description
31:8	RESERVED_1	
7:3	LEVEL	Set the Priority Mask Level. The CPU interface asserts an interrupt request to CPU if the priority of the highest Pending interrupt sent by the interrupt Distributor is strictly higher than at least the mask set in Priority Mask Register.
2:0	RESERVED_2	

0x1000C008 GSS_A5_GICV_BPR

Type: Read/write
Clock: CLK
Reset State: 0x00000002

Security Treatment: Common

The GICV_BPR register configures the GIC2 Virtual CPU interface Binary Point. The Binary Point is used to limit interrupts that can cause an interrupt request to the CPU based on the interrupt's priority and the interrupt priority that currently being serviced by the CPU (if there is one). If the CPU is not servicing an interrupt, the Binary Point register is not used.

GSS_A5_GICV_BPR

Bits	Name	Description
31:3	RESERVED	
2:0	VAL	The VAL setting is used to determine the priority bits used for preemption according to Table 10-9 Interpretation of Binary Point Register value.

0x1000C00C GSS_A5_GICV_IAR

Type: Read (Command)
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Common

The GICV_IAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn.

Performing this read has the side effect of causing the GICH to change the interrupt from the Pending state to the Active or Active and Pending state according to the rules below:

Using the 2 bits defined by Security of the HPPI(1=non-secure) and the value of GICV_CTLR[AckCtl]:

0x ’ respond with the true interrupt number, transitioning to active (ignore APROTNS and consider as a secure request to secure interrupt, ACKCTL is don't care)

10 ’ respond with 1022 (ignore APROTNS and consider as secure request to non-secure interrupt but ACKCTL=0 disabling secure handling of non-secure interrupts)

11 ’ respond with the true interrupt number, transitioning to active (ignore APROTNS and consider as secure request to non-secure interrupt with ACKCTL=1)

GSS_A5_GICV_IAR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier - a virtual interrupt number determined by the Hypervisor SW.

0x1000C010 GSS_A5_GICV_EOIR

Type: Write (Command)
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

GICV_EOIR (End Of Interrupt) register has two possible behaviors. By default it can be written to to indicate when software has finished handling an interrupt.

If GICV_CTLR[EOImode] is set (1), writing this register has the "priority drop" (PD) effect. The PD effect is when the active priority bit for the highest priority active interrupt is cleared. The key difference, when EOImode is (1), is the interrupt itself does not become inactive.

When EOImode is (0), writing to this register will, in addition to the PD effect described above, set the interrupt to Inactive or Pending (if prior to writing to this register, the interrupt was both Active and Pending it becomes just pending). However, if GICV_CTLR[EOImode] is (0), then the CPU_ID and INT_ID must match an active interrupt for a state change to occur.

In either case, the value written must be the interrupt ID, and the CPU Source ID for SGIs, of the interrupt that is being completed.

GSS_A5_GICV_EOIR

Bits	Name	Description
31:13	RESERVED	

GSS_A5_GICV_EOIR (cont.)

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. The CPU_ID is written must match that delivered to software when GICV_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICV_IAR register.

0x1000C014 GSS_A5_GICV_RPR

Type: Read
Clock: CLK
Reset State: 0x000000F8

Security Treatment: Common

The GICV_RPR (Running Priority) register provides access to the highest priority of all the Active interrupts on this Virtual CPU.

GSS_A5_GICV_RPR

Bits	Name	Description
31:8	RESERVED_1	
7:3	VAL	Running Priority
2:0	RESERVED_2	

0x1000C018 GSS_A5_GICV_HPPIR

Type: Read
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Common

The GICV_HPPIR register provides access to the highest priority pending interrupt to the Virtual CPU Interface. If no interrupt is pending, responds with 0x3FF.

NOTE Interrupts that are Active and Pending in the GICH (hypervisor) are not considered candidates to be come the highest priority pending interrupt.

Using 2 bits defined by the value of GICV_CTLR[AckCtl]and the NS bit of the HPPI(1=non-secure):

1x ’ respond with the virtual interrupt number

00 ’ respond with the virtual interrupt number

01 ’ respond with 1022

GSS_A5_GICV_HPPIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier.

0x1000C01C GSS_A5_GICV_ABPR

Type: Read/write
Clock: CLK
Reset State: 0x00000003

Security Treatment: Common

The GICV_ABPR register provides access to the non-secure binary point register used by non-secure interrupts when GICV_CTRL[GBPR]=0. See the definition of the GICV_BPR register for details on the use of this register.

GSS_A5_GICV_ABPR

Bits	Name	Description
31:3	RESERVED	
2:0	VAL	Same as the GICV_BPR register - affects only non-secure interrupts.

0x1000C020 GSS_A5_GICV_AIAR

Type: Read (Command)
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Common

The GICV_AIAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn.

Performing this read has the side effect of causing the GICH to change the interrupt from the Pending state to the Active or Active and Pending state according to the rules below:

Using the security state of the pending interrupt:

- 0 ’ respond with 1023
- 1 ’ respond with the true interrupt number, transitioning to active

GSS_A5_GICV_AIAR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier - a virtual interrupt number determined by the Hypervisor SW.

0x1000C024 GSS_A5_GICV_AEOIR

Type: Write (Command)
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

This register presents the same programmers model as GICC_AEOIR.

The effect of writing to this register is identical to the effect of writing the same value to the GICV_EOIR register. This alias is provided for compatibility with the Physical CPU Interface, where the two registers have a different effect due to the provision of separate Secure and Non-Secure Active Priority Registers.

GSS_A5_GICV_AEOIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. The CPU_ID is written must match that delivered to software when GICV_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICV_IAR register.

0x1000C028 GSS_A5_GICV_AHPPIR

Type: Read
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Common

This register presents the same programmers model as GICC_AHPPIR.

This register returns the interrupt ID of the highest priority PENDING interrupt if it has an NS value of 1. Reading this interrupt has no side effects and simply returns the highest priority PENDING interrupt among the list registers or a status code according to the following table:

Using the NS bit of the HPPI(1=non-secure):

0 ’ 1023

1 ’ respond with the virtual interrupt number

Note that in some cases the returned value may not be strictly accurate if interrupts are currently paged out in software.

GSS_A5_GICV_AHPPIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier.

0x1000C0D0 GSS_A5_GICV_APR

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

Each bit in the GICV_APR is an alias of GICH_APR. The data and access control are one and the same.

GSS_A5_GICV_APR

Bits	Name	Description
31:0	PRI	0x1: A (ACTIVE) 0x0: NA (NOT ACTIVE)

0x1000C0FC GSS_A5_GICV_IIDR

Type: Read
Clock: CLK
Reset State: 0x00020070

Security Treatment: Common

The GICV_IIDR register provides information about the GIC2 Virtual CPU Interface version and device implementor information.

GSS_A5_GICV_IIDR

Bits	Name	Description
31:20	PART_NUM	Part Number: 0x390
19:16	ARCH_VERSION	Architecture Version : 0x2
15:12	REVISION	Revision number: 0x0
11:0	IMPLEMENTOR	Bits[11:8] contain the implementor's JEP106 continuation code, 0x0 Bit[7] is always 0 Bits[6:0] contain bits [6:0] of the implementor's JEP106 code,

0x1000D000 GSS_A5_GICV_DIR

Type: Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICV_DIR register provides the mechanism by which Software can Deactivate a specific interrupt.

GSS_A5_GICV_DIR

Bits	Name	Description
31:13	RESERVED	

GSS_A5_GICV_DIR (cont.)

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt.
9:0	INT_ID	Interrupt Identifier. The value should match the INT_ID returned from the read of GICV_IAR.

10.9 GSS A5 Timer Registers (0x10002000 GSS_A5_TIMERS_BASE)

This section contains the Global Navigation Subsystem (GSS) A5 Timer registers.

10.9.1 a5ss Registers

0x10002000 GSS_A5_APCS_TMRSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Restricted

The APCS_TMRSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Scorpion's APROTNS pin. When APROTNS is set to '0' the state of the APCS_TMRSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_TMRSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_TMRSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_TMRSECURE register correspond to.

GSS_A5_APCS_TMRSECURE

Bits	Name	Description
4	WDT0	Controls security treatment for the Watch Dog Timer registers: APCS_WDT0_FRZ, APCS_WDT0_INT_EN, APCS_WDT0_STS, APCS_WDT0_INT_WIDTH, APCS_WDT0_BARK_TIME, APCS_WDT0_TST_LD_STS, APCS_WDT0_TST_LD. 0x1: NSEC 0x0: SEC
3	WDT1	Controls security treatment for the Watch Dog Timer registers: APCS_WDT1_FRZ, APCS_WDT1_INT_EN, APCS_WDT1_STS, APCS_WDT1_INT_WIDTH, APCS_WDT1_BARK_TIME, APCS_WDT1_TST_LD_STS, APCS_WDT1_TST_LD. 0x1: NSEC 0x0: SEC
2	GPT0	Controls security treatment for the General Purpose Timer registers: APCS_GPT1_MTCH, APCS_GPT1__CNT, APCS_GPT1_EN, APCS_GPT1_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC

GSS_A5_APCS_TMRSECURE (cont.)

Bits	Name	Description
1	GPT1	Controls security treatment for the General Purpose Timer registers: APCS_GPT0_MTCH, APCS_GPT0__CNT, APCS_GPT0_EN, APCS_GPT0_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC
0	DGT	Controls security treatment for the Debug Timer registers; APCS_DGT_MTCH, APCS_DGT_CNT, APCS_DGT_EN, APCS_DGT_CLR, APCS_DGT_CLK_CTL, and bits 3-0 of APCS_TMR_STS 0x1: NSEC 0x0: SEC

0x10002004 GSS_A5_APCS_GPT0_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: APCS_TMRSECURE [GPT0].

The general purpose timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT0_MTCH register.

GSS_A5_APCS_GPT0_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT0_CNT at which an interrupt will be generated.

0x10002008 GSS_A5_APCS_GPT0_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CNT register contains the current value of the GPT0 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT0_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_GPT0_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT0_EN.

- Write APCS_GPT0_CNT.
- Write (to set/restore) APCS_GPT0_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT0_EN.

GSS_A5_APCS_GPT0_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer.

0x1000200C GSS_A5_APCS_GPT0_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_EN register is used to enable the GPT0 timer.

GSS_A5_APCS_GPT0_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency ACC_SLP_CLK.

0x10002010 GSS_A5_APCS_GPT0_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CLR register is a one-shot command register that, when written with any value, resets the timer to a value of 0. This occurs regardless of the state of the APCS_GPT0_EN register.

GSS_A5_APCS_GPT0_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x10002014 GSS_A5_APCS_GPT1_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The GPT timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT1_MTCH register.

GSS_A5_APCS_GPT1_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT1_CNT at which an interrupt will be generated.

0x10002018 GSS_A5_APCS_GPT1_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CNT register contains the current value of the GPT1 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT1_MTCH register at the same time. The procedure for writing the APCS_GPT1_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT1_EN.
- Write APCS_GPT1_CNT.
- Write (to set/restore) APCS_GPT1_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT1_EN.

GSS_A5_APCS_GPT1_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer

0x1000201C GSS_A5_APCS_GPT1_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_EN register is used to enable the GPT1 timer.

GSS_A5_APCS_GPT1_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), timer will clear when it reaches the match value.
0	EN	When set (1), timer is enabled and counts with frequency sleep clock.

0x10002020 GSS_A5_APCS_GPT1_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CLR register is a one-shot command register that, when written with any value, resets the GPT1 timer to a value of 0. This occurs regardless of the state of the APCS_GPT1_EN register.

GSS_A5_APCS_GPT1_CLR

Bits	Name	Description
31:0	RESERVED_BITS_31_0	Data written is not used.

0x10002024 GSS_A5_APCS_DGT_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The DBG timer will signal interrupt when its counter value has reached the value stored in the APCS_DGT_MTCH register.

GSS_A5_APCS_DGT_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_DGT_CNT at which an interrupt will be generated.

0x10002028 GSS_A5_APCS_DGT_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CNT register contains the current value of the DGT timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_DGT_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_DGT_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_DGT_EN.
- Write APCS_DGT_CNT.
- Write (to set/restore) APCS_DGT_MTCH if required.
- Enable the timer by setting the EN bit in APCS_DGT_EN.

GSS_A5_APCS_DGT_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer count

0x1000202C GSS_A5_APCS_DGT_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_EN register is used to enable the DGT timer.

GSS_A5_APCS_DGT_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	

GSS_A5_APCS_DGT_EN (cont.)

Bits	Name	Description
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency TCXO clock.

0x10002030 GSS_A5_APCS_DGT_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLR register is a one-shot command register that, when written with any value, resets the DGT timer to a value of 0. This occurs regardless of the state of the APCS_DGT_EN register.

GSS_A5_APCS_DGT_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x10002034 GSS_A5_APCS_DGT_CLK_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0003

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLK_CTL controls the clock divider inside the Debug Timer.

NOTE It is possible for the AHB clock to run at as slow as 5 MHz using settings of the Global Clock Controller. The debug timer's counter can also run at 5 MHz (TCXO divided by 4). However, due to the synchronization circuit using the edge detect, the timer should always run at least 4x slower than the AHB clock. Thus, if the timer's use is required by the system, the divider should be set to divide by 4 and the slowest usable AHB frequency is 20MHz. The timer would run at 5MHz in this case.

GSS_A5_APCS_DGT_CLK_CTL

Bits	Name	Description
31:2	RESERVED_BITS_31_2	

GSS_A5_APCS_DGT_CLK_CTL (cont.)

Bits	Name	Description
1:0	DIV	0x3: 4 0x2: 3 0x1: 2 0x0: 1

0x10002038 GSS_A5_APCS_WDT0_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

GSS_A5_APCS_WDT0_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT0_STB during the non-sleep mode. A pulse is generated on WDT0_STB when this bit is written with a ’1

0x1000203C GSS_A5_APCS_WDT0_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT0_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

GSS_A5_APCS_WDT0_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved

GSS_A5_APCS_WDT0_FRZ (cont.)

Bits	Name	Description
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a '1'.

0x10002040 GSS_A5_APCS_WDT0_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_EN register controls when the watch dog timer is enabled.

GSS_A5_APCS_WDT0_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x10002044 GSS_A5_APCS_WDT0_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_STS register is the watchdog status register.

GSS_A5_APCS_WDT0_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The sleep counter value is sampled using the AHB clk. Multiple reads are required to determine the value (assuming AHB clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog0 counter reset.

GSS_A5_APCS_WDT0_STS (cont.)

Bits	Name	Description
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT0) 0x0: reset (the last system reset was not due to WDT0.)

0x10002048 GSS_A5_APCS_WDT0_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_INT_WIDTH register defines the width of the WDT0 biteExpired pulse in the number of sleep_clk pulses. The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

GSS_A5_APCS_WDT0_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to de-assert the WDI bite pulse.

0x1000204C GSS_A5_APCS_WDT0_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (‘bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (‘bark’) interrupt.

GSS_A5_APCS_WDT0_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to trigger the bark interrupt.

0x10002050 GSS_A5_APCS_WDT0_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

GSS_A5_APCS_WDT0_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x10002054 GSS_A5_APCS_WDT0_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TEST_LD register loads the WDT0_TST register value into the watchdog counter.

GSS_A5_APCS_WDT0_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT0_TST register into the WDT0 counter.

0x10002058 GSS_A5_APCS_WDT0_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

GSS_A5_APCS_WDT0_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter test load value [28:0].

0x1000205C GSS_A5_APCS_WDT0_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BITE_TIME register determines the counter value at which WDT0 asserts the biteExpired signal.

GSS_A5_APCS_WDT0_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 bite expiration time [28:0].

0x10002060 GSS_A5_APCS_WDT1_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

GSS_A5_APCS_WDT1_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT1_STB during the non-sleep mode. A pulse is generated on WDT1_STB when this bit is written with a '1'

0x10002064 GSS_A5_APCS_WDT1_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT1_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

GSS_A5_APCS_WDT1_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a '1'.

0x10002068 GSS_A5_APCS_WDT1_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_EN register controls when the watchdog timer is enabled.

GSS_A5_APCS_WDT1_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x1000206C GSS_A5_APCS_WDT1_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_STS register is the watchdog status register.

GSS_A5_APCS_WDT1_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The counter value is sampled using the ahb clk. Multiple reads are required to determine the value (assuming ahb clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog counter reset.
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT1) 0x0: reset (the last system reset was not due to WDT1.)

0x10002070 GSS_A5_APCS_WDT1_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_INT_WIDTH register defines the width of the WDT1_expired pulse in the number of sleep_clk pulses.The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

.

GSS_A5_APCS_WDT1_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to de-assert the WDI expired pulse.

0x10002074 GSS_A5_APCS_WDT1_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (‘bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (‘bark’) interrupt.

..

GSS_A5_APCS_WDT1_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to trigger the bark interrupt.

0x10002078 GSS_A5_APCS_WDT1_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

..

GSS_A5_APCS_WDT1_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x1000207C GSS_A5_APCS_WDT1_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TEST_LD register loads the WDT1_TST register value into the watchdog counter.

GSS_A5_APCS_WDT1_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT1_TST register into the WDT counter

0x10002080 GSS_A5_APCS_WDT1_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

GSS_A5_APCS_WDT1_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter test load value [28:0]

0x10002084 GSS_A5_APCS_WDT1_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BITE_TIME register determines the counter value at which WDT1 asserts the biteExpired signal.

GSS_A5_APCS_WDT1_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 bite expiration time [28:0].

0x10002088 GSS_A5_APCS_TMR_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [WDT0, WDT1, GPT0, GPT1, DGT].

The APCS_TMR_STS can be used to determine the status of each of the SCSS timers in the timer's resident clock domain. Since the timer clock domain may be much slower than the AHB clock, AHB transactions may be delayed in taking effect. This information can be used to qualify other actions or used simply for debug purposes. For example, software can determine when a write to APCS_DGT_CLR has taken effect by examining the DGT_CLR_PEND bit.

Each timer's bits are receive security treatment as specified by the APCS_TMRSECURE register.

GSS_A5_APCS_TMR_STS

Bits	Name	Description
31	RESERVED_BIT31	
30	WDT1_AUTOKICK	Auto-kicker is on (1) or off (0)
29	WDT1_INT_EN	An unmasked interrupt will enable the timer (1) or not (0)
28	WDT1_EN	Timer is enabled (1) or not (0)
27	RESERVED_BIT27	
26	WDT0_AUTOKICK	Auto-kicker is on (1) or off (0)
25	WDT0_INT_EN	An unmasked interrupt will enable the timer (1) or not (0)
24	WDT0_EN	Timer is enabled (1) or not (0)
23:20	RESERVED_BIT20_23	
19	GPT1_WR_PEND	Timer has a write pending (1) or not (0)
18	GPT1_CLR_PEND	Timer has a clear pending (1) or not (0)
17	GPT1_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
16	GPT1_EN	Timer is enabled (1) or not (0)
15:12	RESERVED_BITS15_12	
11	GPT0_WR_PEND	Timer has a write pending (1) or not (0)
10	GPT0_CLR_PEND	Timer has a clear pending (1) or not (0)
9	GPT0_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
8	GPT0_EN	Timer is enabled (1) or not (0)
7:4	RESERVED_BITS7_4	
3	DGT_WR_PEND	Timer has a write pending (1) or not (0)
2	DGT_CLR_PEND	Timer has a clear pending (1) or not (0)
1	DGT_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
0	DGT_EN	Timer is enabled (1) or not (0)

10.10 GSS A5 Wrapper SSBI Registers (0x10003000 GSS_A5_SSBI_BASE)

This section contains the Global Navigation Subsystem (GSS) A5 Wrapper SSBI registers.

10.10.1 Singlewire Serial Bus Interface (SSBI)

This section defines registers and tasks to configure and access SSBI Engine. All registers are AHB accessible.

NOTE All command register settings take effect immediately unless otherwise noted.

0x10003000 SSBI_ENABLE

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

This register provides clock enable for each SSBI master.

SSBI_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS	
0	CLK_EN	Setting (1) enables clock for SSBI master

0x10003004 SSBI_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0F8001

SSBI control register. It specifies various generic control information.

SSBI_CTL

Bits	Name	Description
31:21	RESERVED_BITS_1	
20:17	WAKEUP_FINAL_CNT	This field specifies the number of idle clock cycles between wakeup pulse and actual read/write access to SSBI slave.
16	SSBI_DATA_PDEN	Pull down enable for SSBI_DATA pad.
15	RESERVED_BITS_2	
14	DISABLE_TERM_SYM	In FTM mode, set this bit to disable the termination symbol.

SSBI_CTL (cont.)

Bits	Name	Description
13:8	SLAVE_ID	In FTM mode, specifies the Slave ID.
7	FTM_MODE	Set this bit to force all the transfers to be in FTM mode.
6:5	SEL_RD_DATA	Safety feature to address routing delay Increase SEL_RD_DATA increase waiting cycles before getting the rd_data
4	ENABLE_SSBI_INT	When asserted, SSBI IRQ is generated when SSBI R/W through AHB is done
3:2	SSBI_DATA_DEL	Specifies the number of 1/2 clock periods, SSBI_DATA will be delayed before sampling.
1:0	IDLE_SYMS	The master ensures there are at least this number of idle symbol periods in between the accesses. For successive writes, this value can be 0x0. However if the following access is a read operation, then this value has to be greater then 0x0.

0x10003008 SSBI_RESET

Type: Command
Clock: AHB_CLK
Reset State: 0x0

SSBI_RESET

Bits	Name	Description
31:1	RESERVED_BITS	
0	RESET_REQ	Setting (1) this bit resets the SSBI master

0x1000300C SSBI_CMD

Type: Command
Clock: AHB_CLK
Reset State: 0x0

This register specifies the information to use for the transfer. For both reads and writes, SW must write to this register to initiate the transfer. The REG_DATA field is ignored for reads. For a read, once it has completed, read the data through SSBI_RD. Note that, if software initiates a read, it is expected that no subsequent access will be done until that data has been read from SSBI_RD. When this register is read, 0 is returned.

SSBI_CMD

Bits	Name	Description
31:28	RESERVED_BITS_1	

SSBI_CMD (cont.)

Bits	Name	Description
27	SEND_TERM_SYM	In FTM mode, writing 0x1 to this bit generates just the termination symbol without requesting for an access.
26	WAKEUP_SLAVE	When set(1), any following read or write transactions will first cause the ssbi_master_if block to send a single wakeup pulse to the slave. After WAKEUP_FINAL_CNT number of idle clocks, the read or write transaction begins. Setting this bit allows the SSBI slave to shut off its clock between transactions.
25	RESERVED_BIT	
24	RDWRN	Denotes whether the command to perform is a register write (0) or read (1).
23:16	REG_ADDR	Slave register address.
15:8	RESERVED_BITS_2	
7:0	REG_DATA	Write data for a slave register.

0x10003010 SSBI_BYPASS

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

This register allows software to override SSBI_DATA value. This provides a safety option to drive SSBI_DATA with different values in idle mode.

SSBI_BYPASS

Bits	Name	Description
31:2	RESERVED_BITS	
1	OVR_VALUE	When OVR_MODE is 1, this bit is driven onto SSBI_DATA. This is NOT intended to enable SW to bit-bang SSBI commands. Rather, this is a safety option in case a need arises to program this bit differently in idle mode.
0	OVR_MODE	Override mode bit. When set(1), the value driven onto SSBI_DATA is given by OVR_VALUE.

0x10003018 SSBI_RD

Type: Read
Clock: AHB_CLK
Reset State: 0x0

When reading a slave register, write to SSBI_CMD (REG_DATA is ignored). Once data is ready, read this register and it returns the read data from the slave and the other fields filled in correctly to match. Reading from this register may clear some bits in SSBI_STATUS. Note if software send the second read command to SSBI_CMD before reading the contents of this register after the 1st read command. All fields except REG_DATA may be invalid, and depending on the second access, REG_DATA may reflect the first read data or second read data.

SSBI_RD

Bits	Name	Description
31:26	RESERVED_BITS_1	
25	USE_ENABLE	Reflects how SSBI_CMD was written to initiate this read.
24	RDWRN	Reflects how SSBI_CMD was written to initiate this read.
23:16	REG_ADD	Reflects how SSBI_CMD was written to initiate this read.
15:8	RESERVED_BITS_2	
7:0	REG_DATA	Returned read register data.

0x1000301C SSBI_STATUS

Type: Read
Clock: AHB_CLK
Reset State: 0x0

Returns information about the internal status of the SSBI master. If software wants to perform an access, it should first ensure READY is 1. If software wants to wait until the transfer has completed, it can poll MCHN_BUSY. If software wants to know when read data has returned, it can poll RD_READY.

SSBI_STATUS

Bits	Name	Description
31:5	RESERVED_BITS	
4	SSBI_DATA_IN	Returns the instantaneous value of SSBI_DATA input. This is not affected by SSBI_CTL: SSBI_DATA_DEL. This is intended as a test feature.
3	RD_CLOBBERED	This bit gets set(1) if SW initiates another access (read or write) while a SSBI read is being performed. The result of this action is that all the fields except REG_DATA in SSBI_RD will be invalid. Reads from SSBI_RD clear this bit.
2	RD_READY	Normally clear(0). If a SSBI read is performed, this bit will be set upon read completion (DONE assertion). Reads from SSBI_RD clear this bit.

SSBI_STATUS (cont.)

Bits	Name	Description
1	READY	Indicates that the master can accept a new transfer request. When clear(0), further writes to SSBI_CMD should not be done since the previous access may be lost. This signal will be clear for the duration from REQ assertion until ACK assertion. It also remains clear following reset, until the time SW writes to SSBI_CTL register and resets SSBI_DATA_PDEN bit.
0	MCHN_BUSY	When set(1), indicates the SSBI master is actively performing a transfer. This signal will be set for the duration from REQ assertion until DONE assertion.

11.2 KPSS GIC2 GICD Registers (0x02000000 APCS_QGIC2_BASE)

This section contains the Krait Processor Subsystem (KPSS) GIC2 GICD registers.

The Generic Interrupt Controller 2 (GIC2) is a reusable configurable soft core. This GIC2 specification conforms to ARM's Generic Interrupt Controller architecture specification. Where differences exist, either additional features have been added or this document must change to conform to ARM's specified architecture. Where additional features were added, they will be clearly marked. The GIC2 design supports ARM's TrustZone architecture with two security zones: secure and non-secure.

The GIC2 is made of two parts: the Distributor and CPU Interfaces (up to eight). Each of these interfaces contains a CRIF slave interface. There must be at least one CPU Interface in the design.

In this manual, addresses are offsets from zero. When constants are exported, they are re-assigned to the appropriate base address.

Half-word and Byte access is supported by a subset of the registers.

Security treatment of registers in the GIC2 is divided into four types of registers. These are:

- "Common" indicates that both secure and non-secure software have full access to the register.
- "NS-int Dependent" indicates that state belonging to both secure and non-secure interrupts may be present in the register, depending on the value set in the Interrupt Security Register. Secure accesses to such a register are able to access all of the register's state, regardless of the Interrupt Security Register setting. Non-secure accesses may only access state belonging to non-secure interrupts. For non-secure accesses to state belonging to secure interrupts, writes are ignored and reads return zero.
- "Banked" indicates that the register exhibits different functionality according to whether it is accessed with a secure or non-secure request.
- "Restricted" indicates that only secure requests may access this register. If non-secure accesses are attempted, writes are ignored and reads return zero.

The type of register is specified for each register individual. Table 11-2 explains security treatment for register bits.

Table 11-2 Register security treatment

bus NS bit	SECURITY BIT	ALLOW Access
0	0	1
0	1	1
1	0	0
1	1	1

Glossary:

CPU Interface: That part of the GIC2 responsible for receiving the next interrupt from the Distributor and, if the interrupt has sufficient priority, asserting an interrupt indication to the CPU.

CPU MID: The Master ID of a CPU interface (as in AXI's AMID). The CPU MID reaching the Distributor must match the CPU Interface connected to that master.

Distributor: That part of the GIC2 responsible for detecting, disabling, prioritizing, and directing interrupts to CPU(s). The Distributor also accepts requests from and signals software interrupts to the CPU(s).

FABRIC: Flexible Advanced Buses & Reusable Interconnect Cores

NS-int: Security status of a particular interrupt ID. The value 0x0 is "secure", 0x1 is "non-secure".

NS-prot: Security status of the a bus transaction (read or write) according to the NS bit.

PPI: Private Peripheral Interrupt, interrupt from a peripheral whose interrupt line is destined to a particular CPU and can't be physically connected/directed to any other.

SGI: Software Generated Interrupt, interrupt from one CPU (or thread) to another.

SPI: Shared Peripheral Interrupt, interrupt from a peripheral whose interrupt line's CPU target is programmable to one or more CPU interface by the Distributor.

11.2.1 GIC2 Distributor

Table 11-3 GIC2 Distributor Register Summary

Address	Name	Type	Reset	Security Treatment	Description

11.2.1.1 GIC2 distributor registers

0x02000000 APCS_GICD_CTLR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICD_CTLR register controls if the Distributor responds to external interrupt stimulus changes.

Non-secure access: Distributor provides access to the enable_ns register in bit 0.

Secure access: Distributor provides access to the enable_s register in bit 0, and the enable_ns register in bit 1.

APCS_GICD_CTLR

Bits	Name	Description
31:2	RESERVED	
1	ENABLE_NS	This bit is an alias of the enable_ns bit. This bit is only usable by Secure software. 0x0: CLR 0x1: SET
0	ENABLE	This bit is the enable bit for both Secure and Non-secure software. Secure software accesses enable_s at this location. Non-secure software accesses enable_ns. 0x0: CLR 0x1: SET

0x02000004 APCS_GICD_TYPER

Type: Read
Clock: CLK
Reset State: Unknown

Security Treatment: Common

The GICD_TYPER register provides information about the configuration of the GIC2.

APCS_GICD_TYPER

Bits	Name	Description
31:16	RESERVED	

APCS_GICD_TYPER (cont.)

Bits	Name	Description
15:11	LSPI	Returns the number of Lockable Shared Peripheral Interrupts (LSPIs) that the GIC2 contains. GIC2 does not support lockable SPIs, always reads back 0x0.
10	TZ	TrustZone support. GIC2 supports TrustZone, always reads back 0x1.
9:8	RESERVED_BITS9_TO_8	
7:5	CPU_NUM	Returns the number of CPU interfaces that the generic interrupt controller provides. The generic interrupt controller provides either: 0b 000 = one CPU interface 0b 001 = two CPU interfaces 0b 010 = three CPU interfaces 0b 011 = four CPU interfaces 0b 100 = five CPU interfaces 0b 101 = six CPU interfaces 0b 110 = seven CPU interfaces 0b 111 = eight CPU interfaces.
4:0	IT_LINES	Returns the number of INTIDs, to the nearest 32, that the Distributor provides. Read as: 0b 00000 = the Distributor is configured for up to 32 INTIDs 0b 00001 = the Distributor is configured for up to 64 INTIDs 0b 00010 = the Distributor is configured for up to 96 INTIDs 0b 00011 = the Distributor is configured for up to 128 INTIDs . . . 0b 11110 = the Distributor is configured for up to 992 INTIDs 0b 11111 = the Distributor is configured for up to 1020 INTIDs.

0x02000008 APCS_GICD_IIDR

Type: Read
Clock: CLK
Reset State: 0x00001070

Security Treatment: Common

The GICD_IIDR register provides the implementor of the Distributor and the revision of the Distributor.

APCS_GICD_IIDR

Bits	Name	Description
31:24	RESERVED	

APCS_GICD_IIDR (cont.)

Bits	Name	Description
15:12	REVISION	Returns the revision number of the Distributor, 0x1
11:0	IMPLEMENTOR	Returns JEP106 ID number, 0b 01110000

0x02000020 APCS_GICD_ANSACR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Restricted

The auxiliary non-secure access control register (GICD_ANSACR) is used to control non-secure access to GICD_CGCR.

APCS_GICD_ANSACR

Bits	Name	Description
31:1	RESERVED	
0	GICD_CGCR	0x0: SEC (Dis-allows non-secure access.) 0x1: NS (Allows non-secure access.)

0x02000024 APCS_GICD_CGCR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Restricted

The clock gate control register (GICD_CGCR) is used to control localized clock gating over-ride logic. Setting bits in GICD_CGCR disables the corresponding local clock gating logic. The local clock gating logic normally turns off a local (small subset) clock tree automatically if there is no need for the clock. If any error is found in the gating logic, these bits can be used to over-ride it.

APCS_GICD_CGCR

Bits	Name	Description
31:17	RESERVED_31_TO_17	
16	TOP	Controls the top level clock gate (which gates entire GIC2). 0x1: DISABLE 0x0: ENABLE
15:4	RESERVED_15_TO_4	

APCS_GICD_CGCR (cont.)

Bits	Name	Description
3	DI_SGI_STATE	Controls the clock gate for Distributor interrupt state data base registers for SGI interrupts. 0x1: DISABLE 0x0: ENABLE
2	DI_PPI_SPI_STATE	Controls the clock gate for Distributor interrupt state data base registers for PPI and SPI interrupts. 0x1: DISABLE 0x0: ENABLE
1	DI_DEMET	Controls the clock gate for Distributor interrupt input demet registers. 0x1: DISABLE 0x0: ENABLE
0	DI_RD	Controls the clock gate for Distributor CRIF Read Data. 0x1: DISABLE 0x0: ENABLE

0x02000080+4*n APCS_GICD_ISRn, n=[0..8]

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Restricted

Each bit in an GICD_ISR register controls the security state of an interrupt, to be either secure or non-secure. You can only access these registers with secure read or secure write accesses.

NOTE The GICD_ISR register at address offset 0x0080 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

APCS_GICD_ISRn

Bits	Name	Description
31:0	INT_NS	0x0: SEC (Assigns INTID N to the Secure state.) 0x1: NS (Assigns INTID N to the Non-secure state.)

0x02000100+4*n APCS_GICD_ISENABLERn, n=[0..8]

Type: Write (command - readable)
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ISENABLER register controls the enabling of an interrupt.

Reading this register returns the currently enabled interrupts subject to NS-int dependent access rules.

NOTE The GICD_ISENABLER register at address offset 0x0100 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

APCS_GICD_ISENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ICENABLER register.) 0x1: SET (Enables INTID N.)

0x02000180+4*n APCS_GICD_ICENABLERn, n=[0..8]

Type: Write (command - readable)
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ICENABLER register controls the disabling of an interrupt.

Reading this register returns the currently enabled interrupts subject to NS-int dependent access rules.

NOTE The GICD_ICENABLER register at address offset 0x0180 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

APCS_GICD_ICENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ISENABLER register.) 0x1: CLR (Enables INTID N.)

0x02000200+4*n APCS_GICD_ISPENDRn, n=[0..8]

Type: Write (command - readable)
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ISPENDR register controls the enabling of an interrupt.

Reading this register returns the currently pending interrupts subject to NS-int dependent access rules.

NOTE The GICD_ISPENDR register at address offset 0x0200 is repeated once per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

APCS_GICD_ISPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ICPENDR register.) 0x1: SET (Sets INTID N to the Pending state.)

0x02000280+4*n APCS_GICD_ICPENDRn, n=[0..8]

Type: Write (command - readable)
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in an GICD_ICPENDR register controls the disabling of an interrupt.

Reading this register returns the currently pending interrupts subject to NS-int dependent access rules.

NOTE The GICD_ICPENDR register at address offset 0x0280 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

APCS_GICD_ICPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ISPENDR register.) 0x1: CLR (Clears INTID N. from the pending state.)

0x02000300+4*n APCS_GICD_ISACTIVERn, n=[0..8]

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in the GICD_ISACTIVER register provides the active status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt to the Active (or Active and Pending) state

NOTE The GICD_ISACTIVER register at address offset 0x0300 is repeated once per CPU Interface. It is only accessible from the designated CPU and provides information for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

APCS_GICD_ISACTIVERn

Bits	Name	Description
31:0	INT	0x0: DO NOTHING 0x1: SET

0x02000380+4*n APCS_GICD_ICACTIVERn, n=[0..8]

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each bit in the GICD_ICACTIVER register provides the active status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt out of the Active (or Active and Pending) state

NOTE The GICD_ICACTIVER register at address offset 0x0300 is repeated once per CPU Interface. It is only accessible from the designated CPU and provides information for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

APCS_GICD_ICACTIVERn

Bits	Name	Description
31:0	INT	0x1: CLR 0x0: DO NOTHING

0x02000400+4*n APCS_GICD_IPRIORITYRn, n=[0..71]

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each field in the GICD_IPRIORITYR registers controls the priority level of an interrupt.

NOTE The GICD_IPRIORITYR registers at address offsets 0x0400 to 0x41C are repeated once per CPU Interface. These are only accessible from the designated CPU and control the priority levels for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupt priority levels.

NOTE This register is byte addressable.

The GICD_IPRIORITYR register behaves differently depending on the security setting of interrupt associated with the address written (NS-int) and the security of the bus transaction (NS-prot).

APCS_GICD_IPRIORITYRn

Bits	Name	Description
31:27	INT3	
26:24	RESERVED_1	
23:19	INT2	
18:16	RESERVED_2	
15:11	INT1	
10:8	RESERVED_3	
7:3	INT0	All bits cleared (0x0) is the highest priority. All bits set (5'b11111) is the lowest priority. For non-secure write access, the MSB is always set (1). For non-secure read access, the MSB is always clear (0). Non-secure entities can't use the highest priorities without secure software setting such a priority. The highest priorities are typically reserved for secure software. On the other hand, secure software can, if needed, write and read the MSB. Secure entities have access to all priorities. Secure interrupts can use priority numbers 5'b10000-5'b11111 (the lower half of the priority spectrum) if needed. Due to strict "less than" comparisons used in the CPU interface, setting an interrupt's priority to 5'b11111 effectively disables that interrupt. The number of priorities actually supported is 32. Software can determine this number by writing 0xFF and reading back the result.
2:0	RESERVED_4	

0x02000800+ 4*n APCS_GICD_ITARGETSRn, n=[0..71]

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: NS-int dependent

Each field in the GICD_ITARGETSR registers controls the destination CPU(s) of an interrupt.

NOTE The GICD_ITARGETSR registers at address offsets 0x0800 to 0x81C are not actually implemented. These are place holders PPI and SGI interrupts. PPI interrupts, being private, only have one destination CPU. SGI interrupts are generated by the GIC2_DI_SOFT_INT register only. The remaining registers control the SPI interrupt destinations.

NOTE This register is byte addressable.

APCS_GICD_ITARGETSRn

Bits	Name	Description
31:24	INT3	
23:16	INT2	
15:8	INT1	
7:0	INT0	Each bit represents one of 8 CPUs. Bit 0 represents the zeroth CPU, bit 7 represents the seventh CPU. Setting this field to 0 will disable the interrupt as no CPU will see it set. For INTIDs < 32 (the SGI and PPI), reads return the bit corresponding to the CPU performing the read (ie CPU 0 reads back 0x01010101). Writes are ignored. The number of CPUs actually supported is determined by NUM_CPU generic. Software can determine this number by writing 0xFF and reading back the result.

0x02000C00+ 4*n APCS_GICD_ICFGRn, n=[0..17]

Type: Read/write
Clock: CLK
Reset State: 0x55555555

Security Treatment: NS-int dependent

Each field in the GICD_ICFGR registers allows:

- control of type of an SPI:
- level-sensitive

- edge-sensitive
- reading the type of PPIs and SGIs

NOTE The GICD_ICFGR registers at address offsets 0x0C00 to 0xC04 are repeated once per CPU Interface. These are only accessible from the designated CPU and allow read access for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

NOTE PPI(0) is the maintenance interrupt and must be configured as level type.

NOTE This register is not byte addressable, interrupts should be disabled before configuring their type.

NOTE Reset state for GICD_ICFGR0 is 0xaaaaaaaa.

APCS_GICD_ICFGRn

Bits	Name	Description

APCS_GICD_ICFGRn (cont.)

Bits	Name	Description
1:0	INT0	These bits behave differently for each of the three interrupt types as follows: ' For SGI, read back as 0b10 - SGI interrupts are edge-sensitive and use the N-N model. ' For PPI/SPI, read/writable as 0b01 or 0b11 - PPI/SPI interrupts can be edge or level sensitive and use the 1-N model. 0x0: LVL N to N 0x1: LVL 1 to N 0x2: EDGE N to N 0x3: EDGE 1 to N

0x02000F00 APCS_GICD_SGIR

Type: Write (command)
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICD_SGIR register provides the method by which software may cause interrupts to become pending for designated target CPU(s). The GIC2 maintains an internal database of all outstanding software interrupt requests pended to each CPU Interface and rotates through them in Round Robin fashion. Signaling the same interrupt a second time before it is serviced will result in only one interrupt from the source CPU to the target CPU(s).

Table 11-4 Security status

Security status of the write event to the GICD_SGIR register (the state of the NS bit)	SATT Value	Interrupt's security status as set by GICD_ISR	Requested Interrupt set as pending on the target CPU
Secure	0	Secure	YES
Secure	0	Non-secure	NO
Secure	1	Secure	NO
Secure	1	Non-secure	YES
Non-secure	X	Secure	NO
Non-secure	X	Non-secure	YES

11.3 KPSS GIC2 GICH Registers (0x02000000 APCS_QGIC2_BASE)

This section contains the Krait Processor Subsystem (KPSS) GIC2 GICH registers.

The Generic Interrupt Controller 2 (GIC2) is a reusable configurable soft core. This GIC2 specification conforms to ARM's Generic Interrupt Controller architecture specification. Where differences exist, either additional features have been added or this document must change to conform to ARM's specified architecture. Where additional features were added, they will be clearly. The GIC2 design supports ARM's TrustZone architecture, with two security zones: secure and non-secure.

The GIC2 is made of two parts: the Distributor and up to eight CPU Interfaces. Each of these interfaces contains a CRIF slave interface. There must be at least one CPU Interface in the design.

In this manual, addresses are offsets from zero. When constants are exported, they are re-assigned to the appropriate base address.

Half-word and Byte access is supported by a subset of the registers.

Security treatment of registers in the GIC2 is divided into four types of registers. These are:

- "Common" indicates that both secure and non-secure software have full access to the register.
- "NS-int Dependent" indicates that state belonging to both secure and non-secure interrupts may be present in the register, depending on the value set in the Interrupt Security Register. Secure accesses to such a register are able to access all of the register's state, regardless of the Interrupt Security Register setting. Non-secure accesses may only access state belonging to non-secure interrupts. For non-secure accesses to state belonging to secure interrupts, writes are ignored and reads return zero.
- "Banked" indicates that the register exhibits different functionality according to whether it is accessed with a secure or non-secure request.
- "Restricted" indicates that only secure requests may access this register. If non-secure accesses are attempted, writes are ignored and reads return zero.

The type of register is specified for each register individual. Table 11-5 explains security treatment for register bits.

Table 11-5 Register security treatment

bus NS bit	SECURITY BIT	ALLOW Access
0	0	1
0	1	1
1	0	0
1	1	1

Glossary:

CPU Interface: That part of the GIC2 responsible for receiving the next interrupt from the Distributor and, if the interrupt has sufficient priority, asserting an interrupt indication to the CPU.

CPU MID: The Master ID of a CPU interface (as in AXI's AMID). The CPU MID reaching the Distributor must match the CPU Interface connected to that master.

Distributor: That part of the GIC2 responsible for detecting, disabling, prioritizing, and directing interrupts to CPU(s). The Distributor also accepts requests from and signals software interrupts to the CPU(s).

FABRIC: Flexible Advanced Buses & Reusable Interconnect Cores

NS-int: Security status of a particular interrupt ID. The value 0x0 is "secure", 0x1 is "non-secure".

NS-prot: Security status of the a bus transaction (read or write) according to the NS bit.

PPI: Private Peripheral Interrupt, interrupt from a peripheral whose interrupt line is destined to a particular CPU and can't be physically connected/directed to any other.

SGI: Software Generated Interrupt, interrupt from one CPU (or thread) to another.

SPI: Shared Peripheral Interrupt, interrupt from a peripheral whose interrupt line's CPU target is programmable to one or more CPU interface by the Distributor.

11.3.1 QGIC2 Hypervisor Interface

Table 11-6 QGIC2 Hypervisor Interface Register Summary

Address	Name	Type	Reset	Security Treatment	Description
0x1000	GICH_HCR	RW	0x0000_0000	Common	general Hypervisor control
0x1004	GICH_VTR	R	0x9000_0003	Common	Hypervisor implementation - type register
0x1008	GICH_VMCR	R/W	0x004C_0000	Common	virtual machine control register

11.3.2 QGIC2 Hypervisor interface registers

0x02001000 APCS_GICH_HCR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICH_HCR configures the GIC2 Hypervisor interface.

APCS_GICH_HCR

Bits	Name	Description
31:27	EOICOUNT	Counts the number of EOIs which have been received without a corresponding entry being found among the list registers. Incremented automatically by the CPU Interface when such an EOI is received. EOIs which do not clear a bit in the Active Priorities register do not cause an increment. The maintenance interrupt is asserted whenever this field is non-zero and the SKIDIE bit is set (see below).
26:8	RESERVED	
7	VDG1IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnableG1] is cleared. 0x0: CLR 0x1: SET
6	VEG1IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnableG1] is set. 0x0: CLR 0x1: SET
5	VDG0IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnalbeG0] is cleared. 0x0: CLR 0x1: SET
4	VEG0IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnableG0] is set. 0x0: CLR 0x1: SET
3	NPIE	No Pending Interrupt Maintenance Interrupt Enable. If this bit is set, the maintenance interrupt will be asserted whenever no list registers contain an interrupt in PENDING state. 0x0: CLR 0x1: SET

APCS_GICH_HCR (cont.)

Bits	Name	Description
2	SKIDIE	SKID Maintenance Interrupt Enable. If this bit is set, the maintenance interrupt will be asserted whenever GICH_HCR[EOICount] is non-zero. 0x0: CLR 0x1: SET
1	UIE	Underflow Maintenance Interrupt Enable. If this bit is set, the maintenance interrupt will be asserted whenever zero or one of the list entries are marked as valid. 0x0: CLR 0x1: SET
0	EN	Enable or Disable maintenance and by proxy Virtual CPU interface Interrupts 0x0: CLR 0x1: SET

0x02001004 APCS_GICH_VTR

Type: Read
Clock: CLK
Reset State: 0x90000003

Security Treatment: Common

The GICH_VTR provides information about the configuration of the Hypervisor Interface (virtual generic interrupt controller type register).

APCS_GICH_VTR

Bits	Name	Description
31:29	PRIBITS	Indicates the number of priority bits implemented, minus one. For this version of the specification the only acceptable value is 100, indicating 5 bits of priority (32 levels)
28:26	PREBITS	Indicates the number of preemption bits implemented, minus one. For this version of the specification the only acceptable value is 100, indicating 5 bits of preemption (32 levels)
25:6	RESERVED	
5:0	LISTREGS	Indicates the number of implemented List Registers, minus one. GIC2 has 4 list registers. This is set to 0x3

0x02001008 APCS_GICH_VMCR

Type: Read/write
Clock: CLK
Reset State: 0x004C0000

Security Treatment: Common

The GICH_VMCR contains read/write aliases of all the Virtual Machine accessible state (aliases from the GICV_* registers). This alias allows the Hypervisor to easily save and restore this state with a single read or write, and without needing to map in the Virtual Machine registers.

NOTE Various bits of this register include the terms group 0 or group 1in their names. This is purely for compatibility with the physical generic interrupt controller interface and does not pertain to actual TrustZone security.

APCS_GICH_VMCR

Bits	Name	Description
31:27	VMPMR	Alias of the GICV_PMR bits 7:3 in GICV
26:24	RESERVED_1	
23:21	VMG0BP	Alias of the group0 GICV_BPR bit in GICV
20:18	VMG1BP	Alias of the group1 GICV_ABPR bit in GICV
17:10	RESERVED_2	
9	VEM	Alias of the GICV_CTLR[EOIMode] bit in GICV
8:5	RESERVED	
4	VMGBPR	Alias of the GICV_CTLR[GBPR] bit in GICV
3	VMFIQEN	Alias of the GICV_CTLR[FIQen] bit in GICV.
2	VMACKCTL	Alias of the GICV_CTLR[ActCtl] bit in GICV.
1	VMENABLE_G1	Alias of the GICV_CTLR[ENABLE_G1] bit in GICV.
0	VMENABLE_G0	Alias of the GICV_CTLR[ENABLE_G0] bit in GICV.

0x02001010 APCS_GICH_MISR

Type: Read
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICH_MISR is the Maintenance interrupt syndrome register in the Hypervisor Interface. This register indicates which Maintenance Interrupts are currently asserted. This takes into account the individual Maintenance Interrupt Enable bits in GICH_HCR. However, the global enable in

GICH_HCR (EN) is not factored in to these bits. Therefore the maintenance interrupt is asserted if and only if at least one bit is set in this register and the EN bit in GICH_HCR is set.

Reset State: 0x00000000

Security Treatment: Common

The GICH_EISR provides EOI interrupt status in the Hypervisor Interface - which Software interrupts in the LRn registers that have EI set and are currently in the Invalid state.

APCS_GICH_EISR

Bits	Name	Description
25:5	RESERVED	
3:0	LR	0x0: NOT_EOI 0x1: EOI

0x02001030 APCS_GICH_ELRSR

Type: Read
Clock: CLK
Reset State: 0x0000000F

Security Treatment: Common

The GICH_ELRSR provides Empty List Register Status in the Hypervisor Interface.

APCS_GICH_ELRSR

Bits	Name	Description
31:5	RESERVED	
3:0	LR	0x0: NOT EMPTY 0x1: EMPTY

0x020010F0 APCS_GICH_APR

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICH_APR provides information about the priorities currently active in the Hypervisor Interface.

APCS_GICH_APR

Bits	Name	Description
31:0	PRI	0x0: INACTIVE 0x1: ACTIVE

0x02001100+4*n APCS_GICH_LRn, n=[0..3]

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICH_LRn provides access to each of the list registers in the Hypervisor Interface.

APCS_GICH_LRn

Bits	Name	Description
31	HW	Indicates that this is a Hardware interrupt. When this bit is set, bits 19:10 contain the Physical interrupt number, and when this interrupt is subject to an EOI request, a Deactivate Interrupt request will be sent to the Interrupt Distributor.

APCS_GICH_LRn (cont.)

Bits	Name	Description
30	GRP	Indicates that this interrupt should be treated as Group1. This means that the interrupt will present as an IRQ if GICV_CTLR[EnableG1] bit is set. If the GRP bit is clear, the interrupt is put into Group0 and will present as either IRQ or FIQ depending on the setting of the GICV_CTLR[FIQen] but only if GICV_CTLR[EnableG0] bit is also set. This bit is also used with GICV_CTLR[CBPR] to determine which Binary Point register is used in GICV for preemption calculations.
29:28	STATE	**NOTE** For hardware interrupts, the PENDING+ACTIVE state is held in the physical Distributor rather than the VCPUIF. The PENDING+ACTIVE state (11) should only be used for software originated interrupts (Virtual Devices) or SGIs. 0x0: IDL (INVALID) 0x1: PNA (PENDING, NOT ACTIVE) 0x2: A (ACTIVE) 0x3: PA (PENDING and ACTIVE)
27:23	PRI	Indicates the priority of this interrupt. This is converted to a traditional 8-bit generic interrupt controller priority value by appending three zero bits.
22:20	RESERVED	
19:10	PHY_ID	The physical ID of the interrupt (which SGI/PPI/SPI is it'). When the HW bit is set this field indicates the physical interrupt ID, which is forwarded to the Distributor when this interrupt is subject to an EOI request. See below for details when the HW bit is clear. If the Physical ID is between 16 and 31 inclusive (PPI space), the Deactivation will apply to the PPI associated with the same physical CPU as the VCPUIF making the request. If the Physical ID is between 0 and 15 inclusive (SGI space), the Deactivation will still apply to SGI associated with the same physical CPU as the VCPUIF making the request but it is expected that the HW bit and Physical ID will NOT be used for SGIs.
9:0	VIRTL_ID	Indicates the Virtual ID. This ID is returned to the Guest OS when this interrupt is acknowledged via the GICV_IAR (Interrupt Acknowledge register).

0x02001120 APCS_GICH_SW_LR

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

This register is not a real physical register or address in the design. It is placed here in the Software Manual to describe the alternate meanings for bits 19:10 in the LRn registers. Adding it here allows SW to pick up defines for these alternate meanings and use them in LRn accesses.

The HW uses these alternate definitions when bit 31 (HW) is set to 0 - indicating a (a pure virtual interrupt) written directly to this Hypervisor interface or an interrupt generated due to an SGI that originated in the Distributor. Bits 31:20 and 9:0 retain the normal GICH_LRn meanings.

APCS_GICH_SW_LR

Bits	Name	Description
19	EI	Indicates that this interrupt should trigger an EOI Interrupt. When this bit is set, a maintenance interrupt will be asserted whenever this interrupt becomes INVALID.
18:13	RESERVED	
12:10	CPUID	If this interrupt is an SGI, indicates the requesting CPU ID. This will appear in the relevant field of the VM Interrupt Acknowledge register. If the interrupt is not an SGI, software must set this field to 0.

11.4 KPSS GIC2 GICC Registers (0x02000000 APCS_QGIC2_BASE)

This section contains the Krait Processor Subsystem (KPSS) GIC2 GICC registers.

The Generic Interrupt Controller 2 (QGIC2) is a re-usable configurable soft core. This GIC2 specification conforms to ARM's Generic Interrupt Controller architecture specification. Where differences exist, either additional features were added or this document must change to conform to ARM's specified architecture. Where additional features were added, they will be clearly marked. The GIC2 design supports ARM's TrustZone architecture, with two security zones: secure and non-secure.

The GIC2 is made of two parts: the Distributor and CPU Interfaces (up to eight). Each of these interfaces contains a CRIF slave interface. There must be at least one CPU Interface in the design.

In this manual, addresses are offsets from zero. When constants are exported, they are re-assigned to the appropriate base address.

Half-word and Byte access is supported by a subset of the registers.

Security treatment of registers in the GIC2 is divided into four types of registers. These are:

- "Common" indicates that both secure and non-secure software have full access to the register.
- "NS-int Dependent" indicates that state belonging to both secure and non-secure interrupts may be present in the register, depending on the value set in the Interrupt Security Register. Secure accesses to such a register are able to access all of the register's state, regardless of the Interrupt Security Register setting. Non-secure accesses may only access state belonging to non-secure interrupts. For non-secure accesses to state belonging to secure interrupts, writes are ignored and reads return zero.
- "Banked" indicates that the register exhibits different functionality according to whether it is accessed with a secure or non-secure request.
- "Restricted" indicates that only secure requests may access this register. If non-secure accesses are attempted, writes are ignored and reads return zero.

The type of register is specified for each register individual. Table 11-7 explains security treatment for register bits.

Table 11-7 Register security treatment

bus NS bit	SECURITY BIT	ALLOW Access
0	0	1
0	1	1
1	0	0
1	1	1

Glossary:

CPU Interface: That part of the GIC2 responsible for receiving the next interrupt from the Distributor and, if the interrupt has sufficient priority, asserting an interrupt indication to the CPU.

CPU MID: The Master ID of a CPU interface (as in AXI's AMID). The CPU MID reaching the Distributor must match the CPU Interface connected to that master.

Distributor: That part of the GIC2 responsible for detecting, disabling, prioritizing, and directing interrupts to CPU(s). The Distributor also accepts requests from and signals software interrupts to the CPU(s).

FABRIC: Flexible Advanced Buses & Reusable Interconnect Cores

NS-int: Security status of a particular interrupt ID. The value 0x0 is "secure", 0x1 is "non-secure".

NS-prot: Security status of the a bus transaction (read or write) according to the NS bit.

PPI: Private Peripheral Interrupt, interrupt from a peripheral whose interrupt line is destined to a particular CPU and can't be physically connected/directed to any other.

SGI: Software Generated Interrupt, interrupt from one CPU (or thread) to another.

SPI: Shared Peripheral Interrupt, interrupt from a peripheral whose interrupt line's CPU target is programmable to one or more CPU interface by the Distributor.

11.4.2 QGIC2 CPU interface registers

0x02002000 APCS_GICC_CTLR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_CTLR configures the GIC2 CPU interface.

Non-secure access: Access is granted only to bits 0, 5,6 and 9.

Secure access: Access is granted to all register bits. Non-secure bits 0,5,6, and 9 are aliased into bits 1, 7, 8, and 10 for access by secure software.Modifying these aliased bits will modify the non-secure settings. Bits 0, 5, 6, 9 are physically banked into Secure and Non-secure space.

APCS_GICC_CTLR

Bits	Name	Description
31:11	RESERVED	
10	EOIMODENS	For secure software, a read/writable alias of Non-Secure EOImode.

APCS_GICC_CTLR (cont.)

Bits	Name	Description
9	EOIMODE	For secure software, controls the behavior of secure access to GICC_EOI and GICC_DIR. For non-secure software, controls the behavior of non-secure access to GICC_EOI and GICC_DIR. 0x0: PD_AND_DI (Both Priority Drop and Deactivate Interrupt, GICC_DIR does not function) 0x1: PD (GICC_EOI performs Priority Drop, GICC_DIR performs deactivate interrupt function)
8	IRQBYPDISABLENS	For secure software, a read/writable alias of Non-secure version of IRQBypDisable.
7	FIQBYPDISABLENS	For secure software, a read/writable alias of Non-secure version of FIQBypDisable
6	IRQBYPDISABLE	For Non-secure software, when CPU Interface is disabled, prevents the legacy bypass IRQ signal from being forwarded to the CPU (if IRQ is under Non-secure control). For secure software, prevents bypass if FIQ is under secure control. 0x0: CLR 0x1: SET
5	FIQBYPDISABLE	For Non-secure software, when CPU Interface is disabled, prevents the legacy bypass FIQ signal from being forwarded to the CPU (if FIQ is under Non-secure control). For secure software, prevents bypass if FIQ is under secure control. 0x0: CLR 0x1: SET
4	SBPR	Controls which binary point register is used to calculate preemption. 0x0: BANKED (secure interrupts use the secure Binary Point Register, non-secure interrupts use the non-secure Binary Point Register) 0x1: RESTRICTED (all interrupts use the secure Binary Point Register)
3	S_DEST	Controls destination of secure interrupts. 0x0: IRQ 0x1: FIQ

APCS_GICC_CTLR (cont.)

Bits	Name	Description
2	ACKCTL	Controls the side effect behavior of a secure read request to the Interrupt Acknowledge Register in the case where the highest priority pending interrupt is non-secure. If AckCtl is set to 0, a secure read request to the Interrupt Acknowledge Register returns an Interrupt ID value of 1022, and the read request does not cause the interrupt to be acknowledged (that is the Pending status of the interrupt remains unchanged). If AckCtl is set to 1, a secure read request to the Interrupt Acknowledge Register returns the Interrupt ID value of the non-secure interrupt, and causes the interrupt to be acknowledged (that is the interrupt becomes Active, or Active and Pending). 0x0: DISABLE ACK OF NS PENDING 0x1: ENABLE ACK OF NS PENDING
1	ENABLE_NS	For secure software, a read/writable alias of non secure software's enable bit (bit 0 of this same register in non secure space). 0x0: CLR 0x1: SET
0	ENABLE	For non-secure software, this bit enables/disables non secure interrupts. For secure software, this bit enables/disables secure interrupts. 0x0: CLR 0x1: SET

0x02002004 APCS_GICC_PMR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_PMR register configures the GIC2 CPU interface Priority Mask. The Priority Mask can be used to limit the interrupts that can cause an interrupt request to the CPU based on priority levels.

Non-secure access: Write access is granted only if bit 7 is 0x1, writes are ignored otherwise. Reads are always granted, however, bit 7 is always set in the data returned. Bit 0 is always zero.

Secure access: Access is granted to all register bits.

APCS_GICC_PMR

Bits	Name	Description
31:8	RESERVED_1	
7:3	LEVEL	Set the Priority Mask Level. The CPU interface asserts an interrupt request to CPU if the priority of the highest Pending interrupt sent by the interrupt Distributor is strictly higher than at least the mask set in Priority Mask Register.
2:0	RESERVED_2	

0x02002008 APCS_GICC_BPR

Type: Read/write
Clock: CLK
Reset State: 0x00000002

Security Treatment: Banked

The GICC_BPR register configures the GIC2 CPU interface Binary Point. The Binary Point is used to limit interrupts that can cause an interrupt request to the CPU based on the interrupt's priority and the interrupt priority that is currently being serviced by the CPU (if there is one). If the CPU is not servicing an interrupt, the Binary Point register is not used.

Non-secure access: Provides access to the non-secure Binary Point register.

Secure access: Provides access to the secure Binary Point register.
Secure software may access the non-secure Binary Point register at offset 0x001C.

Table 11-9 Interpretation of Binary Point Register value

register value	Priority bits used to determine preemption for secure interrupts.	Priority bits used to determine preemption for non-secure interrupts. (Bit 7 is always 0x1)
0	7:1	7:0
1	7:2	7:1
2	7:3	7:2
3	7:4	7:3
4	7:5	7:4
5	7:6	7:5
6	7	7:6
7	No preemption	No preemption

APCS_GICC_BPR

Bits	Name	Description
31:3	RESERVED	
2:0	VAL	The VAL setting is used to determine the priority bits used for preemption according to Table 11-9.

0x0200200C APCS_GICC_IAR

Type: Read (Command)
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Banked

The GICC_IAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn.

Performing this read has the side effect of causing the Distributor to change the interrupt from the Pending state to the Active or Active and Pending state according the description below:

Using three bits defined by AHB bus security state (1=non-secure), security of the HPPI(1=non-secure)and the value of GICC_CTLR[AckCtl]:

00x ’ respond with the true interrupt number, transitioning to active (secure request to secure interrupt, ACKCTL is don't care)

010 ’ respond with 1022 (secure request to non-secure interrupt but ACKCTL=0 disabling secure handling of non-secure interrupts)

011 ’ respond with the true interrupt number, transitioning to active (secure request to non-secure interrupt with ACKCTL=1)

10x ’ respond with 1023 (non-secure request to secure interrupt)

11x ’ respond with the true interrupt number, transitioning to active (non-secure request to non-secure interrupt)

APCS_GICC_IAR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.

APCS_GICC_IAR (cont.)

Bits	Name	Description
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, the security state of any outstanding interrupts, the value of GICC_CTLR[AckCtl] as defined in the description above.

0x02002010 APCS_GICC_EOIR

Type: Write (Command)
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

Unlike GIC1, GICC_EOIR (End Of Interrupt) register has two possible behaviors. By default it acts as it did in GIC1, that is, it can be written to indicate when software has finished handling an interrupt.

In GIC2, if GICC_CTLR[EOImode] is set (1), writing this register has the "priority drop" (PD) effect. The PD effect is when the active priority bit for the highest priority active interrupt is cleared. The key difference, when EOImode is one, is that the Distributor is not notified that this happened - that is, the interrupt itself does not become inactive.

When EOImode is zero, writing to this register will, in addition to the PD effect described above, set the interrupt to Inactive or Pending (if prior to writing to this register, the interrupt was both Active and Pending it becomes just pending) in the Distributor.

In either case, the value written must be the interrupt ID, and the CPU Source ID for SGIs, of the interrupt that is being completed.

The security status of the write to this register (NS-prot) must match the security status (NS-int) of the interrupt ID, according to Table 11-10 for the interrupt to be successfully cleared.

Non-secure access: See Table 11-10.

Secure access: See Table 11-10.

Table 11-10 GICC_EOIR Priority Drop Effect Definition

[AckCtl]	Security status of the write request	Highest Priority Active interrupt security value	Effect
x	Non-secure	Non-secure	Clear the highest active Non-secure priority level
x	Non-secure	Secure	Clear the highest active Non-secure priority level

Table 11-10 GICC_EOIR Priority Drop Effect Definition

[AckCtl]	Security status of the write request	Highest Priority Active interrupt security value	Effect
0	Secure	X	Clear the highest active Secure priority level
1	Secure	X	Clears the highest active priority level.

APCS_GICC_EOIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. As described in Table 17-9 (GICC_EIOR security (and source CPU) match definition), the CPU Source ID must match an active interrupt in order for the GICC_EOIR to take effect. The CPU_ID is written must match that delivered to software when GICC_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICC_IAR register. If the security settings match (see Table 11-10) a write will cause the priority drop effect and if EOImode=0, the Active state in the Distributor for the corresponding interrupt will also be cleared.

0x02002014 APCS_GICC_RPR

Type: Read
Clock: CLK
Reset State: 0x000000F8

Security Treatment: Banked

The GICC_RPR (Running Priority) register provides access to the highest priority of all the Active interrupts on this CPU. The priority value returned is sensitive to the security status (NS-int) of the interrupt currently running and the NS-prot

Non-secure access: If the currently interrupt is secure (NS-int = 0), and a non-secure read of the Running Priority register is attempted (NS-prot = 1), then the value 0 (maximum priority) is returned.

Secure access: Returns the true value in the register.

APCS_GICC_RPR

Bits	Name	Description
31:8	RESERVED_1	
7:3	VAL	Running Priority
2:0	RESERVED_2	

0x02002018 APCS_GICC_HPPIR

Type: Read
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Banked

The GICC_HPPIR register provides access to the highest priority pending interrupt to the CPU Interface.

NOTE Interrupts that are Active and Pending in the Distributor are not considered candidates to become the highest priority pending interrupt.

Using three bits defined by AHB bus security state (1=non-secure), security of the HPPI(1=non-secure)and the value of GICC_CTLR[AckCtl]:

00x ’ respond with the true interrupt number (secure request to secure interrupt, ACKCTL is don't care)

010 ’ respond with 1022 (secure request to non-secure interrupt but ACKCTL=0 disabling secure handling of non-secure interrupts)

011 ’ respond with the true interrupt number (secure request to non-secure interrupt with ACKCTL=1)

10x ’ respond with 1023 (non-secure request to secure interrupt)

11x ’ respond with the true interrupt number (non-secure request to non-secure interrupt).

APCS_GICC_HPPIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.

APCS_GICC_HPPIR (cont.)

Bits	Name	Description
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, and the security state of any outstanding interrupts, as described above.

0x0200201C APCS_GICC_ABPR

Type: Read/write
Clock: CLK
Reset State: 0x00000003

Security Treatment: Restricted

The GICC_ABPR register provides a copy of the non-secure binary point register for use by secure software. See the definition of the GICC_BPR register for details on the use of this register.

Non-secure access: No access.

Secure access: Access granted, updates are reflected to non-secure software at the GICC_BPR register at address offset 0x08.

APCS_GICC_ABPR

Bits	Name	Description
31:3	RESERVED	
2:0	VAL	Same as the GICC_BPR register - affects only non-secure interrupts.

0x02002020 APCS_GICC_AIAR

Type: Read (Command)
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Restricted

The GICC_AIAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn. This is a secure only register used to read non-secure interrupts by Secure Software.

Performing this read has the side effect of causing the Distributor to change the interrupt from the Pending state to the Active or Active and Pending state.

Non-secure access: No access. Read as zero.

Secure access: See description below.

Based on the 2 bits defined by the AHB Security of the request (1=non-secure) and the security of the interrupt (1=non-secure):

00 ’ respond with 1023 (secure request that behaves as if it is a non-secure request, to secure interrupt)

01 ’ respond with the true interrupt number, transitioning to active (secure request that behaves as if it is a non-secure request, to non-secure interrupt)

1x ’ RAZ/WI (non-secure request cannot access this register)

APCS_GICC_AIAR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier..

0x02002024 APCS_GICC_AEOIR

Type: Write (Command)
Clock: CLK
Reset State: 0x00000000

Security Treatment: Restricted

A secure write to this register has an identical effect to a non-secure write to GICC_EOIR, with the exception of the EOImode bit; the value of the secure EOImode bit (bit 9) in GICC_CTLR is used to determine whether the interrupt is deactivated or just priority dropped rather than the non-secure EOImode bit (bit 10).

This register must be used by secure software to signal completion of non-secure interrupts when GICC_CTLR AckCtl bit is set to 0; GICC_EOIR cannot be used for this purpose since it would affect GICC_APRn rather than GICC_NSAPRn.

Non-secure access: ignored

Secure access: signal completion of non-secure interrupt

APCS_GICC_AEOIR

Bits	Name	Description
31:13	RESERVED	

APCS_GICC_AEOIR (cont.)

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. The CPU Source ID must match an active interrupt in order for the GICC_AEOIR to take effect. The CPU_ID is written must match that delivered to software when GICC_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICC_IAR register. Interrupt Identifier. A write will cause the priority drop effect and if EOImode=0, the Active state in the Distributor for the corresponding interrupt will also be cleared.

0x02002028 APCS_GICC_AHPPIR

Type: Read
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Restricted

This is a Secure-Only register.

A read from this register has an identical effect to a Non-Secure read from GICC_HPPIR. It can therefore be used to check for a pending Non-Secure interrupt without the possibility of returning a Secure Interrupt ID value.

Interrupts that are Active and Pending in the Distributor are not considered candidates to become the highest priority pending interrupt.

Non-secure access: No access. Read as zero.

Secure access: See description below.

NOTE

Using three bits defined by AHB bus security state (1=non-secure), security of the HPPI(1=non-secure)and the value of GICC_CTLR[AckCtl]:

00x ’ respond with 1023 (hppi is a secure interrupt)

01x ’ respond with the true interrupt number (hppi is a non-secure interrupt)

1xx ’ RAZ/WI (non-secure request cannot access this register)

.

APCS_GICC_AHPPIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, and the security state of any outstanding interrupts, as described above.

0x020020D0 APCS_GICC_APR

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

Each bit in the GICC_APR register provides the active status of priorities in the CPU Interface.

Non-secure access: Bits 15-0 represent priorities 31 to 16 of the non-secure active priorities.

Secure access: Bits 31-0 represent priorities 31 to 0 of the active secure priorities.

APCS_GICC_APR

Bits	Name	Description
31:0	PRI	0x1: A (ACTIVE) 0x0: NA (NOT ACTIVE)

0x020020E0 APCS_GICC_NSAPR

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Restricted

Each bit in the GICC_NSAPR register provides the active status of non-secure priorities in the CPU Interface.

Non-secure access: None - write ignore, read-as-zero.

Secure access: Bits 31-0 represent priorities 31 to 0 of teh active non-secure priorities.

APCS_GICC_NSAPR

Bits	Name	Description
31:0	PRI	0x1: A (ACTIVE) 0x0: NA (NOT ACTIVE)

0x020020FC APCS_GICC_IIDR

Type: Read
Clock: CLK
Reset State: 0x00020070

Security Treatment: Common

The GICC_IIDR register provides information about the GIC2 CPU Interface version and device implementor information.

APCS_GICC_IIDR

Bits	Name	Description
31:20	PART_NUM	Part Number: 0x0
19:16	ARCH_VERSION	Architecture Version : 0x2
15:12	REVISION	Revision number: 0x0
11:0	IMPLEMENTOR	Bits[11:8] contain the implementor's JEP106 continuation code, 0x0 Bit[7] is always 0 Bits[6:0] contain bits [6:0] of the implementor's JEP106 code,

0x02003000 APCS_GICC_DIR

Type: Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICC_DIR register provides the mechanism by which Software can Deactivate a specific interrupt.

Secure writes can deactivate secure and non-secure interrupts.

Non-secure writes can only deactivate non-secure interrupts.

Note that unlike GICC_EOIR and GICC_IAR, there is no restriction of the Deactivation of Non-Secure interrupts with Secure accesses. The AckCtl bit does not affect the behavior of GICC_DIR. This is because unlike GICC_IAR there is no chance of the access affecting an interrupt from an

unexpected security state, and unlike GICC_EOIR there is no effect on GICC_APRn or GICC_NSAPRn, so there is no need to indicate which register should be affected.

APCS_GICC_DIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. INT_ID written should match value returned from GICC_IAR read.

11.5 KPSS GIC2 GICV Registers (0x02000000 APCS_QGIC2_BASE)

This section contains the Krait Processor Subsystem (KPSS) GIC2 GICV registers.

The Generic Interrupt Controller 2 (GIC2) is a reusable configurable soft core. This GIC2 specification conforms to ARM's Generic Interrupt Controller architecture specification. Where differences exist, either additional features were added or this document must change to conform to ARM's specified architecture. Where additional features were added, they will be clearly marked. The GIC2 design supports ARM's TrustZone architecture with two security zones: secure and non-secure.

The GIC2 is made of two parts: the Distributor and CPU Interfaces (up to eight). Each of these interfaces contains a CRIF slave interface. There must be at least one CPU Interface in the design.

In this manual, addresses are offsets from zero. When constants are exported, they are re-assigned to the appropriate base address.

Half-word and Byte access is supported by a subset of the registers.

Security treatment of registers in the GIC2 is divided into four types of registers. These are:

- "Common" indicates that both secure and non-secure software have full access to the register.
- "NS-int Dependent" indicates that state belonging to both secure and non-secure interrupts may be present in the register, depending on the value set in the Interrupt Security Register. Secure accesses to such a register are able to access all of the register's state, regardless of the Interrupt Security Register setting. Non-secure accesses may only access state belonging to non-secure interrupts. For non-secure accesses to state belonging to secure interrupts, writes are ignored and reads return zero.
- "Banked" indicates that the register exhibits different functionality according to whether it is accessed with a secure or non-secure request.
- "Restricted" indicates that only secure requests may access this register. If non-secure accesses are attempted, writes are ignored and reads return zero.

The type of register is specified for each register individual. Table 11-11 explains security treatment for register bits.

Table 11-11 Register security treatment

bus NS bit	SECURITY BIT	ALLOW Access
0	0	1
0	1	1
1	0	0
1	1	1

Glossary:

CPU Interface: That part of the GIC2 responsible for receiving the next interrupt from the Distributor and, if the interrupt has sufficient priority, asserting an interrupt indication to the CPU.

CPU MID: The Master ID of a CPU interface (as in AXI's AMID). The CPU MID reaching the Distributor must match the CPU Interface connected to that master.

Distributor: That part of the GIC2 responsible for detecting, disabling, prioritizing, and directing interrupts to CPU(s). The Distributor also accepts requests from and signals software interrupts to the CPU(s).

FABRIC: Flexible Advanced Buses & Reusable Interconnect Cores

NS-int: Security status of a particular interrupt ID. The value 0x0 is "secure", 0x1 is "non-secure".

NS-prot: Security status of the a bus transaction (read or write) according to the NS bit.

PPI: Private Peripheral Interrupt, interrupt from a peripheral whose interrupt line is destined to a particular CPU and can't be physically connected/directed to any other.

SGI: Software Generated Interrupt, interrupt from one CPU (or thread) to another.

SPI: Shared Peripheral Interrupt, interrupt from a peripheral whose interrupt line's CPU target is programmable to one or more CPU interface by the Distributor.

11.5.1 QGIC2 Virtual CPU Interface

Table 11-12 QGIC2 Virtual CPU Interface Register Summary

11.5.2 QGIC2 Virtual CPU interface registers

NOTE All transactions to the Virtual CPU Interface are treated as secure. All bits are accessible to every transaction. There the secure and non-secure views do not apply to this block of registers. All access to GICV registers operate upon the Hypervisor portion of GIC2 in a similar fashion as GICC registers operate on the distributor.

0x02004000 APCS_GICV_CTLR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICV_CTLR configures the GIC2 Virtual CPU interface.

APCS_GICV_CTLR

Bits	Name	Description
31:10	RESERVED_1	
9	EOIMODE	Controls the behavior of Non-secure access to GICV_EOI and GICV_DIR 0x0: PD_AND_DI (Both Priority Drop and Deactivate Interrupt, GICV_DIR does not function) 0x1: PD (GICV_EOI performs Priority Drop, GICV_DIR performs deactivate interrupt function)
8:5	RESERVED_2	

APCS_GICV_CTLR (cont.)

Bits	Name	Description
4	GBPR	Controls which binary point register is used to calculate preemption, GICV_BPR or the GICV_ABPR. 0x0: BANKED (Group 0 interrupts use the Group 0 Binary Point Register, Group 1 interrupts use the Group 1 Binary Point Register) 0x1: G0 (all interrupts use the Group 0 Binary Point Register)
3	FIQEN	Controls destination of secure interrupts. 0x0: IRQ 0x1: FIQ
2	ACKCTL	Controls whether reads of the VM Interrupt Acknowledge Register can acknowledge interrupts where the NS bit is set in the List Register. acknowledged only if the NS bit is clear in the corresponding List Register. If the NS bit in that List Register is set, the read will return 1022 and the interrupt can only be acknowledge by a read to the VM Aliased Interrupt Acknowledge Register.) always acknowledged regardless of the NS bit setting in the corresponding List Register.) 0x0: NO_IAR_4G0 (On a read of GICV_IAR, the highest priority unmasked PENDING interrupt is) 0x1: IAR_4G0 (On a read of GICV_IAR, the highest priority unmasked PENDING interrupt is)
1	ENABLE_G1	This bit enables Group 1 interrupts. 0x0: CLR 0x1: SET
0	ENABLE_G0	This bit enables Group 0 interrupts. 0x0: CLR 0x1: SET

0x02004004 APCS_GICV_PMR

Type: Read/write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

The GICV_PMR register configures the GIC2 Virtual CPU interface Priority Mask. The Priority Mask can be used to limit the interrupts that can cause an interrupt request to the CPU based on priority levels.

APCS_GICV_PMR

Bits	Name	Description
31:8	RESERVED_1	
7:3	LEVEL	Set the Priority Mask Level. The CPU interface asserts an interrupt request to CPU if the priority of the highest Pending interrupt sent by the interrupt Distributor is strictly higher than at least the mask set in Priority Mask Register.
2:0	RESERVED_2	

0x02004008 APCS_GICV_BPR

Type: Read/write
Clock: CLK
Reset State: 0x00000002

Security Treatment: Common

The GICV_BPR register configures the GIC2 Virtual CPU interface Binary Point. The Binary Point is used to limit interrupts that can cause an interrupt request to the CPU based on the interrupt's priority and the interrupt priority that currently being serviced by the CPU (if there is one). If the CPU is not servicing an interrupt, the Binary Point register is not used.

APCS_GICV_BPR

Bits	Name	Description
31:3	RESERVED	
2:0	VAL	The VAL setting is used to determine the priority bits used for preemption according to Table 11-9 Interpretation of Binary Point Register value.

0x0200400C APCS_GICV_IAR

Type: Read (Command)
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Common

The GICV_IAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn.

Performing this read has the side effect of causing the GICH to change the interrupt from the Pending state to the Active or Active and Pending state according to the rules below:

Using the 2 bits defined by Security of the HPPI(1=non-secure) and the value of GICV_CTLR[AckCtl]:

0x ’ respond with the true interrupt number, transitioning to active (ignore APROTNS and consider as a secure request to secure interrupt, ACKCTL is don't care)

10 ’ respond with 1022 (ignore APROTNS and consider as secure request to non-secure interrupt but ACKCTL=0 disabling secure handling of non-secure interrupts)

11 ’ respond with the true interrupt number, transitioning to active (ignore APROTNS and consider as secure request to non-secure interrupt with ACKCTL=1)

APCS_GICV_IAR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier - a virtual interrupt number determined by the Hypervisor SW.

0x02004010 APCS_GICV_EOIR

Type: Write (Command)
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

GICV_EOIR (End Of Interrupt) register has two possible behaviors. By default it can be written to to indicate when software has finished handling an interrupt.

If GICV_CTLR[EOImode] is set (1), writing this register has the "priority drop" (PD) effect. The PD effect is when the active priority bit for the highest priority active interrupt is cleared. The key difference, when EOImode is (1), is the interrupt itself does not become inactive.

When EOImode is (0), writing to this register will, in addition to the PD effect described above, set the interrupt to Inactive or Pending (if prior to writing to this register, the interrupt was both Active and Pending it becomes just pending). However, if GICV_CTLR[EOImode] is (0), then the CPU_ID and INT_ID must match an active interrupt for a state change to occur.

In either case, the value written must be the interrupt ID, and the CPU Source ID for SGIs, of the interrupt that is being completed.

APCS_GICV_EOIR

Bits	Name	Description
31:13	RESERVED	

APCS_GICV_EOIR (cont.)

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. The CPU_ID is written must match that delivered to software when GICV_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICV_IAR register.

0x02004014 APCS_GICV_RPR

Type: Read
Clock: CLK
Reset State: 0x000000F8

Security Treatment: Common

The GICV_RPR (Running Priority) register provides access to the highest priority of all the Active interrupts on this Virtual CPU.

APCS_GICV_RPR

Bits	Name	Description
31:8	RESERVED_1	
7:3	VAL	Running Priority
2:0	RESERVED_2	

0x02004018 APCS_GICV_HPPIR

Type: Read
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Common

The GICV_HPPIR register provides access to the highest priority pending interrupt to the Virtual CPU Interface. If no interrupt is pending, responds with 0x3FF.

NOTE Interrupts that are Active and Pending in the GICH (hypervisor) are not considered candidates to be come the highest priority pending interrupt.

Using 2 bits defined by the value of GICV_CTLR[AckCtl]and the NS bit of the HPPI(1=non-secure):

1x ’ respond with the virtual interrupt number

00 ’ respond with the virtual interrupt number

01 ’ respond with 1022

APCS_GICV_HPPIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier.

0x0200401C APCS_GICV_ABPR

Type: Read/write
Clock: CLK
Reset State: 0x00000003

Security Treatment: Common

The GICV_ABPR register provides access to the non-secure binary point register used by non-secure interrupts when GICV_CTRL[GBPR]=0. See the definition of the GICV_BPR register for details on the use of this register.

APCS_GICV_ABPR

Bits	Name	Description
31:3	RESERVED	
2:0	VAL	Same as the GICV_BPR register - affects only non-secure interrupts.

0x02004020 APCS_GICV_AIAR

Type: Read (Command)
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Common

The GICV_AIAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn.

Performing this read has the side effect of causing the GICH to change the interrupt from the Pending state to the Active or Active and Pending state according to the rules below:

Using the security state of the pending interrupt:

- 0 ’ respond with 1023
- 1 ’ respond with the true interrupt number, transitioning to active

APCS_GICV_AIAR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier - a virtual interrupt number determined by the Hypervisor SW.

0x02004024 APCS_GICV_AEOIR

Type: Write (Command)
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

This register presents the same programmers model as GICC_AEOIR.

The effect of writing to this register is identical to the effect of writing the same value to the GICV_EOIR register. This alias is provided for compatibility with the Physical CPU Interface, where the two registers have a different effect due to the provision of separate Secure and Non-Secure Active Priority Registers.

APCS_GICV_AEOIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. The CPU_ID is written must match that delivered to software when GICV_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICV_IAR register.

0x02004028 APCS_GICV_AHPPIR

Type: Read
Clock: CLK
Reset State: 0x000003FF

Security Treatment: Common

This register presents the same programmers model as GICC_AHPPIR.

This register returns the interrupt ID of the highest priority PENDING interrupt if it has an NS value of 1. Reading this interrupt has no side effects and simply returns the highest priority PENDING interrupt among the list registers or a status code according to the following table:

Using the NS bit of the HPPI(1=non-secure):

0 ’ 1023

1 ’ respond with the virtual interrupt number

Note that in some cases the returned value may not be strictly accurate if interrupts are currently paged out in software.

APCS_GICV_AHPPIR

Bits	Name	Description
31:13	RESERVED	
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier.

0x020040D0 APCS_GICV_APR

Type: Read/Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Common

Each bit in the GICV_APR is an alias of GICH_APR. The data and access control are one and the same.

APCS_GICV_APR

Bits	Name	Description
31:0	PRI	0x1: A (ACTIVE) 0x0: NA (NOT ACTIVE)

0x020040FC APCS_GICV_IIDR

Type: Read
Clock: CLK
Reset State: 0x00020070

Security Treatment: Common

The GICV_IIDR register provides information about the GIC2 Virtual CPU Interface version and device implementor information.

APCS_GICV_IIDR

Bits	Name	Description
31:20	PART_NUM	Part Number: 0x390
19:16	ARCH_VERSION	Architecture Version : 0x2
15:12	REVISION	Revision number: 0x0

0x02005000 APCS_GICV_DIR

Type: Write
Clock: CLK
Reset State: 0x00000000

Security Treatment: Banked

The GICV_DIR register provides the mechanism by which Software can Deactivate a specific interrupt.

APCS_GICV_DIR

Bits	Name	Description
31:13	RESERVED	

APCS_GICV_DIR (cont.)

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt.
9:0	INT_ID	Interrupt Identifier. The value should match the INT_ID returned from the read of GICV_IAR.

11.6 KPSS ACC Registers (0x02008000 APCS_ACC_BASE)

This section contains the Krait Processor Subsystem (KPSS) ACC Secure registers.

0x02008000 APCS_ACCSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0007

Security Treatment: Restricted

The APCS_ACCSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_ACCSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_ACCSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_ACCSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_ACCSECURE register correspond to.

APCS_ACCSECURE

Bits	Name	Description
31:4	RESERVED	
31:3	RESERVED_BITS31_3	
2	TST	Controls security treatment for test control registers: APCS_ATSTBUS_SEL 0x1: NSEC 0x0: SEC
1	CLK_CTL	Controls security treatment for the clock control registers: APCS_ACC_STS, APCS_CPU_AUX_CLK_SEL. 0x1: NSEC 0x0: SEC
0	SLP_CTL	Controls security treatment for the sleep control registers: APCS_CPU_PWR_CTL, APCS_CPU_TRGTD_DBG_RST. 0x1: NSEC 0x0: SEC

0x02008004 APCS_CPU_PWR_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0109

Security Treatment: Controlled by APCS_ACCSECURE [SLP_CTL].

The APCS_CPU_PWR_CTL register is used to control the clamps, reset and array head switches.

.

APCS_CPU_PWR_CTL

Bits	Name	Description
31:21	RESERVED_BITS31_21	
20:16	CLK_EN	Clock enables for CORE clock. This is only to workaround hardware dynamic clock gating problems. [20:18]= SYS_apcNAux_Clk[3:1] [17] = SYS_apcsRef_Clk [16] = SYS_apcNPll_Clk 0x1: Always enabled 0x0: dynamically enabled by hardware
15:10	RESERVED_BITS15_10	
9	RET_SLP_REQ	When set, this bit request the L2SCU to in-flight snoop operation and block new snoops request from entering FIFO. This control is intended to permit external masters such as the RPM to put CPU to retention sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a retention sleep request control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU's snoop FIFO is quiesce.
8	PLL_CLAMP	When set, this bit clamp the output of TDC logic in PLL. This signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the APC PLL.
7	CORE_PWRD_UP	Report that the CPU is powered up.
6	GATE_CLK	When set, this bit forces the CPU clock to be gated off. This control is intended to permit external masters such as the RPM to gate off the CPU clock during sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a clock gating control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU clock will be gated off. When set, this bit gate the CPU clock that must be asserted during sleep state. This bit is ORed with a SAW output before passing to the CPU core.
5	COREPOR_RST	When set, this bit asserts corepor areset to the CPU core.
4	CORE_RST	When set, this bit asserts core areset to the COPU core.

APCS_CPU_PWR_CTL (cont.)

Bits	Name	Description
3	L2DT_SLP	When set, this bit opens a head switch to put the L2 duplicate tag array into a low-leakage, non-data-retaining state. This bit is ORed with a SAW output before passing to the CPU core. The controlled memory array contains a duplicate of the tags contained in the L1 data cache, and is used by the L2 to snoop and see if a shared memory access from one processor necessitates invalidating a line in another processor's L1 data cache. Thus, this memory array generally can be offline when the associated CPU is power-collapsed and its L1 data cache is also off-line.
2	RESERVED_BIT2	Previously ETB HS
1	RESERVED_BIT1	Previously L1 HS
0	CLAMP	When set, this bit asserts the clamp signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the CPU core.

0x02008008 APCS_ACC_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: N/A

Security Treatment: Controlled by APCS_ACCSECURE [CLK_CTL].

The APCS_ACC_STS register is used to monitor the output of the clock gating cells.

APCS_ACC_STS

Bits	Name	Description
31:18	RESERVED_BITS31_18	
17	RET_SLP_ACK	This bit reflect the status of APCN_sysRetSlpAck bit. L2 assert the signal when it see the APCN_sysRetSlpReq and CPU snoop FIFO is quieced. L2 de-assert this signal after APCN_sysRetSlpReq is de-asserted and all snoop invalidation is completed.
16	SLP_CLK	This bit reflect the status of APCN_sleepClkOnReq bit
15	AHB_CLK	This bit reflect the status of APCN_ahbClkOnReq bit
14	REF_CLK	This bit reflect the status of APCN_refClkOnReq bit
13	SPM_SLP_STATE	This bit reflect the status of SPM Sleep State
12	FRC_CLK_OFF	This bit reflect the status of APCN_apccForceClocksOff bit
11	RET_SLP_REQ	This bit reflect the status of APCN_apccRetSlpReq bit
10	TRGTD_DBG_RST	This bit reflect the status of APCN_apcTargetedDbg_Areset_N bit
9	CORE_RST	This bit reflect the status of APCN_apccCore_Areset_N bit
8	COREPOR_RST	This bit reflect the status of APCN_apccCorePor_Areset_N bit

APCS_ACC_STS (cont.)

Bits	Name	Description
7	L2DT_HS	This bit reflect the status of the SYS_apcNSwCtlDupTagArrayCollapse bit
6	CLAMP	This bit reflect the status of the SYS_apcNClampApcNvd bit.
5:3	CORE_AUX_CLK	This bits reflect the status of the APCS_sysApcNAuxClkOnReq bits.
2	CORE_PLL_CLK	This bit reflect the status of the APCS_sysApcNPllClkOnReq bit.
1	CORE_NO_PWR_DWN	This bit reflect the status of the APCN_dbgCoreNoPwrDwn bits.
0	CORE_PWRUP_REQ	This bit reflect the status of the APCN_dbgCorePwrUpReq bits.

0x0200800C APCS_ATSTBUS_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [TST].

APCS_ATSTBUS_SEL selects different modules' test bus outputs.

APCS_ATSTBUS_SEL

Bits	Name	Description

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [SLP_CTL].

APCS_CPU_TRGTD_DBG_RST is used to reset the CPU core debug logic. The hardware clear the register after the CPU debug logic is reset. Software need to poll this register to check if the reset is complete.

APCS_CPU_TRGTD_DBG_RST

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	RST	When set this bit de-assert SYS_apcNTargetedDbg_Areset_N to the CPU core for 32 REF clock cycle to the CPU core. At the end of the reset hardware clear this bit.

0x02008014 APCS_CPU_AUX_CLK_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [CLK_CTL]

The APCS_CPU_AUX_CLK_SEL register controls the gfmux, which selects the AUX clock source for the Krait CPU clock. An additional selection set is provided to determine the clock source for the Krait core (4-1 GFMUX) in the Krait Hard Macro. The QSB clock is the raw source clk at reset.

APCS_CPU_AUX_CLK_SEL

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	AUX_SRC	Krait CPU AUX clock select: 0x3: SYS_apcNAux_Clk_1 0x2: SYS_apcNAux_Clk_2 0x1: SYS_apcNAux_Clk_3 0x0: SYS_apcsRef_Clk

11.7 KPSS SAW2 Registers (0x02009000 APCS_SAW2_BASE)

This section contains the Krait Processor Subsystem (KPSS) SAW2 registers.

The SAW2 (SPM and AVS. Wrapper2) design is an AHB slave that contains both SPM and AVS. CSRs.

