3:2	SRCC1_BITS	Number of bits for component 1 (B / Cb) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	SRCC0_BITS	Number of bits for component 0 (G / luma) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x05310128 VPE_PPP_SRC_UNPACK_PATTERN1

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0302_0001

VPE_PPP_SRC_UNPACK_PATTERN1

Bits	Name	Description
31:0	UNPACK_PATTERN31_0	Unpacking pattern, maximum of 8 pattern elements starting from LSB to MSB. Run length portion of the pattern is not supported, thus most significant 6 bits of each byte unused, and returns 0.

0x0531012C VPE_PPP_SRC_UNPACK_PATTERN2

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_SRC_UNPACK_PATTERN2

Bits	Name	Description
31:0	UNPACK_PATTERN63_32	Unpacking pattern, maximum of 8 pattern elements starting from LSB to MSB. Run length portion of the pattern is not supported, thus most significant 6 bits of each byte unused, and returns 0.

0x05310138 VPE_PPP_OP_MODE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_OP_MODE

Bits	Name	Description
31	RESERVED_BIT31	
30	DST_DATA_FORMAT	0x0: RGB 0x1: YCbCr
29	DEINT_ODD_REF	De-interlace uses Odd field as Reference when set.
28	DEINT_EN	De-interlace enable
27	BG_CHROMA_SITE	Background tile chroma siting. 1= offsite, 0 = cosite.
26:25	BG_CHROMA_SAMP	Background tile chroma sampling: 0x0: 4:4:4/RGB 0x1: H2V1 0x2: H1V2 0x3: 4:2:0.
24	BLEND_TRANSP_EN	Transparency check enable: 0x0: Off (Output is according to blend_alpha_sel/blend_eq_sel combo) 0x1: On (Color keying is done on the foreground layer selected by blend_eq_sel, and blended result specified is passed if non-matching.)
23	DST_CHROMA_SITE	Destination chroma siting. 1 = offsite, 0 = cosite.
22:21	DST_CHROMA_SAMP	Destination chroma sampling: 0x0: 4:4:4/RGB 0x1: H2V1 0x2: H1V2 0x3: 4:2:0.
20	SRC_CHROMA_SITE	Source chroma siting. 1 = offsite, 0 = cosite.
19:18	SRC_CHROMA_SAMP	Source chroma sampling: 0x0: 4:4:4/RGB 0x1: H2V1 0x2: H1V2 0x3: 4:2:0.
17	RESERVED_BIT17	Reserved for backward compatibility
16	DITHER_EN	Dither enable.

VPE_PPP_OP_MODE (cont.)

Bits	Name	Description
15	BLEND_EQ_SEL	Blend equation select: 0x0: normal (same as indicating layer0/fg fetch is the foreground in the blend equation) 0x1: reverse alpha (1-alpha is applied to layer0, same as indicating layer1/bg fetch is the foreground in the blend equation)
14:13	BLEND_ALPHA_SEL	Blending alpha select: 0x0: fg per pixel alpha blend (layer0 alpha) 0x1: bg per pixel alpha blend (layer1 alpha) 0x2: constant alpha blend
12	BLEND_EN	Blending is on. When this bit is set (1), the source tile is fetched first followed by the background tile and subsequently alternating between the two.
11:9	ROT_MODE	Rotation mode: Bit 0: Rotate 90 degrees Bit 1: Left/right flip Bit 2: Up/down flip.
8	ROT_EN	Rotate buffer enable. This must be set (1) when blend is enabled also. When this bit is set (1), the mid-PPP ping-pong tile buffer is always used independent of the rotation mode.
7	LUT_C2_EN	Component 2 LUT enable.
6	LUT_C1_EN	Component 1 LUT enable.
5	LUT_C0_EN	Component 0 LUT enable.
4	CONVERT_MATRIX_SEL	Selects which matrix to use during processing 0x0: Primary matrix 0x1: Secondary matrix.
3	CONVERT_MATRIX_EN	Enable color convert. This enables the matrix conversion in the convert block only.
2	SRC_DATA_FORMAT	0x0: RGB 0x1: YCbCr
1	SCALEY_EN	Y scaling enable
0	SCALEX_EN	X scaling enable

0x0531013C VPE_PPP_SCALE_PHASEX_INIT

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_SCALE_PHASEX_INIT

Bits	Name	Description
31:0	PHASEX_INIT	Initial phase accumulator value for x scale (Q29). This is set to 0 normally, unless performing anamorphic scaling of the same source image or scale down to 1 pixel.

0x05310140 VPE_PPP_SCALE_PHASEY_INIT

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_SCALE_PHASEY_INIT

Bits	Name	Description
31:0	PHASEY_INIT	Initial phase accumulator value for y scale (Q29). This is set to 0 normally, unless performing anamorphic scaling of the same source image or scale down to 1 pixel.

0x05310144 VPE_PPP_SCALE_PHASEX_STEP

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_SCALE_PHASEX_STEP

Bits	Name	Description
31:0	PHASEX_STEP	X phase step which is input width/output width in u3.29, phase step of 8 (1/8 scale) is encoded by setting this value to 0 (representing 0x1_0000_0000). For scaling ratio >1/4 using polyphase scaler, this is ((input size -1) / (output size -1))<<29 and round. For scaling ratio <=1/4, please use M/N scaler and set this to (input size / output size)<<29.

0x05310148 VPE_PPP_SCALE_PHASEY_STEP

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_SCALE_PHASEY_STEP

Bits	Name	Description
31:0	PHASEY_STEP	X phase step which is input width/output width in u3.29, phase step of 8 (1/8 scale) is encoded by setting this value to 0 (representing 0x1_0000_0000). For scaling ratio >1/4 using polyphase scaler, this is ((input size -1) / (output size -1))<<29 and round. For scaling ratio <=1/4, please use M/N scaler and set this to (input size / output size)<<29.

0x0531014C VPE_PPP_BLEND_PARAM

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_BLEND_PARAM

Bits	Name	Description
31:24	CONSTANT_ALPHA	Constant alpha value.
23:0	TRANSPARENT_COLOR	Transparent color to be masked if in this mode (C2,C1,C0 each 8 bits from MSB to LSB).

0x05310150 VPE_PPP_OUT_FORMAT

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0003_27FF

VPE_PPP_OUT_FORMAT

Bits	Name	Description
31:23	RESERVED_BITS31_23	
22:21	COMP_MODE	Compression mode. Output is written out in 4x4 compressed tile format when compression is enabled. If lossy compression is done, the pixel size could be further reduced by 3-bit at a cost of picture quality degradation. When doing lossy compression, either rounding or truncation is supported. 0x0: Lossless compression (Default) 0x1: Lossy with rounding 0x2: Lossy with truncation 0x3: Undefined
20	COMP_EN	Compression enable. 0x0: Disable (Default) 0x1: Enable

VPE_PPP_OUT_FORMAT (cont.)

Bits	Name	Description
19:18	WRITE_PLANES	It determines the number of planes to write: 0x0: Interleaved 0x2: pseudo planar
17:16	PPP_DST_BPP	Effective destination byte per pixel: 0 = 1 byte, 1 = 2 bytes, 2 = 3 bytes, 3 = 4 bytes. This is only useful when estimating ROI line width for the interleaved plane (chroma plane in pseudo-planar)
15	RESERVED_BIT15	Processing pipe output device select no longer supported, fixed to AXI.
14	PPP_PACK_ALIGN	0x0: To LSB 0x1: To MSB
13	PPP_PACK_TIGHT	0x0: Loose 0x1: Tight
12:9	PPP_PACK_COUNT	Valid packing elements count: 0 = 1 element, 1 = 2 elements, ..., 15 = 16 elements. Packing pattern only applies to the interleaved planes (chroma plane in pseudo-planar) and going to MDDI or AXI write only.
8	PPP_DSTC3_EN	0x1: Destination has alpha.
7:6	PPP_DSTC3_BITS	Number of bits for component 3 (alpha) output, this is not used for dither: 0 = 1 bit, 1 = 4 bits, 2 = 6 bits, 3 = 8 bits.
5:4	PPP_DSTC2_BITS	Number of bits for component 2 (R / Cr) output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	PPP_DSTC1_BITS	Number of bits for component 1 (B / Cb) output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	PPP_DSTC0_BITS	Number of bits for component 0 (G / luma) output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x05310154 VPE_PPP_OUT_PACK_PATTERN1

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0302_0001

VPE_PPP_OUT_PACK_PATTERN1

Bits	Name	Description
31:0	PPP_PACK_PATTERN31_0	Packing pattern, maximum of 8 pattern elements starting from LSB to MSB. Run length portion of the pattern is not supported, thus most significant 6 bits of each byte unused, and returns 0. The packing pattern should be set to the intermediate frame buffer format when going to it, for example, for LCD display RGB888 and 4:2:2 interleaved cosite for TV out display.

0x05310158 VPE_PPP_OUT_PACK_PATTERN2

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_OUT_PACK_PATTERN2

Bits	Name	Description
31:0	PPP_PACK_PATTERN63_32	Packing pattern, maximum of 8 pattern elements starting from LSB to MSB. Run length portion of the pattern is not supported, thus most significant 6 bits of each byte unused, and returns 0.

0x05310164 VPE_PPP_OUT_SIZE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0020_0020

The output width has to be a multiple of 16. Although the PPP logic supports output sizes that's not multiple of 16 pixels, we've mainly tested for output size that is multiple of 16 bytes. So, the DST_W should be a multiple of 16.

VPE_PPP_OUT_SIZE

Bits	Name	Description
31:28	RESERVED_BITS31_28	
27:16	DST_H	Output ROI height (pixel).
15:12	RESERVED_BITS15_12	
11:0	DST_W	Output ROI width (pixel).

0x05310168 VPE_PPP_OUTP0_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_OUTP0_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the output Image's single interleave color plane or luma component plane for pseudo planar format.

0x0531016C VPE_PPP_OUTP1_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_OUTP1_ADDR

Bits	Name	Description
31:0	DSTP1_ADDR	Base byte address of the Image's chroma component plane for pseudo planar format.

0x05310174 VPE_PPP_OUTP3_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_OUTP3_ADDR

Bits	Name	Description
31:0	DSTP3_ADDR	Base byte address of the Image's component plane 3, used only in pseudo planar+alpha format.