0x02009000 APCS_SAW2_SECURE

Type: Read/write
Clock: SYS_REF_CLK
Reset State: {3{CFGNSINIT}}

Security Treatment: Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to ‘0’ the state of the SAW2_SECURE register is not considered; a secure transaction is always allowed. When ahb_saw_hprotns is set to ‘1’, the SAW2_SECURE register security treatment bit of that register must be ‘1’ for access to be granted. If the security treatment bit of the register is set to ‘0’, the non-secure (ahb_saw_hprotns = ‘1’) transactions are denied. When access is denied, a write is ignored, and a read will return ‘0’. No error is signaled.

When reading the SAW2_SECURE register, non-secure agents will always read ‘0’. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

APCS_SAW2_SECURE

Bits	Name	Description
31:3	RESERVED	
2	SAW_CTL	Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST 0x1: NSEC 0x0: SEC
1	PWR_CTL	Controls security treatment for SPM registers: SAW2_SPM_CTL, SAW2_SPM_PMIC_DLY, SAW2_SPM_PMIC_DATA_0, SAW2_SPM_PMIC_DATA_1, SAW2_SPM_SLP_SEQ_ENTRY_n, SAW2_SPM_DLY 0x1: NSEC 0x0: SEC
0	VLT_CTL	Controls security treatment for the AVS. registers: SAW2_AVS_CTL, SAW2_VLVL, SAW2_AVS_HYSTERESIS 0x1: NSEC 0x0: SEC

0x02009004 APCS_SAW2_ID

Type: Read
Clock: SYS_REF_CLK
Reset State: Undefined

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register reports the revision and parameter information for the SAW2 core.

APCS_SAW2_ID

Bits	Name	Description
31	RESERVED_BITS31	
30:25	NUM_SPM_ENTRY	SAW2 parameter: Indicates number of SAW2_SPM_SLP_SEQ_ENTRY register implemented. Value can range from 1 - 32
24:20	NUM_PWR_CTL	SAW2 parameter: Indicates number of power control implemented. Value can range from 2 - 16
19	RESERVED_BITS19	
18	PMIC_ARB_INTF	SAW2 parameter: Indicates PMIC Arbiter Interface function is implemented
17	AVS_PRESENT	SAW2 parameter: Indicates AVS. function is implemented
16	SPM_PRESENT	SAW2 parameter: Indicates SPM function is implemented
15:12	MAJOR	Major variant
11:0	MINOR	Minor variant

0x02009008 APCS_SAW2_CFG

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_CFG register is used to configure the common control between AVS. and SPM.system.

APCS_SAW2_CFG

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON.
11:8	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port.

APCS_SAW2_CFG (cont.)

Bits	Name	Description
7:6	RESERVED_BITS7_6	
5	PMIC_MODE	PMIC Handshake 0x0: 8K_PMIC (only DONE signal) 0x1: 7K_PMIC (both ACK and DONE signals)
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period. ..... For sys_ref_clk = 20 MHz (53ns) The timer tick range 53 ns to 1.6us. 0x0: Timer Tick every sys_ref_clk 0x1F: Timer Tick every 128 sys_ref_clk.

0x0200900C APCS_SAW2_STS_0

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

APCS_SAW2_STS_0

Bits	Name	Description
15	SHTDWN_REQ	This bit reflects the shutdown request from the SPM(spm_rpm_shutdown_req) to RPM.
14	SHTDWN_ACK	This bit reflects the shutdown acknowledgement from the RPM(rpm_spm_shutdown_ack) to SPM.
13	BRNGUP_REQ	This bit reflects the bringup request from the SPM(spm_rpm_bringup_req) to RPM.
12	BRNGUP_ACK	This bit reflects the bringup acknowledgement from the RPM(rpm_spm_bringup_ack) to SPM.
11:10	PMIC_STATE	State of the PMIC FSM: transitions back to IDLE) transitions back to IDLE) 0x0: IDLE (waiting for PMIC transaction from AVS. or SPM) 0x1: ACK (waiting for ACK from PMIC Arb) 0x2: DONE (waiting for DONE form PMIC Arb before) 0x3: DELAY (waiting for delay count termination before)

APCS_SAW2_STS_0 (cont.)

Bits	Name	Description
9:8	RPM_STATE	State of the RPM FSM: 0x0: RUN (waiting for SPM request) 0x1: STDNACK (waiting for shutdown ACK from RPM) 0x2: WAKEUP (waiting for wakeup interrupt) 0x3: BGUPACK (waiting for bringup ACK from RPM)
7	AVS_STATE	State of the AVS. FSM: indication) 0x0: IDLE (waiting to be enabled or for next UP/DOWN) 0x1: REQ (waiting for PMIC FSM to transition to IDLE)
6:0	SPM_CMD_ADDR	Last SPM command executed.

0x02009010 APCS_SAW2_STS_1

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

APCS_SAW2_STS_1

Bits	Name	Description
31	RESERVED1	
30	SW_WR_PEND	This bit reflects the VLVL state of the request from the SAW2_VCTL write is pending.
29	CPU_UP	This bit reflects the VLVL state of the request from the CPU (avs_saw_up) to raise the VLVL.
28	CPU_DN	This bit reflects the VLVL state of the request from the CPU (avs_saw_down) to lower the VLVL.
27	MAX_INT	IRQ status bit, AVS. controller detected that raising the VLVL by AVS_CTL[VLVL_STEP] would result in a value greater than AVS_CTL[MAX_VLVL]. If AVS_CTL[IRQ_MAX_EN] is set, an interrupt is issued. NOTE that SW can set MAX_VLVL lower than current VLVL creating a condition where VLVL is higher than MAX_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MAX.

APCS_SAW2_STS_1 (cont.)

Bits	Name	Description
26	MIN_INT	IRQ status bit, AVS. controller detected that lowering the VLVL by SAW2_AVS_CTL[VLVL_STEP] would result in a value less than SAW2_AVS_CTL[MIN_VLVL]. If SAW2_AVS_CTL[IRQ_MIN_EN] is set, an interrupt is issued. NOTE that SW can set MIN_VLVL higher than current VLVL creating a condition where VLVL is lower than MIN_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MIN.
25:16	CURR_DLY	VLVL value of the counter used to calculate the time until the next AVS. controller request for a new VLVL.

0x02009014 APCS_SAW2_VCTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

Though this register is read/writable, it also causes a command pulse to the PMIC FSM. Writing this register results in a transaction to the PMIC with SAW2_VCTL being sent to the PMIC. SAW2 support both 8901 and 8058 regulator.

APCS_SAW2_VCTL

Bits	Name	Description
31:16	RESERVED_BITS31_16	

0x02009018 APCS_SAW2_AVS_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_CTL register is used to control the Adaptive Voltage Scaling (AVS) system.

APCS_SAW2_AVS_CTL

Bits	Name	Description
31	RESERVED	

APCS_SAW2_AVS_CTL (cont.)

Bits	Name	Description
30	VLVL_WIDTH	Defines the VLVL field of PMIC data. SAW2 at minimum supports 8901 and 8058 regulator. See PMIC document for details. 0x0: 5 bits VLVL (8058 regulator) 0x1: 6 bits VLVL (8901 regulator)
29:28	VLVL_STEP	Controls the step size of each request to PMIC Arbiter. SW may use values from 0 to 3. Note that the value 0 will result in no change - that is if the CPU requests UP or DOWN, the CURR_PVLVL will be sent to the PMIC Arbiter. This may be useful for debug. If an increment or decrement operation would cause the current VLVL to transition above or below the MAX_VLVL or MIN_VLVL, the current VLVL will not be changed. An interrupt will be signaled if IRQ_MAX/MIN_EN is 1
27	EN	AVS. Enable. **NOTE** Setting to 0 does not disable any pending interrupts. **NOTE** AVS. FSM and SPM FSM are mutually exclusive. Only one FSM is active at a time. SW does not have to disable AVS. before going to sleep. 0x0: Disable AVS 0x1: Enable AVS
26	SW_DONE_INT_EN	Set to 1 to turn on AVS. interrupt for when a SW initiated voltage change has completed. Set to 0 to mask it (turn it off). ASSERTION: This interrupt is asserted only after a SW write to SAW2_AVS_VLVL. Specifically, after the AVS. FSM traverses through all its states and transitions back to IDLE, the interrupt line is pulsed. The interrupt controller should be set to edge capture to receive this interrupt. CLEARING: None. This interrupt is a pulse, SW does not need to clear it (aside from requirements of the interrupt controller).
25	MAX_INT_EN	Set to 1 to turn on AVS. interrupt for MAX_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be greater than MAX_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit.
24	MIN_INT_EN	Set to 1 to turn on AVS. interrupt for MIN_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be smaller than MIN_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit
23	RESERVED_23	

APCS_SAW2_AVS_CTL (cont.)

Bits	Name	Description
22:17	MAX_VLVL	Control maximum value of AVS. controller's VLVL. When current VLVL reaches this value it may not grow any larger. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level higher, an interrupt is issued. This value may be updated at anytime. Setting to a value lower than MIN_VLVL is not supported, and unpredictable results may occur.
16	RESERVED_16	
15:10	MIN_VLVL	Control the minimum value of AVS. controller's VLVL. When the current VLVL reaches this level it may not shrink any smaller. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level lower, an interrupt is issued. This value may be updated at anytime. Setting to a value higher than MAX_VLVL is not supported, and unpredictable results may occur.
9:0	AVS_DELAY	Control the time between AVS. controller's requests to change the VLVL

0x0200901C APCS_SAW2_AVS_HYSTERESIS

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_HYSTERESIS register is used to delay the AVS. UP/DN signal to AVS. FSM. This is used to prevent the false PMIC step due to PDN noise.

APCS_SAW2_AVS_HYSTERESIS

Bits	Name	Description
31:24	RESERVED31_24	
23:16	DN_COUNT	HYSTERESIS DN COUNT. Delays of PMIC DN step operation.
15:8	RESERVED15_8	
7:0	UP_COUNT	HYSTERESIS UP COUNT. Delays of PMIC UP step operation.

0x02009020 APCS_SAW2_SPM_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

APCS_SAW2_SPM_CTL

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	SPM_START_ADR	Start address for the SPM sequence.
3	ISAR	Inhibit Start Address Reset 0x0: End of program reset the SPM_START_ADR to zero. 0x1: Inhibit End of program to reset SPM_START_ADR
2:1	WAKEUP_CONFIG	Wakeup Configuration 0x0: sys_spm_wakeup 0x1: sys_spm_wakeup or !cpu_spm_wait_req 0x2: sys_spm_wakeup or rising edge of sys_spm_dbg_nopwrdwn 0x3: sys_spm_wakeup or !cpu_spm_wait_req or rising edge of sys_spm_dbg_nopwrdwn
0	SPM_EN	SPM En.

0x02009024 APCS_SAW2_SPM_PMIC_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC delay values after SPM FSM PMIC transaction. SPM wait for the programmed delay before executing the next SPM command.

APCS_SAW2_SPM_PMIC_DLY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:24	DATA_1_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
23:19	RESERVED_BITS23_19	
18:16	DATA_1_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
15:11	RESERVED_BITS15_11	

APCS_SAW2_SPM_PMIC_DLY (cont.)

Bits	Name	Description
10:8	DATA_0_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
7:3	RESERVED_BITS7_3	
2:0	DATA_0_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms

0x02009028 APCS_SAW2_SPM_PMIC_DATA_0

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

APCS_SAW2_SPM_PMIC_DATA_0

Bits	Name	Description

0x0200902C APCS_SAW2_SPM_PMIC_DATA_1

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

APCS_SAW2_SPM_PMIC_DATA_1

Bits	Name	Description

0x02009030 APCS_SAW2_RST

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_RST register is used to reset the SAW logic. This register clear itself. It does not reset any SAW2 CSR's. It reset AVS. and SPM FSM and control registers. This is use to clear any hang condition.

APCS_SAW2_RST

Bits	Name	Description
31:1	RESERVED31_1	
0	RST	Reset AVS. and SPM FSM and control registers.

0x02009034 APCS_SAW2_SPM_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the delay values for SPM Delay command. SPM wait for the programmed delay before executing the next SPM command.

APCS_SAW2_SPM_DLY

Bits	Name	Description
31:30	RESERVED_BITS31_30	
29:20	DLY3	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
19:10	DLY2	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
9:0	DLY1	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

0x02009080+4*n APCS_SAW2_SPM_SLP_SEQ_ENTRY_n

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter.

APCS_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description

11.8 KPSS Timer Registers (0x0200A000 APCS_TMR_BASE)

This section contains the Krait Processor Subsystem (KPSS) Timer registers.

0x0200A000 APCS_TMRSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Restricted

The APCS_TMRSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Scorpion's APROTNS pin. When APROTNS is set to '0' the state of the APCS_TMRSECURE register is not considered; a secure transaction is always allowed. When APROTNS is set to '1', the APCS_TMRSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_TMRSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_TMRSECURE register correspond to.

APCS_TMRSECURE

Bits	Name	Description
31:5	RESERVED	
4	WDT0	Controls security treatment for the Watch Dog Timer registers: APCS_WDT0_FRZ, APCS_WDT0_INT_EN, APCS_WDT0_STS, APCS_WDT0_INT_WIDTH, APCS_WDT0_BARK_TIME, APCS_WDT0_TST_LD_STS, APCS_WDT0_TST_LD. 0x1: NSEC 0x0: SEC
3	WDT1	Controls security treatment for the Watch Dog Timer registers: APCS_WDT1_FRZ, APCS_WDT1_INT_EN, APCS_WDT1_STS, APCS_WDT1_INT_WIDTH, APCS_WDT1_BARK_TIME, APCS_WDT1_TST_LD_STS, APCS_WDT1_TST_LD. 0x1: NSEC 0x0: SEC
2	GPT0	Controls security treatment for the General Purpose Timer registers: APCS_GPT1_MTCH, APCS_GPT1__CNT, APCS_GPT1_EN, APCS_GPT1_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC

APCS_TMRSECURE (cont.)

Bits	Name	Description
1	GPT1	Controls security treatment for the General Purpose Timer registers: APCS_GPT0_MTCH, APCS_GPT0__CNT, APCS_GPT0_EN, APCS_GPT0_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC
0	DGT	Controls security treatment for the Debug Timer registers; APCS_DGT_MTCH, APCS_DGT_CNT, APCS_DGT_EN, APCS_DGT_CLR, APCS_DGT_CLK_CTL, and bits 3-0 of APCS_TMR_STS 0x1: NSEC 0x0: SEC

0x0200A004 APCS_GPT0_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: APCS_TMRSECURE [GPT0].

The general purpose timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT0_MTCH register.

APCS_GPT0_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT0_CNT at which an interrupt will be generated.

0x0200A008 APCS_GPT0_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CNT register contains the current value of the GPT0 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT0_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_GPT0_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT0_EN.

- Write APCS_GPT0_CNT.
- Write (to set/restore) APCS_GPT0_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT0_EN.

APCS_GPT0_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer.

0x0200A00C APCS_GPT0_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_EN register is used to enable the GPT0 timer.

APCS_GPT0_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency ACC_SLP_CLK.

0x0200A010 APCS_GPT0_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CLR register is a one-shot command register that, when written with any value, resets the timer to a value of 0. This occurs regardless of the state of the APCS_GPT0_EN register.

APCS_GPT0_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x0200A014 APCS_GPT1_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The GPT timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT1_MTCH register.

APCS_GPT1_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT1_CNT at which an interrupt will be generated.

0x0200A018 APCS_GPT1_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CNT register contains the current value of the GPT1 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT1_MTCH register at the same time. The procedure for writing the APCS_GPT1_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT1_EN.
- Write APCS_GPT1_CNT.
- Write (to set/restore) APCS_GPT1_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT1_EN.

APCS_GPT1_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer

0x0200A01C APCS_GPT1_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_EN register is used to enable the GPT1 timer.

APCS_GPT1_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), timer will clear when it reaches the match value.
0	EN	When set (1), timer is enabled and counts with frequency sleep clock.

0x0200A020 APCS_GPT1_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CLR register is a one-shot command register that, when written with any value, resets the GPT1 timer to a value of 0. This occurs regardless of the state of the APCS_GPT1_EN register.

APCS_GPT1_CLR

Bits	Name	Description
31:0	RESERVED_BITS_31_0	Data written is not used.

0x0200A024 APCS_DGT_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The DBG timer will signal interrupt when its counter value has reached the value stored in the APCS_DGT_MTCH register.

APCS_DGT_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_DGT_CNT at which an interrupt will be generated.

0x0200A028 APCS_DGT_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CNT register contains the current value of the DGT timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_DGT_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_DGT_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_DGT_EN.
- Write APCS_DGT_CNT.
- Write (to set/restore) APCS_DGT_MTCH if required.
- Enable the timer by setting the EN bit in APCS_DGT_EN.

APCS_DGT_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer count

0x0200A02C APCS_DGT_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_EN register is used to enable the DGT timer.

APCS_DGT_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	

APCS_DGT_EN (cont.)

Bits	Name	Description
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency TCXO clock.

0x0200A030 APCS_DGT_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLR register is a one-shot command register that, when written with any value, resets the DGT timer to a value of 0. This occurs regardless of the state of the APCS_DGT_EN register.

APCS_DGT_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x0200A034 APCS_DGT_CLK_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0003

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLK_CTL controls the clock divider inside the Debug Timer.

NOTE It is possible for the AHB clock to run at as slow as 5 MHz using settings of the Global Clock Controller. The debug timer's counter can also run at 5 MHz (TCXO divided by 4). However, due to the synchronization circuit using the edge detect, the timer should always run at least 4x slower than the AHB clock. Thus, if the timer's use is required by the system, the divider should be set to divide by 4 and the slowest usable AHB frequency is 20MHz. The timer would run at 5MHz in this case.

APCS_DGT_CLK_CTL

Bits	Name	Description
31:2	RESERVED_BITS_31_2	

APCS_DGT_CLK_CTL (cont.)

Bits	Name	Description
1:0	DIV	0x3: 4 0x2: 3 0x1: 2 0x0: 1

0x0200A038 APCS_WDT0_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

APCS_WDT0_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT0_STB during the non-sleep mode. A pulse is generated on WDT0_STB when this bit is written with a ’1

0x0200A03C APCS_WDT0_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT0_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

APCS_WDT0_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved

APCS_WDT0_FRZ (cont.)

Bits	Name	Description
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a '1'.

0x0200A040 APCS_WDT0_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_EN register controls when the watch dog timer is enabled.

APCS_WDT0_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x0200A044 APCS_WDT0_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_STS register is the watchdog status register.

APCS_WDT0_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The sleep counter value is sampled using the AHB clk. Multiple reads are required to determine the value (assuming AHB clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog0 counter reset.

APCS_WDT0_STS (cont.)

Bits	Name	Description
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT0) 0x0: reset (the last system reset was not due to WDT0.)

0x0200A048 APCS_WDT0_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_INT_WIDTH register defines the width of the WDT0 biteExpired pulse in the number of sleep_clk pulses. The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

APCS_WDT0_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to de-assert the WDI bite pulse.

0x0200A04C APCS_WDT0_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (’bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (’bark’) interrupt.

APCS_WDT0_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to trigger the bark interrupt.

0x0200A050 APCS_WDT0_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

APCS_WDT0_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x0200A054 APCS_WDT0_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TEST_LD register loads the WDT0_TST register value into the watchdog counter.

APCS_WDT0_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT0_TST register into the WDT0 counter.

0x0200A058 APCS_WDT0_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

APCS_WDT0_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter test load value [28:0].

0x0200A05C APCS_WDT0_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BITE_TIME register determines the counter value at which WDT0 asserts the biteExpired signal.

APCS_WDT0_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 bite expiration time [28:0].

0x0200A060 APCS_WDT1_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

APCS_WDT1_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT1_STB during the non-sleep mode. A pulse is generated on WDT1_STB when this bit is written with a '1'.

0x0200A064 APCS_WDT1_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT1_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

APCS_WDT1_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a '1'.

0x0200A068 APCS_WDT1_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_EN register controls when the watchdog timer is enabled.

APCS_WDT1_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x0200A06C APCS_WDT1_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_STS register is the watchdog status register.

APCS_WDT1_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The counter value is sampled using the ahb clk. Multiple reads are required to determine the value (assuming ahb clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog counter reset.
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT1) 0x0: reset (the last system reset was not due to WDT1.)

0x0200A070 APCS_WDT1_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_INT_WIDTH register defines the width of the WDT1_expired pulse in the number of sleep_clk pulses.The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

APCS_WDT1_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to de-assert the WDI expired pulse.

0x0200A074 APCS_WDT1_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (’bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (’bark’) interrupt.

Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BITE_TIME register determines the counter value at which WDT1 asserts the biteExpired signal.

APCS_WDT1_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 bite expiration time [28:0].

0x0200A088 APCS_TMR_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [WDT0, WDT1, GPT0, GPT1, DGT].

The APCS_TMR_STS can be used to determine the status of each of the SCSS timers in the timer's resident clock domain. Since the timer clock domain may be much slower than the AHB clock, AHB transactions may be delayed in taking effect. This information can be used to qualify other actions or used simply for debug purposes. For example, software can determine when a write to APCS_DGT_CLR has taken effect by examining the DGT_CLR_PEND bit.

Each timer's bits are receive security treatment as specified by the APCS_TMRSECURE register.

APCS_TMR_STS

Bits	Name	Description
31	RESERVED_BIT31	
30	WDT1_AUTOKICK	Auto-kicker is on (1) or off (0)
29	WDT1_INT_EN	An unmasked interrupt will enable the timer (1) or not (0)
28	WDT1_EN	Timer is enabled (1) or not (0)
27	RESERVED_BIT27	
26	WDT0_AUTOKICK	Auto-kicker is on (1) or off (0)

11.9 KPSS GLB Registers (0x02010000 APCS_GLB_BASE)

This section contains the Krait Processor Subsystem (KPSS) GLB Secure registers.

0x02010000 APCS_GLBSECURE

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0001

Security Treatment: Restricted

The APCS_GLBSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_GLBSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_GLBSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_GLBSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_GCCSECURE register correspond to.

APCS_GLBSECURE

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	GLB_CTL	Controls security treatment for the global control registers: APCS_START_ADDR. 0x1: NSEC 0x0: SEC

0x02010004 APCS_START_ADDR

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: {START_ADDR, 0x0000}

Security Treatment: Controlled by APCS_GLBSECURE[GLB_CTL].

The APCS_START_ADDR register is used to determine the address to boot from. It resets to the value on START_ADDR PARAMETER.Reset by SYS_apcsSYSPor_Ares|SYS_apcsSys_Ares

APCS_START_ADDR

Bits	Name	Description
31:16	ADDR	Start address for the Krait

APCS_START_ADDR (cont.)

Bits	Name	Description
15:0	RESERVED_BITS15_0	

11.10 KPSS L2 SAW2 Registers (0x02012000 APCS_L2_GDHS_BASE)

This section contains the Krait Processor Subsystem (KPSS) L2 SAW2 registers.

The SAW2 (SPM and AVS. Wrapper2) design is an AHB slave that contains both SPM and AVS. CSRs.

0x02012000 APCS_L2_SAW2_SECURE

Type: Read/write
Clock: SYS_REF_CLK
Reset State: {3{CFGNSINIT}}

Security Treatment: Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to ’0’ the state of the SAW2_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to ’1’, the SAW2_SECURE register security treatment bit of that register must be ’1’ for access to be granted. If the security treatment bit of the register is set to ’0’, the non-secure (ahb_saw_hprotns = ’1’) transactions are denied. When access is denied, a write is ignored, and a read will return ’0’. No error is signaled.

When reading the SAW2_SECURE register, non secure agents will always read ’0’. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

APCS_L2_SAW2_SECURE

Bits	Name	Description
31:3	RESERVED	
2	SAW_CTL	Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST 0x1: NSEC 0x0: SEC
1	PWR_CTL	Controls security treatment for SPM registers: SAW2_SPM_CTL, SAW2_SPM_PMIC_DLY, SAW2_SPM_PMIC_DATA_0, SAW2_SPM_PMIC_DATA_1, SAW2_SPM_SLP_SEQ_ENTRY_n, SAW2_SPM_DLY 0x1: NSEC 0x0: SEC
0	VLT_CTL	Controls security treatment for the AVS. registers: SAW2_AVS_CTL, SAW2_VLVL, SAW2_AVS_HYSTERESIS 0x1: NSEC 0x0: SEC

0x02012004 APCS_L2_SAW2_ID

Type: Read
Clock: SYS_REF_CLK
Reset State: Undefined

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register reports the revision and parameter information for the SAW2 core.

APCS_L2_SAW2_ID

Bits	Name	Description
31	RESERVED_BITS31	
30:25	NUM_SPM_ENTRY	SAW2 parameter: Indicates number of SAW2_SPM_SLP_SEQ_ENTRY register implemented. Value can range from 1 - 32
24:20	NUM_PWR_CTL	SAW2 parameter: Indicates number of power control implemented. Value can range from 2 - 16
19	RESERVED_BITS19	
18	PMIC_ARB_INTF	SAW2 parameter: Indicates PMIC Arbiter Interface function is implemented
17	AVS_PRESENT	SAW2 parameter: Indicates AVS. function is implemented
16	SPM_PRESENT	SAW2 parameter: Indicates SPM function is implemented
15:12	MAJOR	Major variant
11:0	MINOR	Minor variant

0x02012008 APCS_L2_SAW2_CFG

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_CFG register is used to configure the common control between AVS. and SPM.system.

APCS_L2_SAW2_CFG

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON.
11:8	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port.

APCS_L2_SAW2_CFG (cont.)

Bits	Name	Description
7:6	RESERVED_BITS7_6	
5	PMIC_MODE	PMIC Handshake 0x0: 8K_PMIC (only DONE signal) 0x1: 7K_PMIC (both ACK and DONE signals)
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period. ..... For sys_ref_clk = 20 MHz (53ns) The timer tick range 53 ns to 1.6us. 0x0: Timer Tick every sys_ref_clk 0x1F: Timer Tick every 128 sys_ref_clk.

0x0201200C APCS_L2_SAW2_STS_0

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

APCS_L2_SAW2_STS_0

Bits	Name	Description
15	SHTDWN_REQ	This bit reflects the shutdown request from the SPM(spm_rpm_shutdown_req) to RPM.
14	SHTDWN_ACK	This bit reflects the shutdown acknowledgement from the RPM(rpm_spm_shutdown_ack) to SPM.
13	BRNGUP_REQ	This bit reflects the bringup request from the SPM(spm_rpm_bringup_req) to RPM.
12	BRNGUP_ACK	This bit reflects the bringup acknowledgement from the RPM(rpm_spm_bringup_ack) to SPM.
11:10	PMIC_STATE	State of the PMIC FSM: transitions back to IDLE) transitions back to IDLE) 0x0: IDLE (waiting for PMIC transaction from AVS. or SPM) 0x1: ACK (waiting for ACK from PMIC Arb) 0x2: DONE (waiting for DONE form PMIC Arb before) 0x3: DELAY (waiting for delay count termination before)

APCS_L2_SAW2_STS_0 (cont.)

Bits	Name	Description
9:8	RPM_STATE	State of the RPM FSM: 0x0: RUN (waiting for SPM request) 0x1: STDNACK (waiting for shutdown ACK from RPM) 0x2: WAKEUP (waiting for wakeup interrupt) 0x3: BGUPACK (waiting for bringup ACK from RPM)
7	AVS_STATE	State of the AVS. FSM: indication) 0x0: IDLE (waiting to be enabled or for next UP/DOWN) 0x1: REQ (waiting for PMIC FSM to transition to IDLE)
6:0	SPM_CMD_ADDR	Last SPM command executed.

0x02012010 APCS_L2_SAW2_STS_1

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

APCS_L2_SAW2_STS_1

Bits	Name	Description
31	RESERVED1	
30	SW_WR_PEND	This bit reflects the VLVL state of the request from the SAW2_VCTL write is pending.
29	CPU_UP	This bit reflects the VLVL state of the request from the CPU (avs_saw_up) to raise the VLVL.
28	CPU_DN	This bit reflects the VLVL state of the request from the CPU (avs_saw_down) to lower the VLVL.
27	MAX_INT	IRQ status bit, AVS. controller detected that raising the VLVL by AVS_CTL[VLVL_STEP] would result in a value greater than AVS_CTL[MAX_VLVL]. If AVS_CTL[IRQ_MAX_EN] is set, an interrupt is issued. NOTE that SW can set MAX_VLVL lower than current VLVL creating a condition where VLVL is higher than MAX_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MAX.

APCS_L2_SAW2_STS_1 (cont.)

Bits	Name	Description
26	MIN_INT	IRQ status bit, AVS. controller detected that lowering the VLVL by SAW2_AVS_CTL[VLVL_STEP] would result in a value less than SAW2_AVS_CTL[MIN_VLVL]. If SAW2_AVS_CTL[IRQ_MIN_EN] is set, an interrupt is issued. NOTE that SW can set MIN_VLVL higher than current VLVL creating a condition where VLVL is lower than MIN_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MIN.
25:16	CURR_DLY	VLVL value of the counter used to calculate the time until the next AVS. controller request for a new VLVL.

0x02012014 APCS_L2_SAW2_VCTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

Though this register is read/writable, it also causes a command pulse to the PMIC FSM. Writing this register results in a transaction to the PMIC with SAW2_VCTL being sent to the PMIC. SAW2 support both 8901 and 8058 regulator.

APCS_L2_SAW2_VCTL

Bits	Name	Description
31:16	RESERVED_BITS31_16	

0x02012018 APCS_L2_SAW2_AVS_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_CTL register is used to control the Adaptive Voltage Scaling (AVS) system.

APCS_L2_SAW2_AVS_CTL

Bits	Name	Description
31	RESERVED	

APCS_L2_SAW2_AVS_CTL (cont.)

Bits	Name	Description
30	VLVL_WIDTH	Defines the VLVL field of PMIC data. SAW2 at minimum supports 8901 and 8058 regulator. See PMIC document for details. 0x0: 5 bits VLVL (8058 regulator) 0x1: 6 bits VLVL (8901 regulator)
29:28	VLVL_STEP	Controls the step size of each request to PMIC Arbiter. SW may use values from 0 to 3. Note that the value 0 will result in no change - that is if the CPU requests UP or DOWN, the CURR_PVLVL will be sent to the PMIC Arbiter. This may be useful for debug. If an increment or decrement operation would cause the current VLVL to transition above or below the MAX_VLVL or MIN_VLVL, the current VLVL will not be changed. An interrupt will be signaled if IRQ_MAX/MIN_EN is 1
27	EN	AVS. Enable. **NOTE** Setting to 0 does not disable any pending interrupts. **NOTE** AVS. FSM and SPM FSM are mutually exclusive. Only one FSM is active at a time. SW does not have to disable AVS. before going to sleep. 0x0: Disable AVS 0x1: Enable AVS
26	SW_DONE_INT_EN	Set to 1 to turn on AVS. interrupt for when a SW initiated voltage change has completed. Set to 0 to mask it (turn it off). ASSERTION: This interrupt is asserted only after a SW write to SAW2_AVS_VLVL. Specifically, after the AVS. FSM traverses through all its states and transitions back to IDLE, the interrupt line is pulsed. The interrupt controller should be set to edge capture to receive this interrupt. CLEARING: None. This interrupt is a pulse, SW does not need to clear it (aside from requirements of the interrupt controller).
25	MAX_INT_EN	Set to 1 to turn on AVS. interrupt for MAX_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be greater than MAX_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit.
24	MIN_INT_EN	Set to 1 to turn on AVS. interrupt for MIN_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be smaller than MIN_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit
23	RESERVED_23	

APCS_L2_SAW2_AVS_CTL (cont.)

Bits	Name	Description
22:17	MAX_VLVL	Control maximum value of AVS. controller's VLVL. When current VLVL reaches this value it may not grow any larger. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level higher, an interrupt is issued. This value may be updated at anytime. Setting to a value lower than MIN_VLVL is not supported, and unpredictable results may occur.
16	RESERVED_16	
15:10	MIN_VLVL	Control the minimum value of AVS. controller's VLVL. When the current VLVL reaches this level it may not shrink any smaller. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level lower, an interrupt is issued. This value may be updated at anytime. Setting to a value higher than MAX_VLVL is not supported, and unpredictable results may occur.
9:0	AVS_DELAY	Control the time between AVS. controller's requests to change the VLVL

0x0201201C APCS_L2_SAW2_AVS_HYSTERESIS

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_HYSTERESIS register is used to delay the AVS. UP/DN signal to AVS. FSM. This is used to prevent the false PMIC step due to PDN noise.

APCS_L2_SAW2_AVS_HYSTERESIS

Bits	Name	Description
31:24	RESERVED31_24	
23:16	DN_COUNT	HYSTERESIS DN COUNT. Delays of PMIC DN step operation.
15:8	RESERVED15_8	
7:0	UP_COUNT	HYSTERESIS UP COUNT. Delays of PMIC UP step operation.

0x02012020 APCS_L2_SAW2_SPM_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

APCS_L2_SAW2_SPM_CTL

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	SPM_START_ADR	Start address for the SPM sequence.
3	ISAR	Inhibit Start Address Reset 0x0: End of program reset the SPM_START_ADR to zero. 0x1: Inhibit End of program to reset SPM_START_ADR
2:1	WAKEUP_CONFIG	Wakeup Configuration 0x0: sys_spm_wakeup 0x1: sys_spm_wakeup or !cpu_spm_wait_req 0x2: sys_spm_wakeup or rising edge of sys_spm_dbg_nopwrdwn 0x3: sys_spm_wakeup or !cpu_spm_wait_req or rising edge of sys_spm_dbg_nopwrdwn
0	SPM_EN	SPM En.

0x02012024 APCS_L2_SAW2_SPM_PMIC_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC delay values after SPM FSM PMIC transaction. SPM wait for the programmed delay before executing the next SPM command.

APCS_L2_SAW2_SPM_PMIC_DLY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:24	DATA_1_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
23:19	RESERVED_BITS23_19	
18:16	DATA_1_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
15:11	RESERVED_BITS15_11	

APCS_L2_SAW2_SPM_PMIC_DLY (cont.)

Bits	Name	Description
10:8	DATA_0_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
7:3	RESERVED_BITS7_3	
2:0	DATA_0_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms

0x02012028 APCS_L2_SAW2_SPM_PMIC_DATA_0

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

APCS_L2_SAW2_SPM_PMIC_DATA_0

Bits	Name	Description

0x0201202C APCS_L2_SAW2_SPM_PMIC_DATA_1

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

APCS_L2_SAW2_SPM_PMIC_DATA_1

Bits	Name	Description

0x02012030 APCS_L2_SAW2_RST

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_RST register is used to reset the SAW logic. This register clear itself. It does not reset any SAW2 CSR's. It reset AVS. and SPM FSM and control registers. This is use to clear any hang condition.

APCS_L2_SAW2_RST

Bits	Name	Description
31:1	RESERVED31_1	
0	RST	Reset AVS. and SPM FSM and control registers.

0x02012034 APCS_L2_SAW2_SPM_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the delay values for SPM Delay command. SPM wait for the programmed delay before executing the next SPM command.

APCS_L2_SAW2_SPM_DLY

Bits	Name	Description
31:30	RESERVED_BITS31_30	
29:20	DLY3	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
19:10	DLY2	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
9:0	DLY1	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

0x02012080+4*n APCS_L2_SAW2_SPM_SLP_SEQ_ENTRY_n

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter.

APCS_L2_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description

11.11 KPSS XPU Registers (0x02013000 APCS_L2_MPU_BASE)

This section contains the Krait Processor Subsystem (KPSS) XPU registers.

0x02013000+4*n APCS_MPU_PRTn_RACR, n=[0..31]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU. These registers include a single bit per VMID granting read access

APCS_MPU_PRTn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x02013400+4*n APCS_MPU_PRTn_WACR, n=[0..31]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU.

APCS_MPU_PRTn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x02013800+4*n APCS_MPU_PRTn_START, n=[0..31]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition Start Address Register. This register contains the start address of the partition. Only the bit numbers indicated by MPU_IDR[MSb] through MPU_IDR[LSb] are valid and physically exist.

APCS_MPU_PRTn_START

Bits	Name	Description
31:12	ADDR	MPU Partition Start Address
11:0	RESERVED_11_0	Reserved

0x02013C00+4*n APCS_MPU_PRTn_END, n=[0..31]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition End Address Register. This register contains the start address of the partition.Only the bit numbers indicated by MPU_IDR[MSB] through MPU_IDR[LSB] are valid and physically exist.

APCS_MPU_PRTn_END

Bits	Name	Description
31:12	ADDR	MPU Partition End Address
11:0	RESERVED_11_0	Reserved

0x02013F80 APCS_MPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Configuration Register: This register includes fields governing various MPU behaviors.

APCS_MPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set MPU_ESR. MPU_EAR and MPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set MPU_ESR. MPU_EAR and MPU_ESYNR0 updated with address and syndrome of error.

APCS_MPU_CR (cont.)

Bits	Name	Description
2	MPUEIE	MPU Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the MPU. Interrupt output is asserted if MPU_CR[MPUEIE] = 1 and any bit is set in MPU_ESR.
1	MPUERE	MPU Error Report Enable. MPUERE = 0 causes the MPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. MPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective MPU port. Errors from either port are terminated by the MPU as RAZ/WI Both client and configuration port errors are recorded in MPU_ESR, independent of the value of MPU_CR[MPUERE]
0	MPUE	MPU Enable. Governs whether MPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures MPU and the MID to VMID mapping tables.

0x02013F84 APCS_MPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the MPU, for both the client port and the configuration port. Client port addresses are 32 bits width and configuration port addresses are 12 bits wide (the width of the configuration address port).

APCS_MPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x02013F88 APCS_MPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the MPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and

leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the MPU's interrupt output (when enabled by MPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the MPU_ESYNRn registers, which are merely the "syndrome" of an error indicated by MPU_ESR.

APCS_MPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x02013F8C APCS_MPU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Restore Register. This register is an aliased address for the MPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

APCS_MPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x02013F90 APCS_MPU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

APCS_MPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x02013F94 APCS_MPU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

APCS_MPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved

APCS_MPU_ESYNR1 (cont.)

Bits	Name	Description
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x02013FF4 APCS_MPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

MPU Revision Register: This register provides major/minor revision codes for the implementation.

APCS_MPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x02013FF8 APCS_MPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x1F0C2C1F

MPU ID Register: Read-only register that defines various configuration attributes of the MPU instance.

APCS_MPU_IDR

Bits	Name	Description
31:29	RESERVED31_29	Reserved
28:24	MSB	Indicates most significant address bit number used in START/END address comparisons.
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used in START/END address comparisons.
15:14	RESERVED15_12	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only MPU_PRTn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate MPU_PRTn_RACR and MPU_PRTn_WACR registers govern read vs. write access. For single VMID, MPU_PRTn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. MPU_PRTn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMD type access control. MPU_PRTn_xACR registers include separate bit per VMID (32 bits) for governing access.
9	RESERVED9	Reserved
8:0	NPRT	Number of partitions. Indicates the number of partitions (minus 1) supported by the MPU. Values range from 0-223 (1-224 partitions)

0x02013FFC APCS_MPU_MPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

MPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the MPU (including the MPU_MPU_ACR itself).

APCS_MPU_MPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the MPU's 4KB address region (including the MPU_MPU_ACR itself). For single VMID type MPUs (MPU_IDR[MV] = 0) the MPU_MPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

11.12 KPSS Base Offset Registers (0x02100000 APCS_HSEL_BASE)

This section contains the Krait Processor Subsystem (KPSS) Base Offset registers.

0x02100000 APCS_QGIC

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: NA.

APCS_QGIC

Bits	Name	Description
14:2	ADDR	These are the bits needed to address the generic interrupt controller registers.

0x02108000 APCS_ACC

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: NA

APCS_ACC

Bits	Name	Description
5:2	ADDR	These are the bits needed to address the ACC registers

0x02109000 APCS_SAW2

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: NA

APCS_SAW2

Bits	Name	Description
7:2	ADDR	These are the bits needed to address the SAW registers

0x0210A000 APCS_TMR

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: NA

APCS_TMR

Bits	Name	Description
7:2	ADDR	These are the bits needed to address the TMR registers

0x02110000 APCS_GLB

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: NA

APCS_GLB

Bits	Name	Description
6:2	ADDR	These are the bits needed to address the GLB registers

0x02111000 APCS_GCC

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: NA

x1_2000

APCS_L2_GDHS

7:2	ADDR	These are the bits needed to address the SAW2 registers for L2 GDHS

APCS_GCC

Bits	Name	Description
6:2	ADDR	These are the bits needed to address the GCC registers

0x02113000 APCS_L2_MPU

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

This is the base address of the AHB slave in the MPU.

APCS_L2_MPU

Bits	Name	Description

0x02180000 APCS_EXT_MSTR_ALIAS0

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

This is the aliased address to access CPU0's private peripherals from an external master.

APCS_EXT_MSTR_ALIAS0

Bits	Name	Description

0x02190000 APCS_EXT_MSTR_ALIAS1

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

This is the aliased address to access CPU1's private peripherals from an external master.

APCS_EXT_MSTR_ALIAS1

Bits	Name	Description

0x021A0000 APCS_EXT_MSTR_ALIAS2

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

This is the aliased address to access CPU2's private peripherals from an external master.

APCS_EXT_MSTR_ALIAS2

Bits	Name	Description

0x021B0000 APCS_EXT_MSTR_ALIAS3

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: NA

This is the aliased address to access CPU3's private peripherals from an external master.

APCS_EXT_MSTR_ALIAS3

Bits	Name	Description

11.13 KPSS ACC Registers (0x02088000 CPU0_APCS_ACC_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU0 ACC registers.

0x02088000 CPU0_APCS_ACCSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0007

Security Treatment: Restricted

The APCS_ACCSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_ACCSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_ACCSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_ACCSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_ACCSECURE register correspond to.

CPU0_APCS_ACCSECURE

Bits	Name	Description
31:4	RESERVED	
31:3	RESERVED_BITS31_3	
2	TST	Controls security treatment for test control registers: APCS_ATSTBUS_SEL 0x1: NSEC 0x0: SEC
1	CLK_CTL	Controls security treatment for the clock control registers: APCS_ACC_STS, APCS_CPU_AUX_CLK_SEL. 0x1: NSEC 0x0: SEC
0	SLP_CTL	Controls security treatment for the sleep control registers: APCS_CPU_PWR_CTL, APCS_CPU_TRGTD_DBG_RST. 0x1: NSEC 0x0: SEC

0x02088004 CPU0_APCS_CPU_PWR_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0109

Security Treatment: Controlled by APCS_ACCSECURE [SLP_CTL].

The APCS_CPU_PWR_CTL register is used to control the clamps, reset and array head switches.

CPU0_APCS_CPU_PWR_CTL

Bits	Name	Description
31:21	RESERVED_BITS31_21	
20:16	CLK_EN	Clock enables for CORE clock. This is only to workaround hardware dynamic clock gating problems. [20:18]= SYS_apcNAux_Clk[3:1] [17] = SYS_apcsRef_Clk [16] = SYS_apcNPll_Clk 0x1: Always enabled 0x0: dynamically enabled by hardware
15:10	RESERVED_BITS15_10	
9	RET_SLP_REQ	When set, this bit request the L2SCU to in-flight snoop operation and block new snoops request from entering FIFO. This control is intended to permit external masters such as the RPM to put CPU to retention sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a retention sleep request control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU's snoop FIFO is quiesce.
8	PLL_CLAMP	When set, this bit clamp the output of TDC logic in PLL. This signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the APC PLL.
7	CORE_PWRD_UP	Report that the CPU is powered up.
6	GATE_CLK	When set, this bit forces the CPU clock to be gated off. This control is intended to permit external masters such as the RPM to gate off the CPU clock during sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a clock gating control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU clock will be gated off. When set, this bit gate the CPU clock that must be asserted during sleep state. This bit is ORed with a SAW output before passing to the CPU core.
5	COREPOR_RST	When set, this bit asserts corepor areset to the CPU core.
4	CORE_RST	When set, this bit asserts core areset to the COPU core.

CPU0_APCS_CPU_PWR_CTL (cont.)

Bits	Name	Description
3	L2DT_SLP	When set, this bit opens a head switch to put the L2 duplicate tag array into a low-leakage, non-data-retaining state. This bit is ORed with a SAW output before passing to the CPU core. The controlled memory array contains a duplicate of the tags contained in the L1 data cache, and is used by the L2 to snoop and see if a shared memory access from one processor necessitates invalidating a line in another processor's L1 data cache. Thus, this memory array generally can be offline when the associated CPU is power-collapsed and its L1 data cache is also off-line.
2	RESERVED_BIT2	Previously ETB HS
1	RESERVED_BIT1	Previously L1 HS
0	CLAMP	When set, this bit asserts the clamp signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the CPU core.

0x02088008 CPU0_APCS_ACC_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: N/A

Security Treatment: Controlled by APCS_ACCSECURE [CLK_CTL].

The APCS_ACC_STS register is used to monitor the output of the clock gating cells.

CPU0_APCS_ACC_STS

Bits	Name	Description
31:18	RESERVED_BITS31_18	
17	RET_SLP_ACK	This bit reflect the status of APCN_sysRetSlpAck bit. L2 assert the signal when it see the APCN_sysRetSlpReq and CPU snoop FIFO is quiesced. L2 de-assert this signal after APCN_sysRetSlpReq is de-asserted and all snoop invalidation is completed.
16	SLP_CLK	This bit reflect the status of APCN_sleepClkOnReq bit
15	AHB_CLK	This bit reflect the status of APCN_ahbClkOnReq bit
14	REF_CLK	This bit reflect the status of APCN_refClkOnReq bit
13	SPM_SLP_STATE	This bit reflect the status of SPM Sleep State
12	FRC_CLK_OFF	This bit reflect the status of APCN_apccForceClocksOff bit
11	RET_SLP_REQ	This bit reflect the status of APCN_apccRetSlpReq bit
10	TRGTD_DBG_RST	This bit reflect the status of APCN_apcTargetedDbg_Areset_N bit
9	CORE_RST	This bit reflect the status of APCN_apccCore_Areset_N bit
8	COREPOR_RST	This bit reflect the status of APCN_apccCorePor_Areset_N bit

CPU0_APCS_ACC_STS (cont.)

Bits	Name	Description
7	L2DT_HS	This bit reflect the status of the SYS_apcNSwCtlDupTagArrayCollapse bit
6	CLAMP	This bit reflect the status of the SYS_apcNClampApcNvd bit.
5:3	CORE_AUX_CLK	This bits reflect the status of the APCS_sysApcNAuxClkOnReq bits.
2	CORE_PLL_CLK	This bit reflect the status of the APCS_sysApcNPllClkOnReq bit.
1	CORE_NO_PWR_DWN	This bit reflect the status of the APCN_dbgCoreNoPwrDwn bits.
0	CORE_PWRUP_REQ	This bit reflect the status of the APCN_dbgCorePwrUpReq bits.

0x0208800C CPU0_APCS_ATSTBUS_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [TST].

APCS_ATSTBUS_SEL selects different modules' test bus outputs.

CPU0_APCS_ATSTBUS_SEL

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2	EN	Set to 1 to cause APCS to drive the test bus outputs. 0x1: enabled 0x0: disabled
1:0	SEL	0x3: CONSTANT 0x2: SAW 0x1: TMR 0x0: CLK

0x02088010 CPU0_APCS_CPU_TRGTD_DBG_RST

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [SLP_CTL].

APCS_CPU_TRGTD_DBG_RST is used to reset the CPU core debug logic. The hardware clear the register after the CPU debug logic is reset. Software need to poll this register to check if the reset is complete.

CPU0_APCS_CPU_TRGTD_DBG_RST

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	RST	When set this bit de-assert SYS_apcNTargetedDbg_Areset_N to the CPU core for 32 REF clock cycle to the CPU core. At the end of the reset hardware clear this bit.

0x02088014 CPU0_APCS_CPU_AUX_CLK_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [CLK_CTL]

The APCS_CPU_AUX_CLK_SEL register controls the gfmux which selects the AUX clock source for the Krait CPU clock. An additional selection set is provided to determine the clock source for the Krait core (4-1 GFMUX) in the Krait Hard Macro. The QSB clock is the raw source clk at reset.

CPU0_APCS_CPU_AUX_CLK_SEL

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	AUX_SRC	Krait CPU AUX clock select: 0x3: SYS_apcNAux_Clk_1 0x2: SYS_apcNAux_Clk_2 0x1: SYS_apcNAux_Clk_3 0x0: SYS_apcsRef_Clk

11.14 KPSS CPU0 SAW2 Registers (0x02089000 CPU0_APCS_SAW2_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU0 SAW2 registers.

The SAW2 (SPM and AVS. Wrapper2) design is an AHB slave that contains both SPM and AVS. CSRs.

0x02089000 CPU0_APCS_SAW2_SECURE

Type: Read/write
Clock: SYS_REF_CLK
Reset State: {3{CFGNSINIT}}

Security Treatment: Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to ‘0’ the state of the SAW2_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to ‘1’, the SAW2_SECURE register security treatment bit of that register must be ‘1’ for access to be granted. If the security treatment bit of the register is set to ‘0’, the non-secure (ahb_saw_hprotns = ‘1’) transactions are denied. When access is denied, a write is ignored, and a read will return ‘0’. No error is signaled.

When reading the SAW2_SECURE register, non-secure agents will always read ‘0’. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

CPU0_APCS_SAW2_SECURE

Bits	Name	Description
31:3	RESERVED	
2	SAW_CTL	Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST 0x1: NSEC 0x0: SEC
1	PWR_CTL	Controls security treatment for SPM registers: SAW2_SPM_CTL, SAW2_SPM_PMIC_DLY, SAW2_SPM_PMIC_DATA_0, SAW2_SPM_PMIC_DATA_1, SAW2_SPM_SLP_SEQ_ENTRY_n, SAW2_SPM_DLY 0x1: NSEC 0x0: SEC
0	VLT_CTL	Controls security treatment for the AVS. registers: SAW2_AVS_CTL, SAW2_VLVL, SAW2_AVS_HYSTERESIS 0x1: NSEC 0x0: SEC

0x02089004 CPU0_APCS_SAW2_ID

Type: Read
Clock: SYS_REF_CLK
Reset State: Undefined

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register reports the revision and parameter information for the SAW2 core.

CPU0_APCS_SAW2_ID

Bits	Name	Description
31	RESERVED_BITS31	
30:25	NUM_SPM_ENTRY	SAW2 parameter: Indicates number of SAW2_SPM_SLP_SEQ_ENTRY register implemented. Value can range from 1 - 32
24:20	NUM_PWR_CTL	SAW2 parameter: Indicates number of power control implemented. Value can range from 2 - 16
19	RESERVED_BITS19	
18	PMIC_ARB_INTF	SAW2 parameter: Indicates PMIC Arbiter Interface function is implemented
17	AVS_PRESENT	SAW2 parameter: Indicates AVS. function is implemented
16	SPM_PRESENT	SAW2 parameter: Indicates SPM function is implemented
15:12	MAJOR	Major variant
11:0	MINOR	Minor variant

0x02089008 CPU0_APCS_SAW2_CFG

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_CFG register is used to configure the common control between AVS. and SPM.system.

CPU0_APCS_SAW2_CFG

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON.
11:8	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port.

CPU0_APCS_SAW2_CFG (cont.)

Bits	Name	Description
7:6	RESERVED_BITS7_6	
5	PMIC_MODE	PMIC Handshake 0x0: 8K_PMIC (only DONE signal) 0x1: 7K_PMIC (both ACK and DONE signals)
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period. ..... For sys_ref_clk = 20 MHz (53ns) The timer tick range 53 ns to 1.6us. 0x0: Timer Tick every sys_ref_clk 0x1F: Timer Tick every 128 sys_ref_clk.

0x0208900C CPU0_APCS_SAW2_STS_0

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

CPU0_APCS_SAW2_STS_0

Bits	Name	Description
15	SHTDWN_REQ	This bit reflects the shutdown request from the SPM(spm_rpm_shutdown_req) to RPM.
14	SHTDWN_ACK	This bit reflects the shutdown acknowledgement from the RPM(rpm_spm_shutdown_ack) to SPM.
13	BRNGUP_REQ	This bit reflects the bringup request from the SPM(spm_rpm_bringup_req) to RPM.
12	BRNGUP_ACK	This bit reflects the bringup acknowledgement from the RPM(rpm_spm_bringup_ack) to SPM.
11:10	PMIC_STATE	State of the PMIC FSM: transitions back to IDLE) transitions back to IDLE) 0x0: IDLE (waiting for PMIC transaction from AVS. or SPM) 0x1: ACK (waiting for ACK from PMIC Arb) 0x2: DONE (waiting for DONE form PMIC Arb before) 0x3: DELAY (waiting for delay count termination before)

CPU0_APCS_SAW2_STS_0 (cont.)

Bits	Name	Description
9:8	RPM_STATE	State of the RPM FSM: 0x0: RUN (waiting for SPM request) 0x1: STDNACK (waiting for shutdown ACK from RPM) 0x2: WAKEUP (waiting for wakeup interrupt) 0x3: BGUPACK (waiting for bringup ACK from RPM)
7	AVS_STATE	State of the AVS. FSM: indication) 0x0: IDLE (waiting to be enabled or for next UP/DOWN) 0x1: REQ (waiting for PMIC FSM to transition to IDLE)
6:0	SPM_CMD_ADDR	Last SPM command executed.

0x02089010 CPU0_APCS_SAW2_STS_1

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

CPU0_APCS_SAW2_STS_1

Bits	Name	Description
31	RESERVED1	
30	SW_WR_PEND	This bit reflects the VLVL state of the request from the SAW2_VCTL write is pending.
29	CPU_UP	This bit reflects the VLVL state of the request from the CPU (avs_saw_up) to raise the VLVL.
28	CPU_DN	This bit reflects the VLVL state of the request from the CPU (avs_saw_down) to lower the VLVL.
27	MAX_INT	IRQ status bit, AVS. controller detected that raising the VLVL by AVS_CTL[VLVL_STEP] would result in a value greater than AVS_CTL[MAX_VLVL]. If AVS_CTL[IRQ_MAX_EN] is set, an interrupt is issued. NOTE that SW can set MAX_VLVL lower than current VLVL creating a condition where VLVL is higher than MAX_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MAX.

CPU0_APCS_SAW2_STS_1 (cont.)

Bits	Name	Description
26	MIN_INT	IRQ status bit, AVS. controller detected that lowering the VLVL by SAW2_AVS_CTL[VLVL_STEP] would result in a value less than SAW2_AVS_CTL[MIN_VLVL]. If SAW2_AVS_CTL[IRQ_MIN_EN] is set, an interrupt is issued. NOTE that SW can set MIN_VLVL higher than current VLVL creating a condition where VLVL is lower than MIN_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MIN.
25:16	CURR_DLY	VLVL value of the counter used to calculate the time until the next AVS. controller request for a new VLVL.

0x02089014 CPU0_APCS_SAW2_VCTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

Though this register is read/writable, it also causes a command pulse to the PMIC FSM. Writing this register results in a transaction to the PMIC with SAW2_VCTL being sent to the PMIC. SAW2 support both 8901 and 8058 regulator.

CPU0_APCS_SAW2_VCTL

Bits	Name	Description
31:16	RESERVED_BITS31_16	

0x02089018 CPU0_APCS_SAW2_AVS_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_CTL register is used to control the Adaptive Voltage Scaling (AVS) system.

CPU0_APCS_SAW2_AVS_CTL

Bits	Name	Description
31	RESERVED	

CPU0_APCS_SAW2_AVS_CTL (cont.)

Bits	Name	Description
30	VLVL_WIDTH	Defines the VLVL field of PMIC data. SAW2 at minimum supports 8901 and 8058 regulator. See PMIC document for details. 0x0: 5 bits VLVL (8058 regulator) 0x1: 6 bits VLVL (8901 regulator)
29:28	VLVL_STEP	Controls the step size of each request to PMIC Arbiter. SW may use values from 0 to 3. Note that the value 0 will result in no change - that is if the CPU requests UP or DOWN, the CURR_PVLVL will be sent to the PMIC Arbiter. This may be useful for debug. If an increment or decrement operation would cause the current VLVL to transition above or below the MAX_VLVL or MIN_VLVL, the current VLVL will not be changed. An interrupt will be signaled if IRQ_MAX/MIN_EN is 1
27	EN	AVS. Enable. **NOTE** Setting to 0 does not disable any pending interrupts. **NOTE** AVS. FSM and SPM FSM are mutually exclusive. Only one FSM is active at a time. SW does not have to disable AVS. before going to sleep. 0x0: Disable AVS 0x1: Enable AVS
26	SW_DONE_INT_EN	Set to 1 to turn on AVS. interrupt for when a SW initiated voltage change has completed. Set to 0 to mask it (turn it off). ASSERTION: This interrupt is asserted only after a SW write to SAW2_AVS_VLVL. Specifically, after the AVS. FSM traverses through all its states and transitions back to IDLE, the interrupt line is pulsed. The interrupt controller should be set to edge capture to receive this interrupt. CLEARING: None. This interrupt is a pulse, SW does not need to clear it (aside from requirements of the interrupt controller).
25	MAX_INT_EN	Set to 1 to turn on AVS. interrupt for MAX_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be greater than MAX_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit.
24	MIN_INT_EN	Set to 1 to turn on AVS. interrupt for MIN_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be smaller than MIN_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit
23	RESERVED_23	

CPU0_APCS_SAW2_AVS_CTL (cont.)

Bits	Name	Description
22:17	MAX_VLVL	Control maximum value of AVS. controller's VLVL. When current VLVL reaches this value it may not grow any larger. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level higher, an interrupt is issued. This value may be updated at anytime. Setting to a value lower than MIN_VLVL is not supported, and unpredictable results may occur.
16	RESERVED_16	
15:10	MIN_VLVL	Control the minimum value of AVS. controller's VLVL. When the current VLVL reaches this level it may not shrink any smaller. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level lower, an interrupt is issued. This value may be updated at anytime. Setting to a value higher than MAX_VLVL is not supported, and unpredictable results may occur.
9:0	AVS_DELAY	Control the time between AVS. controller's requests to change the VLVL

0x0208901C CPU0_APCS_SAW2_AVS_HYSTERESIS

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_HYSTERESIS register is used to delay the AVS. UP/DN signal to AVS. FSM. This is used to prevent the false PMIC step due to PDN noise.

CPU0_APCS_SAW2_AVS_HYSTERESIS

Bits	Name	Description
31:24	RESERVED31_24	
23:16	DN_COUNT	HYSTERESIS DN COUNT. Delays of PMIC DN step operation.
15:8	RESERVED15_8	
7:0	UP_COUNT	HYSTERESIS UP COUNT. Delays of PMIC UP step operation.

0x02089020 CPU0_APCS_SAW2_SPM_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

CPU0_APCS_SAW2_SPM_CTL

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	SPM_START_ADR	Start address for the SPM sequence.
3	ISAR	Inhibit Start Address Reset 0x0: End of program reset the SPM_START_ADR to zero. 0x1: Inhibit End of program to reset SPM_START_ADR
2:1	WAKEUP_CONFIG	Wakeup Configuration 0x0: sys_spm_wakeup 0x1: sys_spm_wakeup or !cpu_spm_wait_req 0x2: sys_spm_wakeup or rising edge of sys_spm_dbg_nopwrdwn 0x3: sys_spm_wakeup or !cpu_spm_wait_req or rising edge of sys_spm_dbg_nopwrdwn
0	SPM_EN	SPM En.

0x02089024 CPU0_APCS_SAW2_SPM_PMIC_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC delay values after SPM FSM PMIC transaction. SPM wait for the programmed delay before executing the next SPM command.

CPU0_APCS_SAW2_SPM_PMIC_DLY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:24	DATA_1_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
23:19	RESERVED_BITS23_19	
18:16	DATA_1_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
15:11	RESERVED_BITS15_11	

CPU0_APCS_SAW2_SPM_PMIC_DLY (cont.)

Bits	Name	Description
10:8	DATA_0_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
7:3	RESERVED_BITS7_3	
2:0	DATA_0_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms

0x02089028 CPU0_APCS_SAW2_SPM_PMIC_DATA_0

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

CPU0_APCS_SAW2_SPM_PMIC_DATA_0

Bits	Name	Description

0x0208902C CPU0_APCS_SAW2_SPM_PMIC_DATA_1

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

CPU0_APCS_SAW2_SPM_PMIC_DATA_1

Bits	Name	Description

0x02089030 CPU0_APCS_SAW2_RST

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_RST register is used to reset the SAW logic. This register clear itself. It does not reset any SAW2 CSR's. It reset AVS. and SPM FSM and control registers. This is use to clear any hang condition.

CPU0_APCS_SAW2_RST

Bits	Name	Description
31:1	RESERVED31_1	
0	RST	Reset AVS. and SPM FSM and control registers.

0x02089034 CPU0_APCS_SAW2_SPM_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the delay values for SPM Delay command. SPM wait for the programmed delay before executing the next SPM command.

CPU0_APCS_SAW2_SPM_DLY

Bits	Name	Description
31:30	RESERVED_BITS31_30	
29:20	DLY3	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
19:10	DLY2	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
9:0	DLY1	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

0x02089080+4*n CPU0_APCS_SAW2_SPM_SLP_SEQ_ENTRY_n

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter.

CPU0_APCS_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description

11.15 KPSS CPU0 Timer Registers (0x0208A000 CPU0_APCS_TMR_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU0 Timer registers.

0x0208A000 CPU0_APCS_TMRSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Restricted

The APCS_TMRSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Scorpion's APROTNS pin. When APROTNS is set to '0' the state of the APCS_TMRSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_TMRSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_TMRSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_TMRSECURE register correspond to.

CPU0_APCS_TMRSECURE

Bits	Name	Description
31:5	RESERVED	
4	WDT0	Controls security treatment for the Watch Dog Timer registers: APCS_WDT0_FRZ, APCS_WDT0_INT_EN, APCS_WDT0_STS, APCS_WDT0_INT_WIDTH, APCS_WDT0_BARK_TIME, APCS_WDT0_TST_LD_STS, APCS_WDT0_TST_LD. 0x1: NSEC 0x0: SEC
3	WDT1	Controls security treatment for the Watch Dog Timer registers: APCS_WDT1_FRZ, APCS_WDT1_INT_EN, APCS_WDT1_STS, APCS_WDT1_INT_WIDTH, APCS_WDT1_BARK_TIME, APCS_WDT1_TST_LD_STS, APCS_WDT1_TST_LD. 0x1: NSEC 0x0: SEC
2	GPT0	Controls security treatment for the General Purpose Timer registers: APCS_GPT1_MTCH, APCS_GPT1__CNT, APCS_GPT1_EN, APCS_GPT1_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC

CPU0_APCS_TMRSECURE (cont.)

Bits	Name	Description
1	GPT1	Controls security treatment for the General Purpose Timer registers: APCS_GPT0_MTCH, APCS_GPT0__CNT, APCS_GPT0_EN, APCS_GPT0_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC
0	DGT	Controls security treatment for the Debug Timer registers; APCS_DGT_MTCH, APCS_DGT_CNT, APCS_DGT_EN, APCS_DGT_CLR, APCS_DGT_CLK_CTL, and bits 3-0 of APCS_TMR_STS 0x1: NSEC 0x0: SEC

0x0208A004 CPU0_APCS_GPT0_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: APCS_TMRSECURE [GPT0].

The general purpose timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT0_MTCH register.

CPU0_APCS_GPT0_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT0_CNT at which an interrupt will be generated.

0x0208A008 CPU0_APCS_GPT0_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CNT register contains the current value of the GPT0 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT0_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_GPT0_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT0_EN.

- Write APCS_GPT0_CNT.
- Write (to set/restore) APCS_GPT0_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT0_EN.

CPU0_APCS_GPT0_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer.

0x0208A00C CPU0_APCS_GPT0_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_EN register is used to enable the GPT0 timer.

CPU0_APCS_GPT0_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency ACC_SLP_CLK.

0x0208A010 CPU0_APCS_GPT0_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CLR register is a one-shot command register that, when written with any value, resets the timer to a value of 0. This occurs regardless of the state of the APCS_GPT0_EN register.

CPU0_APCS_GPT0_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x0208A014 CPU0_APCS_GPT1_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The GPT timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT1_MTCH register.

CPU0_APCS_GPT1_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT1_CNT at which an interrupt will be generated.

0x0208A018 CPU0_APCS_GPT1_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CNT register contains the current value of the GPT1 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT1_MTCH register at the same time. The procedure for writing the APCS_GPT1_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT1_EN.
- Write APCS_GPT1_CNT.
- Write (to set/restore) APCS_GPT1_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT1_EN.

CPU0_APCS_GPT1_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer

0x0208A01C CPU0_APCS_GPT1_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_EN register is used to enable the GPT1 timer.

CPU0_APCS_GPT1_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), timer will clear when it reaches the match value.
0	EN	When set (1), timer is enabled and counts with frequency sleep clock.

0x0208A020 CPU0_APCS_GPT1_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CLR register is a one-shot command register that, when written with any value, resets the GPT1 timer to a value of 0. This occurs regardless of the state of the APCS_GPT1_EN register.

CPU0_APCS_GPT1_CLR

Bits	Name	Description
31:0	RESERVED_BITS_31_0	Data written is not used.

0x0208A024 CPU0_APCS_DGT_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The DBG timer will signal interrupt when its counter value has reached the value stored in the APCS_DGT_MTCH register.

CPU0_APCS_DGT_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_DGT_CNT at which an interrupt will be generated.

0x0208A028 CPU0_APCS_DGT_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CNT register contains the current value of the DGT timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_DGT_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_DGT_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_DGT_EN.
- Write APCS_DGT_CNT.
- Write (to set/restore) APCS_DGT_MTCH if required.
- Enable the timer by setting the EN bit in APCS_DGT_EN.

CPU0_APCS_DGT_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer count

0x0208A02C CPU0_APCS_DGT_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_EN register is used to enable the DGT timer.

CPU0_APCS_DGT_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	

CPU0_APCS_DGT_EN (cont.)

Bits	Name	Description
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency TCXO clock.

0x0208A030 CPU0_APCS_DGT_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLR register is a one-shot command register that, when written with any value, resets the DGT timer to a value of 0. This occurs regardless of the state of the APCS_DGT_EN register.

CPU0_APCS_DGT_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x0208A034 CPU0_APCS_DGT_CLK_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0003

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLK_CTL controls the clock divider inside the Debug Timer.

NOTE It is possible for the AHB clock to run at as slow as 5 MHz using settings of the Global Clock Controller. The debug timer's counter can also run at 5 MHz (TCXO divided by 4). However, due to the synchronization circuit using the edge detect, the timer should always run at least 4x slower than the AHB clock. Thus, if the timer's use is required by the system, the divider should be set to divide by 4 and the slowest usable AHB frequency is 20MHz. The timer would run at 5MHz in this case.

CPU0_APCS_DGT_CLK_CTL

Bits	Name	Description
31:2	RESERVED_BITS_31_2	

CPU0_APCS_DGT_CLK_CTL (cont.)

Bits	Name	Description
1:0	DIV	0x3: 4 0x2: 3 0x1: 2 0x0: 1

0x0208A038 CPU0_APCS_WDT0_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

CPU0_APCS_WDT0_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT0_STB during the non-sleep mode. A pulse is generated on WDT0_STB when this bit is written with a ’1

0x0208A03C CPU0_APCS_WDT0_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT0_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

CPU0_APCS_WDT0_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved

CPU0_APCS_WDT0_FRZ (cont.)

Bits	Name	Description
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a '1'.

0x0208A040 CPU0_APCS_WDT0_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_EN register controls when the watch dog timer is enabled.

CPU0_APCS_WDT0_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x0208A044 CPU0_APCS_WDT0_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_STS register is the watchdog status register.

CPU0_APCS_WDT0_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The sleep counter value is sampled using the AHB clk. Multiple reads are required to determine the value (assuming AHB clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog0 counter reset.

CPU0_APCS_WDT0_STS (cont.)

Bits	Name	Description
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT0) 0x0: reset (the last system reset was not due to WDT0.)

0x0208A048 CPU0_APCS_WDT0_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_INT_WIDTH register defines the width of the WDT0 biteExpired pulse in the number of sleep_clk pulses. The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

CPU0_APCS_WDT0_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to de-assert the WDI bite pulse.

0x0208A04C CPU0_APCS_WDT0_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (’bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (’bark’) interrupt.

CPU0_APCS_WDT0_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to trigger the bark interrupt.

0x0208A050 CPU0_APCS_WDT0_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

CPU0_APCS_WDT0_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x0208A054 CPU0_APCS_WDT0_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TEST_LD register loads the WDT0_TST register value into the watchdog counter.

CPU0_APCS_WDT0_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT0_TST register into the WDT0 counter.

0x0208A058 CPU0_APCS_WDT0_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

CPU0_APCS_WDT0_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter test load value [28:0].

0x0208A05C CPU0_APCS_WDT0_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BITE_TIME register determines the counter value at which WDT0 asserts the biteExpired signal.

CPU0_APCS_WDT0_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 bite expiration time [28:0].

0x0208A060 CPU0_APCS_WDT1_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

CPU0_APCS_WDT1_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT1_STB during the non-sleep mode. A pulse is generated on WDT1_STB when this bit is written with a ’1

0x0208A064 CPU0_APCS_WDT1_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT1_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

CPU0_APCS_WDT1_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a ’1’.

0x0208A068 CPU0_APCS_WDT1_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_EN register controls when the watchdog timer is enabled.

CPU0_APCS_WDT1_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x0208A06C CPU0_APCS_WDT1_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_STS register is the watchdog status register.

CPU0_APCS_WDT1_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The counter value is sampled using the ahb clk. Multiple reads are required to determine the value (assuming ahb clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog counter reset.
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT1) 0x0: reset (the last system reset was not due to WDT1.)

0x0208A070 CPU0_APCS_WDT1_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_INT_WIDTH register defines the width of the WDT1_expired pulse in the number of sleep_clk pulses.The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

.

CPU0_APCS_WDT1_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to de-assert the WDI expired pulse.

0x0208A074 CPU0_APCS_WDT1_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (’bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (’bark’) interrupt.

CPU0_APCS_WDT1_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to trigger the bark interrupt.

0x0208A078 CPU0_APCS_WDT1_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

CPU0_APCS_WDT1_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x0208A07C CPU0_APCS_WDT1_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TEST_LD register loads the WDT1_TST register value into the watchdog counter.

CPU0_APCS_WDT1_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT1_TST register into the WDT counter

0x0208A080 CPU0_APCS_WDT1_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

CPU0_APCS_WDT1_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.

CPU0_APCS_WDT1_TST (cont.)

Bits	Name	Description
28:0	DATA	The WDT1 counter test load value [28:0]

0x0208A084 CPU0_APCS_WDT1_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BITE_TIME register determines the counter value at which WDT1 asserts the biteExpired signal.

CPU0_APCS_WDT1_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 bite expiration time [28:0].

0x0208A088 CPU0_APCS_TMR_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [WDT0, WDT1, GPT0, GPT1, DGT].

The APCS_TMR_STS can be used to determine the status of each of the SCSS timers in the timer's resident clock domain. Since the timer clock domain may be much slower than the AHB clock, AHB transactions may be delayed in taking effect. This information can be used to qualify other actions or used simply for debug purposes. For example, software can determine when a write to APCS_DGT_CLR has taken effect by examining the DGT_CLR_PEND bit.

Each timer's bits are receive security treatment as specified by the APCS_TMRSECURE register.

CPU0_APCS_TMR_STS

Bits	Name	Description
31	RESERVED_BIT31	
30	WDT1_AUTOKICK	Auto-kicker is on (1) or off (0)

CPU0_APCS_TMR_STS (cont.)

Bits	Name	Description

8	GPT0_EN	Timer is enabled (1) or not (0)
7:4	RESERVED_BITS7_4	
3	DGT_WR_PEND	Timer has a write pending (1) or not (0)
2	DGT_CLR_PEND	Timer has a clear pending (1) or not (0)
1	DGT_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
0	DGT_EN	Timer is enabled (1) or not (0)

11.16 KPSS CPU1 ACC Registers (0x02098000 CPU1_APCS_ACC_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU1 ACC registers.

0x02098000 CPU1_APCS_ACCSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0007

Security Treatment: Restricted

The APCS_ACCSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_ACCSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_ACCSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_ACCSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_ACCSECURE register correspond to.

CPU1_APCS_ACCSECURE

Bits	Name	Description
31:4	RESERVED	
31:3	RESERVED_BITS31_3	
2	TST	Controls security treatment for test control registers: APCS_ATSTBUS_SEL 0x1: NSEC 0x0: SEC
1	CLK_CTL	Controls security treatment for the clock control registers: APCS_ACC_STS, APCS_CPU_AUX_CLK_SEL. 0x1: NSEC 0x0: SEC
0	SLP_CTL	Controls security treatment for the sleep control registers: APCS_CPU_PWR_CTL, APCS_CPU_TRGTD_DBG_RST. 0x1: NSEC 0x0: SEC

0x02098004 CPU1_APCS_CPU_PWR_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0109

Security Treatment: Controlled by APCS_ACCSECURE [SLP_CTL].

The APCS_CPU_PWR_CTL register is used to control the clamps, reset and array head switches.

CPU1_APCS_CPU_PWR_CTL

Bits	Name	Description
31:21	RESERVED_BITS31_21	
20:16	CLK_EN	Clock enables for CORE clock. This is only to workaround hardware dynamic clock gating problems. [20:18]= SYS_apcNAux_Clk[3:1] [17] = SYS_apcsRef_Clk [16] = SYS_apcNPll_Clk 0x1: Always enabled 0x0: dynamically enabled by hardware
15:10	RESERVED_BITS15_10	
9	RET_SLP_REQ	When set, this bit request the L2SCU to in-flight snoop operation and block new snoops request from entering FIFO. This control is intended to permit external masters such as the RPM to put CPU to retention sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a retention sleep request control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU's snoop FIFO is quiesce.
8	PLL_CLAMP	When set, this bit clamp the output of TDC logic in PLL. This signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the APC PLL.
7	CORE_PWRD_UP	Report that the CPU is powered up.
6	GATE_CLK	When set, this bit forces the CPU clock to be gated off. This control is intended to permit external masters such as the RPM to gate off the CPU clock during sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a clock gating control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU clock will be gated off. When set, this bit gate the CPU clock that must be asserted during sleep state. This bit is ORed with a SAW output before passing to the CPU core.
5	COREPOR_RST	When set, this bit asserts corepor areset to the CPU core.
4	CORE_RST	When set, this bit asserts core areset to the COPU core.

CPU1_APCS_CPU_PWR_CTL (cont.)

Bits	Name	Description
3	L2DT_SLP	When set, this bit opens a head switch to put the L2 duplicate tag array into a low-leakage, non-data-retaining state. This bit is ORed with a SAW output before passing to the CPU core. The controlled memory array contains a duplicate of the tags contained in the L1 data cache, and is used by the L2 to snoop and see if a shared memory access from one processor necessitates invalidating a line in another processor's L1 data cache. Thus, this memory array generally can be offline when the associated CPU is power-collapsed and its L1 data cache is also off-line.
2	RESERVED_BIT2	Previously ETB HS
1	RESERVED_BIT1	Previously L1 HS
0	CLAMP	When set, this bit asserts the clamp signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the CPU core.

0x02098008 CPU1_APCS_ACC_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: N/A

Security Treatment: Controlled by APCS_ACCSECURE [CLK_CTL].

The APCS_ACC_STS register is used to monitor the output of the clock gating cells.

CPU1_APCS_ACC_STS

Bits	Name	Description
31:18	RESERVED_BITS31_18	
17	RET_SLP_ACK	This bit reflect the status of APCN_sysRetSlpAck bit. L2 assert the signal when it see the APCN_sysRetSlpReq and CPU snoop FIFO is quiesced. L2 de-assert this signal after APCN_sysRetSlpReq is de-asserted and all snoop invalidation is completed.
16	SLP_CLK	This bit reflect the status of APCN_sleepClkOnReq bit
15	AHB_CLK	This bit reflect the status of APCN_ahbClkOnReq bit
14	REF_CLK	This bit reflect the status of APCN_refClkOnReq bit
13	SPM_SLP_STATE	This bit reflect the status of SPM Sleep State
12	FRC_CLK_OFF	This bit reflect the status of APCN_apccForceClocksOff bit
11	RET_SLP_REQ	This bit reflect the status of APCN_apccRetSlpReq bit
10	TRGTD_DBG_RST	This bit reflect the status of APCN_apcTargetedDbg_Areset_N bit
9	CORE_RST	This bit reflect the status of APCN_apccCore_Areset_N bit
8	COREPOR_RST	This bit reflect the status of APCN_apccCorePor_Areset_N bit

CPU1_APCS_ACC_STS (cont.)

Bits	Name	Description
7	L2DT_HS	This bit reflect the status of the SYS_apcNSwCtlDupTagArrayCollapse bit
6	CLAMP	This bit reflect the status of the SYS_apcNClampApcNvd bit.
5:3	CORE_AUX_CLK	This bits reflect the status of the APCS_sysApcNAuxClkOnReq bits.
2	CORE_PLL_CLK	This bit reflect the status of the APCS_sysApcNPllClkOnReq bit.
1	CORE_NO_PWR_DWN	This bit reflect the status of the APCN_dbgCoreNoPwrDwn bits.
0	CORE_PWRUP_REQ	This bit reflect the status of the APCN_dbgCorePwrUpReq bits.

0x0209800C CPU1_APCS_ATSTBUS_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [TST].

APCS_ATSTBUS_SEL selects different modules' test bus outputs.

CPU1_APCS_ATSTBUS_SEL

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2	EN	Set to 1 to cause APCS to drive the test bus outputs. 0x1: enabled 0x0: disabled
1:0	SEL	0x3: CONSTANT 0x2: SAW 0x1: TMR 0x0: CLK

0x02098010 CPU1_APCS_CPU_TRGTD_DBG_RST

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [SLP_CTL].

APCS_CPU_TRGTD_DBG_RST is used to reset the CPU core debug logic. The hardware clear the register after the CPU debug logic is reset. Software need to poll this register to check if the reset is complete.

CPU1_APCS_CPU_TRGTD_DBG_RST

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	RST	When set this bit de-assert SYS_apcNTargetedDbg_Areset_N to the CPU core for 32 REF clock cycle to the CPU core. At the end of the reset hardware clear this bit.

0x02098014 CPU1_APCS_CPU_AUX_CLK_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [CLK_CTL]

The APCS_CPU_AUX_CLK_SEL register controls the gfmux which selects the AUX clock source for the Krait CPU clock. An additional selection set is provided to determine the clock source for the Krait core (4-1 GFMUX) in the Krait Hard Macro. The QSB clock is the raw source clk at reset.

CPU1_APCS_CPU_AUX_CLK_SEL

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	AUX_SRC	Krait CPU AUX clock select: 0x3: SYS_apcNAux_Clk_1 0x2: SYS_apcNAux_Clk_2 0x1: SYS_apcNAux_Clk_3 0x0: SYS_apcsRef_Clk

11.17 KPSS CPU1 SAW2 Registers (0x02099000 CPU1_APCS_SAW2_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU1 SAW2 registers.

The SAW2 (SPM and AVS. Wrapper2) design is an AHB slave that contains both SPM and AVS. CSRs.

0x02099000 CPU1_APCS_SAW2_SECURE

Type: Read/write
Clock: SYS_REF_CLK
Reset State: {3{CFGNSINIT}}

Security Treatment: Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to ’0’ the state of the SAW2_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to ’1’, the SAW2_SECURE register security treatment bit of that register must be ’1’ for access to be granted. If the security treatment bit of the register is set to ’0’, the non-secure (ahb_saw_hprotns = ’1’) transactions are denied. When access is denied, a write is ignored, and a read will return ’0’. No error is signaled.

When reading the SAW2_SECURE register, non-secure agents will always read ’0’. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

CPU1_APCS_SAW2_SECURE

Bits	Name	Description
31:3	RESERVED	
2	SAW_CTL	Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST 0x1: NSEC 0x0: SEC
1	PWR_CTL	Controls security treatment for SPM registers: SAW2_SPM_CTL, SAW2_SPM_PMIC_DLY, SAW2_SPM_PMIC_DATA_0, SAW2_SPM_PMIC_DATA_1, SAW2_SPM_SLP_SEQ_ENTRY_n, SAW2_SPM_DLY 0x1: NSEC 0x0: SEC
0	VLT_CTL	Controls security treatment for the AVS. registers: SAW2_AVS_CTL, SAW2_VLVL, SAW2_AVS_HYSTERESIS 0x1: NSEC 0x0: SEC

0x02099004 CPU1_APCS_SAW2_ID

Type: Read
Clock: SYS_REF_CLK
Reset State: Undefined

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register reports the revision and parameter information for the SAW2 core.

CPU1_APCS_SAW2_ID

Bits	Name	Description
31	RESERVED_BITS31	
30:25	NUM_SPM_ENTRY	SAW2 parameter: Indicates number of SAW2_SPM_SLP_SEQ_ENTRY register implemented. Value can range from 1 - 32
24:20	NUM_PWR_CTL	SAW2 parameter: Indicates number of power control implemented. Value can range from 2 - 16
19	RESERVED_BITS19	
18	PMIC_ARB_INTF	SAW2 parameter: Indicates PMIC Arbiter Interface function is implemented
17	AVS_PRESENT	SAW2 parameter: Indicates AVS. function is implemented
16	SPM_PRESENT	SAW2 parameter: Indicates SPM function is implemented
15:12	MAJOR	Major variant
11:0	MINOR	Minor variant

0x02099008 CPU1_APCS_SAW2_CFG

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_CFG register is used to configure the common control between AVS. and SPM.system.

CPU1_APCS_SAW2_CFG

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON.
11:8	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port.

CPU1_APCS_SAW2_CFG (cont.)

Bits	Name	Description
7:6	RESERVED_BITS7_6	
5	PMIC_MODE	PMIC Handshake 0x0: 8K_PMIC (only DONE signal) 0x1: 7K_PMIC (both ACK and DONE signals)
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period. ..... For sys_ref_clk = 20 MHz (53ns) The timer tick range 53 ns to 1.6us. 0x0: Timer Tick every sys_ref_clk 0x1F: Timer Tick every 128 sys_ref_clk.

0x0209900C CPU1_APCS_SAW2_STS_0

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

CPU1_APCS_SAW2_STS_0

Bits	Name	Description
15	SHTDWN_REQ	This bit reflects the shutdown request from the SPM(spm_rpm_shutdown_req) to RPM.
14	SHTDWN_ACK	This bit reflects the shutdown acknowledgement from the RPM(rpm_spm_shutdown_ack) to SPM.
13	BRNGUP_REQ	This bit reflects the bringup request from the SPM(spm_rpm_bringup_req) to RPM.
12	BRNGUP_ACK	This bit reflects the bringup acknowledgement from the RPM(rpm_spm_bringup_ack) to SPM.
11:10	PMIC_STATE	State of the PMIC FSM: transitions back to IDLE) transitions back to IDLE) 0x0: IDLE (waiting for PMIC transaction from AVS. or SPM) 0x1: ACK (waiting for ACK from PMIC Arb) 0x2: DONE (waiting for DONE form PMIC Arb before) 0x3: DELAY (waiting for delay count termination before)

CPU1_APCS_SAW2_STS_0 (cont.)

Bits	Name	Description
9:8	RPM_STATE	State of the RPM FSM: 0x0: RUN (waiting for SPM request) 0x1: STDNACK (waiting for shutdown ACK from RPM) 0x2: WAKEUP (waiting for wakeup interrupt) 0x3: BGUPACK (waiting for bringup ACK from RPM)
7	AVS_STATE	State of the AVS. FSM: indication) 0x0: IDLE (waiting to be enabled or for next UP/DOWN) 0x1: REQ (waiting for PMIC FSM to transition to IDLE)
6:0	SPM_CMD_ADDR	Last SPM command executed.

0x02099010 CPU1_APCS_SAW2_STS_1

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

CPU1_APCS_SAW2_STS_1

Bits	Name	Description
31	RESERVED1	
30	SW_WR_PEND	This bit reflects the VLVL state of the request from the SAW2_VCTL write is pending.
29	CPU_UP	This bit reflects the VLVL state of the request from the CPU (avs_saw_up) to raise the VLVL.
28	CPU_DN	This bit reflects the VLVL state of the request from the CPU (avs_saw_down) to lower the VLVL.
27	MAX_INT	IRQ status bit, AVS. controller detected that raising the VLVL by AVS_CTL[VLVL_STEP] would result in a value greater than AVS_CTL[MAX_VLVL]. If AVS_CTL[IRQ_MAX_EN] is set, an interrupt is issued. NOTE that SW can set MAX_VLVL lower than current VLVL creating a condition where VLVL is higher than MAX_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MAX.

CPU1_APCS_SAW2_STS_1 (cont.)

Bits	Name	Description
26	MIN_INT	IRQ status bit, AVS. controller detected that lowering the VLVL by SAW2_AVS_CTL[VLVL_STEP] would result in a value less than SAW2_AVS_CTL[MIN_VLVL]. If SAW2_AVS_CTL[IRQ_MIN_EN] is set, an interrupt is issued. NOTE that SW can set MIN_VLVL higher than current VLVL creating a condition where VLVL is lower than MIN_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MIN.
25:16	CURR_DLY	VLVL value of the counter used to calculate the time until the next AVS. controller request for a new VLVL.

0x02099014 CPU1_APCS_SAW2_VCTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

Though this register is read/writable, it also causes a command pulse to the PMIC FSM. Writing this register results in a transaction to the PMIC with SAW2_VCTL being sent to the PMIC. SAW2 support both 8901 and 8058 regulator.

CPU1_APCS_SAW2_VCTL

Bits	Name	Description
31:16	RESERVED_BITS31_16	

0x02099018 CPU1_APCS_SAW2_AVS_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_CTL register is used to control the Adaptive Voltage Scaling (AVS) system.

CPU1_APCS_SAW2_AVS_CTL

Bits	Name	Description
31	RESERVED	

CPU1_APCS_SAW2_AVS_CTL (cont.)

Bits	Name	Description
30	VLVL_WIDTH	Defines the VLVL field of PMIC data. SAW2 at minimum supports 8901 and 8058 regulator. See PMIC document for details. 0x0: 5 bits VLVL (8058 regulator) 0x1: 6 bits VLVL (8901 regulator)
29:28	VLVL_STEP	Controls the step size of each request to PMIC Arbiter. SW may use values from 0 to 3. Note that the value 0 will result in no change - that is if the CPU requests UP or DOWN, the CURR_PVLVL will be sent to the PMIC Arbiter. This may be useful for debug. If an increment or decrement operation would cause the current VLVL to transition above or below the MAX_VLVL or MIN_VLVL, the current VLVL will not be changed. An interrupt will be signaled if IRQ_MAX/MIN_EN is 1
27	EN	AVS. Enable. **NOTE** Setting to 0 does not disable any pending interrupts. **NOTE** AVS. FSM and SPM FSM are mutually exclusive. Only one FSM is active at a time. SW does not have to disable AVS. before going to sleep. 0x0: Disable AVS 0x1: Enable AVS
26	SW_DONE_INT_EN	Set to 1 to turn on AVS. interrupt for when a SW initiated voltage change has completed. Set to 0 to mask it (turn it off). ASSERTION: This interrupt is asserted only after a SW write to SAW2_AVS_VLVL. Specifically, after the AVS. FSM traverses through all its states and transitions back to IDLE, the interrupt line is pulsed. The interrupt controller should be set to edge capture to receive this interrupt. CLEARING: None. This interrupt is a pulse, SW does not need to clear it (aside from requirements of the interrupt controller).
25	MAX_INT_EN	Set to 1 to turn on AVS. interrupt for MAX_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be greater than MAX_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit.
24	MIN_INT_EN	Set to 1 to turn on AVS. interrupt for MIN_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be smaller than MIN_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit
23	RESERVED_23	

CPU1_APCS_SAW2_AVS_CTL (cont.)

Bits	Name	Description
22:17	MAX_VLVL	Control maximum value of AVS. controller's VLVL. When current VLVL reaches this value it may not grow any larger. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level higher, an interrupt is issued. This value may be updated at anytime. Setting to a value lower than MIN_VLVL is not supported, and unpredictable results may occur.
16	RESERVED_16	
15:10	MIN_VLVL	Control the minimum value of AVS. controller's VLVL. When the current VLVL reaches this level it may not shrink any smaller. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level lower, an interrupt is issued. This value may be updated at anytime. Setting to a value higher than MAX_VLVL is not supported, and unpredictable results may occur.
9:0	AVS_DELAY	Control the time between AVS. controller's requests to change the VLVL

0x0209901C CPU1_APCS_SAW2_AVS_HYSTERESIS

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_HYSTERESIS register is used to delay the AVS. UP/DN signal to AVS. FSM. This is used to prevent the false PMIC step due to PDN noise.

CPU1_APCS_SAW2_AVS_HYSTERESIS

Bits	Name	Description
31:24	RESERVED31_24	
23:16	DN_COUNT	HYSTERESIS DN COUNT. Delays of PMIC DN step operation.
15:8	RESERVED15_8	
7:0	UP_COUNT	HYSTERESIS UP COUNT. Delays of PMIC UP step operation.

0x02099020 CPU1_APCS_SAW2_SPM_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

CPU1_APCS_SAW2_SPM_CTL

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	SPM_START_ADR	Start address for the SPM sequence.
3	ISAR	Inhibit Start Address Reset 0x0: End of program reset the SPM_START_ADR to zero. 0x1: Inhibit End of program to reset SPM_START_ADR
2:1	WAKEUP_CONFIG	Wakeup Configuration 0x0: sys_spm_wakeup 0x1: sys_spm_wakeup or !cpu_spm_wait_req 0x2: sys_spm_wakeup or rising edge of sys_spm_dbg_nopwrdwn 0x3: sys_spm_wakeup or !cpu_spm_wait_req or rising edge of sys_spm_dbg_nopwrdwn

0x02099024 CPU1_APCS_SAW2_SPM_PMIC_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC delay values after SPM FSM PMIC transaction. SPM wait for the programmed delay before executing the next SPM command.

CPU1_APCS_SAW2_SPM_PMIC_DLY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:24	DATA_1_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
23:19	RESERVED_BITS23_19	
18:16	DATA_1_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
15:11	RESERVED_BITS15_11	

CPU1_APCS_SAW2_SPM_PMIC_DLY (cont.)

Bits	Name	Description
10:8	DATA_0_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
7:3	RESERVED_BITS7_3	
2:0	DATA_0_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms

0x02099028 CPU1_APCS_SAW2_SPM_PMIC_DATA_0

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

CPU1_APCS_SAW2_SPM_PMIC_DATA_0

Bits	Name	Description

0x0209902C CPU1_APCS_SAW2_SPM_PMIC_DATA_1

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

CPU1_APCS_SAW2_SPM_PMIC_DATA_1

Bits	Name	Description

0x02099030 CPU1_APCS_SAW2_RST

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_RST register is used to reset the SAW logic. This register clear itself. It does not reset any SAW2 CSR's. It reset AVS. and SPM FSM and control registers. This is use to clear any hang condition.

CPU1_APCS_SAW2_RST

Bits	Name	Description
31:1	RESERVED31_1	
0	RST	Reset AVS. and SPM FSM and control registers.

0x02099034 CPU1_APCS_SAW2_SPM_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the delay values for SPM Delay command. SPM wait for the programmed delay before executing the next SPM command.

CPU1_APCS_SAW2_SPM_DLY

Bits	Name	Description
31:30	RESERVED_BITS31_30	
29:20	DLY3	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
19:10	DLY2	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
9:0	DLY1	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

0x02099080+4*n CPU1_APCS_SAW2_SPM_SLP_SEQ_ENTRY_n

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter.