0x05310178 VPE_PPP_OUT_YSTRIDE1

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0080

VPE_PPP_OUT_YSTRIDE1

Clock: CC_VPE_CLK
Reset State: 0x0002_67FF

VPE_PPP_BG_FORMAT

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:24	DECOMP_MODE	Decompression mode. Background is in 4x4 compressed tile format when decompression is enabled. If lossy compression was done, the pixel size was reduced by 3-bit at a cost of picture quality degradation. When doing decompression for a lossy input, either bit promotion or just shifting is supported.) 0x0: Lossless 0x1: Lossy by rounding 0x2: Lossy by truncation 0x3: Undefined
23	DECOMP_EN	Decompression enable. 0x0: Disable (Default) 0x1: Enable
22	BG_NOT_ROTATE	Set (1) this bit to indicate that the background fetch order will remain the same as foreground regardless of the rotate mode at the output of PPP (in ROI2 operations). Normally (when this is 0 by default), as in blending on an intermediate buffer background, the fetching tile order will vary depending on the rot_mode setting in 0x10138.
21	BG_WMV9_MODE	WMV9 mode 0x1: on 0x0: off
20:19	BG_FETCH_PLANES	Determines the number of planes for background fetch: 0x0: Interleaved 0x2: pseudo planar
18	BG_UNPACK_ALIGN	0x0: To LSB 0x1: To MSB
17	BG_UNPACK_TIGHT	0x0: Loose 0x1: Tight

VPE_PPP_BG_FORMAT (cont.)

Bits	Name	Description
16:13	BG_UNPACK_COUNT	Valid unpacking pattern count: 0 = 1 component, 1 = 2 components, ..., 15 = 16 components. Unpacking pattern only applies to the interleaved plane (chroma plane in pseudo planar).
12:11	RESERVED_BITS12_11	
10:9	BG_BPP	Effective background byte per pixel: 0 = 1 byte, 1 = 2 bytes, 2 = 3 bytes, 3 = 4 bytes. This is only used when unpacking the interleaved plane.
8	BGC3_EN	0x1: background has alpha
7:6	BGC3_BITS	Number of bits for component 3 (alpha) input, this is not used for dither: 0 = 1 bit, 1 = 4 bits, 2 = 6 bits, 3 = 8 bits.
5:4	BGC2_BITS	Number of bits for component 2 (R / Cr) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	BGC1_BITS	Number of bits for component 1 (B / Cb) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	BGC0_BITS	Number of bits for component 0 (G / luma) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x05310230 VPE_PPP_SCALE_CONFIG

Type: Read/Write
Clock: VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_SCALE_CONFIG register selects additional scale parameters.

VPE_PPP_SCALE_CONFIG

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8	PIX_REPEAT_MODE	Put scaler in Pixel Repeat scaling mode, make sure both scale unit selects are in polyphase when this is on. 0x0: Off 0x1: On
7	SHARPEN_EN	Sharpening enable in polyphase scaling 0x0: Off 0x1: On
6	SVI_EN	Enable SVI on green/luma channel in polyphase scaling 0x0: Off 0x1: On
5:4	Y_TABLE	Scale Y coefficient set for polyphase scaler: 0x0: D0 Set 0x1: D1 Set 0x2: D2 Set 0x3: U1 Set
3:2	X_TABLE	Scale X coefficient set for polyphase scaler: 0x0: D0 Set 0x1: D1 Set 0x2: D2 Set 0x3: U1 Set
1	SCALEY_UNIT_SEL	Select Polyphase FIR or M/N filter for X scaler. M/N should be used at low-end of down scaling (between 1/8 and 1/4) 0x0: Polyphase 0x1: M/N phase-controlled
0	SCALEX_UNIT_SEL	Select Polyphase FIR or M/N filter for Y scaler. M/N should be used at low-end of down scaling (between 1/8 and 1/4) 0x0: Polyphase 0x1: M/N phase-controlled

0x05310240 VPE_PPP_CSC_CONFIG

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_CSC_CONFIG register defines the color and gamma correct parameters.

VPE_PPP_CSC_CONFIG

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5	LUT_SEL	Selects which LUT to use during processing 0x0: Set1 0x1: Set2
4	POST_LIMIT_SEL	Selects which post-limit (i.e., post-clamp) to use during processing 0x0: Set1 0x1: Set2
3	PRE_LIMIT_SEL	Selects which pre-limit (i.e., pre-clamp) to use during processing 0x0: Set1 0x1: Set2
2	POST_BIAS_SEL	Selects which post-bias to use during processing 0x0: Set1 0x1: Set2
1	PRE_BIAS_SEL	Selects which pre-bias to use during processing 0x0: Set1 0x1: Set2
0	LUT_POSITION	Specifies the position of LUT/Gamma table 0x0: Pre-LUT (before matrix convert) 0x1: Post-LUT (after matrix convert)

Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_BLEND_PARAM2

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	TRANSPARENCY_MASK	Transparency check bit mask, setting a bit to 1 means the corresponding bit in the transparent color setting is ignored when doing color keying. (c2 c1 c0 each 8 bits from MSB to LSB)

0x05320004 VPE_PPP_TFETCH_TEST_MODE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_TFETCH_TEST_MODE

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	TFETCH_SOLID_FILL	This takes precedence over tfetch_unpack_bypass. If this bit is set (1), the output color is forced to the value written into register 0x20040.This is useful in filling a ROI with a constant color.
0	TFETCH_UNPACK_BYPASS	Setting (1)this bit enables a bypass in the unpacker. Therefore, each data read would be treated as color0, color1, color2, and color3 from lower byte to upper byte.

0x05320008 VPE_PPP_TFETCH_STATUS

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_00FF

VPE_PPP_TFETCH_STATUS

Bits	Name	Description
31:12	RESERVED_BITS31_12	
11:8	FIFO_ERRORS	TileFetch internal FIFO errors. These error bits are pulse catching, and returned to zero when this register is read: Bit 11 = control FIFO error Bit 10 = burstbuf FIFO error Bit 9= line_gen luma FIFO error Bit 8= line_gen chroma FIFO error
7:5	IDLES2	TileFetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 7= conv idle Bit 6= decomp idle Bit 5= lbufs idle
4:0	IDLES	TileFetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 4= dma_rd idle Bit 3= ctl idle Bit 2= burstbuf idle Bit 1= unpack idle Bit 0= line_gen idle

0x05320010 VPE_PPP_TFETCH_TILE_COUNT

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_TFETCH_TILE_COUNT

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:16	NUM_CHROMA_TILE	Number of chroma tiles in an ROI
15:11	RESERVED_BITS15_11	
10:0	NUM_LUMA_TILE	Number of luma/RGB tiles in an ROI

0x05320014 VPE_PPP_TFETCH_FETCH_COUNT

0x05330004 VPE_PPP_DEINT_DECISION

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0003_0032

VPE_PPP_DEINT_DECISION

Bits	Name	Description
31:20	RESERVED_BITS31_20	
18:16	ATTENU	Attenuation (the shift value) for less temporal resolution; valid range is 0
15:11	RESERVED_BITS15_11	
10:0	THRESH	Threshold (u11) for De-interlace attenuation decision

0x05330010+ 4*n VPE_PPP_DEINT_COEFFn, n=[0..3]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_DEINT_COEFFn registers contain the set of luma filter coefficients, where w3 is for the center pixel, w2 is for (+1, -1) pixels, w1 is for (+2, -2) pixels, and w0 is for (+3, -3) pixels.

VPE_PPP_DEINT_COEFFn

Bits	Name	Description
31:10	RESERVED_BITS31_10	
9:0	COEFF	Luma filter coefficient w0 to w3 (s10).

0x05340400+ 4*n VPE_PPP_CSC_MV1n, n=[0..8]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_CSC_MV1n register contains the set1 matrix vector.

VPE_PPP_CSC_MV1n

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12:0	MV1	MV1 = Matrix vector set1 (s4.9). Matrices are indexed left to right, top to bottom. That is, row 1, col 0 index = 3 (index range - 0 to 8).

0x05340440+ 4*n VPE_PPP_CSC_MV2n, n=[0..8]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_CSC_MV2n register contains the set2 matrix vector.

VPE_PPP_CSC_MV2n

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12:0	MV2	MV2 = Matrix vector set2 (s4.9). Matrices are indexed left to right, top to bottom. That is, row 1, col 0 index = 3 (index range - 0 to 8).

0x05340500+ 4*n VPE_PPP_CSC_PRE_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_CSC_PRE_BV1n register contains the set1 pre-bias vector.

P_

VPE_PPP_CSC_PRE_BV1n

Bits	Name	Description
31:9	RESERVED_BITS31_9	

VPE_PPP_CSC_PRE_BV1n (cont.)

Bits	Name	Description
8:0	PRE_BV1	PRE_BV1= Pre-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05340540+4*n VPE_PPP_CSC_PRE_BV2n, n=[0..2]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_CSC_PRE_BV2n register contains the set2 pre-bias vector.

VPE_PPP_CSC_PRE_BV2n

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8:0	PRE_BV2	PRE_BV2 = Pre-bias vector set2 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05340580+4*n VPE_PPP_CSC_POST_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_CSC_POST_BV1n register contains the set1 post-bias vector.

VPE_PPP_CSC_POST_BV1n

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8:0	POST_BV1	POST_BV1 = Post-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x053405C0+4*n VPE_PPP_CSC_POST_BV2n, n=[0..2]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_CSC_POST_BV2n register contains the set2 post-bias vector.

VPE_PPP_CSC_POST_BV2n

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8:0	POST_BV2	POST_BV2 = Post-bias vector set2 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_CSC_PRE_LV2n register contains the set2 pre-limit vectors.

VPE_PPP_CSC_PRE_LV2n

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	PRE_LV2	PRE_LV2 = Pre-limit vector set2 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05340680+ 4*n VPE_PPP_CSC_POST_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_CSC_POST_LV1n register contains the set1 post-limit vector.

VPE_PPP_CSC_POST_LV1n

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	POST_LV1	POST_LV1 = Post-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x053406C0+ 4*n VPE_PPP_CSC_POST_LV2n, n=[0..5]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_CSC_POST_LV2n register contains the set2 post-limit vectors.

VPE_PPP_CSC_POST_LV2n

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	POST_LV2	POST_LV2 = Post-limit vector set2 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05340800+ 4*n VPE_PPP_CSC_LUT1n, n=[0..255]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0xXXXX_XXXX

The VPE_PPP_CSC_LUT1n registers contains the color lookup values for LUT set1. These are implemented as a ram, so on reset the value is X.

VPE_PPP_CSC_LUT1n

Bits	Name	Description
31:24	RESERVED_BITS31_24	

VPE_PPP_CSC_LUT1n (cont.)

Bits	Name	Description
23:16	LUT_COLOR2	LUT value for color2.
15:8	LUT_COLOR1	LUT value for color1.
7:0	LUT_COLOR0	LUT value for color0.