CPU1_APCS_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description

11.18 KPSS CPU1 Timer Registers (0x0209A000 CPU1_APCS_TMR_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU1 Timer registers.

0x0209A000 CPU1_APCS_TMRSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Restricted

The APCS_TMRSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Scorpion's APROTNS pin. When APROTNS is set to '0' the state of the APCS_TMRSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_TMRSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_TMRSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_TMRSECURE register correspond to.

CPU1_APCS_TMRSECURE

Bits	Name	Description
31:5	RESERVED	
4	WDT0	Controls security treatment for the Watch Dog Timer registers: APCS_WDT0_FRZ, APCS_WDT0_INT_EN, APCS_WDT0_STS, APCS_WDT0_INT_WIDTH, APCS_WDT0_BARK_TIME, APCS_WDT0_TST_LD_STS, APCS_WDT0_TST_LD. 0x1: NSEC 0x0: SEC
3	WDT1	Controls security treatment for the Watch Dog Timer registers: APCS_WDT1_FRZ, APCS_WDT1_INT_EN, APCS_WDT1_STS, APCS_WDT1_INT_WIDTH, APCS_WDT1_BARK_TIME, APCS_WDT1_TST_LD_STS, APCS_WDT1_TST_LD. 0x1: NSEC 0x0: SEC
2	GPT0	Controls security treatment for the General Purpose Timer registers: APCS_GPT1_MTCH, APCS_GPT1__CNT, APCS_GPT1_EN, APCS_GPT1_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC

CPU1_APCS_TMRSECURE (cont.)

Bits	Name	Description
1	GPT1	Controls security treatment for the General Purpose Timer registers: APCS_GPT0_MTCH, APCS_GPT0__CNT, APCS_GPT0_EN, APCS_GPT0_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC
0	DGT	Controls security treatment for the Debug Timer registers; APCS_DGT_MTCH, APCS_DGT_CNT, APCS_DGT_EN, APCS_DGT_CLR, APCS_DGT_CLK_CTL, and bits 3-0 of APCS_TMR_STS 0x1: NSEC 0x0: SEC

0x0209A004 CPU1_APCS_GPT0_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: APCS_TMRSECURE [GPT0].

The general purpose timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT0_MTCH register.

CPU1_APCS_GPT0_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT0_CNT at which an interrupt will be generated.

0x0209A008 CPU1_APCS_GPT0_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CNT register contains the current value of the GPT0 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT0_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_GPT0_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT0_EN.

- Write APCS_GPT0_CNT.
- Write (to set/restore) APCS_GPT0_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT0_EN.

CPU1_APCS_GPT0_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer.

0x0209A00C CPU1_APCS_GPT0_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_EN register is used to enable the GPT0 timer.

CPU1_APCS_GPT0_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency ACC_SLP_CLK.

0x0209A010 CPU1_APCS_GPT0_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CLR register is a one-shot command register that, when written with any value, resets the timer to a value of 0. This occurs regardless of the state of the APCS_GPT0_EN register.

CPU1_APCS_GPT0_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x0209A014 CPU1_APCS_GPT1_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The GPT timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT1_MTCH register.

CPU1_APCS_GPT1_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT1_CNT at which an interrupt will be generated.

0x0209A018 CPU1_APCS_GPT1_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CNT register contains the current value of the GPT1 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT1_MTCH register at the same time. The procedure for writing the APCS_GPT1_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT1_EN.
- Write APCS_GPT1_CNT.
- Write (to set/restore) APCS_GPT1_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT1_EN.

CPU1_APCS_GPT1_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer

0x0209A01C CPU1_APCS_GPT1_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_EN register is used to enable the GPT1 timer.

CPU1_APCS_GPT1_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), timer will clear when it reaches the match value.
0	EN	When set (1), timer is enabled and counts with frequency sleep clock.

0x0209A020 CPU1_APCS_GPT1_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CLR register is a one-shot command register that, when written with any value, resets the GPT1 timer to a value of 0. This occurs regardless of the state of the APCS_GPT1_EN register.

CPU1_APCS_GPT1_CLR

Bits	Name	Description
31:0	RESERVED_BITS_31_0	Data written is not used.

0x0209A024 CPU1_APCS_DGT_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The DBG timer will signal interrupt when its counter value has reached the value stored in the APCS_DGT_MTCH register.

CPU1_APCS_DGT_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_DGT_CNT at which an interrupt will be generated.

0x0209A028 CPU1_APCS_DGT_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CNT register contains the current value of the DGT timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_DGT_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_DGT_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_DGT_EN.
- Write APCS_DGT_CNT.
- Write (to set/restore) APCS_DGT_MTCH if required.
- Enable the timer by setting the EN bit in APCS_DGT_EN.

CPU1_APCS_DGT_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer count

0x0209A02C CPU1_APCS_DGT_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_EN register is used to enable the DGT timer.

CPU1_APCS_DGT_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	

CPU1_APCS_DGT_EN (cont.)

Bits	Name	Description
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency TCXO clock.

0x0209A030 CPU1_APCS_DGT_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLR register is a one-shot command register that, when written with any value, resets the DGT timer to a value of 0. This occurs regardless of the state of the APCS_DGT_EN register.

CPU1_APCS_DGT_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x0209A034 CPU1_APCS_DGT_CLK_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0003

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLK_CTL controls the clock divider inside the Debug Timer.

NOTE It is possible for the AHB clock to run at as slow as 5 MHz using settings of the Global Clock Controller. The debug timer's counter can also run at 5 MHz (TCXO divided by 4). However, due to the synchronization circuit using the edge detect, the timer should always run at least 4x slower than the AHB clock. Thus, if the timer's use is required by the system, the divider should be set to divide by 4 and the slowest usable AHB frequency is 20MHz. The timer would run at 5MHz in this case.

CPU1_APCS_DGT_CLK_CTL

Bits	Name	Description
31:2	RESERVED_BITS_31_2	

CPU1_APCS_DGT_CLK_CTL (cont.)

Bits	Name	Description
1:0	DIV	0x3: 4 0x2: 3 0x1: 2 0x0: 1

0x0209A038 CPU1_APCS_WDT0_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

CPU1_APCS_WDT0_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT0_STB during the non-sleep mode. A pulse is generated on WDT0_STB when this bit is written with a ’1

0x0209A03C CPU1_APCS_WDT0_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT0_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

CPU1_APCS_WDT0_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved

CPU1_APCS_WDT0_FRZ (cont.)

Bits	Name	Description
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a '1'.

0x0209A040 CPU1_APCS_WDT0_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_EN register controls when the watch dog timer is enabled.

CPU1_APCS_WDT0_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x0209A044 CPU1_APCS_WDT0_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_STS register is the watchdog status register.

CPU1_APCS_WDT0_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The sleep counter value is sampled using the AHB clk. Multiple reads are required to determine the value (assuming AHB clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog0 counter reset.

CPU1_APCS_WDT0_STS (cont.)

Bits	Name	Description
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT0) 0x0: reset (the last system reset was not due to WDT0.)

0x0209A048 CPU1_APCS_WDT0_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_INT_WIDTH register defines the width of the WDT0 biteExpired pulse in the number of sleep_clk pulses. The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

CPU1_APCS_WDT0_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to de-assert the WDI bite pulse.

0x0209A04C CPU1_APCS_WDT0_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (’bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (’bark’) interrupt.

..

CPU1_APCS_WDT0_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to trigger the bark interrupt.

0x0209A050 CPU1_APCS_WDT0_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

CPU1_APCS_WDT0_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x0209A054 CPU1_APCS_WDT0_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TEST_LD register loads the WDT0_TST register value into the watchdog counter.

CPU1_APCS_WDT0_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT0_TST register into the WDT0 counter.

0x0209A058 CPU1_APCS_WDT0_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

CPU1_APCS_WDT0_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter test load value [28:0].

0x0209A05C CPU1_APCS_WDT0_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BITE_TIME register determines the counter value at which WDT0 asserts the biteExpired signal.

CPU1_APCS_WDT0_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 bite expiration time [28:0].

0x0209A060 CPU1_APCS_WDT1_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

CPU1_APCS_WDT1_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT1_STB during the non-sleep mode. A pulse is generated on WDT1_STB when this bit is written with a ’1

0x0209A064 CPU1_APCS_WDT1_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT1_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

CPU1_APCS_WDT1_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a ’1’.

0x0209A068 CPU1_APCS_WDT1_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_EN register controls when the watchdog timer is enabled.

CPU1_APCS_WDT1_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x0209A06C CPU1_APCS_WDT1_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_STS register is the watchdog status register.

CPU1_APCS_WDT1_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The counter value is sampled using the ahb clk. Multiple reads are required to determine the value (assuming ahb clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog counter reset.
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT1) 0x0: reset (the last system reset was not due to WDT1.)

0x0209A070 CPU1_APCS_WDT1_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_INT_WIDTH register defines the width of the WDT1_expired pulse in the number of sleep_clk pulses.The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

CPU1_APCS_WDT1_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to de-assert the WDI expired pulse.

0x0209A074 CPU1_APCS_WDT1_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (’bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (’bark’) interrupt.

CPU1_APCS_WDT1_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to trigger the bark interrupt.

0x0209A078 CPU1_APCS_WDT1_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

CPU1_APCS_WDT1_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x0209A07C CPU1_APCS_WDT1_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TEST_LD register loads the WDT1_TST register value into the watchdog counter.

CPU1_APCS_WDT1_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT1_TST register into the WDT counter

0x0209A080 CPU1_APCS_WDT1_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

CPU1_APCS_WDT1_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter test load value [28:0]

0x0209A084 CPU1_APCS_WDT1_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BITE_TIME register determines the counter value at which WDT1 asserts the biteExpired signal.

CPU1_APCS_WDT1_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 bite expiration time [28:0].

0x0209A088 CPU1_APCS_TMR_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [WDT0, WDT1, GPT0, GPT1, DGT].

The APCS_TMR_STS can be used to determine the status of each of the SCSS timers in the timer's resident clock domain. Since the timer clock domain may be much slower than the AHB clock, AHB transactions may be delayed in taking effect. This information can be used to qualify other actions or used simply for debug purposes. For example, software can determine when a write to APCS_DGT_CLR has taken effect by examining the DGT_CLR_PEND bit.

Each timer's bits are receive security treatment as specified by the APCS_TMRSECURE register.

CPU1_APCS_TMR_STS

Bits	Name	Description
31	RESERVED_BIT31	
30	WDT1_AUTOKICK	Auto-kicker is on (1) or off (0)
29	WDT1_INT_EN	An unmasked interrupt will enable the timer (1) or not (0)
28	WDT1_EN	Timer is enabled (1) or not (0)
27	RESERVED_BIT27	
26	WDT0_AUTOKICK	Auto-kicker is on (1) or off (0)

CPU1_APCS_TMR_STS (cont.)

Bits	Name	Description
25	WDT0_INT_EN	An unmasked interrupt will enable the timer (1) or not (0)
24	WDT0_EN	Timer is enabled (1) or not (0)
23:20	RESERVED_BIT20_23	
19	GPT1_WR_PEND	Timer has a write pending (1) or not (0)
18	GPT1_CLR_PEND	Timer has a clear pending (1) or not (0)
17	GPT1_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
16	GPT1_EN	Timer is enabled (1) or not (0)
15:12	RESERVED_BITS15_12	
11	GPT0_WR_PEND	Timer has a write pending (1) or not (0)
10	GPT0_CLR_PEND	Timer has a clear pending (1) or not (0)
9	GPT0_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
8	GPT0_EN	Timer is enabled (1) or not (0)
7:4	RESERVED_BITS7_4	
3	DGT_WR_PEND	Timer has a write pending (1) or not (0)
2	DGT_CLR_PEND	Timer has a clear pending (1) or not (0)
1	DGT_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
0	DGT_EN	Timer is enabled (1) or not (0)

11.19 KPSS CPU2 ACC Registers (0x020A8000 CPU2_APCS_ACC_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU2 ACC registers.

0x020A8000 CPU2_APCS_ACCSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0007

Security Treatment: Restricted

The APCS_ACCSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_ACCSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_ACCSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_ACCSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_ACCSECURE register correspond to.

CPU2_APCS_ACCSECURE

Bits	Name	Description
31:4	RESERVED	
31:3	RESERVED_BITS31_3	
2	TST	Controls security treatment for test control registers: APCS_ATSTBUS_SEL 0x1: NSEC 0x0: SEC
1	CLK_CTL	Controls security treatment for the clock control registers: APCS_ACC_STS, APCS_CPU_AUX_CLK_SEL. 0x1: NSEC 0x0: SEC
0	SLP_CTL	Controls security treatment for the sleep control registers: APCS_CPU_PWR_CTL, APCS_CPU_TRGTD_DBG_RST. 0x1: NSEC 0x0: SEC

0x020A8004 CPU2_APCS_CPU_PWR_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0109

Security Treatment: Controlled by APCS_ACCSECURE [SLP_CTL].

The APCS_CPU_PWR_CTL register is used to control the clamps, reset and array head switches.

CPU2_APCS_CPU_PWR_CTL

Bits	Name	Description
31:21	RESERVED_BITS31_21	
20:16	CLK_EN	Clock enables for CORE clock. This is only to workaround hardware dynamic clock gating problems. [20:18]= SYS_apcNAux_Clk[3:1] [17] = SYS_apcsRef_Clk [16] = SYS_apcNPll_Clk 0x1: Always enabled 0x0: dynamically enabled by hardware
15:10	RESERVED_BITS15_10	
9	RET_SLP_REQ	When set, this bit request the L2SCU to in-flight snoop operation and block new snoops request from entering FIFO. This control is intended to permit external masters such as the RPM to put CPU to retention sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a retention sleep request control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU's snoop FIFO is quiesced.
8	PLL_CLAMP	When set, this bit clamp the output of TDC logic in PLL. This signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the APC PLL.
7	CORE_PWRD_UP	Report that the CPU is powered up.
6	GATE_CLK	When set, this bit forces the CPU clock to be gated off. This control is intended to permit external masters such as the RPM to gate off the CPU clock during sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a clock gating control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU clock will be gated off. When set, this bit gate the CPU clock that must be asserted during sleep state. This bit is ORed with a SAW output before passing to the CPU core.
5	COREPOR_RST	When set, this bit asserts corepor areset to the CPU core.
4	CORE_RST	When set, this bit asserts core areset to the COPU core.

CPU2_APCS_CPU_PWR_CTL (cont.)

Bits	Name	Description
3	L2DT_SLP	When set, this bit opens a head switch to put the L2 duplicate tag array into a low-leakage, non-data-retaining state. This bit is ORed with a SAW output before passing to the CPU core. The controlled memory array contains a duplicate of the tags contained in the L1 data cache, and is used by the L2 to snoop and see if a shared memory access from one processor necessitates invalidating a line in another processor's L1 data cache. Thus, this memory array generally can be offline when the associated CPU is power-collapsed and its L1 data cache is also off-line.
2	RESERVED_BIT2	Previously ETB HS
1	RESERVED_BIT1	Previously L1 HS
0	CLAMP	When set, this bit asserts the clamp signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the CPU core.

0x020A8008 CPU2_APCS_ACC_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: N/A

Security Treatment: Controlled by APCS_ACCSECURE [CLK_CTL].

The APCS_ACC_STS register is used to monitor the output of the clock gating cells.

CPU2_APCS_ACC_STS

Bits	Name	Description
31:18	RESERVED_BITS31_18	
17	RET_SLP_ACK	This bit reflect the status of APCN_sysRetSlpAck bit. L2 assert the signal when it see the APCN_sysRetSlpReq and CPU snoop FIFO is quiesced. L2 de-assert this signal after APCN_sysRetSlpReq is de-asserted and all snoop invalidation is completed.
16	SLP_CLK	This bit reflect the status of APCN_sleepClkOnReq bit
15	AHB_CLK	This bit reflect the status of APCN_ahbClkOnReq bit
14	REF_CLK	This bit reflect the status of APCN_refClkOnReq bit
13	SPM_SLP_STATE	This bit reflect the status of SPM Sleep State
12	FRC_CLK_OFF	This bit reflect the status of APCN_apccForceClocksOff bit
11	RET_SLP_REQ	This bit reflect the status of APCN_apccRetSlpReq bit
10	TRGTD_DBG_RST	This bit reflect the status of APCN_apcTargetedDbg_Areset_N bit
9	CORE_RST	This bit reflect the status of APCN_apccCore_Areset_N bit
8	COREPOR_RST	This bit reflect the status of APCN_apccCorePor_Areset_N bit

CPU2_APCS_ACC_STS (cont.)

Bits	Name	Description
7	L2DT_HS	This bit reflect the status of the SYS_apcNSwCtlDupTagArrayCollapse bit
6	CLAMP	This bit reflect the status of the SYS_apcNClampApcNvd bit.
5:3	CORE_AUX_CLK	This bits reflect the status of the APCS_sysApcNAuxClkOnReq bits.
2	CORE_PLL_CLK	This bit reflect the status of the APCS_sysApcNPllClkOnReq bit.
1	CORE_NO_PWR_DWN	This bit reflect the status of the APCN_dbgCoreNoPwrDwn bits.
0	CORE_PWRUP_REQ	This bit reflect the status of the APCN_dbgCorePwrUpReq bits.

0x020A800C CPU2_APCS_ATSTBUS_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [TST].

APCS_ATSTBUS_SEL selects different modules' test bus outputs.

CPU2_APCS_ATSTBUS_SEL

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2	EN	Set to 1 to cause APCS to drive the test bus outputs. 0x1: enabled 0x0: disabled
1:0	SEL	0x3: CONSTANT 0x2: SAW 0x1: TMR 0x0: CLK

0x020A8010 CPU2_APCS_CPU_TRGTD_DBG_RST

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [SLP_CTL].

APCS_CPU_TRGTD_DBG_RST is used to reset the CPU core debug logic. The hardware clear the register after the CPU debug logic is reset. Software need to poll this register to check if the reset is complete.

CPU2_APCS_CPU_TRGTD_DBG_RST

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	RST	When set this bit de-assert SYS_apcNTargetedDbg_Areset_N to the CPU core for 32 REF clock cycle to the CPU core. At the end of the reset hardware clear this bit.

0x020A8014 CPU2_APCS_CPU_AUX_CLK_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [CLK_CTL]

The APCS_CPU_AUX_CLK_SEL register controls the gfmux which selects the AUX clock source for the Krait CPU clock. An additional selection set is provided to determine the clock source for the Krait core (4-1 GFMUX) in the Krait Hard Macro. The QSB clock is the raw source clk at reset.

CPU2_APCS_CPU_AUX_CLK_SEL

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	AUX_SRC	Krait CPU AUX clock select: 0x3: SYS_apcNAux_Clk_1 0x2: SYS_apcNAux_Clk_2 0x1: SYS_apcNAux_Clk_3 0x0: SYS_apcsRef_Clk

11.20 KPSS CPU2 SAW2 Registers (0x020A9000 CPU2_APCS_SAW2_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU2 SAW2 registers.

The SAW2 (SPM and AVS. Wrapper2) design is an AHB slave that contains both SPM and AVS. CSRs.

0x020A9000 CPU2_APCS_SAW2_SECURE

Type: Read/write
Clock: SYS_REF_CLK
Reset State: {3{CFGNSINIT}}

Security Treatment: Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to ’0’ the state of the SAW2_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to ’1’, the SAW2_SECURE register security treatment bit of that register must be ’1’ for access to be granted. If the security treatment bit of the register is set to ’0’, the non-secure (ahb_saw_hprotns = ’1’) transactions are denied. When access is denied, a write is ignored, and a read will return ’0’. No error is signaled.

When reading the SAW2_SECURE register, non-secure agents will always read ’0’. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

CPU2_APCS_SAW2_SECURE

Bits	Name	Description
31:3	RESERVED	
2	SAW_CTL	Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST 0x1: NSEC 0x0: SEC
1	PWR_CTL	Controls security treatment for SPM registers: SAW2_SPM_CTL, SAW2_SPM_PMIC_DLY, SAW2_SPM_PMIC_DATA_0, SAW2_SPM_PMIC_DATA_1, SAW2_SPM_SLP_SEQ_ENTRY_n, SAW2_SPM_DLY 0x1: NSEC 0x0: SEC
0	VLT_CTL	Controls security treatment for the AVS. registers: SAW2_AVS_CTL, SAW2_VLVL, SAW2_AVS_HYSTERESIS 0x1: NSEC 0x0: SEC

0x020A9004 CPU2_APCS_SAW2_ID

Type: Read
Clock: SYS_REF_CLK
Reset State: Undefined

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register reports the revision and parameter information for the SAW2 core.

CPU2_APCS_SAW2_ID

Bits	Name	Description
31	RESERVED_BITS31	
30:25	NUM_SPM_ENTRY	SAW2 parameter: Indicates number of SAW2_SPM_SLP_SEQ_ENTRY register implemented. Value can range from 1 - 32
24:20	NUM_PWR_CTL	SAW2 parameter: Indicates number of power control implemented. Value can range from 2 - 16
19	RESERVED_BITS19	
18	PMIC_ARB_INTF	SAW2 parameter: Indicates PMIC Arbiter Interface function is implemented
17	AVS_PRESENT	SAW2 parameter: Indicates AVS. function is implemented
16	SPM_PRESENT	SAW2 parameter: Indicates SPM function is implemented
15:12	MAJOR	Major variant
11:0	MINOR	Minor variant

0x020A9008 CPU2_APCS_SAW2_CFG

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_CFG register is used to configure the common control between AVS. and SPM.system.

CPU2_APCS_SAW2_CFG

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON.
11:8	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port.

CPU2_APCS_SAW2_CFG (cont.)

Bits	Name	Description
7:6	RESERVED_BITS7_6	
5	PMIC_MODE	PMIC Handshake 0x0: 8K_PMIC (only DONE signal) 0x1: 7K_PMIC (both ACK and DONE signals)
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period. ..... For sys_ref_clk = 20 MHz (53ns) The timer tick range 53 ns to 1.6us. 0x0: Timer Tick every sys_ref_clk 0x1F: Timer Tick every 128 sys_ref_clk.

0x020A900C CPU2_APCS_SAW2_STS_0

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

CPU2_APCS_SAW2_STS_0

Bits	Name	Description
15	SHTDWN_REQ	This bit reflects the shutdown request from the SPM(spm_rpm_shutdown_req) to RPM.
14	SHTDWN_ACK	This bit reflects the shutdown acknowledgement from the RPM(rpm_spm_shutdown_ack) to SPM.
13	BRNGUP_REQ	This bit reflects the bringup request from the SPM(spm_rpm_bringup_req) to RPM.
12	BRNGUP_ACK	This bit reflects the bringup acknowledgement from the RPM(rpm_spm_bringup_ack) to SPM.
11:10	PMIC_STATE	State of the PMIC FSM: transitions back to IDLE) transitions back to IDLE) 0x0: IDLE (waiting for PMIC transaction from AVS. or SPM) 0x1: ACK (waiting for ACK from PMIC Arb) 0x2: DONE (waiting for DONE form PMIC Arb before) 0x3: DELAY (waiting for delay count termination before)

CPU2_APCS_SAW2_STS_0 (cont.)

Bits	Name	Description
9:8	RPM_STATE	State of the RPM FSM: 0x0: RUN (waiting for SPM request) 0x1: STDNACK (waiting for shutdown ACK from RPM) 0x2: WAKEUP (waiting for wakeup interrupt) 0x3: BGUPACK (waiting for bringup ACK from RPM)
7	AVS_STATE	State of the AVS. FSM: indication) 0x0: IDLE (waiting to be enabled or for next UP/DOWN) 0x1: REQ (waiting for PMIC FSM to transition to IDLE)
6:0	SPM_CMD_ADDR	Last SPM command executed.

0x020A9010 CPU2_APCS_SAW2_STS_1

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

CPU2_APCS_SAW2_STS_1

Bits	Name	Description
31	RESERVED1	
30	SW_WR_PEND	This bit reflects the VLVL state of the request from the SAW2_VCTL write is pending.
29	CPU_UP	This bit reflects the VLVL state of the request from the CPU (avs_saw_up) to raise the VLVL.
28	CPU_DN	This bit reflects the VLVL state of the request from the CPU (avs_saw_down) to lower the VLVL.
27	MAX_INT	IRQ status bit, AVS. controller detected that raising the VLVL by AVS_CTL[VLVL_STEP] would result in a value greater than AVS_CTL[MAX_VLVL]. If AVS_CTL[IRQ_MAX_EN] is set, an interrupt is issued. NOTE that SW can set MAX_VLVL lower than current VLVL creating a condition where VLVL is higher than MAX_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MAX.

CPU2_APCS_SAW2_STS_1 (cont.)

Bits	Name	Description
26	MIN_INT	IRQ status bit, AVS. controller detected that lowering the VLVL by SAW2_AVS_CTL[VLVL_STEP] would result in a value less than SAW2_AVS_CTL[MIN_VLVL]. If SAW2_AVS_CTL[IRQ_MIN_EN] is set, an interrupt is issued. NOTE that SW can set MIN_VLVL higher than current VLVL creating a condition where VLVL is lower than MIN_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MIN.
25:16	CURR_DLY	VLVL value of the counter used to calculate the time until the next AVS. controller request for a new VLVL.

0x020A9014 CPU2_APCS_SAW2_VCTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

Though this register is read/writable, it also causes a command pulse to the PMIC FSM. Writing this register results in a transaction to the PMIC with SAW2_VCTL being sent to the PMIC. SAW2 support both 8901 and 8058 regulator.

CPU2_APCS_SAW2_VCTL

Bits	Name	Description
31:16	RESERVED_BITS31_16	

0x020A9018 CPU2_APCS_SAW2_AVS_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_CTL register is used to control the Adaptive Voltage Scaling (AVS) system.

CPU2_APCS_SAW2_AVS_CTL

Bits	Name	Description
31	RESERVED	

CPU2_APCS_SAW2_AVS_CTL (cont.)

Bits	Name	Description
30	VLVL_WIDTH	Defines the VLVL field of PMIC data. SAW2 at minimum supports 8901 and 8058 regulator. See PMIC document for details. 0x0: 5 bits VLVL (8058 regulator) 0x1: 6 bits VLVL (8901 regulator)
29:28	VLVL_STEP	Controls the step size of each request to PMIC Arbiter. SW may use values from 0 to 3. Note that the value 0 will result in no change - that is if the CPU requests UP or DOWN, the CURR_PVLVL will be sent to the PMIC Arbiter. This may be useful for debug. If an increment or decrement operation would cause the current VLVL to transition above or below the MAX_VLVL or MIN_VLVL, the current VLVL will not be changed. An interrupt will be signaled if IRQ_MAX/MIN_EN is 1
27	EN	AVS. Enable. **NOTE** Setting to 0 does not disable any pending interrupts. **NOTE** AVS. FSM and SPM FSM are mutually exclusive. Only one FSM is active at a time. SW does not have to disable AVS. before going to sleep. 0x0: Disable AVS 0x1: Enable AVS
26	SW_DONE_INT_EN	Set to 1 to turn on AVS. interrupt for when a SW initiated voltage change has completed. Set to 0 to mask it (turn it off). ASSERTION: This interrupt is asserted only after a SW write to SAW2_AVS_VLVL. Specifically, after the AVS. FSM traverses through all its states and transitions back to IDLE, the interrupt line is pulsed. The interrupt controller should be set to edge capture to receive this interrupt. CLEARING: None. This interrupt is a pulse, SW does not need to clear it (aside from requirements of the interrupt controller).
25	MAX_INT_EN	Set to 1 to turn on AVS. interrupt for MAX_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be greater than MAX_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit.
24	MIN_INT_EN	Set to 1 to turn on AVS. interrupt for MIN_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be smaller than MIN_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit
23	RESERVED_23	

CPU2_APCS_SAW2_AVS_CTL (cont.)

Bits	Name	Description
22:17	MAX_VLVL	Control maximum value of AVS. controller's VLVL. When current VLVL reaches this value it may not grow any larger. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level higher, an interrupt is issued. This value may be updated at anytime. Setting to a value lower than MIN_VLVL is not supported, and unpredictable results may occur.
16	RESERVED_16	
15:10	MIN_VLVL	Control the minimum value of AVS. controller's VLVL. When the current VLVL reaches this level it may not shrink any smaller. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level lower, an interrupt is issued. This value may be updated at anytime. Setting to a value higher than MAX_VLVL is not supported, and unpredictable results may occur.
9:0	AVS_DELAY	Control the time between AVS. controller's requests to change the VLVL

0x020A901C CPU2_APCS_SAW2_AVS_HYSTERESIS

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_HYSTERESIS register is used to delay the AVS. UP/DN signal to AVS. FSM. This is used to prevent the false PMIC step due to PDN noise.

CPU2_APCS_SAW2_AVS_HYSTERESIS

Bits	Name	Description
31:24	RESERVED31_24	
23:16	DN_COUNT	HYSTERESIS DN COUNT. Delays of PMIC DN step operation.
15:8	RESERVED15_8	
7:0	UP_COUNT	HYSTERESIS UP COUNT. Delays of PMIC UP step operation.

0x020A9020 CPU2_APCS_SAW2_SPM_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

CPU2_APCS_SAW2_SPM_CTL

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	SPM_START_ADR	Start address for the SPM sequence.
3	ISAR	Inhibit Start Address Reset 0x0: End of program reset the SPM_START_ADR to zero. 0x1: Inhibit End of program to reset SPM_START_ADR
2:1	WAKEUP_CONFIG	Wakeup Configuration 0x0: sys_spm_wakeup 0x1: sys_spm_wakeup or !cpu_spm_wait_req 0x2: sys_spm_wakeup or rising edge of sys_spm_dbg_nopwrdwn 0x3: sys_spm_wakeup or !cpu_spm_wait_req or rising edge of sys_spm_dbg_nopwrdwn
0	SPM_EN	SPM En.

0x020A9024 CPU2_APCS_SAW2_SPM_PMIC_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC delay values after SPM FSM PMIC transaction. SPM wait for the programmed delay before executing the next SPM command.

CPU2_APCS_SAW2_SPM_PMIC_DLY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:24	DATA_1_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
23:19	RESERVED_BITS23_19	
18:16	DATA_1_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
15:11	RESERVED_BITS15_11	

CPU2_APCS_SAW2_SPM_PMIC_DLY (cont.)

Bits	Name	Description
10:8	DATA_0_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
7:3	RESERVED_BITS7_3	
2:0	DATA_0_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms

0x020A9028 CPU2_APCS_SAW2_SPM_PMIC_DATA_0

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

CPU2_APCS_SAW2_SPM_PMIC_DATA_0

Bits	Name	Description

0x020A902C CPU2_APCS_SAW2_SPM_PMIC_DATA_1

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

CPU2_APCS_SAW2_SPM_PMIC_DATA_1

Bits	Name	Description

0x020A9030 CPU2_APCS_SAW2_RST

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_RST register is used to reset the SAW logic. This register clear itself. It does not reset any SAW2 CSRs. It reset AVS. and SPM FSM and control registers. This is use to clear any hang condition.

CPU2_APCS_SAW2_RST

Bits	Name	Description
31:1	RESERVED31_1	
0	RST	Reset AVS. and SPM FSM and control registers.

0x020A9034 CPU2_APCS_SAW2_SPM_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the delay values for SPM Delay command. SPM wait for the programmed delay before executing the next SPM command.

CPU2_APCS_SAW2_SPM_DLY

Bits	Name	Description
31:30	RESERVED_BITS31_30	
29:20	DLY3	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
19:10	DLY2	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
9:0	DLY1	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

0x020A9080+4*n CPU2_APCS_SAW2_SPM_SLP_SEQ_ENTRY_n

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter.

CPU2_APCS_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description

11.21 KPSS CPU2 Timer Registers (0x020AA000 CPU2_APCS_TMR_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU2 Timer registers.

0x020AA000 CPU2_APCS_TMRSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Restricted

The APCS_TMRSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Scorpion's APROTNS pin. When APROTNS is set to '0' the state of the APCS_TMRSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_TMRSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_TMRSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_TMRSECURE register correspond to.

CPU2_APCS_TMRSECURE

Bits	Name	Description
31:5	RESERVED	
4	WDT0	Controls security treatment for the Watch Dog Timer registers: APCS_WDT0_FRZ, APCS_WDT0_INT_EN, APCS_WDT0_STS, APCS_WDT0_INT_WIDTH, APCS_WDT0_BARK_TIME, APCS_WDT0_TST_LD_STS, APCS_WDT0_TST_LD. 0x1: NSEC 0x0: SEC
3	WDT1	Controls security treatment for the Watch Dog Timer registers: APCS_WDT1_FRZ, APCS_WDT1_INT_EN, APCS_WDT1_STS, APCS_WDT1_INT_WIDTH, APCS_WDT1_BARK_TIME, APCS_WDT1_TST_LD_STS, APCS_WDT1_TST_LD. 0x1: NSEC 0x0: SEC
2	GPT0	Controls security treatment for the General Purpose Timer registers: APCS_GPT1_MTCH, APCS_GPT1__CNT, APCS_GPT1_EN, APCS_GPT1_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC

CPU2_APCS_TMRSECURE (cont.)

Bits	Name	Description
1	GPT1	Controls security treatment for the General Purpose Timer registers: APCS_GPT0_MTCH, APCS_GPT0__CNT, APCS_GPT0_EN, APCS_GPT0_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC
0	DGT	Controls security treatment for the Debug Timer registers; APCS_DGT_MTCH, APCS_DGT_CNT, APCS_DGT_EN, APCS_DGT_CLR, APCS_DGT_CLK_CTL, and bits 3-0 of APCS_TMR_STS 0x1: NSEC 0x0: SEC

0x020AA004 CPU2_APCS_GPT0_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: APCS_TMRSECURE [GPT0].

The general purpose timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT0_MTCH register.

CPU2_APCS_GPT0_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT0_CNT at which an interrupt will be generated.

0x020AA008 CPU2_APCS_GPT0_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CNT register contains the current value of the GPT0 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT0_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_GPT0_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT0_EN.

- Write APCS_GPT0_CNT.
- Write (to set/restore) APCS_GPT0_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT0_EN.

CPU2_APCS_GPT0_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer.

0x020AA00C CPU2_APCS_GPT0_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_EN register is used to enable the GPT0 timer.

CPU2_APCS_GPT0_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency ACC_SLP_CLK.

0x020AA010 CPU2_APCS_GPT0_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CLR register is a one-shot command register that, when written with any value, resets the timer to a value of 0. This occurs regardless of the state of the APCS_GPT0_EN register.

CPU2_APCS_GPT0_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x020AA014 CPU2_APCS_GPT1_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The GPT timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT1_MTCH register.

CPU2_APCS_GPT1_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT1_CNT at which an interrupt will be generated.

0x020AA018 CPU2_APCS_GPT1_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CNT register contains the current value of the GPT1 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT1_MTCH register at the same time. The procedure for writing the APCS_GPT1_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT1_EN.
- Write APCS_GPT1_CNT.
- Write (to set/restore) APCS_GPT1_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT1_EN.

CPU2_APCS_GPT1_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer

0x020AA01C CPU2_APCS_GPT1_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_EN register is used to enable the GPT1 timer.

CPU2_APCS_GPT1_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), timer will clear when it reaches the match value.
0	EN	When set (1), timer is enabled and counts with frequency sleep clock.

0x020AA020 CPU2_APCS_GPT1_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CLR register is a one-shot command register that, when written with any value, resets the GPT1 timer to a value of 0. This occurs regardless of the state of the APCS_GPT1_EN register.

CPU2_APCS_GPT1_CLR

Bits	Name	Description
31:0	RESERVED_BITS_31_0	Data written is not used.

0x020AA024 CPU2_APCS_DGT_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The DBG timer will signal interrupt when its counter value has reached the value stored in the APCS_DGT_MTCH register.

CPU2_APCS_DGT_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_DGT_CNT at which an interrupt will be generated.

0x020AA028 CPU2_APCS_DGT_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CNT register contains the current value of the DGT timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_DGT_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_DGT_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_DGT_EN.
- Write APCS_DGT_CNT.
- Write (to set/restore) APCS_DGT_MTCH if required.
- Enable the timer by setting the EN bit in APCS_DGT_EN.

CPU2_APCS_DGT_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer count

0x020AA02C CPU2_APCS_DGT_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_EN register is used to enable the DGT timer.

CPU2_APCS_DGT_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	

CPU2_APCS_DGT_EN (cont.)

Bits	Name	Description
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency TCXO clock.

0x020AA030 CPU2_APCS_DGT_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLR register is a one-shot command register that, when written with any value, resets the DGT timer to a value of 0. This occurs regardless of the state of the APCS_DGT_EN register.

CPU2_APCS_DGT_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x020AA034 CPU2_APCS_DGT_CLK_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0003

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLK_CTL controls the clock divider inside the Debug Timer.

NOTE It is possible for the AHB clock to run at as slow as 5 MHz using settings of the Global Clock Controller. The debug timer's counter can also run at 5 MHz (TCXO divided by 4). However, due to the synchronization circuit using the edge detect, the timer should always run at least 4x slower than the AHB clock. Thus, if the timer's use is required by the system, the divider should be set to divide by 4 and the slowest usable AHB frequency is 20MHz. The timer would run at 5MHz in this case.

CPU2_APCS_DGT_CLK_CTL

Bits	Name	Description
31:2	RESERVED_BITS_31_2	

CPU2_APCS_DGT_CLK_CTL (cont.)

Bits	Name	Description
1:0	DIV	0x3: 4 0x2: 3 0x1: 2 0x0: 1

0x020AA038 CPU2_APCS_WDT0_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

CPU2_APCS_WDT0_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT0_STB during the non-sleep mode. A pulse is generated on WDT0_STB when this bit is written with a '1'.

0x020AA03C CPU2_APCS_WDT0_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT0_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

CPU2_APCS_WDT0_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved

CPU2_APCS_WDT0_FRZ (cont.)

Bits	Name	Description
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a '1'.

0x020AA040 CPU2_APCS_WDT0_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_EN register controls when the watch dog timer is enabled.

CPU2_APCS_WDT0_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x020AA044 CPU2_APCS_WDT0_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_STS register is the watchdog status register.

CPU2_APCS_WDT0_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The sleep counter value is sampled using the AHB clk. Multiple reads are required to determine the value (assuming AHB clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog0 counter reset.

CPU2_APCS_WDT0_STS (cont.)

Bits	Name	Description
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT0) 0x0: reset (the last system reset was not due to WDT0.)

0x020AA048 CPU2_APCS_WDT0_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_INT_WIDTH register defines the width of the WDT0 biteExpired pulse in the number of sleep_clk pulses. The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

CPU2_APCS_WDT0_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to de-assert the WDI bite pulse.

0x020AA04C CPU2_APCS_WDT0_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (’bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (’bark’) interrupt.

CPU2_APCS_WDT0_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to trigger the bark interrupt.

0x020AA050 CPU2_APCS_WDT0_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

CPU2_APCS_WDT0_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x020AA054 CPU2_APCS_WDT0_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TEST_LD register loads the WDT0_TST register value into the watchdog counter.

CPU2_APCS_WDT0_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT0_TST register into the WDT0 counter.

0x020AA058 CPU2_APCS_WDT0_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

CPU2_APCS_WDT0_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter test load value [28:0].

0x020AA05C CPU2_APCS_WDT0_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BITE_TIME register determines the counter value at which WDT0 asserts the biteExpired signal.

CPU2_APCS_WDT0_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 bite expiration time [28:0].

0x020AA060 CPU2_APCS_WDT1_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

CPU2_APCS_WDT1_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT1_STB during the non-sleep mode. A pulse is generated on WDT1_STB when this bit is written with a ’1

0x020AA064 CPU2_APCS_WDT1_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT1_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

CPU2_APCS_WDT1_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a ’1’.

0x020AA068 CPU2_APCS_WDT1_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_EN register controls when the watchdog timer is enabled.

CPU2_APCS_WDT1_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x020AA06C CPU2_APCS_WDT1_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_STS register is the watchdog status register.

CPU2_APCS_WDT1_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The counter value is sampled using the ahb clk. Multiple reads are required to determine the value (assuming ahb clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog counter reset.
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT1) 0x0: reset (the last system reset was not due to WDT1.)

0x020AA070 CPU2_APCS_WDT1_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_INT_WIDTH register defines the width of the WDT1_expired pulse in the number of sleep_clk pulses.The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

CPU2_APCS_WDT1_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to de-assert the WDI expired pulse.

0x020AA074 CPU2_APCS_WDT1_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (’bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (’bark’) interrupt.

CPU2_APCS_WDT1_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to trigger the bark interrupt.

0x020AA078 CPU2_APCS_WDT1_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

CPU2_APCS_WDT1_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x020AA07C CPU2_APCS_WDT1_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TEST_LD register loads the WDT1_TST register value into the watchdog counter.

CPU2_APCS_WDT1_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT1_TST register into the WDT counter

0x020AA080 CPU2_APCS_WDT1_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

CPU2_APCS_WDT1_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter test load value [28:0]

0x020AA084 CPU2_APCS_WDT1_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BITE_TIME register determines the counter value at which WDT1 asserts the biteExpired signal.

CPU2_APCS_WDT1_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 bite expiration time [28:0].

0x020AA088 CPU2_APCS_TMR_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [WDT0, WDT1, GPT0, GPT1, DGT].

The APCS_TMR_STS can be used to determine the status of each of the SCSS timers in the timer's resident clock domain. Since the timer clock domain may be much slower than the AHB clock, AHB transactions may be delayed in taking effect. This information can be used to qualify other actions or used simply for debug purposes. For example, software can determine when a write to APCS_DGT_CLR has taken effect by examining the DGT_CLR_PEND bit.

Each timer's bits are receive security treatment as specified by the APCS_TMRSECURE register.

CPU2_APCS_TMR_STS

Bits	Name	Description
31	RESERVED_BIT31	
30	WDT1_AUTOKICK	Auto-kicker is on (1) or off (0)
29	WDT1_INT_EN	An unmasked interrupt will enable the timer (1) or not (0)
28	WDT1_EN	Timer is enabled (1) or not (0)
27	RESERVED_BIT27	
26	WDT0_AUTOKICK	Auto-kicker is on (1) or off (0)

CPU2_APCS_TMR_STS (cont.)

Bits	Name	Description
25	WDT0_INT_EN	An unmasked interrupt will enable the timer (1) or not (0)
24	WDT0_EN	Timer is enabled (1) or not (0)
23:20	RESERVED_BIT20_23	
19	GPT1_WR_PEND	Timer has a write pending (1) or not (0)
18	GPT1_CLR_PEND	Timer has a clear pending (1) or not (0)
17	GPT1_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
16	GPT1_EN	Timer is enabled (1) or not (0)
15:12	RESERVED_BITS15_12	
11	GPT0_WR_PEND	Timer has a write pending (1) or not (0)
10	GPT0_CLR_PEND	Timer has a clear pending (1) or not (0)
9	GPT0_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
8	GPT0_EN	Timer is enabled (1) or not (0)
7:4	RESERVED_BITS7_4	
3	DGT_WR_PEND	Timer has a write pending (1) or not (0)
2	DGT_CLR_PEND	Timer has a clear pending (1) or not (0)
1	DGT_CLR_ON_MTCH	Timer will reset (1) or hold (0) when it reaches the match value
0	DGT_EN	Timer is enabled (1) or not (0)

11.22 KPSS CPU3 ACC Registers (0x020B8000 CPU3_APCS_ACC_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU3 ACC registers.

0x020B8000 CPU3_APCS_ACCSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0007

Security Treatment: Restricted

The APCS_ACCSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_ACCSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_ACCSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_ACCSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_ACCSECURE register correspond to.

CPU3_APCS_ACCSECURE

Bits	Name	Description
31:4	RESERVED	
31:3	RESERVED_BITS31_3	
2	TST	Controls security treatment for test control registers: APCS_ATSTBUS_SEL 0x1: NSEC 0x0: SEC
1	CLK_CTL	Controls security treatment for the clock control registers: APCS_ACC_STS, APCS_CPU_AUX_CLK_SEL. 0x1: NSEC 0x0: SEC
0	SLP_CTL	Controls security treatment for the sleep control registers: APCS_CPU_PWR_CTL, APCS_CPU_TRGTD_DBG_RST. 0x1: NSEC 0x0: SEC

0x020B8004 CPU3_APCS_CPU_PWR_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0109

Security Treatment: Controlled by APCS_ACCSECURE [SLP_CTL].

The APCS_CPU_PWR_CTL register is used to control the clamps, reset and array head switches.

CPU3_APCS_CPU_PWR_CTL

Bits	Name	Description
31:21	RESERVED_BITS31_21	
20:16	CLK_EN	Clock enables for CORE clock. This is only to workaround hardware dynamic clock gating problems. [20:18]= SYS_apcNAux_Clk[3:1] [17] = SYS_apcsRef_Clk [16] = SYS_apcNPll_Clk 0x1: Always enabled 0x0: dynamically enabled by hardware
15:10	RESERVED_BITS15_10	
9	RET_SLP_REQ	When set, this bit request the L2SCU to in-flight snoop operation and block new snoops request from entering FIFO. This control is intended to permit external masters such as the RPM to put CPU to retention sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a retention sleep request control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU's snoop FIFO is quiesce.
8	PLL_CLAMP	When set, this bit clamp the output of TDC logic in PLL. This signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the APC PLL.
7	CORE_PWRD_UP	Report that the CPU is powered up.
6	GATE_CLK	When set, this bit forces the CPU clock to be gated off. This control is intended to permit external masters such as the RPM to gate off the CPU clock during sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a clock gating control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU clock will be gated off. When set, this bit gate the CPU clock that must be asserted during sleep state. This bit is ORed with a SAW output before passing to the CPU core.
5	COREPOR_RST	When set, this bit asserts corepor areset to the CPU core.
4	CORE_RST	When set, this bit asserts core areset to the COPU core.

CPU3_APCS_CPU_PWR_CTL (cont.)

Bits	Name	Description
3	L2DT_SLP	When set, this bit opens a head switch to put the L2 duplicate tag array into a low-leakage, non-data-retaining state. This bit is ORed with a SAW output before passing to the CPU core. The controlled memory array contains a duplicate of the tags contained in the L1 data cache, and is used by the L2 to snoop and see if a shared memory access from one processor necessitates invalidating a line in another processor's L1 data cache. Thus, this memory array generally can be offline when the associated CPU is power-collapsed and its L1 data cache is also off-line.
2	RESERVED_BIT2	Previously ETB HS
1	RESERVED_BIT1	Previously L1 HS
0	CLAMP	When set, this bit asserts the clamp signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the CPU core.

0x020B8008 CPU3_APCS_ACC_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: N/A

Security Treatment: Controlled by APCS_ACCSECURE [CLK_CTL].

The APCS_ACC_STS register is used to monitor the output of the clock gating cells.

CPU3_APCS_ACC_STS

Bits	Name	Description
31:18	RESERVED_BITS31_18	
17	RET_SLP_ACK	This bit reflect the status of APCN_sysRetSlpAck bit. L2 assert the signal when it see the APCN_sysRetSlpReq and CPU snoop FIFO is quiesced. L2 de-assert this signal after APCN_sysRetSlpReq is de-asserted and all snoop invalidation is completed.
16	SLP_CLK	This bit reflect the status of APCN_sleepClkOnReq bit
15	AHB_CLK	This bit reflect the status of APCN_ahbClkOnReq bit
14	REF_CLK	This bit reflect the status of APCN_refClkOnReq bit
13	SPM_SLP_STATE	This bit reflect the status of SPM Sleep State
12	FRC_CLK_OFF	This bit reflect the status of APCN_apccForceClocksOff bit

10	TRGTD_DBG_RST	This bit reflect the status of APCN_apcTargetedDbg_Areset_N bit
9	CORE_RST	This bit reflect the status of APCN_apccCore_Areset_N bit
8	COREPOR_RST	This bit reflect the status of APCN_apccCorePor_Areset_N bit

CPU3_APCS_ACC_STS (cont.)

Bits	Name	Description
7	L2DT_HS	This bit reflect the status of the SYS_apcNSwCtlDupTagArrayCollapse bit
6	CLAMP	This bit reflect the status of the SYS_apcNClampApcNvd bit.
5:3	CORE_AUX_CLK	This bits reflect the status of the APCS_sysApcNAuxClkOnReq bits.
2	CORE_PLL_CLK	This bit reflect the status of the APCS_sysApcNPllClkOnReq bit.
1	CORE_NO_PWR_DWN	This bit reflect the status of the APCN_dbgCoreNoPwrDwn bits.
0	CORE_PWRUP_REQ	This bit reflect the status of the APCN_dbgCorePwrUpReq bits.

0x020B800C CPU3_APCS_ATSTBUS_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [TST].

APCS_ATSTBUS_SEL selects different modules' test bus outputs.

CPU3_APCS_ATSTBUS_SEL

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2	EN	Set to 1 to cause APCS to drive the test bus outputs. 0x1: enabled 0x0: disabled
1:0	SEL	0x3: CONSTANT 0x2: SAW 0x1: TMR 0x0: CLK

0x020B8010 CPU3_APCS_CPU_TRGTD_DBG_RST

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [SLP_CTL].

APCS_CPU_TRGTD_DBG_RST is used to reset the CPU core debug logic. The hardware clear the register after the CPU debug logic is reset. Software need to poll this register to check if the reset is complete.

CPU3_APCS_CPU_TRGTD_DBG_RST

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	RST	When set this bit de-assert SYS_apcNTargetedDbg_Areset_N to the CPU core for 32 REF clock cycle to the CPU core. At the end of the reset hardware clear this bit.

0x020B8014 CPU3_APCS_CPU_AUX_CLK_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_ACCSECURE [CLK_CTL]

The APCS_CPU_AUX_CLK_SEL register controls the gfmux which selects the AUX clock source for the Krait CPU clock. An additional selection set is provided to determine the clock source for the Krait core (4-1 GFMUX) in the Krait Hard Macro. The QSB clock is the raw source clk at reset.

CPU3_APCS_CPU_AUX_CLK_SEL

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	AUX_SRC	Krait CPU AUX clock select: 0x3: SYS_apcNAux_Clk_1 0x2: SYS_apcNAux_Clk_2 0x1: SYS_apcNAux_Clk_3 0x0: SYS_apcsRef_Clk

11.23 KPSS GCC Registers (0x02011000 APCS_GCC_BASE)

This section contains the Krait Processor Subsystem (KPSS) GCC Secure registers.

0x02011000 APCS_GCCSECURE

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0007

Security Treatment: Restricted

The APCS_GCCSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_GCCSECURE register is not considered; a secure transaction is always allowed. When APROTNS is set to '1', the APCS_GCCSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_GCCSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_GCCSECURE register correspond to.

APCS_GCCSECURE

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2	TST	Controls security treatment for the global test control registers: APCS_ALL_TSTBUS_SEL, APCS_CLK_DIAG, APCS_SPARE, APCS_SPARE_STS 0x1: NSEC 0x0: SEC
1	SLP_CTL	Controls security treatment for the global sleep control registers: APCS_L2_PWR_CTL, APCS_PWR_STS, APCS_DBG_PWR_CTL 0x1: NSEC 0x0: SEC

0x02011004 APCS_IPC_SECURITY

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Restricted

The APCS_IPC_SECURITY register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_IPC_SECURITY register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_IPC_SECURITY register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_IPC_SECURITY register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_IPC_SECURITY register correspond to.

APCS_IPC_SECURITY

Bits	Name	Description
31:0	IPC_SEC	User-defined. (Each bit in this register controls access to the corresponding bit in the APCS_IPC).

0x02011008 APCS_IPC

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_IPC_SECURITY on a bit-wise basis.

Inter-process communication signals from Krait to other masters.

APCS_IPC

Bits	Name	Description
31:0	IPC_INT	User-defined. (Each bit can be written and it will cause an IPC interrupt).

0x0201100C APCS_PWR_CTL_OVERRIDE

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [CLK_CTL].

The APCS_PWR_CTL_OVERRIDE register is used to enable the global APCS clocks. This is used to workaround hardware dynamic clock gating problems.

APCS_PWR_CTL_OVERRIDE

Bits	Name	Description
31:17	RESERVED_BITS31_17	
16	L2_RET_SLP_DIS	When set, this bit will take L2 array out of retention mode. This bit needs to be set before the vdd_mem voltage is lowered. The L2 data will be lost if vdd_mem is lowered to a voltage level such that the internal array voltage is below the retention voltage.
15:10	RESERVED_BITS15_10	
9:0	CLK_EN	Clock enables for global APCS clocks. This is only to work-around hardware dynamic clock gating problems. [9:7]= SYS_apcsL2Aux_Clk[3:1] [6] = SYS_apccL2Pll_Clk [5] = ATB_apcc_Clk [4] = APB_apccDbg_Clk [3] = SYS_apcsPiSleep_Clk [2] = SYS_apcsRef_Clk [1] = SYS_apcsAhb_Clk [0] = SYS_apcsQsb_Clk 0x1: Always enabled 0x0: dynamically enabled by hardware

0x02011010 APCS_GCLK_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: N/A

Security Treatment: Controlled by APCS_GCCSECURE [CLK_CTL].

The APCS_GCLK_STS register is used to monitor the output of the clock gating cells.

APCS_GCLK_STS

Bits	Name	Description
31:10	RESERVED_BITS31_10	

APCS_GCLK_STS (cont.)

Bits	Name	Description
9:0	STS	Status for global APCS clocks [9:7]= APCS_sysL2AuxClkOnReq [6] = APCS_sysL2PllClkOnReq [5] = APCS_sysAtbClkOnReq [4] = APCS_sysApbDbgClkOnReq [3] = APCS_sysSleepClkOnReq [2] = APCS_sysRefClkOnReq [1] = APCS_sysAhbClkOnReq [0] = APCS_sysQsbClkOnReq 0x1: toggling, 0x0: halted

0x02011014 APCS_L2_PWR_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_8100

Security Treatment: Controlled by APCS_GCCSECURE [SLP_CTL].

The APCS_L2_PWR_CTL register controls the L2 Global Distrubuted Head Switch and L2 array head switches.

APCS_L2_PWR_CTL

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	L2_HS_CNT	Count value for headswitched L2 logic
15	PLL_CLAMP	When set, this bit clamp the output of TDC logic in PLL. This signal must be asserted prior to opening the l2swvd head switch.This bit is ORed with SAW output before passing to the L2 PLL .
14	LVE	When set, this bit select the ACC value for low voltage mode for all Krait L2 RAMs.
13	L2_RET_SLP	When set, this bit will put the L2 array in retention mode resulting in lower cache array leakage.The data in the L2 array is retained.. This is ORed with SAW output before passing to the CPU.
12	SYS_RESET	Setting this bit asserts the SYS_apccSys_Areset_N input to the Krait CPU, causing a warm system reset (all powered non-debug logic will be reset) to the CPU core without resetting subsystem functions such as timers, clock control, etc.
11	RESERVED_BIT11	Previous drive SYS_scQdmapHaltReq (resets to 1)
10	L2_HS_RST	When set, this bit asserts reset to the headswitched L2 logic

APCS_L2_PWR_CTL (cont.)

Bits	Name	Description
9	L2_HS_EN	When set, this bit closes the switches for the headswitched L2 logic, putting it into an operational state
8	L2_HS_CLAMP	When set, this bit clamps the outputs from the headswitched L2 logic into the unswitched domain This bit is ORed with SAW outputs before passing to the CPU(resets to 1).
7:4	RESERVED_BITS7_4	
3:2	L2_ARRAY_HS3_2	(Reserved if NUM_CPU < 4). Only for QUAD Krait variant (2 MB L2). When set, these bits open the array head switches for 512 KB sections of the L2 cache array, resulting a lower cache array leakage when data does not need to be retained in the array. These bits are ORed with SAW outputs before passing to the CPU
1:0	L2_ARRAY_HS1_0	When set, these bits open the array head switches for 512 KB sections of the L2 cache array, resulting a lower cache array leakage when data does not need to be retained in the array. These bits are ORed with SAW outputs before passing to the CPU

0x02011018 APCS_PWR_STS

Type: Read Only
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_GCCSECURE [SLP_CTL].

The APCS_PWR_STS register contains the status bits necessary to support an MP with foot switched L2.

APCS_PWR_STS

Bits	Name	Description
31:15	RESERVED_BITS31_15	
14:13	L2_HS_STS3_2	(Reserved if NUM_CPU < 4). Only for QUAD Krait variant (2MB L2). This bit reflects the status of APCS_apccSwCtlL2ArrayCollapse[3:2] signal
12	SPM_SLP_STATE	This bit reflects the status of L2 SPM Sleep state.
11	SAW_SLP_ACK	This bit reflects the status of APCS_apccL2SleepAck signal
10	DBG_RST_STS	This bit reflects the status of APCS_apccDbg_Areset_N signal
9	L2_HS_RST_STS	This bit reflects the status of APCS_apccL2swvd_Areset_N signal
8	L2_CLMP_STS	This bit reflects the status of APCS_apccClampL2swvd signal

APCS_PWR_STS (cont.)

Bits	Name	Description
7	L2_RET_SLP_STS	This bit reflects the status of APCS_apccSwCtlL2RetentionSleep signal
6:5	L2_HS_STS1_0	This bit reflects the status of APCS_apccSwCtlL2ArrayCollapse[1:0] signal
4	DBG_PWRUP_REQ	This bit reflects the status of SYS_apcsDbgPwrUpReq
3	L2_FS_STS	Status for foot-switched L2 logic
2	RESERVED_BITS2	Legacy SC_sysQdmapHaltAck signal
1	L2_CLK_IDLE	This bit reflects the status of the APCC_sysL2ClkIdle signal
0	L2_SLV_IDLE	This bit reflects the status of the APCC_qsbSlvIdle signal

0x0201101C APCS_CLK_DIAG

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [TST].

The APCS_CLK_DIAG register selects the test clock to be output from the APCS to the chip's clock controller. It also controls the functional inputs to the Boundary Scan block.

NOTE The Krait core Leaf clock is always sent to the chip's clock controller as the first test clock. Under proper configuration of the chip's clock controller and the GPIO, this clock can be observed at either the EXT_CLK or through the clock debug test bus.

APCS_CLK_DIAG

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	FAST_CLK_EN	Enable the Krait Diagnostic clock from the leaf of the clock tree.
6	FAST_CLK_INV	Invert the Krait Diagnostic clock output.
5:3	FAST_CLK_SEL	Selects the Krait HS Leaf clock to output for test mode. 0x0: APC0_sysLeaf_Clk 0x1: APC1_sysLeaf_Clk 0x2: APCC_sysL2Leaf_Clk 0x3: SYS_apcsQsb_Clk 0x4: APC2_sysLeaf_Clk (Quad Krait Variant only) 0x5: APC3_sysLeaf_Clk (Quad Krait Variant only) 0x6: Reserved_1 0x7: Reserved_2

APCS_CLK_DIAG (cont.)

Bits	Name	Description
2:0	SLOW_CLK_SEL	Selects the APCS slow clock to output for test mode. 0x0: None (No clock selected, tied low.) 0x1: SYS_apcsAhb_Clk 0x2: SYS_apcsRef_Clk 0x3: SYS_apcsPiSleep_Clk 0x4: APB_apccDbg_Clk 0x5: ATB_apcc_Clk 0x6: Reserved_1 0x7: Reserved_2

0x02011020 APCS_ALL_TSTBUS_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [TST].

The APCS_ALL_TSTBUS_SEL register selects which module's test bus output will be sent out of the subsystem.

APCS_ALL_TSTBUS_SEL

Bits	Name	Description
31:5	RESERVED_BITS31_5	
4	EN	Set to 1 to cause APCS to drive the test bus outputs. 0x1: enabled 0x0: disabled
3:0	SEL	For each category, see appropriate selections for control of the output. 0x6: CONSTANT 0x5: L2 GDHS (SAW2.) 0x4: GLB (global testbus) 0x3: APC3 (Reserved if NUM_CPU < 4.) 0x2: APC2 (Reserved if NUM_CPU < 3.) 0x1: APC1 (Reserved if NUM_CPU < 2) 0x0: APC0

0x02011024 APCS_DBG_PWR_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [SLP_CTL].

The APCS_DBG_PWR_CTL register is used for debugger communication. The REQ bit is used to enable a signal to the RPM to assert a power up sequence when the APCS's interrupt controller receives any enabled interrupt. The clocks need not be running for this signal to propagate.

APCS_DBG_PWR_CTL

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	REQ	Setting this bit asserts APCS_dbgPwrUpInt. Note that this signal can also be set by hardware.

0x02011028 APCS_L2_AUX_CLK_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [CLK_CTL]

The APCS_L2_AUX_CLK_SEL register controls the gfmux which selects the AUX clock source for the Krait MP's L2 clock. An additional selection set is provided to determine the clock source for the Krait core (4-1 GFMUX) in the Krait Hard Macor. The QSB clock is the raw source clk at reset.

APCS_L2_AUX_CLK_SEL

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	AUX_SRC	Krait AUX clock select: 0x3: SYS_apcsL2Aux_Clk_1 0x2: SYS_apcsL2Aux_Clk_2 0x1: SYS_apcsL2Aux_Clk_3 0x0: SYS_apcsRef_Clk

0x0201102C APCS_SPARE

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [TST].

The APCS_SPARE register is used for ECO. The output of this register is controlled by BSL.

APCS_SPARE

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	BITS	SPARE BITS for ECO

0x02011030 APCS_SPARE_STS

Type: Read Only
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [TST].

The output of the APCS_SPARE BSL register.

APCS_SPARE_STS

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	BITS	SPARE BITS for ECO

0x02011FD0 APCS_VERSION

Type: Read Only
Clock: SYS_AHB_CLK
Reset State: 0x1001_0000
Security Treatment: Controlled by APCS_GCCSECURE [CLK_CTL].

This read only register reports the hardware version information for the KPSS core.

.

APCS_VERSION

Bits	Name	Description
31:28	MAJOR	Indicate different interface version. Major version changes are not backward compatible
15:0	MINOR	Indicates expanded functionality. Minor versions add functionality while being backward compatible
15:0	STEP	Indicates a change in the hardware which is not intended to impact software

11.24 KPSS CPU3 SAW2 Registers (0x020B9000 CPU3_APCS_SAW2_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU3 SAW2 registers.

11.24.1 SAW2 Registers

The SAW2 (SPM and AVS. Wrapper2) design is an AHB slave that contains both SPM and AVS. CSRs.

0x020B9000 CPU3_APCS_SAW2_SECURE

Type: Read/write
Clock: SYS_REF_CLK
Reset State: {3{CFGNSINIT}}

Security Treatment: Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to ’0’ the state of the SAW2_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to ’1’, the SAW2_SECURE register security treatment bit of that register must be ’1’ for access to be granted. If the security treatment bit of the register is set to ’0’, the non-secure (ahb_saw_hprotns = ’1’) transactions are denied. When access is denied, a write is ignored, and a read will return ’0’. No error is signaled.

When reading the SAW2_SECURE register, non-secure agents will always read ’0’. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

CPU3_APCS_SAW2_SECURE

Bits	Name	Description
31:3	RESERVED	
2	SAW_CTL	Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST 0x1: NSEC 0x0: SEC
1	PWR_CTL	Controls security treatment for SPM registers: SAW2_SPM_CTL, SAW2_SPM_PMIC_DLY, SAW2_SPM_PMIC_DATA_0, SAW2_SPM_PMIC_DATA_1, SAW2_SPM_SLP_SEQ_ENTRY_n, SAW2_SPM_DLY 0x1: NSEC 0x0: SEC
0	VLT_CTL	Controls security treatment for the AVS. registers: SAW2_AVS_CTL, SAW2_VLVL, SAW2_AVS_HYSTERESIS 0x1: NSEC 0x0: SEC

0x020B9004 CPU3_APCS_SAW2_ID

Type: Read
Clock: SYS_REF_CLK
Reset State: Undefined

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register reports the revision and parameter information for the SAW2 core.

CPU3_APCS_SAW2_ID

Bits	Name	Description
31	RESERVED_BITS31	
30:25	NUM_SPM_ENTRY	SAW2 parameter: Indicates number of SAW2_SPM_SLP_SEQ_ENTRY register implemented. Value can range from 1 - 32
24:20	NUM_PWR_CTL	SAW2 parameter: Indicates number of power control implemented. Value can range from 2 - 16
19	RESERVED_BITS19	
18	PMIC_ARB_INTF	SAW2 parameter: Indicates PMIC Arbiter Interface function is implemented
17	AVS_PRESENT	SAW2 parameter: Indicates AVS. function is implemented
16	SPM_PRESENT	SAW2 parameter: Indicates SPM function is implemented
15:12	MAJOR	Major variant
11:0	MINOR	Minor variant

0x020B9008 CPU3_APCS_SAW2_CFG

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_CFG register is used to configure the common control between AVS. and SPM.system.

CPU3_APCS_SAW2_CFG

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON.
11:8	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port.

CPU3_APCS_SAW2_CFG (cont.)

Bits	Name	Description
7:6	RESERVED_BITS7_6	
5	PMIC_MODE	PMIC Handshake 0x0: 8K_PMIC (only DONE signal) 0x1: 7K_PMIC (both ACK and DONE signals)
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period. ..... For sys_ref_clk = 20 MHz (53ns) The timer tick range 53 ns to 1.6us. 0x0: Timer Tick every sys_ref_clk 0x1F: Timer Tick every 128 sys_ref_clk.

0x020B900C CPU3_APCS_SAW2_STS_0

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

CPU3_APCS_SAW2_STS_0

Bits	Name	Description
15	SHTDWN_REQ	This bit reflects the shutdown request from the SPM(spm_rpm_shutdown_req) to RPM.
14	SHTDWN_ACK	This bit reflects the shutdown acknowledgement from the RPM(rpm_spm_shutdown_ack) to SPM.
13	BRNGUP_REQ	This bit reflects the bringup request from the SPM(spm_rpm_bringup_req) to RPM.
12	BRNGUP_ACK	This bit reflects the bringup acknowledgement from the RPM(rpm_spm_bringup_ack) to SPM.
11:10	PMIC_STATE	State of the PMIC FSM: transitions back to IDLE) transitions back to IDLE) 0x0: IDLE (waiting for PMIC transaction from AVS. or SPM) 0x1: ACK (waiting for ACK from PMIC Arb) 0x2: DONE (waiting for DONE form PMIC Arb before) 0x3: DELAY (waiting for delay count termination before)

CPU3_APCS_SAW2_STS_0 (cont.)

Bits	Name	Description
9:8	RPM_STATE	State of the RPM FSM: 0x0: RUN (waiting for SPM request) 0x1: STDNACK (waiting for shutdown ACK from RPM) 0x2: WAKEUP (waiting for wakeup interrupt) 0x3: BGUPACK (waiting for bringup ACK from RPM)
7	AVS_STATE	State of the AVS. FSM: indication) 0x0: IDLE (waiting to be enabled or for next UP/DOWN) 0x1: REQ (waiting for PMIC FSM to transition to IDLE)
6:0	SPM_CMD_ADDR	Last SPM command executed.

0x020B9010 CPU3_APCS_SAW2_STS_1

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

CPU3_APCS_SAW2_STS_1

Bits	Name	Description
31	RESERVED1	
30	SW_WR_PEND	This bit reflects the VLVL state of the request from the SAW2_VCTL write is pending.
29	CPU_UP	This bit reflects the VLVL state of the request from the CPU (avs_saw_up) to raise the VLVL.
28	CPU_DN	This bit reflects the VLVL state of the request from the CPU (avs_saw_down) to lower the VLVL.
27	MAX_INT	IRQ status bit, AVS. controller detected that raising the VLVL by AVS_CTL[VLVL_STEP] would result in a value greater than AVS_CTL[MAX_VLVL]. If AVS_CTL[IRQ_MAX_EN] is set, an interrupt is issued. NOTE that SW can set MAX_VLVL lower than current VLVL creating a condition where VLVL is higher than MAX_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MAX.

CPU3_APCS_SAW2_STS_1 (cont.)

Bits	Name	Description
26	MIN_INT	IRQ status bit, AVS. controller detected that lowering the VLVL by SAW2_AVS_CTL[VLVL_STEP] would result in a value less than SAW2_AVS_CTL[MIN_VLVL]. If SAW2_AVS_CTL[IRQ_MIN_EN] is set, an interrupt is issued. NOTE that SW can set MIN_VLVL higher than current VLVL creating a condition where VLVL is lower than MIN_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MIN.
25:16	CURR_DLY	VLVL value of the counter used to calculate the time until the next AVS. controller request for a new VLVL.

0x020B9014 CPU3_APCS_SAW2_VCTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

Though this register is read/writable, it also causes a command pulse to the PMIC FSM. Writing this register results in a transaction to the PMIC with SAW2_VCTL being sent to the PMIC. SAW2 support both 8901 and 8058 regulator.

CPU3_APCS_SAW2_VCTL

Bits	Name	Description
31:16	RESERVED_BITS31_16	

0x020B9018 CPU3_APCS_SAW2_AVS_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_CTL register is used to control the Adaptive Voltage Scaling (AVS) system.

CPU3_APCS_SAW2_AVS_CTL

Bits	Name	Description
31	RESERVED	

CPU3_APCS_SAW2_AVS_CTL (cont.)

Bits	Name	Description
30	VLVL_WIDTH	Defines the VLVL field of PMIC data. SAW2 at minimum supports 8901 and 8058 regulator. See PMIC document for details. 0x0: 5 bits VLVL (8058 regulator) 0x1: 6 bits VLVL (8901 regulator)
29:28	VLVL_STEP	Controls the step size of each request to PMIC Arbiter. SW may use values from 0 to 3. Note that the value 0 will result in no change - that is if the CPU requests UP or DOWN, the CURR_PVLVL will be sent to the PMIC Arbiter. This may be useful for debug. If an increment or decrement operation would cause the current VLVL to transition above or below the MAX_VLVL or MIN_VLVL, the current VLVL will not be changed. An interrupt will be signaled if IRQ_MAX/MIN_EN is 1
27	EN	AVS. Enable. **NOTE** Setting to 0 does not disable any pending interrupts. **NOTE** AVS. FSM and SPM FSM are mutually exclusive. Only one FSM is active at a time. SW does not have to disable AVS. before going to sleep. 0x0: Disable AVS 0x1: Enable AVS
26	SW_DONE_INT_EN	Set to 1 to turn on AVS. interrupt for when a SW initiated voltage change has completed. Set to 0 to mask it (turn it off). ASSERTION: This interrupt is asserted only after a SW write to SAW2_AVS_VLVL. Specifically, after the AVS. FSM traverses through all its states and transitions back to IDLE, the interrupt line is pulsed. The interrupt controller should be set to edge capture to receive this interrupt. CLEARING: None. This interrupt is a pulse, SW does not need to clear it (aside from requirements of the interrupt controller).
25	MAX_INT_EN	Set to 1 to turn on AVS. interrupt for MAX_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be greater than MAX_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit.
24	MIN_INT_EN	Set to 1 to turn on AVS. interrupt for MIN_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be smaller than MIN_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit
23	RESERVED_23	

CPU3_APCS_SAW2_AVS_CTL (cont.)

Bits	Name	Description
22:17	MAX_VLVL	Control maximum value of AVS. controller's VLVL. When current VLVL reaches this value it may not grow any larger. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level higher, an interrupt is issued. This value may be updated at anytime. Setting to a value lower than MIN_VLVL is not supported, and unpredictable results may occur.
16	RESERVED_16	
15:10	MIN_VLVL	Control the minimum value of AVS. controller's VLVL. When the current VLVL reaches this level it may not shrink any smaller. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level lower, an interrupt is issued. This value may be updated at anytime. Setting to a value higher than MAX_VLVL is not supported, and unpredictable results may occur.
9:0	AVS_DELAY	Control the time between AVS. controller's requests to change the VLVL

0x020B901C CPU3_APCS_SAW2_AVS_HYSTERESIS

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_HYSTERESIS register is used to delay the AVS. UP/DN signal to AVS. FSM. This is used to prevent the false PMIC step due to PDN noise.

CPU3_APCS_SAW2_AVS_HYSTERESIS

Bits	Name	Description
31:24	RESERVED31_24	
23:16	DN_COUNT	HYSTERESIS DN COUNT. Delays of PMIC DN step operation.
15:8	RESERVED15_8	
7:0	UP_COUNT	HYSTERESIS UP COUNT. Delays of PMIC UP step operation.

0x020B9020 CPU3_APCS_SAW2_SPM_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

CPU3_APCS_SAW2_SPM_CTL

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	SPM_START_ADR	Start address for the SPM sequence.
3	ISAR	Inhibit Start Address Reset 0x0: End of program reset the SPM_START_ADR to zero. 0x1: Inhibit End of program to reset SPM_START_ADR
2:1	WAKEUP_CONFIG	Wakeup Configuration 0x0: sys_spm_wakeup 0x1: sys_spm_wakeup or !cpu_spm_wait_req 0x2: sys_spm_wakeup or rising edge of sys_spm_dbg_nopwrdwn 0x3: sys_spm_wakeup or !cpu_spm_wait_req or rising edge of sys_spm_dbg_nopwrdwn
0	SPM_EN	SPM En.

0x020B9024 CPU3_APCS_SAW2_SPM_PMIC_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC delay values after SPM FSM PMIC transaction. SPM wait for the programmed delay before executing the next SPM command.

CPU3_APCS_SAW2_SPM_PMIC_DLY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:24	DATA_1_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
23:19	RESERVED_BITS23_19	
18:16	DATA_1_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
15:11	RESERVED_BITS15_11	

CPU3_APCS_SAW2_SPM_PMIC_DLY (cont.)

Bits	Name	Description
10:8	DATA_0_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
7:3	RESERVED_BITS7_3	
2:0	DATA_0_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms

0x020B9028 CPU3_APCS_SAW2_SPM_PMIC_DATA_0

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

CPU3_APCS_SAW2_SPM_PMIC_DATA_0

Bits	Name	Description

0x020B902C CPU3_APCS_SAW2_SPM_PMIC_DATA_1

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

CPU3_APCS_SAW2_SPM_PMIC_DATA_1

Bits	Name	Description

0x020B9030 CPU3_APCS_SAW2_RST

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_RST register is used to reset the SAW logic. This register clear itself. It does not reset any SAW2 CSRs. It reset AVS. and SPM FSM and control registers. This is use to clear any hang condition.

CPU3_APCS_SAW2_RST

Bits	Name	Description
31:1	RESERVED31_1	
0	RST	Reset AVS. and SPM FSM and control registers.

0x020B9034 CPU3_APCS_SAW2_SPM_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the delay values for SPM Delay command. SPM wait for the programmed delay before executing the next SPM command.

CPU3_APCS_SAW2_SPM_DLY

Bits	Name	Description
31:30	RESERVED_BITS31_30	
29:20	DLY3	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
19:10	DLY2	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
9:0	DLY1	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

0x020B9080+4*n CPU3_APCS_SAW2_SPM_SLP_SEQ_ENTRY_n

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter.

CPU3_APCS_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description

11.25 KPSS CPU3Timer Registers (0x020BA000 CPU3_APCS_TMR_BASE)

This section contains the Krait Processor Subsystem (KPSS) CPU3 Timer registers.

0x020BA000 CPU3_APCS_TMRSECURE

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Restricted

The APCS_TMRSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Scorpion's APROTNS pin. When APROTNS is set to '0' the state of the APCS_TMRSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_TMRSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_TMRSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_TMRSECURE register correspond to.

CPU3_APCS_TMRSECURE

Bits	Name	Description
31:5	RESERVED	
4	WDT0	Controls security treatment for the Watch Dog Timer registers: APCS_WDT0_FRZ, APCS_WDT0_INT_EN, APCS_WDT0_STS, APCS_WDT0_INT_WIDTH, APCS_WDT0_BARK_TIME, APCS_WDT0_TST_LD_STS, APCS_WDT0_TST_LD. 0x1: NSEC 0x0: SEC
3	WDT1	Controls security treatment for the Watch Dog Timer registers: APCS_WDT1_FRZ, APCS_WDT1_INT_EN, APCS_WDT1_STS, APCS_WDT1_INT_WIDTH, APCS_WDT1_BARK_TIME, APCS_WDT1_TST_LD_STS, APCS_WDT1_TST_LD. 0x1: NSEC 0x0: SEC
2	GPT0	Controls security treatment for the General Purpose Timer registers: APCS_GPT1_MTCH, APCS_GPT1__CNT, APCS_GPT1_EN, APCS_GPT1_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC

CPU3_APCS_TMRSECURE (cont.)

Bits	Name	Description
1	GPT1	Controls security treatment for the General Purpose Timer registers: APCS_GPT0_MTCH, APCS_GPT0__CNT, APCS_GPT0_EN, APCS_GPT0_CLR and bits 11-8 of APCS_TMR_STS. 0x1: NSEC 0x0: SEC
0	DGT	Controls security treatment for the Debug Timer registers; APCS_DGT_MTCH, APCS_DGT_CNT, APCS_DGT_EN, APCS_DGT_CLR, APCS_DGT_CLK_CTL, and bits 3-0 of APCS_TMR_STS 0x1: NSEC 0x0: SEC

0x020BA004 CPU3_APCS_GPT0_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: APCS_TMRSECURE [GPT0].

The general purpose timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT0_MTCH register.

CPU3_APCS_GPT0_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT0_CNT at which an interrupt will be generated.

0x020BA008 CPU3_APCS_GPT0_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CNT register contains the current value of the GPT0 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT0_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_GPT0_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT0_EN.

- Write APCS_GPT0_CNT.
- Write (to set/restore) APCS_GPT0_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT0_EN.

CPU3_APCS_GPT0_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer.

0x020BA00C CPU3_APCS_GPT0_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_EN register is used to enable the GPT0 timer.

CPU3_APCS_GPT0_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency ACC_SLP_CLK.

0x020BA010 CPU3_APCS_GPT0_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT0].

The APCS_GPT0_CLR register is a one-shot command register that, when written with any value, resets the timer to a value of 0. This occurs regardless of the state of the APCS_GPT0_EN register.

CPU3_APCS_GPT0_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x020BA014 CPU3_APCS_GPT1_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The GPT timer will signal interrupt when its counter value has reached the value stored in the APCS_GPT1_MTCH register.

CPU3_APCS_GPT1_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_GPT1_CNT at which an interrupt will be generated.

0x020BA018 CPU3_APCS_GPT1_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CNT register contains the current value of the GPT1 timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_GPT1_MTCH register at the same time. The procedure for writing the APCS_GPT1_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_GPT1_EN.
- Write APCS_GPT1_CNT.
- Write (to set/restore) APCS_GPT1_MTCH if required.
- Enable the timer by setting the EN bit in APCS_GPT1_EN.

CPU3_APCS_GPT1_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer

0x020BA01C CPU3_APCS_GPT1_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_EN register is used to enable the GPT1 timer.

CPU3_APCS_GPT1_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	CLR_ON_MTCH_EN	When set (1), timer will clear when it reaches the match value.
0	EN	When set (1), timer is enabled and counts with frequency sleep clock.

0x020BA020 CPU3_APCS_GPT1_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [GPT1].

The APCS_GPT1_CLR register is a one-shot command register that, when written with any value, resets the GPT1 timer to a value of 0. This occurs regardless of the state of the APCS_GPT1_EN register.

CPU3_APCS_GPT1_CLR

Bits	Name	Description
31:0	RESERVED_BITS_31_0	Data written is not used.

0x020BA024 CPU3_APCS_DGT_MTCH

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The DBG timer will signal interrupt when its counter value has reached the value stored in the APCS_DGT_MTCH register.

CPU3_APCS_DGT_MTCH

Bits	Name	Description
31:0	MTCH	The value of APCS_DGT_CNT at which an interrupt will be generated.

0x020BA028 CPU3_APCS_DGT_CNT

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CNT register contains the current value of the DGT timer. The current value can be set by software.

The count value is writable as a test/debug only feature. Writing this register ALSO changes the APCS_DGT_MTCH register at the same time due to HW re-use. The procedure for writing the APCS_DGT_CNT is as follows:

- Disable the timer by clearing the EN bit in APCS_DGT_EN.
- Write APCS_DGT_CNT.
- Write (to set/restore) APCS_DGT_MTCH if required.
- Enable the timer by setting the EN bit in APCS_DGT_EN.

CPU3_APCS_DGT_CNT

Bits	Name	Description
31:0	CNT	The current value of the timer count

0x020BA02C CPU3_APCS_DGT_EN

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_EN register is used to enable the DGT timer.

CPU3_APCS_DGT_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	

CPU3_APCS_DGT_EN (cont.)

Bits	Name	Description
1	CLR_ON_MTCH_EN	When set (1), the timer will clear when it reaches the match value.
0	EN	When set (1), the timer is enabled and counts with frequency TCXO clock.

0x020BA030 CPU3_APCS_DGT_CLR

Type: Write (Command)
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLR register is a one-shot command register that, when written with any value, resets the DGT timer to a value of 0. This occurs regardless of the state of the APCS_DGT_EN register.

CPU3_APCS_DGT_CLR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Data written is not used.

0x020BA034 CPU3_APCS_DGT_CLK_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0003

Security Treatment: Controlled by APCS_TMRSECURE [DGT].

The APCS_DGT_CLK_CTL controls the clock divider inside the Debug Timer.

NOTE It is possible for the AHB clock to run at as slow as 5 MHz using settings of the Global Clock Controller. The debug timer's counter can also run at 5 MHz (TCXO divided by 4). However, due to the synchronization circuit using the edge detect, the timer should always run at least 4x slower than the AHB clock. Thus, if the timer's use is required by the system, the divider should be set to divide by 4 and the slowest usable AHB frequency is 20MHz. The timer would run at 5MHz in this case.

CPU3_APCS_DGT_CLK_CTL

Bits	Name	Description
31:2	RESERVED_BITS_31_2	

CPU3_APCS_DGT_CLK_CTL (cont.)

Bits	Name	Description
1:0	DIV	0x3: 4 0x2: 3 0x1: 2 0x0: 1

0x020BA038 CPU3_APCS_WDT0_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

CPU3_APCS_WDT0_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT0_STB during the non-sleep mode. A pulse is generated on WDT0_STB when this bit is written with a ’1

0x020BA03C CPU3_APCS_WDT0_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT0_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

CPU3_APCS_WDT0_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved

CPU3_APCS_WDT0_FRZ (cont.)

Bits	Name	Description
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a '1'.

0x020BA040 CPU3_APCS_WDT0_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_EN register controls when the watch dog timer is enabled.

CPU3_APCS_WDT0_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x020BA044 CPU3_APCS_WDT0_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_STS register is the watchdog status register.

CPU3_APCS_WDT0_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The sleep counter value is sampled using the AHB clk. Multiple reads are required to determine the value (assuming AHB clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog0 counter reset.

CPU3_APCS_WDT0_STS (cont.)

Bits	Name	Description
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT0) 0x0: reset (the last system reset was not due to WDT0.)

0x020BA048 CPU3_APCS_WDT0_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_INT_WIDTH register defines the width of the WDT0 biteExpired pulse in the number of sleep_clk pulses. The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

CPU3_APCS_WDT0_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to de-assert the WDI bite pulse.

0x020BA04C CPU3_APCS_WDT0_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (’bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (’bark’) interrupt.

CPU3_APCS_WDT0_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter value on which to trigger the bark interrupt.

0x020BA050 CPU3_APCS_WDT0_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

CPU3_APCS_WDT0_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x020BA054 CPU3_APCS_WDT0_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TEST_LD register loads the WDT0_TST register value into the watchdog counter.

CPU3_APCS_WDT0_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT0_TST register into the WDT0 counter.

0x020BA058 CPU3_APCS_WDT0_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

CPU3_APCS_WDT0_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 counter test load value [28:0].

0x020BA05C CPU3_APCS_WDT0_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT0].

The APCS_WDT0_BITE_TIME register determines the counter value at which WDT0 asserts the biteExpired signal.

CPU3_APCS_WDT0_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT0 bite expiration time [28:0].

0x020BA060 CPU3_APCS_WDT1_RST

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_RST register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

CPU3_APCS_WDT1_RST

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	STB	This bit generates the WDT1_STB during the non-sleep mode. A pulse is generated on WDT1_STB when this bit is written with a ’1

0x020BA064 CPU3_APCS_WDT1_FRZ

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_FRZ register freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep. This register is reset by setting the APCS_WDT1_RST register.

NOTE This register is only needed for backward compatible power-on sleep, not for power-collapsed sleep.

CPU3_APCS_WDT1_FRZ

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	FRZ	This bit is used to freeze the watchdog timer at time 0. To enable the watchdog timer auto-kicker, write a ’1’.

0x020BA068 CPU3_APCS_WDT1_EN

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_EN register controls when the watchdog timer is enabled.

CPU3_APCS_WDT1_EN

Bits	Name	Description
31:2	RESERVED_BITS_31_2	Reserved
1	INT_EN	Any write to this register: 0x1: yes (any unmasked IRQ or FIQ will enable the WDT0 timer.) 0x0: no
0	EN	Any write to this register: 0x1: yes (the watch dog timer is enabled) 0x0: no

0x020BA06C CPU3_APCS_WDT1_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_STS register is the watchdog status register.

CPU3_APCS_WDT1_STS

Bits	Name	Description
31:3	WDT_CNT	Counter value [28:0] of the watch dog counter. **NOTE** The counter value is sampled using the ahb clk. Multiple reads are required to determine the value (assuming ahb clk is much faster than sleep clock).
2	WDT_RST_STS	Show the status of watchdog counter reset.
1	AUTOKICK	This bit indicates whether the auto-kicker is on. 0x1: On 0x0: Off
0	RST_STS	0x1: wdt (the last system reset was due to WDT1) 0x0: reset (the last system reset was not due to WDT1.)

0x020BA070 CPU3_APCS_WDT1_INT_WIDTH

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_INT_WIDTH register defines the width of the WDT1_expired pulse in the number of sleep_clk pulses.The default value is 0x0C7C, but this reset value is not readable through the AHB interface.

CPU3_APCS_WDT1_INT_WIDTH

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to de-assert the WDI expired pulse.

0x020BA074 CPU3_APCS_WDT1_BARK_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (’bark’) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (’bark’) interrupt.

CPU3_APCS_WDT1_BARK_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the wdog bark time is synchronizing to the SLP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter value on which to trigger the bark interrupt.

0x020BA078 CPU3_APCS_WDT1_TST_LD_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TST_LD_STS register indicates when the watchdog test load is synchronizing to the SLP_CLK.

CPU3_APCS_WDT1_TST_LD_STS

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SYNC_STS	When set (1) wdog test load is synchronizing to SLP_CLK. Data value is not guaranteed until sync_status bit is clear (0).

0x020BA07C CPU3_APCS_WDT1_TST_LD

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TEST_LD register loads the WDT1_TST register value into the watchdog counter.

CPU3_APCS_WDT1_TST_LD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	LD	Set on this bit to load the value into the WDT1_TST register into the WDT counter

0x020BA080 CPU3_APCS_WDT1_TST

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: Undefined

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_TST register indicates that the watchdog test is synchronizing to the SLP_CLK and contains the watch dog counter test load value.

CPU3_APCS_WDT1_TST

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 counter test load value [28:0]

0x020BA084 CPU3_APCS_WDT1_BITE_TIME

Type: Read/write
Clock: SYS_AHB_CLK
Reset State: 0x0000_31F3

Security Treatment: .Controlled by APCS_TMRSECURE [WDT1].

The APCS_WDT1_BITE_TIME register determines the counter value at which WDT1 asserts the biteExpired signal.

CPU3_APCS_WDT1_BITE_TIME

Bits	Name	Description
31:30	RESERVED_BITS_31_30	Reserved
29	SYNC_STS	When set (1), the watchdog bite time is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STS bit is clear (0). This bit is read only.
28:0	DATA	The WDT1 bite expiration time [28:0].

0x020BA088 CPU3_APCS_TMR_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_TMRSECURE [WDT0, WDT1, GPT0, GPT1, DGT].

The APCS_TMR_STS can be used to determine the status of each of the SCSS timers in the timer's resident clock domain. Since the timer clock domain may be much slower than the AHB clock, AHB transactions may be delayed in taking effect. This information can be used to qualify other actions or used simply for debug purposes. For example, software can determine when a write to APCS_DGT_CLR has taken effect by examining the DGT_CLR_PEND bit.

Each timer's bits are receive security treatment as specified by the APCS_TMRSECURE register.

CPU3_APCS_TMR_STS

Bits	Name	Description
31	RESERVED_BIT31	
30	WDT1_AUTOKICK	Auto-kicker is on (1) or off (0)
29	WDT1_INT_EN	An unmasked interrupt will enable the timer (1) or not (0)
28	WDT1_EN	Timer is enabled (1) or not (0)
27	RESERVED_BIT27	
26	WDT0_AUTOKICK	Auto-kicker is on (1) or off (0)

CPU3_APCS_TMR_STS (cont.)

Bits	Name	Description
25	WDT0_INT_EN	An unmasked interrupt will enable the timer (1) or not (0)
24	WDT0_EN	Timer is enabled (1) or not (0)
23:20	RESERVED_BIT20_23	
19	GPT1_WR_PEND	Timer has a write pending (1) or not (0)

11.26 KPSS GLB Registers (0x02090000 EXT_APCS_GLB_BASE)

This section contains the Krait Processor Subsystem (KPSS) GLB registers.

0x02090000 EXT_APCS_GLBSECURE

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0001

Security Treatment: Restricted

The APCS_GLBSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_GLBSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_GLBSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_GLBSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_GCCSECURE register correspond to.

EXT_APCS_GLBSECURE

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	GLB_CTL	Controls security treatment for the global control registers: APCS_START_ADDR. 0x1: NSEC 0x0: SEC

0x02090004 EXT_APCS_START_ADDR

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: {START_ADDR, 0x0000}

Security Treatment: Controlled by APCS_GLBSECURE[GLB_CTL].

The APCS_START_ADDR register is used to determine the address to boot from. It resets to the value on START_ADDR PARAMETER.Reset by SYS_apcsSYSPor_Ares|SYS_apcsSys_Ares

EXT_APCS_START_ADDR

Bits	Name	Description
31:16	ADDR	Start address for the Krait

EXT_APCS_START_ADDR (cont.)

Bits	Name	Description
15:0	RESERVED_BITS15_0	

11.27 KPSS GCC Registers (0x02091000 EXT_APCS_GCC_BASE)

This section contains the Krait Processor Subsystem (KPSS) GCC registers.

0x02091000 EXT_APCS_GCCSECURE

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0007

Security Treatment: Restricted

The APCS_GCCSECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_GCCSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_GCCSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_GCCSECURE register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_GCCSECURE register correspond to.

EXT_APCS_GCCSECURE

Bits	Name	Description
31:3	RESERVED_BITS31_3

1	SLP_CTL	Controls security treatment for the global sleep control registers: APCS_L2_PWR_CTL, APCS_PWR_STS, APCS_DBG_PWR_CTL 0x1: NSEC 0x0: SEC
0	CLK_CTL	Controls security treatment for the global clock control registers: APCS_PWR_CTL_OVERRIDE, APCS_GCLK_STS, APCS_L2_AUX_CLK_SEL 0x1: NSEC 0x0: SEC

0x02091004 EXT_APCS_IPC_SECURITY

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Restricted

The APCS_IPC_SECURITY register is used to enable or disable non-secure bus transactions. The bus security status is signaled by Krait's APROTNS pin. When APROTNS is set to '0' the state of the APCS_IPC_SECURITY register is not considered; a secure transaction is always allowed. When APROTNS is set to '1', the APCS_IPC_SECURITY register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_IPC_SECURITY register, non-secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_IPC_SECURITY register correspond to.