0x05340C00+4*n VPE_PPP_CSC_LUT2n, n=[0..255]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0xXXXX_XXXX

The VPE_PPP_CSC_LUT2n registers contains the color lookup values for LUT set2.These are implemented as a ram, so on reset the value is X.

VPE_PPP_CSC_LUT2n

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	LUT_COLOR2	LUT value for color2.
15:8	LUT_COLOR1	LUT value for color1.
7:0	LUT_COLOR0	LUT value for color0.

0x05350000 VPE_PPP_SCALE_STATUS

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0FFF

VPE_PPP_SCALE_STATUS

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	IDLES	Internal block idles

0x05350010 VPE_PPP_SCALE_SVI_PARAM

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_7304

The VPE_PPP_SCALE_SVI_PARAM register contains all the parameters for applying the SVI on the polyphase scaler.

VPE_PPP_SCALE_SVI_PARAM

Bits	Name	Description
31:16	RESERVED_BIT31_16	
15:8	SVI_THRESH0	SVI threshold 0 (A0), default 0.45
7:4	RESERVED_BITS7_4	
3:0	SVI_AMP0	SVI gain 0 (k0), default 4

0x05350020 VPE_PPP_SCALE_SHARPEN_CFG

Type: Read/Write
Clock: VPE_CLK
Reset State: 0x0000_0040

The VPE_PPP_SCALE_SHARPEN_STRENGTH register sets the sharpening strength.

VPE_PPP_SCALE_SHARPEN_CFG

Bits	Name	Description
31:17	RESERVED_BITS31_17	
7:0	STRENGTH	Sharpening strength (a), range = [-127, 127], default 64

0x05350400+8*n VPE_PPP_SCALE_COEFF_LSP_n, n=[0..127]

Type: Read/Write
Clock: VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_SCALE_COEFF_LSP_n register contains the Least Significant Portion of the whole coefficient word, i.e., coefficients for k-1 and k samples. Note, each coefficient value is aligned to 16-bit word boundary.

VPE_PPP_SCALE_COEFF_LSP_n

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	COEFF1	10 bit (signed) poly-phase scale coefficient for k sample.
15:10	RESERVED_BITS15_10	
9:0	COEFF0	10 bit (signed) poly-phase scale coefficient for k-1 sample.

0x05350404+8*n VPE_PPP_SCALE_COEFF_MSP_n, n=[0..127]

Type: Read/Write
Clock: VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_SCALE_COEFF_MSP_n register contains the Most Significant Portion of the whole coefficient word, i.e., coefficients for k+1 and k+2 samples. Note, each coefficient value is aligned to 16-bit word boundary. The FIR coefficient tables should be written to in sequence of LSP write first followed by MSP write, writing from lower address to higher address. Each MSP register write actually triggers the write of whole 40-bit coefficient word into the RAM. The tables are separated into different ranges: set D0 starts at 0x50400; set D1 starts at 0x50500; set D2 starts at 0x50600; and set U1 starts at 0x50700. Each set takes up 0x100 addresses.

VPE_PPP_SCALE_COEFF_MSP_n

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	COEFF3	10 bit (signed) poly-phase scale coefficient for k+2 sample.
15:10	RESERVED_BITS15_10	
9:0	COEFF2	10 bit (signed) poly-phase scale coefficient for k+1 sample.

0x05370000 VPE_PPP_BLEND_STATUS

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0027

VPE_PPP_BLEND_STATUS

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5:0	IDLES	Internal idles and valids

0x05370004 VPE_PPP_BLEND_COLOR3_OUT

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_BLEND_COLOR3_OUT

Bits	Name	Description
31:1	RESERVED_BITS31_1	

VPE_PPP_BLEND_COLOR3_OUT (cont.)

Bits	Name	Description
0	C3_OUT_SEL	Selects which source to drive on the color3 component output in the blending region: 0x0: Background layer color3 0x1: Foreground color3

0x05370010 VPE_PPP_BLEND_BG_ALPHA_SEL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_BLEND_BG_ALPHA_SEL

Bits	Name	Description
31:24	CONSTANT_ALPHA	Constant alpha value.
23:4	RESERVED_BITS23_4	
3	BLEND_EQ_SEL	Blend equation select: 0x0: normal (alpha selected is applied to bg pixel) 0x1: reverse alpha (1-alpha is applied to bg pixel)
2:1	BLEND_ALPHA_SEL	Blending alpha select: 0x0: fg per pixel alpha blend (layer0 alpha) 0x1: bg per pixel alpha blend (layer1 alpha) 0x2: constant alpha blend
0	MODE	Selects whether PPP_OP_MODE register setting chooses the alpha selection for both fg and bg (Normal mode) or bg alpha blending is destinated separately using this register: 0x0: Normal 0x1: Separate BG alpha sel

14.16.8 DMA_P registers

0x05390000 VPE_DMA_P_CONFIG

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_CONFIG

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:25	IBUF_FORMAT	0x0: RGB888 format (Default) 0x1: RGB565 format 0x2: xRGB8888 format (not supported for compressed IBUF) 0x3: Undefined
24	DITHER_EN	Dither enable
23:22	RESERVED_BIT23_22	
21	RESERVED_BIT21	
20:19	OUT_SEL	DMA channel output interface select. 0x0: AHB (EBI2) 0x1: MDDI 0x2: LCDC (parallel RGB interface) 0x3: MDDI based LCDC
18	BIT_MASK_POLARITY	Select the bit mask polarity. 0x0: Masked bits are set to '0' 0x1: Masked bits are set to '1'
17	RESERVED_BIT17	
16	COMP2_BIT_FLIP_EN	When set (1) flips all the bits of component2.
15	COMP1_BIT_FLIP_EN	When set (1) flips all the bits of component1.
14	COMP0_BIT_FLIP_EN	When set (1) flips all the bits of component0.
13:8	PACK_PATTERN	Packing pattern used by the packer. 0x21: Data packed as RGB (default) 0x24: Data packed as RBG 0x12: Data packed as BGR 0x18: Data packed as BRG 0x6: Data packed as GBR 0x9: Data packed as GRB
7	PACK_ALIGN	Packing alignment (within a byte) for each color component. This is valid only in parallel LCDC case where the output is packed loose. Not valid for MDDI based LCDC where the output is packed tight. 0x0: LSB (default) 0x1: MSB
6	EBI2_SPLIT_PIX	Set (1) to split one pixel (in 888 format) in to two 12-bit writes. This bit should be set only if the output interface is AHB.
5:4	COMP2_OUT_BITS	Number of bits for component 2 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
3:2	COMP1_OUT_BITS	Number of bits for component 1 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).

VPE_DMA_P_CONFIG (cont.)

Bits	Name	Description
1:0	COMP0_OUT_BITS	Number of bits for component 0 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).

0x05390004 VPE_DMA_P_SIZE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_SIZE register defines the primary DMA output ROI width and height in pixels. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_SIZE

Bits	Name	Description
31:27	RESERVED_BITS31_27	This field has no function and should be set to zero for future compatibility
26:16	DMA_H	DMA output ROI height (in pixels). For LCDC, this specifies the active region height.
15:11	RESERVED_BITS15_11	This field has no function and should be set to zero for future compatibility
10:0	DMA_W	DMA output ROI width (in pixels). For LCDC, this specifies the active region width. Note: The max. ROI width supported when the IBUF is compressed is 1280 when ROI start is 4x4 grid aligned and is 1277 (worst-case) if not grid aligned. The max. width supported is 2047 when IBUF is uncompressed. These restrictions are because of line buffer size limitations in hardware.

0x05390008 VPE_DMA_P_IBUF_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_IBUF_ADDR register defines the primary DMA IBUF address. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_IBUF_ADDR

Bits	Name	Description
31:0	IBUF_ADDR	Intermediate buffer base address (byte-aligned). This defines the start of image. Note: If decompression is enabled, the memory size allocated for IBUF should be a multiple of 4x4 irrespective of whether the image in IBUF is a multiple of 4x4.

0x0539000C VPE_DMA_P_IBUF_Y_STRIDE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_IBUF_Y_STRIDE register defines the line jump value (in bytes) in the intermediate buffer. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_IBUF_Y_STRIDE

Bits	Name	Description
31:14	RESERVED_BITS31_14	This field has no function and should be set to zero for future compatibility
13:0	IBUF_Y_STRIDE	Y-stride (or) line jump in bytes in the image IBUF.

0x05390010 VPE_DMA_P_OUT_XY

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_OUT_XY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:16	DMA_OUT_Y	Display (or) screen y coordinate (pixel) where the first line of a ROI will be written. Program this parameter to zero if the output interface is LCDC since all LCDC updates are full screen.
15:11	RESERVED_BITS15_11	
10:0	DMA_OUT_X	Display (or) screen x coordinate (pixel) where the first pixel of a ROI will be written. Program this parameter to zero if the output interface is LCDC since all LCDC updates are full screen.

0x05390014 VPE_DMA_P_LINE_COUNT

Type: Read
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_LINE_COUNT

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:0	LINE_COUNT	Provides the line count or write pointer value (read pointer if output to LCDC). This value is w.r.t. display height and not ROI height.

0x05390018 VPE_DMA_P_LINE_IRQ

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_LINE_IRQ defines the line count or write_pointer value at which an interrupt has to be generated.

VPE_DMA_P_LINE_IRQ

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	IRQ_LINE	Specify the line count or write pointer value at which an interrupt has to be generated. Specify this value w.r.t. display height and not ROI height.

0x0539001C VPE_DMA_P_MASK_PATTERN

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_MASK_PATTERN register defines the pattern that will be used when bit masking is enabled.

VPE_DMA_P_MASK_PATTERN

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	BIT_MASK_PATTERN	This pattern is used to mask the pixel bits when bit masking is enabled. If a pattern bit is set (1) the corresponding pixel bit is masked. The pattern is specified as {C2, C1, C0} where each color component is loosely packed according to the output format in to 8-bits and LSB aligned.

0x05390020 VPE_DMA_P_PROFILE_EN

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_DMA_P_PROFILE_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	EN	Enable the ROI cycle counter for profiling

0x05390024 VPE_DMA_P_PROFILE_COUNT

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	TOTAL_CYCLE	Total cycle count (in AXI cycles) in a ROI, from ROI start to last pixel out of Packer (DMA_P goes back to Idle). This count will be reset automatically at the beginning of each ROI start.