EXT_APCS_IPC_SECURITY

Bits	Name	Description
31:0	IPC_SEC	User-defined. (Each bit in this register controls access to the corresponding bit in the APCS_IPC).

0x02091008 EXT_APCS_IPC

Type: Write (command)
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_IPC_SECURITY on a bit-wise basis.

Inter-process communication signals from Krait to other masters.

EXT_APCS_IPC

Bits	Name	Description
31:0	IPC_INT	User-defined. (Each bit can be written and it will cause an IPC interrupt).

0x0209100C EXT_APCS_PWR_CTL_OVERRIDE

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [CLK_CTL].

The APCS_PWR_CTL_OVERRIDE register is used to enable the global APCS clocks. This is used to workaround hardware dynamic clock gating problems.

EXT_APCS_PWR_CTL_OVERRIDE

Bits	Name	Description
31:17	RESERVED_BITS31_17	
16	L2_RET_SLP_DIS	When set, this bit will take L2 array out of retention mode. This bit needs to be set before the vdd_mem voltage is lowered. The L2 data will be lost if vdd_mem is lowered to a voltage level such that the internal array voltage is below the retention voltage.
15:10	RESERVED_BITS15_10	
9:0	CLK_EN	Clock enables for global APCS clocks. This is only to workaround hardware dynamic clock gating problems. [9:7]= SYS_apcsL2Aux_Clk[3:1] [6] = SYS_apccL2Pll_Clk [5] = ATB_apcc_Clk [4] = APB_apccDbg_Clk [3] = SYS_apcsPiSleep_Clk [2] = SYS_apcsRef_Clk [1] = SYS_apcsAhb_Clk [0] = SYS_apcsQsb_Clk 0x1: Always enabled 0x0: dynamically enabled by hardware

0x02091010 EXT_APCS_GCLK_STS

Type: Read
Clock: SYS_AHB_CLK
Reset State: N/A

Security Treatment: Controlled by APCS_GCCSECURE [CLK_CTL].

The APCS_GCLK_STS register is used to monitor the output of the clock gating cells.

EXT_APCS_GCLK_STS

Bits	Name	Description
31:10	RESERVED_BITS31_10	

EXT_APCS_GCLK_STS (cont.)

Bits	Name	Description
9:0	STS	Status for global APCS clocks [9:7]= APCS_sysL2AuxClkOnReq [6] = APCS_sysL2PllClkOnReq [5] = APCS_sysAtbClkOnReq [4] = APCS_sysApbDbgClkOnReq [3] = APCS_sysSleepClkOnReq [2] = APCS_sysRefClkOnReq [1] = APCS_sysAhbClkOnReq [0] = APCS_sysQsbClkOnReq 0x1: toggling, 0x0: halted

0x02091014 EXT_APCS_L2_PWR_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_8100

Security Treatment: Controlled by APCS_GCCSECURE [SLP_CTL].

The APCS_L2_PWR_CTL register controls the L2 Global Distrubuted Head Switch and L2 array head switches.

EXT_APCS_L2_PWR_CTL

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	L2_HS_CNT	Count value for headswitched L2 logic
15	PLL_CLAMP	When set, this bit clamp the output of TDC logic in PLL. This signal must be asserted prior to opening the l2swvd head switch.This bit is ORed with SAW output before passing to the L2 PLL .
14	LVE	When set, this bit select the ACC value for low voltage mode for all Krait L2 RAMs.
13	L2_RET_SLP	When set, this bit will put the L2 array in retention mode resulting in lower cache array leakage.The data in the L2 array is retained.. This is ORed with SAW output before passing to the CPU.
12	SYS_RESET	Setting this bit asserts the SYS_apccSys_Areset_N input to the Krait CPU, causing a warm system reset (all powered non-debug logic will be reset) to the CPU core without resetting subsystem functions such as timers, clock control, etc.
11	RESERVED_BIT11	Previous drive SYS_scQdmapHaltReq (resets to 1)
10	L2_HS_RST	When set, this bit asserts reset to the headswitched L2 logic

EXT_APCS_L2_PWR_CTL (cont.)

Bits	Name	Description
9	L2_HS_EN	When set, this bit closes the switches for the headswitched L2 logic, putting it into an operational state
8	L2_HS_CLAMP	When set, this bit clamps the outputs from the headswitched L2 logic into the unswitched domain This bit is ORed with SAW outputs before passing to the CPU(resets to 1).
7:4	RESERVED_BITS7_4	
3:2	L2_ARRAY_HS3_2	(Reserved if NUM_CPU < 4). Only for QUAD Krait variant (2 MB L2). When set, these bits open the array head switches for 512 KB sections of the L2 cache array, resulting a lower cache array leakage when data does not need to be retained in the array. These bits are ORed with SAW outputs before passing to the CPU
1:0	L2_ARRAY_HS1_0	When set, these bits open the array head switches for 512 KB sections of the L2 cache array, resulting a lower cache array leakage when data does not need to be retained in the array. These bits are ORed with SAW outputs before passing to the CPU

0x02091018 EXT_APCS_PWR_STS

Type: Read Only
Clock: SYS_AHB_CLK
Reset State: NA

Security Treatment: Controlled by APCS_GCCSECURE [SLP_CTL].

The APCS_PWR_STS register contains the status bits necessary to support an MP with foot switched L2.

EXT_APCS_PWR_STS

Bits	Name	Description
31:15	RESERVED_BITS31_15	
14:13	L2_HS_STS3_2	(Reserved if NUM_CPU < 4). Only for QUAD Krait variant (2MB L2). This bit reflects the status of APCS_apccSwCtlL2ArrayCollapse[3:2] signal
12	SPM_SLP_STATE	This bit reflects the status of L2 SPM Sleep state.
11	SAW_SLP_ACK	This bit reflects the status of APCS_apccL2SleepAck signal
10	DBG_RST_STS	This bit reflects the status of APCS_apccDbg_Areset_N signal
9	L2_HS_RST_STS	This bit reflects the status of APCS_apccL2swvd_Areset_N signal
8	L2_CLMP_STS	This bit reflects the status of APCS_apccClampL2swvd signal

EXT_APCS_PWR_STS (cont.)

Bits	Name	Description
7	L2_RET_SLP_STS	This bit reflects the status of APCS_apccSwCtlL2RetentionSleep signal
6:5	L2_HS_STS1_0	This bit reflects the status of APCS_apccSwCtlL2ArrayCollapse[1:0] signal
4	DBG_PWRUP_REQ	This bit reflects the status of SYS_apcsDbgPwrUpReq
3	L2_FS_STS	Status for foot-switched L2 logic
2	RESERVED_BITS2	Legacy SC_sysQdmapHaltAck signal
1	L2_CLK_IDLE	This bit reflects the status of the APCC_sysL2ClkIdle signal
0	L2_SLV_IDLE	This bit reflects the status of the APCC_qsbSlvIdle signal

0x0209101C EXT_APCS_CLK_DIAG

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [TST].

The APCS_CLK_DIAG register selects the test clock to be output from the APCS to the chip's clock controller. It also controls the functional inputs to the Boundary Scan block.

NOTE The Krait core Leaf clock is always sent to the chip's clock controller as the first test clock. Under proper configuration of the chip's clock controller and the GPIO, this clock can be observed at either the EXT_CLK or through the clock debug test bus.

EXT_APCS_CLK_DIAG

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	FAST_CLK_EN	Enable the Krait Diagnostic clock from the leaf of the clock tree.
6	FAST_CLK_INV	Invert the Krait Diagnostic clock output.
5:3	FAST_CLK_SEL	Selects the Krait HS Leaf clock to output for test mode. 0x0: APC0_sysLeaf_Clk 0x1: APC1_sysLeaf_Clk 0x2: APCC_sysL2Leaf_Clk 0x3: SYS_apcsQsb_Clk 0x4: APC2_sysLeaf_Clk (Quad Krait Variant only) 0x5: APC3_sysLeaf_Clk (Quad Krait Variant only) 0x6: Reserved_1 0x7: Reserved_2

EXT_APCS_CLK_DIAG (cont.)

Bits	Name	Description
2:0	SLOW_CLK_SEL	Selects the APCS slow clock to output for test mode. 0x0: None (No clock selected, tied low.) 0x1: SYS_apcsAhb_Clk 0x2: SYS_apcsRef_Clk 0x3: SYS_apcsPiSleep_Clk 0x4: APB_apccDbg_Clk 0x5: ATB_apcc_Clk 0x6: Reserved_1 0x7: Reserved_2

0x02091020 EXT_APCS_ALL_TSTBUS_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [TST].

The APCS_ALL_TSTBUS_SEL register selects which module's test bus output will be sent out of the subsystem.

EXT_APCS_ALL_TSTBUS_SEL

Bits	Name	Description
31:5	RESERVED_BITS31_5	
4	EN	Set to 1 to cause APCS to drive the test bus outputs. 0x1: enabled 0x0: disabled
3:0	SEL	For each category, see appropriate selections for control of the output. 0x6: CONSTANT 0x5: L2 GDHS (SAW2.) 0x4: GLB (global testbus) 0x3: APC3 (Reserved if NUM_CPU < 4.) 0x2: APC2 (Reserved if NUM_CPU < 3.) 0x1: APC1 (Reserved if NUM_CPU < 2) 0x0: APC0

0x02091024 EXT_APCS_DBG_PWR_CTL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [SLP_CTL].

The APCS_DBG_PWR_CTL register is used for debugger communication. The REQ bit is used to enable a signal to the RPM to assert a power up sequence when the APCS's interrupt controller receives any enabled interrupt. The clocks need not be running for this signal to propagate.

EXT_APCS_DBG_PWR_CTL

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	REQ	Setting this bit asserts APCS_dbgPwrUpInt. Note that this signal can also be set by hardware.

0x02091028 EXT_APCS_L2_AUX_CLK_SEL

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [CLK_CTL]

The APCS_L2_AUX_CLK_SEL register controls the gfmux which selects the AUX clock source for the Krait MP's L2 clock. An additional selection set is provided to determine the clock source for the Krait core (4-1 GFMUX) in the Krait Hard Macro. The QSB clock is the raw source clk at reset.

EXT_APCS_L2_AUX_CLK_SEL

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	AUX_SRC	Krait AUX clock select: 0x3: SYS_apcsL2Aux_Clk_1 0x2: SYS_apcsL2Aux_Clk_2 0x1: SYS_apcsL2Aux_Clk_3 0x0: SYS_apcsRef_Clk

0x0209102C EXT_APCS_SPARE

Type: Read/Write
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [TST].

The APCS_SPARE register is used for ECO. The output of this register is controlled by BSL.

EXT_APCS_SPARE

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	BITS	SPARE BITS for ECO

0x02091030 EXT_APCS_SPARE_STS

Type: Read Only
Clock: SYS_AHB_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by APCS_GCCSECURE [TST].

The output of the APCS_SPARE BSL register.

EXT_APCS_SPARE_STS

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	BITS	SPARE BITS for ECO

0x02091FD0 EXT_APCS_VERSION

Type: Read Only
Clock: SYS_AHB_CLK
Reset State: 0x1001_0000
Security Treatment: Controlled by APCS_GCCSECURE [CLK_CTL].

This read only register reports the hardware version information for the KPSS core.

EXT_APCS_VERSION

Bits	Name	Description
31:28	MAJOR	Indicate different interface version. Major version changes are not backward compatible
15:0	MINOR	Indicates expanded functionality. Minor versions add functionality while being backward compatible
15:0	STEP	Indicates a change in the hardware which is not intended to impact software

11.28 KPSS L2 SAW2 Registers (0x02092000 EXT_APCS_L2_GDHS_BASE)

This section contains the Krait Processor Subsystem (KPSS) L2 SAW2 registers.

The SAW2 (SPM and AVS. Wrapper2) design is an AHB slave that contains both SPM and AVS. CSRs.

0x02092000 EXT_APCS_L2_SAW2_SECURE

Type: Read/write
Clock: SYS_REF_CLK
Reset State: {3{CFGNSINIT}}

Security Treatment: Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to ’0’ the state of the SAW2_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to ’1’, the SAW2_SECURE register security treatment bit of that register must be ’1’ for access to be granted. If the security treatment bit of the register is set to ’0’, the non-secure (ahb_saw_hprotns = ’1’) transactions are denied. When access is denied, a write is ignored, and a read will return ’0’. No error is signaled.

When reading the SAW2_SECURE register, non-secure agents will always read ’0’. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

EXT_APCS_L2_SAW2_SECURE

Bits	Name	Description
31:3	RESERVED	
2	SAW_CTL	Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST 0x1: NSEC 0x0: SEC
1	PWR_CTL	Controls security treatment for SPM registers: SAW2_SPM_CTL, SAW2_SPM_PMIC_DLY, SAW2_SPM_PMIC_DATA_0, SAW2_SPM_PMIC_DATA_1, SAW2_SPM_SLP_SEQ_ENTRY_n, SAW2_SPM_DLY 0x1: NSEC 0x0: SEC
0	VLT_CTL	Controls security treatment for the AVS. registers: SAW2_AVS_CTL, SAW2_VLVL, SAW2_AVS_HYSTERESIS 0x1: NSEC 0x0: SEC

0x02092004 EXT_APCS_L2_SAW2_ID

Type: Read
Clock: SYS_REF_CLK
Reset State: Undefined

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register reports the revision and parameter information for the SAW2 core.

EXT_APCS_L2_SAW2_ID

Bits	Name	Description
31	RESERVED_BITS31	
30:25	NUM_SPM_ENTRY	SAW2 parameter: Indicates number of SAW2_SPM_SLP_SEQ_ENTRY register implemented. Value can range from 1 - 32
24:20	NUM_PWR_CTL	SAW2 parameter: Indicates number of power control implemented. Value can range from 2 - 16
19	RESERVED_BITS19	
18	PMIC_ARB_INTF	SAW2 parameter: Indicates PMIC Arbiter Interface function is implemented
17	AVS_PRESENT	SAW2 parameter: Indicates AVS. function is implemented
16	SPM_PRESENT	SAW2 parameter: Indicates SPM function is implemented
15:12	MAJOR	Major variant
11:0	MINOR	Minor variant

0x02092008 EXT_APCS_L2_SAW2_CFG

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_CFG register is used to configure the common control between AVS. and SPM.system.

EXT_APCS_L2_SAW2_CFG

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON.
11:8	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port.

EXT_APCS_L2_SAW2_CFG (cont.)

Bits	Name	Description
7:6	RESERVED_BITS7_6	
5	PMIC_MODE	PMIC Handshake 0x0: 8K_PMIC (only DONE signal) 0x1: 7K_PMIC (both ACK and DONE signals)
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period. ..... For sys_ref_clk = 20 MHz (53ns) The timer tick range 53 ns to 1.6us. 0x0: Timer Tick every sys_ref_clk 0x1F: Timer Tick every 128 sys_ref_clk.

0x0209200C EXT_APCS_L2_SAW2_STS_0

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

EXT_APCS_L2_SAW2_STS_0

Bits	Name	Description
15	SHTDWN_REQ	This bit reflects the shutdown request from the SPM(spm_rpm_shutdown_req) to RPM.
14	SHTDWN_ACK	This bit reflects the shutdown acknowledgement from the RPM(rpm_spm_shutdown_ack) to SPM.
13	BRNGUP_REQ	This bit reflects the bringup request from the SPM(spm_rpm_bringup_req) to RPM.
12	BRNGUP_ACK	This bit reflects the bringup acknowledgement from the RPM(rpm_spm_bringup_ack) to SPM.
11:10	PMIC_STATE	State of the PMIC FSM: transitions back to IDLE) transitions back to IDLE) 0x0: IDLE (waiting for PMIC transaction from AVS. or SPM) 0x1: ACK (waiting for ACK from PMIC Arb) 0x2: DONE (waiting for DONE form PMIC Arb before) 0x3: DELAY (waiting for delay count termination before)

EXT_APCS_L2_SAW2_STS_0 (cont.)

Bits	Name	Description
9:8	RPM_STATE	State of the RPM FSM: 0x0: RUN (waiting for SPM request) 0x1: STDNACK (waiting for shutdown ACK from RPM) 0x2: WAKEUP (waiting for wakeup interrupt) 0x3: BGUPACK (waiting for bringup ACK from RPM)
7	AVS_STATE	State of the AVS. FSM: indication) 0x0: IDLE (waiting to be enabled or for next UP/DOWN) 0x1: REQ (waiting for PMIC FSM to transition to IDLE)
6:0	SPM_CMD_ADDR	Last SPM command executed.

0x02092010 EXT_APCS_L2_SAW2_STS_1

Type: Read
Clock: SYS_REF_CLK
Reset State: Unknown

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

EXT_APCS_L2_SAW2_STS_1

Bits	Name	Description
31	RESERVED1	
30	SW_WR_PEND	This bit reflects the VLVL state of the request from the SAW2_VCTL write is pending.
29	CPU_UP	This bit reflects the VLVL state of the request from the CPU (avs_saw_up) to raise the VLVL.
28	CPU_DN	This bit reflects the VLVL state of the request from the CPU (avs_saw_down) to lower the VLVL.
27	MAX_INT	IRQ status bit, AVS. controller detected that raising the VLVL by AVS_CTL[VLVL_STEP] would result in a value greater than AVS_CTL[MAX_VLVL]. If AVS_CTL[IRQ_MAX_EN] is set, an interrupt is issued. NOTE that SW can set MAX_VLVL lower than current VLVL creating a condition where VLVL is higher than MAX_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MAX.

EXT_APCS_L2_SAW2_STS_1 (cont.)

Bits	Name	Description
26	MIN_INT	IRQ status bit, AVS. controller detected that lowering the VLVL by SAW2_AVS_CTL[VLVL_STEP] would result in a value less than SAW2_AVS_CTL[MIN_VLVL]. If SAW2_AVS_CTL[IRQ_MIN_EN] is set, an interrupt is issued. NOTE that SW can set MIN_VLVL higher than current VLVL creating a condition where VLVL is lower than MIN_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MIN.
25:16	CURR_DLY	VLVL value of the counter used to calculate the time until the next AVS. controller request for a new VLVL.

0x02092014 EXT_APCS_L2_SAW2_VCTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

Though this register is read/writable, it also causes a command pulse to the PMIC FSM. Writing this register results in a transaction to the PMIC with SAW2_VCTL being sent to the PMIC. SAW2 support both 8901 and 8058 regulator.

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_CTL register is used to control the Adaptive Voltage Scaling (AVS) system.

EXT_APCS_L2_SAW2_AVS_CTL

Bits	Name	Description
31	RESERVED	

EXT_APCS_L2_SAW2_AVS_CTL (cont.)

Bits	Name	Description
30	VLVL_WIDTH	Defines the VLVL field of PMIC data. SAW2 at minimum supports 8901 and 8058 regulator. See PMIC document for details. 0x0: 5 bits VLVL (8058 regulator) 0x1: 6 bits VLVL (8901 regulator)
29:28	VLVL_STEP	Controls the step size of each request to PMIC Arbiter. SW may use values from 0 to 3. Note that the value 0 will result in no change - that is if the CPU requests UP or DOWN, the CURR_PVLVL will be sent to the PMIC Arbiter. This may be useful for debug. If an increment or decrement operation would cause the current VLVL to transition above or below the MAX_VLVL or MIN_VLVL, the current VLVL will not be changed. An interrupt will be signaled if IRQ_MAX/MIN_EN is 1
27	EN	AVS. Enable. **NOTE** Setting to 0 does not disable any pending interrupts. **NOTE** AVS. FSM and SPM FSM are mutually exclusive. Only one FSM is active at a time. SW does not have to disable AVS. before going to sleep. 0x0: Disable AVS 0x1: Enable AVS
26	SW_DONE_INT_EN	Set to 1 to turn on AVS. interrupt for when a SW initiated voltage change has completed. Set to 0 to mask it (turn it off). ASSERTION: This interrupt is asserted only after a SW write to SAW2_AVS_VLVL. Specifically, after the AVS. FSM traverses through all its states and transitions back to IDLE, the interrupt line is pulsed. The interrupt controller should be set to edge capture to receive this interrupt. CLEARING: None. This interrupt is a pulse, SW does not need to clear it (aside from requirements of the interrupt controller).
25	MAX_INT_EN	Set to 1 to turn on AVS. interrupt for MAX_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be greater than MAX_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit.
24	MIN_INT_EN	Set to 1 to turn on AVS. interrupt for MIN_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be smaller than MIN_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit
23	RESERVED_23	

EXT_APCS_L2_SAW2_AVS_CTL (cont.)

Bits	Name	Description
22:17	MAX_VLVL	Control maximum value of AVS. controller's VLVL. When current VLVL reaches this value it may not grow any larger. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level higher, an interrupt is issued. This value may be updated at anytime. Setting to a value lower than MIN_VLVL is not supported, and unpredictable results may occur.
16	RESERVED_16	
15:10	MIN_VLVL	Control the minimum value of AVS. controller's VLVL. When the current VLVL reaches this level it may not shrink any smaller. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level lower, an interrupt is issued. This value may be updated at anytime. Setting to a value higher than MAX_VLVL is not supported, and unpredictable results may occur.
9:0	AVS_DELAY	Control the time between AVS. controller's requests to change the VLVL

0x0209201C EXT_APCS_L2_SAW2_AVS_HYSTERESIS

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [VLT_CTL].

The SAW2_AVS_HYSTERESIS register is used to delay the AVS. UP/DN signal to AVS. FSM. This is used to prevent the false PMIC step due to PDN noise.

EXT_APCS_L2_SAW2_AVS_HYSTERESIS

Bits	Name	Description
31:24	RESERVED31_24	
23:16	DN_COUNT	HYSTERESIS DN COUNT. Delays of PMIC DN step operation.
15:8	RESERVED15_8	
7:0	UP_COUNT	HYSTERESIS UP COUNT. Delays of PMIC UP step operation.

0x02092020 EXT_APCS_L2_SAW2_SPM_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

EXT_APCS_L2_SAW2_SPM_CTL

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	SPM_START_ADR	Start address for the SPM sequence.
3	ISAR	Inhibit Start Address Reset 0x0: End of program reset the SPM_START_ADR to zero. 0x1: Inhibit End of program to reset SPM_START_ADR
2:1	WAKEUP_CONFIG	Wakeup Configuration 0x0: sys_spm_wakeup 0x1: sys_spm_wakeup or !cpu_spm_wait_req 0x2: sys_spm_wakeup or rising edge of sys_spm_dbg_nopwrdwn 0x3: sys_spm_wakeup or !cpu_spm_wait_req or rising edge of sys_spm_dbg_nopwrdwn
0	SPM_EN	SPM En.

0x02092024 EXT_APCS_L2_SAW2_SPM_PMIC_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC delay values after SPM FSM PMIC transaction. SPM wait for the programmed delay before executing the next SPM command.

EXT_APCS_L2_SAW2_SPM_PMIC_DLY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:24	DATA_1_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
23:19	RESERVED_BITS23_19	
18:16	DATA_1_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
15:11	RESERVED_BITS15_11	

EXT_APCS_L2_SAW2_SPM_PMIC_DLY (cont.)

Bits	Name	Description
10:8	DATA_0_VLVL1_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
7:3	RESERVED_BITS7_3	
2:0	DATA_0_VLVL0_DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms

0x02092028 EXT_APCS_L2_SAW2_SPM_PMIC_DATA_0

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

EXT_APCS_L2_SAW2_SPM_PMIC_DATA_0

Bits	Name	Description

0x0209202C EXT_APCS_L2_SAW2_SPM_PMIC_DATA_1

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

EXT_APCS_L2_SAW2_SPM_PMIC_DATA_1

Bits	Name	Description

0x02092030 EXT_APCS_L2_SAW2_RST

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_RST register is used to reset the SAW logic. This register clear itself. It does not reset any SAW2 CSR's. It reset AVS. and SPM FSM and control registers. This is use to clear any hang condition.

EXT_APCS_L2_SAW2_RST

Bits	Name	Description
31:1	RESERVED31_1	
0	RST	Reset AVS. and SPM FSM and control registers.

0x02092034 EXT_APCS_L2_SAW2_SPM_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

This register provide the delay values for SPM Delay command. SPM wait for the programmed delay before executing the next SPM command.

EXT_APCS_L2_SAW2_SPM_DLY

Bits	Name	Description
31:30	RESERVED_BITS31_30	
29:20	DLY3	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
19:10	DLY2	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
9:0	DLY1	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

0x02092080+4*n EXT_APCS_L2_SAW2_SPM_SLP_SEQ_ENTRY_n

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0xXXXX_XXXX

Security Treatment: Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter.

EXT_APCS_L2_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description

11.29 KPSS XPU Registers (0x02093000 EXT_APCS_L2_MPU_BASE)

This section contains the Krait Processor Subsystem (KPSS) XPU registers.

0x02093000+4*n EXT_APCS_MPU_PRTn_RACR, n=[0..31]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU. These registers include a single bit per VMID granting read access

EXT_APCS_MPU_PRTn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x02093400+4*n EXT_APCS_MPU_PRTn_WACR, n=[0..31]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU.

EXT_APCS_MPU_PRTn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x02093800+4*n EXT_APCS_MPU_PRTn_START, n=[0..31]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition Start Address Register. This register contains the start address of the partition. Only the bit numbers indicated by MPU_IDR[MSb] through MPU_IDR[LSb] are valid and physically exist.

EXT_APCS_MPU_PRTn_START

Bits	Name	Description
31:12	ADDR	MPU Partition Start Address
11:0	RESERVED_11_0	Reserved

0x02093C00+4*n EXT_APCS_MPU_PRTn_END, n=[0..31]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition End Address Register. This register contains the start address of the partition.Only the bit numbers indicated by MPU_IDR[MSB] through MPU_IDR[LSB] are valid and physically exist.

EXT_APCS_MPU_PRTn_END

Bits	Name	Description
31:12	ADDR	MPU Partition End Address
11:0	RESERVED_11_0	Reserved

0x02093F80 EXT_APCS_MPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Configuration Register: This register includes fields governing various MPU behaviors.

EXT_APCS_MPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set MPU_ESR. MPU_EAR and MPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set MPU_ESR. MPU_EAR and MPU_ESYNR0 updated with address and syndrome of error.

EXT_APCS_MPU_CR (cont.)

Bits	Name	Description
2	MPUEIE	MPU Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the MPU. Interrupt output is asserted if MPU_CR[MPUEIE] = 1 and any bit is set in MPU_ESR.
1	MPUERE	MPU Error Report Enable. MPUERE = 0 causes the MPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. MPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective MPU port. Errors from either port are terminated by the MPU as RAZ/WI Both client and configuration port errors are recorded in MPU_ESR, independent of the value of MPU_CR[MPUERE]
0	MPUE	MPU Enable. Governs whether MPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures MPU and the MID to VMID mapping tables.

0x02093F84 EXT_APCS_MPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the MPU, for both the client port and the configuration port. Client port addresses are 32 bits width and configuration port addresses are 12 bits wide (the width of the configuration address port).

EXT_APCS_MPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x02093F88 EXT_APCS_MPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the MPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and

leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the MPU's interrupt output (when enabled by MPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the MPU_ESYNRn registers, which are merely the "syndrome" of an error indicated by MPU_ESR.

EXT_APCS_MPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x02093F8C EXT_APCS_MPU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Restore Register. This register is an aliased address for the MPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

EXT_APCS_MPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x02093F90 EXT_APCS_MPU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

EXT_APCS_MPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x02093F94 EXT_APCS_MPU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

EXT_APCS_MPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved

EXT_APCS_MPU_ESYNR1 (cont.)

Bits	Name	Description
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x02093FF4 EXT_APCS_MPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

MPU Revision Register: This register provides major/minor revision codes for the implementation.

EXT_APCS_MPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x02093FF8 EXT_APCS_MPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x1F0C2C1F

MPU ID Register: Read-only register that defines various configuration attributes of the MPU instance.

EXT_APCS_MPU_IDR

Bits	Name	Description
31:29	RESERVED31_29	Reserved
28:24	MSB	Indicates most significant address bit number used in START/END address comparisons.
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used in START/END address comparisons.
15:14	RESERVED15_12	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only MPU_PRTn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate MPU_PRTn_RACR and MPU_PRTn_WACR registers govern read vs. write access. For single VMID, MPU_PRTn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. MPU_PRTn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMD type access control. MPU_PRTn_xACR registers include separate bit per VMID (32 bits) for governing access.
9	RESERVED9	Reserved
8:0	NPRT	Number of partitions. Indicates the number of partitions (minus 1) supported by the MPU. Values range from 0-223 (1-224 partitions)

0x02093FFC EXT_APCS_MPU_MPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

MPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the MPU (including the MPU_MPU_ACR itself).

EXT_APCS_MPU_MPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the MPU's 4KB address region (including the MPU_MPU_ACR itself). For single VMID type MPUs (MPU_IDR[MV] = 0) the MPU_MPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

12 LP Audio Subsystem Registers

12.1 Overview

Table 12-1 LP_Audio_Sub_System Bases

Base Name	Parent	Address
LCC_PLL0_MODE	LPASS_CSR_BASE	0x28000000
LPASS_M2VMT_M2VMRn	LPASS_M2VMT_BASE	0x28002000
Q6SS_M2VMT_M2VMRn	LPASS_M2VMT_Q6SS_BASE	0x28003000
LPASS_AHBTM_CFG	LPASS_AHBTM_BASE	0x2800A000
LPASS_SB_COMP_CFG	LPASS_SLIMBUS_BASE	0x28080000
LPASS_BAM_CTRL	LPASS_BAM_LITE_BASE	0x28084000
LPAIF_PCM_CTL	LPA_IF_BASE	0x28100000
MIDI_CORE_CONTROL	MIDI_BASE	0x28200000
LPASS_QDSP6SS_RST_EVB	LPASS_QDSP6SS_PUB_BASE	0x28800000
LPASS_QDSP6SS_RGPT_MATCH_VAL	LPASS_QDSP6SS_CSR_BASE	0x28880000
LPASS_QDSP6SS_L2VIC_INT_ENABLEn	LPASS_QDSP6SS_L2VIC_BASE	0x28890000
LPASS_SAW_SECURE	LPASS_QDSP6SS_SAW_BASE	0x288B0000

12.2 LPA SS Registers (0x28000000 LPASS_CSR_BASE)

This section contains the Low Power Audio Subsystem (LPASS) Clocks registers.

12.2.1 Clocks

0x28000000 LCC_PLL0_MODE

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to configure the LPASS PLL.

LCC_PLL0_MODE

Bits	Name	Description
31:22	RESERVED_31_22	RESERVED
21	PLL_VOTE_FSM_RESET	Resets PLL voting FSM: 0x0: De-asserts Reset to PLL voting FSM 0x1: Resets PLL voting FSM
20	PLL_VOTE_FSM_ENA	Enables PLL voting FSM: 0x0: Disabled 0x1: Enabled
19:14	PLL_BIAS_COUNT	Sets PLL bias count of PLL voting FSM.
13:8	PLL_LOCK_COUNT	Sets PLL lock time of PLL voting FSM.
7:6	RESERVED_7_6	RESERVED
5:4	REF_XO_SEL	Specify the reference XO to be used 0x0: PXO (24.576MHz) 0x1: MXO (27MHz) 0x2: CXO (19.2MHz)
3	PLLTEST	Put the PLL in normal mode. Put the PLL in test mode. 0x0: NORMAL_MODE 0x1: TEST_MODE
2	RESET_N	Reset the digital logic of the PLL including the MN counters and integer divider. Normal mode. 0x0: RESET 0x1: NORMAL_MODE

LCC_PLL0_MODE (cont.)

Bits	Name	Description
1	BYPASSNL	Bypass the PLL. This causes the input reference clock to be routed directly to the PLL clock output, PLLOUT_*. Normal mode. MN counters and integer divider used. 0x0: BYPASS 0x1: NORMAL_MODE
0	OUTCTRL	Disable the PLL output clock, PLLOUT_*. This saves power in the raw clock tree. Enable the PLL output clock, PLLOUT_*. 0x0: DISABLE_OUTPUT_CLOCKS 0x1: ENABLE_OUTPUT_CLOCKS

0x28000004 LCC_PLL0_L_VAL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000001

The PLL clock output frequency is determined as follows:

- Fractional mode: PLLOUT_*: LPXO * [L + M/N] / (PRE_DIV * POST_DIV)
- Integer mode: PLLOUT_*: LPXO * L / (PRE_DIV * POST_DIV)

This register specifics the L value.

LCC_PLL0_L_VAL

Bits	Name	Description
31:10	RESERVED_31_10	Reserved.
9:0	L_VAL	Specifies the L value used in the PLL's multiplication factor. Used in integer and fractional modes.

0x28000008 LCC_PLL0_M_VAL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

See the register description for LCC_PLL0_L_VAL for more information.

LCC_PLL0_M_VAL

Bits	Name	Description
31:19	RESERVED_31_19	Reserved.
18:0	M_VAL	Specifies the M value used in the PLL's multiplication factor. Used only when the PLL is in fractional mode.

0x2800000C LCC_PLL0_N_VAL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000001

See the register description for LCC_PLL0_L_VAL for more information.

LCC_PLL0_N_VAL

Bits	Name	Description
31:19	RESERVED_31_19	Reserved.
18:0	N_VAL	Specifies the N value used in the PLL's reference multiplication factor. Used only when the PLL is in fractional mode. This value cannot be 0x0 (division by 0).

0x28000010 LCC_PLL0_TEST_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

First section of the field descriptions shows the mapping from 45nm NT wrapper PLL0_TEST register to SR PLL input, PLL_TEST_CTL. Second section describes corresponding PLL_TEST_CTL bit assignment. Some bits of PLL_TEST_CTL come from PLL0_CONFIG, MMCC_PLL2_N_VAL andMMCC_PLL2_M_VAL (CR154463).

LCC_PLL0_TEST_CTL

Bits	Name	Description
31:19	SPARE_31_19	LCC_PLL0_TEST_CTL(31:19): Not Used
18:17	TESTOUT_SEL	LCC_PLL0_TEST_CTL(18:17): Not Used

LCC_PLL0_TEST_CTL (cont.)

Bits	Name	Description
16	INVERT_EN	LCC_PLL0_TEST_CTL(16): PLL_CONFIG_CTL(5) Output clock polarity Use the normal PLL output. Invert the PLL output. 0x0: DISABLE 0x1: ENABLE
15	PLLOUT_LV_TEST_EN	LCC_PLL0_TEST_CTL(15): PLL_CONFIG_CTL(4) PLLOUT_LV_TEST enable 0x0: DISABLE 0x1: ENABLE
14	SPARE_14	LCC_PLL0_TEST_CTL(14): Not used. See MMCC_PLL2_M_VAL CSR PLLOUT_LV_TEST field which maps to PLL_TEST_CTL(14).
13	PLLOUT_LV_BIST_EN	LCC_PLL0_TEST_CTL(13): PLL_CONFIG_CTL(2) PLLOUT_LV_BIST enable 0x0: DISABLE 0x1: ENABLE
12	PLLOUT_LV_AUX_EN	LCC_PLL0_TEST_CTL(12): PLL_CONFIG_CTL(1) PLLOUT_LV_AUX enable 0x0: DISABLE 0x1: ENABLE
11	NT_TEST0_SWITCH_EN	LCC_PLL0_TEST_CTL(11): Not Used
10	NT_TEST1_SWITCH_EN	LCC_PLL0_TEST_CTL(10): PLL_TEST_CTL(8) Charge pump external bias control 0x0: DISABLE 0x1: ENABLE
9	PFD_UP_GATE_EN	LCC_PLL0_TEST_CTL(9:8): PLL_CONFIG_CTL(29:28) PFD force bits PLL0_TEST_CTL(9) = Force PFD up See MMCC_PLL2_N_VAL CSR ICP_TST_EN field for PLL_TEST_CTL(9) control. 0x0: Normal operation 0x1: Force PFD UP -> 1
8	PFD_DN_GATE_EN	LCC_PLL0_TEST_CTL(9:8): PLL_CONFIG_CTL(29:28) PFD force bits PLL0_TEST_CTL(8) = Force PFD down See LCC_PLL0_TEST_CTL CSR NT_TEST1_SWITCH_EN field for PLL_TEST_CTL(8) control. 0x0: Normal operation 0x1: Force PFD DN -> 1

LCC_PLL0_TEST_CTL (cont.)

Bits	Name	Description
7	SPARE_7	This is a reserved field for LPASS CSR. See MMCC_PLL2_M_VAL CSR DTEST_SEL field for PLL_TEST_CTL(7) control.
6	SPARE_6	This is a reserved field for LPASS CSR. See MMCC_PLL2_M_VAL CSR BYP_TESTAMP field for PLL_TEST_CTL(6) control.
5	TEST_OP_AMP_IMODE	LCC_PLL0_TEST_CTL(5:4): PLL_TEST_CTL(5:4) ATEST1 signal select
4	FILTER_OP_AMP_EN	LCC_PLL0_TEST_CTL(5:4): PLL_TEST_CTL(5:4) ATEST1 signal select
3	EXT_VOLTAGE_EN	LCC_PLL0_TEST_CTL(3:2): PLL_TEST_CTL(3:2) ATEST0 signal select
2	VCTRL_CONN_EN	LCC_PLL0_TEST_CTL(3:2): PLL_TEST_CTL(3:2) ATEST0 signal select
1	VFS1_CONN_EN	LCC_PLL0_TEST_CTL(1): PLL_TEST_CTL(1) ATEST1 Control 0x0: Disable ATEST1 0x1: Enable ATEST1
0	VFS0_CONN_EN	LCC_PLL0_TEST_CTL(0): PLL_TEST_CTL(0) ATEST0 Control 0x0: Disable ATEST0 0x1: Enable ATEST0

0x28000014 LCC_PLL0_CONFIG

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to configure the LPASS PLL:

- Enable the main output
- Setup integer or fractional mode
- Setup the Post divider ratio
- Setup the Pre-divider ratio
- Select the appropriate VCO depending on the generated frequency

First section of the field descriptions shows the mapping from 45nm NT wrapper PLL0_CONFIG register to SR PLL input, PLL_CONFIG_CTL. Second section describes corresponding PLL_CONFIG_CTL bit assignment. Some bits of PLL_CONFIG_CTL come from PLL0_TEST_CTL, MMCC_PLL2_N_VAL andMMCC_PLL2_M_VAL (CR154463).

LCC_PLL0_CONFIG

Bits	Name	Description
31:24	SPARE_31_24	This is a reserved field for LPASS CSR. See LCC_PLL0_TEST_CTL CSR PFD_UP_GATE_EN field for PLL_CONFIG_CTL(29) control. See LCC_PLL0_TEST_CTL CSR PFD_DN_GATE_EN field for PLL_CONFIG_CTL(28) control. See MMCC_PLL2_M_VAL CSR NMOSC_FREQ_CTL field for PLL_CONFIG_CTL(27:26) control. See MMCC_PLL2_N_VAL CSR PFD_DZSEL field for PLL_CONFIG_CTL(25:24) control.
23	PLLOUT_LV_MAIN_EN	PLL0_CONFIG(23): PLL_CONFIG_CTL(0) PLLOUT_LV_MAIN enable See MMCC_PLL2_M_VAL CSR NMOSC_EN field for PLL_CONFIG_CTL(23) control. 0x0: DISABLE 0x1: ENABLE
22	FRAC_MODE_EN	PLL0_CONFIG(22): PLL_CONFIG_CTL(14) PLL fractional mode control 0x0: DISABLE 0x1: ENABLE
21:20	POST_DIV	PLL0_CONFIG(21:20): PLL_CONFIG_CTL(8:7) PLL Post-divider control See MMCC_PLL2_N_VAL CSR ICP_DIV field for PLL_CONFIG_CTL(21:20) control. 0x0: DIV 1 0x1: DIV 2 0x2: DIV 4 0x3: RESERVED
19	PRE_DIV	PLL0_CONFIG(19): PLL_CONFIG_CTL(6) PLL pre-divider control Disable a DIV 2 pre-division of the input reference clock (PFD frequency: reference frequency). Enable a DIV 2 pre-division of the input reference clock (PFD frequency: reference frequency / 2). See MMCC_PLL2_N_VAL CSR IREG_DIV field for PLL_CONFIG_CTL(19) control. 0x0: DIV1 0x1: DIV2

LCC_PLL0_CONFIG (cont.)

Bits	Name	Description
18	NO_CLK_GATE_EN	Not Used. See MMCC_PLL2_N_VAL CSR IREG_DIV field for PLL_CONFIG_CTL(18) control.
17:16	VCO_SEL	PLL0_CONFIG(17): PLL_CONFIG_CTL(9). VCO select. Ensure the proper VCO is selected based on the frequency output. Low frequency (100 - 500 MHz) High frequency (400 - 1400 MHz) PLL0_CONFIG(16): Not Used. See MMCC_PLL2_N_VAL CSR CUSEL field for PLL_CONFIG_CTL(17:16) control. 0x0: LO_FREQ 0x1: HI_FREQ
15	ADZ_SIZE_SEL	Not Used See MMCC_PLL2_M_VAL CSR REF_MODE field for PLL_CONFIG_CTL(15) control.
14:11	ADZ_LEN_SEL	Not Used See LCC_PLL0_CONFIG CSR FRAC_MODE_EN field for PLL_CONFIG_CTL(14) control. See MMCC_PLL2_N_VAL CSR CFG_LOCKDET field for PLL_CONFIG_CTL(13:12) control. See MMCC_PLL2_N_VAL CSR FORCE_ISEED field for PLL_CONFIG_CTL(11) control.
10:9	ISTARTUP_CTL	Not Used See LCC_PLL0_CONFIG CSR VCO_SEL field for PLL_CONFIG_CTL(9) control.
8:4	ISEED_CTL	Not Used See LCC_PLL0_CONFIG CSR POST_DIV (1:0) field for PLL_CONFIG_CTL(8:7) control. See LCC_PLL0_CONFIG CSR PRE_DIV field for PLL_CONFIG_CTL(6) control. See LCC_PLL0_TEST_CTL CSR INVERT_EN field for PLL_CONFIG_CTL(5) control. See LCC_PLL0_TEST_CTL CSR PLLOUT_LV_TEST_EN field for PLL_CONFIG_CTL(4) control.

LCC_PLL0_CONFIG (cont.)

Bits	Name	Description
3:2	IMIRROR_DIV	Not Used See MMCC_PLL2_M_VAL CSR LVEARLY_EN field for PLL_CONFIG_CTL(3) control. See LCC_PLL0_TEST_CTL CSR PLLOUT_LV_BIST_EN field for PLL_CONFIG_CTL(2) control.
1:0	REF_PATH_DELAY	Not Used See LCC_PLL0_TEST_CTL CSR PLLOUT_LV_AUX_EN field for PLL_CONFIG_CTL(1) control. See LCC_PLL0_CONFIG CSR PLLOUT_LV_MAIN_EN field for PLL_CONFIG_CTL(0) control.

0x28000018 LCC_PLL0_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

Read-only register used to query the status of the PLL.

LCC_PLL0_STATUS

Bits	Name	Description
31:17	RESERVED_31_17	Reserved.
16	PLL_ACTIVE_FLAG	pll_active_flag from PLL voting FSM. It indicates when FSM has enabled the PLL and PLL should be locked.
15:1	DUMMY	Unused, driven to VSS.
0	NO_CLOCK_N	Negated version of the no_clock signal.

0x2800001C LCC_Q6_FUNC

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00002D50

This register is used to configure the Q6 functional clocks and resets.

LCC_Q6_FUNC

Bits	Name	Description
31:14	RESERVED_31_14	Reserved.
13	Q6_JTAG_CRC_EN	This field enables or disables the CRC for the Q6 JTAG clock. 0x0: DISABLE 0x1: ENABLE
12	Q6_JTAG_INV_EN	This field enables or disables inversion of the Q6 JTAG clock at the CXC. Uninverted clock Inverted clock 0x0: DISABLE 0x1: ENABLE
11	Q6_JTAG_CXC_EN	This field enables or disables the Q6 JTAG clock at the CXC. 0x0: DISABLE 0x1: ENABLE
10	Q6_PXO_CRC_EN	This field enables or disables the CRC for the Q6 PXO clock. 0x0: DISABLE 0x1: ENABLE
9	Q6_PXO_INV_EN	This field enables or disables inversion of the Q6 PXO clock at the CXC. Uninverted clock Inverted clock 0x0: DISABLE 0x1: ENABLE
8	Q6_PXO_CXC_EN	This field enables or disables the Q6 PXO clock at the CXC. 0x0: DISABLE 0x1: ENABLE
7	Q6_PXO_SLEEP_EN	This field enables Q6 PXO HW clock halt 0x0: DISABLE 0x1: ENABLE
6	Q6_SLP_CRC_EN	This field enables or disables the CRC for the Q6 sleep clock. 0x0: DISABLE 0x1: ENABLE

LCC_Q6_FUNC (cont.)

Bits	Name	Description
5	Q6_SLP_INV_EN	This field enables or disables inversion of the Q6 sleep clock at the CXC. Uninverted clock Inverted clock 0x0: DISABLE 0x1: ENABLE
4	Q6_SLP_CXC_EN	This field enables or disables the Q6 sleep clock at the CXC. 0x0: DISABLE 0x1: ENABLE
3:2	CORE_FUNC_DIV_SEL	Integer divide for Q6 Core clock which is fed via glit-free mux (GFM4) C port. 0x0: BYPASS (DIV1) 0x1: DIV2 0x2: DIV3 0x3: DIV4
1	CORE_FUNC_SRC_SEL	Select PLL source for Q6 Core integer clock which is fed via glit-free mux (GFM4) C port. 0x0: Primary LPASS PLL 0x1: Secondary PLL (MMPLL1 or GPLL0)
0	Q6_SYS_ARES	Soft reset for Q6 Subsystem and Q6 core. 0x0: NORMAL_MODE 0x1: RESET

0x28000020 LCC_Q6_CORE_FRACDIV_CLK

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000600

This register is used to configure the Q6 functional clocks and resets.

LCC_Q6_CORE_FRACDIV_CLK

Bits	Name	Description
31:20	RESERVED_31_20	Reserved.
19:12	N_VAL	MN Circuit to derive fractional divide clock for Q6 Core feeding D port of GFM4 mux. Specifies the N value for the MN counter. Used only when the MN counter is enabled. Must use software register format NOT(N-M).

LCC_Q6_CORE_FRACDIV_CLK (cont.)

Bits	Name	Description
11	INV_EN	This field enables or disables inversion of the fractional divide Q6 core clock at the CXC. Uninverted clock Inverted clock 0x0: DISABLE 0x1: ENABLE
10	CXC_EN	This field enables or disables the fractional divide Q6 core clock at the CXC. 0x0: DISABLE 0x1: ENABLE
9	MNCNTR_CLK_EN	MN Circuit to derive fractional divide clock for Q6 Core feeding D port of GFM4 mux. Halts the output clock of the MN counter. 0x0: DISABLE 0x1: ENABLE
8	MNCNTR_EN	MN Circuit to derive fractional divide clock for Q6 Core feeding D port of GFM4 mux. This field is used to enable or disable the MN counter. 0x0: DISABLE 0x1: ENABLE
7	MNCNTR_RST	MN Circuit to derive fractional divide clock for Q6 Core feeding D port of GFM4 mux. This field activates the MN counter reset. 0x0: NORMAL_MODE 0x1: RESET
6:5	MNCNTR_MODE	MN Circuit to derive fractional divide clock for Q6 Core feeding D port of GFM4 mux. This field sets the mode of the MN counter. No division. Remove clock cycles to reduce the average frequency. Requires timing closure at the undivided frequency. Uses both edges of the input clock to perform division. Provides better output duty cycles than single edge and swallow. Uses only the rising edge of the input clock to perform division. Better than clock swallowing. 0x0: BYPASS 0x1: SWALLOW 0x2: DUAL_EDGE 0x3: SINGLE_EDGE

LCC_Q6_CORE_FRACDIV_CLK (cont.)

Bits	Name	Description
4:3	PRE_DIV_SEL	MN Circuit to derive fractional divide clock for Q6 Core feeding D port of GFM4 mux. This field sets the pre-division of the input clock to the MN counter. 0x0: BYPASS 0x1: DIV2 0x2: DIV3 0x3: DIV4
2:0	MN_SRC_SEL	MN Circuit to derive fractional divide clock for Q6 Core feeding D port of GFM4 mux. This field sets the clock select of the MN counter. OTHERS: RESERVED 0x0: PXO 0x1: CXO 0x2: LPA_PLL 0x3: SEC_PLL 0x6: CLK_TEST_SE 0x7: PLL_TEST_SE

0x28000024 LCC_Q6_CORE_FRACDIV_CLK_MD

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to configure the Q6 Core fractional divide clock.

LCC_Q6_CORE_FRACDIV_CLK_MD

Bits	Name	Description
31:16	RESERVED_31_16	Reserved.
15:8	M_VAL	Specifies the M value for the MN counter. Used only when the MN counter is enabled.
7:0	NOT_2D_VAL	Specifies the NOT(2*D) value for the MN counter.

0x28000028 LCC_Q6_CORE_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register provides status feedback on the Q6 clocks.

LCC_Q6_CORE_STATUS

Bits	Name	Description
31:3	RESERVED_31_4	Reserved.
3	Q6_SLEEP_CLK_ON	Set if the Q6 sleep clock is on.
2	Q6_JTAG_CLK_ON	Set if the Q6 sub-system JTAG clock is on.
1	Q6_PXO_CLK_ON	Set if the Q6 PXO clock is on.
0	Q6_FRACDIV_CLK_ON	Set if the Q6 Core Fractional divide clock is on.

0x2800002C LCC_MIDI_NS

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x0001aa00

This register is used to configure the MIDI clock.

LCC_MIDI_NS

Bits	Name	Description
31:24	N_VAL	Specifies the N value for the MN counter. Used only when the MN counter is enabled. Must use software register format NOT(N-M).
23:18	RESERVED_23_18	Reserved.
17	ARES	MIDI core asynchronous reset. This resets both the core and its bus interface. 0x0: NORMAL_MODE 0x1: RESET
16	MEM_CORE_EN	Power collapses the MIDI memory core. All data will be lost. 0x0: COLLAPSE 0x1: NORMAL_MODE
15:14	MEM_PERIPH_EN	Power collapse the MIDI memory periphery. Data is retained but is inaccessible until the periphery is powered up. 0x0: COLLAPSE_GRACEFULLY 0x1: COLLAPSE_IMMEDIATELY 0x2: NORMAL_MODE 0x3: RESERVED
13	CRC_EN	This field enables or disables the CRC (right after the GFM) feeding all downstream CXCs. 0x0: DISABLE 0x1: ENABLE

LCC_MIDI_NS (cont.)

Bits	Name	Description
12	INV_EN	This field enables or disables inversion of the MIDI clock at the CXC. Uninverted clock Inverted clock 0x0: DISABLE 0x1: ENABLE
11	CXC_EN	This field enables or disables the MIDI clock at the CXC. 0x0: DISABLE 0x1: ENABLE
10	GFM_SRC_SEL	This field sets the clock select of the downstream glitch free clock mux. This mux is used to switch to LPXO when software wishes to change the MN counter values (which results in glitches in the MN counter output clock). 0x0: MN_COUNTER 0x1: PXO
9	MNCNTR_CLK_EN	Halts the output clock of the MN counter. 0x0: DISABLE 0x1: ENABLE
8	MNCNTR_EN	This field is used to enable or disable the MN counter. 0x0: DISABLE 0x1: ENABLE
7	MNCNTR_RST	This field activates the MN counter reset. 0x0: NORMAL_MODE 0x1: RESET
6:5	MNCNTR_MODE	This field sets the mode of the MN counter. No division. Remove clock cycles to reduce the average frequency. Requires timing closure at the undivided frequency. Uses both edges of the input clock to perform division. Provides better output duty cycles than single edge and swallow. Uses only the rising edge of the input clock to perform division. Better than clock swallowing. 0x0: BYPASS 0x1: SWALLOW 0x2: DUAL_EDGE 0x3: SINGLE_EDGE

LCC_MIDI_NS (cont.)

Bits	Name	Description
4:3	PRE_DIV_SEL	This field sets the pre-division of the input clock to the MN counter. 0x0: BYPASS 0x1: DIV2 0x2: DIV3 0x3: DIV4
2:0	MN_SRC_SEL	This field sets the clock select of the MN counter. OTHERS: RESERVED 0x0: PXO 0x1: CXO 0x2: LPA_PLL 0x3: SEC_PLL 0x6: CLK_TEST_SE 0x7: PLL_TEST_SE

0x28000030 LCC_MIDI_MD

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to configure the MIDI clock.

LCC_MIDI_MD

Bits	Name	Description
31:16	RESERVED_31_16	Reserved.
15:8	M_VAL	Specifies the M value for the MN counter. Used only when the MN counter is enabled.
7:0	NOT_2D_VAL	Specifies the NOT(2*D) value for the MN counter.

0x28000034 LCC_MIDI_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000007

This register provides status feedback on the MIDI core clock.

LCC_MIDI_STATUS

Bits	Name	Description
31:3	RESERVED_31_3	Reserved.
2	MEM_CORE_ON	Set if the MIDI memory core is on.
1	MEM_PERIPH_ON	Set if the MIDI memory periphery is on.
0	CLK_ON	Set if the final MIDI core clock is on.

0x28000038 LCC_AHBIX_NS

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000a00

This register is used to configure the common LPASS clocks.

LCC_AHBIX_NS

Bits	Name	Description
31:24	N_VAL	Specifies the N value for the MN counter. Used only when the MN counter is enabled. Must use software register format NOT(N-M).
23:12	RESERVED_23_12	Reserved.
11	CRC_EN	This field enables or disables the CRC (right after the GFM) feeding all downstream CXCs. 0x0: DISABLE 0x1: ENABLE
10	GFM_SRC_SEL	This field sets the clock select of the downstream glitch free clock mux. This mux is used to switch to LPXO when software wishes to change the MN counter values (which results in glitches in the MN counter output clock). 0x0: PXO 0x1: MN_COUNTER
9	MNCNTR_CLK_EN	Halts the output clock of the MN counter. 0x0: DISABLE 0x1: ENABLE
8	MNCNTR_EN	This field is used to enable or disable the MN counter. 0x0: DISABLE 0x1: ENABLE
7	MNCNTR_RST	This field activates the MN counter reset. 0x0: NORMAL_MODE 0x1: RESET

LCC_AHBIX_NS (cont.)

Bits	Name	Description
6:5	MNCNTR_MODE	This field sets the mode of the MN counter. No division. Remove clock cycles to reduce the average frequency. Requires timing closure at the undivided frequency. Uses both edges of the input clock to perform division. Provides better output duty cycles than single edge and swallow. Uses only the rising edge of the input clock to perform division. Better than clock swallowing. 0x0: BYPASS 0x1: SWALLOW 0x2: DUAL_EDGE 0x3: SINGLE_EDGE
4:3	PRE_DIV_SEL	This field sets the pre-division of the input clock to the MN counter. 0x0: BYPASS 0x1: DIV2 0x2: DIV3 0x3: DIV4
2:0	MN_SRC_SEL	This field sets the clock select of the MN counter. OTHERS: RESERVED 0x0: PXO 0x1: CXO 0x2: LPA_PLL 0x3: SEC_PLL 0x6: CLK_TEST_SE 0x7: PLL_TEST_SE

0x2800003C LCC_AHBIX_MD

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to configure the common LPASS clocks.

LCC_AHBIX_MD

Bits	Name	Description
31:16	RESERVED_31_16	Reserved.

LCC_AHBIX_MD (cont.)

Bits	Name	Description
15:8	M_VAL	Specifies the M value for the MN counter. Used only when the MN counter is enabled.
7:0	NOT_2D_VAL	Specifies the NOT(2*D) value for the MN counter.

0x28000040 LCC_AHBIX_BRANCH_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x53524B2A

This register is used to configure the AHBIX LPASS clock branches.

LCC_AHBIX_BRANCH_CTL

Bits	Name	Description
31	AVT_HCLK_INV_EN	This field enables or disables inversion of the AV timer AHB clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
30	AVT_HCLK_CXC_EN	This field enables or disables the AVTimer clock at the CXC. 0x0: DISABLE 0x1: ENABLE
29	AHB_HCLK_INV_EN	This field enables or disables inversion of the LPASS AHB clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
28	AHB_HCLK_CXC_EN	This field enables or disables the AHB clock at the CXC. 0x0: DISABLE 0x1: ENABLE
27	AIF_ARES	LPA_IF core asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET

LCC_AHBIX_BRANCH_CTL (cont.)

Bits	Name	Description
26	AIF_HCLK_INV_EN	This field enables or disables inversion of the LPA_IF clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
25	AIF_HCLK_CXC_EN	This field enables or disables the LPA_IF clock at the CXC. 0x0: DISABLE 0x1: ENABLE
24	HW_DYNAMIC_CLK_EN	This field enables or disables hardware dynamic clocking for all AHB Clock branches. 0x0: DISABLE 0x1: ENABLE.
23	SECURITY_HCLK_INV_EN	This field enables or disables inversion of the security clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
22	SECURITY_HCLK_CXC_EN	This field enables or disables the security clock at the CXC. 0x0: DISABLE 0x1: ENABLE
21	LPB_SF_FORCE_CLKON	This field forces lpb_sf_clkon signal to one. lpb_sf_clkon controlled by internal logic lpb_sf_clkon is forced to one. 0x0: DISABLE 0x1: ENABLE
20	SF_LPB_CLKON	This field sets the value of sf_lpb_clkon signal. sf_lpb_clkon is zero sf_lpb_clkon is one 0x0: ZERO 0x1: ONE
19	DML_ARES	DMLite core asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET

LCC_AHBIX_BRANCH_CTL (cont.)

Bits	Name	Description
18	DML_HCLK_INV_EN	This field enables or disables inversion of the DML clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
17	DML_HCLK_CXC_EN	This field enables or disables the DML clock at the CXC. 0x0: DISABLE 0x1: ENABLE
16	FAB_LPB_ARES	Asynchronous reset for the FABRIC to LPASS bus interface. 0x0: NORMAL_MODE 0x1: RESET
15	FAB_LPB_HCLK_INV_EN	This field enables or disables inversion of the FABRIC to LPASS bus clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
14	FAB_LPB_HCLK_CXC_EN	This field enables or disables the FABRIC to LPASS bus clock at the CXC. 0x0: DISABLE 0x1: ENABLE
13	LPB_FAB_ARES	Asynchronous reset for the LPASS bus to FABRIC interface. 0x0: NORMAL_MODE 0x1: RESET
12	LPB_FAB_HCLK_INV_EN	This field enables or disables inversion of the LPASS bus to FABRIC clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
11	LPB_FAB_HCLK_CXC_EN	This field enables or disables the LPASS bus to FABRIC clock at the CXC. 0x0: DISABLE 0x1: ENABLE

LCC_AHBIX_BRANCH_CTL (cont.)

Bits	Name	Description
10	LPM_ARES	LPM asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET
9	LPM_MEM_CORE_EN	Power collapses the LPM memory core. All data will be lost. 0x0: COLLAPSE 0x1: NORMAL_MODE
8:7	LPM_MEM_PERIPH_EN	Power collapse the LPM memory periphery. Data is retained but is inaccessible until the periphery is powered up. 0x0: COLLAPSE_GRACEFULLY 0x1: COLLAPSE_IMMEDIATELY 0x2: NORMAL_MODE 0x3: RESERVED
6	LPM_HCLK_INV_EN	This field enables or disables inversion of the LPM clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
5	LPM_HCLK_CXC_EN	This field enables or disables the LPM clock at the CXC. 0x0: DISABLE 0x1: ENABLE
4	MIDI_HCLK_INV_EN	This field enables or disables inversion of the MIDI AHB clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
3	MIDI_HCLK_CXC_EN	This field enables or disables the AHB clock at the CXC. 0x0: DISABLE 0x1: ENABLE
2	Q6SS_HCLK_INV_EN	This field enables or disables inversion of the Q6SS AHB clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE

LCC_AHBIX_BRANCH_CTL (cont.)

Bits	Name	Description
1	Q6SS_HCLK_CXC_EN	This field enables or disables the Q6SS AHB clock at the CXC. 0x0: DISABLE 0x1: ENABLE
0	Q6SS_HCLK_SLEEP_EN	This field enables QDSP6SS HW clock halt. 0x0: DISABLE 0x1: ENABLE

0x28000044 LCC_AHBIX_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000fff

This register provides status feedback on the AHBIX clocks.

LCC_AHBIX_STATUS

Bits	Name	Description
31:12	RESERVED_31_12	Reserved.
11	AVT_HCLK_ON	Set if the final AV timer AHB clock is on.
10	AHB_HCLK_ON	Set if the final LPASS bus AHB clock is on.
9	AIF_HCLK_ON	Set if the final LPA_IF AHB clock is on.
8	SECURITY_HCLK_ON	Set if the final Crypto3 AHB clock is on.
7	DML_HCLK_ON	Set if the final DMLite AHB clock is on.
6	FAB_LPB_HCLK_ON	Set if the final FABRIC to LPASS bus AHB clock is on.
5	LPB_FAB_HCLK_ON	Set if the final LPASS bus to FABRIC AHB clock is on.
4	LPM_MEM_CORE_ON	Set if the LPM memory core is on.
3	LPM_MEM_PERIPH_ON	Set if the LPM memory periphery is on.
2	LPM_HCLK_ON	Set if the final LPM AHB clock is on.
1	MIDI_HCLK_ON	Set if the final MIDI AHB clock is on.
0	Q6SS_HCLK_ON	Set if the final Q6SS AHB clock is on.

0x28000048 LCC_MI2S_NS

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00028200

This register is used to configure the MI2S clocks.

LCC_MI2S_NS

Bits	Name	Description
31:24	N_VAL	Specifies the N value for the MN counter. Used only when the MN counter is enabled. Must use software register format NOT(N-M).
23:20	RESERVED_23_20	Reserved.
19	ARES	MI2S asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET
18	OSR_INV_EN	This field enables or disables inversion of the OSR clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
17	OSR_CXC_EN	This field enables or disables the OSR clock at the CXC. 0x0: DISABLE 0x1: ENABLE
16	BIT_INV_EN	This field enables or disables inversion of the bit-clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
15	BIT_CXC_EN	This field enables or disables the bit-clock at the CXC. 0x0: DISABLE 0x1: ENABLE

LCC_MI2S_NS (cont.)

Bits	Name	Description
14	BIT_SRC_SEL	This field is used to select the bit-clock source between the internally generated clock of the MN counter and an external GPIO clock provided by the codec. In normal mode, the bit-clock is provided by the internal MN counter. In bit-clock slave mode, the bit-clock is provided by the external codec via a GPIO. The external codec uses its own OSR clock and not the one generated by the LCC. Normal mode Bit-clock slave mode 0x0: MASTER 0x1: SLAVE
13:10	BIT_DIV	This field is used to configure further division of the bit-clock relative to the OSR clock. 0x0: BYPASS 0x1: DIV2 0x2: DIV3 0x3: DIV4 0x4: DIV5 0x5: DIV6 0x6: DIV7 0x7: DIV8 0x8: DIV9 0x9: DIV10 0xA: DIV11 0xB: DIV12 0xC: DIV13 0xD: DIV14 0xE: DIV15 0xF: DIV16
9	MNCNTR_CLK_EN	Halts the output clock of the MN counter which is also the CRC. 0x0: DISABLE 0x1: ENABLE
8	MNCNTR_EN	This field is used to enable or disable the MN counter. 0x0: DISABLE 0x1: ENABLE
7	MNCNTR_RST	This field activates the MN counter reset. 0x0: NORMAL_MODE 0x1: RESET

LCC_MI2S_NS (cont.)

Bits	Name	Description
6:5	MNCNTR_MODE	This field sets the mode of the MN counter. No division. Remove clock cycles to reduce the average frequency. Requires timing closure at the undivided frequency. Uses both edges of the input clock to perform division. Provides better output duty cycles than single edge and swallow. Uses only the rising edge of the input clock to perform division. Better than clock swallowing. 0x0: BYPASS 0x1: SWALLOW 0x2: DUAL_EDGE 0x3: SINGLE_EDGE
4:3	PRE_DIV_SEL	This field sets the pre-division of the input clock to the MN counter. 0x0: BYPASS 0x1: DIV2 0x2: DIV3 0x3: DIV4
2:0	MN_SRC_SEL	This field sets the clock select of the MN counter. OTHERS: RESERVED 0x0: PXO 0x1: CXO 0x2: LPA_PLL 0x3: SEC_PLL 0x6: CLK_TEST_SE 0x7: PLL_TEST_SE

0x2800004C LCC_MI2S_MD

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to configure the MI2S clocks.

LCC_MI2S_MD

Bits	Name	Description
31:16	RESERVED_31_16	Reserved.

LCC_MI2S_MD (cont.)

Bits	Name	Description
15:8	M_VAL	Specifies the M value for the MN counter. Used only when the MN counter is enabled.
7:0	NOT_2D_VAL	Specifies the NOT(2*D) value for the MN counter.

0x28000050 LCC_MI2S_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000003

This register provides status feedback on the MI2S clocks.

LCC_MI2S_STATUS

Bits	Name	Description
31:2	RESERVED_31_2	Reserved.
1	OSR_CLK_ON	Set if the final MI2S OSR clock is on.
0	BIT_CLK_ON	Set if the final MI2S bit clock is on.

0x28000054 LCC_PCM_NS

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000a00

This register is used to configure the PCM clock.

LCC_PCM_NS

Bits	Name	Description
31:16	N_VAL	Specifies the N value for the MN counter. Used only when the MN counter is enabled. Must use software register format NOT(N-M).
15:14	RESERVED_15_14	Reserved.
13	ARES	PCM asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET

LCC_PCM_NS (cont.)

Bits	Name	Description
12	INV_EN	This field enables or disables inversion of the PCM clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
11	CXC_EN	This field enables or disables the PCM clock at the CXC. 0x0: DISABLE 0x1: ENABLE
10	SRC_SEL	This field is used to select the PCM clock source between the internally generated clock of the MN counter and an external GPIO clock provided by the codec. In normal mode, the PCM clock is provided by the internal MN counter. In slave mode, the PCM clock is provided by the external codec via a GPIO. Normal mode Slave mode 0x0: MASTER 0x1: SLAVE
9	MNCNTR_CLK_EN	Halts the output clock of the MN counter which is also the CRC. 0x0: DISABLE 0x1: ENABLE
8	MNCNTR_EN	This field is used to enable or disable the MN counter. 0x0: DISABLE 0x1: ENABLE
7	MNCNTR_RST	This field activates the MN counter reset. 0x0: NORMAL_MODE 0x1: RESET

LCC_PCM_NS (cont.)

Bits	Name	Description

Bits	Name	Description
31:16	RESERVED_31_16	Reserved.
15:8	M_VAL	Specifies the M value for the MN counter. Used only when the MN counter is enabled.
7:0	NOT_2D_VAL	Specifies the NOT(2*D) value for the MN counter.

0x2800008C LCC_SPARE_I2S_SPKR_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000003

This register provides status feedback on the spare I2S speaker clocks.

LCC_SPARE_I2S_SPKR_STATUS

Bits	Name	Description
31:2	RESERVED_31_2	Reserved.
1	OSR_CLK_ON	Set if the final spare I2S speaker OSR clock is on.
0	BIT_CLK_ON	Set if the final spare I2S speaker bit clock is on.

0x28000090 LCC_AVT_NS

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x000318D8

This register is used to configure the AV timer clocks.

LCC_AVT_NS

Bits	Name	Description
31:19	RESERVED_31_19	Reserved.
18	RIVA_BT_XO_INV_EN	This field enables or disables inversion of the AV timer RIVA interface BT XO clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE

LCC_AVT_NS (cont.)

Bits	Name	Description
17	RIVA_BT_XO_CXC_EN	This field enables or disables the AV timer RIVA interface BT XO clock at the CXC. 0x0: DISABLE 0x1: ENABLE
16	RIVA_BT_XO_CRC_EN	This field enables or disables the AV timer RIVA interface BT XO clock at the CRC. 0x0: DISABLE 0x1: ENABLE
15:14	RIVA_BT_XO_SRC_SEL	AV Timer RIVA interface BT XO Clock mux select. This mux is used to select BT XO clock to be MXO, CXO or PXO. 0x0: PXO 0x1: MXO 0x2: CXO 0x3: Unused
13	RIVA_FM_XO_INV_EN	This field enables or disables inversion of the AV timer RIVA interface FM XO clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
12	RIVA_FM_XO_CXC_EN	This field enables or disables the AV timer RIVA interface FM XO clock at the CXC. 0x0: DISABLE 0x1: ENABLE
11	RIVA_FM_XO_CRC_EN	This field enables or disables the AV timer RIVAinterface FM XO clock at the CRC. 0x0: DISABLE 0x1: ENABLE
10:9	RIVA_FM_XO_SRC_SEL	AV Timer RIVA interface FM XO Clock mux select. This mux is used to select FM XO clock to be MXO, CXO or PXO. 0x0: PXO 0x1: MXO 0x2: CXO 0x3: Unused
8	AVT_PXO_INV_EN	This field enables or disables inversion of the AV timer PXO clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE

LCC_AVT_NS (cont.)

Bits	Name	Description
7	AVT_PXO_CXC_EN	This field enables or disables the AV timer PXO clock at the CXC. 0x0: DISABLE 0x1: ENABLE
6	AVT_PXO_CRC_EN	This field enables or disables the AV timer PXO clock at the CRC. 0x0: DISABLE 0x1: ENABLE
5	AVT_MXO_INV_EN	This field enables or disables inversion of the AV timer MXO clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
4	AVT_MXO_CXC_EN	This field enables or disables the AV timer MXO clock at the CXC. 0x0: DISABLE 0x1: ENABLE
3	AVT_MXO_CRC_EN	This field enables or disables the AV timer MXO clock at the CRC. 0x0: DISABLE 0x1: ENABLE
2:1	AVT_GFM_SRC_SEL	XO Clock Select. This mux is used to switch to MXO, CXO or PXO. 0x0: PXO 0x1: MXO 0x2: CXO 0x3: Unused
0	ARES	AV timer asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET

0x28000094 LCC_AVT_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register provides status feedback on the AV Timer clocks.

LCC_AVT_STATUS

Bits	Name	Description
31:4	RESERVED_31_4	Reserved.

LCC_AVT_STATUS (cont.)

Bits	Name	Description
3	AVT_RIVA_BT_XO_CLK_ON	Set if the AVT timer RIVA BT Interface XO clock is on.
2	AVT_RIVA_FM_XO_CLK_ON	Set if the AVT timer RIVA FM Interface XO clock is on.
1	AVT_PCLK_ON	Set if the AVT timer PXO clock is on.
0	AVT_MCLK_ON	Set if the AVT timer MXO clock is on.

0x28000098 LCC_GLOBAL_SLP_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x000000ff

This register is used to configure global memory sleep settings.

LCC_GLOBAL_SLP_CTL

Bits	Name	Description
31:9	RESERVED_31_9	Reserved.
7:4	S	Specifies the number of cycles to wait before power collapsing the memory core/periphery after gating the clock.
3:0	W	Specifies the number of clock cycles to wait before ungating the clock after the memory core/periphery has been powered up.

0x2800009C LCC_DEBUG_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

Register for controlling LPASS Clock Control debug bus.

LCC_DEBUG_CTL

Bits	Name	Description
31:5	RESERVED_31_5	Reserved.
4:1	LCC_DEBUG_SEL	Select LPASS core debug signals.
0	LCC_DEBUG_EN	Enable debug for LCC. 0x0: Disable driving LCC debug bus on to MUX. 0x1: Drive debug bus.

0x280000A4 LCC_CLK_HS_DEBUG_CFG

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register controls mux for high speed clock debugging.

LCC_CLK_HS_DEBUG_CFG

Bits	Name	Description
31:3	RESERVED_31_3	Reserved.
2:1	HS_DEBUG_SEL	Select high speed clk to be driven to IO. 0x0: CLK_VEC_HS_lcc_q6_func_clk 0x1: CLK_VEC_HS_lcc_q6_fracdiv_clk
0	HS_DEBUG_EN	Enable debug clock.

0x280000A8 LCC_CLK_LS_DEBUG_CFG

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register controls mux for low speed clock debugging.

LCC_CLK_LS_DEBUG_CFG

Bits	Name	Description
31:7	RESERVED_31_7	Reserved.

LCC_CLK_LS_DEBUG_CFG (cont.)

Bits	Name	Description
6:1	LS_DEBUG_SEL	Select clk to be driven to IO. 0x0: CLK_VEC_LS_lcc_ahb_hclk 0x1: CLK_VEC_LS_lcc_aif_hclk 0x2: CLK_VEC_LS_lcc_security_hclk 0x3: CLK_VEC_LS_lcc_dml_hclk 0x4: CLK_VEC_LS_lcc_fab_lpb_hclk 0x5: CLK_VEC_LS_lcc_lpb_fab_hclk 0x6: CLK_VEC_LS_lcc_lpm_hclk 0x7: CLK_VEC_LS_lcc_midi_hclk 0x8: CLK_VEC_LS_lcc_q6ss_hclk 0x9: CLK_VEC_LS_lcc_avt_hclk 0xA: CLK_VEC_LS_lcc_ebus_hclk 0xB: CLK_VEC_LS_lcc_ibus_hclk 0xC: CLK_VEC_LS_lcc_core_csr_hclk 0xD: CLK_VEC_LS_lcc_lpaif_csr_hclk 0xE: CLK_VEC_LS_lcc_slimbus_hclk 0xF: CLK_VEC_LS_lcc_mi2s_bit_clk 0x10: CLK_VEC_LS_lcc_codec_i2s_mic_bit_clk 0x11: CLK_VEC_LS_lcc_codec_i2s_spkr_bit_clk 0x12: CLK_VEC_LS_lcc_spare_i2s_mic_bit_clk 0x13: CLK_VEC_LS_lcc_spare_i2s_spkr_bit_clk 0x14: CLK_VEC_LS_lcc_pcm_clk 0x15: CLK_VEC_LS_lcc_midi_clk 0x16: CLK_VEC_LS_lcc_q6_tcxo_clk 0x17: CLK_VEC_LS_lcc_q6_jtag_clk 0x18: CLK_VEC_LS_lcc_q6_slp_clk 0x19: CLK_VEC_LS_lcc_avt_mclk 0x1A: CLK_VEC_LS_lcc_avt_pclk 0x1B: CLK_VEC_LS_lcc_avt_riva_bt_clk 0x1C: CLK_VEC_LS_lcc_avt_riva_fm_clk 0x1D: CLK_VEC_LS_lcc_slimbus_core_clk
0	LS_DEBUG_EN	Enable debug clock.

0x280000AC LCC_CLK_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register provides the current status of the LPASS clocks.

LCC_CLK_STATUS

Bits	Name	Description
31:0	RESERVED_31_0	Reserved.

0x280000B0 LCC_LPM_MEM_FSCGC_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0xffffffff

LPM memory foot-switch control and clock gating cell control register.

LCC_LPM_MEM_FSCGC_CTL

Bits	Name	Description
31:24	CGC_EN	This will enable or disable the CGC clocks connected to each of the LPM memories. When enabled, the CGC block will take into account the SLP_MODE settings for the particular power collapse mode requested.
23:20	SLEEP_TIME	Programmable delay in the HM_FSCGC to turn off the clock. Min delay from HM_FSCGC is 3 cycles. Setting these bits to 0000 will result in no extra cycle delay. Setting to 1111 will result in 16 extra cycles delay.
19:16	WAKE_TIME	Programmable delay in the HM_FSCGC to turn on the clock. Min delay from HM_FSCGC is 2 cycles. Setting these bits to 0000 will result in no extra cycle delay. Setting to 1111 will result in 16 extra cycles delay.
15:0	SLP_MODE	Power collapse mode. Each successive pair of bits control the GDFS to one 16KB memory bank. Bits [1:0] correspond to the lowest 16KB, bits [3:2] correspond to the next 16KB, etc. Available modes are: ['b00] - Full Memory Collapse (immediate collapse of both periphery and core power subject to SLEEP_TIME and WAKE_TIME settings; data not retained) ['b01] - Partial Memory Collapse (collapse of periphery power subject to SLEEP_TIME and WAKE_TIME settings; collapse of core power; data retained) ['b11] - No Memory Collapse (both periphery and core power not collapsed; memory remains active and data retained)

0x280000B4 LCC_PXO_SRC_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

PXO clock source mux control register.

LCC_PXO_SRC_CTL

Bits	Name	Description
31:3	RESERVED_31_3	Reserved.
2	PXO_SRC_SEL	This mux is used to switch PXO source clock from PXO to MXO sources. This field sets the clock select of the clock mux to select. 0x0: PXO 0x1: MXO
1	GFM_CXO_SRC_ARES	CXO GFM asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET
0	GFM_CXO_SRC_SEL	There are three possible XO sources: CXO (external from PMIC), PXO (from internal oscillator) and MXO (from internal oscillator). This anti-glitch mux is used to switch PXO source clock from CXO to other possible XO sources. This field sets the clock select of the glitch free clock mux to select. 0x0: CXO 0x1: MXO/PXO

0x280000B8 LCC_SPDM_CYCNTR_CLK_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x0000000B

This register is used to configure the SPDM cycle counter clock.

LCC_SPDM_CYCNTR_CLK_CTL

Bits	Name	Description
31:5	RESERVED_31_5	Reserved.
4:3	FUNC_DIV_SEL	Controls the division ratio of the integer divider feeding the SPDM cycle counter clock. 0x0: BYPASS (DIV1) 0x1: DIV2 0x2: DIV3 0x3: DIV4

LCC_SPDM_CYCNTR_CLK_CTL (cont.)

Bits	Name	Description
2	INV_EN	This field enables or disables inversion of the SPDM cycle counter clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
1	CXC_EN	This field enables or disables the SPDM cycle counter clock at the CXC. 0x0: DISABLE 0x1: ENABLE
0	CRC_EN	This field enables or disables the SPDM cycle counter clock at the CRC. 0x0: DISABLE 0x1: ENABLE

0x280000BC LCC_SPDM_CYCNTR_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register provides status feedback on the SPDM cycle counter clock.

LCC_SPDM_CYCNTR_STATUS

Bits	Name	Description
31:1	RESERVED_31_1	Reserved.
0	CLK_ON	Set if the SPDM cycle counter clock is on.

0x280000C0 LCC_AHBIX_CSR_ARES

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

Soft Reset register for LPASS Clock Control CSR.

LCC_AHBIX_CSR_ARES

Bits	Name	Description
31:1	RESERVED_31_1	RESERVED
0	ARES	Soft Reset for CSR on AHBE Bus which consists of LCC and AHBE CSs. CSR asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET

0x280000C4 LCC_PRI_PLL_CLK_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

PXO clock source mux control register.

LCC_PRI_PLL_CLK_CTL

Bits	Name	Description
31:2	RESERVED_31_2	Reserved.
1	GFM_PRI_PLL_ARES	Primary PLL GFM asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET
0	GFM_PRI_PLL_SRC_SEL	This field sets the clock select of the glitch free clock mux to select. 0x0: PXO 0x1: PRI_PLL_CLK

0x280000C8 LCC_SEC_PLL_CLK_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

Secondary PLL clock source mux control register.

LCC_SEC_PLL_CLK_CTL

Bits	Name	Description
31:5	RESERVED_31_5	Reserved.
4	GFM_SEC_PLL_ARES	Secondary PLL GFM asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET

LCC_SEC_PLL_CLK_CTL (cont.)

Bits	Name	Description
3:2	SEC_PLL_CLK_DIV_SEL	Controls the division ratio of the integer divider feeding the muxed secondary PLL clock. 0x0: BYPASS (DIV1) 0x1: DIV2 0x2: DIV3 0x3: DIV4
1	GFM_SEC_PLL_XO_SEL	This field sets the clock select of the glitch free clock mux to select. 0x0: PXO 0x1: SEC_PLL_CLK
0	SEC_PLL_MUX_SEL	This field sets the clock select of clock mux to select: 0x0: MMPLL1 clock source (800 MHz.) 0x1: GPLL0 clock source (552 MHz.)

0x280000CC LCC_SLIMBUS_NS

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00001600

This register is used to configure the SLIMBus Core clock.

LCC_SLIMBUS_NS

Bits	Name	Description
31:24	N_VAL	Specifies the N value for the MN counter. Used only when the MN counter is enabled. Must use software register format NOT(N-M).
23:14	RESERVED_23_14	Reserved.
13	SPS_SLIMBUS_INV_EN	LPASS shares SLIMBus in SPS. This field enables or disables the inversion of the SLIMBus clock to SPS at the CXC. Uninverted clock Inverted clock 0x0: DISABLE 0x1: ENABLE
12	SPS_SLIMBUS_CXC_EN	LPASS shares SLIMBus in SPS. This field enables or disables the SLIMBus clock to SPS at the CXC. 0x0: DISABLE 0x1: ENABLE

LCC_SLIMBUS_NS (cont.)

Bits	Name	Description
11	AUDIO_SLIMBUS_INV_EN	This field enables or disables inversion of the Audio SLIMBus clock at the CXC. Uninverted clock Inverted clock 0x0: DISABLE 0x1: ENABLE
10	AUDIO_SLIMBUS_CXC_EN	This field enables or disables the Audio SLIMBus clock at the CXC. 0x0: DISABLE 0x1: ENABLE
9	MNCNTR_CLK_EN	Halts the output clock of the MN counter. 0x0: DISABLE 0x1: ENABLE
8	MNCNTR_EN	This field is used to enable or disable the MN counter. 0x0: DISABLE 0x1: ENABLE
7	MNCNTR_RST	This field activates the MN counter reset. 0x0: NORMAL_MODE 0x1: RESET
6:5	MNCNTR_MODE	This field sets the mode of the MN counter. No division. Remove clock cycles to reduce the average frequency. Requires timing closure at the undivided frequency. Uses both edges of the input clock to perform division. Provides better output duty cycles than single edge and swallow. Uses only the rising edge of the input clock to perform division. Better than clock swallowing. 0x0: BYPASS 0x1: SWALLOW 0x2: DUAL_EDGE 0x3: SINGLE_EDGE
4:3	PRE_DIV_SEL	This field sets the pre-division of the input clock to the MN counter. 0x0: BYPASS 0x1: DIV2 0x2: DIV3 0x3: DIV4

LCC_SLIMBUS_NS (cont.)

Bits	Name	Description
2:0	MN_SRC_SEL	This field sets the clock select of the MN counter. OTHERS: RESERVED 0x0: PXO 0x1: CXO 0x2: LPA_PLL 0x3: SEC_PLL 0x6: CLK_TEST_SE 0x7: PLL_TEST_SE

0x280000D0 LCC_SLIMBUS_MD

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to configure the SLIMBus clock.

LCC_SLIMBUS_MD

Bits	Name	Description
31:16	RESERVED_31_16	Reserved.
15:8	M_VAL	Specifies the M value for the MN counter. Used only when the MN counter is enabled.
7:0	NOT_2D_VAL	Specifies the NOT(2*D) value for the MN counter.

0x280000D4 LCC_SLIMBUS_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register provides status feedback on the SLIMBus core clock.

LCC_SLIMBUS_STATUS

Bits	Name	Description
31:2	RESERVED_31_2	Reserved.
1	SPS_SLIMBUS_CLK_ON	Set if the SPS SLIMBus core clock is on.
0	AUDIO_SLIMBUS_CLK_ON	Set if the LPASS Audio SLIMBus core clock is on.

0x280000D8 LCC_GFS_CNTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000300

Control for Global Footer Switch Controller.

LCC_GFS_CNTL

Bits	Name	Description
31:10	RESERVED_31_10	Reserved.
9	GFS_RET	Foot-switch Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode).
8	GFS_EN	Foot-switch enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care.
7:6	RESERVED_7_6	Reserved
5	CLAMP	Clamp I/O bit for the core. 0x1: clamp 0x0: unclamp
4:0	GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed footswitch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x280000DC LCC_GFS_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

Control for Global Footer Switch Controller Status.

LCC_GFS_STATUS

Bits	Name	Description
31:1	RESERVED_31_1	Reserved.
0	GFS_STATUS	Power status for GFS 0x0: OFF 0x1: ON.

0x280000E0 LCC_MEM_ACC_NS

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

.Controls LPASS Memory ACC value settings.

LCC_MEM_ACC_NS

Bits	Name	Description
31:24	RESERVED_31_24	Reserved.
23:20	SPLRF240	Compiler regfile.
19:16	STDSP155	Compiler single port RAM.
15:12	LLRF240	Compiler regfile.
11:8	STDVROM	Compiler ROM.
7:4	LLPDP155	Compiler pseudo dual port RAM.
3:0	LLSP155	Compiler single port RAM.

0x280000E4 LCC_AHBEX_BRANCH_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x000A1259

This register is used to configure the AHB LPASS clock branches.

LCC_AHBEX_BRANCH_CTL

Bits	Name	Description
31:21	RESERVED_31_21	Reserved
20	CORE_IBUS_SPDMTM_HCLK_INV_EN	This field enables or disables inversion of the LPASSCore AHB-IX Fabric SPDM Traffic Monitor CSR clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
19	CORE_IBUS_SPDMTM_HCLK_CXC_EN	This field enables or disables the LPASS Core AHB-IX Fabric SPDM Traffic Monitor CSR clock at the CXC. 0x0: DISABLE 0x1: ENABLE

LCC_AHBEX_BRANCH_CTL (cont.)

Bits	Name	Description
18	LPASS_EBUS_HCLK_INV_EN	This field enables or disables inversion of the LPASS AHB-E Bus clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
17	LPASS_EBUS_HCLK_CXC_EN	This field enables or disables the LPASS AHB-E Bus clock at the CXC. 0x0: DISABLE 0x1: ENABLE
16	CORE_SPDM_XBUS_CGC_EN	LPASS Core AHB-X Bus SPDM Traffic monitor clock enable.
15	CORE_SPDM_IBUS_CGC_EN	LPASS Core AHB-I Bus SPDM Traffic monitor clock enable.
14	CORE_IBUS_ARES	LPASS Core AHB-IX Bus Fabric soft reset. 0x0: NORMAL_MODE 0x1: RESET
13	CORE_IBUS_HCLK_INV_EN	This field enables or disables inversion of the LPASS Core AHB-IX Bus clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
12	CORE_IBUS_HCLK_CXC_EN	This field enables or disables the LPASS Core AHB-IX Bus clock at the CXC. 0x0: DISABLE 0x1: ENABLE
11	CORE_CSR_ARES	LPASS Core CSR core soft reset. 0x0: NORMAL_MODE 0x1: RESET
10	CORE_CSR_HCLK_INV_EN	This field enables or disables inversion of the LPASS Core CSR clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE

LCC_AHBEX_BRANCH_CTL (cont.)

Bits	Name	Description
9	CORE_CSR_HCLK_CXC_EN	This field enables or disables the LPASS Core CSR clock at the CXC. 0x0: DISABLE 0x1: ENABLE
8	LPAIF_CSR_ARES	Asynchronous reset for the LPA Interface CSR interface. 0x0: NORMAL_MODE 0x1: RESET
7	LPAIF_CSR_HCLK_INV_EN	This field enables or disables inversion of the LPA Interface CSR clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
6	LPAIF_CSR_HCLK_CXC_EN	This field enables or disables the LPA Interface CSR clock at the CXC. 0x0: DISABLE 0x1: ENABLE
5	SLIMBUS_ARES	SLIMBus asynchronous reset. 0x0: NORMAL_MODE 0x1: RESET
4	SLIMBUS_MEM_CORE_EN	Power collapses the SLIMBus memory core. All data will be lost. 0x0: COLLAPSE 0x1: NORMAL_MODE
3:2	SLIMBUS_MEM_PERIPH_EN	Power collapse the SLIMBus memory periphery. Data is retained but is inaccessible until the periphery is powered up. 0x0: COLLAPSE_GRACEFULLY 0x1: COLLAPSE_IMMEDIATELY 0x2: NORMAL_MODE 0x3: RESERVED
1	SLIMBUS_HCLK_INV_EN	This field enables or disables inversion of the SLIMBus clock at the CXC. Uninverted clock. Inverted clock. 0x0: DISABLE 0x1: ENABLE
0	SLIMBUS_HCLK_CXC_EN	This field enables or disables the SLIMBus clock at the CXC. 0x0: DISABLE 0x1: ENABLE

0x280000E8 LCC_AHBEX_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x000000ff

This register provides status feedback on the AHB LPASS clocks.

LCC_AHBEX_STATUS

Bits	Name	Description
31:8	RESERVED_31_8	Reserved.
7	LPASS_IBUS_SPDMTM_HCLK_ON	Set if the final LPASS Core Fabric AHB-IX SPADM Traffic Monitor Clock AHB clock is on.
6	LPASS_EBUS_HCLK_ON	Set if the final LPASS AHB-E AHB clock is on.
5	CORE_IBUS_HCLK_ON	Set if the final LPASS Core AHB-I Bus AHB clock is on.
4	CORE_CSR_HCLK_ON	Set if the final LPASS Core CSR AHB clock is on.
3	LPAIF_CSR_HCLK_ON	Set if the final LPA Interface CSR AHB clock is on.
2	SLIMBUS_MEM_CORE_ON	Set if the SLIMBus memory core is on.
1	SLIMBUS_MEM_PERIPH_ON	Set if the SLIMBus memory periphery is on.
0	SLIMBUS_HCLK_ON	Set if the final SLIMBus AHB clock is on.

0x280000EC LCC_AHBM_CLK_HYSTERISIS_CTL

Type: Read/Write
Clock: LCC_AHB_HCLK
Reset State: 0x00000001

This register controls LPASS AHB Master Interface to System fabric clock hysterisis counters.

t

LCC_AHBM_CLK_HYSTERISIS_CTL

Bits	Name	Description
31:11	RESERVED_31_11	Reserved.

LCC_AHBM_CLK_HYSTERISIS_CTL (cont.)

Bits	Name	Description
10:8	SEL_STARTUP_HYSTERISIS	This fields specifies the number of cycles the clock has to be active before the AHB Master can begin any transaction. 0x0: 0 clocks. 0x1: 3 clocks. 0x2: 5 clocks. 0x3: 7 clocks. 0x4: 9 clocks. 0x5: 11clocks. 0x6: 13 clocks. 0x7: 15 clocks.
7	RESERVED_7	Reserved.
6:4	SELECT_HALT_HYSTERISIS	This counter is meant to cover any gaps resulting from early de-assertion of CLK ON. Number of clock cycles to wait before halting LPASS Master AHBIX Clock after clock active is de-asserted. Keep Clock running for: 0x0: 15 clocks. 0x1: 13 clocks. 0x2: 11 clocks. 0x3: 9 clocks. 0x4: 7 clocks. 0x5: 5 clocks. 0x6: 3 clocks. 0x7: 0 clocks.
3:1	SEL_ACTIVE_HYSTERISIS	This counter start counting with after CLK ON is deasseterd. Number of clock cycles to wait before de-asserting clock active status. Number of clock to wait before de-asserting Clock Active: 0x0: 255 Clock 0x1: 128 Clock 0x2: 64 Clock 0x3: 32 Clock 0x4: 16 Clock 0x5: 8 Clock 0x6: 4 Clock 0x7: 2 Clock
0	DISABLE	Enable Hysteris Counter for LPASS Master AHBIX Clock.

12.2.2 AHBE

0x28001000 AHBE_CFG

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000100

In programmable priority mode a higher value on master priority indicates higher priority. Priority values programmed must lie in the range [0,1].