0x05390040 VPE_DMA_P_CURSOR_FORMAT

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_CURSOR_FORMAT

Bits	Name	Description
31:3	RESERVED_BITS31_2	
2:0	CURSOR_FORMAT	0x0: ARGB8888 format (Default)

0x05390044 VPE_DMA_P_CURSOR_SIZE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_CURSOR_SIZE register defines the hardware cursor width and height in pixels. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_CURSOR_SIZE

Bits	Name	Description
31:23	RESERVED_BITS31_23	This field has no function and should be set to zero for future compatibility
22:16	CURSOR_H	Cursor height (in lines). Max. supported height = 64 lines.
15:7	RESERVED_BITS15_7	This field has no function and should be set to zero for future compatibility
6:0	CURSOR_W	Cursor width (in pixels). Max. supported width = 64 pixels

0x05390048 VPE_DMA_P_CURSOR_BUF_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_CURSOR_BUF_ADDR register defines the cursor buffer address. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_CURSOR_BUF_ADDR

Bits	Name	Description
31:0	CURSOR_BUF_ADDR	Cursor buffer base address (byte-aligned).

0x0539004C VPE_DMA_P_CURSOR_POSITION

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_CURSOR_POSITION register defines the start x and y positions of the cursor relative to ROI start x and y. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_CURSOR_POSITION

Bits	Name	Description
31:28	RESERVED_BITS31_28	This field has no function and should be set to zero for future compatibility
27:16	CURSOR_Y_START	Define the start (y) position of the cursor relative to ROI start (y). This is a signed value and has to be programmed in (s12) format.
15:12	RESERVED_BITS15_12	This field has no function and should be set to zero for future compatibility
11:0	CURSOR_X_START	Define the start (x) position of the cursor relative to ROI start (x). This is a signed value and has to be programmed in (s12) format.

0x05390060 VPE_DMA_P_CURSOR_BLEND_CONFIG

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_CURSOR_BLEND_CONFIG register enables cursor blend and defines some blend parameters. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_CURSOR_BLEND_CONFIG

Bits	Name	Description
31:4	RESERVED_BITS31_4	
3	BLEND_TRANSP_EN	Transparency check enable: 0x0: Off (Output is according to blend_alpha_sel blend output.) 0x1: On (Color keying is done on the cursor and blended result specified from the 2 layers is passed if non-matching; otherwise, the background image layer is sent.)
2:1	BLEND_ALPHA_SEL	Blending alpha select: 0x1: Cursor per pixel alpha (Default) 0x2: Constant alpha
0	BLEND_EN	Cursor blend enable (when disabled, output pixels would be the same as the background image pixels).

0x05390064 VPE_DMA_P_CURSOR_BLEND_PARAM

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_CURSOR_BLEND_PARAM

Bits	Name	Description
31:24	CONSTANT_ALPHA	Constant alpha value.
23:0	TRANSPARENT_COLOR	Color to be used if transparency (color-keying) is enabled (C2,C1,C0 each 8 bits from MSB to LSB).

0x05390068 VPE_DMA_P_CURSOR_BLEND_TRANS_MASK

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_CURSOR_BLEND_TRANS_MASK

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	TRANSPARENCY_MASK	Mask to be used if transparency is enabled (C2,C1,C0 each 8 bits from MSB to LSB). Setting a bit to (1) means the corresponding bit in the transparent_color is ignored during color-keying.

0x05390070 VPE_DMA_P_COLOR_CORRECT_CONFIG

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_COLOR_CORRECT_CONFIG register defines the color and gamma correct parameters. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_COLOR_CORRECT_CONFIG

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12	COLOR_FMT_OUT	Select the output color format after correction/conversion 0x0: RGB (default) 0x1: YCbCr
11	COLOR_FMT_IN	Select the input color format for correction/conversion 0x0: RGB (default) 0x1: YCbCr
10	LUT_SEL	Selects which LUT to use during processing 0x0: Set1 0x1: Set2
9	POST_LIMIT_SEL	Selects which post-limit (i.e., post-clamp) to use during processing 0x0: Set1 0x1: Set2
8	PRE_LIMIT_SEL	Selects which pre-limit (i.e., pre-clamp) to use during processing 0x0: Set1 0x1: Set2
7	POST_BIAS_SEL	Selects which post-bias to use during processing 0x0: Set1 0x1: Set2
6	PRE_BIAS_SEL	Selects which pre-bias to use during processing 0x0: Set1 0x1: Set2
5	CONVERT_MATRIX_SEL	Selects which matrix to use during processing 0x0: Set1 0x1: Set2
4	LUT_POSITION	Specifies the position of LUT/Gamma table 0x0: Pre-LUT (before matrix convert) 0x1: Post-LUT (after matrix convert)
3	CONVERT_MATRIX_EN	Enable color convert. This enables the matrix conversion in the convert block.
2	LUT_C2_EN	Component 2 LUT enable.
1	LUT_C1_EN	Component 1 LUT enable.
0	LUT_C0_EN	Component 0 LUT enable.

0x05390080 VPE_DMA_P_DECOMP_CONFIG

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_DECOMP_CONFIG register enables decompression and selects decompress mode. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_DECOMP_CONFIG

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2:1	DECOMP_MODE	Select decompression mode 0x0: Lossless (default) 0x1: Lossy with bit shift 0x2: Lossy with bit promotion 0x3: Undefined
0	DECOMP_EN	Decompression enable 0x0: Disable (default) 0x1: Enable

0x05390084 VPE_DMA_P_DECOMP_HDR_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_DECOMP_HDR_ADDR register defines the header address corresponding to the first 4x4 compressed tile in the image IBUF. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_DECOMP_HDR_ADDR

Bits	Name	Description
31:0	DECOMP_HDR_ADDR	Header address (byte-aligned) corresponding to the first 4x4 compressed tile in the image IBUF. First 4x4 compressed tile is located at x=0, y=0 input (pixel) coordinate.