AHBE_CFG

Bits	Name	Description
31:9	RESERVED_31_9	Reserved.
8	Q6SS_PRIORITY	Q6SS priority in programmable priority mode
7:5	RESERVED_7_5	Reserved.
4	FABRIC_PRIORITY	FABRIC priority in programmable priority mode
3:1	RESERVED_3_1	Reserved.
0	ROUND_ROBIN_EN	Set(1) to enable round robin arbitration on AHB Clear(0) to enable priority based arbitration on AHB

0x28001004 AHBE_LOCK_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to enable or disable locking of the AHBE bus by its masters.

AHBE_LOCK_CTL

Bits	Name	Description
31:2	RESERVED_31_2	Reserved.
1	Q6SS_LOCK_EN	Set(1) to enable locking of AHBE by Q6SS Clear(0) to disable locking of AHBE by Q6SS
0	FABRIC_LOCK_EN	Set(1) to enable locking of AHBE by FABRIC Clear(0) to disable locking of AHBE by FABRIC

0x28001008 LPASS_AHBE_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register provides the status of lpass_ahbe errors.

LPASS_AHBE_STATUS

Bits	Name	Description
31:8	RESERVED_31_3	Reserved.
2	AHBE_DECODE_BOUNDARY_ERROR	This bit is set when beats of a burst on AHBE are decoded to different slaves.
1	AHBE_DECODE_ERROR	This bit is set when an access is made to a reserved region.on AHBE.
0	AHBE_MISALIGNED	This bit is set if there is a word or half-word access on AHBE with address not aligned to word or half-word boundary respectively. e.g., hsize=1, haddr(0)=1

0x2800100C LPASS_AHBE_ACK

Type: Write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This write-only register is used to clear the status bits set in LPASS_AHBE_STATUS.

LPASS_AHBE_ACK

Bits	Name	Description
31:8	RESERVED_31_3	Reserved.
2	AHBE_DECODE_BOUNDARY_ERROR	Set (1) to clear corresponding bit in LPASS_AHBE_STATUS.
1	AHBE_DECODE_ERROR	Set (1) to clear corresponding bit in LPASS_AHBE_STATUS.
0	AHBE_MISALIGNED	Set (1) to clear corresponding bit in LPASS_AHBE_STATUS.

0x28001010 LPASS_AHBE_SPARE

Type: Read/Write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This is spare register for using future.

LPASS_AHBE_SPARE

Bits	Name	Description
31:0	AHBE_SPARE	Spare register.

12.2.3 LPASS Wrapper General Registers

0x28004004 LPASS_VFR_IRQ_MUX_CTL

Type: Read/Write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This is spare register for using future.

LPASS_VFR_IRQ_MUX_CTL

Bits	Name	Description
31:3	RESERVED_31_3	Reserved
2:0	SEL	(source from internal modem) 0x0: VFR. Vocoder frame rate interrupt from modem for voice rate matching. 0x1: EXT_VFR. External VFR from gpio. 20 ms reference time tick for tracking audio rates vs. the air interface. 0x2: LPASS IRQ0_1 0x3: LPASS IRQ0_2 0x4: LPASS IRQ0_3 0x5: LPASS IRQ0_4 0x6: LPASS IRQ0_5 0x7: Undefined

12.2.4 Non-Clock

12.2.4.1 General subsystem

0x28008000 LPASS_CSR_GP_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000001

General purpose ECO over-ride bits.

LPASS_CSR_GP_CTL

Bits	Name	Description
31:7	SPARE_LPASS	Spare register for using future
6	BUS_BUG_RRBUG_DIS	Disable of bug fix logic related to CR-0000146349.
5	BUS_BUG_BUSY_DIS	Disable of fixed hready de-assert timing when busy cycle.

LPASS_CSR_GP_CTL (cont.)

Bits	Name	Description
4	BUS_BUG_SEL_DIS	Disable of fixed hsel signal active time.
3	BUS_BUG_ARITER_DIS	Disable of hgrant extending logic.
2	DML_HPROT_NB_EN	Enable DMLITE non-buffer-able transfers
1	MIDI_HPROT_NB_EN	Enable non-bufferable AHB transfer for MIDI.
0	AHB2AXI_HPROT_RETAIN	Disable AHB to AXI HPROT retaining.

12.2.4.2 AHB

0x28008004 AHBI_CFG

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00512340

In programmable priority mode a higher value on master priority indicates higher priority. Priority values programmed must lie in the range [0,4].

AHBI_CFG

Bits	Name	Description
31:27	RESERVED_31_23	Reserved.
26:24	SLIMBUS_PRIORITY	SLIMBUS priority in programmable priority mode.
23	RESERVED_23	Reserved.
22:20	MIDI_PRIORITY	MIDI priority in programmable priority mode.
19	RESERVED_19	Reserved.
18:16	FABRIC_PRIORITY	FABRIC priority in programmable priority mode.
15	RESERVED_15	Reserved.
14:12	DM_PRIORITY	DM priority in programmable priority mode
11	RESERVED_11	Reserved.
10:8	Q6SS_PRIORITY	Q6SS priority in programmable priority mode
7	RESERVED_7	Reserved
6:4	AUDIO_IF_PRIORITY	Audio_If priority in programmable priority mode
3:1	RESERVED_3_1	Reserved.
0	ROUND_ROBIN_EN	Set(1) to enable round robin arbitration on AHB Clear(0) to enable priority based arbitration on AHB

0x28008008 AHBX_CFG

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00301020

In programmable priority mode a higher value on master priority indicates higher priority. Priority values programmed must lie in the range [0,3].

AHBX_CFG

Bits	Name	Description
31:26	RESERVED_31_26	Reserved.
25:24	SLIMBUS_PRIORITY	SLIMBUS priority in programmable priority mode.
23:22	RESERVED_23_22	Reserved.
21:20	MIDI_PRIORITY	MIDI priority in programmable priority mode.
19:14	RESERVED_19_14	Reserved.
13:12	DM_PRIORITY	DM priority in programmable priority mode
11:6	RESERVED_11_6	Reserved.
5:4	AUDIO_IF_PRIORITY	Audio_If priority in programmable priority mode
3:1	RESERVED_3_1	Reserved.
0	ROUND_ROBIN_EN	Set(1) to enable round robin arbitration on AHB Clear(0) to enable priority based arbitration on AHB

0x2800800C AHB_CLK_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is un-used.

AHB_CLK_CTL

Bits	Name	Description
31:16	RESERVED_31_16	Reserved.
15:8	FORCE_CLK_ON_AHBI	Force AHB (I) slave clock on.
7:0	FORCE_CLK_ON_AHBX	Force AHB (X) slave clock on.

0x28008010 AHBI_LOCK_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to enable or disable locking of the AHBI bus by its masters.

AHBI_LOCK_CTL

Bits	Name	Description
31:6	RESERVED_31_6	Reserved.
5	SLIMBUS_LOCK_EN	Set(1) to enable locking of AHBI by SLIMBUS Clear(0) to disable locking of AHBI by SLIMBUS
4	MIDI_LOCK_EN	Set(1) to enable locking of AHBI by MIDI Clear(0) to disable locking of AHBI by MIDI
3	FABRIC_LOCK_EN	Set(1) to enable locking of AHBI by FABRIC Clear(0) to disable locking of AHBI by FABRIC
2	DM_LOCK_EN	Set(1) to enable locking of AHBI by DM Clear(0) to disable locking of AHBI by DM
1	Q6SS_LOCK_EN	Set(1) to enable locking of AHBI by Q6SS Clear(0) to disable locking of AHBI by Q6SS
0	AUDIO_IF_LOCK_EN	Set(1) to enable locking of AHBI by AUDIO_IF Clear(0) to disable locking of AHBI by AUDIO_IF

0x28008014 AHBX_LOCK_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to enable or disable locking of the AHBI bus by its masters

AHBX_LOCK_CTL

Bits	Name	Description
31:6	RESERVED_31_6	Reserved.
5	SLIMBUS_LOCK_EN	Set(1) to enable locking of AHBX by SLIMBUS Clear(0) to disable locking of AHBX by SLIMBUS
4	MIDI_LOCK_EN	Set(1) to enable locking of AHBX by MIDI Clear(0) to disable locking of AHBX by MIDI
3	RESERVED_3	Reserved.

AHBX_LOCK_CTL (cont.)

Bits	Name	Description
2	DM_LOCK_EN	Set(1) to enable locking of AHBX by DM Clear(0) to disable locking of AHBX by DM
1	RESERVED_1	Reserved.
0	AUDIO_IF_LOCK_EN	Set(1) to enable locking of AHBX by AUDIO_IF Clear(0) to disable locking of AHBX by AUDIO_IF

0x2800802C LPASS_BUS_STATUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register provides the status of lpass_bus errors.

LPASS_BUS_STATUS

Bits	Name	Description
31:8	RESERVED_31_8	Reserved.
7	Q6TCM_WRITE_ERROR	This bit is set when the Q6 AXI slave returns a write response error.
6	Q6TCM_READ_ERROR	This bit is set when the Q6 AXI slave returns a read response error.
5	AHBX_DECODE_BOUNDARY_ERROR	This bit is set when beats of a burst on AHBX are decoded to different slaves.
4	AHBX_DECODE_ERROR	This bit is set when an access is made to a reserved region.on AHBX.
3	AHBX_MISALIGNED	This bit is set if there is a word or half-word access on AHBX with address not aligned to word or half-word boundary respectively. e.g., hsize=1, haddr(0)=1
2	AHBI_DECODE_BOUNDARY_ERROR	This bit is set when beats of a burst on AHBI are decoded to different slaves.
1	AHBI_DECODE_ERROR	This bit is set when an access is made to a reserved region.on AHBI.
0	AHBI_MISALIGNED	This bit is set if there is a word or half-word access on AHBI with address not aligned to word or half-word boundary respectively. e.g., hsize=1, haddr(0)=1

0x28008030 LPASS_BUS_ACK

Type: Write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This write-only register is used to clear the status bits set in LPASS_BUS_STATUS.

LPASS_BUS_ACK

Bits	Name	Description
31:8	RESERVED_31_8	Reserved.
7	Q6TCM_WRITE_ERROR	Set (1) to clear corresponding bit in LPASS_BUS_STATUS.
6	Q6TCM_READ_ERROR	Set (1) to clear corresponding bit in LPASS_BUS_STATUS.
5	AHBX_DECODE_BOUNDARY_ERROR	Set (1) to clear corresponding bit in LPASS_BUS_STATUS.
4	AHBX_DECODE_ERROR	Set (1) to clear corresponding bit in LPASS_BUS_STATUS.
3	AHBX_MISALIGNED	Set (1) to clear corresponding bit in LPASS_BUS_STATUS.
2	AHBI_DECODE_BOUNDARY_ERROR	Set (1) to clear corresponding bit in LPASS_BUS_STATUS.
1	AHBI_DECODE_ERROR	Set (1) to clear corresponding bit in LPASS_BUS_STATUS.
0	AHBI_MISALIGNED	Set (1) to clear corresponding bit in LPASS_BUS_STATUS.

12.2.4.3 DM lite

DM is a single channel data mover that has been designed to offload DSP from long/large size transfers, while not incurring the area or power penalty of a fully-functional data mover such as ADM2 etc. The intended mode of operation is DM operating as a slave accelerator of the LPASS QDSP6. However protection from other processors is not guaranteed. Other processors (or even user mode QDSP6 processes) can reprogram DMLite in the midst of an active transfer, and cause undefined states in the system. Only QDSP6 has the outgoing interrupt from DMLite, and hence is fully capable of controlling it.

0x28008040 DML_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register controls the operation for the DM-Lite block. The Crypto block is not featured in this version of LPASS, therefore the Crypto enable register (bit 4) is not functional.

DML_CTL

Bits	Name	Description
31:5	RESERVED_31_5	Reserved.
4	CRYPTO_EN	When set (1), pipe through internal crypto engine
3:2	SWAP	No modification {a,b,c,d} -> {c,d,a,b} {a,b,c,d} -> {d,c,b,a} {a,b,c,d} -> {b,a,d,c} 0x0: NULL 0x1: Half word 0x2: Half word and byte 0x3: Byte
1:0	CMD	Commands to the DML can be Flush will force DM to terminate an initiate or a zero command if it is in progress. If DM is active, flush has no effect. Initiate is used to start a single transfer from the given source to destination. Zero is a special mode to initiate a transfer where the source data value is constant and equal to zero. This command can be used to zero fill a memory 0x0: Flush 0x1: Initiate 0x2: Zero

0x28008044 DML_SRC

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register will provide the DML block with the source address from which to request data from.

DML_SRC

Bits	Name	Description
31:2	ADDR	Source address.
1:0	RESERVED_1_0	Reserved due to 32-bit alignment of address.

0x28008048 DML_DST

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register will provide the DML block with the destination address from which to write data to.

DML_DST

Bits	Name	Description
31:2	ADDR	Destination address.
1:0	RESERVED_1_0	Reserved due to 32-bit alignment of address.

0x2800804C DML_TRAN

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to identify the number of bytes the DML should transfer from the source address to the destination address. The maximum amount of data that can be transferred is 128KB. The value programmed into this register should be (number of dwords) - 1.

DML_TRAN

Bits	Name	Description
31:20	RESERVED_31_20	Reserved.
19:2	LEN	Maximum length of transfer is 128 KB.
1:0	RESERVED_1_0	Reserved due to 32-bit alignment of address.

0x28008050 DML_STATUS

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to convey the status of some DML internal signals.

DML_STATUS

Bits	Name	Description
23:6	WORDS	READ ONLY: DWords remaining.
5:2	RESERVED_5_2	Reserved.
1	ERROR	Error during transfer. Set (1) to clear error bit.
0	DONE	Transfer complete. Set (1) to clear done bit.

0x2800805C LPASS_DEBUG_CTL

Type: Read/write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

This register is used to select which module or sub-core drives the lpass test bus.

LPASS_DEBUG_CTL

Bits	Name	Description
31:23	RESERVED_31_23	Reserved.
22:11	LPASS_DEBUG_SEL	Select LPASS core debug signals.
10:7	LPASS_DEBUG_SEL_4	Select AVTimer debug signals.
6	LPASS_DEBUG_EN	Enable debug for LPASS core. 0x0: Disable driving LPASS bus on to MUX 0x1: Drive debug bus
5:3	IP_DEBUG_SEL	Selects connection of LPASS_TEST_BUS to: 0x0: All 0's 0x1: All 5's 0x2: All A's 0x3: LPA_IF debug bus 0x4: MIDI debug bus 0x5: LCC debug bus 0x6: Q6SS debug bus 0x7: LPASS_CORE debug bus
2:0	SEL	Selects connection of LPASS_CORE debug bus to: 0x0: LPM0 signals 0x1: LPM1 signals 0x2: DML debug bus 0x3: AHB debug bus 0x4: CSR debug bus 0x5: AVTIMER debug bus 0x6: SLIMBus debug bus

0x28008060 LPASS_DEBUG_BUS

Type: Read
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

Debug signals sourced by lpass modules or subcores.

LPASS_DEBUG_BUS

Bits	Name	Description
31:0	READ	Read back for debug bus.

0x28008070 LPASS_CORE_GEN_CTL

Type: Read/Write
Clock: LCC_AHB_HCLK
Reset State: 0x00000000

LPASS Core General Control.

LPASS_CORE_GEN_CTL

Bits	Name	Description
31:1	RESERVED_31_1	Reserved.
0	VFR_IRQ_SRC_SEL	VFR IRQ source select 0x0: AVTIMER output 0x1: On-chip modem output

12.2.5 AVtimer/AVsync

0x28009000 AVTIMER_CTL

Type: Read/write
Clock: LCC_AVT_HCLK
Reset State: 0x00000000

AVtimer control/status register

AVTIMER_CTL

Bits	Name	Description
31:12	RESERVED_31_12	Reserved.
11	VCAP_TIMER_OUT_EN	VCAP Timer output enable. 0x1: Enable
10	DRE_BUSY	READ ONLY: High when DRE counter is running.
9	TIMEOUT_EN	Enables time out function if ahb to mxo transfers takes longer than timeout value register 0x1: Enable ahb timeout

AVTIMER_CTL (cont.)

Bits	Name	Description
8	TIMER_RST	Sets timer counter to zero. This is not a soft reset for AVTIMER. 0x1: Reset timer value to zero
7	TIMER_EN	0x1: Enable timer
6	INTD_MSK	0x1: Mask DRE interrupt 0x0: Unmask DRE interrupt
5	INT1_MSK	0x1: Mask INT1 0x0: Unmask INT1
4	INT0_MSK	0x1: Mask INT0 0x0: Unmask INT0
3	INTD_CLR	0x1: Clear DRE INT
2	INT1_CLR	0x1: Clear INT1
1	INT0_CLR	0x1: Clear INT0
0	DRE_GO	0x1: Start DRE operation

0x28009004 AVTIMER_RESMOD

Type: Read/write
Clock: LCC_AVT_HCLK
Reset State: 0x0000000

Residue_modulus register.

AVTIMER_RESMOD

Bits	Name	Description
31:0	RESMOD	Resmod value (12.20 fixed format).

0x28009008 AVTIMER_TIMER_LSB

Type: Read/write
Clock: LCC_AVT_HCLK
Reset State: 0x00000000

Timer LSB bits.

AVTIMER_TIMER_LSB

Bits	Name	Description
31:0	TIMER_LSB	Value of timer lsb[31:0] bits.

0x2800900C AVTIMER_TIMER_MSB

Type: Read/write
Clock: LCC_AVT_HCLK
Reset State: 0x00000000

Timer MSB bits.

AVTIMER_TIMER_MSB

Bits	Name	Description
31:16	RESERVED	Reserved.
15:0	TIMER_MSB	Value of timer lsb[47:32] bits.

0x28009010 AVTIMER_INT0_LSB

Type: Read/write
Clock: LCC_AVT_HCLK
Reset State: 0x00000000

INT0 LSB bits.

AVTIMER_INT0_LSB

Bits	Name	Description
31:0	INT0_LSB	Value at which timer issues int0. LSB bits.

0x28009014 AVTIMER_INT0_MSB

Type: Read/write
Clock: LCC_AVT_HCLK
Reset State: 0x00000000

INT0 MSB bits

AVTIMER_INT0_MSB

Bits	Name	Description
31:16	RESERVED	Reserved.
15:0	INT0_MSB	Value at which timer issues int0. MSB bits.

0x28009018 AVTIMER_INT1_LSB

Type: Read/write
Clock: LCC_AVT_HCLK
Reset State: 0x00000000

INT1 LSB bits.

AVTIMER_INT1_LSB

Bits	Name	Description
31:0	INT1_LSB	Value at which timer issues int1. LSB bits.

0x2800901C AVTIMER_INT1_MSB

Type: Read/write
Clock: LCC_AVT_HCLK
Reset State: 0x00000000

INT1 MSB bits

AVTIMER_INT1_MSB

Bits	Name	Description
31:16	RESERVED	Reserved.
15:0	INT1_MSB	Value at which timer issues int1. MSB bits.

0x28009020 AVTIMER_DRE_TARGET_VALUE

Type: Read/write
Clock: LCC_AVT_HCLK
Reset State: 0x00000000

DRE target value (max count) in mxo domain.

AVTIMER_DRE_TARGET_VALUE

Bits	Name	Description
31:0	DRE_TARGET_VALUE	DRE target value.

0x28009024 AVTIMER_TIMEOUT_VAL

Type: Read/write
Clock: LCC_AVT_HCLK
Reset State: 0x00000000

AHB interface timeout.

AVTIMER_TIMEOUT_VAL

Bits	Name	Description
31:12	RESERVED	Reserved.
11:0	TIMEOUT_VAL	AHB to MXO interface will abort if it does not receive an ack from mxo after this number of ahb clocks. Returns ERROR on AHB.

0x28009028 AVTIMER_DRE_CNT_PXO

Type: Read
Clock: LCC_AVT_HCLK
Reset State: 0x00000000

DRE (slave) counter in pxo domain.

AVTIMER_DRE_CNT_PXO

Bits	Name	Description
31:0	DRE_CNT_PXO	Value of dre slave counter in PXO clock domain

0x28009400 AUD_SYNC_CTL

Type: Read/write
Clock: LCC_AVS_XCLK
Reset State: 0x00000000

Control register

AUD_SYNC_CTL

Bits	Name	Description
31:17	RESERVED_1	RESERVED
16	VFR_INT_SEL	Selects either the external modem interrupt or the internal modem interrupt. 0x0: internal 0x1: external

AUD_SYNC_CTL (cont.)

Bits	Name	Description
15:14	RESERVED_2	RESERVED
13	FM_PH_ADJ_NEG_WE	In SW tracking method, writing 1 to this bit decrements sample counter by 1
12	FM_PH_ADJ_POS_WE	In SW tracking method, writing 1 to this bit increments sample counter by 1
11	FM_XO_DIV_EN	Enables XO divider 0x1: ENABLE
10	FM_PH_TRK_EN	FM Phase Tracker Enable 0x1: ENABLE
9	FM_XO_DIV_RESET	FM XO divider Reset 0x1: RESET
8	FM_PH_TRK_RESET	Resets FM Phase Tracker. 0x1: RESET
7	BT_PH_ADJ_NEG_WE2	In SW tracking method, writing 1 to this bit decrements sample counter by 1 for DPLL 2
6	BT_PH_ADJ_POS_WE2	In SW tracking method, writing 1 to this bit increments sample counter by 1 for DPLL 2.
5	BT_PH_ADJ_NEG_WE1	In SW tracking method, writing 1 to this bit decrements sample counter by 1 for DPLL 1
4	BT_PH_ADJ_POS_WE1	In SW tracking method, writing 1 to this bit increments sample counter by 1 for DPLL 1
3	BT_XO_DIV_EN	Enables XO divider 0x1: ENABLE
2	BT_PH_TRK_EN	Enables BT SCO TX Phase Tracker. 0x1: ENABLE
1	BT_XO_DIV_RESET	Resets BT SCO TX divider 0x1: RESET
0	BT_PH_TRK_RESET	BT SCO TX Phase Tracker Reset 0x1: RESET

0x28009404 AUD_SYNC_STATUS

Type: Read/write
Clock: LCC_RES_XCLK
Reset State: 0x00000000

Status of AUD_SYNC module. This is a write-one-to-clear register.

AUD_SYNC_STATUS

Bits	Name	Description
31:6	RESEREVED	RESERVED
5	FM_COUNT_OVF_REF	FM overflow status for reference counter
4	FM_COUNT_OVF_XO	FM overflow status for sample counter
3	BT_COUNT_OVF_REF2	BT SCO TX overflow status for reference counter 2
2	BT_COUNT_OVF_XO2	BT SCO TX overflow status for sample counter 2
1	BT_COUNT_OVF_REF1	BT SCO TX overflow status for reference counter 1
0	BT_COUNT_OVF_XO1	BT SCO TX overflow status for sample counter 1

12.3 LPA SS M2VMT Registers (0x28002000 LPASS_M2VMT_BASE)

This section contains the Low Power Audio Subsystem (LPASS) M2MVT registers.

12.3.1 M2VMT VMID mapping registers

0x28002000+ 0x4*n LPASS_M2VMT_M2VMRn

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where n = NUM_M2VMT_ENTRIES from the design generics

LPASS_M2VMT_M2VMRn

Bits	Name	Description
31:5	RESERVED	n = NUM_M2VMT_ENTRIES from the design generic/parameter.
4:0	VMID	Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRn address associations. For the tables of the size of non power of 2, there will be undefined/unmapped entries and such entities will be set to 'zero' value. In other word, when such entities are accessed, vmid will always be set to zero.

12.3.2 M2VMT configuration registers

0x28002F80 LPASS_M2VMT_CR

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: xxx0

Global configuration register.

NOTE When REMOVE_M2VMT_RPU = '1', this register is not available. Also, bit [2], is not valid or has no effect when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT ='1'.

LPASS_M2VMT_CR

Bits	Name	Description
31:4	RESERVED	
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., in valid addresses) are recorded as such. Decode error is asserted when config access to un-implemented and/or unmapped register/address are done. Also, note that decode error is never asserted for client port accesses. When value is set to '0' i.e., 'do not record', decode errors do not set the M2VMT_ESR[CFG], and M2VMT_EAR & M2VMT_SYNRn is not updated. When value is set to '1', i.e., 'record', decode errors set M2VMT_ESR[CFG] and M2VMT_EAR & M2VMT_SYNRn is updated with the address and the syndrome of the error. Reset State: x
2	RPUEIE	RPU error interrupt Enable: When set, configuration port errors are reported directly to the interrupt controller via the M2VMT_intr, interrupt output signal. Interrupt output is asserted if M2VMT_CR[RPUIE_EN] is '1' and ANY bit is set in the M2VMT_ESR register. **NOTE** Not valid or has no effect on the interrupt when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT='1' Reset State: x
1	RPUERE	RPU error report enable: When set, M2VMT reports configuration port errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via CRIF port will use a decode error, rather than a slave error. Regardless of the value of this field, both configuration port errors are terminated by the M2VMT as RAZ/WI, and are recorded in M2VMT_ESR register. **NOTE** Current design does not support the configurable slave error responses, therefore, effect of this bit is similar to RPUE. Reset State: X
0	RPUE	RPU Enable: Governs whether M2VMT_RPU_ACR is enabled to check the VMID of the configuration request. When set, all configuration port accesses are checked against M2VMT_RPU_ACR register for access permissions. It's cleared by reset. Set once SROT configures MID->VMID mapping tables Reset State: 0

12.3.3 M2VMT error report registers

0x28002F84 LPASS_M2VMT_EAR

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: unknown

When there is an error, this register holds the physical address of the errant transaction.

LPASS_M2VMT_EAR

Bits	Name	Description
31:0	PA	M2VMT Error Address Register: Physical address[31:0]. Contains the physical address of the errant request. Based on implementation, it may not contain the full 32 bits of the address. Captures the address on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT = '1', this register is not available and therefore access to this register are treated as RAZ/WI.

0x28002F88 LPASS_M2VMT_ESR

Type: Read/Write to clear
Clock: CRIF_BUS_CLOCK
Reset State: Undefined

M2VMT Error Status Register:

Captures the status upon M2VMT configuration errors, as determined by the M2VMT_RPU_ACR.

This register has read/write-clear access, meaning that reads simply provide a value in the register, while writes are performed by clearing those bits corresponding to '1's in the value written data, and leaving unchanged those bits corresponding to 0s n the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old error. A write with a '1' set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

The presence of an asserted value on any bit in this register is what prompts the assertion when enabled by M2VMT_CR[RPUEIE] of the M2MVT's interrupt output. Therefore these bits must be cleared by the interrupt handler. This is contrasted with the fields in the M2VMT_ESYNRn register, which are merely the 'syndrome' of an error indicated by the M2VMT_ESR.

For M2VMT, there is only one defined error status bit in the M2VMT_SER (actually two counting multi-error).

LPASS_M2VMT_ESR

Bits	Name	Description
31	MULTI	Multi-Error: When set to '1', indicates that an additional error occurred while M2VMT_ESR is non-zero. The M2VMT_EAR,M2VMT_ESYNRn and M2VMT_ESR registers (with the exception of this bit) lock on the first error, and must be cleared to unlock. Therefore, the status and the syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., syndrome register and status register stores details of only the first error. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this register is treated as RAZ/WI.
30:1	RESERVED	
0	CFG	Configuration Port Error: When set to '1', indicates an error associated with a configuration port request.

0x28002F8C LPASS_M2VMT_ESRRESTORE

Type: Write Only/reads ignored
Clock: CRIF_BUS_CLOCK
Reset State: unknown

LPASS_M2VMT_ESRRESTORE

Bits	Name	Description
31:0	M2VMT_ESRRTORE	M2VMT Error Status Register Restore This is just an aliased address for M2VMT_ESR, which provides direct write access (rather than write-clear) for restoration purpose **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this register is treated as RAZ/WI.

0x28002F90 LPASS_M2VMT_ESYNR0

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: undefined

Error Syndrome Register 0:

Captures the syndrome on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) 'lock' upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., the syndrome register and the status register stores details of only the first error.

LPASS_M2VMT_ESYNR0

Bits	Name	Description
31:24	ATID	ATID[7:0] field of errant request. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT="1", this register is not available and therefore access to this register is treated as RAZ/WI.
23:21	RESERVED	
20:16	AVMID	AVMID[4:0] field of errant request.
15:0	AMID	AMID[15:0] field of errant request.

0x28002F94 LPASS_M2VMT_ESYNR1

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: Undefined

Error Syndrome Register 1:

Captures syndrome upon M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) 'lock' upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., the syndrome register and the status register stores details of only the first error.

LPASS_M2VMT_ESYNR1

Bits	Name	Description
31	DCD	Decode: Indicates configuration port error due to invalid/ unrecognized/ unmapped/ un-implemented address (e.g., a reserved register address). Includes decode errors within the global address space. Also, note that decode error is never asserted for client port accesses. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this registers is treated as RAZ/WI.

LPASS_M2VMT_ESYNR1 (cont.)

Bits	Name	Description
30	AC	Access control: Indicates configuration port error due to lack of permission, as specified by the access control registers
29:25	RESERVED	
24	AFULL	AFULL field of the errant request
23	AOOOWR	AOOOWR field of the errant request
22	AOOORD	AOOORD field of the errant request.
21:20	ALOCK	ALOCK[1:0] (ALOCK field of the errant request).
19	RESERVED_2	
18:16	ASIZE	ASIZE[2:0] field of the errant request).
15:12	ALEN	ALEN[3:0] field of the errant request.
11:10	ABURST	ABURST[1:0] field of the errant request.
9	RESERVED_1	
8	AWRITE	AWRITE field of the errant request.
7	AINST	AINST field of the errant request.
6	APROTNS	APROTNS field of the errant request.
5	APRIV	APRIV field of the errant request.
4	AINNERSHARED	AINNERSHARED field of the errant request.
3	ASHARED	ASHARED field of the errant request.
2:0	AMEMTYPE	AMEMTYPE[2:0] field of the errant request.

12.3.4 M2VMT revision register

0x28002FF4 LPASS_M2VMT_REV

Type: Read
Clock: CRIF_BUS_CLOCK
Reset State: 0x00000010

Reports the revision information for the M2VMT core and wrapper.

LPASS_M2VMT_REV

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	Major variant field

LPASS_M2VMT_REV (cont.)

Bits	Name	Description
3:0	MINOR	Minor variant field.

12.3.5 M2VMT implementation parameter register

0x28002FF8 LPASS_M2VMT_IDR

Type: Read
Clock: CRIF_BUS_CLOCK
Reset State: 0x00000001

Reports the size of the M2VMT table. It is a read-only register.

LPASS_M2VMT_IDR

Bits	Name	Description
31:9	RESERVED	M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.
8:0	M2VMTSIZE	.M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping.

0x28002FFC LPASS_M2VMT_RPU_ACR

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: Undefined

Using the incoming VMID, this register controls access to the global register space.

LPASS_M2VMT_RPU_ACR

Bits	Name	Description
31:0	RWE	M2VMT local RPU Access control Register. Each bit position corresponds to a VMID. When set to ’1’, that VMID is granted VMID read/write access to the entire block of registers within the M2VMT’s 4KB global address space, including this register itself. In practice, this register designates the VMID(s) that can act as SROT (e.g., scorpion-secure) or pseudo SROT (e.g., RPM ARM11). **NOTE** When REMOVE_M2VMT_RPU=’1’, this register is not available and therefore access to this register is treated as RAZ/WI.

12.4 LPA SS Q6 SS M2VMT Registers (0x28003000 LPASS_M2VMT_Q6SS_BASE)

This section contains the Low Power Audio Subsystem (LPASS) Q6SS M2MVT registers.

12.4.1 M2VMT VMID mapping register

0x28003000+ 0x4*n Q6SS_M2VMT_M2VMRn

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where n = NUM_M2VMT_ENTRIES from the design generics

Q6SS_M2VMT_M2VMRn

Bits	Name	Description
31:5	RESERVED	n = NUM_M2VMT_ENTRIES from the design generic/parameter.
4:0	VMID	Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRn address associations. For the tables of the size of non power of 2, there will be undefined/unmapped entries and such entities will be set to 'zero' value. In other word, when such entities are accessed, vmid will always be set to zero.

12.4.2 M2VMT configuration registers

0x28003F80 Q6SS_M2VMT_CR

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: xxx0

Global configuration register.

NOTE When REMOVE_M2VMT_RPU = '1', this register is not available. Also, bit [2], is not valid or has no effect when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT ='1'.

Q6SS_M2VMT_CR

Bits	Name	Description
31:4	RESERVED	
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., in valid addresses) are recorded as such. Decode error is asserted when config access to un-implemented and/or unmapped register/address are done. Also, note that decode error is never asserted for client port accesses. When value is set to ’0’ i.e., ’do not record’, decode errors do not set the M2VMT_ESR[CFG], and M2VMT_EAR & M2VMT_SYNRn is not updated. When value is set to ’1’, i.e., ’record’, decode errors set M2VMT_ESR[CFG] and M2VMT_EAR & M2VMT_SYNRn is updated with the address and the syndrome of the error. Reset State: x
2	RPUEIE	RPU error interrupt Enable: When set, configuration port errors are reported directly to the interrupt controller via the M2VMT_intr, interrupt output signal. Interrupt output is asserted if M2VMT_CR[RPUIE_EN] is ’1’ and ANY bit is set in the M2VMT_ESR register. **Note**: Not valid or has no effect on the interrupt when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=’1’. Reset State: x
1	RPUERE	RPU error report enable: When set, M2VMT reports configuration port errors to the requesting bus master, according to the respective port’s bus protocol. All error types reported via CRIF port will use a decode error, rather than a slave error. Regardless of the value of this field, both configuration port errors are terminated by the M2VMT as RAZ/WI, and are recorded in M2VMT_ESR register. **NOTE** Current design does not support the configurable slave error responses, therefore, effect of this bit is similar to RPUE. Reset State: X
0	RPUE	RPU Enable: Governs whether M2VMT_RPU_ACR is enabled to check the VMID of the configuration request. When set, all configuration port accesses are checked against M2VMT_RPU_ACR register for access permissions. It’s cleared by reset. Set once SROT configures MID->VMID mapping tables Reset State: 0

12.4.3 M2VMT error report registers

0x28003F84 Q6SS_M2VMT_EAR

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: unknown

When there is an error, this register holds the physical address of the errant transaction.

Q6SS_M2VMT_EAR

Bits	Name	Description
31:0	PA	M2VMT Error Address Register: Physical address[31:0]. Contains the physical address of the errant request. Based on implementation, it may not contain the full 32 bits of the address. Captures the address on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT = '1', this register is not available and therefore access to this register are treated as RAZ/WI.

0x28003F88 Q6SS_M2VMT_ESR

Type: Read/Write to clear
Clock: CRIF_BUS_CLOCK
Reset State: Undefined

M2VMT Error Status Register:

Captures the status upon M2VMT configuration errors, as determined by the M2VMT_RPU_ACR.

This register has read/write-clear access, meaning that reads simply provide a value in the register, while writes are performed by clearing those bits corresponding to '1's in the value written data, and leaving unchanged those bits corresponding to 0s n the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old error. A write with a '1' set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

The presence of an asserted value on any bit in this register is what prompts the assertion when enabled by M2VMT_CR[RPUEIE] of the M2MVT's interrupt output. Therefore these bits must be cleared by the interrupt handler. This is contrasted with the fields in the M2VMT_ESYNRn register, which are merely the 'syndrome' of an error indicated by the M2VMT_ESR.

For M2VMT, there is only one defined error status bit in the M2VMT_SER (actually two, if you count multi-error).

Q6SS_M2VMT_ESR

Bits	Name	Description
31	MULTI	Multi-Error: When set to ’1’, indicates that an additional error occurred while M2VMT_ESR is non-zero. The M2VMT_EAR,M2VMT_ESYNRn and M2VMT_ESR registers (with the exception of this bit) lock on the first error, and must be cleared to unlock. Therefore, the status and the syndrome of errors that occurred while M2VMT_ESR[CFG] is ’1’ are lost., ie., syndrome register and status register stores details of only the first error. **NOTE** When REMOVE_M2VMT_RPU=’1’ OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT=’1’, this register is not available and therefore access to this register is treated as RAZ/WI.
30:1	RESERVED	
0	CFG	Configuration Port Error: When set to ’1’, indicates an error associated with a configuration port request.

0x28003F8C Q6SS_M2VMT_ESRRESTORE

Type: Write Only/reads ignored
Clock: CRIF_BUS_CLOCK
Reset State: unknown

Q6SS_M2VMT_ESRRESTORE

Bits	Name	Description
31:0	M2VMT_ESRRTORE	M2VMT Error Status Register Restore This is just an aliased address for M2VMT_ESR, which provides direct write access (rather than write-clear) for restoration purpose **NOTE** When REMOVE_M2VMT_RPU=’1’ OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=’1’, this register is not available and therefore access to this register is treated as RAZ/WI.

0x28003F90 Q6SS_M2VMT_ESYNR0

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: undefined

Error Syndrome Register 0:

Captures the syndrome on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) 'lock' upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., the syndrome register and the status register stores details of only the first error.

Q6SS_M2VMT_ESYNR0

Bits	Name	Description
31:24	ATID	ATID[7:0] field of errant request. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT="1", this register is not available and therefore access to this register is treated as RAZ/WI.
23:21	RESERVED	
20:16	AVMID	AVMID[4:0] field of errant request.
15:0	AMID	AMID[15:0] field of errant request.

0x28003F94 Q6SS_M2VMT_ESYNR1

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: Undefined

Error Syndrome Register 1:

Captures syndrome upon M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) 'lock' upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., the syndrome register and the status register stores details of only the first error.

Q6SS_M2VMT_ESYNR1

Bits	Name	Description
31	DCD	Decode: Indicates configuration port error due to invalid/ unrecognized/ unmapped/ un-implemented address (e.g., a reserved register address). Includes decode errors within the global address space. Also, note that decode error is never asserted for client port accesses. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this registers is treated as RAZ/WI.

Q6SS_M2VMT_ESYNR1 (cont.)

Bits	Name	Description
30	AC	Access control: Indicates configuration port error due to lack of permission, as specified by the access control registers
29:25	RESERVED	
24	AFULL	AFULL field of the errant request
23	AOOOWR	AOOOWR field of the errant request
22	AOOORD	AOOORD field of the errant request.
21:20	ALOCK	ALOCK[1:0] (ALOCK field of the errant request).
19	RESERVED_2	
18:16	ASIZE	ASIZE[2:0] field of the errant request).
15:12	ALEN	ALEN[3:0] field of the errant request.
11:10	ABURST	ABURST[1:0] field of the errant request.
9	RESERVED_1	
8	AWRITE	AWRITE field of the errant request.
7	AINST	AINST field of the errant request.
6	APROTNS	APROTNS field of the errant request.
5	APRIV	APRIV field of the errant request.
4	AINNERSHARED	AINNERSHARED field of the errant request.
3	ASHARED	ASHARED field of the errant request.
2:0	AMEMTYPE	AMEMTYPE[2:0] field of the errant request.

12.4.4 M2VMT revision register

0x28003FF4 Q6SS_M2VMT_REV

Type: Read
Clock: CRIF_BUS_CLOCK
Reset State: 0x00000010

Reports the revision information for the M2VMT core and wrapper.

Q6SS_M2VMT_REV

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	Major variant field

Q6SS_M2VMT_REV (cont.)

Bits	Name	Description
3:0	MINOR	Minor variant field.

12.4.5 M2VMT implementation parameter register

0x28003FF8 Q6SS_M2VMT_IDR

Type: Read
Clock: CRIF_BUS_CLOCK
Reset State: 0x00000001

Reports the size of the M2VMT table. It is a read-only register.

Q6SS_M2VMT_IDR

Bits	Name	Description
31:9	RESERVED	M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.
8:0	M2VMTSIZE	.M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping.

0x28003FFC Q6SS_M2VMT_RPU_ACR

Type: Read/Write
Clock: CRIF_BUS_CLOCK
Reset State: Undefined

Using the incoming VMID, this register controls access to the global register space.

Q6SS_M2VMT_RPU_ACR

Bits	Name	Description
31:0	RWE	M2VMT local RPU Access control Register. Each bit position corresponds to a VMID. When set to ’1’, that VMID is granted VMID read/write access to the entire block of registers within the M2VMT’s 4KB global address space, including this register itself. In practice, this register designates the VMID(s) that can act as SROT (e.g., scorpion-secure) or pseudo SROT (e.g., RPM ARM11). **NOTE** When REMOVE_M2VMT_RPU=’1’, this register is not available and therefore access to this register is treated as RAZ/WI.

12.5 LPA SS AHBTM Registers (0x2800A000 LPASS_AHBTM_BASE)

This section contains the Low Power Audio Subsystem (LPASS) AHBTM registers.

12.5.1 LPASS AHMTM Configuration registers

0x2800A000 LPASS_AHBTM_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The AHBTM_CFG register configures the following:

LPASS_AHBTM_CFG

Bits	Name	Description
29:31	UNUSED_1	
28	RESERVED_BIT28	
27:1	UNUSED_2	
0	CGC_CLK_ENA	0x0: No clock running 0x1: Clock enabled

0x2800A020+ 0x20*n LPASS_AHBTM_Cn_CFG0, n=[0..7]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The AHBTM_Cn_CFG0 register configures the following:

LPASS_AHBTM_Cn_CFG0

Bits	Name	Description
31:28	PORT_SELECT	Identifies which AHB port the monitor should be observing

0x2800A024+ 0x20*n LPASS_AHBTM_Cn_CFG1, n=[0..7]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The AHBTM_Cn_CFG1 register configures the following:

LPASS_AHBTM_Cn_CFG1

Bits	Name	Description
20	SEQ_ADDR_ENA	Setting (1) this bit enables the Sequential Address state checking in the enable logic of the counter. On reset this bit is initialized to 0.
18	HMASTLOCK_ENA	Setting (1) this bit enables the HMASTLOCK state checking in the enable logic of the counter. On reset this bit is initialized to 0.
17	HWRITE_ENA	Setting (1) this bit enables the HWRITE state checking in the enable logic of the counter. On reset this bit is initialized to 0.
16	HREADY_ENA	Setting (1) this bit enables the HREADY state checking in the enable logic of the counter. On reset this bit is initialized to 0.
15	HBURST_ENA	Setting (1) this bit enables the HBURST state checking in the enable logic of the counter. On reset this bit is initialized to 0.
14	HTRANS_ENA	Setting (1) this bit enables the HTRANS state checking in the enable logic of the counter. On reset this bit is initialized to 0.
13	HSIZE_ENA	Setting (1) this bit enables the HSIZE state checking in the enable logic of the counter. On reset this bit is initialized to 0.
12	HRESP_ENA	Setting (1) this bit enables the HRESP state checking in the enable logic of the counter. On reset this bit is initialized to 0.
9	HPROT_ENA	Setting (1) this bit enables the HPROT state checking in the enable logic of the counter. On reset this bit is initialized to 0.
8	HSEL_ENA	Setting (1) this bit enables the HSEL state checking in the enable logic of the counter. On reset this bit is initialized to 0.
4	HADDR_ENA	Setting (1) this bit enables the HADDR state checking in the enable logic of the counter. On reset this bit is initialized to 0.
1	MSTR_GNT_ENA	Setting (1) this bit enables the MSTR_GNTstate checking in the enable logic of the counter. On reset this bit is initialized to 0.
0	ARB_LAT_ENA	Setting (1) this bit enables the ARB_LAT state checking in the enable logic of the counter. On reset this bit is initialized to 0.

0x2800A028+0x20*n LPASS_AHBTM_Cn_CFG2, n=[0..7]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The AHBTM_Cn_CFG2 register configures the following:

LPASS_AHBTM_Cn_CFG2

Bits	Name	Description
8	HMASTLOCK_VAL	Value used in the match circuit.
4	HWRITE_VAL	Value used in the match circuit.
0	HREADY_VAL	Value used in the match circuit.

0x2800A02C+0x20*n LPASS_AHBTM_Cn_CFG3, n=[0..7]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The AHBTM_Cn_CFG3 register configures the following:

LPASS_AHBTM_Cn_CFG3

Bits	Name	Description
30:28	HBURST_MASK	Setting (1) these bits masks off the corresponding bit in the VAL register prior to being used in the match circuit.
27	HBURST_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
26:24	HBURST_VAL	Value used in the match circuit.
22:20	HTRANS_MASK	Setting (1) these bits masks off the corresponding bit in the VAL register prior to being used in the match circuit.
19	HTRANS_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
18:16	HTRANS_VAL	Value used in the match circuit.
14:12	HSIZE_MASK	Setting (1) these bits masks off the corresponding bit in the VAL register prior to being used in the match circuit.
11	HSIZE_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
10:8	HSIZE_VAL	Value used in the match circuit.
6:4	HRESP_MASK	Setting (1) these bits masks off the corresponding bit in the VAL register prior to being used in the match circuit.

LPASS_AHBTM_Cn_CFG3 (cont.)

Bits	Name	Description
3	HRESP_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
2:0	HRESP_VAL	Value used in the match circuit.

0x2800A030+ 0x20*n LPASS_AHBTM_Cn_CFG4, n=[0..7]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The AHBTM_Cn_CFG4 register configures the following:

LPASS_AHBTM_Cn_CFG4

Bits	Name	Description
27:24	HPROT_MASK	Setting (1) this bit masks off the corresponding bit in the VAL register prior to being used in the match circuit.
20	HPROT_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
19:16	HPROT_VAL	Value used in the match circuit.
11:4	HSEL_MASK	Setting (1) this bit masks off the corresponding bit in the VAL register prior to being used in the match circuit.
0	HSEL_VAL	Value used in the match circuit.

0x2800A034+ 0x20*n LPASS_AHBTM_Cn_CFG5, n=[0..7]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The AHBTM_Cn_CFG5 register configures the following:

LPASS_AHBTM_Cn_CFG5

Bits	Name	Description
28	HADDR_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
27:8	HADDR_VAL	Value used in the match circuit.
7:0	HADDR_MASK	Setting (1) this bit masks off the corresponding bit (7->15...0->8) in the VAL register prior to being used in the match circuit.

0x2800A038+ 0x20*n LPASS_AHBTM_Cn_CFG6, n=[0..7]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The AHBTM_Cn_CFG6 register configures the following:

LPASS_AHBTM_Cn_CFG6

Bits	Name	Description
27:20	MSTR_GNT_MASK	Setting (1) these bits masks off the corresponding bits being used in the match circuit. When set = 0xFF this disables the MSTR_GNT state checking from the enable logic of the counter
16	MSTR_GNT_VAL	Value used in the match circuit.
11:4	ARB_LAT_MASK	Setting (1) these bits masks off the corresponding bits being used in the match circuit. When set = 0xFF this disables the ARB_LAT state checking from the enable logic of the counter
0	ARB_LAT_VAL	Value used in the match circuit.

12.6 LPA SS SLIM Bus Registers (0x28080000 LPASS_SLIMBUS_BASE)

This section contains the Low Power Audio Subsystem (LPASS) SLIMBus registers.

12.6.1 Component registers

0x28080000 LPASS_SB_COMP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

1. Enable for the entire component

LPASS_SB_COMP_CFG

Bits	Name	Description
31:1	RESERVED	
0	ENABLE	If set, enables the entire component

0x28080004 LPASS_SB_SW_RESET

Type: Write
Clock: HCLK
Reset State: 0x00000000

A Write to this register resets the whole SLIMBus component. The write data accompanying the write is ignored.

LPASS_SB_SW_RESET

Bits	Name	Description
31:0	RESERVED31_0	Reserved.

0x28080008 LPASS_SB_COMP_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_COMP_STATUS

Bits	Name	Description
31:0	RESERVED	reserved

0x2808000C LPASS_SB_COMP_TEST

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

Setting a INT_EE* bit of this register asserts interrupt for that EE. Clearing that bit again clears that interrupt. This is mainly for testing interrupt connectivity of a component at chip top without a functional test.

LPASS_SB_COMP_TEST

Bits	Name	Description
6:4	SB_TESTBUS_SEL	0x0: select intf def testbus 0x1: select frm def testbus 0x2: select mgr def testbus 0x3: select pgd def testbus 0x4: select ngd1 def testbus 0x5: select ngd2 def testbus 0x6: select mp testbus 0x7: select frame layer testbus
3	SB_TESTBUS_EN	If set, the debug bus is driven actively by the SLIMbus component.
2	INT_EE2	
1	INT_EE1	
0	INT_EE0	Assert interrupt for EE (EE0) if set, de-assert the interrupt if cleared.

0x28080010 LPASS_SB_COMP_DEBUG

Type: Read
Clock: HCLK
Reset State: 0x00000000

Mainly for testing/debug.

LPASS_SB_COMP_DEBUG

Bits	Name	Description
0	TBD	Tbd

0x28080014 LPASS_SB_COMP_TRUST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

NOTE Note the very consistent device interrupts found in: SB_MGR_INT_*, SB_FRM_INT_*, SB_INTF_INT_*, SB_NGD1_INT_*, SB_NGD2_INT_*, SB_NGD3_INT_*, and SB_PGD_DEV_INT_*. This register provides a means of routing same to one of the available EE's.

LPASS_SB_COMP_TRUST_CFG

Bits	Name	Description
11:10	EE_FOR_MGR_RSRC_GRP	EE value (i.e., 0,1,2,3) for the Manager resource group containing Manager, Framer and Interface and PGD* Devices. Used to route device interrupts from this group to the programmed EE.
9:8	EE_FOR_NGD1	EE value for NGD1 - to route NGD1 interrupts
7:6	EE_FOR_NGD2	EE value for NGD2 - to route NGD1 interrupts
5	HALD_MGR_MSG_TX	Prevents MGR from sending out any SLIMbus message to the trusted device
4	HALT_NGD2_MSG_TX	Prevents NGD2 from sending out any SLIMbus message to the trusted device
3	HALT_NGD1_MSG_TX	Prevents NGD1 from sending out any SLIMbus message to the trusted device
2	HALT_EN_CHANGE	Blocks changes to EN bit of all devices in the component.
1	HALT_SW_RESET	
0	HALT_RECONFIG	Blocks Reconfig messages from being sent or executed if received.

0x28080018 LPASS_SB_COMP_TRUST_DEV1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_COMP_TRUST_DEV1

Bits	Name	Description
31:16	TRUSTED_EA_MSB	MSB Bits 47:32 of the EA of the trusted device whose LA should be assigned as above
15:8	TRUSTED_LA	LA of the Trusted Device. Used by NGDs as well if HALT_NGD*_MSG_TX bit is set.

LPASS_SB_COMP_TRUST_DEV1 (cont.)

Bits	Name	Description
7:1	RESERVED	
0	TRUST_DEV_EN	Enables the Manager to monitor for said Trusted device access

0x2808001C LPASS_SB_COMP_TRUST_DEV2

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_COMP_TRUST_DEV2

Bits	Name	Description
31:0	TRUSTED_EA_LSB	LSB Bits 31:0 of the EA of the trusted device whose LA should be assigned as above

12.6.2 Manager Device Registers

0x28080200 LPASS_SB_MGR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_MGR_CFG

Bits	Name	Description
3	TX_MSGQ_EN_LOW	
2	TX_MSGQ_EN_HIGH	
1	RX_MSGQ_EN	
0	ENABLE	

0x28080204 LPASS_SB_MGR_STATUS

Type: Read
Clock: HCLK
Reset State: 0x0000000U

LPASS_SB_MGR_STATUS

Bits	Name	Description
23:17	NACKED_TX_MSG_MC	Read Only. The MC of the TX msg that was nacked by the destination twice or the MC of the invalid message depending on which intr bit is set.
16:10	ACKED_TX_MSG_MC	Read Only. The MC of the latest TX msg from the msg queues that was positively acked by the destination.
9:8	ERROR	Read only. Two bits holding any error conditions that the device may want to report. Valid only if DEV_ERR intr bit is set
7:2	PIPE_NUM_OFFSET	This field is the pipe to which the RxQ of the Manager is connected to. The TxL and TxH are connected to pipe with numbers PIPE_NUM_OFFSET+1, PIPE_NUM_OFFSET+2 respectively
1	ENUMERATED	If set, the device has been enumerated.
0	TX_MSG_BUFFER_BUSY	If set, then the Tx Msg Buffer has a message waiting to be sent out. Hence the direct access should not be used until this bit is a 0 again. Its recommended to wait for the enumerated bit to get set before polling this bit. Should not be used as a check for txmsg sent.

0x28080208 LPASS_SB_MGR_RX_MSGQ_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The fields that control the RX message queue (i.e., producer queue).

LPASS_SB_MGR_RX_MSGQ_CFG

Bits	Name	Description
31:16	TIME_OUT_VAL	TIme out counter enabled if this field is non zero and when the first message is received. Time out cntr reset after every Rx msg received, If next Rx message not received before it expires, a trans_end is automatically generated even if BLOCK_SIZE/TRANS_SIZE is not got. Specified in terms of AHB Bus clock cycles given to the core by the ClockCtrl of SoC.
15:8	TRANS_SIZE	Specified in units of messages. After receiving that many a trans_end is asserted.
7:0	BLOCK_SIZE	Specified in units of messages. After receiving this many, a block_end is asserted. SW can leave this 0 in system producer mode to prevent block_end assertion.

0x28080210 LPASS_SB_MGR_INT_EN

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_MGR_INT_EN

Bits	Name	Description
31	TX_MSG_SENT	If queue is not enabled, this bit is set When a message written to TX_MSG reg is sent out. If queue is enabled, this bit is set when last TX msg of the current transaction is sent out.
30	RX_MSG_RCVD	When a message has been received in the RX_MSG registers.Honoured only if RX Q is disabled.
29	DEV_ERR	Device reported error. See status register for details.
28	IE_VE_CHANGE	An IE or VE has changed its value.
27	INVALID_TX_MSG	An invalid TX message not allowed for this device is written into the Tx buffer.
26	TX_MSG_BUF_CONTENTIO N	If enabled, this generates an interrupt whenever SW (through direct AHB access) tries to write to an tx buffer that is not available for SW.
25	TX_MSG_NACKED_TWICE	A TX msg was nacked twice by destination.
24	RECONFIG_DONE	After successfully sending a RECONFIG_NOW command

0x28080214 LPASS_SB_MGR_INT_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

Status of interrupt elements mentioned in the MSG_INT_EN register.

LPASS_SB_MGR_INT_STATUS

Bits	Name	Description
31	TX_MSG_SENT	
30	RX_MSG_RCVD	
29	DEV_ERR	
28	IE_VE_CHANGE	
27	INVALID_TX_MSG	
26	TX_MSG_BUF_CONTENTIO N	

LPASS_SB_MGR_INT_STATUS (cont.)

Bits	Name	Description
25	TX_MSG_NACKED_TWICE	.
24	RECONFIG_DONE	

0x28080218 LPASS_SB_MGR_INT_CLR

Type: Write
Clock: HCLK
Reset State: 0x00000000

Interrupt clear for the listed interrupt events.

LPASS_SB_MGR_INT_CLR

Bits	Name	Description
31	TX_MSG_SENT	
30	RX_MSG_RCVD	
29	DEV_ERR	
28	IE_VE_CHANGE	
27	INVALID_TX_MSG	
26	TX_MSG_BUF_CONTENTION	
25	TX_MSG_NACKED_TWICE	
24	RECONFIG_DONE	

0x28080230+4*n LPASS_SB_MGR_TX_MSGn, n=[0..9]

Type: Write
Clock: HCLK
Reset State: 0x00000000

SW uses these registers for Direct Access Tx Message sending over SLIMbus. These hold the TX message to be sent (40bytes max).

CAUTION This Direct access Messaging registers SHOULD NOT be used if any of the Tx queues are enabled. The resulting behavior is not defined.

LPASS_SB_MGR_TX_MSGn

Bits	Name	Description
31:0	MSGVAL	message contents

0x28080270+4*n LPASS_SB_MGR_RX_MSGn, n=[0..9]

Type: Read
Clock: HCLK
Reset State: 0x00000000

SW uses these registers for Direct Access Rx Message receiving over SLIMbus. These hold the RX message received and waiting for SW to consume(40bytes max).

CAUTION This Direct access Messaging registers SHOULD NOT be used if the Rx queue is enabled. The resulting behavior is not defined.

LPASS_SB_MGR_RX_MSGn

Bits	Name	Description
31:0	MSGVAL	message contents

0x280802F0 LPASS_SB_MGR_IE_STATUS

Type: Read
Clock: HCLK
Reset State: 0xFF010000

Holds status of IE elements listed out in spec.

LPASS_SB_MGR_IE_STATUS

Bits	Name	Description
31:24	DEV_CLASS_CODE	
23:16	DEV_CLASS_VER	
15:4	RESERVED_15_4	reserved
3	EX_ERROR	
2	RECONFIG_OBJ	
1	RESERVED	reserved
0	UNSPRTD_MSG	unsupported msg

0x28080300 LPASS_SB_MGR_VE_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

Place Holder.

LPASS_SB_MGR_VE_STATUS

Bits	Name	Description
31:0	VE_VAL	presently reads all 0's

Framer Device Registers

0x28080400 LPASS_SB_FRM_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_FRM_CFG

Bits	Name	Description
25	SEL_INTFB_CAPTURE_CLK	When 1, the intfb clk is chosen as capture clock When 0, the ext clk is chosen as capture clock
24:22	CDL_TIMEOUT	Number of superframes that Active framer stays in checking DataLine state before timing out and returning to Undefined state. When timeout value of 0 is provided, timeout functionality is disabled. If Framer times out before exiting CheckingDataLine state, a timeout interrupt is triggered. Refer section 10.1.1.2 of SLIMbus spec v 1.01.01 for more details on CheckingDataLine state. See http://www.mipi.org/specifications/serial-low-power-inter-chip-media-bus-slimbussm-specification
21:20	CLK_QUALITY	Encoded as specified in Table 76 of SLIMbus spec v 1.01.01
19	INTERNAL_WAKEUP_EN	When set, allows devices within component to wakeup framer when in idle mode.
18:15	REFERENCE_CLK_CG	The equivalent CG of the SLIMbus Reference CLK
14:11	BOOT_ROOT_FREQ	The Boot value of RF used by Framer if defined as the active one
10:7	BOOT_CLOCK_GEAR	The Boot value of CG used by Framer if defined as the active one
6:2	BOOT_SUBFRAME_MODE	The Boot value of SM used by Framer if defined as the active one

LPASS_SB_FRM_CFG (cont.)

Bits	Name	Description
1	BOOT_AS_ACTIVE_FRAMER	If set, this Framer Device is made the active one in the bus. This setting takes effect only when bus is booting up. Any subsequent changes to this bit has no effect until bus re-boots again.
0	ENABLE	If enabled it will be the active Framer and will start booting the bus, when component is also enabled.

0x28080404 LPASS_SB_FRM_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_FRM_STATUS

Bits	Name	Description
31:27	RESERVED	
26:19	DEV_LA	Assigned logical address of device. Only valid when enumerated.
18	ENUMERATED	When set, device is enumerated and has been assigned a logical address
17	IDLE_MODE	When set, framer is in idle mode and must be woken up by one of the defined wake-up methods.
16	ACTIVE_FRAMER	Read only. When set, component is active framer.
15:12	CUR_ROOT_FREQUENCY	
11:8	CUR_CLOCK_GEAR	
7:6	ERROR	Read only. Two bits holding any error conditions that the device may want to report. Valid only if FRM DEV_ERR bit is set.
5:1	CUR_SUBFRAME_MODE	
0	FRAMER_BOOTED	Asserted after framer has finished booting up

0x28080410 LPASS_SB_FRM_INT_EN

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_FRM_INT_EN

Bits	Name	Description
4	CDL_TIMEDOUT	Active Framer could not exit CheckingDataLine state before timer expired. This interrupt is triggered only if programmable timer value set in register SB_FRM_CFG register is non-zero.
3	IDLE_MODE_EXITED	Slimbus has exited idle mode
2	FRAMER_BOOT_COMPLETE	Framer has booted successfully
1	IE_VE_CHANGE	An IE or VE has changed its value.
0	DEV_ERR	Device reported error. See status register for details.

0x28080414 LPASS_SB_FRM_INT_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

Status of interrupt elements.

LPASS_SB_FRM_INT_STATUS

Bits	Name	Description
4	CDL_TIMEDOUT	Active Framer could not exit CheckingDataLine state before timer expired. This interrupt is triggered only if programmable timer value set in register SB_FRM_CFG register is non-zero.
3	IDLE_MODE_EXITED	Slimbus has exited idle mode
2	FRAMER_BOOT_COMPLETE	Framer has booted successfully
1	IE_VE_CHANGE	An IE or VE has changed its value.
0	DEV_ERR	Device reported error. See status register for details.

0x28080418 LPASS_SB_FRM_INT_CLR

Type: Write
Clock: HCLK
Reset State: 0x00000000

Interrupt clear.

LPASS_SB_FRM_INT_CLR

Bits	Name	Description
4	CDL_TIMEDOUT	Active Framer could not exit CheckingDataLine state before timer expired. This interrupt is triggered only if programmable timer value set in register SB_FRM_CFG register is non-zero.
3	IDLE_MODE_EXITED	Slimbus has exited idle mode
2	FRAMER_BOOT_COMPLETE	Framer has booted successfully
1	IE_VE_CHANGE	An IE or VE has changed its value.
0	DEV_ERR	Device reported error. See status register for details.

0x2808041C LPASS_SB_FRM_WAKEUP

Type: Write
Clock: HCLK
Reset State: 0x00000000

Wakeup register.

LPASS_SB_FRM_WAKEUP

Bits	Name	Description
0	WAKEUP_NOW	Wakes up framer if in idle mode.

0x28080420 LPASS_SB_FRM_CLKCTL_DONE

Type: Write
Clock: HCLK
Reset State: 0x00000000

This command-type register is used to indicate to hardware that clk_ctl block has completed reconfiguring the clock.

LPASS_SB_FRM_CLKCTL_DONE

Bits	Name	Description
0	CLKCTL_DONE	Indicates to H/W that clkctl block is done re-configuring the ref clk.

0x28080430 LPASS_SB_FRM_IE_STATUS

Type: Read
Clock: HCLK
Reset State: 0xFE010000

Holds status of IE elements listed out in spec.

LPASS_SB_FRM_IE_STATUS

Bits	Name	Description
31:24	DEV_CLASS_CODE	
23:16	DEV_CLASS_VER	
15:10	RESERVED_15	reserved
9:8	QUAL	Framer Clk Quality
7	GC_TX_COL	
6	FI_TX_COL	
5	FS_TX_COL	
4	ACTIVE_FRAMER	
3	EX_ERROR	
2	RECONFIG_OBJ	
1	RESERVED	reserved
0	UNSPRTD_MSG	unsupported msg

0x28080440 LPASS_SB_FRM_VE_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

place holder.

LPASS_SB_FRM_VE_STATUS

Bits	Name	Description
31:0	VE_VAL	currently reads all zeroes

12.6.3 Interface Device Registers

0x28080600 LPASS_SB_INTF_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_INTF_CFG

Bits	Name	Description
0	ENABLE	

0x28080604 LPASS_SB_INTF_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_INTF_STATUS

Bits	Name	Description
13	MESSAGE_SYNC_ACQUIRED	
12	SUPERFRAME_SYNC_ACQUIRED	
11	FRAME_SYNC_ACQUIRED	
10:3	DEV_LA	Logical address assigned to device. Valued only if ENUMERATED is asserted.
2	ENUMERATED	Indicates if Interface device has been assigned a logical address.
1:0	ERROR	Read only. Two bits holding any error conditions that the device may want to report. Valid only if INTF DEV_ERR bit is set.

0x28080610 LPASS_SB_INTF_INT_EN

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_INTF_INT_EN

Bits	Name	Description
1	IE_VE_CHANGE	An IE or VE has changed its value.
0	DEV_ERR	Device reported error. See status register for details.

0x28080614 LPASS_SB_INTF_INT_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

Status of interrupt elements.

LPASS_SB_INTF_INT_STATUS

Bits	Name	Description
1	IE_VE_CHANGE	An IE or VE has changed its value.
0	DEV_ERR	Device reported error. See status register for details.

0x28080618 LPASS_SB_INTF_INT_CLR

Type: Write
Clock: HCLK
Reset State: 0x00000000

Interrupt clear.

LPASS_SB_INTF_INT_CLR

Bits	Name	Description
1	IE_VE_CHANGE	An IE or VE has changed its value.
0	DEV_ERR	Device reported error. See status register for details.

0x28080630 LPASS_SB_INTF_IE_STATUS

Type: Read
Clock: HCLK
Reset State: 0xFD010000

Holds status of IE elements listed out in spec.

LPASS_SB_INTF_IE_STATUS

Bits	Name	Description
31:24	DEV_CLASS_CODE	
23:16	DEV_CLASS_VER	
15:9	RESERVED_15	reserved
8	DS_OVERLAP	

LPASS_SB_INTF_IE_STATUS (cont.)

2	RECONFIG_OBJ	
1	DATA_TX_COL	reserved
0	UNSPRTD_MSG	unsupported msg

0x28080640 LPASS_SB_INTF_VE_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

place holder.

LPASS_SB_INTF_VE_STATUS

Bits	Name	Description
31:0	VE_VAL	currently reads all zeroes

12.6.4 Non-Ported Generic Device(s) (NGD) Registers

There are two NGDs in a given slimbus component. NGDs do not have ports hence no data channel support. They are intended to help the various EE send messages to devices across SLIMbus and to each other through SLIMbus. NGDs may or may not have message queue support as per what their register bits states.

0x28080800 LPASS_SB_NGD1_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_NGD1_CFG

Bits	Name	Description
2	TX_MSGQ_EN	Enable the Tx Msg Queue if supported. If not supported, this bit is a don’t care and will read back 0.

LPASS_SB_NGD1_CFG (cont.)

Bits	Name	Description
1	RX_MSGQ_EN	Enable the Rx Msg Queue if supported. If not supported, this bit is a don't care and will read back a 0.
0	ENABLE	

0x28080804 LPASS_SB_NGD1_STATUS

Type: Read
Clock: HCLK
Reset State: 0x0000040C

.

LPASS_SB_NGD1_STATUS

Bits	Name	Description
26:20	NACKED_TX_MSG_MC	Read Only. The MC of the TX msg that was nacked by the destination twice or the MC of the invalid tx msg depending on which intr bit is set
19:13	ACKED_TX_MSG_MC	Read Only. The MC of the latest TX msg from the msg queues that was positively acked by the destination.
12:11	ERROR	Read only. Two bits holding any error conditions that the device may want to report. Valid only if Gen DEV_ERR bit is set.
10	MSGQ_SUPPORT	If set, this Generic device supports two message queues - Tx and Rx - at pipe numbers OFFSET and OFFSET+1
9:2	PIPE_NUM_OFFSET	The offset value for pipe number set for this generic devices. If MSGQ_SUPPORT=1, then this offset indicates the pipe number for Rx and Tx Msg Queues at pipe numbers OFFSET and OFFSET+1 respectively. This field is don't care if MSQ_SUPPORT = 0.
1	ENUMERATED	If set, the device has been enumerated.
0	TX_MSG_BUFFER_BUSY	If set, then the Tx Msg Buffer has a message waiting to be sent out. Hence the direct access should not be used until this bit is a 0 again. Its recommended to wait for the enumerated bit to get set before polling this bit. Should not be used as a check for txmsg sent.

0x28080808 LPASS_SB_NGD1_RX_MSGQ_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The fields that control the RX message queue (i.e., producer queue) if present.

LPASS_SB_NGD1_RX_MSGQ_CFG

Bits	Name	Description
31:16	TIME_OUT_VAL	TIme out counter enabled if this field is non zero and when the first message is received. Time out cntr reset after every Rx msg received, If next Rx message not received before it expires, a trans_end is automatically generated even if BLOCK_SIZE/TRANS_SIZE is not got. Specified in terms of AHB Bus clock cycles given to the core by the ClockCtrl of SoC.
15:8	TRANS_SIZE	Specified in units of messages. After receiving that many a trans_end is asserted.Honored only if MSGQ_SUPPORT bit reads a 1
7:0	BLOCK_SIZE	Specified in units of messages. AFter receiving this many, a block_end is asserted.SW can leave this 0 in system producer mode to prevent block_end assertion. Honored only if MSGQ_SUPPORT bit reads a 1.

0x28080810 LPASS_SB_NGD1_INT_EN

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register has interrupt enables for regular device events (bits 31:28)

LPASS_SB_NGD1_INT_EN

Bits	Name	Description
31	TX_MSG_SENT	If queue is not enabled, this bit is set When a message written to TX_MSG reg is sent out. If queue is enabled, this bit is set when last TX msg of the current transaction is sent out.
30	RX_MSG_RCVD	When a message has been received in the RX_MSG registers.
29	DEV_ERR	Device reported error. See status register for details.
28	IE_VE_CHANGE	An IE or VE has changed its value.
27	INVALID_TX_MSG	An invalid TX message not allowed for this device is written into the Tx buffer.
26	TX_MSG_BUF_CONTENTIO N	If enabled, this generates an interrupt whenever SW (through direct AHB access) tries to write to an tx buffer that is not available for SW.
25	TX_MSG_NACKED_TWICE	A Tx msg nacked twice
24	RECONFIG_DONE	After successfully sending a RECONFIG_NOW command

0x28080814 LPASS_SB_NGD1_INT_STATUS

Type: Read

1	IE_VE_CHANGE	An IE or VE has changed its value.
0	DEV_ERR	Device reported error. See status register for details.

0x28081020 LPASS_SB_PGD_TRUST_OWN_EE0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

.Decides the port int ownership of a given EE. This register is programmed by the Trusted EE.

LPASS_SB_PGD_TRUST_OWN_EE0

Bits	Name	Description
31:0	PORT_OWN	If bit n of this register is set, then EE0 owns that port. EE0 may choose to enable an interrupt from this port based on its setting in SB_PGD_PORT_INT_EN_EE0 register. This owner is allocated by the trusted EE to prevent an EE from receiving intr from a port that it does NOT own.

0x28081024 LPASS_SB_PGD_TRUST_OWN_EE1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

.Decides the port int ownership of a given EE. This register is programmed by the Trusted EE.

LPASS_SB_PGD_TRUST_OWN_EE1

Bits	Name	Description
31:0	PORT_OWN	If bit n of this register is set, then EE1 owns that port. EE1 may choose to enable an interrupt from this port based on its setting in SB_PGD_PORT_INT_EN_EE1 register. This owner is allocated by the trusted EE to prevent an EE from receiving intr from a port that it does NOT own.

0x28081028 LPASS_SB_PGD_TRUST_OWN_EE2

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

.Decides the port int ownership of a given EE. This register is programmed by the Trusted EE.

LPASS_SB_PGD_TRUST_OWN_EE2

Bits	Name	Description
31:0	PORT_OWN	If bit n of this register is set, then EE2 owns that port. EE2 may choose to enable an interrupt from this port based on its setting in SB_PGD_PORT_INT_EN_EE2 register. This owner is allocated by the trusted EE to prevent an EE from receiving intr from a port that it does NOT own.

0x28081030+16*n LPASS_SB_PGD_PORT_INT_EN_EEn, n=[0..2]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

This register has an enable per port. Port events are recorded in the corresponding port status/param registers and this enable bit merely makes sure that an interrupt to the said EE is fired if the port has an event to report per port status bits. Only bits up to the number dictated by NUM_PORTS field of the Generics register is valid.

The sources of interrupt for a port could be -

i. Over flow condition of FIFOs (reflected in PGD_PORT_STATUSn register)

ii. Underflow condition of FIFOs (reported in PGD_PORT_STATUSn register)

iii. A port Disconnect event (reported in PGD_PORT_STATUSn register)

LPASS_SB_PGD_PORT_INT_EN_EEn

Bits	Name	Description
31:0	PORT_INT	Interrupt event from Ports. The actual number of bits here depends on the number of ports inferred for the generic device.

0x28081034+16*n LPASS_SB_PGD_PORT_INT_STATUS_EEn, n=[0..2]

Type: Read
Clock: HCLK
Reset State: 0x00000000

Status of interrupt elements.

LPASS_SB_PGD_PORT_INT_STATUS_EEn

Bits	Name	Description
31:0	PORT_INT	Interrupt event from Ports. The actual number of bits here depends on the number of ports inferred for the generic device.

0x28081038+16*n LPASS_SB_PGD_PORT_INT_CLR_EEn, n=[0..2]

31:0	PORT_INT	Interrupt event from Ports. The actual number of bits here depends on the number of ports inferred for the generic device.

0x28081080+32*n LPASS_SB_PGD_PORT_CFGn, n=[0..23]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

Only EVEN numbered ports (0,2,4, ...) should be configured by the Manager to support a Half duplex or extended half duplex data channel. If so, the data stream and hence the FIFOs etc corresponding to that port should be configured appropriately for outbound traffic (consumer). And hence its own Block and Trans size registers should NOT be used.

If Half duplex data channel, then use an even numbered port. Its immediately next odd numbered port should not be used for another channel as long as that half duplex channel is active. Even port's data stream (pipe) should be outbound (i.e., consumer or TX). Its immediate next odd port's data stream (pipe) is inbound (producer or Rx) and hence blk/trans size for this odd port should be configured as needed. The BAM pipe should be configured appropriately.

LPASS_SB_PGD_PORT_CFGn

Bits	Name	Description
7	ALIGN_MSB	If set, data is MSB aligned. If 0, data is LSB aligned. (applies to pieces data segments that are not integer multiple of words or packed to word boundary).
6	PACK	If set by SW, implies the incoming data to this port is to be packed by HW (or if port is outbound, then the HW is getting a packed data to send out and hence should unpack before sending).
5:1	WATERMARK	Water mark for the FIFO in bytes. Legal values are 1 to max fifo size.
0	ENABLE	Enables the port

0x28081084+ 32*n LPASS_SB_PGD_PORT_STATUSn, n=[0..23]

Type: Read
Clock: HCLK
Reset State: 0x00000UUU

LPASS_SB_PGD_PORT_STATUSn

Bits	Name	Description
19	PRT_DISCONN	If set, a port Disconnect Event has happened.Read only
18	FIFO_FILL_LEVEL	If set, implies that the FIFO is having 'watermark' worth of data when acting as a source to a data channel.
17:12	FIFO_WORD_CNT	Dynamically Reflects the number of words in the FIFO
11:4	PIPE_NUM	The pipe number (aka data stream number this port is connected to). Takes into account the offset and presence of other generic devices if any.
3	UNDERFLOW	IF set, this port has faced a FIFO underflow. Read only
2	OVERFLOW	If set, this port has faced a FIFO overflow. Read only
1:0	FIFO_SIZE	Encoded size of the data stream FIFO. 0x0: 8 bytes (2x 32bits) 0x1: 16 bytes (4x32bits) 0x2: 32 bytes (8x32bits) 0x3: reserved

0x28081088+ 32*n LPASS_SB_PGD_PORT_PARAMn, n=[0..23]

Type: Read
Clock: HCLK
Reset State: 0x00000000

Reflects if the port is active, if so, what is the SD, SL, CN, TP etc.

LPASS_SB_PGD_PORT_PARAMn

Bits	Name	Description
29:25	SEG_LENGTH	
24:21	TRANSPORT_PROTOCOL	
20:9	SEG_DISTN	
8:1	CHANNEL_NUMBER	
0	CHANNEL_ACTIVE	

0x2808108C+ 32*n LPASS_SB_PGD_PORT_BLK_SIZEn, n=[0..23]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_PGD_PORT_BLK_SIZEn

Bits	Name	Description
31:0	BLK_SIZE	In units of bytes. SW can leave this 0 in system producer mode to prevent block_end assertion.

0x28081090+ 32*n LPASS_SB_PGD_PORT_TRANS_SIZEn, n=[0..23]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_PGD_PORT_TRANS_SIZEn

Bits	Name	Description
31:0	TRANS_SIZE	In units of bytes

0x28081094+ 32*n LPASS_SB_PGD_PORT_MULTI_CHNLn, n=[0..23]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

Each bit m of this register represents a port. If that bit m is set, then it means port m is involved in a multichannel audio stream with this port n. The number of bits set in this register hence represents the number of streams in the multichnl stream. Note, even the participating port's bit (i.e., bit n) should be set as well. For example, if ports 0 to 5 participate in a 5:1 audio stream, then the SB_PGD_MULTI_CHNLn register for n=0..5 should be set to 0x3F (i.e., bits 0 to 5 of each being set). These register for every port are used to generate silence tone if any of the participating streams run dry.

CAUTION To ensure proper functionality, for a given port number p, at least one bit of this register MUST be set, i.e., bit p should be set in SB_PGD_PORT_MULTI_CHNLp when port number p is used. If the said port p was involved in a multichannel stream, then one or more other bits in this register can be set to 1.

LPASS_SB_PGD_PORT_MULTI_CHNLn

Bits	Name	Description
31:0	PORTS	see description of register

0x28081098+ 32*n LPASS_SB_PGD_PORT_PUSHPULLn, n=[0..23]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

Contains the repeat_period and num_samples parameters used the push/pull TP hardware to calculate the P-bit, SRQ-bit and the STRbit.

LPASS_SB_PGD_PORT_PUSHPULLn

Bits	Name	Description
31:16	NUM_SAMPLES	Num_samples value.
15:0	RPT_PERIOD	repeat period value

0x28081600+ 32*n LPASS_SB_PGD_PC_CFGn, n=[0..5]

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

Progress Counter Configuration

LPASS_SB_PGD_PC_CFGn

Bits	Name	Description
31	INIT	write-only. Reads a 0 always. When written a 1, its rise edge detected to load the PC with INIT_VAL field value.
29:30	RESERVED	reserved
28:24	PORT_SEL	The Port number that this nth instance of PC/VFR Logic is associated to.
23:0	INIT_VAL	The PC init val to be loaded into the PC. Value Loaded only when INIT bit is set. INIT bit is rise-edge detected inside for loading PC.

0x28081604+ 32*n LPASS_SB_PGD_PC_VALn, n=[0..5]

Type: Read
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_PGD_PC_VALn

Bits	Name	Description
31:24	PC_FIFO_SAMPLES	The number of samples in the FIFO (taking into account segment length and pack bit settings) plus any sample in the phy/FL stages. **NOTE** When acting as SRC, there will be duplication between the DMA and the SAMPLE fields, as samples already counted in DMA may still be awaiting processing in FIFO
23:0	PC_DMA	Value of the 24bit counter counting the ‘number of words’ DMA-ed to (if src) or from (if snk) from the associated port. The Firmware needs to convert it into number of samples based on sample size and if pack bit is set or not.

0x28081608+ 32*n LPASS_SB_PGD_PC_VFR_TSn, n=[0..5]

Type: Read
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_PGD_PC_VFR_TSn

Bits	Name	Description
31:0	VAL	The value of the 32bit PC_VAL register when the VFR TS Interrupt occurred.

0x2808160C+32*n LPASS_SB_PGD_PC_VFR_TS_STATUSn, n=[0..5]

Type: Read
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_PGD_PC_VFR_TS_STATUSn

Bits	Name	Description
31:30	RESERVED	reserved
0	VFR_INT	Set when VFR interrupt pulse gets asserted, cleared when clear register is written to.

0x28081610+32*n LPASS_SB_PGD_PC_VFR_TS_CLRn, n=[0..5]

Type: Write
Clock: HCLK
Reset State: 0x00000000

LPASS_SB_PGD_PC_VFR_TS_CLRn

Bits	Name	Description
31:30	RESERVED	reserved
0	VFR_INT	When written with 1, clears the TS_STATUS bit if that is set.

0x28081700 LPASS_SB_PGD_IE_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00010000

Holds status of IE elements listed out in spec

LPASS_SB_PGD_IE_STATUS

Bits	Name	Description
31:24	DEV_CLASS_CODE	
23:16	DEV_CLASS_VER	
15:4	RESERVED_15_4	reserved
3	EX_ERROR	
2	RECONFIG_OBJ	
1	DATA_TX_COL	reserved
0	UNSPRTD_MSG	unsupported msg

0x28081710 LPASS_SB_PGD_VE_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

place holder

LPASS_SB_PGD_VE_STATUS

Bits	Name	Description
31:0	VE_VAL	reads zeroes

12.7 LPASS BAM Registers (0x28084000 LPASS_BAM_LITE_BASE)

This section contains the Low Power Audio Subsystem (LPASS) BAM registers.

BAM supports only Word (4 byte) aligned writes and reads on the Configuration Bus interface.

BAM has MAX_PIPES hardware generic parameter defining the number of pipes it supports. Each BAM can have up to 31 pipes supported.

BAM has BAM_CONF_AHBS_ADDR_WIDTH hardware generic parameter defining the Bit Number for selecting BAM access or Peripheral access. Legal Ranges are 14 to 20. Count starts from 1, meaning a value of 17 will set BAM Base address as 0x0001_0000.

12.7.1 BAM control registers

BAM Control registers configure the BAM operational state, SW reset, interrupts and others.

0x28084F80 LPASS_BAM_CTRL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

BAM Control register allows global controls for the BAM.

LPASS_BAM_CTRL

Bits	Name	Description
31:17	RESERVED_BITS31_17	Set to Zero (0)
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1’b1 - Enable Power Saving Mode 1’b0 - Disable Power Saving Mode

LPASS_BAM_CTRL (cont.)

Bits	Name	Description
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2’b00 - Cache when current descriptor has less than 64 bytes left. 2’b01 - Cache when current descriptor has less than 128 bytes left. 2’b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2’b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
12	RESERVED_BITS12	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_SIC_SEL
11:5	BAM_TESTBUS_SEL	Set to Zero (0) Obsolete field: BAM_TESTBUS_SEL Test Bus selector. Supported until (including) bam_p3q3r29 (BlackBird). Moved to a dedicated register - BAM_TEST_BUS_SEL in the following releases.
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1’b1 - Enabled 1’b0 - Disabled Available in BAM only
3	RESERVED_BITS3	Set to Zero (0)
2	RESERVED_BITS2	Set to Zero (0)

LPASS_BAM_CTRL (cont.)

Bits	Name	Description
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x28084F84 LPASS_BAM_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

LPASS_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)

LPASS_BAM_REVISION (cont.)

Bits	Name	Description
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists
16	SECURED	This field indicates BAM/BAM-Lite has security support (APU inside) 1'b1 - Secured 1'b0 - Not Secured
15:12	RESERVED_BITS15_12	Set to Zero (0)
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRCS*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRCS*_EEn registers exist for n=[0..3].
7:0	REVISION	This field contains the revision number of the core, Hard Coded. 8'h01 - Voyager (bam_p3q3r22 +) 8'h02 - BlackBird (bam_p3q3r27 +) 8'h03 - Waverider BAM (bam_p3q3r30 +) 8'h04 - Aurora BAM (bam_p3q2r43 +) 8'h05 - Shelby BAM (bam_p2q2r45 +) 8'h10 - Waverider BAM Lite (bam_lite_p1q1r0 +) 8'h11 - Aurora BAM Lite (bam_lite_p3q2r16 +) 8'h12 - Shelby BAM Lite (bam_lite_p2q2r18 +)

0x28084FBC LPASS_BAM_NUM_PIPES

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

LPASS_BAM_NUM_PIPES

Bits	Name	Description
31:24	BAM_NON_PIPE_GRP	This field contains the number of BAM Non Pipe security groups (APU Entries). Zeros when Non-Secured BAM
23:16	PERIPH_NON_PIPE_GRP	This field contains the number of Peripheral's Non Pipe security groups (APU Entries). Zeros when Non-Secured BAM
15:8	RESERVED_BITS15_8	Set to Zero (0)
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x28084FC0 LPASS_BAM_TIMER

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

LPASS_BAM_TIMER

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x28084FC4 LPASS_BAM_TIMER_CTRL

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

The resolution of the BAM inactivity timer are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define

the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * TIMER_TRSHLD.

LPASS_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x28084F88 LPASS_BAM_DESC_CNT_TRSHLD

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

LPASS_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0).
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. Available in BAM only

0x28084F8C LPASS_BAM_IRQ_SRCS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

LPASS_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x28084F90 LPASS_BAM_IRQ_SRCS_MSK

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

LPASS_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x28084FB0 LPASS_BAM_IRQ_SRCS_UNMASKED

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

LPASS_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x28084F94 LPASS_BAM_IRQ_STTS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

LPASS_BAM_IRQ_STTS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.

LPASS_BAM_IRQ_STTS (cont.)

Bits	Name	Description
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x28084F98 LPASS_BAM_IRQ_CLR

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

LPASS_BAM_IRQ_CLR

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x28084F9C LPASS_BAM_IRQ_EN

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

LPASS_BAM_IRQ_EN

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x28084FA0 LPASS_BAM_RESERVED_1

Type: Read
Clock: BAM_CLK
Reset State: 0x00000000

LPASS_BAM_RESERVED_1

Bits	Name	Description
31	RESERVED_BITS31	Set to Zero (0) Obsolete field: BAM_IRQ_SIC_SEL
30:0	RESERVED_BITS30_0	Set to Zero (0) Obsolete field: P_IRQ_SIC_SEL

0x28084FA4 LPASS_BAM_AHB_MASTER_ERR_CTRLS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

LPASS_BAM_AHB_MASTER_ERR_CTRLS

Bits	Name	Description
31:23	RESERVED_BITS31_16	Set to Zero (0)
22:18	BAM_ERR_HVMID	HVMID
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x28084FA8 LPASS_BAM_AHB_MASTER_ERR_ADDR

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

LPASS_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x28084FAC LPASS_BAM_AHB_MASTER_ERR_DATA

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

LPASS_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x28084FB4 LPASS_BAM_RESERVED_2

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

LPASS_BAM_RESERVED_2

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_IRQ_DEST_ADDR

0x28084FB8 LPASS_BAM_RESERVED_3

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

.

LPASS_BAM_RESERVED_3

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_DEST_ADDR

0x28084FF0 LPASS_BAM_TRUST_REG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside - SECURED field in the BAM_REVISION register) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

LPASS_BAM_TRUST_REG

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_VMID	Those bits indicate the VMID value to be used when performing BAM type accesses to the bus. BAM Type accesses include BAM MTI (or Direct Mode accesses, not applicable for BAM Lite)
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable
6:2	RESERVED_BITS6_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_EE	This Field Indicates the EE (0,1,2,3) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x28084FF4 LPASS_BAM_TEST_BUS_SEL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is the testbus selector register.

Supported in releases after bam_p3q3r29 (BlackBird).

LPASS_BAM_TEST_BUS_SEL

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	BAM_DATA_ERASE	When enabled, BAM will be instructed to erase all the data it currently has inside. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Erase 1'b0 - Disabled
17	BAM_DATA_FLUSH	When enabled, BAM will be instructed to flush all the data it currently has inside. BAM will only flush the data once it has enough data and a valid destination for it. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 1'b1 - Enable Flush 1'b0 - Disabled
16	BAM_CLK_ALWAYS_ON	This bit controls the BAM to issue 'always on' clock request. 1'b1 - Enable Always On clock request. 1'b0 - Disabled
15:7	RESERVED_BITS15_7	Set to Zero (0)
6:0	BAM_TESTBUS_SEL	Test Bus selector. Values with bit[11] set high are reserved for the BAM Lite integrator to provide testbus from outside of the BAM Lite. For example, eDML testbus may reside at X'100_0000' to X'111_1111' selector values. eDML has no registers thus has no test bus selector, so its test bus is combined with the BAM lite's. BAM provides zeroes on its testbus when external values selected. X'000_0000' - Zeros X'000_0001' - Slave test bus X'000_0010' - Pipe state machine test bus X'000_0011' - Buffer test bus X'000_0100' - Sideband test bus X'000_1101' - Bus Manager test bus X'001_0000' - Reg file test bus X'1''_''''' - BAM Lite sets zeroes on the test bus, leaving it for external use

0x28084FF8 LPASS_BAM_TEST_BUS_REG

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the value being output to the testbus of the chip. It is not intended for SW usage but for lab debugging of the BAM. Values here can change every cycle.

LPASS_BAM_TEST_BUS_REG

Bits	Name	Description
31:0	BAM_TESTBUS_REG	32 bit Testbus value. To select the Block in BAM to show here, use the BAM_TESTBUS_SEL field in BAM_CTRL register.

0x28084FFC LPASS_BAM_CNFG_BITS

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

LPASS_BAM_CNFG_BITS

Bits	Name	Description
31:27	RESERVED_BITS31_27	Set to Zero (0)
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset. 1’b1 - Enable Fix 1’b0 - Disable Available in BAM only

LPASS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there are available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided. 1'b1 - Enable 1'b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission savepoint, but into the illegal's pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1'b1 - Enabled 1'b0 - Disable Available in BAM only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1'b1 - Enable 1'b0 - Disable Available in BAM only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there's no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1'b1 - Enable 1'b0 - Disable Available in BAM only

LPASS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1'b1 - 1'b0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix) 1'b1 - Enable 1'b0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM's common clock request. 1'b1 - Propagate Sideband Clock Request 1'b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. 1'b1 - Enable Power Saving 1'b0 - Disable Power Saving

LPASS_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reset pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1'b1 - Enable external block pipe reset 1'b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. This functionality has been found to be buggy and was removed from APQ8064. Bit is currently unused. 1'b1 - Enable 1'b0 - Disable Available in BAM only
10:3	RESERVED_BITS10_3	Set to Zero (0)
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It's invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1'b1 - Enable 1'b0 - Disable Available in BAM only
1:0	RESERVED_BITS1_0	Set to Zero (0)

0x28085800+ 128*n LPASS_BAM_IRQ_SRCS_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads

the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

LPASS_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x28085804+ 128*n LPASS_BAM_IRQ_SRCS_MSK_EEn, n=[0..3]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

LPASS_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x28085808+ 128*n LPASS_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

LPASS_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

12.7.2 BAM PIPE management registers

BAM Pipe management registers control each pipe's parameters. Those reside in physical registers.

0x28084000+ 128*n LPASS_BAM_P_CTRLn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Control register provides various controls for the pipe.

LPASS_BAM_P_CTRLn

Bits	Name	Description
31:11	RESERVED_BITS31_11	Set to Zero (0)
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be prefetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

LPASS_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only.When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
2	RESERVED_BITS2	Set to Zero (0)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe
0	RESERVED_BITS0	Set to Zero (0)

0x28084004+ 128*n LPASS_BAM_P_RSTn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

LPASS_BAM_P_RSTn

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	P_SW_RST	This resets the pipe and its' registers, (Both Flip-Flops and RAM). 1'b1 - Reset 1'b0 - Do Nothing

0x28084008+ 128*n LPASS_BAM_P_HALTn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Halt register Enables/Disables the Halt Sequence.

This is a self-modifying register.

LPASS_BAM_P_HALTn

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it.

0x28084030+ 128*n LPASS_BAM_P_TRUST_REGn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

LPASS_BAM_P_TRUST_REGn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_P_VMID	Those bits indicate the VMID value to be used when performing Pipe type accesses to the bus. BAM Type accesses include Pipe MTI, Data and Descriptors.
7:2	RESERVED_BITS7_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_P_EE	This Field Indicates the EE (0,1,2,3) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 2'b00 - EE0 2'b01 - EE1 2'b10 - EE2 2'b11 - EE3

0x28084010+ 128*n LPASS_BAM_P_IRQ_STTSn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

LPASS_BAM_P_IRQ_STTSn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

0x28084014+128*n LPASS_BAM_P_IRQ_CLRn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

LPASS_BAM_P_IRQ_CLRn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_CLR	1’b1 - Clear 1’b0 - Unchanged
4	P_ERR_CLR	1’b1 - Clear 1’b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1’b1 - Clear 1’b0 - Unchanged

LPASS_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

0x28084018+128*n LPASS_BAM_P_IRQ_ENn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

LPASS_BAM_P_IRQ_ENn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

0x2808401C+ 128*n LPASS_BAM_P_TIMERn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the pipe.

LPASS_BAM_P_TIMERn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x28084020+ 128*n LPASS_BAM_P_TIMER_CTRLn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the P_TIMER_THRSHLD is 10 will indicate the 2^3*1us*10 which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * P_TIMER_TRSHLD.

LPASS_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x28084024+ 128*n LPASS_BAM_P_PRDCR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

LPASS_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value

0x28084028+ 128*n LPASS_BAM_P_CNSMR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

LPASS_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value

12.7.3 BAM PIPE configuration registers (RAM)

BAM Pipe management registers configure each pipes' parameters.

Pipe Address span: currently defining each pipe to have 32 addresses, therefore inter pipe offset is 32*4=128=0x80 bytes.

0x2808502C+ 64*n LPASS_BAM_P_EVNT_DEST_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

LPASS_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x28085018+ 64*n LPASS_BAM_P_EVNT_REGn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

LPASS_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x28085000+ 64*n LPASS_BAM_P_SW_OFSTSn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

LPASS_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode.
15:0	SW_DESC_OFST	Descriptor FIFO offset.

0x28085024+ 64*n LPASS_BAM_P_DATA_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

LPASS_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x2808501C+ 64*n LPASS_BAM_P_DESC_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

LPASS_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x28085028+64*n LPASS_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When a BAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

LPASS_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x28085020+64*n LPASS_BAM_P_FIFO_SIZESn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

LPASS_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors.

12.7.4 BAM PIPE internal state registers (RAM)

BAM Pipe debug registers allow a software look inside on the internal parameters of the BAM State Machines stored in RAM.

Those shouldn't be normally used or altered by the software.

0x28085034+64*n LPASS_BAM_P_RETR_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context stored for retransmission.

This is being stored by Ack Update state machine in consumer mode or by the Writeback state machine in producer mode.

This is being loaded by the Writeback state machine when retransmission happens.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

LPASS_BAM_P_RETR_CNTXT_n

Bits	Name	Description
31:16	RETR_DESC_OFST	Descriptor Fifo Offset for retransmission.
15:0	RETR_OFST_IN_DESC	The Offset inside the Descriptor for retransmission.

0x28085038+64*n LPASS_BAM_P_SI_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Sideband Inform state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

LPASS_BAM_P_SI_CNTXT_n

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

0x28085004+ 64*n LPASS_BAM_P_AU_PSM_CNTXT_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Ack Update state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

LPASS_BAM_P_AU_PSM_CNTXT_1_n

Bits	Name	Description
31:16	AU_PSM_ACCUMED	PSM: The acknowledged (EOB/T) number of bytes since last Write Event. AU: The accumulation of the descriptor sizes for the present ack_on_success event. This is never bigger than the ACKED field. Once the ACCUMED values are bigger than Event Threshold, an Event will be issued, the ACKED value will decrease by the ACCUMED size and this value will be zeroed. This also serves as the Bytes Consumed value in the Event.
15:0	AU_ACKED	AU: The left over of the number of bytes that were received via the ack_on_success, that did not cause a descriptor closure. This value is down counting upon issuing Read Event. PSM:

0x28085008+ 64*n LPASS_BAM_P_PSM_CNTXT_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

LPASS_BAM_P_PSM_CNTXT_2_n

Bits	Name	Description
31	PSM_DESC_VALID	The Descriptor Valid bit provided by the Writeback state machine to Pipe state machine.
30	PSM_DESC_IRQ	The Descriptor Interrupt bit provided by the Writeback state machine to pipe state machine.
29	PSM_DESC_IRQ_DONE	The Descriptor Interrupt needed selection bit.
28:25	PSM_GENERAL_BITS	General Context Switch Bits
24:22	PSM_CONS_STATE	State of the Pipe Consumer state machine.
21:19	PSM_PROD_SYS_STATE	State of the Pipe Producer System state machine.
18:16	PSM_PROD_B2B_STATE	State of the Pipe Producer BAM to BAM state machine.
15:0	PSM_DESC_SIZE	The Descriptor Size provided by the Writeback state machine to pipe state machine.

0x2808500C+ 64*n LPASS_BAM_P_PSM_CNTXT_3_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

LPASS_BAM_P_PSM_CNTXT_3_n

Bits	Name	Description
31:0	PSM_DESC_ADDR	The Data Address provided in the current descriptor from the Writeback state machine.

0x28085010+ 64*n LPASS_BAM_P_PSM_CNTXT_4_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

LPASS_BAM_P_PSM_CNTXT_4_n

Bits	Name	Description
31:16	PSM_DESC_OFST	The running Descriptor Fifo Offset of the Writeback state machine
15:0	PSM_SAVED_ACCUMED_SIZE	The Saved Accumulated Size from the Pipe state machine.

0x28085014+64*n LPASS_BAM_P_PSM_CNTXT_5_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

LPASS_BAM_P_PSM_CNTXT_5_n

Bits	Name	Description
31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

0x28085030+64*n LPASS_BAM_P_RESERVED_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

LPASS_BAM_P_RESERVED_1_n

Bits	Name	Description
31:0	BAM_P_RES_1	Set to zero (0) Reserved

0x2808503C+64*n LPASS_BAM_P_RESERVED_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

LPASS_BAM_P_RESERVED_2_n

Bits	Name	Description
31:0	BAM_P_RES_2	Set to zero (0) Obsolete Register: BAM_P_IRQ_DEST_ADDRn, n=[0..30]

12.8 MIDI CORE Registers (0x28200000 MIDI_BASE)

This section contains MIDI core registers.

12.8.1 Config Registers

0x28200000 MIDI_CORE_CONTROL

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

This register is used to control core operations and to enable/disable clocks for the sub-blocks.

MIDI_CORE_CONTROL

Bits	Name	Description
31:16	SUM_BUF_LOCK	Each bit corresponds to locking a section of the summing buffer. and so on... NOTE Each sum buffer line is read as 2 32-bit words, and hence locking granularity here is 64 32-bit words. 0x1F: sum_buffer to sum_buff_1 0x1E: sum_buffer to sum_buff_2 0x11: sum_buffer to sum_buff_3 0x10: sum_buffer to sum_buff_4
15:14	RESERVED_15_14	
13	WFU_SKIP_PHASE_ENABLE	Set (1) to stop the WFU from sending the fractional phase back to the PE.
12	SVRLINK_LOAD_ENABLE	Set (1) to enable link list and SVR loading.
11	SUM_ENABLE	Set (1) to enable sum buffer operation
10	WFU_ENABLE	Set (1) to enable WFU operation
9	LFO_ENABLE	Set (1) to enable LFO operation
8	WFU_INVALIDATE_ENABLE	Set (1) to enable the WFU cache invalidate at the beginning of the SVR list processing.
7	RESERVED_7	
6	PE_ENABLE_2	Set (1) to enable the processing element 2. This bit needs to be set to program the program RAM for processing element 2.
5	PE_ENABLE_1	Set (1) to enable the processing element 1. This bit needs to be set to program the program RAM for processing element 1.
4	PE_ENABLE_0	Set (1) to enable the processing element 0. This bit needs to be set to program the program RAM for processing element 0.

MIDI_CORE_CONTROL (cont.)

Bits	Name	Description
3	SUM_CLEAR_ENABLE	Set (1) to enable/disable the summing buffer clear at the beginning of the SVR list.
2	PREEMPT	Set (1) to preempt core functionality and return with ADSP interrupt as soon as all current SVRs are synthesized.
1	OFSM_ENABLE	Set (1) to enable overall state machine operation. If 0, then registers can be programmed, but there won't be core activity. For programming program RAMs, this bit must be 0.
0	TEST_MODE	Set (1) to initiate a built-in self-test.

0x28200004 MIDI_LINK_BASE

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_LINK_BASE

Bits	Name	Description
31:2	VALUE	This bit field is a 32-bit word-aligned base of the link list. Entries of the link list give the SVR number, which is multiplied by SVR offset to get the actual address of the SVR.
1:0	RESERVED_1_0	

0x28200008 MIDI_SVR_BASE

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_SVR_BASE

Bits	Name	Description
31:2	VALUE	This bit field is a 32-bit word-aligned AHB word address of the SVR record. This field is used in addition to the MIDI_SVR_OFFSET thus base of SVR(n) = MIDI_SVR_OFFSET * MIDI_LINK_BASE(n) MIDI_SVR_BASE.
1:0	RESERVED_1_0	

0x2820000C MIDI_SVR_TOTAL_LENGTH

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_SVR_TOTAL_LENGTH

Bits	Name	Description
31:10	RESERVED_31_10	
9:2	VALUE	Size in words (32 bits) of a single SVR record type. For N words, program N in this register.
1:0	RESERVED_1_0	

0x28200010 MIDI_NUM_OF_SVRS

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_NUM_OF_SVRS

Bits	Name	Description
31:8	RESERVED_31_8	
7:0	VALUE	Number of SVRs to be processed. If N SVRs need to be processed, program N-1 in this register.

0x28200014 MIDI_SVR_HW_LENGTH

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_SVR_HW_LENGTH

Bits	Name	Description
31:9	RESERVED_31_9	
8:2	VALUE	Length of the SVR section that is fetched by hardware, specified in number of 32-bit words. If N words are to be fetched, program N-1.
1:0	RESERVED_1_0	

0x28200018 MIDI_SVR_RW_OFFSET

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_SVR_RW_OFFSET

Bits	Name	Description
31:9	RESERVED_31_9	
8:2	VALUE	Offset of the read/write section in the hardware fetched portion, specified in number of 32-bit words. This is the first word that is written back. If N words are fetched, program N-1.
1:0	RESERVED_1_0	

0x2820001C MIDI_SVR_RW_LENGTH

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_SVR_RW_LENGTH

Bits	Name	Description
31:9	RESERVED_31_9	
8:2	VALUE	Length of the read/write section in the hardware fetched portion, specified in number of 32 bit words. If N words are fetched, program N-1.
1:0	RESERVED_1_0	

0x28200020 MIDI_SAMPLES_PER_FRAME

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_SAMPLES_PER_FRAME

Bits	Name	Description
31:9	RESERVED_31_9	
8:0	VALUE	Number of samples per frame. If there are N samples, program N-1.

0x28200024 MIDI_INTR_ENABLE

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_INTR_ENABLE

Bits	Name	Description
31:17	RESERVED_31_17	
16	ARM_INTR	Enable the interrupt to ARM
15:6	RESERVED_15_6	
5	AXI_ERROR	Enable the AXI master error interrupt. valid only if MIDI has AXI master
4	AHB_ERROR	Enable the AHB error interrupt
3	TEST_ERROR	Enable the TM error interrupt
2	WFU_ERROR	Enable the WFU error interrupt
1	PE_DEC_ERROR	Enable the PE decoder error
0	SYNTH_DONE	Enable synthesis done interrupt

0x28200028 MIDI_INTR_STATUS

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_INTR_STATUS

Bits	Name	Description
31:16	RESERVED_31_16	
15:8	SVR_COUNT	Current number of SVR(s) processed. This field is read-only, and is equal to N where N is the number of SVRs processed.
7:6	RESERVED_7_6	
5	AXI_ERROR	Indicates an AXI error when set. This is only a status indicator.
4	AHB_ERROR	Indicates an AHB error when set. This is only a status indicator.
3	TEST_ERROR	Indicates a TM error when set. This is only a status indicator.
2	WFU_ERROR	Indicates WFU error when set. This is only a status indicator.
1	PE_DEC_ERROR	Indicates decoder error when set. This is only a status indicator.
0	SYNTH_DONE	Indicates synthesis done when set. To clear interrupt, write 1 to this bit.

0x2820002C MIDI_RESETS

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_RESETS

Bits	Name	Description
31:2	RESERVED_31_1	
1	AXI_BRIDGE_RESET	Resets the AXI bridge, not self clearing
0	OVERALL_RESET	Resets internal core including Xmemc registers, self clearing.

0x28200030 MIDI_PE_MISR

Type: Read
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

This register is used to read back the MISR values corresponding to each PE in test mode.

MIDI_PE_MISR

Bits	Name	Description
31:0	VALUE	Value of the PE MISR.

0x28200034 MIDI_PE_LFSR

Type: Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x12345678

This register is used to seed each PE separately, if needed, before putting the core in the test mode.

MIDI_PE_LFSR

Bits	Name	Description
31:0	SEED	Seed for the PE LFSR.

0x28200038 MIDI_BUS_STATS

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_BUS_STATS

Bits	Name	Description
31:0	COUNT	Total number of bus accesses since last clear.

0x2820003C MIDI_DEBUG_REG_01

Type: Read
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_DEBUG_REG_01

Bits	Name	Description
31:16	WFU_CACHE_TAG_0	The WFU cache tag for PE 0.
15:0	WFU_CACHE_TAG_1	The WFU cache tag for PE 1.

0x28200040 MIDI_DEBUG_REG_02

Type: Read
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_DEBUG_REG_02

Bits	Name	Description
31:16	WFU_CACHE_TAG_2	The WFU cache tag for PE 2.
15	WFU_TAG_0_VALID	The valid bit for PE 0's WFU cache.
14	WFU_TAG_1_VALID	The valid bit for PE 1's WFU cache.
13	WFU_TAG_2_VALID	The valid bit for PE 2's WFU cache.
12:10	WFU_OUTFSM_0_STATE	The WFU OUTFSM state for PE 0.
9:7	WFU_OUTFSM_1_STATE	The WFU OUTFSM state for PE 1.
6:4	WFU_OUTFSM_2_STATE	The WFU OUTFSM state for PE 2.
3:1	WFU_SRFSM_STATE	The WFU SRFSM state.
0	SB_CLRFSM_STATE	The SB CLRFSM state.

0x28200044 MIDI_DEBUG_REG_03

Type: Read
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_DEBUG_REG_03

Bits	Name	Description
31:29	WFU_ACRFSM_STATE	The WFU ACRFSM state.
28:27	WFU_OWFSM_STATE	The WFU OWFSM state.
26:24	TEST_STATE	The TM state.
23:22	SB_SBFSM_STATE	The SB SBFSM state.
21:6	SB_THERMOMETER	The SB internal SB RAM lock.
5:3	BUSIF_AHB_MASTER_STATE	The BUSIF AHB master state.
2:0	LFO_STATE	The LFO state.

0x28200048 MIDI_DEBUG_REG_04

Type: Read
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_DEBUG_REG_04

Bits	Name	Description
31:28	OFSM_STATE	The OFSM state.
27:20	OFSM_SVR_ID_0	The SVR ID being processed by PE 0.
19:12	OFSM_SVR_ID_1	The SVR ID being processed by PE 1.
11:4	OFSM_SVR_ID_2	The SVR ID being processed by PE 2.
3	OFSM_SVR_ID_0_VALID	Set if OFSM_SVR_ID_0 is valid.
2	OFSM_SVR_ID_1_VALID	Set if OFSM_SVR_ID_1 is valid.
1	OFSM_SVR_ID_2_VALID	Set if OFSM_SVR_ID_2 is valid.
0	BUSIF_AHB_CRIF2INT_STATE	The BUSIF AHB CRIF2INT state.

0x2820004C MIDI_DEBUG_REG_05

Type: Read
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_DEBUG_REG_05

Bits	Name	Description
31	BUSIF_XMEMC_CRIF2INT_STATE	The BUSIF XMEMC CRIF2INT state.
30	PE0_SVR_R_BUSY	Set if PE 0's SVR RAM read port is busy.
29:24	PE0_PC	The program counter for PE 0.
23:15	PE0_SUM_CNT	The sum counter value for PE 0.
14:9	PE1_PC	The program counter for PE 1.
8:0	PE1_SUM_CNT	The sum counter value for PE 1.

0x28200050 MIDI_DEBUG_REG_06

Type: Read
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_DEBUG_REG_06

Bits	Name	Description
31	PE1_SVR_R_BUSY	Set if PE 1's SVR RAM read port is busy.
30	PE2_SVR_R_BUSY	Set if PE 2's SVR RAM read port is busy.
29:24	PE2_PC	The program counter for PE 2.
23:15	PE2_SUM_CNT	The sum counter value for PE 2.
14:13	PE0_DEC_STATE	The PE 0 decoder state.
12:11	PE1_DEC_STATE	The PE 1 decoder state.
10:9	PE2_DEC_STATE	The PE 2 decoder state.
8	PE0_SVR_W_BUSY	Set if PE 0's SVR RAM write port is busy.
7	PE1_SVR_W_BUSY	Set if PE 1's SVR RAM write port is busy.
6	PE2_SVR_W_BUSY	Set if PE 2's SVR RAM write port is busy.
5	PE0_SB_R_BUSY	Set if PE 0's SB RAM read port is busy.
4	PE1_SB_R_BUSY	Set if PE 1's SB RAM read port is busy.
3	PE2_SB_R_BUSY	Set if PE 2's SB RAM read port is busy.

MIDI_DEBUG_REG_06 (cont.)

Bits	Name	Description
2	PE0_SB_W_BUSY	Set if PE 0's SB RAM write port is busy.
1	PE1_SB_W_BUSY	Set if PE 1's SB RAM write port is busy.
0	PE2_SB_W_BUSY	Set if PE 2's SB RAM write port is busy.

0x28200054 MIDI_DEBUG_REG_07

Type: Read
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_DEBUG_REG_07

Bits	Name	Description
31:9	RESERVED_31_9	
8	PE0_LFO_BUSY	Set if PE 0 interface to the LFO is busy.
7	PE1_LFO_BUSY	Set if PE 1 interface to the LFO is busy.
6	PE2_LFO_BUSY	Set if PE 2 interface to the LFO is busy.
5	PE0_WFU_R_BUSY	Set if PE 0 WFU RAM read port is busy.
4	PE1_WFU_R_BUSY	Set if PE 1 WFU RAM read port is busy.
3	PE2_WFU_R_BUSY	Set if PE 2 WFU RAM read port is busy.
2	PE0_WFU_W_BUSY	Set if PE 0 WFU RAM write port is busy.
1	PE1_WFU_W_BUSY	Set if PE 1 WFU RAM write port is busy.
0	PE2_WFU_W_BUSY	Set if PE 2 WFU RAM write port is busy.

0x28200058 MIDI_DEBUG_BUS_CTL

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

This register is used to switch/enable the test bus muxes and enable the BPM triggers.

MIDI_DEBUG_BUS_CTL

Bits	Name	Description
31:6	RESERVED_31_6	
5	ENA	Set (1) to enable the test bus.

MIDI_DEBUG_BUS_CTL (cont.)

Bits	Name	Description
4	BPM_MODE	Set (1) to switch to level mode trigger. Clear (0) for edge mode trigger.
3:0	SEL	Test mode is as specified in the Debug table/spreadsheet.

0x28200060 MIDI_CONFIG_SPARE_0

Type: Read/Write
Clock: ADSP_AHB_AS_APPLICABLE
Reset State: 0x00000000

MIDI_CONFIG_SPARE_0

Bits	Name	Description
31:8	RESERVED_31_8	Reserved
7:0	SPARE	This address range is reserved as a spare for ECOs.

12.8.2 Data Registers

0x28203700 MIDI_DATA_SPARE_0

Type: Read/Write
Clock: AHB
Reset State: 0x00000000

MIDI_DATA_SPARE_0

Bits	Name	Description
31:8	RESERVED_31_8	Reserved.
7:0	SPARE	This address range is reserved as a Spare for ECOs.

12.9 LPA SS QDSP6 SS Public Registers (0x28800000 LPASS_QDSP6SS_PUB_BASE)

This section contains the Low Power Audio Subsystem (LPASS) QDSPSS Public registers.

These registers configure some of the settings for QDSP6 and QDSP6SS. The base address for these registers is configurable. They belong to uncacheable address space of QDSP6.

0x28800000 LPASS_QDSP6SS_RST_EVB

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

This register contains the QDSP6 event vector table base address. These 20 bits define the boot address for QDSP6.

LPASS_QDSP6SS_RST_EVB

Bits	Name	Description
31:24	RESERVED_BITS_31_24	Reserved
23:0	EVB	Event vector table base address. This corresponds to bits 31:8 of the address bits.

0x28800004 LPASS_QDSP6SS_RESET

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x32

This register is used to control reset.

LPASS_QDSP6SS_RESET

Bits	Name	Description
31:6	RESERVED_BITS_31_6	Reserved
5	PRIV	Software reset for the QDSP6SS private peripheral. 0x1: Active
4	STOP_CORE	Software stop core out of reset and only TCM is out of reset when CORE reset is de-asserted 0x1: Active
3	ETM	Software reset for the QDSP6 ETM. 0x1: Active

LPASS_QDSP6SS_RESET (cont.)

Bits	Name	Description
2	ISDB	Software reset for the QDSP6 ISDB. 0x1: Active
1	CORE	Software reset for the QDSP6 core. 0x1: Active
0	SS	Software reset for the QDSP6SS. 1 Active, resets the QDSP6SS. Since it will assert qdsp6_clamp_io, resetting the subsystem should always be accompanied by resetting QDSP6. To program any other registers in the subsystem, this bit needs to be set to 0.

0x28800008 LPASS_QDSP6SS_STRAP_ACC

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x0

This register contains the ACC values of all the memories inside the QDSP6 hardmacro.

LPASS_QDSP6SS_STRAP_ACC

Bits	Name	Description
31:24	UNUSED_31_24	Reserved, writeable
23:22	L2_DATA_WACC	Write ACC for L2 data
21:16	L2_DATA_RACC	Read ACC for L2 data
15:14	RESERVED_BITS_15_14	Reserved
13:12	OTHER_WACC	Shared write ACC for ITCM, ETB and L2 Tag
11	RSERVED_BITS_11	Reserved
10:7	OTHER_RACC	Shared read ACC for ITCM, ETB and L2 Tag
6:5	DU_DATA_WACC	Write ACC for DU data Array
4	RESERVED_BITS_4	Reserved
3:0	DU_DATA_RACC	Read ACC for DU data array

0x2880000C LPASS_QDSP6SS_DCC_CTRL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

This register contains control value for the duty cycle corrector inside QDSP6 hardmacro.

LPASS_QDSP6SS_DCC_CTRL

Bits	Name	Description
31:0	CTRL	Control value for the Duty cycle corrector

0x28800010 LPASS_QDSP6SS_NMI

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

This register controls QDSP6 non-maskable interrupt (NMI) signal.

LPASS_QDSP6SS_NMI

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	SET	0x0: Disabled 0x1: ENABLED (assert the QDSP NMI IRQ signal)

0x28800018 LPASS_QDSP6SS_CGC_OVERRIDE

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000010

This register controls various CGC overrides in QDSP6 subsystem and core.

LPASS_QDSP6SS_CGC_OVERRIDE

Bits	Name	Description
31:11	RESERVED_BITS_31_11	Reserved
10	AHBM_HCLK_EN	When reset (0), it enables the QDSP6 AHBM_HCLK to be gated off. When set (1), the AHBM_HCLK runs whenever there is cc_ahb_clk. Leave the bit clear for normal operations.
9	AXIS_ACLK_EN	When reset (0), it enables the QDSP6 AXIS_ACLK to be gated off if this bus is not used. When set (1), AXIS_ACLK is always running. Leave the bit clear for normal operations.
8	TEST_HCLK_EN	When reset (0), it enables the crpc_test_ahb_gclk to be gated off if testbus and TCXO counter are disabled. When set (1), the crpc_test_ahb_gclk runs whenever there is cc_ahb_clk. Leave the bit clear for normal operations.

LPASS_QDSP6SS_CGC_OVERRIDE (cont.)

Bits	Name	Description
7	L2VIC_HCLK_EN	When reset (0), it enables the crpc_l2vic_ahb_gclk to be gated. It will add 2 additional AHB clocks for interrupt latency. When set (1), the crpc_l2vic_ahb_gclk runs whenever there is cc_ahb_clk. Leave the bit clear for power savings. Set the bit to 1 if minimal interrupt latency is required.
6	TCXO_CLK_EN	When reset (0), it enables TCXO clock to be gated. When set (1), the TCXO clock is always running.
5	TIMER_HCLK_EN	When reset (0), it enables the crpc_timer_ahb_gclk to be gated off if all timers are disabled. When set (1), the crpc_timer_ahb_gclk runs whenever there is cc_ahb_clk. Leave the bit clear for normal operations.
4	PUB_HCLK_EN	crpc_pub_ahb_gclk is used for doing the AHB transactions to public CSR registers. When this bit is reset(0), it enables the crpc_pub_ahb_gclk to be gated off when there are no AHB transactions. When set(1), the crpc_pub_ahb_gclk runs whenever there is cc_ahb_clk. The reset value for this bit is 0x1
3	CSR_HCLK_EN	crpc_csr_ahb_gclk is used for doing the AHB transactions to AHB router and private CSR. The qdsp6 core, crpc, ugpt, rgpt, AVS. controller and tcxo_counter operate on the ungated cc_ahb_clk. When this EN bit is reset (0), this enables the crpc_ahb_gclk to be gated off. When set (1), the crpc_ahb_gclk runs whenever there is cc_ahb_clk.
2	CORE_BUS_EN	0x0: hardware clock gating enabled 0x1: force on QDSP6 bus clk
1	CORE_RCLK_EN	0x0: hardware clock gating enabled 0x1: force on QDSP6 core rclk
0	CORE_CLK_EN	0x0: hardware clock gating enabled 0x1: force on QDSP6 core clk

0x2880001C LPASS_QDSP6SS_STRAP_TCM

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x02000000

These bits define the upper bits of the TCM base and the config table. If the core accesses any address within the TCM config/TCM region, it goes to TCM config/TCM. Otherwise, it goes to either AHB or AXI access. The TCM address space must be at 4 MB boundary.

The default value of this register does not match with SoC address map necessarily. It must be programmed before QDSP6 is out of reset.

LPASS_QDSP6SS_STRAP_TCM

Bits	Name	Description
31:27	RESERVED_BITS_31_27	Reserved
26:16	BASE_ADDR	QDSP TCM Base Address
15:0	RESERVED_BITS_15_0	Reserved

0x28800020 LPASS_QDSP6SS_STRAP_AHB

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00A10A00

These bits define the upper and lower bits for the AHB boundary. If the address is between the upper AHB address (exclusive) and lower AHB address (inclusive) and not for the TCM configuration space, it is decoded and sent to the AHB interface. The AHB address space must be at 16 MB boundary.

The default value of this register does not match with SoC address map necessarily. It must be programmed before QDSP6 is out of reset.

LPASS_QDSP6SS_STRAP_AHB

Bits	Name	Description
31:24	RESERVED_BITS_31_24	Reserved
23:16	UPPER_ADDRESS	QDSP6 AHB Upper Address
15:12	RESERVED_BITS_15_12	Reserved
11:4	LOWER_ADDRESS	QDSP6 AHB Lower Address
3:0	RESERVED_BITS_3_0	Reserved

0x28800024 LPASS_QDSP6SS_EXT_WAKEUP

Type: Write (Command)
Clock: AHB_CLOCK
Reset State: 0x0

This register is used by external processor to start the wakeup process. To enable this feature, QDSP6 must program 1 to CSR register QDSP6SS_SLPC_CFG bit EXT_WAKEUP_ENA.

LPASS_QDSP6SS_EXT_WAKEUP

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	CMD	Write 1 starts wakeup process.

0x28800028 LPASS_QDSP6SS_EXT_PD

Type: Write (Command)
Clock: AHB_CLOCK
Reset State: 0x0

This register is used by external processor to continue the power down process. To enable this feature, QDSP6 must program 1 to CSR register QDSP6SS_SLPC_CFG bit PD_SRC_SEL. The external processor must respond to QDSP6 core idle interrupt and write 1 to QDSP6SS_EXT_PD when it is ready for QDSP6SS to proceed with actual power down.

LPASS_QDSP6SS_EXT_PD

Bits	Name	Description
31:1	RESERVED_BITS_31_1	Reserved
0	CMD	Write 1 starts power down process.

0x2880002C LPASS_QDSP6SS_ZMEAS_CONFIG

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x0

This register is used to control impedance measurement circuit.

LPASS_QDSP6SS_ZMEAS_CONFIG

Bits	Name	Description
31:24	RESERVED_BITS_31_24	Reserved
23:5	ZMEAS_COUNT	19-bit count value for setting the clock divides value. This directly determines the resonance cycle time period.
4	MUX_SEL	0 normal functional mode. The output from the circuit in not used 1 The output from the circuit is connected to GFMUX input d for impedance measurement
3	ZMEAS_CLK_R_ENA	Gates the output clock of the circuit regardless of how bypass is set. CGC_EN bit must be set in order for this enable to take effect.

LPASS_QDSP6SS_ZMEAS_CONFIG (cont.)

Bits	Name	Description
2	ZMEAS_CGC_EN	It activates the internal clock "CGC" so that activity is present only when the circuit is in use. When cleared, the internal FSM clock is not active to save power.
1	ZMEAS_BYPASS	When set, it enables which passes the input clock to the unit's output pin "clk_divn" so as to appear continuous and undivided
0	ZMEAS_SW_RESET	When set, it resets the circuit

0x28800030 LPASS_QDSP6SS_GFMUX_CTL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x102

This register is used for QDSP6 core clock GFMUX control

LPASS_QDSP6SS_GFMUX_CTL

Bits	Name	Description
31:10	RESERVED_BITS_31_10	Reserved
9	IDLE_CORE_CLK_EN	When reset (0), it enables core clock gating if QDSP6 core is idle. When set (1), the core clock keeps running even if QDSP6 core is idle.
8	SRC_SWITCH_CLK_OVR	0x1: force clock on during source switch 0x0: Not force clock on during source switch
7:4	RESERVED_BITS_7_4	Reserved
3:2	CLK_SRC_SEL	GFMUX clock source select
1	CLK_ENA	SW enable for QDSP6 core clock from GFMUX 0x0: QDSP6 core clock is off 0x1: QDSP6 core clock in on, if dynamic clock gating is enabled, the clock is under hardware control
0	CLK_ARES	Reset GFMUX

0x28800034 LPASS_QDSP6SS_GFMUX_STATUS

Type: Read
Clock: AHB_CLOCK
Reset State: NA

This register reads GFMUX status during clock source switching.

LPASS_QDSP6SS_GFMUX_STATUS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Reserved
4:1	SEL_STATUS	Reflect the sel value (sel_d, sel_c, sel_b, sel_a) **NOTE** The bits are all 0 if clock is halted
0	SWITCH_STATUS	0x1: GFMUX has yet to switch to new clock source 0x0: GFMUX matches the clock source selection

0x28800038 LPASS_QDSP6SS_PWR_CTL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x7D

This register is used for QDSP6 CORE power control sequence directly by SW during initial PON boot up or when SPM is not used.

LPASS_QDSP6SS_PWR_CTL

Bits	Name	Description
31:7	RESERVED_BITS_31_7	Reserved
6	CLAMP_IO	Assert QDSP6 core clamp when set to 1. Must be programmed to 0 before boot up QDSP6
5	ARR_STBY_N	De-assert active low memory arr_stby_n when set to 0. Must be programmed to 1 before boot up QDSP6
4	ETB_SLP_NRET_N	De-assert active low ETB memory non-retention sleep signal when set to 0. Must be programmed to 0 before boot up QDSP6
3	L2TAG_SLP_NRET_N	De-assert active low L2TAG memory non-retention sleep signal when set to 0. Must be programmed to 0 before boot up QDSP6
2	L1TCM_SLP_NRET_N	De-assert active low L1TCM memory non-retention sleep signal when set to 0. Must be programmed to 0 before boot up QDSP6
1	SLP_RET_N	De-assert active low QDSP6 memory retention sleep signal when set to 0. Must be programmed to 0 before boot up QDSP6
0	L2DATA_SLP_NRET_N	De-assert active low L2DATA memory non-retention sleep signal when set to 0. Must be programmed to 0 before boot up QDSP6

0x2880003C LPASS_QDSP6SS_FLL_CTL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x0

This register is used for QDSP6 frequency locked loop (FLL) control. FLL is a low power alternative to PLL for QDSP6 core clock.

LPASS_QDSP6SS_FLL_CTL

Bits	Name	Description
31:28	RESERVED_BITS_31_28	Reserved
27:16	M	FLL M value
15:11	N	FLL N value
10:3	DCO_INIT	Initial value of FLL DCO
2	CLK_SEL	0x0: select normal clk source 0x1: select FLL clock
1	RESET	0x0: Do nothing 0x1: Assert FLL reset
0	ENA	0x0: disable FLL 0x1: enable FLL

0x28800040 LPASS_QDSP6SS_FLL_STATUS

Type: Read
Clock: AHB_CLOCK
Reset State: NA

This register is used for QDSP6 FLL status. The register needs to be read multiple times for accurate value, due to the implementation of clock gating.

LPASS_QDSP6SS_FLL_STATUS

Bits	Name	Description
31:9	RESERVED_BITS_31_9	Reserved
8:1	DCO_CURRENT	Current FLL DCO value. It needs multiple reads for a correct value due to possible delay variation between multiple bits
0	LOCKED	0x0: FLL not locked 0x1: FLL locked

0x28800048 LPASS_QDSP6SS_TEST_BUS_CTL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0000_0000

QDSP6SS_TEST_BUS_CTL controls the test bus muxes in the QDSP6SS. The TESTBUS_EN field is used to enable testbus and the clock to synchronize testbus value to register QDSP6SS_TEST_BUS_VALUE. When not enabled, the test bus sources hold the test bus at 0 to save power. The Q6_SEL field is used to choose between QDSP6 core or QDSP6 subsystem. The field SEL only lists selections for subsystem test bus. For QDSP6 testbus selection, refer to the QDSP6 document.

LPASS_QDSP6SS_TEST_BUS_CTL

Bits	Name	Description
31:24	SPARE_CFG	Spare r/w bits available for ECOs.
23:18	RESERVED_BITS23_18	Reserved
17	TESTBUS_EN	0x1: enable testbus 0x0: disable testbus
16	Q6_SEL	Select the test bus from QDSP6 or QDSP6SS 0x0: SUBSYSTEM_EN 0x1: Q6_EN

LPASS_QDSP6SS_TEST_BUS_CTL (cont.)

Bits	Name	Description
15:0	SEL	When bit[16]=0, select the test bus from QDSP6SS. 0x0: NONE 0x1: POWER_CNTL 0x2: UGPT_COUNT 0x3: RGPT_COUNT 0x4: IDLT_COUNT 0x5: CRPC 0x6: TCXOC_COUNT 0x7: JTAG 0x8: SAW_WRAPPER 0x9: WDOG_WRAPPER 0xA: SLPC 0xB: L2VIC 0xC: TESTBUS_WDATA 0x20: INT_SRC_31_0 0x21: INT_SRC_63_32 0x22: INT_SRC_95_64 0x23: INT_SRC_127_96 0x24: INT_SRC_159_128 0x25: INT_SRC_191_160 0x26: INT_SRC_223_192 0x27: INT_SRC_255_224 0x28: INT_SRC_287_256 0x29: INT_SRC_319_288 0x2A: INT_SRC_351_320 0x2B: INT_SRC_383_352 0x2C: INT_SRC_415_384 0x2D: INT_SRC_447_416 0x2E: INT_SRC_479_448 0x2F: INT_SRC_511_480 0x30: INT_SRC_543_512 0x31: INT_SRC_575_544 0x32: INT_SRC_607_576 0x33: INT_SRC_639_608 0x34: INT_SRC_671_640 0x35: INT_SRC_703_672 0x36: INT_SRC_735_704 0x37: INT_SRC_767_736 0x38: INT_SRC_799_768 0x39: INT_SRC_831_800 0x3A: INT_SRC_863_832 0x3B: INT_SRC_895_864 0x3C: INT_SRC_927_896 0x3D: INT_SRC_959_928 0x3E: INT_SRC_991_960 0x3F: INT_SRC_1023_992

0x2880004C LPASS_QDSP6SS_TEST_BUS_VALUE

Type: Read
Clock: AHB_CLOCK
Reset State: NA

This register is used for accessing testbus values during debug.

LPASS_QDSP6SS_TEST_BUS_VALUE

Bits	Name	Description
31:0	VALUE	The data may have incorrect value due to timing difference between signals

0x28800050 LPASS_QDSP6SS_TEST_BUS_WDATA

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x0

This register is used for driving testbus values during debug.

LPASS_QDSP6SS_TEST_BUS_WDATA

Bits	Name	Description
31:0	VALUE	

0x28800054 LPASS_QDSP6SS_TEST_CLK_CTL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0000_0000

The QDSP6SS_TEST_CLK_CTL register selects the high speed and low speed test clocks to be output from the QDSP6SS to the chip's clock controller.

LPASS_QDSP6SS_TEST_CLK_CTL

Bits	Name	Description
31:5	RESERVED_BITS31_5	Reserved
4	Q6_DBG_CLK_EN	Selects the high speed clock to output for test mode 0x0: No clock selected, tied low. 0x1: QDSP6 core clock (non-inverted or inverted - determined by Q6_DBG_CLK_INV)

LPASS_QDSP6SS_TEST_CLK_CTL (cont.)

Bits	Name	Description
3	Q6_DBG_CLK_INV	When set (1), selects inverted QDSP6 core clock
2:0	DBG_LS_CLK_SEL	Selects the local clock to output for test mode 0x0: No clock selected, tie_1 0x1: AXI master clock 0x2: AXI slave clock 0x3: QDSP6SS ahb clock 0x4: No clock selected, tie_2 0x5: XO clock 0x6: Sleep (RGPT timer clock) 0x7: JTAG TCK

12.10 LPA SS QDSP6 SS Slave Registers (0x28880000 LPASS_QDSP6SS_CSR_BASE)

This section contains the Low Power Audio Subsystem (LPASS) QDSP6SS CSR AHB Slave registers.

These registers belong to the CSR AHB slave in the QDSP6SS. The base address for these registers is configurable. They belong to uncacheable address space of QDSP6.

12.10.1 RTOS general purpose timer registers

0x28880000 LPASS_QDSP6SS_RGPT_MATCH_VAL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x00000000

The QDSP6SS_RGPT_MATCH_VAL register contains the RGPT timer match value. The RTOS general purpose timer generates an interrupt to QDSP6 when its counter value reaches this match value. Due to the synchronization to the slow 32 kHz timer clock, we should not program the match value to be less than 3 ticks from the timer's current value as obtained from reading RGPT_COUNT_VAL register.

LPASS_QDSP6SS_RGPT_MATCH_VAL

Bits	Name	Description
31:0	MATCH	During the reset, the count gets initialized to zero. If the timer is enabled, it starts counting up in SLP_CLK domain. An interrupt is generated if the count reaches this programmed match value.

0x28880004 LPASS_QDSP6SS_RGPT_COUNT_VAL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_RGPT_COUNT_VAL register returns the current value of the RGPT timer. It should be considered read-only for software. The count value is writable ONLY as a test/debug feature.

Writing this register ALSO changes the QDSP6SS_RGPT_MATCH_VAL register at the same time due to HW reuse. The procedure for writing the QDSP6SS_RGPT_COUNT_VAL is as follows:

1. Disable the timer by clearing the EN bit in QDSP6SS_RGPT_ENABLE.
2. Write QDSP6SS_RGPT_COUNT_VAL.
3. Make sure that the COUNT_VAL is written by reading the QDSP6SS_RGPT_COUNT_VAL

4. Write (to set/restore) QDSP6SS_RGPT_MATCH_VAL, if required.
5. Enable the timer by setting the EN bit in QDSP6SS_RGPT_ENABLE.

LPASS_QDSP6SS_RGPT_COUNT_VAL

Bits	Name	Description
31:0	COUNT	When read, it specifies the current value of the COUNTER. If written the timer starts to count from the written value. Follow the procedure mentioned above for writing the timer.

0x28880008 LPASS_QDSP6SS_RGPT_ENABLE

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x00000000

The QDSP6SS_RGPT_ENABLE register is used to enable the RGPT timer.

LPASS_QDSP6SS_RGPT_ENABLE

Bits	Name	Description
31:9	RESERVED_BITS31_9	Reserved
8:2	STATUS	Due to the synchronization between the ahb_clk (which programs the timer) and the SLP_CLK (the clock at which the timer runs), it might take up to one SLP_CLK cycle to transfer the AHB_CLK programmed values to SLP_CLK registers. These status bits read back the internal status. bit 8: rtos timer is still under reset after the subsystem reset. bit 7: write transaction to QDSP6SS_RGPT_MATCH_VAL is pending. bit 6: write transaction to QDSP6SS_RGPT_ENABLE is pending. bit 5: write transaction to QDSP6SS_RGPT_COUNT_VAL is pending. bit 4: write transaction to QDSP6SS_RGPT_CLEAR is pending. bit 3: CLR_ON_MATCH_EN in SLP_CLK domain bit 2: EN in SLP_CLK domain
1	CLR_ON_MATCH_EN	When set (1), the TIMER clears when it reaches the match value.
0	EN	When set (1), the TIMER is enabled and counts with frequency SLP_CLK

0x2888000C LPASS_QDSP6SS_RGPT_CLEAR

Type: Write (Command)
Clock: AHB_CLK
Reset State: NA

The QDSP6SS_RGPT_CLEAR register is a one-shot command register that, when written with any value, resets the TIMER to a value of 0. This occurs regardless of the state of the QDSP6SS_RGPT_ENABLE register.

Upon clearing the counter with RGPT_CLEAR command, the immediate following RGPT_COUNT_VAL read returns zero even if the command has not synchronized and takes effect in the timer hardware. Software may read RGPT_ENABLE(4) to determine whether the command has taken full effect.

LPASS_QDSP6SS_RGPT_CLEAR

Bits	Name	Description
31:0	RESERVED_BITS31_0	Reserved

12.10.2 Idle timer registers

0x28881000 LPASS_QDSP6SS_IDLT_MATCH_VAL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x00000010

The QDSP6SS_IDLT_MATCH_VAL register contains the idle timer match value. The idle timer starts counting if the QDSP6 core is in all-wait (i.e., QDSP6_core_state is 1). It generates an interrupt to QDSP6 when its counter value reaches this match value. If the QDSP6 is active, the counter will be reset and held at 0. Due to the synchronization to the slow 32 kHz timer clock, we should not program the match value to be less than 3.

LPASS_QDSP6SS_IDLT_MATCH_VAL

Bits	Name	Description
31:0	MATCH	During the reset, the count gets initialized to zero. If the timer is enabled, it starts counting up in SLP_CLK domain. An interrupt is generated if the count reaches this programmed match value.

0x28881004 LPASS_QDSP6SS_IDLT_COUNT_VAL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_IDLT_COUNT_VAL register returns the current value of the idle timer. It should be considered debug-only feature.

NOTE It will be automatically held to 0 when QDSP6 is active.

LPASS_QDSP6SS_IDLT_COUNT_VAL

Bits	Name	Description
31:0	COUNT	When read, it specifies the current value of the COUNTER. If written, the timer starts to count from the written value. Follow the procedure mentioned above for writing the timer.

0x28881008 LPASS_QDSP6SS_IDLT_ENABLE

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x00000000

The QDSP6SS_IDLT_ENABLE register is used to enable the idle timer.

LPASS_QDSP6SS_IDLT_ENABLE

Bits	Name	Description
31:9	RESERVED_BITS31_9	Reserved
8:2	STATUS	Due to the synchronization between the ahb_clk (which programs the timer) and the SLP_CLK (the clock at which the timer runs), it might take up to one SLP_CLK cycle to transfer the AHB_CLK programmed values to SLP_CLK registers. These status bits read back the internal status. bit 8: rtos timer is still under reset after the subsystem reset. bit 7: write transaction to QDSP6SS_IDLT_MATCH_VAL is pending. bit 6: write transaction to QDSP6SS_IDLT_ENABLE is pending. bit 5: write transaction to QDSP6SS_IDLT_COUNT_VAL is pending. bit 4: Reserved, always 0. bit 3: CLR_ON_MATCH_EN in SLP_CLK domain bit 2: EN in SLP_CLK domain
1	CLR_ON_MATCH_EN	When set (1), the TIMER clears when it reaches the match value.

LPASS_QDSP6SS_IDLT_ENABLE (cont.)

Bits	Name	Description
0	EN	When set (1), the TIMER is enabled and counts with frequency SLP_CLK

12.10.3 Watchdog timer registers

The watchdog registers exists in ahb_clock domain and they are reset by SS reset or private peripheral reset. The watchdog timer runs at a separate sleep_clock.

NOTE When QDSP6 is in debug mode (ISDB break), the watchdog timer is halted to keep its current value until QDSP6 is resumed in normal mode. The debugger must program ISDBCFG1[5:0] to all ones to enable this feature.

0x28882000 LPASS_QDSP6SS_WDOG_RESET

Type: Write (Command)
Clock: AHB_CLK
Reset State: NA

The QDSP6SS_WDOG_RESET register resets the watchdog counter. In normal operation, QDSP6 should periodically write this command register to reset watchdog. This command register also resets (clears) watchdog freeze, re-enabling the watchdog counter.

LPASS_QDSP6SS_WDOG_RESET

Bits	Name	Description
0	QDSP6SS_WDOG_RESET	This bit generates the wdog_reset_stb during the non-sleep mode. A pulse is generated on wdog_reset_stb when this bit is written with a 0x1.

0x28882004 LPASS_QDSP6SS_WDOG_FREEZE

Type: Write (Command)
Clock: AHB_CLK
Reset State: NA

The QDSP6SS_WDOG_FREEZE register freezes the watchdog timer at count 0. QDSP6 should write this register before it goes to power-down mode to avoid a watchdog timeout during power-down. It may be wakened (unfreeze) by interrupts enabled in the interrupt monitor when QDSP6SS_WDOG_UNMASKED_INT_EN is set to 1. This register is also reset by writing to the QDSP6SS_WDOG_RESET register.

It is expected that QDSP6 power-up sequence as triggered by the same interrupt event that wakes up WDOG should be completed before WDOG expires in approximated 390 ms.

LPASS_QDSP6SS_WDOG_FREEZE

Bits	Name	Description
0	QDSP6SS_WDOG_FREEZE	Set 1 to this bit to freeze the watchdog timer at time 0.

0x28882008 LPASS_QDSP6SS_WDOG_UNMASKED_INT_EN

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_WDOG_UNMASKED_INT_EN register enables the unfreeze of WDOG on the interrupt as detected in the interrupt monitor or SIRC during QDSP6 power-down. The interrupt monitor and SIRC must be programmed ahead of the power-down process to enable all or a sub-set of interrupts to power up the QDSP6 and unfreeze the WDOG.

If this register bit is cleared, QDSP6 should program WDOG_RESET to unfreeze the WDOG after it is powered up.

This register must be programmed before WDOG freezes.

LPASS_QDSP6SS_WDOG_UNMASKED_INT_EN

Bits	Name	Description
0	WDOG_UNMASKED_INT_EN	Set 1 to this bit to enable interrupt wakeup.

0x2888200C LPASS_QDSP6SS_WDOG_STATUS

Type: Read
Clock: AHB_CLK
Reset State: NA

The QDSP6SS_WDOG_STATUS register provides watchdog status.

WDOG_RESET_STATUS bit is intended to inform QDSP6 processor cold boot routine whether the cold boot is caused by a watchdog expire event. To support this feature, the system software handling QDSP6 reset on WDOG expiration must apply only to the QDSP6SS private reset and QDSP6 core reset.

The WDOG_RESET_STATUS bit is cleared on full subsystem reset. QDSP6 firmware can write to WDOG_RESET to clear it.

WDOG_READY bit should be checked when:

- Programming watchdog for the first time after reset
- Before writing WDOG_FREEZE. Otherwise the freeze command might never be taken.

LPASS_QDSP6SS_WDOG_STATUS

Bits	Name	Description
17	WDOG_READY	The bit indicates whether it is safe to write to watchdog registers. Watchdog in reset from the assertion of QDSP6SS full reset or private reset Watchdog has not taken the previously issued WDOG_RESET command due to synchronization 0x1: Watchdog is ready. 0x0: Watchdog is not ready. Writing to watchdog register may cause handshaking error. Watchdog not-ready status can be caused by any of these events:
16:3	WDOG_COUNT	Counter value [13:0] of watch dog counter. **NOTE** The sleep counter value is sampled using the AHB_CLK. Multiple reads are required to determine the value (assuming AHB_CLK is much faster than sleep clock)
2	WDOG_CNT_RESET_STATUS	Show the value of watchdog internal counter reset signal wdog_res signal (for test).
1	WDOG_IS_FROZEN	This bit indicates whether the watchdog timer is frozen (disabled). 0x1: Watchdog Frozen (disabled) 0x0: Watchdog not Frozen (enabled)
0	WDOG_RESET_STATUS	Reading 1 indicates a watchdog expired event occurs after a full subsystem reset is asserted.After watchdog expires, it is 1 until software writes 1 to register QDSP6SS_WDOG_RESET

0x28882010 LPASS_QDSP6SS_WDOG_EXPIRED_WIDTH

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0C7C

The WDOG_EXPIRED_WIDTH register defines the width of the wdog_expired pulse in the number of sleep_clk. The default value is 0x0C7C = 3196.

WDOG_EXPIRED_WIDTH should not be programmed with a value greater than 0x31F3 = 12787.

LPASS_QDSP6SS_WDOG_EXPIRED_WIDTH

Bits	Name	Description
14	SYNC_STATUS	When set (1), the wdog expired width data is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STATUS bit is clear (0).
13:0	DATA	Wdog counter terminal value to de-assert the wdog_expired pulse. The wdog counter is14-bits.

0x28882014 LPASS_QDSP6SS_WDOG_BARK_TIME

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x3FFF

The WDOG_BARK_TIME register defines the time in sleep_clk when to assert the watchdog (bark) interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, which is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog (bark) interrupt.

LPASS_QDSP6SS_WDOG_BARK_TIME

Bits	Name	Description
14	SYNC_STATUS	When set (1), the wdog bark time is synchronizing to the SLEEP_CLK. The data value is not guaranteed until the SYNC_STATUS bit is clear (0).
13:0	DATA	The wdog counter value on which to trigger the bark interrupt

0x28882020 LPASS_QDSP6SS_WDOG_TEST

Type: Read/Write
Clock: AHB_CLK
Reset State: NA

The WDOG_TEST register is used to load a test value into the watchdog timer counter. After the value is loaded, the watchdog counts from this value.

LPASS_QDSP6SS_WDOG_TEST

Bits	Name	Description
14	SYNC_STATUS	When set (1), the watchdog test is synchronizing to SLEEP_CLK. The data value is not guaranteed until the SYNC_STATUS bit is clear (0).
13:0	WDOG_TEST_CNT	The watchdog counter test load value [13:0]. The watchdog counter is 14-bits.

0x28882024 LPASS_QDSP6SS_WDOG_ENABLE

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

If the QDSP6SS_WDOG_ENABLE register is 0, the watchdog timer is held in reset.

LPASS_QDSP6SS_WDOG_ENABLE

Bits	Name	Description
0	WDOG_ENABLE	Set 1 to this bit to enable watchdog.

12.10.4 User general purpose timer registers

0x28884000 LPASS_QDSP6SS_UGPT_MATCH_VAL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x00000000

The QDSP6SS_UGPT_MATCH_VAL register contains the UGPT match value. The user general purpose timer generates an interrupt to QDSP6 when its counter value reaches this match value.

LPASS_QDSP6SS_UGPT_MATCH_VAL

Bits	Name	Description
31:0	MATCH	During the reset, the count gets initialized to zero. If the timer is enabled, it starts counting up. An interrupt is generated if the count reaches this programmed match value.

0x28884004 LPASS_QDSP6SS_UGPT_COUNT_VAL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_UGPT_COUNT_VAL register contains the current value of the UGPT TIMER. The current value can be set by software.

The count value is writable as a test/debug only feature. The procedure for writing the QDSP6SS_UGPT_COUNT_VAL is as follows:

1. Disable the timer by clearing the EN bit in QDSP6SS_UGPT_ENABLE.
2. Write QDSP6SS_UGPT_COUNT_VAL (Do not write to the QDSP6SS_UGPT_COUNT_VAL for a second time. It might result in different bits capturing the first or second write value.)
3. Enable the timer by setting the EN bit in QDSP6SS_UGPT_ENABLE.
4. The count value can be read back to see that the timer starts to count from the programmed value (it may take up to 32 tcxo clock cycles to get the value reflected).

LPASS_QDSP6SS_UGPT_COUNT_VAL

Bits	Name	Description
31:0	COUNT	When read, it returns the current value of the COUNTER. If written, the timer starts to count from the written value. Follow the procedure mentioned above for writing the timer.

0x28884008 LPASS_QDSP6SS_UGPT_ENABLE

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x00000000

The UGPT_ENABLE register is used to enable the UGPT timer.

LPASS_QDSP6SS_UGPT_ENABLE

Bits	Name	Description
31:2	RESERVED_BITS31_2	Reserved
1	CLR_ON_MATCH_EN	When set (1), the TIMER clears when it reaches the match value.
0	EN	When set (1), the TIMER is enabled and counts with frequency TCXO_CLK.

0x2888400C LPASS_QDSP6SS_UGPT_CLEAR

Type: Write (Command)
Clock: AHB_CLK
Reset State: NA

The UGPT_CLEAR register is a one-shot command register that, when written with any value, resets the UGPT TIMER to a value of 0. This occurs regardless of the state of the UGPT_ENABLE register.

LPASS_QDSP6SS_UGPT_CLEAR

Bits	Name	Description
31:0	RESERVED_BITS_31_0	Reserved

12.10.5 QDSP6SS interrupt registers

0x28885000+ 4*n LPASS_QDSP6SS_INTn, n=[0..31]

Type: Write (Command)
Clock: AHB_CLK
Reset State: 0x0

Writing any value to the QDSP6SS_INTn register generates an interrupt pulse from the QDSP6SS to other processors.

LPASS_QDSP6SS_INTn

Bits	Name	Description
31:0	RESERVED_BITS31_0	Reserved

12.10.6 Reset/Clock/Power control registers

0x28887004 LPASS_QDSP6SS_CORE_IDLE_GATEOFF

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0000_000F

This register is introduced to enable other processors (another QDSP6, Scorpion, ARM9, MPM) to control QDSP6 power collapse or Vdd-minimization. In a SoC with RPM, this feature might not be used since QDSP6SS SPM may communicate with RPM on the processor power state.

If the QDSP6 wants itself to enter into Vdd-Min or a power collapsed state, it needs to communicate itself to another master in the system via a core idle interrupt. It should write to QDSP6SS_PD_HS_START first before going into idle. The idle interrupt needs to be sent only to the master that is performing the task. To gate off the interrupts to other masters, this register is used. Software should program the register to enable only one of the masters. How the 4-bit idle interrupts are mapped is chip-specific. One recommended way is as follows:

1. IDLE_0 is sent to the MPM
2. IDLE_1 is sent to the ARM9
3. IDLE_2 is sent to the other QDSP6
4. IDLE_3 is sent to the Scorpion

LPASS_QDSP6SS_CORE_IDLE_GATEOFF

Bits	Name	Description
31:4	RESERVED_BITS31_4	reserved space.

LPASS_QDSP6SS_CORE_IDLE_GATEOFF (cont.)

Bits	Name	Description
3:0	GATEOFF	0xF: IDLE_NONE 0xE: IDLE_0 0xD: IDLE_1 0xB: IDLE_2 0x7: IDLE_3

0x2888700C LPASS_QDSP6SS_PD_HS_START

Type: Write/Command
Clock: AHB_CLK
Reset State: NA

This is the command register for starting the power down preparation process.

It should be written (the written value is ignored) when the core decides to power down after QDSP6 core interrupt is disabled globally by QDSP6 CR register SYSCFG bit. Firmware must poll QDSP6_PD_HS_DONE to indicate hardware has completed the preparation before proceed further.

Writing this register triggers a hardware state machine in the sleep controller to isolate interrupt inputs to QDSP6 core, and de-isolate interrupt inputs to the interrupt monitor. It also clears all status registers in the interrupt monitor. As a result, the interrupt monitor is now responding to external interrupt event and QDSP6 core is isolated from external interrupt during the power down process.

Writing this register also clears idle interrupts to other processors, which is asserted from previous core idle event.

LPASS_QDSP6SS_PD_HS_START

Bits	Name	Description
31:0	RESERVED_BITS31_0	reserved space

0x28887010 LPASS_QDSP6SS_PD_HS_DONE

Type: Read
Clock: AHB_CLK
Reset State: 0x0

This is the handshake response register for the power down preparation process. The value 1 indicates hardware has completed the preparation

After polling the register, QDSP6 firmware should check the level one interrupt controller pending status CR register IPEND, copy pending interrupts to interrupt monitor, and then re-enable interrupt globally by QDSP6 CR register SYSCFG bit before putting the last thread to wait.

LPASS_QDSP6SS_PD_HS_DONE

Bits	Name	Description
31:1	RESERVED_BITS31_1	reserved space.
0	DONE	Status bit showing 1 if power down steps are complete.

0x28887014 LPASS_QDSP6SS_PU_HS_START

Type: Write/Command
Clock: AHB_CLK
Reset State: NA

This is used to request the hardware to complete power up process after the QDSP6 core has booted up from the power down state.

Writing this register triggers a hardware state machine in the sleep controller to de-isolate interrupt inputs to QDSP6 core, replay edge trigger interrupts recorded by the interrupt monitor since last time the interrupts to QDSP6 core is isolated, and then isolate the interrupt inputs to the interrupt monitor.

LPASS_QDSP6SS_PU_HS_START

Bits	Name	Description
31:0	RESERVED_BITS31_0	reserved space.

0x28887018 LPASS_QDSP6SS_PU_HS_DONE

Type: Read
Clock: AHB_CLK
Reset State: 0x1

This register is asserted after hardware has completed the power up sequence as triggered by QDSP6SS_PU_HS_START. It is optional for the SW to check this register after writing to PU_HS_START.

LPASS_QDSP6SS_PU_HS_DONE

Bits	Name	Description
31:1	RESERVED_BITS31_1	reserved space.
0	DONE	Status bit showing 1 if power up steps are complete.

0x2888701C LPASS_QDSP6SS_SLPC_CFG

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

Sleep controller configuration register. It should be configured before power down sequence starts.

LPASS_QDSP6SS_SLPC_CFG

Bits	Name	Description
31:5	RESERVED_BITS31_5	reserved space.
4	EXT_AVS_SRC_EN	0x0: use QDSP6 AVS. macro up/down request to trigger AVS 0x1: use both QDSP6 AVS. macro and external AVS. macro up/down request to trigger AVS
3	SAW_DBG	Set to 1 to allow SPM to go through states without actually turning off clock, hsfs, and clamp. This bit is expected to be set by ISDB via stuffed instruction to enable ISDB during the power down sequence
2:1	PD_SRC_SEL	Failure to provide the proper power down trigger after hardware has completed the power down preparation leaves the QDSP6 core in an unusable state because the core interrupt controller is isolated and no interrupt reaches the core. 0x0: use qdsp6_core_idle to trigger power down. 0x1: use public CSR register QDSP6SS_EXT_PD to trigger power down. 0x2: use external signal input to trigger power down 0x3: Un-used
0	EXT_WAKEUP_ENA	Set to 1 to enable wakeup by external processor writing to public CSR register QDSP6SS_EXT_WAKEUP. Set to 0 to disable. It needs to be set to 1 before power down if external processor is expected to initiate the wakeup.

0x28887020 LPASS_QDSP6SS_SLPC_STATUS

Type: Read
Clock: AHB_CLK
Reset State: 0x0

Sleep controller status register. This register is intended for debugging purposes.

LPASS_QDSP6SS_SLPC_STATUS

Bits	Name	Description
31:2	RESERVED_BITS31_2	reserved space.
1:0	FSM_STATE	This is the SLPC FSM current state

12.10.7 Test/Debug registers

0x28888008 LPASS_QDSP6SS_INSTANCE_ID

Type: Read
Clock: AHB_CLK
Reset State: N/A

In a chip, it is possible to have multiple instances of QDSP6SS to be present. This register returns the instance ID of the QDSP6SS.

LPASS_QDSP6SS_INSTANCE_ID

Bits	Name	Description
31:3	RESERVED_BITS31_3	reserved space.
2:0	ID	returns the instance ID value of the QDSP6SS

12.10.8 Free Running TCXO counter

0x2888C000 LPASS_QDSP6SS_TCXO_COUNT_VAL

Type: Read
Clock: AHB_CLK
Reset State: 0x0000_0000

The TCXO counter is reset when the QDSP6SS subsystem is reset and starts counting up on every pulse of the TCXO clock (the nominal operating frequency of TXCO clock is 19.2 MHz). The counter can be read through the CSR.

LPASS_QDSP6SS_TCXO_COUNT_VAL

Bits	Name	Description
31:0	COUNT	Returns the count value of the free running TCXO counter. This counter is reset when the QDSP6SS is reset. Due to the frequency relations between the TCXO clock and the AHB clock, the count can differ by an ahb_clk period or a TCXO clock period, whichever is higher.

0x2888C004 LPASS_QDSP6SS_TCXO_COUNTER_ENABLE

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_TCXO_COUNTER_ENABLE register is used to enable the TCXO counter. The counter is enabled after the reset. The counter keeps running until it is disabled by programming above register to 0x0.

LPASS_QDSP6SS_TCXO_COUNTER_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	Reserved
0	EN	When set (1), the TIMER is enabled and incremented on TCXO clk

12.11 LPA SS QDSP6 SS L2VIC Slave Registers (0x28890000 LPASS_QDSP6SS_L2VIC_BASE)

This section contains the Low Power Audio Subsystem (LPASS) QDSP6SS L2VIC registers.

QDSP6SS L2VIC register starts at the base from QDSP6SS_CSR_BASE + 0x1_0000.

0x28890100+ 4*n LPASS_QDSP6SS_L2VIC_INT_ENABLEn, n=[0..31]

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_L2VIC_INT_ENABLE register enables interrupts sources to generate both an IRQ and a wakeup (both are generated for any detected interrupt).

LPASS_QDSP6SS_L2VIC_INT_ENABLEn

Bits	Name	Description
31:0	ENABLE	0x0: Disable 0x1: Enable

0x28890180+ 4*n LPASS_QDSP6SS_L2VIC_INT_ENABLE_CLEARn, n=[0..31]

Type: Write (Command)
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_L2VIC_INT_ENABLE_CLEARn register is used to clear to 0x0 the bits of the QDSP6SS_L2VIC_INT_ENABLEn register. Any bit that is written 0x1 causes the corresponding enable bit to be cleared..

LPASS_QDSP6SS_L2VIC_INT_ENABLE_CLEARn

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x28890200+ 4*n LPASS_QDSP6SS_L2VIC_INT_ENABLE_SETn, n=[0..31]

Type: Write (Command)
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_L2VIC_INT_ENABLE_SETn register is used to set to 0x1 the bits of the QDSP6SS_L2VIC_INT_ENABLEn register. Any bit that is written 0x1 causes the corresponding enable bit to be set. Because interrupts are automatically cleared and disabled when it is taken by QDSP6 core, the interrupt service should re-enable this interrupt after the interrupt source is cleared.

LPASS_QDSP6SS_L2VIC_INT_ENABLE_SETn

Bits	Name	Description
31:0	SET	0x0: Do nothing 0x1: Set

0x28890280+4*n LPASS_QDSP6SS_L2VIC_INT_TYPEn, n=[0..31]

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_L2VIC_INT_TYPEn register determines the edge/level type of interrupt..

LPASS_QDSP6SS_L2VIC_INT_TYPEn

Bits	Name	Description
31:0	SRC_TYPE	0x0: Level 0x1: Edge

0x28890300+4*n LPASS_QDSP6SS_L2VIC_INT_POLARITYn, n=[0..31]

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_L2VIC_INT_POLARITYn register determines the polarity of interrupt..

LPASS_QDSP6SS_L2VIC_INT_POLARITYn

Bits	Name	Description
31:0	POL	0x0: Active high 0x1: Active low

0x28890380+4*n LPASS_QDSP6SS_L2VIC_INT_STATUSn, n=[0..31]

Type: Read
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_L2VIC_INT_STATUSn register indicates which enabled interrupt is active..

LPASS_QDSP6SS_L2VIC_INT_STATUSn

Bits	Name	Description
31:0	STATUS	0x0: Inactive 0x1: Active

0x28890400+4*n LPASS_QDSP6SS_L2VIC_INT_CLEARn, n=[0..31]

Type: Write (Command)
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_L2VIC_INT_CLEARn register is used to clear the status of an active edge interrupt. Because an interrupt is automatically cleared and disabled after the interrupt is taken by QDSP6 core, this register is not used in normal interrupt service.

LPASS_QDSP6SS_L2VIC_INT_CLEARn

Bits	Name	Description
31:0	CLEAR	0x0: Do nothing 0x1: Clear

0x28890480+4*n LPASS_QDSP6SS_L2VIC_SOFT_INTn, n=[0..31]

Type: Write (Command)
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_L2VIC_SOFT_INTn register is used to set the status of an edge interrupt..

LPASS_QDSP6SS_L2VIC_SOFT_INTn

Bits	Name	Description
31:0	SW_INT	0x0: Do nothing 0x1: Set

0x28890500+4*n LPASS_QDSP6SS_L2VIC_INT_PENDINGn, n=[0..31]

Type: Read
Clock: AHB_CLK
Reset State: 0x0

The QDSP6SS_L2VIC_INT_PENDINGn register is used to indicate the status of an interrupt regardless of the enable. It is mainly for debug purpose.

LPASS_QDSP6SS_L2VIC_INT_PENDINGn

Bits	Name	Description
31:0	STATUS	0x0: Inactive 0x1: Active

12.12 LPA SS SAW Slave Registers (0x288B0000 LPASS_QDSP6SS_SAW_BASE)

This section contains the Low Power Audio Subsystem (LPASS) QDSP6SS SAW registers.

0x288B0000 LPASS_SAW_SECURE

Type: Read/write
Clock: SYS_REF_CLK
Reset State: 0x0000_0007

Security Treatment: Restricted

The SAW_SECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to 0x0 the state of the SAW_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to 0x1, the SAW_SECURE register security treatment bit of that register must be 0x1 for access to be granted. If the security treatment bit of the register is set to 0x0, the non-secure (ahb_saw_hprotns = 0x1) transactions are denied. When access is denied, a write is ignored and a read returns 0x0. No error is signaled.

When reading the SAW_SECURE register, non-secure agents always read 0x0. Secure agents see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

NOTE In QDSP6SS, the signal ahb_saw_hprotns is driven by input port q6ss_hs_hprotns. The CFGNSINIT is pulled to 1. It is recommended to leave the register unchanged from its default setting to disable the security feature, not needed for the QDSP6SS.

LPASS_SAW_SECURE

Bits	Name	Description
31:3	RESERVED	Reserved
2	SAW_CTL	Controls security treatment for SAW registers: SAW_TMR_CFG, SAW_STS 0x1: NSEC 0x0: SEC
1	PWR_CTL	Controls security treatment for SPM registers: SAW_SPM_CTL, SAW_SPM_SLP_TMR_DLY, SAW_SPM_WAKE_TMR_DLY, SAW_SPM_PMIC_CTL, SAW_SLP_CLK_EN, SAW_SLP_HSFS_PRECLMP_EN, SAW_SLP_HSFS_POSTCLMP_EN, SAW_SLP_CLMP_EN, SAW_SLP_RST_EN, SAW_SPM_MPM_CFG 0x1: NSEC 0x0: SEC
0	VLT_CTL	Controls security treatment for the AVS. registers: SAW_AVS_CTL, SAW_VCTL 0x1: NSEC 0x0: SEC

0x288B0004 LPASS_SAW_AVS_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW_SECURE [VLT_CTL].

The SAW_AVS_CTL register is used to control the Adaptive Voltage Scaling (AVS) system.

LPASS_SAW_AVS_CTL

Bits	Name	Description
31	RESERVED_1	Reserved
30	VLVL_WIDTH	Defines the VLVL field of PMIC data. SAW at minimum supports 8901 and 8058 regulator. See PMIC document for details. 0x0: 5 bits VLVL (8058 regulator) 0x1: 6 bits VLVL (8901 regulator)
29:28	VLVL_STEP	Controls the step size of each request to PMIC Arbiter. SW may use values from 0 to 3. Note that the value 0 results in no change - that is if the CPU requests UP or DOWN, the CURR_PVLVL is sent to the PMIC Arbiter. This may be useful for debug. If an increment or decrement operation would cause the current VLVL to transition above or below the MAX_VLVL or MIN_VLVL, the current VLVL is not changed. An interrupt is signaled if IRQ_MAX/MIN_EN is 1
27	EN	AVS. Enable. **NOTE** Setting to 0 does not disable any pending interrupts. **NOTE** AVS. FSM and SPM FSM are mutually exclusive. Only one FSM is active at a time. SW does not have to disable AVS. before going to sleep. 0x0: Disable AVS 0x1: Enable AVS
26	SW_DONE_INT_EN	Set to 1 to turn on AVS. interrupt for when a SW initiated voltage change has completed. Set to 0 to mask it (turn it off). ASSERTION: This interrupt is asserted only after a SW write to SAW_AVS_VLVL. Specifically, after the AVS. FSM traverses through all its states and transitions back to IDLE, the interrupt line is pulsed. The interrupt controller should be set to edge capture to receive this interrupt. CLEARING: None. This interrupt is a pulse, SW does not need to clear it (aside from requirements of the interrupt controller).

LPASS_SAW_AVS_CTL (cont.)

Bits	Name	Description
25	MAX_INT_EN	Set to 1 to turn on AVS. interrupt for MAX_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be greater than MAX_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit.
24	MIN_INT_EN	Set to 1 to turn on AVS. interrupt for MIN_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be smaller than MIN_VLVL. CLEARING: SW may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit
23	RESERVED_2	Reserved
22:17	MAX_VLVL	Control maximum value of AVS. controller's VLVL. When current VLVL reaches this value it may not grow any larger. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level higher, an interrupt is issued. This value may be updated at anytime. Setting to a value lower than MIN_VLVL is not supported, and unpredictable results may occur.
16	RESERVED	Reserved
15:10	MIN_VLVL	Control the minimum value of AVS. controller's VLVL. When the current VLVL reaches this level it may not shrink any smaller. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level lower, an interrupt is issued. This value may be updated at anytime. Setting to a value higher than MAX_VLVL is not supported, and unpredictable results may occur.
9:0	AVS_DELAY	Control the time between AVS. controller's requests to change the VLVL

0x288B0008 LPASS_SAW_VCTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: NA

Security Treatment: Controlled by SAW_SECURE [SAW_CTL].

Though this register is read/writable, it also causes a command pulse to the PMIC FSM. Writing this register results in a transaction to the PMIC with SAW_VCTL being sent to the PMIC. SAW support both 8901 and 8058 regulator.

LPASS_SAW_VCTL

Bits	Name	Description
31:8	RESERVED	Reserved
7:0	PMIC_DATA	PMIC DATA sent to the PMIC Arbiter

0x288B000C LPASS_SAW_STS

Type: Read
Clock: SYS_REF_CLK
Reset State: NA

Security Treatment: Controlled by SAW_SECURE [SAW_CTL].

This read only register provides SW with SAW status.

LPASS_SAW_STS

Bits	Name	Description
31:27	SPM_STATE	State of the SPM FSM.
26	SW_WR_PEND	This bit reflects the VLVL state of the request from the SAW_VCTL write is pending.
25	CPU_UP	This bit reflects the VLVL state of the request from the CPU (avs_saw_up) to raise the VLVL.
24	CPU_DN	This bit reflects the VLVL state of the request from the CPU (avs_saw_down) to lower the VLVL.
23	MAX_INT	IRQ status bit, AVS. controller detected that raising the VLVL by AVS_CTL[VLVL_STEP] would result in a value greater than AVS_CTL[MAX_VLVL]. If AVS_CTL[IRQ_MAX_EN] is set, an interrupt is issued. NOTE that SW can set MAX_VLVL lower than current VLVL creating a condition where VLVL is higher than MAX_VLVL. The AVS. controller can not correct VLVL. However, this condition sets IRQ_MAX.
22	MIN_INT	IRQ status bit, AVS. controller detected that lowering the VLVL by SAW_AVS_CTL[VLVL_STEP] would result in a value less than SAW_AVS_CTL[MIN_VLVL]. If SAW_AVS_CTL[IRQ_MIN_EN] is set, an interrupt is issued. NOTE that SW can set MIN_VLVL higher than current VLVL creating a condition where VLVL is lower than MIN_VLVL. The AVS. controller can not correct VLVL. However, this condition sets IRQ_MIN.

LPASS_SAW_STS (cont.)

Bits	Name	Description
21:20	PMIC_STATE	State of the PMIC FSM: transitions back to IDLE) 0x0: IDLE (waiting for PMIC transaction from AVS. or SPM) 0x1: ACK (waiting for ACK from PMIC Arb) 0x2: DONE (waiting for DONE form PMIC Arb before)
19:18	AVS_STATE	State of the AVS. FSM: indication) transitions back to IDLE) 0x0: IDLE (waiting to be enabled or for next UP/DOWN) 0x1: REQ (waiting for DONE from PMIC Arb) 0x3: DELAY (waiting for delay count termination before)
17:10	CURR_PMIC_DATA	Last PMIC DATA sent to the PMIC Arbiter (and the PMIC).
9:0	CURR_DLY	VLVL value of the counter used to calculate the time until the next AVS. controller request for a new VLVL.

0x288B0010 LPASS_SAW_CFG

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW_SECURE [SAW_CTL].

The SAW_CFG register is used to configure the common control between AVS. and SPM.system.

LPASS_SAW_CFG

Bits	Name	Description
31:13	RESERVED_BITS31_13	Reserved
12	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON.
11:8	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port.
7:6	RESERVED_BITS7_6	Reserved
5	PMIC_MODE	PMIC Handshake 0x0: 8K_PMIC (only DONE signal) 0x1: 7K_PMIC (both ACK and DONE signals)

LPASS_SAW_CFG (cont.)

Bits	Name	Description
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period. ..... For sys_ref_clk = 20 MHz (53ns) The timer tick range 53 ns to 1.6us. 0x0: Timer Tick every sys_ref_clk 0x1F: Timer Tick every 128 sys_ref_clk.

0x288B0014 LPASS_SAW_SPM_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

The SAW_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

LPASS_SAW_SPM_CTL

Bits	Name	Description
31:8	RESERVED_BITS31_8	Reserved
7	NO_CLKEN2GATE	Disable SPM FSM ENBL_CLK to GATE_CLK state transition. This is set to 1 for ARM11 subsystem. 0x0: Allow SPM FSM ENBL_CLK to GATE_CLK state transition (SCSS and Q6SS) 0x1: Disable SPM FSM ENBL_CLK to GATE_CLK state transition (MSS)
6	PWR_RESTORE	Steps to restore VDD during bring up. 0x0: ONE_STEP (SAW_SPM_PMIC, one PMIC operation) 0x1: TWO_STEPS (SAW_SPM_PMIC then SAW_SPM_PMIC, two PMIC operation)
5	PWR_COLLAPSE	Steps to lower VDD during shutdown. 0x0: ONE_STEP (SAW_SPM_PMIC, one PMIC operation) 0x1: TWO_STEPS (SAW_SPM_PMIC then SAW_SPM_PMIC, two PMIC operation)
4	MEM_RET	Turn ON CLOCK and RESET immediately after power restore and before head/foot switch are CLOSE/ON. (Used by Q6 L2 array)
3	RPM_BYP	Bypass RPM Handshake 0x0: PERFORM RPM handshake 0x1: BYPASS RPM handshake (Also set for Halcyon for MPM handshake)

LPASS_SAW_SPM_CTL (cont.)

Bits	Name	Description
2:0	MODE	SPM Power Mode. The various low power sleep state are, 0x0: CLK GATE (clk gate only) 0x1: GDFS (clk gate, head/foot switch) 0x2: PWR DN (clk gate, head/foot switch, vdd min/collapse.) 0x3: RPM S/W DRIVEN (clk gate, RPM controls hsfs, vdd) 0x4: RESERVED_1 0x5: RESERVED_2 0x6: PWR DN 2 (Same as PWR DN for QDSP6 retention mode) 0x7: RESERVED_3

0x288B0018 LPASS_SAW_SPM_SLP_TMR_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

LPASS_SAW_SPM_SLP_TMR_DLY

Bits	Name	Description
31:24	PMIC_SLP	PMIC Sleep Delay. Controls the time between PMIC SLP operation and RPM shutdown request. The delay count is shifted left by 2. 8'h00: 0 timer tick 8'h01: 4 timer tick Time range: 53ns to 1.638ms
23:16	PMIC_MID	PMIC MID Delay. Controls the time between PMIC MID operation and preclamp head/foot switches are OPEN/OFF (low current state). The delay count is shifted left by 2. 8'h00: 0 8'h01: 4 Time range: 53ns to 1.638ms
15:12	HSFS_POST	Header Foot Switch Post Clamp Delay. Controls the time between postclamp head/foot switches are OPEN/OFF (low current state) and PMIC operation begins. Time range: 53ns to 25.6us
11:8	HSFS_PRE	Header Foot Switch Pre Clamp Delay. Controls the time between preclamp head/foot switches are OPEN/OFF (low current state) and clamp is asserted. Time range: 53ns to 25.6us
7:4	CLAMP	Clamp Delay. Controls the time between assertion of clamp and postclamp head/foot switches are OPEN/OFF (low current state). Time range: 53ns to 25.6us

LPASS_SAW_SPM_SLP_TMR_DLY (cont.)

Bits	Name	Description
3:0	CLK_GATE	Clock Gate Delay. Controls the time between clock gating and preclamp head/foot switches are OPEN/OFF (low current state). Time range: 53ns to 25.6us

0x288B001C LPASS_SAW_SPM_WAKE_TMR_DLY

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

This register provide the timer delay values for SPM FSM power up states. The formula for calculate the time delay is:

(SAW_CFG[CLK_DIV]+1) * delay field * sys_ref_clk_period

The sys_ref_clk is commonly connect to TCXO.

LPASS_SAW_SPM_WAKE_TMR_DLY

Bits	Name	Description
31:24	PMIC_WAKE	PMIC Wake Delay. Controls the time between PMIC WAKE operation and next bring up sequence. The delay count is shifted left by 2. 8'h00: 0 timer tick 8'h01: 4 timer tick Time range: 53ns to 1.638ms
23:16	PMIC_MID	PMIC MID Delay. Controls the time between PMIC MID operation and head/foot switches are CLOSE/ON. The delay count is shifted left by 2. 8'h00: 0 timer tick 8'h01: 4 timer tick Time range: 53ns to 1.638ms
15:12	CLAMP_HSFS	Clamp Head/Foot switch Delay. Control the time between clamp_hsfs is de-asserted and clocks are enabled. Time range: 53ns to 25.6us
11:8	HSFS	Header Foot Switch Delay. Controls the time between head/foot switches are CLOSE/ON (functional state) and clocks are enabled. Time range: 53ns to 25.6us
7:4	CLAMP	Clamp Delay. Controls the time between clamp is de-asserted and reset is de-asserted. Time range: 53ns to 25.6us

LPASS_SAW_SPM_WAKE_TMR_DLY (cont.)

Bits	Name	Description
3:0	CLK_EN	Clock Enable Delay. Controls the time between clock is enabled and clamp is de-asserted. Time range: 53ns to 25.6us

0x288B0020 LPASS_SAW_SPM_PMIC_CTL

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: NA

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

LPASS_SAW_SPM_PMIC_CTL

Bits	Name	Description
31:24	RESERVED_BITS31_24	Reserved
23:16	MID	VDD MID Value. This value is only used if SAW_SPM_CTL[PWR_RESTORE] or SAW_SPM_CTL[PWR_COLLAPSE] is set to 0x1. The VLVL should be in average of WAKE VLVL and SLP VLVL.
15:8	WAKE	Wake Up Value. The VLVL during wake (normal operation).
7:0	SLP	Sleep VDD Value. The VLVL during sleep

0x288B0024 LPASS_SAW_SLP_CLK_EN

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

The SAW_SLP_CLK_EN register is used to enable the clocks during sleep. The register width is defined by NUM_CLKEN parameter. The parameter values for subsystems are SCSS = 5, Q6SS = 1, MSS = 4.

LPASS_SAW_SLP_CLK_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	Reserved

LPASS_SAW_SLP_CLK_EN (cont.)

Bits	Name	Description
0	SLP_CLK_EN	Core clock gating enable during sleep. 0x0: clock ON during sleep 0x1: clock halted during sleep.

0x288B0028 LPASS_SAW_SLP_HSFS_PRECLMP_EN

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: NA

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

The SAW_SLP_HSFS_PRECLMP_EN register is used to enable the head/foot switch which needs to be assert before clamp during sleep. The register width is defined by NUM_HSFSPREC parameter.The parameter values for subsystems are SCSS = 3, Q6SS = 1, MSS = 1.

LPASS_SAW_SLP_HSFS_PRECLMP_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	Reserved
0	HSFS_PRE_EN	Header Footer Switch Pre Clamp Enable (unused). 0x0: ON/CLOSE during sleep 0x1: OFF/OPEN during sleep (low current state)

0x288B002C LPASS_SAW_SLP_HSFS_POSTCLMP_EN

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: NA

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

.The SAW_SLP_HSFS_POSTCLMP_EN register is used to enable the head/foot switch which needs to be assert after clamp during sleep. The register width is defined by NUM_HSFSPOSTC parameter. The parameter values for subsystems are SCSS = 1, Q6SS = 6, MSS = 1.

LPASS_SAW_SLP_HSFS_POSTCLMP_EN

Bits	Name	Description
31:6	RESERVED_BITS31_6	Reserved

LPASS_SAW_SLP_HSFS_POSTCLMP_EN (cont.)

Bits	Name	Description
5:0	HSFS_POST_EN	Header Footer Switch Post Clamp Enable. Used for memory sleep control bit 5 to qdsp6_arr_stby_n bit 4 to qdsp6_etb_slp_nret_n bit 3 to qdsp6_l2tag_slp_nret_n bit 2 to qdsp6_l1tcm_slp_nret_n bit 1 to qdsp6_slp_ret_n bit 0 to qdsp6_l2data_slp_nret_n 0x0: ON/CLOSE during sleep 0x1: OFF/OPEN during sleep (low current state)

0x288B0030 LPASS_SAW_SLP_CLMP_EN

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: NA

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

The SAW_SLP_CLMP_EN register is used to enable the clamps which needs to be assert during sleep. The register width is defined by NUM_CLMPEN parameter. The parameter values for subsystems are SCSS = 1, Q6SS = 1, MSS = 1.

LPASS_SAW_SLP_CLMP_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	Reserved
0	CLMP_EN	QDSP6 Core clamp Enable. 0x0: OFF during sleep 0x1: ON during sleep.

0x288B0034 LPASS_SAW_SLP_RST_EN

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: NA

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

The SAW_SLP_RST_EN register is used to enable the reset during sleep. The register width is defined by NUM_RSTEN parameter. The parameter values for subsystems are SCSS = 1, Q6SS = 1, MSS = 1.

LPASS_SAW_SLP_RST_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	Reserved
0	SLP_RST_EN	QDSP6 Core Reset Enable during sleep. When enabled, SPM resets QDSP6 core, isdb and etm during power up. In the special case of bit SAW_DBG of QDSP6SS_SLPC_CFG register is asserted, the reset from SPM propagates to QDSP6 core reset only. 0x0: OFF after power restore 0x1: ON after power restore.

0x288B0038 LPASS_SAW_SPM_MPM_CFG

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: 0x0000_0000

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

The SAW_SPM_MPM_CFG register is used to interface with 7K MPM for TCXO shutdown or power down vetoes.

LPASS_SAW_SPM_MPM_CFG

Bits	Name	Description
31:4	RESERVED_BITS31_4	Reserved
3	TCXO_SD_VOTE	TCXO shutdown vote enable 0x0: No 0x1: Yes.
2	VDD_DIG_MIN_VOTE	VDD_DIG power retention vote enable 0x0: No 0x1: Yes.
1	VDD_DIG_PD_VOTE	VDD_DIG power down vote enable. 0x0: No 0x1: Yes
0	EN	SPM - MPM interface Enable. **NOTE** Setting to 0 votes Yes for the 3 votes, assert SWFI and de-assert wakeup_req to MPM. 0x0: Disable 0x1: Enable

0x288B003C LPASS_SAW_SLP_CLMP_HSFS_EN

Type: Read/Write
Clock: SYS_REF_CLK
Reset State: NA

Security Treatment: Controlled by SAW_SECURE [PWR_CTL].

The SAW_SLP_CLMP_HSFS_EN register is used to enable the clamps which clamps the head/foot switch of the memory during sleep. The register width is defined by NUM_CLMPHSFSEN parameter. The parameter values for subsystems are SCSS = 1, Q6SS = 1, MSS = 1.

LPASS_SAW_SLP_CLMP_HSFS_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	Reserved
0:0	CLMP_HSFS_EN	Clamp Head/Foot switch Enable (Unused). 0x0: OFF during sleep 0x1: ON during sleep.

13 LPDDR Registers

13.1 Overview

Table 13-1 LPDDR Bases

Base Name	Parent	Address

13.2 EBI1 CH0 Registers (0x00A00000 EBI1_CH0_BASE)

This section contains the EBI1 CH0 registers.

The HSDDRx generation 5 memory controller core is an AXI r0p0+ slave that provides a high-performance, low-latency, 32-bit wide interface to LPDDR, LPDDR2, PCDDR2 or PCDDR3 memory.

This section describes the Configuration Status Registers which are available to software for configuring the HSDDRx memory controller core. The configuration registers in the core are organized into the following sub groups based on register functionality.

The access to configuration registers is performed via the AHB bus.

Table 13-2 HSDDRx Register Categories Grouped by Functionality

Function	Prefix	Address Bit (19:16)
Wrapper Configuration Registers	TOP	000x
AXI Performance Monitors	PMON_AXI	0010
DDR Performance Monitors	PMON_DDR	0011
AXI Configuration Registers	SLV	010x
MPU Configuration Registers	HSDDR_MPU	011x
DDRx Configuration Registers	DDR	10xx
LBST Configuration Registers	LBST	11xx

13.2.1 EBI1 Ch0 HSDDRx Registers

13.2.1.1 Top-Level Wrapper Registers

0x00A00004 EBI1_CH0_TOP_MISC_CNTL

Type: Read/Write
Clock: CLK_XO
Reset State: 0x0004A0A8

Top level Miscellaneous Control register.

13.2.1.3 AXI Slave Registers

0x00A40000 EBI1_CH0_SLV_CONFIG

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x80400003

AXI Slave Configuration Register.

This register defines the core interface configuration and memory controller clocking modes.

EBI1_CH0_SLV_CONFIG

Bits	Name	Description
31	CLKON_DISABLE	The slave logic's AXI CLKON signal will be de-asserted when the slave is idle and no data remains in the write data or command buffer. Additionally, AXI_AREADY and AXI_WREADY will be de-asserted when AXI CLKON is de-asserted. The AXI CLKON signal from the slave logic will be constantly driven to 1 and AXI_AREADY and AXI_WREADY will never be de-asserted due to de-asserting the AXI CLKON. 0x0: Disable 0x1: Enable
30:26	RESERVED_30_26	Reserved
25:16	CLKON_IDLE_TIMER	The number of AXI clock cycles that AXI CLKON will remain high after the slave is idle and the write data and command buffers are empty. 0x0: Reserved
15:14	RESERVED_15_14	Reserved
13:12	INTERLEAVE	Defines the way that bus system slave reconstructs the system address for MPU, error capture. 0x0: Disabled 0x1: Done at 1K Granularity 0x2: Done at 2K Granularity 0x3: Done at 4K Granularity
11:10	RESERVED_11_10	Reserved

EBI1_CH0_SLV_CONFIG (cont.)

Bits	Name	Description
9:8	CMD_ORDERING	Defines command reordering strategy (Based on the OOORD signal. OOOWT is not used since all buffered responses are returned immediately. Potentially lower power, higher average latency.) (All transactions from a particular master will be executed in time order. Reordering can occur between masters. Potentially more power, lower average latency.) (All transactions will be executed in time order, independent of the master association.) 0x0: reordering (default) 0x1: in-order per master 0x2: in-order globally 0x3: Reserved
7:3	RESERVED_7_3	RFU
2:0	CMD_Q_DEPTH	Defines number of outstanding requests that may be queued up for processing 0x0: 1 0x1: 2 0x2: 3 0x3: 4 0x4: 5 0x5: 6 0x6: 7 0x7: 8

0x00A40004 EBI1_CH0_SLV_RD_CONFIG

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x000B000F

Read Buffer Configuration Register

EBI1_CH0_SLV_RD_CONFIG

Bits	Name	Description
31:22	RESERVED_31_22	RFU
21:16	RD_CMD_FIFO_DEPTH	Sets the maximum number of read command FIFO entries that may be used at any time. The AXI slave will use at most RD_CMD_FIFO_DEPTH + 1 entires. For example setting this field to 0x0F allows all 16 entires of the buffer to be used.
15:6	RESERVED_15_6	RFU

EBI1_CH0_SLV_RD_CONFIG (cont.)

Bits	Name	Description
5:0	RD_DATA_FIFO_DEPTH	Sets the maximum number of 64 bit Read Buffer entries that may be used at any time. The Read Buffer will use at most RD_FIFO_DEPTH + 1 entires. For example setting this field to 0x3F allows all 64 entires of the buffer to be used. Must not be less than 0xF.

0x00A40008 EBI1_CH0_SLV_RD_STATUS

Type: Read
Clock: AXI_CLK
Reset State: 0x0000FF00

EBI1_CH0_SLV_RD_STATUS

Bits	Name	Description
31:28	RESERVED_31_28	RFU
27:24	RDQUAL_FIFO_ENTRIES_IN_USE	The number of read qualifier FIFO entries that have been reserved for use by reads commands sent to the DDR controller.
23:16	RDDATA_FIFO_ENTRIES_IN_USE	The number of read data FIFO entries that have been reserved for use by reads commands sent to the DDR controller.
15:8	RDDATA_FIFO_EMPTY	The empty status of each of the read data FIFOs. Bit 8 corresponds to the positive-edge dq[0] FIFO. Bit 9corresponds to the positive-edge dq[1] FIFO. Bit 10corresponds to the positive-edge dq[2] FIFO. Bit 11corresponds to the positive-edge dq[3] FIFO. Bit 12corresponds to the negative-edge dq[0] FIFO. Bit 13corresponds to the negative-edge dq[1] FIFO. Bit 14corresponds to the negative-edge dq[2] FIFO. Bit 15corresponds to the negative-edge dq[3] FIFO
7:1	RESERVED_7_1	RFU
0	DQS_ERROR	Set by the hardware if the read data FIFOs have been non-empty while no read commands where outstanding since reset. This bit being set is a strong indication of a spurious DQS edge.

0x00A4000C EBI1_CH0_SLV_WR_CONFIG

Type: Read/Write
Clock: AXI_CLK
Reset State: 0xD70F040F

Write Buffer Configuration Register

The write coalescing buffer is part of the write data path and cannot be completely disabled. However, all read merging and all write coalescing across bursts can be disabled via the SLV_WR_CONFIG register. Beats within narrow (each beat transfers less than the bus width) bursts may be coalesced in any configuration.

EBI1_CH0_SLV_WR_CONFIG

Bits	Name	Description
31	COALESCE_EN	Enable write coalescing. When enabled, data from separate AXI bursts will coalesced. Packing of narrow beats from a single burst is always allowed. 0x0: Disable 0x1: Enable
30	READ_MERGE_EN	Enable read merging with Write Coalescing buffer data. When disabled reads are not executed while the required data is in the write buffer. Also, the Write Buffer is flushed after each burst. 0x0: Disable 0x1: Enable
29	FLUSH	When set to 1, the hardware will flush the Write Coalescing Buffer. Hardware will clear this bit when the requested flush is complete.
28	EMPTY	1 when any valid data exists in the Write Coalescing Buffer. Read-only to software.
27	WRITE_BLOCK_READ	When set, no read command is allowed to execute while there is any write data in the buffer or there are any write commands in the write command buffer. When the Read Command Buffer is limited to one command, read merging is disabled and write coalescing is disabled and this bit is set, the DDR controller will execute commands in the order in which they were received on the AXI bus.
26:24	CMD_BUF_DEPTH	
23:21	RESERVED_23_21	RFU
20:16	FLUSH_UPPER_LIMIT	The flush high water mark. Flushing will begin when the number of valid lines in the Write Coalescing Buffer is greater than FLUSH_UPPER_LIMIT. FLUSH_UPPER_LIMIT must be less than or equal to the number of lines specified in WR_BUFFER_DEPTH. Also, FLUSH_UPPER_LIMIT must be greater than FLUSH_LOWER_LIMIT.
15:13	RESERVED_15_13	RFU
12:8	FLUSH_LOWER_LIMIT	The flush low water mark. Once flushing has begun, lines will be flushed until the number of valid lines is less than or equal to FLUSH_LOWER_LIMIT.
7:5	RESERVED_7_5	RFU
4:0	WR_BUFFER_DEPTH	Sets the maximum number of Write Coalescing Buffer lines that may be used at any time. The Write Coalescing Buffer will use at most WR_BUFFER_DEPTH + 1 entires. For example setting this field to 0xF allows 16 entires of the buffer to be used. Must not be less than 0x5.

0x00A40010 EBI1_CH0_SLV_FLUSH_CONFIG

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x8000800F

Write Buffer Flush Configuration Register

EBI1_CH0_SLV_FLUSH_CONFIG

Bits	Name	Description
31:30	FLUSH_PRIORITY	When the high water mark (see SLV_WR_CONFIG) has been reached, flush the lines with a priority of FLUSH_PRIORITY.
29	RESERVED_29	RFU
28	FLUSH_IN_ORDER	Write Coalescing Buffer lines are flushed in the order in which they were created
27:18	RESERVED_27_18	RFU
17:8	FLUSH_IDLE_DELAY	After the controller is idle for FLUSH_IDLE_DELAY AXI cycles, the Write Buffer will be flushed.
7:0	PAGE_HIT_WINDOW	If the last line was flushed less than PAGE_HIT_WINDOW AXI cycles ago, lines within the same page as the last victim are preferred. Otherwise, lines are flushed oldest to youngest.

0x00A40014 EBI1_CH0_SLV_ID_REVISION

Type: Read
Clock: AXI_CLK
Reset State: 0x00005310

Revision ID Register

This register contains the revision numbers of DDR controller core.

EBI1_CH0_SLV_ID_REVISION

Bits	Name	Description
31:16	RESERVED_31_16	
15:12	REV_MAJOR	Major Revision
11:8	REV_MINOR	Minor Revision
7:4	SITE_ID	Site ID 0x1: RTP
3:0	RESERVED_3_0	

0x00A40020+4*n EBI1_CH0_SLV_ADDR_BASE_CSn, n=[0..1]

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x00000000

System Base Address Register for n

This register defines the base address for the memory that associates to chip select n.

When using ADDR_MAP_MODE == 2'b10 (see SLV_ADDR_MAP_CSn), the base address must be the base address of the entire space allocated to the controller.

EBI1_CH0_SLV_ADDR_BASE_CSn

Bits	Name	Description
31:16	RESERVED_31_16	
15:8	BASE_ADDR	Defines the Base Address decode, in conjunction with the SLV_ADDR_MAP_CSn, to determine the address space of the targeted chip select. The Base Address is compared to the AXI address bus bits [31:24]. If the portions of the two addresses match, then the particular CS is accessed.
7:0	RESERVED_7_0	RFU

0x00A40030+4*n EBI1_CH0_SLV_ADDR_MAP_CSn, n=[0..1]

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x00000100

System Address Mapping Register for Rank n.

This register defines the way to map AXI system address into rank/bank/row/column address to memory devices. Once the number of bank, row size and column size are defined, the memory size of the associated rank is defined.

NOTE When ADDR_MAP_MODE is set to 2'b10 and the controller both ranks must be programmed identically with respect to the SLV_ADDR_BASE_CSn, SLV_ADDR_MAP_CSn and SLV_ADDR_SIZE_MASK_CSn registers.

EBI1_CH0_SLV_ADDR_MAP_CSn

Bits	Name	Description
31:16	RESERVED_31_16	

EBI1_CH0_SLV_ADDR_MAP_CSn (cont.)

Bits	Name	Description
15	RANK_EN	Rank has memory devices attached 0x0: Rank not present (default) 0x1: Rank is present
14	RESERVED_14	RFU
13:12	ADDR_MAP_MODE	Addressing Mode Configuration. Selects the Addressing Mode of the Rank and determines the mapping of the System Address to the Memory Address. Configuring the AddrMode for "Rank,Bank, Row, Column" mode will map the system address in manner that is compatible with the Partial Array Self-Refresh Mechanism. The Partial Array Self-Refresh Mechanism is not supported unless AddrMode is configured for "Rank,Bank,Row,Column" mode. Mapping mode 10 (Row, Bank, Rank, Column) requires that the memory device on each rank has the same row, bank and column width and that SLV_ADDR_BASE_CSn, SLV_ADDR_SIZE_MASK_CSn and SLV_ADDR_MAP_CSn are programmed identically for each rank. Those registers are programmed as normal, according to the device parameters. 0x0: Rank, Row, Bank, Column (default) 0x1: Rank, Bank, Row, Column 0x2: Row, Bank, Rank, Column 0x3: Reserved
11:9	RESERVED_11_9	RFU
8	NUM_BANK	Specifies the number of banks in the memory device. 0x0: 4 banks 0x1: 8 banks (default)
7:6	RESERVED_7_6	RFU
5:4	WIDTH_ROW	Specifies the number of bits used for the row address of the external memory 0x0: 12 bits (default) 0x1: 13 bits 0x2: 14 bits 0x3: 15 bits
3:2	RESERVED_3_2	RFU
1:0	WIDTH_COL	Specifies the number of bits used for the column address of the external memory 0x0: 8 bits (default) 0x1: 9 bits 0x2: 10 bits 0x3: 11 bits

0x00A40040+4*n EBI1_CH0_SLV_ADDR_SIZE_MASK_CSn, n=[0..1]

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x00000000

System Address Size Mask Register for Rank n

This register defines the memory capacity of memory that associates to chip select n.

EBI1_CH0_SLV_ADDR_SIZE_MASK_CSn

Bits	Name	Description
31:16	RESERVED_31_16	
15:8	ADDR_MASK	Define the address size mask bits: 0x0: reserved 0x80: 2GB 0xC0: 1GB 0xE0: 512MB 0xF0: 256MB 0xF8: 128MB 0xFC: 64MB 0xFE: 32MB 0xFF: 16MB

0x00A40050 EBI1_CH0_SLV_STALL

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x00000004

SMI/EBI1 Stall Request and Status Register.

This register provides a mechanism to stall the AXI traffic and drain the internal request queues for the memory controller.

EBI1_CH0_SLV_STALL

Bits	Name	Description
31:3	RESERVED_31_3	
2	AXI_IDLE	The value of the o_axi_idle pin. This is only an indication that all read, write and QoS responses have been sent. It does, by itself, guarantee that the controller has completed all transactions.

EBI1_CH0_SLV_STALL (cont.)

Bits	Name	Description
1	STALL_ACK	SMI/EBI1 Stall Request Status: (After a valid STALL_REQ is asserted, this bit will be set to 1'b1 when AXI interface is stalled and all internal memory commands are executed. No further read/write commands will be sent to memory.) 0x0: normal operation (default) 0x1: AXI stalled and cmd q empty
0	STALL_REQ	SMI/EBI1 Stall Request: (Setting this bit to 1'b1 will stall all AXI traffic. axi_aready and axi_wready will be de-asserted and all AXI requests will NOT be accepted. Previously accepted DDR memory requests will continued be serviced. Setting this bit to 1'b0 will make the controller accept the new AXI requests. This mechanism can be used whenever software needs to switch the voltage or clock frequency of the controller.) 0x0: normal operation (default) 0x1: stall AXI traffic

0x00A40100 EBI1_CH0_SLV_ERR_ADDR

Type: Read
Clock: AXI_CLK
Reset State: 0x00000000

Slave Error Address Register.

This register contains the address of the request that caused the decode or MPU error. The error address is locked with the first error address.

EBI1_CH0_SLV_ERR_ADDR

Bits	Name	Description
31:0	ERR_ADDR	The address of the request that caused the bus error

0x00A40108 EBI1_CH0_SLV_ERR_APACKET_0

Type: Read
Clock: AXI_CLK
Reset State: 0x0000

Slave Error Address Attributes Register 0.

This register provides various information about the request that caused the AXI bus error.

EBI1_CH0_SLV_ERR_APACKET_0

Bits	Name	Description
31:16	RESERVED_31_16	RFU
15:0	ERR_AMID	The master ID of the request that caused the bus error.

0x00A4010C EBI1_CH0_SLV_ERR_APACKET_1

Type: Read
Clock: AXI_CLK
Reset State: 0x00000000

Slave Error Address Attributes Register 1.

0x00A40114 EBI1_CH0_SLV_ERR_CNTL

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x00001000

Slave Error Code Register.

This register provides additional data about the bus error. Additionally, each slave which is capable of detecting an error is also required to have a single programmable register that can be used to optionally interrupt the processor core. This interrupt mechanism is required since write transfers may be posted on the bus and the AXI transfer may complete prior to the occurrence of the error in the AXI interconnect or slave device. The interrupt from the AXI interconnect and the AXI slave devices will be directed to the interrupt controller.

EBI1_CH0_SLV_ERR_CNTL

Bits	Name	Description
31:16	RESERVED_31_16	
15:13	RESERVED_15_13	
12	IRQ_EN	Mask off the bus error interrupt to processor 0x0: disables IRQ 0x1: enables IRQ (default)
11:9	RESERVED_11_9	
8	CLEAR_ERR	Clear error status bit Writing a '1' to this bit will clear the ERR_OCCURRED bit in this register. It will NOT clear other error registers. 0x0: no clear (default) 0x1: clear
7:5	RESERVED_7_5	
4	ERR_OCCURRED	Error Status bit to indicate that an error has occurred. This bit can be set by software. To clear this bit a '1' must be written to the CLEAR_ERR field. Writing a '0' to this field has no effect. 0x0: no error occurred 0x1: error occurred
3:2	RESERVED_3_2	
1:0	ERR_CODE	MPU error and address decode error: Writes to this field are ignored. 0x0: no error (default) 0x1: address decode error 0x2: mpu error 0x3: both

0x00A40200 EBI1_CH0_SLV_PMON_CFG_ACHAN

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x00000000

AXI Slave Performance Monitors

Table 13-3 AXI Performance Monitor event index

Index	Description
0	AXI cycles
1	AXI address channel commands accepted
2	AXI address channel commands matching the attribute in SLV_PMON_CFG_ACHAN
3	High priority AXI address channel commands accepted
4	Number of AXI cycles in which the number of reserved global monitors is greater than or equal to SLV_PMON_CFG_0[N_MONITORS]
5	Number of AXI cycles in which the number of read commands in the read command buffer is greater than or equal to SLV_PMON_CFG_0[N_RD_CMDS]
6	Number of AXI cycles in which the number of write commands in the write command buffer is greater than or equal to SLV_PMON_CFG_0[N_WR_CMDS]
7	Number of AXI cycles in which the number of reserved read data FIFO entires is greater than or equal to SLV_PMON_CFG_0[N_RD_DATA_ENTRIES]
8	Number of AXI cycles in which the number of reserved read qualifier FIFO entires is greater than or equal to SLV_PMON_CFG_0[N_RD_QUAL_ENTRIES]
9	Number of AXI cycles in which the number of valid write data buffer lines is greater than or equal to SLV_PMON_CFG_0[N_WR_DATA]
10	The number of read commands that fully or partially hit in the write buffer
11	The number of write commands that fully or partially hit in the write buffer
12	TBD - Hazards

AXI Performance Monitor event index 2 records the number of address channel requests that match the following fields. The fields can be independently enabled/disabled with the MATCH_* fields in SLV_PMON_CFG_0. When an address channel request is accepted from the bus its attributes are compared to the fields of this register. If all enabled fields in SLV_PMON_CFG_ACHAN (see SLV_PMON_CFG_0) match the address channel request, the performance monitor is incremented. Any disabled fields match all transactions.

EBI1_CH0_SLV_PMON_CFG_ACHAN

Bits	Name	Description
31:16	AMID	AMID field of transactions to be counted with performance monitor index 2.
15:13	RESERVED_15_13	RFU
12:8	ATID	ATID field of transactions to be counted with performance monitor index 2.

EBI1_CH0_SLV_PMON_CFG_ACHAN (cont.)

Bits	Name	Description
7	RESERVED_7	RFU
6:4	ASIZE	ASIZE field of transactions to be counted with performance monitor index 2.
3:0	ALEN	ALEN field of transactions to be counted with performance monitor index 2.

0x00A40204 EBI1_CH0_SLV_PMON_CFG_0

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x00000000

EBI1_CH0_SLV_PMON_CFG_0

Bits	Name	Description
31	MATCH_AMID	Enable AMID matching for event index 2. When disabled, all AMIDs are considered a match.
30	MATCH_ATID	Enable ATID matching for event index 2. When disabled, all ATIDs are considered a match.
29	MATCH_ASIZE	Enable ASIZE matching for event index 2. When disabled, all ASIZEs are considered a match.
28	MATCH_ALEN	Enable ALEN matching for event index 2. When disabled, all ALENs are considered a match.
27:23	N_WR_DATA	See Table 1-3.
22:19	N_WR_CMDS	See Table 1-3.
18:14	N_RD_QUAL_ENTRIES	See Table 1-3.
13:7	N_RD_DATA_ENTRIES	See Table 1-3.
6:3	N_RD_CMDS	See Table 1-3.
2:0	N_MONITORS	See Table 1-3.

0x00A40208 EBI1_CH0_SLV_TEST_CONFIG

EBI1_CH0_SLV_TEST_CONFIG

Bits	Name	Description
31:8	RESERVED_31_8	RFU
7:4	SELECT	Selects the AXI slave internal signal to drive out on the AXI test bus. All other values will result in undefined behavior. 0x0: test_bus_0 0x1: test_bus_1 0x2: test_bus_2 0x3: test_bus_3 0x4: test_bus_4 0x5: test_bus_5 0x6: test_bus_6
3:1	RESERVED_3_1	RFU
0	ENABLE	Enable the slave's test bus.

13.2.1.4 MPU Configuration Registers

0x00A60000+ 4*n EBI1_CH0_MPU_PRTn_RACR, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU. These registers include a single bit per VMID granting read access

EBI1_CH0_MPU_PRTn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x00A60400+ 4*n EBI1_CH0_MPU_PRTn_WACR, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU.

EBI1_CH0_MPU_PRTn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x00A60800+4*n EBI1_CH0_MPU_PRTn_START, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition Start Address Register. This register contains the start address of the partition. Only the bit numbers indicated by MPU_IDR[MSb] through MPU_IDR[LSb] are valid and physically exist.

EBI1_CH0_MPU_PRTn_START

Bits	Name	Description
31:12	ADDR	MPU Partition Start Address
11:0	RESERVED_11_0	Reserved

0x00A60C00+4*n EBI1_CH0_MPU_PRTn_END, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition End Address Register. This register contains the start address of the partition.Only the bit numbers indicated by MPU_IDR[MSB] through MPU_IDR[LSB] are valid and physically exist.

EBI1_CH0_MPU_PRTn_END

Bits	Name	Description
31:12	ADDR	MPU Partition End Address
11:0	RESERVED_11_0	Reserved

0x00A60F80 EBI1_CH0_MPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Configuration Register: This register includes fields governing various MPU behaviors.

EBI1_CH0_MPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set MPU_ESR. MPU_EAR and MPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set MPU_ESR. MPU_EAR and MPU_ESYNR0 updated with address and syndrome of error.
2	MPUEIE	MPU Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the MPU. Interrupt output is asserted if MPU_CR[MPUEIE] = 1 and any bit is set in MPU_ESR.
1	MPUERE	MPU Error Report Enable. MPUERE = 0 causes the MPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. MPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective MPU port. Errors from either port are terminated by the MPU as RAZ/WI Both client and configuration port errors are recorded in MPU_ESR, independent of the value of MPU_CR[MPUERE]
0	MPUE	MPU Enable. Governs whether MPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures MPU and the MID to VMID mapping tables.

0x00A60F84 EBI1_CH0_MPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the MPU, for both the client port and the configuration port.

EBI1_CH0_MPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x00A60F88 EBI1_CH0_MPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the MPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the MPU's interrupt output (when enabled by MPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the MPU_ESYNRn registers, which are merely the "syndrome" of an error indicated by MPU_ESR.

EBI1_CH0_MPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x00A60F8C EBI1_CH0_MPU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Restore Register. This register is an aliased address for the MPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

EBI1_CH0_MPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x00A60F90 EBI1_CH0_MPU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

EBI1_CH0_MPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x00A60F94 EBI1_CH0_MPU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

EBI1_CH0_MPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x00A60FF4 EBI1_CH0_MPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

MPU Revision Register: This register provides major/minor revision codes for the implementation.

EBI1_CH0_MPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x00A60FF8 EBI1_CH0_MPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x1F0C2C0F

MPU ID Register: Read-only register that defines various configuration attributes of the MPU instance.

EBI1_CH0_MPU_IDR

Bits	Name	Description
31:29	RESERVED31_29	Reserved
28:24	MSB	Indicates most significant address bit number used in START/END address comparisons.
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used in START/END address comparisons.
15:14	RESERVED15_12	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only MPU_PRTn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate MPU_PRTn_RACR and MPU_PRTn_WACR registers govern read vs. write access. For single VMID, MPU_PRTn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields

EBI1_CH0_MPU_IDR (cont.)

Bits	Name	Description
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. MPU_PRTn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMD type access control. MPU_PRTn_xACR registers include separate bit per VMID (32 bits) for governing access.
9:8	RESERVED9_8	Reserved
7:0	NPRT	Number of partitions. Indicates the number of partitions (minus 1) supported by the MPU. Values range from 0-223 (1-224 partitions)

0x00A60FFC EBI1_CH0_MPU_MPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

MPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the MPU (including the MPU_MPU_ACR itself).

EBI1_CH0_MPU_MPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the MPU's 4KB address region (including the MPU_MPU_ACR itself). For single VMID type MPUs (MPU_IDR[MV] = 0) the MPU_MPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

13.2.1.5 DDR Configuration Registers

0x00A80000 EBI1_CH0_DDR_DEVICE_CONFIG

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Memory Configuration Register.

The register is used to set up DRAM configuration in the DDR controller.

EBI1_CH0_DDR_DEVICE_CONFIG

Bits	Name	Description
31:28	RESERVED_31_28	
27:26	DEVICE_CONFIG_RANK1	SW: RW, HW: R Device Configuration for Rank 1. This is required for SRR in order to update the refresh rate correctly if multiple devices are involved. 0x0: reserved (default) 0x1: x8,x8,x8,x8 0x2: x16, x16 0x3: x32
25:24	DEVICE_CONFIG_RANK0	SW: RW, HW: R Device Configuration for Rank 0. This is required for SRR in order to update the refresh rate correctly if multiple devices are involved. 0x0: reserved (default) 0x1: x8,x8,x8,x8 0x2: x16, x16 0x3: x32
23:18	RESERVED_23_18	
17	INIT_DONE_RANK1	SW: RW, HW: R DDR Software initialization Complete SW writes this bit after initialization is complete for rank 1. 0x0: init incomplete (default) 0x1: init complete
16	INIT_DONE_RANK0	SW: RW, HW: R DDR Software initialization Complete SW writes this bit after initialization is complete for rank 0. 0x0: init incomplete (default) 0x1: init complete
15:14	NUM_BANKS	SW: RW, HW: R Indicates number of banks of the SDRAM device. Typically, LPDDR1 devices are 4 bank only, LPDDR2 & PCDDR2 devices can be 4 or 8 bank while PCDDR3 devices are 8 bank only. 0x0: 4 (default) 0x1: 8 0x2: Reserved_1 0x3: Reserved_2
13:12	RESERVED_13_12	

EBI1_CH0_DDR_DEVICE_CONFIG (cont.)

Bits	Name	Description
11:10	CLK_SYNC_MODE	SW: R, HW: RW DDR clocked programmed by SW. Read Only. 0x0: Asynchronous (default) 0x1: Synchronous 0x2: Iso Synchronous 0x3: Reserved
9:7	DEVICE_TYPE	SW: RW, HW: None Specify DRAM Device Type. 0x0: LPDDR (default) 0x1: LPDDR2-S2 0x2: LPDDR2-S4 0x3: PCDDR2 0x4: PCDDR3 0x5: Reserved_1 0x6: Reserved_2 0x7: Reserved_3
6	RESERVED_6	
5	MEM_CLK_CONFIG	SW: RW, HW: R Rank Clock Configuration: Note that the initialization of the individual memory ranks is otherwise unchanged when using this feature. 0x0: CK0 drives both Rank 0 and 1 (default) 0x1: CK0 for Rank0 and CK1 for Rank1
4	DDR_COMMAND_BUS	SW: RW, HW: R Specify if DDR needs to be used on the command bus (in addition to the data bus). This needs to be enabled LPDDR2 SDRAM devices & disabled for others. 0x0: Disable (default) 0x1: Enable
3:2	RESERVED_3_2	
1	RANK1_EN	SW: RW, HW: R Rank 1 is present 0x0: Rank not present (default) 0x1: Rank is present
0	RANK0_EN	SW: RW, HW: R Rank 0 is present. 0x0: Rank not present (default) 0x1: Rank is present

0x00A80004 EBI1_CH0_DDR_DEVICE_STATUS

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Device Status Register

This register enables software to read memory device status.

EBI1_CH0_DDR_DEVICE_STATUS

Bits	Name	Description
31:18	RESERVED_31_18	
17	INTERRUPT_EN	SW: RW, HW: R Interrupt will be generated if temperature out-of-range is detected i.e RANK0/1_TEMP_OO_RANGE is set. The interrupt will be set (sticky behavior) until SW can clear it by clearing the RANK0/1_TEMP_OO_RANGE field. The temperature out of range is due to SRR which is a feature only available in LPDDR1/LPDDR2 devices. 0x0: Disable (default) 0x1: Enable
16	CURR_SEL_REG_FREQ_SWITCH	SW: R, HW: W Indicates which DDR timing register set is being currently used. If DDR_CMD_EXEC_OPT_2[UPDATE_MEM_LATENCY_ON_FREQ_SWITCH] is set, then certain CSR fields in DDR_DRAM_TIMING_6 and DDR_CMD_EXEC_OPT_3 are also shadowed. 0x0: DDR_DRAM_TIMING CSRs (default) 0x1: DDR_DRAM_TIMING_ALT CSRs
15:14	RESERVED_15_14	
13	IN_DEEP_POWER_DOWN_RANK1	SW: R, HW: W Indicates the rank 1 is currently in deep power down mode. Deep power down feature is only available in LPDDR1/LPDDR2 devices. 0x0: Not in deep power down (default) 0x1: in deep power down
12	IN_DEEP_POWER_DOWN_RANK0	SW: R, HW: W Indicates the rank 0 is currently in deep power down mode. Deep power down feature is only available in LPDDR1/LPDDR2 devices. 0x0: Not in deep power down (default) 0x1: in deep power down
11:10	RESERVED_11_10	
9	IN_SELF_RFSH_RANK1	SW: R, HW: W Indicates the rank 1 is currently in self-refresh mode 0x0: Not in self-refresh (default) 0x1: in self-refresh

EBI1_CH0_DDR_DEVICE_STATUS (cont.)

Bits	Name	Description
8	IN_SELF_RFSH_RANK0	SW: R, HW: W Indicates the rank 0 is currently in self-refresh mode 0x0: Not in self-refresh (default) 0x1: in self-refresh
7:6	RESERVED_7_6	
5	RANK1_TEMP_OO_RANGE	SW: RW, HW: W Indicates any out-of-range operating temperature for Rank1 This bit is set to '1' if the SRR read returns a temperature reading that is out of range on the high side. This bit is sticky and can only be cleared by software write. The temperature out of range is due to SRR which is a feature only available in LPDDR1/LPDDR2 devices. 0x0: Within range (default) 0x1: Out of range
4	RANK0_TEMP_OO_RANGE	SW: RW, HW: W Indicates any out-of-range operating temperature for Rank0 This bit is set to '1' if the SRR read returns a temperature reading that is out of range on the high side. This bit is sticky and can only be cleared by software write. The temperature out of range is due to SRR which is a feature only available in LPDDR1/LPDDR2 devices. 0x0: Within range (default) 0x1: Out of range
3:2	RESERVED_3_2	
1	RANK1_IDLE	SW: R, HW: W Rank1 Idle Status. If set, it indicates that there are no transactions to that rank and also indicates that the timing parameters have been satisfied such that if the pages are open, they could be closed. 0x0: Rank Busy (default) 0x1: Rank Idle
0	RANK0_IDLE	SW: R, HW: W Rank0 Idle Status. If set, it indicates that there are no transactions to that rank and also indicates that the timing parametes have been satisfied such that if the pages are open, they could be closed. 0x0: Rank Busy (default) 0x1: Rank Idle

0x00A80010 EBI1_CH0_DDR_MANUAL_CMD

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Manual Command Register

This register enables the software to manually issue commands to DDR SDRAM interface. A value of '1' should be written in the bit field of the command that the software wants to force the controller to perform. (This includes the MRR and MRW bits of the DDR_MR_CNTL_WDATA CSR) Only one bit should be active at any given time, except for the "external clock on", the "reset_n" bit and the "CKE" bit. When the controller has finished executing the command, it will clear the bit (including the MRR, MRW and the RD_DQCAL bits of the DDR_MR_CNTL_WDATA CSR), except for the external clock on bit, the "CKE" bit and the "reset_n" bits. It is the software's responsibility to ensure all timing parameters are satisfied before executing the next manual command before the rank is initialized. Once the rank is initialized, it is HW's responsibility to execute the command when possible. The AUTO_REFRESH and PRECHARGE_ALL commands are not to be used after the rank has been initialized.

Once these bits are set, HW can potentially delay executing the command in order to ensure that the memory timings have been satisfied. (This statement is only applicable after the rank is initialized)

The initialization sequence of the SDRAM device is executed by SW via this register and the DDR_MR_CNTL_WDATA CSR.

EBI1_CH0_DDR_MANUAL_CMD

Bits	Name	Description
31:18	RESERVED_31_18	
17:16	RANK_SEL	SW: RW, HW: R Select which chip select should be targeted for the chosen manual command to be executed. 0x0: Invalid (default) 0x1: CS0 only 0x2: CS1 only 0x3: both CS0 CS1
15	RESERVED_15	
14	CK_ON	SW: RW, HW: R Turns on/off external clock CK, CKN. This bit does not reset automatically. Software must turn it on when the clock to the device needs to be enabled and keep it on.Unitl the rank is initialized, HW would control the clocks based on this setting. 0x0: Off (default) 0x1: On
13	CKE	SW: RW, HW: R Turns on/off clock enable CKE. This bit does not reset automatically. Software must turn it on when the clock to the device needs to be enabled and keep it on.Unitl the rank is initialized, HW would control the CKE based on this setting. 0x0: Off (default) 0x1: On

EBI1_CH0_DDR_MANUAL_CMD (cont.)

Bits	Name	Description
12	RESET_N	SW: RW, HW: R Turns on/off reset pin to PCDDR3 device only. This bit does not reset automatically. Software must turn it on, then turn it off 0x0: Active (default) 0x1: Inactive
11:7	RESERVED_11_7	
6	ENTER_DEEP_PD	SW: RW, HW: R Issue Deep Power Down. This bit is self-cleared once the command is executed. Deep Power down feature is only available on LPDDR1 and LPDDR2 SDRAM devices. HW will check to ensure all commands outstanding to the rank have completed before issuing the DPD command. 0x0: no-op (default) 0x1: Issue DPD
5	EXIT_DEEP_PD	SW: RW, HW: R Issue Exit Deep Power Down. This bit is self-cleared once the command is executed. Deep Power down feature is only available on LPDDR1 and LPDDR2 SDRAM devices. When exiting Deep Power Down for a given Rank, it is required to re-initialize the LPDDR1 SDRAM devices by repeating the initialization sequence for the associated Rank before that memory can be utilized or accessed. As such, it is necessary to clear the initialization complete state of the associated Rank by setting DDR_DEVICE_CONFIG[15/14] to 1'b0 before exiting Deep Power Down. It is SW's responsibility to ensure that the minimum duration of DPD is met. Additionally SW needs to ensure that the clocks are stable before exiting DPD. 0x0: no-op (default) 0x1: Issue DPD exit
4	ZQ_CAL_SHORT	SW: RW, HW: RW Issue Short ZQ-Cal Command. This bit is self-cleared once the command is executed. This only applies to PCDDR3 devices. For LPDDR2, use the DDR_MR_CNTL_WDATA CSR. 0x0: no-op (default) 0x1: Issue ZQ-Cal
3	ZQ_CAL_LONG	SW: RW, HW: RW Issue Long ZQ-Cal Command. This bit is self-cleared once the command is executed. This only applies to PCDDR3 devices. For LPDDR2, use the DDR_MR_CNTL_WDATA CSR. 0x0: no-op (default) 0x1: Issue ZQ-Cal

EBI1_CH0_DDR_MANUAL_CMD (cont.)

Bits	Name	Description
2	AUTO_REFRESH	SW: RW, HW: RW Auto-Refresh Command. This can only be set when the rank has not been initialized. This bit is self-cleared once the command is executed. 0x0: no-op (default) 0x1: execute
1	PRECHARGE_ALL	SW: RW, HW: RW Precharge All Command. This can only be set when the rank has not been initialized. This bit is self-cleared once the command is executed. 0x0: no-op (default) 0x1: execute
0	SR_READ	SW: RW, HW: RW Status Register Read Command for LPDDR1. SRR feature is only supported by LPDDR1 and LPDDR2 SDRAM devices. This bit is self-cleared once the command is executed and SR data is captured. The SR data for LPDDR1 is captured in DDR_MR_RDDATA_RANK0/1. A manual SRR command to LPDDR2 devices can be initiated by using the DDR_MR_CNTL_WDATA CSR. 0x0: no-op (default) 0x1: execute

DDR Mode Register Access Control Register

This register is used whenever SW needs to access the DRAM Mode Register. It is used in device initialization for programming the memory device's mode registers. Once the SDRAM device is initialized, it is used for issuing MRW commands to LPDDR1/LPDDR2/PCDDR2/PCDDR3. and MRR commands (manual SRR, manual ZQ commands) for LPDDR2.

EBI1_CH0_DDR_MR_CNTL_WDATA

Bits	Name	Description
31:24	MR_ADDR	SW: RW, HW: R Specify which mode register to access. Note that LPDDR2 supports up to 256 Mode registers. Hence the programmed MR_ADDR needs to be valid based on the specific SDRAM device. 0000_0000 : MR (Mode Register or SR for LPDDR1) 0000_0001 : EMR1 (Extended Mode Register 1) 0000_0010 : EMR2 (Extended Mode Register 2) 0000_0011 : EMR2 (Extended Mode Register 3) .....
23	RESERVED_23	
22	RD_DQCAL	SW: W, HW: RW DQ Calibration command. This is only supported for LPDDR2 & PCDDR3 devices. This is used for read training and/or rank auto detect. A pre-defined read pattern is sent out by the DRAM and captured by the controller. In case of LPDDR2, this is an MRR command with MR_ADDR specified above (valid MR_ADDR is 0x32 & 0x40). In case of PCDDR3 devices, this is an MPR Read command and hence MR_ADDR field is a don't care. The status of the DQ Calibration command is recorded in DDR_DQCAL_STATUS_RANK0/1 and in DDR_DQCAL_RDATA_RANK0/1. This bit is cleared by HW once the command is executed. 0x0: do not execute (default) 0x1: execute
21:20	RD_DQCAL_EXP_PATTERN	SW: RW, HW: R This is the read data pattern from the memory device. The values "00" and "01" are applicable only for LPDDR2 devices (memory burst length of 4), whereas the value "10" is applicable only for PCDDR3 devices (memory burst length of 8). 0x0: Pattern_1010 0x1: Pattern_0011 0x2: Pattern_01010101
19:18	MR_RANK_SEL	SW: RW, HW: R Specify DRAM rank to which the command goes. After the SDRAM device has been initialized, a value of "11" is considered illegal. 0x0: Invalid (default) 0x1: Rank 0 only 0x2: Rank 1 only 0x3: Both ranks 0 and 1

EBI1_CH0_DDR_MR_CNTL_WDATA (cont.)

Bits	Name	Description
17	MRR	SW: W, HW: RW Read Mode Register from LPDDR2 SDRAM. This bit is cleared by HW once the command is executed. MRR commands are only supported by LPDDR2 SDRAM devices and the read data is available in DDR_MR_RDATA_RANK0/1 after the command completes. 0x0: do not execute (default) 0x1: execute
16	MRW	SW: W, HW: RW Writes the Mode Register to the SDRAM. This bit is cleared by HW once the command is executed. 0x0: do not execute (default) 0x1: execute
15:0	MR_WDATA	SW: RW, HW: R Data for Mode Register Writes. SW needs to program the mode register based on the specific SDRAM device as the mapping of the 16-bits is different for different SDRAM device types.

DDR Command Execution Optimization Register 0.

This register is used to define the page management mode, command starvation of the DDR module. Additionally it also controls the enabling of the clockstop/powerdown features of the SDRAM device.

EBI1_CH0_DDR_CMD_EXEC_OPT_0

Bits	Name	Description
31:28	RESERVED_31_28	

EBI1_CH0_DDR_CMD_EXEC_OPT_0 (cont.)

Bits	Name	Description
27:16	PAGE_OPEN_TIMER	SW: RW, HW: R This field is only applicable if the page management policy/mode field is set to "timer-based". In this mode, a down counter based on DDR1x clock is started when the page is opened and the counter enabled only when the page is idle and has no pending runnable HITS. The value indicated by this field determines how long to wait for a potential runnable HIT to come along. When a runnable HIT appears while it is counting down, the counter gets reloaded to the initial value. 12'h000: Reserved 12'h001: Reserved 12'h002: Reserved 12'h003: MIN_CC (3 cycles) (default)
15	PAGE_MGMT_POLICY	SW: RW, HW: R Control how HW manages DRAM pages. 0x0: Keep Page Open (Keep Page Open unless forced to close it. e.g. forced to close because of a refresh, different page to open in the same bank if command causing a conflict has a priority greater than the highest priority of a pending HIT*, tRASmax timer expiry) 0x1: Timer Based (An additional reason to close the page would be if the "page_open_timer" expires)
14:7	RDCMD_STARVATION_TIMER	SW: RW, HW: R This specifies the number of ddr1x cycles since a read command became runnable. Once the down timer expires and the read command hasn't been executed, it gets elevated to a higher priority within the command's original priority level. 0000_0000: Disable (default) 0000_0001: RESERVED 0000_0010: MIN_CC (2 cycles)
6	WR_RD_PREF	SW: RW, HW: R Indicates the Column Command Selection Preference. For example, if set to '0', the column logic will give preference to selecting Read hits Vs. Write hits given they are of equal priority. 0x0: Prefer Reads (default) 0x1: Prefer Writes
5	DDR_CK_ALWAYS_ON_DBG_MODE	SW: RW, HW: R Debug mode wherein the clock to the memory device is always on. This is a debug mode as most of the chip configurations run in shared clock mode. If this debug mode is enabled, then SW needs to ensure that there are no IOCAL requests sent to the DDR controller for calibrating the clock pad. 0x0: Disabled (default) 0x1: Enable

EBI1_CH0_DDR_CMD_EXEC_OPT_0 (cont.)

Bits	Name	Description
4	CONCURRENT_SELF_REFRESH_EN	SW: RW, HW: R This only applies to multi-rank configurations. When set, this causes self refresh to be always entered/exited together for both ranks. This is specifically required to be set for ODT say for example, when DDR_CMD_EXEC_OPT_3[RANK0_ODT_ON_RD_RANK1] or DDR_CMD_EXEC_OPT_3[RANK1_ODT_ON_RD_RANK0] are set or in write scenarios wherein DDR_CMD_EXEC_OPT_3[EN_ODT_SWITCH_RANK_UNAVAIL] isn't used. It is to be noted that in this mode, SW will not have independent rank control for self refresh using DDR_CMD_EXEC_OPT_1[SELF_REFRESH_RANK1/0]. SW can set both bits and both the ranks will enter self refresh together when they can. 0x0: Disabled (default) 0x1: Enabled
3	SEL_REG_FREQ_SWITCH	SW: RW, HW: RW Not Supported. Switch the currently used timing register set to the other set (current set is determined via ddr_device_status[curr_sel_reg_freq_switch]). SW needs to guarantee that this bit is written only when HW is in self refresh mode. Additionally, SW should not write this bit if SW initiated HW sequence for clock switching is in progress. This bit is self-cleared once the command is executed. 0x0: no-op (default) 0x1: execute switch
2	PWR_DOWN_EN	SW: RW, HW: R Enable Power Down mode for the memory device. Power down is supported by LPDDR1/2 and PCDDR2/3 devices. **NOTE** HW will enter clockstop and powerdown irrespective of the enable setting if HW frequency switch using clockstop and powerdown request is received. 0x0: Disabled (default) 0x1: Enabled
1	CLK_STOP_EN	SW: RW, HW: R Enable Clock Stop mode for the memory device. This needs to be set depending on the SDRAM device present. For LPDDR1, this can be enabled, but for PCDDR2/3 & LPDDR2 devices, this must be disabled. **NOTE** HW will enter clockstop and powerdown irrespective of the enable setting if HW frequency switch using clockstop and powerdown request is received. 0x0: Disabled (default) 0x1: Enabled

EBI1_CH0_DDR_CMD_EXEC_OPT_0 (cont.)

Bits	Name	Description
0	CLK_STOP_DURING_PWR_DOWN_EN	SW: RW, HW: R Clock can be stopped to the memory device ONLY during Power Down. This can be enabled for LPDDR2, but must be disabled for PCDDR devices. Note that only CLK_STOP_EN field or this field can be set. LPDDR1 devices should utilize the CLK_STOP_EN setting rather than this setting. **NOTE** HW will enter clockstop and powerdown irrespective of the enable setting if HW frequency switch using clockstop and powerdown request is received. 0x0: Disabled (default) 0x1: Enabled

27	SELF_REFRESH_RANK1	SW: RW, HW: R Enter/Exit Self-Refresh. This bit does not reset automatically. Software must turn it on, then turn it off 0x0: exit (default) 0x1: enter
26	SELF_REFRESH_RANK0	SW: RW, HW: R Enter/Exit Self-Refresh. This bit does not reset automatically. Software must turn it on, then turn it off 0x0: exit (default) 0x1: enter
25:22	RESERVED_25_22	

EBI1_CH0_DDR_CMD_EXEC_OPT_1 (cont.)

Bits	Name	Description
21:12	RANK_IDLE_TIMER	SW: RW, HW: R Counts the number of XO clock cycles wherein the rank(s) is idle. Once expired, this will cause the rank to be in precharge state. This is an useful feature to enable especially if DDR_CMD_EXEC_OPT_0[PAGE_MGMT_POLICY] is set to "Keep Pages Open". 00_0000_0000: Disabled (default) 00_0000_0001: Reserved 00_0000_0010: Reserved
11:8	RUN_AT LEAST_ONE_TRANS_RD_CONFLICT	SW: RW, HW: R This is a vector sized to the number of priority levels (4). It the bit position corresponding to a priority level is set, then it indicates that a read conflict of that priority level can cause a page to close (if the conflict priority level is greater than the priority level of a pending HIT to the open page) only if at least one transaction has been run to an open page. 0xF: run_at least_one (default)
7:4	RUN_AT LEAST_ONE_TRANS_WR_CONFLICT	SW: RW, HW: R This is a vector sized to the number of priority levels (4). It the bit position corresponding to a priority level is set, then it indicates that a write conflict of that priority level can cause a page to close (if the conflict priority level is greater than the priority level of a pending HIT to the open page) only if at least one transaction has been run to an open page. 0xF: run_at least_one (default)
3	ENABLE_DDR2X_CLKON_DURING_CSPD	SW: RW, HW: R By default, the 2X clock will only be turned off only when both ranks are in self refresh and memory clock is no longer needed. This switch enables also turning off the 2X clock during clockstop and powerdown (this from memory perspective only applies to LPDDR1/LPDDR2 devices). 0x0: Disabled (default) 0x1: Enabled
2	ENABLE_POWER_OPT_AUTO_SRR_ZQ	SW: RW, HW: R When enabled, the design will not wakeup the memory device from self refresh (if in self refresh) just because of an auto SRR or an auto ZQCAL is needed. Instead it will promote the auto ZQCAL required to be a long zqcal if a normal auto ZQ was missed. 0x0: Disabled (default) 0x1: Enabled

EBI1_CH0_DDR_CMD_EXEC_OPT_1 (cont.)

Bits	Name	Description
1	ENABLE_CMD_ADDR_OE_CNTL	SW: RW, HW: R This is typically used for PCDDR3 devices. When enabled, the design will indicate to the PHY to tri-state the command address bus when all ranks are in self refresh and the memory clocks are off, as an additional power savings mode. This is required as a shunt resistance is typically used in the command address path for PCDDR3 memory boards and hence will always burn power as the command address is always driven. 0x0: Disabled (default) 0x1: Enabled
0	LOAD_TRP_CNTL	SW: RW, HW: R This bit controls as to when the TRP timer gets started. There seems to be a difference in the memory specifications which requires this control bit. When set to '0' (required for LPDDR1), the TRP timer gets loaded with the first precharge command that closes a rank/bank. Any subsequent precharges (e.g., precharge all) to that rank/bank are ignored as the state of the page is closed. When set to '1' (required for LPDDR2/PCDDR2/PCDDR3), the latest precharge command, e.g., precharge all will cause TRP timer to get reloaded even if the page was closed. 0x0: Valid Precharge (default) 0x1: Latest Precharge

Bits	Name	Description
24	RANK0_ODT_ON_WR_RANK0	SW: RW, HW: R Enable Rank0 ODT to be driven when write occurs on Rank0. 0x0: Disable (default) 0x1: Enable
23	RANK0_ODT_ON_RD_RANK1	SW: RW, HW: R Enable Rank0 ODT to be driven when read occurs on Rank1. 0x0: Disable (default) 0x1: Enable
22	RANK0_ODT_ON_RD_RANK0	SW: RW, HW: R Enable Rank0 ODT to be driven when read occurs on Rank0. 0x0: Disable (default) 0x1: Enable
21:19	ODT_START_DELAY_WR	SW: RW, HW: R This delay only applies to the Rank ODT and not the controller ODT. Specifies the delay in ddr1x clock cycles between the DDR Write command and the ODT being driven high. Typically for PCDDR2 devices for writes, this should be set to (Write latency - tAOND) and for PCDDR3 devices for writes, this must be set to "1" for optimal settings. The above indicates the maximum value allowed for the ODT signal to be turned on/driven high w.r.t the write CAS command. Note that a value of "0" indicates that the ODT signal is turned on 1 cycle before the write CAS command. A value of "1" indicates that the ODT signal is turned on in the same cycle as the write CAS command and so on. The difference between the maximum value and the value programmed is required to be added as additional incremental delays to DDR_DRAM_TIMING_2[tOST], DDR_DRAM_TIMING_2[tRTW_SAME_RANK] and DDR_DRAM_TIMING_2[tRTW_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are MAX and MAX-1.

EBI1_CH0_DDR_CMD_EXEC_OPT_3 (cont.)

Bits	Name	Description
18:16	ODT_START_DELAY_RD	SW: RW, HW: R This delay only applies to the Rank ODT and not the controller ODT. Specifies the delay in ddr1x clock cycles between the DDR Read command and the ODT being driven high. Typically for PCDDR2 devices for reads, this should be set to (Read latency - tAOND) and for PCDDR3 devices for reads, this must be set to (Read Latency - (Write Latency - 2)) for optimal settings. The above indicates the maximum value allowed for the ODT signal to be turned on/driven high w.r.t the read CAS command. Note that a value of "0" indicates that the ODT signal is turned on 1 cycle before the read CAS command. A value of "1" indicates that the ODT signal is turned on in the same cycle as the read CAS command and so on. The difference between the maximum value and the value programmed might need to be added as additional incremental delays to DDR_SM_TIMING_0[DLY_RD_DIFF_RANK], DDR_DRAM_TIMING_2[WR_TO_RD_DLY_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are MAX and MAX-1.
15:13	ODT_OFF_DELAY	SW: RW, HW: R This delay specifies the ODT off memory timing parameter for rank ODT. For PCDDR2, if DDR_CMD_EXEC_OPT_0[PWR_DOWN_EN] is 1'b0 then program this to the timing parameter, tAOFD. For PCDDR2, if DDR_CMD_EXEC_OPT_0[PWR_DOWN_EN] is 1'b1 then program this to MAX(tAOFD, tANPD). For PCDDR3, this is to be programmed to "Write Latency -2", which is ODTLoff.
12:10	ODTH8	SW: RW, HW: R Specifies the timing parameter ODTH8 (for PCDDR3) in ddr1x clock cycles. If using PCDDR2, leave this as POR.
9	EN_ODT_SWITCH_RANK_UNAVAIL	SW: RW, HW: R This only applies in multi-rank systems. When enabled, the design will automatically turn ON the same rank's odt on a write (if not already configured) if the other rank's odt should have been turned on, but it can't as the other rank is in self refresh or power down (If EN_ODT_POWER_DOWN is 1'b1, then the only scenario where the dynamic switch is enabled is when the other rank is in self refresh). 0x0: Disable (default) 0x1: Enable
8	EN_ODT_POWER_DOWN	SW: RW, HW: R If set, then ODT will be driven to a rank (if required - based on ODT configuration) in powerdown mode. The optimal setting is for this bit to be enabled. 0x0: Disable 0x1: Enable (default)

EBI1_CH0_DDR_CMD_EXEC_OPT_3 (cont.)

Bits	Name	Description
7:6	ODT_EXTEND_DELAY_WR	SW: RW, HW: R Specifies the number of ddr1x clock cycles after the write completes should the rank's Rtt ODT resistance be turned off. The optimal case is "01". Additional delays might require the write to read same/diff rank timer delays to be increased. The difference between the value programmed and the optimal settings might need to be added as additional incremental delays to DDR_DRAM_TIMING_2[tOST], DDR_DRAM_TIMING_2[WR_TO_RD_DLY_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are "01" and "10". 0x0: Reserved 0x1: 1 clock cycle later (default) 0x2: 2 clock cycles later 0x3: 3 clock cycles later
5:4	ODT_EXTEND_DELAY_RD	SW: RW, HW: R Specifies the number of ddr1x clock cycles after the read completes should the rank's Rtt ODT resistance be turned off. The optimal case is "01". Additional delays might require the write to read same/diff rank timer delays to be increased. The difference between the value programmed and the optimal settings might need to be added as additional incremental delays to DDR_SM_TIMING_0[DLY_RD_DIFF_RANK], DDR_DRAM_TIMING_2[tRTW_SAME_RANK] and DDR_DRAM_TIMING_2[tRTW_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are "01" and "10". 0x0: Reserved 0x1: 1 clock cycle later (default) 0x2: 2 clock cycles later 0x3: 3 clock cycles later
3:1	TANPD	SW: RW, HW: R This specifies the memory timing parameter tANPD in ddr1x clock cycles. For PCDDR2 devices, program this to the timing parameter tANPD, for PCDDR3 devices, this needs to be programmed to WL - 1 (as per PCDDR3 spec).
0	DLL_CNTL_PCHG_PD	SW: RW, HW: R This field only applies to PCDDR3 devices. It indicates the mode register setting for MR0 bit 12. A value "0" represents that the DLL is frozen when precharge powerdown is entered, while a value "1" represents that the DLL is enabled during precharge powerdown. This is used to determine the ODT to be used (synchronous/asynchronous)

0x00A8004C EBI1_CH0_DDR_CMD_EXEC_OPT_4

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Command Execution Optimization Register 4.

This register has the programmable idle timer for entering powerdown.

EBI1_CH0_DDR_CMD_EXEC_OPT_4

Bits	Name	Description
31:24	PWR_DOWN_IDLE_TIMER	SW: RW, HW: R Count idle ddr1x cycles before entering powerdown/clockstop/clostop-powerdown. This is only valid if powerdown/clockstop/clockstop-powerdown is enabled via the DDR_CMD_EXEC_OPT_0 CSR. A value of 0 indicates that the powerdown/clockstop/clockstop-powerdown will be entered immediately when idle. 0x0: Disable (default)
23:0	RESERVED_23_0

EBI1_CH0_DDR_SM_TIMING_0

Bits	Name	Description
31:15	RESERVED_31_15	

EBI1_CH0_DDR_SM_TIMING_0 (cont.)

Bits	Name	Description
14:12	DLY_RD_DIFF_RANK	SW: RW, HW: R Delays read to read when going to different ranks. For LPDDR1/2 devices (or PCDDR2/3 with ODT disabled), this can be set to MAX(1, RU((tHZ(DQ)max - tLZ(DQ)min)/tck) for optimal setting as these devices do not have ODT. tck here represents the time period for the fastest DDR1x clock frequency which will be used. The optimal value of this CSR is 4 cycles for PCDDR2/3, if Read Rank ODT (i.e DDR_CMD_EXEC_OPT_3[RANK0/1_ODT_ON_RD_RANK0/1]) is enabled. This accounts for the difference in the ODT off max and min timing, the requirement that Rtt needs to be off half cycle before read preamble, etc. 0x0: Reserved 0x1: 1 cycle (default) 0x2: 2 cycles 0x3: 3 cycles 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 7 cycles
11	RD_INT_BY_RD	SW: RW, HW: R Indicates whether Read Interrupt by Read is allowed. This field needs to be set depending on the specific SDRAM device present. Use "Allowed" for LPDDR1/2 and PCDDR2. Use "Not Allowed" for PCDDR3. 0x1: Allowed 0x0: Not Allowed (default)
10	WR_INT_BY_WR	SW: RW, HW: R Indicates whether Write Interrupt by Write is allowed. This field needs to be set depending on the specific SDRAM device present. Use "Allowed" for LPDDR1/2 and PCDDR2. Use "Not Allowed" for PCDDR3. 0x1: Allowed 0x0: Not Allowed (default)
9	RD_INT_BY_BST	SW: RW, HW: R Indicates whether Read Interrupt by Burst Terminate is allowed. This field needs to be set depending on the specific SDRAM device present. Use "Allowed" for LPDDR1/2. Use "Not Allowed" for PCDDR2/3. 0x1: Allowed 0x0: Not Allowed (default)
8	WR_INT_BY_BST	SW: RW, HW: R Indicates whether Write Interrupt by Burst Terminate is allowed. This field needs to be set depending on the specific SDRAM device present. Use "Allowed" for LPDDR2. Use "Not Allowed" for LPDDR1 and PCDDR2/3. 0x1: Allowed 0x0: Not Allowed (default)

EBI1_CH0_DDR_SM_TIMING_0 (cont.)

Bits	Name	Description
7:6	WR_INT_RD_OR_PRECHG_MODE	SW: RW, HW: R Indicates the interruption mode to be allowed for write transactions when followed by Precharge or Reads.This field needs to be set depending on the specific SDRAM device present. Use "Interrupt with no delay" for LPDDR1 devices. Use "Non Interrupting" for PCDDR2/3 and LPDDR2-S2/S4. This basically sets the starting point for twr and twtr timers. 0x0: Int with no dly (default) 0x1: Int with single cc dly (Not Supported) 0x2: Non Interrupting 0x3: Reserved
5:4	RESERVED_5_4	
3:2	INT_BOUNDARY	SW: RW, HW: R Determines when the interrupting/concatenating command can be issued. This field needs to be set depending on the specific SDRAM device present. Use "Every Cycle" for LPDDR1 and LPDDR2-S2 devices. Use "Every 2 cycles" for LPDDR2-S4 and PCDDR2 devices. For PCDDR3 devices, the above fields would indicate that interruption is not allowed. Hence the value used here is not relevant. 0x0: Every Cycle (default) 0x1: Every 2 cycles 0x2: RESERVED_1 0x3: RESERVED_2
1:0	RESERVED_1_0

Bits	Name	Description
31:24	RESERVED_31_24	

EBI1_CH0_DDR_SM_TIMING_1 (cont.)

Bits	Name	Description
23:20	MEM_START_BURST_RD	SW: RW, HW: R Specifies the starting column address restrictions. This field needs to be set depending on the specific SDRAM device. Note that "interleaved" mode of addressing at the SDRAM device is not being supported. For LPDDR1/2 (all burst lengthis) and PCDDR2 (memory BL of 4) use "0000". For PCDDR3 (memory BL of 8) & PCDDR2 (memory BL of 8) use "0011". For PCDDR3 OTF burst mode, this field is a don't care. Others: Reserved 0x0: Address_0_2_4_6_etc (default) 0x3: Address_0_4_etc 0xF: Address_0_only
19:16	MEM_START_BURST_WR	SW: RW, HW: R Specifies the starting column address restrictions. This field needs to be set depending on the specific SDRAM device. Note that "interleaved" mode of addressing at the SDRAM device is not being supported. For LPDDR1/2 (all burst lengthis) and PCDDR2 (memory BL of 4) use "0000". For PCDDR2 (memory BL of 8) use "0011" and for PCDDR3 (memory BL of 8) use "1111". For PCDDR3 OTF burst mode, this field is a don't care. Others: Reserved 0x0: Address_0_2_4_6_etc (default) 0x3: Address_0_4_etc 0xF: Address_0_only
15:14	SYS_TIMING_MODE	SW: RW, HW: R Specifies the command interface timing relative to the chip select. This is necessary to provide an option to guarantee an additional cycle for the more heavily command interface signals to propagate to the RAMs and settle (to meet input setup requirements) before being clocked in. This is not applicable for LPDDR2. 0x0: 1T (default: Address and command can be driven in the same cycle as the chip select.) 0x1: 2T (Address and command must be driven at least 1 cycle before chip select is asserted) 0x2: RESERVED_1 0x3: RESERVED_2
13:8	RESERVED_13_8	
7	USE_ORIG_BL	SW: RW, HW: R Indicates if original or effective burst length should be used when computing timing between column commands. This field needs to be set depending on the specific SDRAM device. For LPDDR1/2, use "effective" and for PCDDR2/3, use "original". 0x1: Original 0x0: Effective (default)
6	RESERVED_6	

EBI1_CH0_DDR_SM_TIMING_1 (cont.)

Bits	Name	Description
5	ON_THE_FLY_MODE	SW: RW, HW: R Indicates that the memory burst mode selected is OTF (on-the-fly) mode. This field is only applicable for PCDDR3 SDRAM devices. 0x1: Allowed 0x0: Not Allowed (default)
4	DRIVE_WR_DQS_EARLY	SW: RW, HW: R Indicates if DQS needs to be toggled a cycle before the write data gets driven. This means that the first piece of write data will be driven on the 2nd rising edge of the Data strobe. This field needs to be set depending on the specific SDRAM device present. This is only "enabled" for PCDDR3 devices. 0x1: Enabled 0x0: Disabled (default)
3:0	BURST_LENGTH	SW: RW, HW: R Specified as Memory Burst Length. This must be in sync with the value programmed in SDRAM's mode register. For PCDDR3, memory BL of 8 ("0100" setting) and On-the-fly (OTF) mode are supported. For PCDDR3 OTF mode program CSR - DDR_SM_TIMING_1[ON_THE_FLY_MODE]. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: BL of 4 0x3: RESERVED_3 0x4: BL of 8 (default) 0x5: RESERVED_4 0x6: RESERVED_5 0x7: RESERVED_6 0x8: BL of 16 0x9: RESERVED_7 0xA: RESERVED_8 0xB: RESERVED_9 0xC: RESERVED_10 0xD: RESERVED_11 0xE: RESERVED_12 0xF: RESERVED_13

Clock: RUNALWAYSCLK
Reset State: 0x44301003

DDR DRAM Timing Register 0

This register contains parameters which are specified by the memory vendor in ns. The alternate register is DDR_DRAM_TIMING_0_ALT

This register holds the SDRAM timing parameters. The value of the settings is in clock cycles and may vary from one SDRAM vendor to another. The value that should be selected for each field is:

the number_of_clock_cycles of the vendor's specified value.

An example:

When the vendor's specification states tRCD = 44nS and the SDRAM clock rate = 166 MHz, the calculations are:

1. 1/166 MHz = 6nS.
2. 44nS/6nS = 7.33 clocks.
3. 7.33 clocks rounds up to 8 clocks.

Therefore, the value of RASmin_timer should be written as 4'b1000.

EBI1_CH0_DDR_DRAM_TIMING_0

Bits	Name	Description
31:29	TRTP	SW: RW, HW: R This is not the same as the memory timing parameter tRTP. Number of Additional clock cycles between a Read and a Precharge command to the same page with actual BL/2 as the initial base delay. This needs to be set depending on the memory device present. For LPDDR, this needs to be set to at least 2 cycles. For LPDDR2-S2, use MAX(2, "tRTP (memory timing parameter in ddr1x clock cycles) -1") For LPDDR2-S4, use MAX(2, "tRTP (memory timing parameter in clock cycles) -2") For PCDDR2, use MAX(2, "tRTP (memory timing parameter in clock cycles) -2") For PCDDR3, use MAX(2, "tRTP (memory timing parameter in clock cycles) -4") 0x0: RESERVED_1 0x1: RESERVED_2 0x2: Additional 2 clock cycles (default) 0x3: Additional 3 clock cycles 0x4: Additional 4 clock cycles 0x5: Additional 5 clock cycles 0x6: Additional 6 clock cycles 0x7: Additional 7 clock cycles

EBI1_CH0_DDR_DRAM_TIMING_0 (cont.)

Bits	Name	Description
28:24	TFAW	SW: RW, HW: R Programmable rolling window during which the number of activations should not exceed the CSR field - max_num_activations_tFAW. This needs to be set based on the specific SDRAM device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: RESERVED_4 0x4: MIN_CC (4 cycles default)
23:20	TRCD	SW: RW, HW: R Number of clock cycles from activate to column command (same bank). This needs to be set based on the specific SDRAM device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
19:16	RESERVED_19_16	
15:12	TRRD	SW: RW, HW: R Number of clock cycles between Activate to Activate (different banks on same chip select). This needs to be set based on the specific SDRAM device. 0x0: RESERVED 0x1: MIN_CC (1 cycle default)
11:9	PWR_DOWN_ODT_OFF_MAX_MIN_DIFF	SW: RW, HW: R Number of clock cycles specifying the difference in the power down ODT off max/min timing parameter. For PCDDR2 & PCDDR3, this is rounded up version in ddr1x clock cycles of (tAOFPDmax - tAOFPDmin).
8:7	RESERVED_8_7	
6:5	TZQCL_MSB	SW: RW, HW: R The complete value of tZQCL timer is {tZQCL_MSB, tZQCL}. tZQCL is from DDR_DRAM_TIMING_7 CSR. Number of ddr1x clock cycles required for the long calibration sequence to execute. ZQ Calibration commands are only supported by LPDDR2 and PCDDR3 devices. For LPDDR2, this is the timing parametet - tZQCL and for PCDDR3, this is the timing parameter tZQoper.
4:0	TRAS_MIN	SW: W, HW: R Number of clocks cycles between Active and Precharge (same bank). This needs to be set based on the specific SDRAM device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

DDR Timing Parameters Register 3

This register contains parameters which are specified by the memory vendor in ns. The alternalte/shadow register is DDR_DRAM_TIMING_3_ALT and is used during HW frequency switching.

EBI1_CH0_DDR_DRAM_TIMING_3

Bits	Name	Description
31:28	PD_EXIT_DURATION_ODT	SW: RW, HW: R This specifies the amount of time after a powerdown exit (which qualifies as asynchronous ODT for PCDDR2/3 devices) for which the column commands will be blocked to avoid large ODT on/off timing ranges. For PCDDR3 devices, this needs to be programmed to the timing parameter tXPDLL delay in ddr1x clock cycles. For PCDDR2 devices, this needs to be programmed to the timing parameter tAXPD delay in ddr1x clock cycles. For LPDDR1/2 devices, leave this field as POR value. The MSB value of this timer is PD_EXIT_DURATION_ODT_MSB.
27:24	TWTR	SW: RW, HW: R tWTR delay in clock cycles. 0x1: 1Cycle (default)
23	PD_EXIT_DURATION_ODT_MSB	SW: RW, HW: R The MSB bit for PD_EXIT_DURATION_ODT. This is required for PCDDR3 at higher frequencies.
22:19	TWR	SW: RW, HW: R Number of clocks from last data word to precharge
18:9	TXSRD	SW: RW, HW: R Number of clock cycles between self refresh exit and next valid Read command. The value is based on the specific SDRAM device present. For PCDDR3, this needs to be programmed with tXSDLL timing parameter. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
8	RESERVED_8	Reserved
7:0	TXSNR	SW: RW, HW: R Number of clock cycles between self refresh exit and next valid Non-Read command. The value is based on the specific SDRAM device present. For LPDDR1/2 devices, the value programmed in TXSNR should be the same as in TXSRD. The different parameters are required for SDRAM devices with DLL's - PCDDR2/3. For PCDDR3, this needs to be programmed with tXS timing parameter. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

DDR Timing Parameters Register 4

This register contains parameters which are specified by the memory vendor in ns. The alternalte/shadow register is DDR_DRAM_TIMING_4_ALT and is used during HW frequency switch.

EBI1_CH0_DDR_DRAM_TIMING_4

Bits	Name	Description
31:24	TRFC	SW: RW, HW: R Number of clock cycles between auto-refresh command and the next activate command. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
23:20	TMOD	SW: RW, HW: R Specifies the timing parameter TMOD in ddr1x clock cycles for PCDDR2/3 devices.
19:16	TXPNR_ACT_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next valid non-read command. This value gets used only if the Power down state was active power down. This distinction is required for PCDDR devices where in a slow/fast exit option in the Mode Register could potentially mean different timers for read commands (which require a DLL) Vs. a non-read command. For PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. For LPDDR1/2 program this to "tXPNR" if available, else set to "tXP". For PCDDR3, set this to "tXP". 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)

EBI1_CH0_DDR_DRAM_TIMING_4 (cont.)

Bits	Name	Description
15:12	TXPR_ACT_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next read command. This value gets used only if the Power down state was active power down. For PCDDR2, if Mode register for "Active Power Down Exit Time" is programmed to "fast exit", set this to memory timing parameter "tXARD", else program this to "tXARDS". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. For LPDDR1/2, program this to "tXPR" if available, else set to "tXP". For PCDDR3, set this to "tXP". 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
11:8	TXPNR_PCHG_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next non-read command. This value gets used only if the Power down state was precharge power down. For PCDDR3, if ODT is enabled and the Mode register for "DLL control for Precharge PD" is programmed to "fast exit", set this to memory timing parameter "tXPDLL", else program this to "tXP". For LPDDR1/2 & PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. The MSB bit for this is from TXPNR_PCHG_PWR_DOWN_MSB. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
7:4	TXPR_PCHG_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next read command. This value gets used only if the Power down state was precharge power down. For PCDDR3, if Mode register for "DLL control for Precharge PD" is programmed to "fast exit", set this to memory timing parameter "tXP", else program this to "tXPDLL". For LPDDR1/2 & PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. The MSB bit for this is from TXPR_PCHG_PWR_DOWN_MSB. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
3:2	RESERVED_3_2	Reserved
1	TXPNR_PCHG_PWR_DOWN_MSB	SW: RW, HW: R The MSB bit for TXPNR_PCHG_PWR_DOWN. This is required for PCDDR3 at higher frequencies.
0	TXPR_PCHG_PWR_DOWN_MSB	SW: RW, HW: R The MSB bit for TXPR_PCHG_PWR_DOWN. This is required for PCDDR3 at higher frequencies.

DDR Timing Parameters Register 5

This register contains parameters which are specified by the memory vendor in ns. The alternalte/shadow register is DDR_DRAM_TIMING_5_ALT and is used during HW frequency switch.

EBI1_CH0_DDR_DRAM_TIMING_5

Bits	Name	Description
31:24	SELF_RFSH_MIN_DURATION	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles the SDRAM device is required to remain in self refresh mode once a self refresh command is registered. For LPDDR1, this is specified as tRFC, for LPDDR2, this is specified as tCKESR, for PCDDR2/3, this is specified as tCKE. Based on current implementation, the design waits this CSR field plus DDR_DRAM_TIMING_5[CLK_RESTART_BEFORE_SELF_RFSH_EXIT] plus 2 ddr1x cycles at least before coming out of self refresh.
23	RESERVED_23	Reserved
22:20	CLK_STOP_AFTER_SELF_RFSH_ENTRY	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles after the Self Refresh command is registered that the external clock to the memory device needs to run before it can be turned off. For LPDDR1/2 and PCDDR2 SDRAM devices, this should be set to "1", for PCDDR3 SDRAM devices, this should be set to "tCKSRE"
19:16	CLK_RESTART_BEFORE_SELF_RFSH_EXIT	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles the memory clock is required to be stable/re-started before CKE can go high to indicate a self refresh exit. Based on the memory device alone, for LPDDR1, this is at least "1", for LPDDR2, this needs to be set to at least 2 clock cycles. For PCDDR2 SDRAM devices, this should be set to "1", for PCDDR3 SDRAM devices, this should be set to "tCKSRX". This CSR field represents the lower 4 bits. The upper 4 bits are in CLK_RESTART_BEFORE_SR_EXIT_UPPER CSR field below. If the cur_mode in the pads is enabled and the system is configured to dynamically turn off the cur_mode during self refresh, then the 8-bit timer needs to be programmed such that it provides at least 100ns of pad settling time.

EBI1_CH0_DDR_DRAM_TIMING_5 (cont.)

Bits	Name	Description
15:12	TRP_AB	SW: RW, HW: R Number of clocks from all bank precharge to Activate (same bank). This needs to be set based on the specific SDRAM device. For LPDDR1, PCDDR3 & 4-bank PCDDR2 devices, set this to timing parameter tRP. For 8-bank PCDDR2 devices, set this to tRP + 1*tck (in clock cycles). For LPDDR2 devices, set this to timing parameter tRPab. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
11:8	CLK_RESTART_BEFORE_SR_EXIT_UPPER	SW: RW, HW: R These bits are the upper 4 bits for the CLK_RESTART_BEFORE_SELF_RFSH_EXIT CSR field above. The timer is 8 bits wide. If the cur_mode in the pads is enabled and the system is configured to dynamically turn off the cur_mode during self refresh, then the 8-bit timer needs to be programmed such that it provides at least 100ns of pad settling time.
7:4	TRP_PB	SW: RW, HW: R Number of clocks from per bank precharge to Activate (same bank). This needs to be set based on the specific SDRAM device. For LPDDR1, PCDDR3 & PCDDR2 devices, set this to timing parameter tRP. For LPDDR2 devices, set this to timing parameter tRPpb. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

EBI1_CH0_DDR_DRAM_TIMING_5 (cont.)

Bits	Name	Description
3:0	RD_LATENCY	SW: RW, HW: R Actual Rd Latency (from Chip select assertion to the clock edge where read data is expected - This will not be exactly equal to CAS latency from memory specs) For LPDDR1, use Read latency of 3(fixed), for LPDDR2, use Read latency of memory device + RU(tdqsckmax/tck) (RU - round up) where tck is the time period of the current ddr1x clock frequency of operation. For PCDDR2/3 devices, use the read latency of the device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: 2 cycles 0x3: 3 cycles (default) 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 7 cycles 0x8: 8 cycles 0x9: 9 cycles 0xA: 10 cycles 0xB: 11 cycles 0xC: 12 cycles 0xD: 13 cycles 0xE: 14 cycles 0xF: 15 cycles

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x44301003

DDR DRAM Timing Register 0_ALT

This register contains parameters which are specified by the memory vendor in ns. The alternalte/shadow register is DDR_DRAM_TIMING_0 and gets used during HW frequency switch.

This register holds the SDRAM timing parameters. The value of the settings is in clock cycles and may vary from one SDRAM vendor to another. The value that should be selected for each field is:

the number_of_clock_cycles of the vendor's specified value.

An example:

When the vendor's specification states tRCD = 44nS and the SDRAM clock rate = 166 MHz, the calculations are:

1. 1/166 MHz = 6nS.
2. 44nS/6nS = 7.33 clocks.
3. 7.33 clocks rounds up to 8 clocks.

Therefore, the value of RASmin_timer should be written as 4'b1000.

EBI1_CH0_DDR_DRAM_TIMING_0_ALT

Bits	Name	Description
31:29	TRTP	SW: RW, HW: R This is not the same as the memory timing parameter tRTP. Number of Additional clock cycles between a Read and a Precharge command to the same page with actual BL/2 as the intial base delay. This needs to be set depending on the memory device present. For LPDDR, this needs to be set to at least 2 cycles. For LPDDR2-S2, use MAX(2, "tRTP (memory timing parameter in ddr1x clock cycles) -1") For LPDDR2-S4, use MAX(2, "tRTP (memory timing parameter in clock cycles) -2") For PCDDR2, use MAX(2, "tRTP (memory timing parameter in clock cycles) -2") For PCDDR3, use MAX(2, "tRTP (memory timing parameter in clock cycles) -4") 0x0: RESERVED_1 0x1: RESERVED_2 0x2: Additional 2 clock cycles (default) 0x3: Additional 3 clock cycles 0x4: Additional 4 clock cycles 0x5: Additional 5 clock cycles 0x6: Additional 6 clock cycles 0x7: Additional 7 clock cycles
28:24	TFAW	SW: RW, HW: R Programmable rolling window during which the number of activations should not exceed the CSR field - max_num_activations_tFAW. This register contains parameters which are specified by the memory vendor in ns. The alternalte/shadow register is DDR_DRAM_TIMING_3 and gets used during HW frequency switch.

EBI1_CH0_DDR_DRAM_TIMING_3_ALT

Bits	Name	Description
31:28	PD_EXIT_DURATION_ODT	SW: RW, HW: R This specifies the amount of time after a powerdown exit (which qualifies as asynchronous ODT for PCDDR2/3 devices) for which the column commands will be blocked to avoid large ODT on/off timing ranges. For PCDDR3 devices, this needs to be programmed to the timing parameter tXPDLL delay in ddr1x clock cycles. For PCDDR2 devices, this needs to be programmed to the timing parameter tAXPD delay in ddr1x clock cycles. For LPDDR1/2 devices, leave this field as POR value. The MSB value of this timer is PD_EXIT_DURATION_ODT_MSB.
27:24	TWTR	SW: RW, HW: R tWTR delay in clock cycles. 0x1: 1Cycle (default)
23	PD_EXIT_DURATION_ODT_MSB	SW: RW, HW: R The MSB bit for PD_EXIT_DURATION_ODT. This is required for PCDDR3 at higher frequencies.
22:19	TWR	SW: RW, HW: R Number of clocks from last data word to precharge
18:9	TXSRD	SW: RW, HW: R Number of clock cycles between self refresh exit and next valid Read command. The value is based on the specific SDRAM device present. For PCDDR3, this needs to be programmed with tXSDLL timing parameter. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
8	RESERVED_8	Reserved
7:0	TXSNR	SW: RW, HW: R Number of clock cycles between self refresh exit and next valid Non-Read command. The value is based on the specific SDRAM device present. For LPDDR1/2 devices, the value programmed in TXSNR should be the same as in TXSRD. The different parameters are required for SDRAM devices with DLL's - PCDDR2/3. For PCDDR3, this needs to be programmed with tXS timing parameter. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

DDR Timing Parameters Register 4_ALT

This register contains parameters which are specified by the memory vendor in ns. The alternalte/shadow register is DDR_DRAM_TIMING_4 and gets used during HW frequency switch.

EBI1_CH0_DDR_DRAM_TIMING_4_ALT

Bits	Name	Description
31:24	TRFC	SW: RW, HW: R Number of clock cycles between auto-refresh command and the next activate command. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
23:20	TMOD	SW: RW, HW: R Specifies the timing parameter TMOD in ddr1x clock cycles for PCDDR2/3 devices.
19:16	TXPNR_ACT_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next valid non-read command. This value gets used only if the Power down state was active power down. This distinction is required for PCDDR devices where in a slow/fast exit option in the Mode Register could potentially mean different timers for read commands (which require a DLL) Vs. a non-read command. For PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. For LPDDR1/2 program this to "tXPNR" if available, else set to "tXP". For PCDDR3, set this to "tXP". 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)

EBI1_CH0_DDR_DRAM_TIMING_4_ALT (cont.)

Bits	Name	Description
15:12	TXPR_ACT_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next read command. This value gets used only if the Power down state was active power down. For PCDDR2, if Mode register for "Active Power Down Exit Time" is programmed to "fast exit", set this to memory timing parameter "tXARD", else program this to "tXARDS". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. For LPDDR1/2, program this to "tXPR" if available, else set to "tXP". For PCDDR3, set this to "tXP". 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
11:8	TXPNR_PCHG_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next non-read command. This value gets used only if the Power down state was precharge power down. For PCDDR3, if ODT is enabled and the Mode register for "DLL control for Precharge PD" is programmed to "fast exit", set this to memory timing parameter "tXPDLL", else program this to "tXP". For LPDDR1/2 & PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. The MSB bit for this is from TXPNR_PCHG_PWR_DOWN_MSB. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
7:4	TXPR_PCHG_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next read command. This value gets used only if the Power down state was precharge power down. For PCDDR3, if Mode register for "DLL control for Precharge PD" is programmed to "fast exit", set this to memory timing parameter "tXP", else program this to "tXPDLL". For LPDDR1/2 & PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. The MSB bit for this is from TXPR_PCHG_PWR_DOWN_MSB. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
3:2	RESERVED_3_2	Reserved
1	TXPNR_PCHG_PWR_DOWN_MSB	SW: RW, HW: R The MSB bit for TXPNR_PCHG_PWR_DOWN. This is required for PCDDR3 at higher frequencies.
0	TXPR_PCHG_PWR_DOWN_MSB	SW: RW, HW: R The MSB bit for TXPR_PCHG_PWR_DOWN. This is required for PCDDR3 at higher frequencies.

DDR Timing Parameters Register 5_ALT

This register contains parameters which are specified by the memory vendor in ns. The alternalte/shadow register is DDR_DRAM_TIMING_5 and gets used during HW frequency switch.

EBI1_CH0_DDR_DRAM_TIMING_5_ALT

Bits	Name	Description
31:24	SELF_RFSH_MIN_DURATION	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles the SDRAM device is required to remain in self refresh mode once a self refresh command is registered. For LPDDR1, this is specified as tRFC, for LPDDR2, this is specified as tCKESR, for PCDDR2/3, this is specified as tCKE. Based on current implementation, the design waits this CSR field plus DDR_DRAM_TIMING_5[CLK_RESTART_BEFORE_SELF_RFSH_EXIT] plus 2 ddr1x cycles at least before coming out of self refresh.
23	RESERVED_23	Reserved
22:20	CLK_STOP_AFTER_SELF_RFSH_ENTRY	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles after the Self Refresh command is registered that the external clock to the memory device needs to run before it can be turned off. For LPDDR1/2 and PCDDR2 SDRAM devices, this should be set to "1", for PCDDR3 SDRAM devices, this should be set to "tCKSRE"
19:16	CLK_RESTART_BEFORE_SELF_RFSH_EXIT	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles the memory clock is required to be stable/re-started before CKE can go high to indicate a self refresh exit. Based on the memory device alone, for LPDDR1, this is at least "1", for LPDDR2, this needs to be set to at least 2 clock cycles. For PCDDR2 SDRAM devices, this should be set to "1", for PCDDR3 SDRAM devices, this should be set to "tCKSRX". This CSR field represents the lower 4 bits. The upper 4 bits are in CLK_RESTART_BEFORE_SR_EXIT_UPPER CSR field below. If the cur_mode in the pads is enabled and the system is configured to dynamically turn off the cur_mode during self refresh, then the 8-bit timer needs to be programmed such that it provides at least 100ns of pad settling time.

EBI1_CH0_DDR_DRAM_TIMING_5_ALT (cont.)

Bits	Name	Description
15:12	TRP_AB	SW: RW, HW: R Number of clocks from all bank precharge to Activate (same bank). This needs to be set based on the specific SDRAM device. For LPDDR1, PCDDR3 & 4-bank PCDDR2 devices, set this to timing parameter tRP. For 8-bank PCDDR2 devices, set this to tRP + 1*tck (in clock cycles). For LPDDR2 devices, set this to timing parameter tRPab. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
11:8	CLK_RESTART_BEFORE_SR_EXIT_UPPER	SW: RW, HW: R These bits are the upper 4 bits for the CLK_RESTART_BEFORE_SELF_RFSH_EXIT CSR field above. The timer is 8 bits wide. If the cur_mode in the pads is enabled and the system is configured to dynamically turn off the cur_mode during self refresh, then the 8-bit timer needs to be programmed such that it provides at least 100ns of pad settling time.
7:4	TRP_PB	SW: RW, HW: R Number of clocks from per bank precharge to Activate (same bank). This needs to be set based on the specific SDRAM device. For LPDDR1, PCDDR3 & PCDDR2 devices, set this to timing parameter tRP. For LPDDR2 devices, set this to timing parameter tRPpb. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

EBI1_CH0_DDR_DRAM_TIMING_5_ALT (cont.)

Bits	Name	Description
3:0	RD_LATENCY	SW: RW, HW: R Actual Rd Latency (from Chip select assertion to the clock edge where read data is expected - This will not be exactly equal to CAS latency from memory specs) For LPDDR1, use Read latency of 3(fixed), for LPDDR2, use Read latency of memory device + RU(tdqsckmax/tck) (RU - round up) where tck is the time period of the current ddr1x clock frequency of operation. For PCDDR2/3 devices, use the read latency of the device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: 2 cycles 0x3: 3 cycles (default) 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 7 cycles 0x8: 8 cycles 0x9: 9 cycles 0xA: 10 cycles 0xB: 11 cycles 0xC: 12 cycles 0xD: 13 cycles 0xE: 14 cycles 0xF: 15 cycles

0x00A8009C EBI1_CH0_DDR_UPDATE_FREQ_CHANGE_ALT

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x10000000

DDR Update Frequency Change ALT register.

This register contains parameters which are dependent on the frequency of operation. The fields in this register are valid only if DDR_CMD_EXEC_OPT_2[UPDATE_MEM_LATENCY_ON_FREQ_SWITCH] is set.

The original CSR field for WR_LATENCY below is DDR_DRAM_TIMING_6[WR_LATENCY].

The original CSR field for ODT_START_DELAY_RD/WR below is DDR_CMD_EXEC_OPT_3[ODT_START_DELAY_RD/WR].

The original CSR field for ODT_OFF_DELAY below is DDR_CMD_EXEC_OPT_3[ODT_OFF_DELAY].

The original CSR field for tANPD below is DDR_CMD_EXEC_OPT_3[tANPD].

EBI1_CH0_DDR_UPDATE_FREQ_CHANGE_ALT

Bits	Name	Description
31:28	WR_LATENCY	SW: RW, HW: R Actual Write Latency (from Chip select assertion to the clock edge where write data is driven - This will not be exactly equal to tWL latency from memory specs). For LPDDR1, use Write latency of 1 (fixed), for LPDDR2, use Write latency of device parameter tWL + 1. For PCDDR2/3 devices, use the write latency of the device. 0x0: RESERVED 0x1: 1 cycle (default) 0x2: 2 cycles 0x3: 3 cycles 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 7 cycles 0x8: 8 cycles 0x9: 9 cycles 0xA: 10 cycles 0xB: 11 cycles 0xC: 12 cycles 0xD: 13 cycles 0xE: 14 cycles 0xF: 15 cycles
27:22	RESERVED_27_22	Reserved
21:19	ODT_START_DELAY_WR	SW: RW, HW: R This delay only applies to the Rank ODT and not the controller ODT. Specifies the delay in ddr1x clock cycles between the DDR Write command and the ODT being driven high. Typically for PCDDR2 devices for writes, this should be set to (Write latency - tAOND) and for PCDDR3 devices for writes, this must be set to "1" for optimal settings. The above indicates the maximum value allowed for the ODT signal to be turned on/driven high w.r.t the write CAS command. Note that a value of "0" indicates that the ODT signal is turned on 1 cycle before the write CAS command. A value of "1" indicates that the ODT signal is turned on in the same cycle as the write CAS command and so on. The difference between the maximum value and the value programmed is required to be added as additional incremental delays to DDR_DRAM_TIMING_2[tOST], DDR_DRAM_TIMING_2[tRTW_SAME_RANK] and DDR_DRAM_TIMING_2[tRTW_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are MAX and MAX-1.

EBI1_CH0_DDR_UPDATE_FREQ_CHANGE_ALT (cont.)

Bits	Name	Description
18:16	ODT_START_DELAY_RD	SW: RW, HW: R This delay only applies to the Rank ODT and not the controller ODT. Specifies the delay in ddr1x clock cycles between the DDR Read command and the ODT being driven high. Typically for PCDDR2 devices for reads, this should be set to (Read latency - tAOND) and for PCDDR3 devices for reads, this must be set to (Read Latency - (Write Latency - 2)) for optimal settings. The above indicates the maximum value allowed for the ODT signal to be turned on/driven high w.r.t the read CAS command. Note that a value of "0" indicates that the ODT signal is turned on 1 cycle before the read CAS command. A value of "1" indicates that the ODT signal is turned on in the same cycle as the read CAS command and so on. The difference between the maximum value and the value programmed might need to be added as additional incremental delays to DDR_SM_TIMING_0[DLY_RD_DIFF_RANK], DDR_DRAM_TIMING_2[WR_TO_RD_DLY_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are MAX and MAX-1.
15:13	ODT_OFF_DELAY	SW: RW, HW: R This delay specifies the ODT off memory timing parameter for rank ODT. For PCDDR2, if DDR_CMD_EXEC_OPT_0[PWR_DOWN_EN] is 1'b0 then program this to the timing parameter, tAOFD. For PCDDR2, if DDR_CMD_EXEC_OPT_0[PWR_DOWN_EN] is 1'b1 then program this to MAX(tAOFD, tANPD). For PCDDR3, this is to be programmed to "Write Latency -2", which is ODTLoff.
12:4	RESERVED_12_4	Reserved
3:1	TANPD	SW: RW, HW: R This specifies the memory timing parameter tANPD in ddr1x clock cycles. For PCDDR2 devices, program this to the timing parameter tANPD, for PCDDR3 devices, this needs to be programmed to WL - 1 (as per PCDDR3 spec).
0	RESERVED_0	Reserved

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Mode Register Write Control for HW Frequency Switch Register

This register is used/valid as part of HW based frequency switch if DDR_CMD_EXEC_OPT_2[UPDATE_MEM_LATENCY_ON_FREQ_SWITCH] is set.There is no rank select field as the mode register write command goes to all initialized ranks. If the memory latencies are required to be changed as part of frequency switching, SW would be required to program the correct Read/Write latency in the corresponding _ALT registers and also program this register to have HW perform an MRW with the updated latency values when a frequency switch request is being processed.

DDR DQ Calibration Read Data Register for Rank1

This register contains the DRAM mode register contents for a DQ calibration command triggered via DDR_MR_CNTL_WDATA[RD_DQCAL] to Rank1. This is used to capture the read data from the SDRAM device's mode register for a read DQ calibration command for LPDDR2 or an MPR read command for PCDDR3. The DQS data bits 0, 8, 16 and 24 are only captured on each DQS edge. Hence for a memory burst length of 4 (LPDDR2 DQ calibration), only 16:0 bits of the field below have valid data. In case of PCDDR3 MPR read command (memory burst length of 8), all 32 bits of the field below are valid.

EBI1_CH0_DDR_DQCAL_RDATA_RANK1

Bits	Name	Description
31:0	DQCAL_RDATA	SW: R, HW: W Data for DQ Calibration Read for Rank1. The data captures the lowest bit for each byte across the memory burst. For example, each cycle of memory burst is 8 bytes of data - 1 bit for each byte is captured which is 8 bits for every cycle of DQS.

Reset State: 0x00000000

DDR DQ Calibration Status Register for Rank0

EBI1_CH0_DDR_DQCAL_STATUS_RANK0

Bits	Name	Description
31	DQCAL_COMPARE_BYTE3	Indicates whether the DQ calibration command for LPDDR2 or PCDDR3 triggered via DDR_MR_CNTL_WDATA[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW de-asserts RD_DQCAL indicating that the command completed. SW also needs to ensure that the number of DQS edges received (NUM_DQS_EDGES_RECD_BYTE3) were correct. A valid pass is only when number of DQS edges received were correct and the PASS comparison read. 0x0: FAIL 0x1: PASS
30	DQCAL_COMPARE_BYTE2	SW: R, HW: W Indicates whether the DQ calibration command for LPDDR2 or PCDDR3 triggered via DDR_MR_CNTL_WDATA[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW de-asserts RD_DQCAL indicating that the command completed. SW also needs to ensure that the number of DQS edges received (NUM_DQS_EDGES_RECD_BYTE2) were correct. A valid pass is only when number of DQS edges received were correct and the PASS comparison read. 0x0: FAIL 0x1: PASS
29	DQCAL_COMPARE_BYTE1	SW: R, HW: W Indicates whether the DQ calibration command for LPDDR2 or PCDDR3 triggered via DDR_MR_CNTL_WDATA[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW de-asserts RD_DQCAL indicating that the command completed. SW also needs to ensure that the number of DQS edges received (NUM_DQS_EDGES_RECD_BYTE1) were correct. A valid pass is only when number of DQS edges received were correct and the PASS comparison read. 0x0: FAIL 0x1: PASS

0x00A80140 EBI1_CH0_DDR_RCW_RESET_AND_CNTL

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR RCW Async Reset & Control Register

This register controls the async reset for the generated RCW (Read capture window for DQS)

signal for DQS qualification in the PHY. It also includes a global disable control which results in the external RCW signal being driven always to 1'b1.

EBI1_CH0_DDR_RCW_RESET_AND_CNTL

Bits	Name	Description
31:28	RESERVED_31_28	
27	RCW_ASYNC_RESET_BYTE3	SW: RW, HW: R SW control for the async reset for the flops in the RCW generation circuit for PHY data byte3. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. HW will assert reset for a few cycles and then de-assert. Sw need not write this to 1'b0. The read value will always be 1'b0. 0x0: RESET OFF (default) 0x1: RESET ON
26	RCW_ASYNC_RESET_BYTE2	SW: RW, HW: R SW control for the async reset for the flops in the RCW generation circuit for PHY data byte3. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. HW will assert reset for a few cycles and then de-assert. Sw need not write this to 1'b0. The read value will always be 1'b0. 0x0: RESET OFF (default) 0x1: RESET ON
25	RCW_ASYNC_RESET_BYTE1	SW: RW, HW: R SW control for the async reset for the flops in the RCW generation circuit for PHY data byte3. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. HW will assert reset for a few cycles and then de-assert. Sw need not write this to 1'b0. The read value will always be 1'b0. 0x0: RESET OFF (default) 0x1: RESET ON
24	RCW_ASYNC_RESET_BYTE0	SW: RW, HW: R SW control for the async reset for the flops in the RCW generation circuit for PHY data byte3. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. HW will assert reset for a few cycles and then de-assert. Sw need not write this to 1'b0. The read value will always be 1'b0. 0x0: RESET OFF (default) 0x1: RESET ON

EBI1_CH0_DDR_RCW_RESET_AND_CNTL (cont.)

Bits	Name	Description
23:17	RESERVED_23_17	
16	RCW_ENABLE	SW: RW, HW: R When set to 1'b0, the external RCW (Read capture window) for precise DQS qualification is always driven to 1'b1 for all data bytes. When enabled (required only for PCDDR3), the design will send out an RCW pulse equal to the memory BL/2 -1 cycles to the PHY data bytes. 0x0: Disable (default) 0x1: Enable
15:1	RESERVED_15_1	
0	RD_FIFO_CNTL_DBG_EN	SW: RW, HW: R When set to 1'b1, this will match the previous design behavior wherein the read data keep/throw is written for MRR commands. If this field is set, then RCW_ENABLE must be disabled. 0x0: Disable (default) 0x1: Enable

0x00A80200 EBI1_CH0_DDR_ENHPRI_EN

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Enhanced command Priority Enable Register.

This register is used to enable and configure enable enhanced prioritization of read and write commands within the DDR controller.

EBI1_CH0_DDR_ENHPRI_EN

Bits	Name	Description
31	ENHANCED_PRI_EN	SW: RW, HW: R Enables enhanced transaction prioritization mode. When enabled the priority of read and write transactions within the DDR controller can be modified to more quickly resolve blocking conditions and minimize worse case latencies. When this feature is enabled is it required that read command starvation be disabled by programming DDR_CMD_EXEC_OPT_0[RDCMD_STARVATION_TIMER] = 0. 0x0: Disable (default) 0x1: Enable

EBI1_CH0_DDR_ENHPRI_EN (cont.)

Bits	Name	Description
30	RD_PRI_AGING_EN	When enabled the DDR priority of read commands increases the longer they remaining unserviced. The priority adjustment is set through the DDR_ENHPRI_RDn registers. 0x0: Disable (default) 0x1: Enable
29	WR_PRI_AGING_EN	When enabled the DDR priority of write commands increases the longer they remaining unserviced. The priority adjustment is set through the DDR_ENHPRI_WRn registers. 0x0: Disable (default) 0x1: Enable
28	RESERVED_28	
27	ADJ_PRI_RDBLOCKING	SW: RW, HW: R When enabled the AXI priority of a read command blocking acceptance of write data is replaced with the value in the PRI_RDBLOCKING field. 0x0: Disable (default) 0x1: Enable
26	ADJ_PRI_RDMERGE	SW: RW, HW: R When enabled a read merge is considered to be blocking write data and its priority is replaced with the value in the PRI_RDBLOCKING field. 0x0: Disable (default) 0x1: Enable
25:24	PRI_RDBLOCKING	AXI priority for blocking read commands 0x0: AXI priority Level 0 (default) 0x1: AXI priority Level 1 0x2: AXI priority Level 2 0x3: AXI priority Level 3
23	ADJ_PRI_WRBLOCKING	SW: RW, HW: R When enabled the AXI priority of a write command blocking acceptance of write data or execution of a subsequent read is replaced with the value in the PRI_RDBLOCKING field. 0x0: Disable (default) 0x1: Enable
22	RESERVED_22	
21:20	PRI_WRBLOCKING	AXI priority for blocking write commands 0x0: AXI priority Level 0 (default) 0x1: AXI priority Level 1 0x2: AXI priority Level 2 0x3: AXI priority Level 3
19:16	RESERVED_19_16	

EBI1_CH0_DDR_ENHPRI_EN (cont.)

Bits	Name	Description
15:8	CONFLICT_BLOCK_HIT	SW: RW, HW: R When not disabled a page conflict of the given priority level(s) blocks any new command presented to the DDR controller from being a page hit to the same rank/bank as the conflict. Others: All combinations of priorities are legal. 0x0: Disabled 0x1: Priority 0 0x2: Priority 1 0x3: Priorities 0 and 1 0x4: Priority 2 0x8: Priority 3 0x10: Priority 4 0x20: Priority 5 0x40: Priority 6 0x80: Priority 7

EBI1_CH0_LBST_CNTL (cont.)

Bits	Name	Description
21:20	FIFO_WE_DQ	SW : RW WE for CA FIFOs and DQ FIFOs 0x0: Write is disabled on all FIFOs 0x1: Write disabled on DQ FIFOs, enabled on CA FIFOs. 0x2: Write enabled all FIFOs 0x3: Dynamic all switching in read/write on DQ FIFOs. Always enabled on CA FIFOs
19	FORCE_OE_DQ	SW : RW Control DQ's OE if FORCE_MODE_DQ == 1 0x0: Force DQ IE to be 0 0x1: Force DQ IE to be 1
18	FORCE_IE_DQ	SW : RW Control DQ's IE if FORCE_MODE_DQ == 1 0x0: Force DQ IE to be 0 0x1: Force DQ IE to be 1
17	FORCE_MODE_DQ	SW : RW DQ's IE/OE is either controlled by DDR controller or by the FORCE_IE_DQ, FORCE_OE_DQ 0x0: Controlled by DDR controller 0x1: Manually controlled by LBST logic
16	FORCE_IE_CA	SW : RW Force IE to turn on all the command/address pads 0x0: Stop forcing IE 0x1: Force to turn on
15:14	READ_BURST	SW : RW Controls numbers of data burst per matching read command: 0x0: 4 burst of data 0x1: 8 burst of data 0x2: 16 burst of data 0x3: unused
13	IGNORE_IDLE_CMD	SW : RW Controls whether IDLE command will be ignored in MISR operation 0x0: Don't ignore zero data 0x1: Ignore zero data
12	IGNORE_ZERO_DQ	SW : RW Controls whether zero data will be ignored or not in MISR operation 0x0: Don't ignore zero data 0x1: Ignore zero data

EBI1_CH0_LBST_CNTL (cont.)

Bits	Name	Description
11:10	MISR_TRIG_DQ	SW : RW Specify condition that triggers shifting of DQ MISR: 0x0: When DQ FIFO is not empty 0x1: by matching command 0x2: by external shift enable bit 0x3: CSR controlled enable. Turned on by writing to START_SHIFT_PRPG. Turned off by writing to STOP_SHIFT_PRPG.
9:8	MISR_TRIG_CA	SW : RW Specify condition that triggers shifting of CA MISR: 0x0: when CMD FIFO is not empty and command matches 0x1: unused 0x2: by external shift enable bit 0x3: CSR controlled enable. Turned on by writing to START_SHIFT_PRPG. Turned off by writing to STOP_SHIFT_PRPG.
7:6	MISR_MODE_DQ	SW : RW Operating mode for DQ MISRs 0x0: Hold 0x1: Parallel-in parallel-out FF buffer 0x2: LFSR 0x3: Shift register only
5:4	MISR_MODE_CA	SW : RW Operating mode for CA MISR 0x0: Hold 0x1: Parallel-in parallel-out FF buffer 0x2: LFSR 0x3: Shift register only
3:2	LB_MODE_DQ	SW : RW Controls loop-back path within DIMs for write data 0x0: Normal functional mode 0x1: External loop-back mode 0x2: Do not use. 0x3: Internal loop-back mode
1	LB_CK_SEL_CA	SW : RW Controls which of the 2 memory clocks is used in command/address loop back 0x0: use rank 0's clock 0x1: use rank 1's clock
0	LB_MODE_CA	SW : RW Controls loop-back path within DIMs for command/address 0x0: path is disabled 0x1: path is enabled

0x00AD0004 EBI1_CH0_LBST_MISR_CA

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

LBST MISR register for command & address. Software can either read out this register to get the signature results, or write to this register to set up the seed for PRPG.

EBI1_CH0_LBST_MISR_CA

Bits	Name	Description
31:0	MISR_VAL	SW : RW MISR value

0x00AD0008 EBI1_CH0_LBST_MISR_DQ_EVEN

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

LBST MISR register for even data burst. Software can either read out this register to get the signature results, or write to this register to set up the seed for PRPG.

EBI1_CH0_LBST_MISR_DQ_EVEN

Bits	Name	Description
31:0	MISR_VAL	SW : RW MISR value

0x00AD000C EBI1_CH0_LBST_MISR_DQ_ODD

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

LBST MISR register for odd data burst. Software can either read out this register to get the signature results, or write to this register to set up the seed for PRPG.

EBI1_CH0_LBST_MISR_DQ_ODD

Bits	Name	Description
31:0	MISR_VAL	SW : RW MISR value

0x00AD0010 EBI1_CH0_LBST_COUNT_CA_ALL

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

This register displays the CA counter value. The counter counts number of all the looped-back commands burst. In SDR command mode, a burst equals to one DRAM command shots. In DDR mode, a burst equals to two DRAM command shots. The counter freezes at 0xFFFF.

EBI1_CH0_LBST_COUNT_CA_ALL

Bits	Name	Description
31:0	COUNT	SW : RW Counter value

0x00AD0014 EBI1_CH0_LBST_COUNT_CA_CMPR

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

This register displays the CA counter value. The counter counts number of all the looped-back commands burst that match the compare value and enable conditions. In SDR command mode, a burst equals to one DRAM command shots. In DDR mode, a burst equals to two DRAM command shots. The counter freezes at 0xFFFF.

EBI1_CH0_LBST_COUNT_CA_CMPR

Bits	Name	Description
31:0	COUNT	SW : R/W Counter value

0x00AD0018 EBI1_CH0_LBST_COUNT_DQ_ALL

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

This register displays the DQ counter value. The counter counts number of all the looped-back DQ data. One DQ data cycle equals to two DQ bursts. The counter freezes at 0xFFFF.

EBI1_CH0_LBST_COUNT_DQ_ALL

Bits	Name	Description
31:0	COUNT	SW : R/W Counter value

0x00AD001C EBI1_CH0_LBST_COUNT_DQ_CMPR

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

This register displays the DQ counter value. The counter counts number of all the looped-back DQ data cycle that are non-zero if the IGNORE_ZERO_DATA in LBST_CNTL is turned on. One DQ data cycle equals to two DQ bursts. The counter freezes at 0xFFFF.

EBI1_CH0_LBST_COUNT_DQ_CMPR

Bits	Name	Description
31:0	COUNT	SW : R/W Counter value

0x00AD0030 EBI1_CH0_LBST_CMPR_VAL_CA_EVEN

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

The command/address compare value for even address burst. If the looped-back CA match the compare value after the LBST_CMPR_EN_CA_EVEN is applied, the matching condition can be used to trigger read data generation. It will also increment the CA compare counter.

EBI1_CH0_LBST_CMPR_VAL_CA_EVEN

Bits	Name	Description
31:29	RESERVED_31_29	
28:8	CMPR_CA	SW : RW Compare value for command/address. Bit definition varies depending on the DRAM technologies.
7:6	CMPR_RESET_N	SW : RW Compare value for RESET_N of both ranks.
5:4	CMPR_CS_N	SW : RW Compare value for CS_N of both ranks.

EBI1_CH0_LBST_CMPR_VAL_CA_EVEN (cont.)

Bits	Name	Description
3:2	CMPR_CKE	SW : RW Compare value for CKE of both ranks.
1:0	CMPR_ODT	SW : RW Compare value for ODT of both ranks.

0x00AD0034 EBI1_CH0_LBST_CMPR_VAL_CA_ODD

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

The command/address compare value for odd address burst. If the looped-back CA match the compare value after the LBST_CMPR_EN_CA_ODD is applied, the matching condition can be used to trigger read data generation. It will also increment the CA compare counter.

EBI1_CH0_LBST_CMPR_VAL_CA_ODD

Bits	Name	Description
31:18	RESERVED_31_18	
17:8	CMPR_CA	SW : RW Compare value for odd command/address in LPDDR2 mode.
7:0	RESERVED_7_0	

0x00AD0038 EBI1_CH0_LBST_CMPR_EN_CA_EVEN

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

The command/address compare Enable for even address burst. The Enable bits of corresponding DRAM command/address bits match the definitions in LBST_CMPR_VAL_CA_EVEN.

EBI1_CH0_LBST_CMPR_EN_CA_EVEN

Bits	Name	Description
31	CMPR_NOT	SW : RW Inverse the compare condition so a match means NOT equal to the compare value and enable conditions.
30:29	RESERVED_30_29	

EBI1_CH0_LBST_CMPR_EN_CA_EVEN (cont.)

Bits	Name	Description
28:8	CMPR_EN_CA	SW : RW Enable bit for command/address compare. 0x0: don't care. 0x1: compare enabled.
7:0	CMPR_EN_CMD	SW : RW Enable bit for command compare. 0x0: don't care. 0x1: compare enabled.

0x00AD003C EBI1_CH0_LBST_CMPR_EN_CA_ODD

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

The command/address compare Enable for odd address burst. The Enable bits of corresponding DRAM command/address bits match the definitions in LBST_CMPR_VAL_CA_ODD.

EBI1_CH0_LBST_CMPR_EN_CA_ODD

Bits	Name	Description
31:18	RESERVED_31_18	
17:8	CMPR_EN_CA	SW : RW Enable bit for command/address compare. 0x0: don't care. 0x1: compare enabled.
7:0	RESERVED_7_0	

0x00AD0040 EBI1_CH0_LBST_CNTL2

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

LBST logic control register 2.

EBI1_CH0_LBST_CNTL2

Bits	Name	Description
31:2	RESERVED_31_2	

EBI1_CH0_LBST_CNTL2 (cont.)

Bits	Name	Description
1	IGNORE_DM	SW : RW When the loop-back data is written into MISR, This bit controls whether the DM bits are used to mask off the data (to force it to zero) or not. 0x0: consider DM bits. Zero the data only when DM is asserted 0x1: Ignore DM bits. Always take the data bit directly
0	MODE_SYNC_DRIVE_PRPG	SW : RW Controls the flop delay along the i_drive_prpg input path. 0x0: i_drive_prpg is feed into a DDR_1x demet directly 0x1: i_drive_prpg is going through 5-stage XO flops then goes to DDR_1x demet

13.3 EBI1 CH1 Registers (0x00D00000 EBI1_CH1_BASE)

This section contains the EBI1 CH1 registers.

The HSDDRx generation 5 memory controller core is an AXI r0p0+ slave that provides a high-performance, low-latency, 32-bit wide interface to LPDDR, LPDDR2, PCDDR2 or PCDDR3 memory.

This section describes the Configuration Status Registers which are available to software for configuring the HSDDRx memory controller core. The configuration registers in the core are organized into the following sub groups based on register functionality.

The access to configuration registers is performed via the AHB bus.

Table 13-4 HSDDRx Register Categories Grouped by Functionality

Function	Prefix	Address Bit (19:16)
Wrapper Configuration Registers	TOP	000x
AXI Performance Monitors	PMON_AXI	0010
DDR Performance Monitors	PMON_DDR	0011
AXI Configuration Registers	SLV	010x
MPU Configuration Registers	HSDDR_MPU	011x
DDRx Configuration Registers	DDR	10xx
LBST Configuration Registers	LBST	11xx

13.3.1 EBI1 CH1 HSDDRx Registers

13.3.1.1 Top-Level Wrapper Registers

0x00D00004 EBI1_CH1_TOP_MISC_CNTL

Type: Read/Write
Clock: CLK_XO
Reset State: 0x0004A0A8

Top level Miscellaneous Control register.

EBI1_CH1_TOP_MISC_CNTL

Bits	Name	Description
31:21	RESERVED_31_21	

EBI1_CH1_TOP_MISC_CNTL (cont.)

Bits	Name	Description
20	IOCAL_UPDATE_METHOD	SW : RW Specify a way to update command/address IO pads' PCNT/NCNT values. 0x0: Update when the bus is idle but CK could be running 0x1: Update when the memory is in self-refresh state and CK is not running
19:16	IOCAL_UPDATE_PULSE_WIDTH	SW : RW Number of DDR1X clock cycles for the pulse for IOCal updates. 0x0: reserved 0x1: 1 DDR 1x cycle 0x2: 2 DDR 1x cycles 0x3: 3 DDR 1x cycles 0x4: 4 DDR 1x cycles 0x5: 5 DDR 1x cycles 0x6: 6 DDR 1x cycles 0x7: 7 DDR 1x cycles 0x8: 8 DDR 1x cycles 0x9: 9 DDR 1x cycles 0xA: 10 DDR 1x cycles 0xB: 11 DDR 1x cycles 0xC: 12 DDR 1x cycles 0xD: 13 DDR 1x cycles 0xE: 14 DDR 1x cycles 0xF: 15 DDR 1x cycles
15	CLKON_DDR_PIPE_MANUAL	SW : RW Control pipeline DDR 1x on/off in clkon manual mode 0x0: Off 0x1: On
14	MODE_CLKON_DDR_PIPE	SW : RW Mode to control clkon for pipeline DDR 1X 0x0: controlled by CLKON_DDR_PIPE_MANUAL 0x1: controlled by internal logic
13	CLKON_DDR_2X_MANUAL	SW : RW Control clk_ddr_2x on/off in clkon manual mode 0x0: Off 0x1: On
12	MODE_CLKON_DDR_2X	SW : RW Mode to control clkon for clk_ddr_2x 0x0: controlled by CLKON_DDR_2X_MANUAL 0x1: controlled by internal logic
11	MODE_MEM_HALT	SW : RW Memory mode used when SW requests clock switching. 0x0: self-refresh mode 0x1: clock-stop/power-down mode

EBI1_CH1_TOP_MISC_CNTL (cont.)

Bits	Name	Description
10:8	TEST_CLK_SEL	SW : RW Test clock select: 0x0: no clock output_1 0x1: ddr_1x 0x2: clk_axi 0x3: clk_ahb 0x4: clk_xo 0x5: no clock output_2 0x6: dqs positive edge 0x7: dqs negative edge
7	CLKON_AHB_MANUAL	SW : RW Control clk_ddr on/off in clkon manual mode 0x0: Off 0x1: On
6	MODE_CLKON_AHB	SW : RW Mode to control clkon for clk_ahb 0x0: controlled by CLKON_AHB_MANUAL 0x1: controlled by internal logic
5	CLKON_DDR_1X_MANUAL	SW : RW Control clk_ddr on/off in clkon manual mode 0x0: Off 0x1: On
4	MODE_CLKON_DDR_1X	SW : RW Mode to control clkon for clk_ddr_1x 0x0: controlled by CLKON_DDR_1X_MANUAL 0x1: controlled by internal logic
3	CLKON_AXI_MANUAL	SW : RW Control clk_axi on/off in clkon manual mode 0x0: Off 0x1: On
2	MODE_CLKON_AXI	SW : RW Mode to control clkon for clk_axi 0x0: controlled by CLKON_AXI_MANUAL 0x1: controlled by internal logic
1:0	RESERVED_1_0	

13.3.1.2 Performance Monitor Registers

0x00D20000 EBI1_CH1_PMON_AXI_CNTL

Type: Read/Write
Clock: CLK_AXI
Reset State: 0x00000000

Performance Monitor Control register.

EBI1_CH1_PMON_AXI_CNTL

Bits	Name	Description
31:17	RESERVED_31_17	
16	INTERRUPT	SW : R 0x0: No interrupt 0x1: Interrupt occurred
15:3	RESERVED_15_3	
2	RESET_COUNTER	SW : W write to '1' resets all the counters
1	STOP_COUNTER	SW : W write to '1' causes all the counters stop counting
0	START_COUNTER	SW : W write to '1' causes all the counters start counting

0x00D20004 EBI1_CH1_PMON_AXI_INTERRUPT

Type: Read/Write
Clock: CLK_AXI
Reset State: 0x00000000

Performance Monitor Interrupt Event Counter register.

EBI1_CH1_PMON_AXI_INTERRUPT

Bits	Name	Description
31:0	INT_EVENT_CNT	SW : RW Number of counter 0 events that will trigger interrupt

0x00D20008 EBI1_CH1_PMON_AXI_SOURCE_0

Type: Read/Write
Clock: CLK_AXI
Reset State: 0x00000000

Performance Monitor Source Control register 0.

EBI1_CH1_PMON_AXI_SOURCE_0

Bits	Name	Description
31:4	RESERVED_31_4	
3:0	PMON_SOURCE	SW : RW Specify the source of the performance monitor counter

0x00D2000C EBI1_CH1_PMON_AXI_COUNT_0

Type: Read
Clock: CLK_AXI
Reset State: 0x00000000

Performance Monitor Count register 0.

EBI1_CH1_PMON_AXI_COUNT_0

Bits	Name	Description
31:0	PMON_COUNT	SW : R Contains the current counter value

0x00D20010 EBI1_CH1_PMON_AXI_SOURCE_1

Type: Read/Write
Clock: CLK_AXI
Reset State: 0x00000000

Performance Monitor Source Control register 1.

EBI1_CH1_PMON_AXI_SOURCE_1

Bits	Name	Description
31:4	RESERVED_31_4

13.3.1.3 AXI Slave Registers

0x00D40000 EBI1_CH1_SLV_CONFIG

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x80400003

AXI Slave Configuration Register.

This register defines the core interface configuration and memory controller clocking modes.

EBI1_CH1_SLV_CONFIG

Bits	Name	Description
31	CLKON_DISABLE	The slave logic's AXI CLKON signal will be de-asserted when the slave is idle and no data remains in the write data or command buffer. Additionally, AXI_AREADY and AXI_WREADY will be de-asserted when AXI CLKON is de-asserted. The AXI CLKON signal from the slave logic will be constantly driven to 1 and AXI_AREADY and AXI_WREADY will never be de-asserted due to de-asserting the AXI CLKON. 0x0: Disable 0x1: Enable
30:26	RESERVED_30_26	Reserved
25:16	CLKON_IDLE_TIMER	The number of AXI clock cycles that AXI CLKON will remain high after the slave is idle and the write data and command buffers are empty. 0x0: Reserved
15:14	RESERVED_15_14	Reserved
13:12	INTERLEAVE	Defines the way that bus system slave reconstructs the system address for MPU, error capture. 0x0: Disabled 0x1: Done at 1K Granularity 0x2: Done at 2K Granularity 0x3: Done at 4K Granularity
11:10	RESERVED_11_10	Reserved

EBI1_CH1_SLV_CONFIG (cont.)

Bits	Name	Description
9:8	CMD_ORDERING	Defines command reordering strategy (Based on the OOORD signal. OOOWT is not used since all buffered responses are returned immediately. Potentially lower power, higher average latency.) (All transactions from a particular master will be executed in time order. Reordering can occur between masters. Potentially more power, lower average latency.) (All transactions will be executed in time order, independent of the master association.) 0x0: reordering (default) 0x1: in-order per master 0x2: in-order globally 0x3: Reserved
7:3	RESERVED_7_3	RFU
2:0	CMD_Q_DEPTH	Defines number of outstanding requests that may be queued up for processing 0x0: 1 0x1: 2 0x2: 3 0x3: 4 0x4: 5 0x5: 6 0x6: 7 0x7: 8

0x00D40004 EBI1_CH1_SLV_RD_CONFIG

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x000B000F

Read Buffer Configuration Register

EBI1_CH1_SLV_RD_CONFIG

Bits	Name	Description
31:22	RESERVED_31_22	RFU
21:16	RD_CMD_FIFO_DEPTH	Sets the maximum number of read command FIFO entries that may be used at any time. The AXI slave will use at most RD_CMD_FIFO_DEPTH + 1 entires. For example setting this field to 0x0F allows all 16 entires of the buffer to be used.
15:6	RESERVED_15_6	RFU

EBI1_CH1_SLV_RD_CONFIG (cont.)

Bits	Name	Description
5:0	RD_DATA_FIFO_DEPTH	Sets the maximum number of 64 bit Read Buffer entries that may be used at any time. The Read Buffer will use at most RD_FIFO_DEPTH + 1 entires. For example setting this field to 0x3F allows all 64 entires of the buffer to be used. Must not be less than 0xF.

0x00D40008 EBI1_CH1_SLV_RD_STATUS

Type: Read
Clock: AXI_CLK
Reset State: 0x0000FF00

EBI1_CH1_SLV_RD_STATUS

Bits	Name	Description
31:28	RESERVED_31_28	RFU
27:24	RDQUAL_FIFO_ENTRIES_IN_USE	The number of read qualifier FIFO entries that have been reserved for use by reads commands sent to the DDR controller.
23:16	RDDATA_FIFO_ENTRIES_IN_USE	The number of read data FIFO entries that have been reserved for use by reads commands sent to the DDR controller.
15:8	RDDATA_FIFO_EMPTY	The empty status of each of the read data FIFOs. Bit 8 corresponds to the positive-edge dq[0] FIFO. Bit 9corresponds to the positive-edge dq[1] FIFO. Bit 10corresponds to the positive-edge dq[2] FIFO. Bit 11corresponds to the positive-edge dq[3] FIFO. Bit 12corresponds to the negative-edge dq[0] FIFO. Bit 13corresponds to the negative-edge dq[1] FIFO. Bit 14corresponds to the negative-edge dq[2] FIFO. Bit 15corresponds to the negative-edge dq[3] FIFO
7:1	RESERVED_7_1	RFU
0	DQS_ERROR	Set by the hardware if the read data FIFOs have been non-empty while no read commands where outstanding since reset. This bit being set is a strong indication of a spurious DQS edge.

0x00D4000C EBI1_CH1_SLV_WR_CONFIG

Type: Read/Write
Clock: AXI_CLK
Reset State: 0xD70F040F

Write Buffer Configuration Register

The write coalescing buffer is part of the write data path and cannot be completely disabled. However, all read merging and all write coalescing across bursts can be disabled via the SLV_WR_CONFIG register. Beats within narrow (each beat transfers less than the bus width) bursts may be coalesced in any configuration.

EBI1_CH1_SLV_WR_CONFIG

Bits	Name	Description
31	COALESCE_EN	Enable write coalescing. When enabled, data from separate AXI bursts will coalesced. Packing of narrow beats from a single burst is always allowed. 0x0: Disable 0x1: Enable
30	READ_MERGE_EN	Enable read merging with Write Coalescing buffer data. When disabled reads are not executed while the required data is in the write buffer. Also, the Write Buffer is flushed after each burst. 0x0: Disable 0x1: Enable
29	FLUSH	When set to 1, the hardware will flush the Write Coalescing Buffer. Hardware will clear this bit when the requested flush is complete.
28	EMPTY	1 when any valid data exists in the Write Coalescing Buffer. Read-only to software.
27	WRITE_BLOCK_READ	When set, no read command is allowed to execute while there is any write data in the buffer or there are any write commands in the write command buffer. When the Read Command Buffer is limited to one command, read merging is disabled and write coalescing is disabled and this bit is set, the DDR controller will execute commands in the order in which they were received on the AXI bus.
26:24	CMD_BUF_DEPTH	
23:21	RESERVED_23_21	RFU
20:16	FLUSH_UPPER_LIMIT	The flush high water mark. Flushing will begin when the number of valid lines in the Write Coalescing Buffer is greater than FLUSH_UPPER_LIMIT. FLUSH_UPPER_LIMIT must be less than or equal to the number of lines specified in WR_BUFFER_DEPTH. Also, FLUSH_UPPER_LIMIT must be greater than FLUSH_LOWER_LIMIT.
15:13	RESERVED_15_13	RFU
12:8	FLUSH_LOWER_LIMIT	The flush low water mark. Once flushing has begun, lines will be flushed until the number of valid lines is less than or equal to FLUSH_LOWER_LIMIT.
7:5	RESERVED_7_5	RFU
4:0	WR_BUFFER_DEPTH	Sets the maximum number of Write Coalescing Buffer lines that may be used at any time. The Write Coalesing Buffer will use at most WR_BUFFER_DEPTH + 1 entires. For example setting this field to 0xF allows 16 entires of the buffer to be used. Must not be less than 0x5.

0x00D40010 EBI1_CH1_SLV_FLUSH_CONFIG

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x8000800F

Write Buffer Flush Configuration Register

EBI1_CH1_SLV_FLUSH_CONFIG

Bits	Name	Description
31:30	FLUSH_PRIORITY	When the high water mark (see SLV_WR_CONFIG) has been reached, flush the lines with a priority of FLUSH_PRIORITY.
29	RESERVED_29	RFU
28	FLUSH_IN_ORDER	Write Coalescing Buffer lines are flushed in the order in which they were created
27:18	RESERVED_27_18	RFU
17:8	FLUSH_IDLE_DELAY	After the controller is idle for FLUSH_IDLE_DELAY AXI cycles, the Write Buffer will be flushed.
7:0	PAGE_HIT_WINDOW	If the last line was flushed less than PAGE_HIT_WINDOW AXI cycles ago, lines within the same page as the last victim are preferred. Otherwise, lines are flushed oldest to youngest.

0x00D40014 EBI1_CH1_SLV_ID_REVISION

Type: Read
Clock: AXI_CLK
Reset State: 0x00005310

Revision ID Register

This register contains the revision numbers of DDR controller core.

EBI1_CH1_SLV_ID_REVISION

Bits	Name	Description
31:16	RESERVED_31_16	
15:12	REV_MAJOR	Major Revision

3:0	RESERVED_3_0	

0x00D40020+4*n EBI1_CH1_SLV_ADDR_BASE_CSn, n=[0..1]

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x00000000

System Base Address Register for n

This register defines the base address for the memory that associates to chip select n.

When using ADDR_MAP_MODE == 2'b10 (see SLV_ADDR_MAP_CSn), the base address must be the base address of the entire space allocated to the controller.

EBI1_CH1_SLV_ADDR_BASE_CSn

Bits	Name	Description
31:16	RESERVED_31_16	
15:8	BASE_ADDR	Defines the Base Address decode, in conjunction with the SLV_ADDR_MAP_CSn, to determine the address space of the targeted chip select. The Base Address is compared to the AXI address bus bits [31:24]. If the portions of the two addresses match, then the particular CS is accessed.
7:0	RESERVED_7_0	RFU

0x00D40030+4*n EBI1_CH1_SLV_ADDR_MAP_CSn, n=[0..1]

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x00000100

System Address Mapping Register for Rank n.

This register defines the way to map AXI system address into rank/bank/row/column address to memory devices. Once the number of bank, row size and column size are defined, the memory size of the associated rank is defined.

NOTE When ADDR_MAP_MODE is set to 2'b10 and the controller both ranks must be programmed identically with respect to the SLV_ADDR_BASE_CSn, SLV_ADDR_MAP_CSn and SLV_ADDR_SIZE_MASK_CSn registers.

EBI1_CH1_SLV_ADDR_MAP_CSn

Bits	Name	Description
31:16	RESERVED_31_16	

EBI1_CH1_SLV_ADDR_MAP_CSn (cont.)

Bits	Name	Description
15	RANK_EN	Rank has memory devices attached 0x0: Rank not present (default) 0x1: Rank is present
14	RESERVED_14	RFU
13:12	ADDR_MAP_MODE	Addressing Mode Configuration. Selects the Addressing Mode of the Rank and determines the mapping of the System Address to the Memory Address. Configuring the AddrMode for "Rank,Bank, Row, Column" mode will map the system address in manner that is compatible with the Partial Array Self-Refresh Mechanism. The Partial Array Self-Refresh Mechanism is not supported unless AddrMode is configured for "Rank,Bank,Row,Column" mode. Mapping mode 10 (Row, Bank, Rank, Column) requires that the memory device on each rank has the same row, bank and column width and that SLV_ADDR_BASE_CSn, SLV_ADDR_SIZE_MASK_CSn and SLV_ADDR_MAP_CSn are programmed identically for each rank. Those registers are programmed as normal, according to the device parameters. 0x0: Rank, Row, Bank, Column (default) 0x1: Rank, Bank, Row, Column 0x2: Row, Bank, Rank, Column 0x3: Reserved
11:9	RESERVED_11_9	RFU
8	NUM_BANK	Specifies the number of banks in the memory device. 0x0: 4 banks 0x1: 8 banks (default)
7:6	RESERVED_7_6	RFU
5:4	WIDTH_ROW	Specifies the number of bits used for the row address of the external memory 0x0: 12 bits (default) 0x1: 13 bits 0x2: 14 bits 0x3: 15 bits
3:2	RESERVED_3_2	RFU
1:0	WIDTH_COL	Specifies the number of bits used for the column address of the external memory 0x0: 8 bits (default) 0x1: 9 bits 0x2: 10 bits 0x3: 11 bits

1	ERR_AOOOWR	The AOOOWR of the request that caused the bus error 0x0: in order 0x1: out of order
0	ERR_AWRITE	The awrite of the request that caused bus error 0x0: read 0x1: write

0x00D40114 EBI1_CH1_SLV_ERR_CNTL

Type: Read/Write
Clock: AXI_CLK
Reset State: 0x00001000

Slave Error Code Register.

This register provides additional data about the bus error. Additionally, each slave which is capable of detecting an error is also required to have a single programmable register that can be used to optionally interrupt the processor core. This interrupt mechanism is required since write transfers may be posted on the bus and the AXI transfer may complete prior to the occurrence of the error in the AXI interconnect or slave device. The interrupt from the AXI interconnect and the AXI slave devices will be directed to the interrupt controller.

EBI1_CH1_SLV_ERR_CNTL

Bits	Name	Description
31:16	RESERVED_31_16	
15:13	RESERVED_15_13	
12	IRQ_EN	Mask off the bus error interrupt to processor 0x0: disables IRQ 0x1: enables IRQ (default)
11:9	RESERVED_11_9	
8	CLEAR_ERR	Clear error status bit Writing a '1' to this bit will clear the ERR_OCCURRED bit in this register. It will NOT clear other error registers. 0x0: no clear (default) 0x1: clear
7:5	RESERVED_7_5	
4	ERR_OCCURRED	Error Status bit to indicate that an error has occurred. This bit can be set by software. To clear this bit a '1' must be written to the CLEAR_ERR field. Writing a '0' to this field has no effect. 0x0: no error occurred 0x1: error occurred
3:2	RESERVED_3_2	
1:0	ERR_CODE	MPU error and address decode error: Writes to this field are ignored. 0x0: no error (default) 0x1: address decode error 0x2: mpu error 0x3: both

AXI Slave Performance Monitors

Table 13-5 AXI Slave Performance Monitor event index

Index	Description
0	AXI cycles
1	AXI address channel commands accepted
2	AXI address channel commands matching the attribute in SLV_PMON_CFG_ACHAN
3	High priority AXI address channel commands accepted
4	Number of AXI cycles in which the number of reserved global monitors is greater than or equal to SLV_PMON_CFG_0[N_MONITORS]
5	Number of AXI cycles in which the number of read commands in the read command buffer is greater than or equal to SLV_PMON_CFG_0[N_RD_CMDS]
6	Number of AXI cycles in which the number of write commands in the write command buffer is greater than or equal to SLV_PMON_CFG_0[N_WR_CMDS]
7	Number of AXI cycles in which the number of reserved read data FIFO entires is greater than or equal to SLV_PMON_CFG_0[N_RD_DATA_ENTRIES]
8	Number of AXI cycles in which the number of reserved read qualifier FIFO entires is greater than or equal to SLV_PMON_CFG_0[N_RD_QUAL_ENTRIES]
9	Number of AXI cycles in which the number of valid write data buffer lines is greater than or equal to SLV_PMON_CFG_0[N_WR_DATA]
10	The number of read commands that fully or partially hit in the write buffer
11	The number of write commands that fully or partially hit in the write buffer
12	TBD - Hazards

AXI Performance Monitor event index 2 records the number of address channel requests that match the following fields. The fields can be independently enabled/disabled with the MATCH_* fields in SLV_PMON_CFG_0. When an address channel request is accepted from the bus its attributes are compared to the fields of this register. If all enabled fields in SLV_PMON_CFG_ACHAN (see SLV_PMON_CFG_0) match the address channel request, the performance monitor is incremented. Any disabled fields match all transactions.

EBI1_CH1_SLV_PMON_CFG_ACHAN

Bits	Name	Description
31:16	AMID	AMID field of transactions to be counted with performance monitor index 2.
15:13	RESERVED_15_13	RFU
12:8	ATID	ATID field of transactions to be counted with performance monitor index 2.

13.3.1.4 MPU Configuration Registers

0x00D60000+ 4*n EBI1_CH1_MPU_PRTn_RACR, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU. These registers include a single bit per VMID granting read access

EBI1_CH1_MPU_PRTn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x00D60400+ 4*n EBI1_CH1_MPU_PRTn_WACR, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU.

EBI1_CH1_MPU_PRTn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x00D60800+4*n EBI1_CH1_MPU_PRTn_START, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition Start Address Register. This register contains the start address of the partition. Only the bit numbers indicated by MPU_IDR[MSb] through MPU_IDR[LSb] are valid and physically exist.

EBI1_CH1_MPU_PRTn_START

Bits	Name	Description
31:12	ADDR	MPU Partition Start Address
11:0	RESERVED_11_0	Reserved

0x00D60C00+4*n EBI1_CH1_MPU_PRTn_END, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition End Address Register. This register contains the start address of the partition.Only the bit numbers indicated by MPU_IDR[MSB] through MPU_IDR[LSB] are valid and physically exist.

EBI1_CH1_MPU_PRTn_END

Bits	Name	Description
31:12	ADDR	MPU Partition End Address
11:0	RESERVED_11_0	Reserved

0x00D60F80 EBI1_CH1_MPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Configuration Register: This register includes fields governing various MPU behaviors.

EBI1_CH1_MPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set MPU_ESR. MPU_EAR and MPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set MPU_ESR. MPU_EAR and MPU_ESYNR0 updated with address and syndrome of error.
2	MPUEIE	MPU Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the MPU. Interrupt output is asserted if MPU_CR[MPUEIE] = 1 and any bit is set in MPU_ESR.
1	MPUERE	MPU Error Report Enable. MPUERE = 0 causes the MPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. MPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective MPU port. Errors from either port are terminated by the MPU as RAZ/WI Both client and configuration port errors are recorded in MPU_ESR, independent of the value of MPU_CR[MPUERE]
0	MPUE	MPU Enable. Governs whether MPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures MPU and the MID to VMID mapping tables.

0x00D60F84 EBI1_CH1_MPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the MPU, for both the client port and the configuration port.

EBI1_CH1_MPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x00D60F88 EBI1_CH1_MPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the MPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the MPU's interrupt output (when enabled by MPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the MPU_ESYNRn registers, which are merely the "syndrome" of an error indicated by MPU_ESR.

EBI1_CH1_MPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x00D60F8C EBI1_CH1_MPU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Restore Register. This register is an aliased address for the MPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

EBI1_CH1_MPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x00D60F90 EBI1_CH1_MPU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

EBI1_CH1_MPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x00D60F94 EBI1_CH1_MPU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

EBI1_CH1_MPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x00D60FF4 EBI1_CH1_MPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

MPU Revision Register: This register provides major/minor revision codes for the implementation.

EBI1_CH1_MPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x00D60FF8 EBI1_CH1_MPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x1F0C2C0F

MPU ID Register: Read-only register that defines various configuration attributes of the MPU instance.

EBI1_CH1_MPU_IDR

Bits	Name	Description
31:29	RESERVED31_29	Reserved
28:24	MSB	Indicates most significant address bit number used in START/END address comparisons.
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used in START/END address comparisons.
15:14	RESERVED15_12	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only MPU_PRTn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate MPU_PRTn_RACR and MPU_PRTn_WACR registers govern read vs. write access. For single VMID, MPU_PRTn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields

EBI1_CH1_MPU_IDR (cont.)

Bits	Name	Description
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. MPU_PRTn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMD type access control. MPU_PRTn_xACR registers include separate bit per VMID (32 bits) for governing access.
9:8	RESERVED9_8	Reserved
7:0	NPRT	Number of partitions. Indicates the number of partitions (minus 1) supported by the MPU. Values range from 0-223 (1-224 partitions)

0x00D60FFC EBI1_CH1_MPU_MPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

MPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the MPU (including the MPU_MPU_ACR itself).

EBI1_CH1_MPU_MPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the MPU's 4KB address region (including the MPU_MPU_ACR itself). For single VMID type MPUs (MPU_IDR[MV] = 0) the MPU_MPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

13.3.1.5 DDR Configuration Registers

0x00D80000 EBI1_CH1_DDR_DEVICE_CONFIG

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Memory Configuration Register.

The register is used to set up DRAM configuration in the DDR controller

EBI1_CH1_DDR_DEVICE_CONFIG

Bits	Name	Description
31:28	RESERVED_31_28	
27:26	DEVICE_CONFIG_RANK1	SW: RW, HW: R Device Configuration for Rank 1. This is required for SRR in order to update the refresh rate correctly if multiple devices are involved. 0x0: reserved (default) 0x1: x8,x8,x8,x8 0x2: x16, x16 0x3: x32
25:24	DEVICE_CONFIG_RANK0	SW: RW, HW: R Device Configuration for Rank 0. This is required for SRR in order to update the refresh rate correctly if multiple devices are involved. 0x0: reserved (default) 0x1: x8,x8,x8,x8 0x2: x16, x16 0x3: x32
23:18	RESERVED_23_18	
17	INIT_DONE_RANK1	SW: RW, HW: R DDR Software initialization Complete SW writes this bit after initialization is complete for rank 1. 0x0: init incomplete (default) 0x1: init complete
16	INIT_DONE_RANK0	SW: RW, HW: R DDR Software initialization Complete SW writes this bit after initialization is complete for rank 0. 0x0: init incomplete (default) 0x1: init complete
15:14	NUM_BANKS	SW: RW, HW: R Indicates number of banks of the SDRAM device. Typically, LPDDR1 devices are 4 bank only, LPDDR2 & PCDDR2 devices can be 4 or 8 bank while PCDDR3 devices are 8 bank only. 0x0: 4 (default) 0x1: 8 0x2: Reserved_1 0x3: Reserved_2
13:12	RESERVED_13_12	

EBI1_CH1_DDR_DEVICE_CONFIG (cont.)

Bits	Name	Description
11:10	CLK_SYNC_MODE	SW: R, HW: RW DDR clocked programmed by SW. Read Only. 0x0: Asynchronous (default) 0x1: Synchronous 0x2: Iso Synchronous 0x3: Reserved
9:7	DEVICE_TYPE	SW: RW, HW: None Specify DRAM Device Type. 0x0: LPDDR (default) 0x1: LPDDR2-S2 0x2: LPDDR2-S4 0x3: PCDDR2 0x4: PCDDR3 0x5: Reserved_1 0x6: Reserved_2 0x7: Reserved_3
6	RESERVED_6	
5	MEM_CLK_CONFIG	SW: RW, HW: R Rank Clock Configuration: Note that the initialization of the individual memory ranks is otherwise unchanged when using this feature. 0x0: CK0 drives both Rank 0 and 1 (default) 0x1: CK0 for Rank0 and CK1 for Rank1
4	DDR_COMMAND_BUS	SW: RW, HW: R Specify if DDR needs to be used on the command bus (in addition to the data bus). This needs to be enabled LPDDR2 SDRAM devices & disabled for others. 0x0: Disable (default) 0x1: Enable
3:2	RESERVED_3_2	
1	RANK1_EN	SW: RW, HW: R Rank 1 is present 0x0: Rank not present (default) 0x1: Rank is present
0	RANK0_EN	SW: RW, HW: R Rank 0 is present. 0x0: Rank not present (default) 0x1: Rank is present

0x00D80004 EBI1_CH1_DDR_DEVICE_STATUS

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Device Status Register

This register enables software to read memory device status.

EBI1_CH1_DDR_DEVICE_STATUS

Bits	Name	Description
31:18	RESERVED_31_18	
17	INTERRUPT_EN	SW: RW, HW: R Interrupt will be generated if temperature out-of-range is detected i.e RANK0/1_TEMP_OO_RANGE is set. The interrupt will be set (sticky behavior) until SW can clear it by clearing the RANK0/1_TEMP_OO_RANGE field. The temperature out of range is due to SRR which is a feature only available in LPDDR1/LPDDR2 devices. 0x0: Disable (default) 0x1: Enable
16	CURR_SEL_REG_FREQ_SWITCH	SW: R, HW: W Indicates which DDR timing register set is being currently used. If DDR_CMD_EXEC_OPT_2[UPDATE_MEM_LATENCY_ON_FREQ_SWITCH] is set, then certain CSR fields in DDR_DRAM_TIMING_6 and DDR_CMD_EXEC_OPT_3 are also shadowed. 0x0: DDR_DRAM_TIMING CSRs (default) 0x1: DDR_DRAM_TIMING_ALT CSRs
15:14	RESERVED_15_14	
13	IN_DEEP_POWER_DOWN_RANK1	SW: R, HW: W Indicates the rank 1 is currently in deep power down mode. Deep power down feature is only available in LPDDR1/LPDDR2 devices. 0x0: Not in deep power down (default) 0x1: in deep power down
12	IN_DEEP_POWER_DOWN_RANK0	SW: R, HW: W Indicates the rank 0 is currently in deep power down mode. Deep power down feature is only available in LPDDR1/LPDDR2 devices. 0x0: Not in deep power down (default) 0x1: in deep power down
11:10	RESERVED_11_10	
9	IN_SELF_RFSH_RANK1	SW: R, HW: W Indicates the rank 1 is currently in self-refresh mode 0x0: Not in self-refresh (default) 0x1: in self-refresh

EBI1_CH1_DDR_DEVICE_STATUS (cont.)

Bits	Name	Description
8	IN_SELF_RFSH_RANK0	SW: R, HW: W Indicates the rank 0 is currently in self-refresh mode 0x0: Not in self-refresh (default) 0x1: in self-refresh
7:6	RESERVED_7_6	
5	RANK1_TEMP_OO_RANGE	SW: RW, HW: W Indicates any out-of-range operating temperature for Rank1 This bit is set to '1' if the SRR read returns a temperature reading that is out of range on the high side. This bit is sticky and can only be cleared by software write. The temperature out of range is due to SRR which is a feature only available in LPDDR1/LPDDR2 devices. 0x0: Within range (default) 0x1: Out of range
4	RANK0_TEMP_OO_RANGE	SW: RW, HW: W Indicates any out-of-range operating temperature for Rank0 This bit is set to '1' if the SRR read returns a temperature reading that is out of range on the high side. This bit is sticky and can only be cleared by software write. The temperature out of range is due to SRR which is a feature only available in LPDDR1/LPDDR2 devices. 0x0: Within range (default) 0x1: Out of range
3:2	RESERVED_3_2	
1	RANK1_IDLE	SW: R, HW: W Rank1 Idle Status. If set, it indicates that there are no transactions to that rank and also indicates that the timing parametes have been satisfied such that if the pages are open, they could be closed. 0x0: Rank Busy (default) 0x1: Rank Idle
0	RANK0_IDLE	SW: R, HW: W Rank0 Idle Status. If set, it indicates that there are no transactions to that rank and also indicates that the timing parameter have been satisfied such that if the pages are open, they could be closed. 0x0: Rank Busy (default) 0x1: Rank Idle

0x00D80010 EBI1_CH1_DDR_MANUAL_CMD

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Manual Command Register

This register enables the software to manually issue commands to DDR SDRAM interface. A value of '1' should be written in the bit field of the command that the software wants to force the controller to perform. (This includes the MRR and MRW bits of the DDR_MR_CNTL_WDATA CSR) Only one bit should be active at any given time, except for the "external clock on", the "reset_n" bit and the "CKE" bit. When the controller has finished executing the command, it will clear the bit (including the MRR, MRW and the RD_DQCAL bits of the DDR_MR_CNTL_WDATA CSR), except for the external clock on bit, the "CKE" bit and the "reset_n" bits. It is the software's responsibility to ensure all timing parameters are satisfied before executing the next manual command before the rank is initialized. Once the rank is initialized, it is HW's responsibility to execute the command when possible. The AUTO_REFRESH and PRECHARGE_ALL commands are not to be used after the rank has been initialized.

Once these bits are set, HW can potentially delay executing the command in order to ensure that the memory timings have been satisfied. (This statement is only applicable after the rank is initialized)

The initialization sequence of the SDRAM device is executed by SW via this register and the DDR_MR_CNTL_WDATA CSR.

EBI1_CH1_DDR_MANUAL_CMD

Bits	Name	Description
31:18	RESERVED_31_18	
17:16	RANK_SEL	SW: RW, HW: R Select which chip select should be targeted for the chosen manual command to be executed. 0x0: Invalid (default) 0x1: CS0 only 0x2: CS1 only 0x3: both CS0 CS1
15	RESERVED_15	
14	CK_ON	SW: RW, HW: R Turns on/off external clock CK, CKN. This bit does not reset automatically. Software must turn it on when the clock to the device needs to be enabled and keep it on.Unitl the rank is initialized, HW would control the clocks based on this setting. 0x0: Off (default) 0x1: On
13	CKE	SW: RW, HW: R Turns on/off clock enable CKE. This bit does not reset automatically. Software must turn it on when the clock to the device needs to be enabled and keep it on.Unitl the rank is initialized, HW would control the CKE based on this setting. 0x0: Off (default) 0x1: On

EBI1_CH1_DDR_MANUAL_CMD (cont.)

Bits	Name	Description
12	RESET_N	SW: RW, HW: R Turns on/off reset pin to PCDDR3 device only. This bit does not reset automatically. Software must turn it on, then turn it off 0x0: Active (default) 0x1: Inactive
11:7	RESERVED_11_7	
6	ENTER_DEEP_PD	SW: RW, HW: R Issue Deep Power Down. This bit is self-cleared once the command is executed. Deep Power down feature is only available on LPDDR1 and LPDDR2 SDRAM devices. HW will check to ensure all commands outstanding to the rank have completed before issuing the DPD command. 0x0: no-op (default) 0x1: Issue DPD
5	EXIT_DEEP_PD	SW: RW, HW: R Issue Exit Deep Power Down. This bit is self-cleared once the command is executed. Deep Power down feature is only available on LPDDR1 and LPDDR2 SDRAM devices. When exiting Deep Power Down for a given Rank, it is required to re-initialize the LPDDR1 SDRAM devices by repeating the initialization sequence for the associated Rank before that memory can be utilized or accessed. As such, it is necessary to clear the initialization complete state of the associated Rank by setting DDR_DEVICE_CONFIG[15/14] to 1'b0 before exiting Deep Power Down. It is SW's responsibility to ensure that the minimum duration of DPD is met. Additionally SW needs to ensure that the clocks are stable before exiting DPD. 0x0: no-op (default) 0x1: Issue DPD exit
4	ZQ_CAL_SHORT	SW: RW, HW: RW Issue Short ZQ-Cal Command. This bit is self-cleared once the command is executed. This only applies to PCDDR3 devices. For LPDDR2, use the DDR_MR_CNTL_WDATA CSR. 0x0: no-op (default) 0x1: Issue ZQ-Cal
3	ZQ_CAL_LONG	SW: RW, HW: RW Issue Long ZQ-Cal Command. This bit is self-cleared once the command is executed. This only applies to PCDDR3 devices. For LPDDR2, use the DDR_MR_CNTL_WDATA CSR. 0x0: no-op (default) 0x1: Issue ZQ-Cal
2	AUTO_REFRESH	SW: RW, HW: RW Auto-Refresh Command. This can only be set when the rank has not been initialized. This bit is self-cleared once the command is executed. 0x0: no-op (default) 0x1: execute

EBI1_CH1_DDR_MANUAL_CMD (cont.)

Bits	Name	Description
1	PRECHARGE_ALL	SW: RW, HW: RW Precharge All Command. This can only be set when the rank has not been initialized. This bit is self-cleared once the command is executed. 0x0: no-op (default) 0x1: execute
0	SR_READ	SW: RW, HW: RW Status Register Read Command for LPDDR1. SRR feature is only supported by LPDDR1 and LPDDR2 SDRAM devices. This bit is self-cleared once the command is executed and SR data is captured. The SR data for LPDDR1 is captured in DDR_MR_RDDATA_RANK0/1. A manual SRR command to LPDDR2 devices can be initiated by using the DDR_MR_CNTL_WDATA CSR. 0x0: no-op (default) 0x1: execute

0x00D80014 EBI1_CH1_DDR_MR_CNTL_WDATA

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Mode Register Access Control Register

This register is used whenever SW needs to access the DRAM Mode Register. It is used in device initialization for programming the memory device's mode registers. Once the SDRAM device is initialized, it is used for issuing MRW commands to LPDDR1/LPDDR2/PCDDR2/PCDDR3. and MRR commands (manual SRR, manual ZQ commands) for LPDDR2.

EBI1_CH1_DDR_MR_CNTL_WDATA

Bits	Name	Description
31:24	MR_ADDR	SW: RW, HW: R Specify which mode register to access. Note that LPDDR2 supports up to 256 Mode registers. Hence the programmed MR_ADDR needs to be valid based on the specific SDRAM device. 0000_0000: MR (Mode Register or SR for LPDDR1) 0000_0001: EMR1 (Extended Mode Register 1) 0000_0010: EMR2 (Extended Mode Register 2) 0000_0011: EMR2 (Extended Mode Register 3) .....
23	RESERVED_23	

EBI1_CH1_DDR_MR_CNTL_WDATA (cont.)

Bits	Name	Description
22	RD_DQCAL	SW: W, HW: RW DQ Calibration command. This is only supported for LPDDR2 & PCDDR3 devices. This is used for read training and/or rank auto detect. A pre-defined read pattern is sent out by the DRAM and captured by the controller. In case of LPDDR2, this is an MRR command with MR_ADDR specified above (valid MR_ADDR is 0x32 & 0x40). In case of PCDDR3 devices, this is an MPR Read command and hence MR_ADDR field is a don't care. The status of the DQ Calibration command is recorded in DDR_DQCAL_STATUS_RANK0/1 and in DDR_DQCAL_RDATA_RANK0/1. This bit is cleared by HW once the command is executed. 0x0: do not execute (default) 0x1: execute
21:20	RD_DQCAL_EXP_PATTERN	SW: RW, HW: R This is the read data pattern from the memory device. The values "00" and "01" are applicable only for LPDDR2 devices (memory burst length of 4), whereas the value "10" is applicable only for PCDDR3 devices (memory burst length of 8). 0x0: Pattern_1010 0x1: Pattern_0011 0x2: Pattern_01010101
19:18	MR_RANK_SEL	SW: RW, HW: R Specify DRAM rank to which the command goes. After the SDRAM device has been initialized, a value of "11" is considered illegal. 0x0: Invalid (default) 0x1: Rank 0 only 0x2: Rank 1 only 0x3: Both ranks 0 and 1
17	MRR	SW: W, HW: RW Read Mode Register from LPDDR2 SDRAM. This bit is cleared by HW once the command is executed. MRR commands are only supported by LPDDR2 SDRAM devices and the read data is available in DDR_MR_RDATA_RANK0/1 after the command completes. 0x0: do not execute (default) 0x1: execute
16	MRW	SW: W, HW: RW Writes the Mode Register to the SDRAM. This bit is cleared by HW once the command is executed. 0x0: do not execute (default) 0x1: execute
15:0	MR_WDATA	SW: RW, HW: R Data for Mode Register Writes. SW needs to program the mode register based on the specific SDRAM device as the mapping of the 16-bits is different for different SDRAM device types.

Reset State: 0x00030000

DDR Command Execution Optimization Register 0.

This register is used to define the page management mode, command starvation of the DDR module. Additionally it also controls the enabling of the clockstop/powerdown features of the SDRAM device.

EBI1_CH1_DDR_CMD_EXEC_OPT_0

Bits	Name	Description
31:28	RESERVED_31_28	
27:16	PAGE_OPEN_TIMER	SW: RW, HW: R This field is only applicable if the page management policy/mode field is set to "timer-based". In this mode, a down counter based on DDR1x clock is started when the page is opened and the counter enabled only when the page is idle and has no pending runnable HITS. The value indicated by this field determines how long to wait for a potential runnable HIT to come along. When a runnable HIT appears while it is counting down, the counter gets reloaded to the initial value. 12'h000: Reserved 12'h00 : Reserved 12'h002: Reserved 12'h003: MIN_CC (3 cycles) (default)

EBI1_CH1_DDR_CMD_EXEC_OPT_0 (cont.)

Bits	Name	Description
15	PAGE_MGMT_POLICY	SW: RW, HW: R Control how HW manages DRAM pages. 0x0: Keep Page Open (Keep Page Open unless forced to close it. e.g. forced to close because of a refresh, different page to open in the same bank if command causing a conflict has a priority greater than the highest priority of a pending HIT*, tRASmax timer expiry) 0x1: Timer Based (An additional reason to close the page would be if the "page_open_timer" expires)
14:7	RDCMD_STARVATION_TIMER	SW: RW, HW: R This specifies the number of ddr1x cycles since a read command became runnable. Once the down timer expires and the read command hasn't been executed, it gets elevated to a higher priority within the command's original priority level. 0000_0000: Disable (default) 0000_0001: RESERVED 0000_0010: MIN_CC (2 cycles)
6	WR_RD_PREF	SW: RW, HW: R Indicates the Column Command Selection Preference. For example, if set to '0', the column logic will give preference to selecting Read hits Vs. Write hits given they are of equal priority. 0x0: Prefer Reads (default) 0x1: Prefer Writes
5	DDR_CK_ALWAYS_ON_DBG_MODE	SW: RW, HW: R Debug mode wherein the clock to the memory device is always on. This is a debug mode as most of the chip configurations run in shared clock mode. If this debug mode is enabled, then SW needs to ensure that there are no IOCAL requests sent to the DDR controller for calibrating the clock pad. 0x0: Disabled (default) 0x1: Enable
4	CONCURRENT_SELF_REFRESH_EN	SW: RW, HW: R This only applies to multi-rank configurations. When set, this causes self refresh to be always entered/exited together for both ranks. This is specifically required to be set for ODT say for example, when DDR_CMD_EXEC_OPT_3[RANK0_ODT_ON_RD_RANK1] or DDR_CMD_EXEC_OPT_3[RANK1_ODT_ON_RD_RANK0] are set or in write scenarios wherein DDR_CMD_EXEC_OPT_3[EN_ODT_SWITCH_RANK_UNAVAIL] isn't used. It is to be noted that in this mode, SW will not have independent rank control for self refresh using DDR_CMD_EXEC_OPT_1[SELF_REFRESH_RANK1/0]. SW can set both bits and both the ranks will enter self refresh together when they can. 0x0: Disabled (default) 0x1: Enabled

EBI1_CH1_DDR_CMD_EXEC_OPT_0 (cont.)

Bits	Name	Description
3	SEL_REG_FREQ_SWITCH	SW: RW, HW: RW Not Supported. Switch the currently used timing register set to the other set (current set is determined via ddr_device_status[curr_sel_reg_freq_switch]). SW needs to guarantee that this bit is written only when HW is in self refresh mode. Additionally, SW should not write this bit if SW initiated HW sequence for clock switching is in progress. This bit is self-cleared once the command is executed. 0x0: no-op (default) 0x1: execute switch
2	PWR_DOWN_EN	SW: RW, HW: R Enable Power Down mode for the memory device. Power down is supported by LPDDR1/2 and PCDDR2/3 devices. **NOTE** HW will enter clockstop and powerdown irrespective of the enable setting if HW frequency switch using clockstop and powerdown request is received. 0x0: Disabled (default) 0x1: Enabled
1	CLK_STOP_EN	SW: RW, HW: R Enable Clock Stop mode for the memory device. This needs to be set depending on the SDRAM device present. For LPDDR1, this can be enabled, but for PCDDR2/3 & LPDDR2 devices, this must be disabled. **NOTE** HW will enter clockstop and powerdown irrespective of the enable setting if HW frequency switch using clockstop and powerdown request is received. 0x0: Disabled (default) 0x1: Enabled
0	CLK_STOP_DURING_PWR_DOWN_EN	SW: RW, HW: R Clock can be stopped to the memory device ONLY during Power Down. This can be enabled for LPDDR2, but must be disabled for PCDDR devices. Note that only CLK_STOP_EN field or this field can be set. LPDDR1 devices should utilize the CLK_STOP_EN setting rather than this setting. **NOTE** HW will enter clockstop and powerdown irrespective of the enable setting if HW frequency switch using clockstop and powerdown request is received. 0x0: Disabled (default) 0x1: Enabled

0x00D80040 EBI1_CH1_DDR_CMD_EXEC_OPT_1

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x0000FF0

DDR Command Execution Optimization Register 1.

EBI1_CH1_DDR_CMD_EXEC_OPT_1

Bits	Name	Description
31:28	RESERVED_31_28	
27	SELF_REFRESH_RANK1	SW: RW, HW: R Enter/Exit Self-Refresh. This bit does not reset automatically. Software must turn it on, then turn it off 0x0: exit (default) 0x1: enter
26	SELF_REFRESH_RANK0	SW: RW, HW: R Enter/Exit Self-Refresh. This bit does not reset automatically. Software must turn it on, then turn it off 0x0: exit (default) 0x1: enter
25:22	RESERVED_25_22	
21:12	RANK_IDLE_TIMER	SW: RW, HW: R Counts the number of XO clock cycles wherein the rank(s) is idle. Once expired, this will cause the rank to be in precharge state. This is an useful feature to enable especially if DDR_CMD_EXEC_OPT_0[PAGE_MGMT_POLICY] is set to "Keep Pages Open". 00_0000_0000: Disabled (default) 00_0000_0001: Reserved 00_0000_0010: Reserved
11:8	RUN_ATLEAST_ONE_TRANS_RD_CONFLICT	SW: RW, HW: R This is a vector sized to the number of priority levels (4). It the bit position corresponding to a priority level is set, then it indicates that a read conflict of that priority level can cause a page to close (if the conflict priority level is greater than the priority level of a pending HIT to the open page) only if at least one transaction has been run to an open page. 0xF: run_at least_one (default)
7:4	RUN_ATLEAST_ONE_TRANS_WR_CONFLICT	SW: RW, HW: R This is a vector sized to the number of priority levels (4). It the bit position corresponding to a priority level is set, then it indicates that a write conflict of that priority level can cause a page to close (if the conflict priority level is greater than the priority level of a pending HIT to the open page) only if at least one transaction has been run to an open page. 0xF: run_at least_one (default)

EBI1_CH1_DDR_CMD_EXEC_OPT_1 (cont.)

Bits	Name	Description
3	ENABLE_DDR2X_CLKON_DURING_CSPD	SW: RW, HW: R By default, the 2X clock will only be turned off only when both ranks are in self refresh and memory clock is no longer needed. This switch enables also turning off the 2X clock during clockstop and powerdown (this from memory perspective only applies to LPDDR1/LPDDR2 devices). 0x0: Disabled (default) 0x1: Enabled
2	ENABLE_POWER_OPT_AUTO_SRR_ZQ	SW: RW, HW: R When enabled, the design will not wakeup the memory device from self refresh (if in self refresh) just because of an auto SRR or an auto ZQCAL is needed. Instead it will promote the auto ZQCAL required to be a long zqcal if a normal auto ZQ was missed. 0x0: Disabled (default) 0x1: Enabled
1	ENABLE_CMD_ADDR_OE_CNTL	SW: RW, HW: R This is typically used for PCDDR3 devices. When enabled, the design will indicate to the PHY to tri-state the command address bus when all ranks are in self refresh and the memory clocks are off, as an additional power savings mode. This is required as a shunt resistance is typically used in the command address path for PCDDR3 memory boards and hence will always burn power as the command address is always driven. 0x0: Disabled (default) 0x1: Enabled
0	LOAD_TRP_CNTL	SW: RW, HW: R This bit controls as to when the TRP timer gets started. There seems to be a difference in the memory specifications which requires this control bit. When set to '0' (required for LPDDR1), the TRP timer gets loaded with the first precharge command that closes a rank/bank. Any subsequent precharges (e.g., precharge all) to that rank/bank are ignored as the state of the page is closed. When set to '1' (required for LPDDR2/PCDDR2/PCDDR3), the latest precharge command, e.g., precharge all will cause TRP timer to get reloaded even if the page was closed. 0x0: Valid Precharge (default) 0x1: Latest Precharge

0x00D80044 EBI1_CH1_DDR_CMD_EXEC_OPT_2

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000390

DDR Command Execution Optimization Register 2.

EBI1_CH1_DDR_CMD_EXEC_OPT_2

Bits	Name	Description
31	RESERVED_31	
30:28	ZQCAL_INTERVAL	SW: RW, HW: R Number of 256 timer clock edges between short ZQCalibrations. This feature is only available for LPDDR2 and PCDDR3 devices. When enabled, zqcalibration is scheduled for rank0 if enabled. Once it completes, zqcalibration is scheduled for rank1 if enabled. This assumes that the ranks zqcalibration commands cannot be overlapped. The timer clock usually runs at 32KHz, providing interval range of 40-2560ms. 0x0: Disabled (default) 0x1: 4 0x2: 8 0x3: 16 0x4: 32 0x5: 64 0x6: 128 0x7: 256
27:20	CLKON_IDLE_TIMER	SW: RW, HW: R Counts the number of DDR1x clock cycles wherein the DDR controller is idle and it's clock can be shut off. Once expired, this will cause the clkon request to get de-asserted. If TOP_MISC_CNTL[MODE_CLKON_DDR_2X] is set, then the value of this field needs to be at least the value of DDR_CMD_EXEC_OPT_2[CLKON2X_ASSERT_WAIT_TIMER]. 0000_0000 : Disabled (default)
19:14	CLKON2X_ASSERT_WAIT_TIMER	SW: RW, HW: R Counts the number of DDR1x clock cycles to wait before waking up from self refresh or clockstop-powerdown (if DDR_CMD_EXEC_OPT_1[ENABLE_DDR2X_CLKON_DURING_CSPD] is enabled) after clkon2x asserts. This is to avoid any clock glitches propagating to the memory device. This delay (clock controller -> hsddrx) is not expected to be more than 15-20 ddr1x clock cycles and needs to be set if TOP_MISC_CNTL[MODE_CLKON_DDR_2X] is set. 00_0000 : Disabled (default)
13:10	RESERVED_13_10	
9:8	RDCMD_HP_REMAP_LEVEL3	SW: RW, HW: R This is used to remap the high priority level 3 of the AXI Read command to a different priority level. 0x0: Map to Priority Level 0 0x1: Map to Priority Level 1 0x2: Map to Priority Level 2 0x3: Map to Priority Level 3 (default)

EBI1_CH1_DDR_CMD_EXEC_OPT_2 (cont.)

Bits	Name	Description
7:6	RDCMD_HP_REMAP_LEVEL2	SW: RW, HW: R This is used to remap the high priority level 2of the AXI Read command to a different priority level. 0x0: Map to Priority Level 0 0x1: Map to Priority Level 1 0x2: Map to Priority Level 2 (default) 0x3: Map to Priority Level 3
5:4	RDCMD_HP_REMAP_LEVEL1	SW: RW, HW: R This is used to remap the high priority level 1of the AXI Read command to a different priority level. 0x0: Map to Priority Level 0 0x1: Map to Priority Level 1 (default) 0x2: Map to Priority Level 2 0x3: Map to Priority Level 3
3:2	RDCMD_HP_REMAP_LEVEL0	SW: RW, HW: R This is used to remap the high priority level 0 of the AXI Read command to a different priority level. 0x0: Map to Priority Level 0 (default) 0x1: Map to Priority Level 1 0x2: Map to Priority Level 2 0x3: Map to Priority Level 3
1	RESERVED_1	
0	UPDATE_MEM_LATENCY_ON_FREQ_SWITCH	SW: RW, HW: R This is a valid bit which controls whether the memory latencies are required to be changed as part of frequency switch. The setting of this bit is dependent on the device type, the frequency of operation and the current memory latencies. If this bit is set, then the alternate values specified in DDR_UPDATE_FREQ_CHANGE_ALT CSR will be taken into account upon receiving a HW based frequency change request. Additionally, when this bit is set, then the mode register writes programmed in DDR_MRW0/1_HW_FREQ_SWITCH will be executed as part of the HW based frequency switch. 0x0: Disabled (default) 0x1: Enabled

0x00D80048 EBI1_CH1_DDR_CMD_EXEC_OPT_3

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000150

DDR Command Execution Optimization Register 3.

This register has controls for ODT for PCDDR2 and PCDDR3.

If DDR_CMD_EXEC_OPT_2[UPDATE_MEM_LATENCY_ON_FREQ_SWITCH] is set, then ODT_START_DELAY_RD/WR, ODT_OFF_DELAY and tANPD are frequency dependent fields.The alternate CSR field for ODT_START_DELAY_RD/WR below is DDR_UPDATE_FREQ_CHANGE_ALT[ODT_START_DELAY_RD/WR].

The alternate CSR field for ODT_OFF_DELAY below is DDR_UPDATE_FREQ_CHANGE_ALT[ODT_OFF_DELAY].

The alternate CSR field for tANPD below is DDR_UPDATE_FREQ_CHANGE_ALT[tANPD].

EBI1_CH1_DDR_CMD_EXEC_OPT_3

Bits	Name	Description
31	CODT_ON_WR	SW: RW, HW: R Enable the Controller ODT to be driven when write occurs on any rank. 0x0: Disable (default) 0x1: Enable
30	CODT_ON_RD	SW: RW, HW: R Enable the Controller ODT to be driven when read occurs on any rank. 0x0: Disable (default) 0x1: Enable
29	RANK1_ODT_ON_WR_RANK1	SW: RW, HW: R Enable Rank1 ODT to be driven when write occurs on Rank1. 0x0: Disable (default) 0x1: Enable
28	RANK1_ODT_ON_WR_RANK0	SW: RW, HW: R Enable Rank1 ODT to be driven when write occurs on Rank0. 0x0: Disable (default) 0x1: Enable
27	RANK1_ODT_ON_RD_RANK1	SW: RW, HW: R Enable Rank1 ODT to be driven when read occurs on Rank1. 0x0: Disable (default) 0x1: Enable
26	RANK1_ODT_ON_RD_RANK0	SW: RW, HW: R Enable Rank1 ODT to be driven when read occurs on Rank0. 0x0: Disable (default) 0x1: Enable
25	RANK0_ODT_ON_WR_RANK1	SW: RW, HW: R Enable Rank0 ODT to be driven when write occurs on Rank1. 0x0: Disable (default) 0x1: Enable

EBI1_CH1_DDR_CMD_EXEC_OPT_3 (cont.)

Bits	Name	Description
24	RANK0_ODT_ON_WR_RANK0	SW: RW, HW: R Enable Rank0 ODT to be driven when write occurs on Rank0. 0x0: Disable (default) 0x1: Enable
23	RANK0_ODT_ON_RD_RANK1	SW: RW, HW: R Enable Rank0 ODT to be driven when read occurs on Rank1. 0x0: Disable (default) 0x1: Enable
22	RANK0_ODT_ON_RD_RANK0	SW: RW, HW: R Enable Rank0 ODT to be driven when read occurs on Rank0. 0x0: Disable (default) 0x1: Enable
21:19	ODT_START_DELAY_WR	SW: RW, HW: R This delay only applies to the Rank ODT and not the controller ODT. Specifies the delay in ddr1x clock cycles between the DDR Write command and the ODT being driven high. Typically for PCDDR2 devices for writes, this should be set to (Write latency - tAOND) and for PCDDR3 devices for writes, this must be set to "1" for optimal settings. The above indicates the maximum value allowed for the ODT signal to be turned on/driven high w.r.t the write CAS command. Note that a value of "0" indicates that the ODT signal is turned on 1 cycle before the write CAS command. A value of "1" indicates that the ODT signal is turned on in the same cycle as the write CAS command and so on. The difference between the maximum value and the value programmed is required to be added as additional incremental delays to DDR_DRAM_TIMING_2[tOST], DDR_DRAM_TIMING_2[tRTW_SAME_RANK] and DDR_DRAM_TIMING_2[tRTW_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are MAX and MAX-1.

EBI1_CH1_DDR_CMD_EXEC_OPT_3 (cont.)

Bits	Name	Description
18:16	ODT_START_DELAY_RD	SW: RW, HW: R This delay only applies to the Rank ODT and not the controller ODT. Specifies the delay in ddr1x clock cycles between the DDR Read command and the ODT being driven high. Typically for PCDDR2 devices for reads, this should be set to (Read latency - tAOND) and for PCDDR3 devices for reads, this must be set to (Read Latency - (Write Latency - 2)) for optimal settings. The above indicates the maximum value allowed for the ODT signal to be turned on/driven high w.r.t the read CAS command. Note that a value of "0" indicates that the ODT signal is turned on 1 cycle before the read CAS command. A value of "1" indicates that the ODT signal is turned on in the same cycle as the read CAS command and so on. The difference between the maximum value and the value programmed might need to be added as additional incremental delays to DDR_SM_TIMING_0[DLY_RD_DIFF_RANK], DDR_DRAM_TIMING_2[WR_TO_RD_DLY_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are MAX and MAX-1.
15:13	ODT_OFF_DELAY	SW: RW, HW: R This delay specifies the ODT off memory timing parameter for rank ODT. For PCDDR2, if DDR_CMD_EXEC_OPT_0[PWR_DOWN_EN] is 1'b0 then program this to the timing parameter, tAOFD. For PCDDR2, if DDR_CMD_EXEC_OPT_0[PWR_DOWN_EN] is 1'b1 then program this to MAX(tAOFD, tANPD). For PCDDR3, this is to be programmed to "Write Latency -2", which is ODTLoff.
12:10	ODTH8	SW: RW, HW: R Specifies the timing parameter ODTH8 (for PCDDR3) in ddr1x clock cycles. If using PCDDR2, leave this as POR.
9	EN_ODT_SWITCH_RANK_UNAVAIL	SW: RW, HW: R This only applies in multi-rank systems. When enabled, the design will automatically turn ON the same rank's odt on a write (if not already configured) if the other rank's odt should have been turned on, but it can't as the other rank is in self refresh or power down (If EN_ODT_POWER_DOWN is 1'b1, then the only scenario where the dynamic switch is enabled is when the other rank is in self refresh). 0x0: Disable (default) 0x1: Enable
8	EN_ODT_POWER_DOWN	SW: RW, HW: R If set, then ODT will be driven to a rank (if required - based on ODT configuration) in powerdown mode. The optimal setting is for this bit to be enabled. 0x0: Disable 0x1: Enable (default)

EBI1_CH1_DDR_CMD_EXEC_OPT_3 (cont.)

Bits	Name	Description
7:6	ODT_EXTEND_DELAY_WR	SW: RW, HW: R Specifies the number of ddr1x clock cycles after the write completes should the rank's Rtt ODT resistance be turned off. The optimal case is "01". Additional delays might require the write to read same/diff rank timer delays to be increased. The difference between the value programmed and the optimal settings might need to be added as additional incremental delays to DDR_DRAM_TIMING_2[tOST], DDR_DRAM_TIMING_2[WR_TO_RD_DLY_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are "01" and "10". 0x0: Reserved 0x1: 1 clock cycle later (default) 0x2: 2 clock cycles later 0x3: 3 clock cycles later
5:4	ODT_EXTEND_DELAY_RD	SW: RW, HW: R Specifies the number of ddr1x clock cycles after the read completes should the rank's Rtt ODT resistance be turned off. The optimal case is "01". Additional delays might require the write to read same/diff rank timer delays to be increased. The difference between the value programmed and the optimal settings might need to be added as additional incremental delays to DDR_SM_TIMING_0[DLY_RD_DIFF_RANK], DDR_DRAM_TIMING_2[tRTW_SAME_RANK] and DDR_DRAM_TIMING_2[tRTW_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are "01" and "10". 0x0: Reserved 0x1: 1 clock cycle later (default) 0x2: 2 clock cycles later 0x3: 3 clock cycles later
3:1	TANPD	SW: RW, HW: R This specifies the memory timing parameter tANPD in ddr1x clock cycles. For PCDDR2 devices, program this to the timing parameter tANPD, for PCDDR3 devices, this needs to be programmed to WL - 1 (as per PCDDR3 spec).
0	DLL_CNTL_PCHG_PD	SW: RW, HW: R This field only applies to PCDDR3 devices. It indicates the mode register setting for MR0 bit 12. A value "0" represents that the DLL is frozen when precharge powerdown is entered, while a value "1" represents that the DLL is enabled during precharge powerdown. This is used to determine the ODT to be used (synchronous/asynchronous)

0x00D8004C EBI1_CH1_DDR_CMD_EXEC_OPT_4

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Command Execution Optimization Register 4.

This register has the programmable idle timer for entering powerdown and the DDR bus efficiency optimization timer.

EBI1_CH1_DDR_CMD_EXEC_OPT_4

Bits	Name	Description
31:24	PWR_DOWN_IDLE_TIMER	SW: RW, HW: R Count idle ddr1x cycles before entering powerdown/clockstop/clostop-powerdown. This is only valid if powerdown/clockstop/clockstop-powerdown is enabled via the DDR_CMD_EXEC_OPT_0 CSR. A value of 0 indicates that the powerdown/clockstop/clockstop-powerdown will be entered immediately when idle. 0x0: Disable (default)
23:0	RESERVED_23_0	

0x00D80050 EBI1_CH1_DDR_SM_TIMING_0

Clock: RUNALWAYSCLK
Reset State: 0x00001000

DDR State Machine Timing Register 0

The fields in this register control the behavior of the Column State Machine.

.

EBI1_CH1_DDR_SM_TIMING_0

Bits	Name	Description
31:15	RESERVED_31_15	

EBI1_CH1_DDR_SM_TIMING_0 (cont.)

Bits	Name	Description
14:12	DLY_RD_DIFF_RANK	SW: RW, HW: R Delays read to read when going to different ranks. For LPDDR1/2 devices (or PCDDR2/3 with ODT disabled), this can be set to MAX(1, RU((tHZ(DQ)max - tLZ(DQ)min)/tck) for optimal setting as these devices do not have ODT. tck here represents the time period for the fastest DDR1x clock frequency which will be used. The optimal value of this CSR is 4 cycles for PCDDR2/3, if Read Rank ODT (i.e DDR_CMD_EXEC_OPT_3[RANK0/1_ODT_ON_RD_RANK0/1]) is enabled. This accounts for the difference in the ODT off max and min timing, the requirement that Rtt needs to be off half cycle before read preamble, etc. 0x0: Reserved 0x1: 1 cycle (default) 0x2: 2 cycles 0x3: 3 cycles 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 7 cycles
11	RD_INT_BY_RD	SW: RW, HW: R Indicates whether Read Interrupt by Read is allowed. This field needs to be set depending on the specific SDRAM device present. Use "Allowed" for LPDDR1/2 and PCDDR2. Use "Not Allowed" for PCDDR3. 0x1: Allowed 0x0: Not Allowed (default)
10	WR_INT_BY_WR	SW: RW, HW: R Indicates whether Write Interrupt by Write is allowed. This field needs to be set depending on the specific SDRAM device present. Use "Allowed" for LPDDR1/2 and PCDDR2. Use "Not Allowed" for PCDDR3. 0x1: Allowed 0x0: Not Allowed (default)
9	RD_INT_BY_BST	SW: RW, HW: R Indicates whether Read Interrupt by Burst Terminate is allowed. This field needs to be set depending on the specific SDRAM device present. Use "Allowed" for LPDDR1/2. Use "Not Allowed" for PCDDR2/3. 0x1: Allowed 0x0: Not Allowed (default)
8	WR_INT_BY_BST	SW: RW, HW: R Indicates whether Write Interrupt by Burst Terminate is allowed. This field needs to be set depending on the specific SDRAM device present. Use "Allowed" for LPDDR2. Use "Not Allowed" for LPDDR1 and PCDDR2/3. 0x1: Allowed 0x0: Not Allowed (default)

EBI1_CH1_DDR_SM_TIMING_0 (cont.)

Bits	Name	Description
7:6	WR_INT_RD_OR_PRECHG_MODE	SW: RW, HW: R Indicates the interruption mode to be allowed for write transactions when followed by Precharge or Reads.This field needs to be set depending on the specific SDRAM device present. Use "Interrupt with no delay" for LPDDR1 devices. Use "Non Interrupting" for PCDDR2/3 and LPDDR2-S2/S4. This basically sets the starting point for twr and twtr timers. 0x0: Int with no dly (default) 0x1: Int with single cc dly (Not Supported) 0x2: Non Interrupting 0x3: Reserved
5:4	RESERVED_5_4	
3:2	INT_BOUNDARY	SW: RW, HW: R Determines when the interrupting/concatenating command can be issued. This field needs to be set depending on the specific SDRAM device present. Use "Every Cycle" for LPDDR1 and LPDDR2-S2 devices. Use "Every 2 cycles" for LPDDR2-S4 and PCDDR2 devices. For PCDDR3 devices, the above fields would indicate that interruption is not allowed. Hence the value used here is not relevant. 0x0: Every Cycle (default) 0x1: Every 2 cycles 0x2: RESERVED_1 0x3: RESERVED_2
1:0	RESERVED_1_0

EBI1_CH1_DDR_SM_TIMING_1 (cont.)

Bits	Name	Description
23:20	MEM_START_BURST_RD	SW: RW, HW: R Specifies the starting column address restrictions. This field needs to be set depending on the specific SDRAM device. Note that "interleaved" mode of addressing at the SDRAM device is not being supported. For LPDDR1/2 (all burst lengths) and PCDDR2 (memory BL of 4) use "0000". For PCDDR3 (memory BL of 8) & PCDDR2 (memory BL of 8) use "0011". For PCDDR3 OTF burst mode, this field is a don't care. Others : Reserved 0x0: Address_0_2_4_6_etc (default) 0x3: Address_0_4_etc 0xF: Address_0_only
19:16	MEM_START_BURST_WR	SW: RW, HW: R Specifies the starting column address restrictions. This field needs to be set depending on the specific SDRAM device. Note that "interleaved" mode of addressing at the SDRAM device is not being supported. For LPDDR1/2 (all burst lengths) and PCDDR2 (memory BL of 4) use "0000". For PCDDR2 (memory BL of 8) use "0011" and for PCDDR3 (memory BL of 8) use "1111". For PCDDR3 OTF burst mode, this field is a don't care. Others : Reserved 0x0: Address_0_2_4_6_etc (default) 0x3: Address_0_4_etc 0xF: Address_0_only
15:14	SYS_TIMING_MODE	SW: RW, HW: R Specifies the command interface timing relative to the chip select. This is necessary to provide an option to guarantee an additional cycle for the more heavily command interface signals to propagate to the RAMs and settle (to meet input setup requirements) before being clocked in. This is not applicable for LPDDR2. 0x0: 1T (default: Address and command can be driven in the same cycle as the chip select.) 0x1: 2T (Address and command must be driven at least 1 cycle before chip select is asserted) 0x2: RESERVED_1 0x3: RESERVED_2
13:8	RESERVED_13_8	
7	USE_ORIG_BL	SW: RW, HW: R Indicates if original or effective burst length should be used when computing timing between column commands. This field needs to be set depending on the specific SDRAM device. For LPDDR1/2, use "effective" and for PCDDR2/3, use "original". 0x1: Original 0x0: Effective (default)
6	RESERVED_6	

EBI1_CH1_DDR_SM_TIMING_1 (cont.)

Bits	Name	Description
5	ON_THE_FLY_MODE	SW: RW, HW: R Indicates that the memory burst mode selected is OTF (on-the-fly) mode. This field is only applicable for PCDDR3 SDRAM devices. 0x1: Allowed 0x0: Not Allowed (default)
4	DRIVE_WR_DQS_EARLY	SW: RW, HW: R Indicates if DQS needs to be toggled a cycle before the write data gets driven. This means that the first piece of write data will be driven on the 2nd rising edge of the Data strobe. This field needs to be set depending on the specific SDRAM device present. This is only "enabled" for PCDDR3 devices. 0x1: Enabled 0x0: Disabled (default)
3:0	BURST_LENGTH	SW: RW, HW: R Specified as Memory Burst Length. This must be in sync with the value programmed in SDRAM's mode register. For PCDDR3, memory BL of 8 ("0100" setting) and On-the-fly (OTF) mode are supported. For PCDDR3 OTF mode program CSR - DDR_SM_TIMING_1[ON_THE_FLY_MODE]. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: BL of 4 0x3: RESERVED_3 0x4: BL of 8 (default) 0x5: RESERVED_4 0x6: RESERVED_5 0x7: RESERVED_6 0x8: BL of 16 0x9: RESERVED_7 0xA: RESERVED_8 0xB: RESERVED_9 0xC: RESERVED_10 0xD: RESERVED_11 0xE: RESERVED_12 0xF: RESERVED_13

DDR DRAM Timing Register 0

This register contains parameters which are specified by the memory vendor in ns. The alternate register is DDR_DRAM_TIMING_0_ALT

This register holds the SDRAM timing parameters. The value of the settings is in clock cycles and may vary from one SDRAM vendor to another. The value that should be selected for each field is:

the number_of_clock_cycles of the vendor's specified value.

An example:

When the vendor's specification states tRCD = 44nS and the SDRAM clock rate = 166 MHz, the calculations are:

1. 1/166 MHz = 6nS.
2. 44nS/6nS = 7.33 clocks.
3. 7.33 clocks rounds up to 8 clocks.

Therefore, the value of RASmin_timer should be written as 4'b1000.

EBI1_CH1_DDR_DRAM_TIMING_0

Bits	Name	Description
31:29	TRTP	SW: RW, HW: R This is not the same as the memory timing parameter tRTP. Number of Additional clock cycles between a Read and a Precharge command to the same page with actual BL/2 as the initial base delay. This needs to be set depending on the memory device present. For LPDDR, this needs to be set to at least 2 cycles. For LPDDR2-S2, use MAX(2, "tRTP (memory timing parameter in ddr1x clock cycles) -1") For LPDDR2-S4, use MAX(2, "tRTP (memory timing parameter in clock cycles) -2") For PCDDR2, use MAX(2, "tRTP (memory timing parameter in clock cycles) -2") For PCDDR3, use MAX(2, "tRTP (memory timing parameter in clock cycles) -4") 0x0: RESERVED_1 0x1: RESERVED_2 0x2: Additional 2 clock cycles (default) 0x3: Additional 3 clock cycles 0x4: Additional 4 clock cycles 0x5: Additional 5 clock cycles 0x6: Additional 6 clock cycles 0x7: Additional 7 clock cycles

EBI1_CH1_DDR_DRAM_TIMING_0 (cont.)

Bits	Name	Description
28:24	TFAW	SW: RW, HW: R Programmable rolling window during which the number of activations should not exceed the CSR field - max_num_activations_tFAW. This needs to be set based on the specific SDRAM device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: RESERVED_4 0x4: MIN_CC (4 cycles default)
23:20	TRCD	SW: RW, HW: R Number of clock cycles from activate to column command (same bank). This needs to be set based on the specific SDRAM device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
19:16	RESERVED_19_16	
15:12	TRRD	SW: RW, HW: R Number of clock cycles between Activate to Activate (different banks on same chip select). This needs to be set based on the specific SDRAM device. 0x0: RESERVED 0x1: MIN_CC (1 cycle default)
11:9	PWR_DOWN_ODT_OFF_MAX_MIN_DIFF	SW: RW, HW: R Number of clock cycles specifying the difference in the power down ODT off max/min timing parameter. For PCDDR2 & PCDDR3, this is rounded up version in ddr1x clock cycles of (tAOFPDmax - tAOFPDmin).
8:7	RESERVED_8_7	
6:5	TZQCL_MSB	SW: RW, HW: R The complete value of tZQCL timer is {tZQCL_MSB, tZQCL}. tZQCL is from DDR_DRAM_TIMING_7 CSR. Number of ddr1x clock cycles required for the long calibration sequence to execute. ZQ Calibration commands are only supported by LPDDR2 and PCDDR3 devices. For LPDDR2, this is the timing parameter - tZQCL and for PCDDR3, this is the timing parameter tZQoper.
4:0	TRAS_MIN	SW: W, HW: R Number of clocks cycles between Active and Precharge (same bank). This needs to be set based on the specific SDRAM device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

DDR Timing Parameters Register 3

This register contains parameters which are specified by the memory vendor in ns. The alternate/shadow register is DDR_DRAM_TIMING_3_ALT and is used during HW frequency switching.

EBI1_CH1_DDR_DRAM_TIMING_3

Bits	Name	Description
31:28	PD_EXIT_DURATION_ODT	SW: RW, HW: R This specifies the amount of time after a powerdown exit (which qualifies as asynchronous ODT for PCDDR2/3 devices) for which the column commands will be blocked to avoid large ODT on/off timing ranges. For PCDDR3 devices, this needs to be programmed to the timing parameter tXPDLL delay in ddr1x clock cycles. For PCDDR2 devices, this needs to be programmed to the timing parameter tAXPD delay in ddr1x clock cycles. For LPDDR1/2 devices, leave this field as POR value. The MSB value of this timer is PD_EXIT_DURATION_ODT_MSB.
27:24	TWTR	SW: RW, HW: R tWTR delay in clock cycles. 0x1: 1Cycle (default)
23	PD_EXIT_DURATION_ODT_MSB	SW: RW, HW: R The MSB bit for PD_EXIT_DURATION_ODT. This is required for PCDDR3 at higher frequencies.
22:19	TWR	SW: RW, HW: R Number of clocks from last data word to precharge
18:9	TXSRD	SW: RW, HW: R Number of clock cycles between self refresh exit and next valid Read command. The value is based on the specific SDRAM device present. For PCDDR3, this needs to be programmed with tXSDLL timing parameter. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
8	RESERVED_8	Reserved
7:0	TXSNR	SW: RW, HW: R Number of clock cycles between self refresh exit and next valid Non-Read command. The value is based on the specific SDRAM device present. For LPDDR1/2 devices, the value programmed in TXSNR should be the same as in TXSRD. The different parameters are required for SDRAM devices with DLL's - PCDDR2/3. For PCDDR3, this needs to be programmed with tXS timing parameter. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

DDR Timing Parameters Register 4

This register contains parameters which are specified by the memory vendor in ns. The alternate/shadow register is DDR_DRAM_TIMING_4_ALT and is used during HW frequency switch.

EBI1_CH1_DDR_DRAM_TIMING_4

Bits	Name	Description
31:24	TRFC	SW: RW, HW: R Number of clock cycles between auto-refresh command and the next activate command. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
23:20	TMOD	SW: RW, HW: R Specifies the timing parameter TMOD in ddr1x clock cycles for PCDDR2/3 devices.
19:16	TXPNR_ACT_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next valid non-read command. This value gets used only if the Power down state was active power down. This distinction is required for PCDDR devices where in a slow/fast exit option in the Mode Register could potentially mean different timers for read commands (which require a DLL) Vs. a non-read command. For PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. For LPDDR1/2 program this to "tXPNR" if available, else set to "tXP". For PCDDR3, set this to "tXP". 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)

EBI1_CH1_DDR_DRAM_TIMING_4 (cont.)

Bits	Name	Description
15:12	TXPR_ACT_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next read command. This value gets used only if the Power down state was active power down. For PCDDR2, if Mode register for "Active Power Down Exit Time" is programmed to "fast exit", set this to memory timing parameter "tXARD", else program this to "tXARDS". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. For LPDDR1/2, program this to "tXPR" if available, else set to "tXP". For PCDDR3, set this to "tXP". 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
11:8	TXPNR_PCHG_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next non-read command. This value gets used only if the Power down state was precharge power down. For PCDDR3, if ODT is enabled and the Mode register for "DLL control for Precharge PD" is programmed to "fast exit", set this to memory timing parameter "tXPDLL", else program this to "tXP". For LPDDR1/2 & PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. The MSB bit for this is from TXPNR_PCHG_PWR_DOWN_MSB. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
7:4	TXPR_PCHG_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next read command. This value gets used only if the Power down state was precharge power down. For PCDDR3, if Mode register for "DLL control for Precharge PD" is programmed to "fast exit", set this to memory timing parameter "tXP", else program this to "tXPDLL". For LPDDR1/2 & PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. The MSB bit for this is from TXPR_PCHG_PWR_DOWN_MSB. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
3:2	RESERVED_3_2	Reserved
1	TXPNR_PCHG_PWR_DOWN_MSB	SW: RW, HW: R The MSB bit for TXPNR_PCHG_PWR_DOWN. This is required for PCDDR3 at higher frequencies.
0	TXPR_PCHG_PWR_DOWN_MSB	SW: RW, HW: R The MSB bit for TXPR_PCHG_PWR_DOWN. This is required for PCDDR3 at higher frequencies.

DDR Timing Parameters Register 5

This register contains parameters which are specified by the memory vendor in ns. The alternate/shadow register is DDR_DRAM_TIMING_5_ALT and is used during HW frequency switch.

EBI1_CH1_DDR_DRAM_TIMING_5

Bits	Name	Description
31:24	SELF_RFSH_MIN_DURATION	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles the SDRAM device is required to remain in self refresh mode once a self refresh command is registered. For LPDDR1, this is specified as tRFC, for LPDDR2, this is specified as tCKESR, for PCDDR2/3, this is specified as tCKE. Based on current implementation, the design waits this CSR field plus DDR_DRAM_TIMING_5[CLK_RESTART_BEFORE_SELF_RFSH_EXIT] plus 2 ddr1x cycles at least before coming out of self refresh.
23	RESERVED_23	Reserved
22:20	CLK_STOP_AFTER_SELF_RFSH_ENTRY	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles after the Self Refresh command is registered that the external clock to the memory device needs to run before it can be turned off. For LPDDR1/2 and PCDDR2 SDRAM devices, this should be set to "1", for PCDDR3 SDRAM devices, this should be set to "tCKSRE"
19:16	CLK_RESTART_BEFORE_SELF_RFSH_EXIT	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles the memory clock is required to be stable/re-started before CKE can go high to indicate a self refresh exit. Based on the memory device alone, for LPDDR1, this is at least "1", for LPDDR2, this needs to be set to at least 2 clock cycles. For PCDDR2 SDRAM devices, this should be set to "1", for PCDDR3 SDRAM devices, this should be set to "tCKSRX". This CSR field represents the lower 4 bits. The upper 4 bits are in CLK_RESTART_BEFORE_SR_EXIT_UPPER CSR field below. If the cur_mode in the pads is enabled and the system is configured to dynamically turn off the cur_mode during self refresh, then the 8-bit timer needs to be programmed such that it provides at least 100ns of pad settling time.

EBI1_CH1_DDR_DRAM_TIMING_5 (cont.)

Bits	Name	Description
15:12	TRP_AB	SW: RW, HW: R Number of clocks from all bank precharge to Activate (same bank). This needs to be set based on the specific SDRAM device. For LPDDR1, PCDDR3 & 4-bank PCDDR2 devices, set this to timing parameter tRP. For 8-bank PCDDR2 devices, set this to tRP + 1*tck (in clock cycles). For LPDDR2 devices, set this to timing parameter tRPab. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
11:8	CLK_RESTART_BEFORE_SR_EXIT_UPPER	SW: RW, HW: R These bits are the upper 4 bits for the CLK_RESTART_BEFORE_SELF_RFSH_EXIT CSR field above. The timer is 8 bits wide. If the cur_mode in the pads is enabled and the system is configured to dynamically turn off the cur_mode during self refresh, then the 8-bit timer needs to be programmed such that it provides at least 100ns of pad settling time.
7:4	TRP_PB	SW: RW, HW: R Number of clocks from per bank precharge to Activate (same bank). This needs to be set based on the specific SDRAM device. For LPDDR1, PCDDR3 & PCDDR2 devices, set this to timing parameter tRP. For LPDDR2 devices, set this to timing parameter tRPpb. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

EBI1_CH1_DDR_DRAM_TIMING_5 (cont.)

Bits	Name	Description
3:0	RD_LATENCY	SW: RW, HW: R Actual Rd Latency (from Chip select assertion to the clock edge where read data is expected - This will not be exactly equal to CAS latency from memory specs) For LPDDR1, use Read latency of 3(fixed), for LPDDR2, use Read latency of memory device + RU(tdqsckmax/tck) (RU - round up) where tck is the time period of the current ddr1x clock frequency of operation. For PCDDR2/3 devices, use the read latency of the device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: 2 cycles 0x3: 3 cycles (default) 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 7 cycles 0x8: 8 cycles 0x9: 9 cycles 0xA: 10 cycles 0xB: 11 cycles 0xC: 12 cycles 0xD: 13 cycles 0xE: 14 cycles 0xF: 15 cycles