0x05390088 VPE_DMA_P_DECOMP_HDR_Y_STRIDE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_DECOMP_HDR_Y_STRIDE register defines the jump value (in bytes) for header fetch when moving from one stripe to next. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_DECOMP_HDR_Y_STRIDE

Bits	Name	Description
31:14	RESERVED_BITS31_14	
13:0	DECOMP_HDR_Y_STRIDE	Y-stride (in bytes) for headers of 4x4 compressed tiles in the image IBUF.

0x0539008C VPE_DMA_P_IBUF_XY

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_IBUF_XY register defines the start location of the ROI within an IBUF. This register is Double Buffered in LCDC mode and the programmed value is latched in to the second buffer every Vsync.

VPE_DMA_P_IBUF_XY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:16	ROI_Y	Defines the y-offset (in pixels) of the ROI in the image IBUF.
15:11	RESERVED_BITS15_11	
10:0	ROI_X	Defines the x-offset (in pixels) of the ROI in the image IBUF.

0x05390090 VPE_DMA_P_DECOMP_PROFILE_COUNT

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_P_DECOMP_PROFILE_COUNT register provides the total number of header bytes and image bytes read from a compressed IBUF for a particular ROI. The compression ratio can be calculated by dividing the contents of this register by the total number of output bytes (ROI_H * ROI_W * bytes_per_pixel).

VPE_DMA_P_DECOMP_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	FETCH_BYTE_CNT	Total no. of bytes (header + compressed image) fetched for the current ROI. This count will be reset automatically at the beginning of each ROI.

0x05393400+ 4*n VPE_DMA_P_CSC_MV1n, n=[0..8]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_MV1n register contains the set1 matrix vector.

VPE_DMA_P_CSC_MV1n

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12:0	MV1	MV1 = Matrix vector set1 (s4.9). Matrices are indexed left to right, top to bottom. That is, row 1, col 0 index = 3 (index range - 0 to 8).

0x05393440+ 4*n VPE_DMA_P_CSC_MV2n, n=[0..8]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_MV2n register contains the set2 matrix vector.

VPE_DMA_P_CSC_MV2n

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12:0	MV2	MV2 = Matrix vector set2 (s4.9). Matrices are indexed left to right, top to bottom. That is, row 1, col 0 index = 3 (index range - 0 to 8).

0x05393500+4*n VPE_DMA_P_CSC_PRE_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_PRE_BV1n register contains the set1 pre-bias vector.

P_

VPE_DMA_P_CSC_PRE_BV1n

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8:0	PRE_BV1	PRE_BV1= Pre-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05393540+4*n VPE_DMA_P_CSC_PRE_BV2n, n=[0..2]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_PRE_BV2n register contains the set2 pre-bias vector.

VPE_DMA_P_CSC_PRE_BV2n

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8:0	PRE_BV2	PRE_BV2 = Pre-bias vector set2 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05393580+4*n VPE_DMA_P_CSC_POST_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_POST_BV1n register contains the set1 post-bias vector.

VPE_DMA_P_CSC_POST_BV1n

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8:0	POST_BV1	POST_BV1 = Post-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x053935C0+4*n VPE_DMA_P_CSC_POST_BV2n, n=[0..2]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_POST_BV2n register contains the set2 post-bias vector.

VPE_DMA_P_CSC_POST_BV2n

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8:0	POST_BV2	POST_BV2 = Post-bias vector set2 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05393600+ 4*n VPE_DMA_P_CSC_PRE_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_PRE_LV1n register contains the set1 pre-limit vector.

VPE_DMA_P_CSC_PRE_LV1n

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	PRE_LV1	PRE_LV1 = Pre-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05393640+ 4*n VPE_DMA_P_CSC_PRE_LV2n, n=[0..5]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_PRE_LV2n register contains the set2 pre-limit vectors.

VPE_DMA_P_CSC_PRE_LV2n

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	PRE_LV2	PRE_LV2 = Pre-limit vector set2 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05393680+ 4*n VPE_DMA_P_CSC_POST_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_POST_LV1n register contains the set1 post-limit vector.

VPE_DMA_P_CSC_POST_LV1n

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	POST_LV1	POST_LV1 = Post-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x053936C0+ 4*n VPE_DMA_P_CSC_POST_LV2n, n=[0..5]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_POST_LV2n register contains the set2 post-limit vectors.

VPE_DMA_P_CSC_POST_LV2n

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	POST_LV2	POST_LV2 = Post-limit vector set2 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05393800+ 4*n VPE_DMA_P_CSC_LUT1n, n=[0..255]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_LUT1n registers contains the color lookup values for LUT set1.

VPE_DMA_P_CSC_LUT1n

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	LUT_COLOR2	LUT value for color2.

VPE_DMA_P_CSC_LUT1n (cont.)

Bits	Name	Description
15:8	LUT_COLOR1	LUT value for color1.
7:0	LUT_COLOR0	LUT value for color0.

0x05393C00+4*n VPE_DMA_P_CSC_LUT2n, n=[0..255]

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_CSC_LUT2n registers contains the color lookup values for LUT set2.

VPE_DMA_P_CSC_LUT2n

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	LUT_COLOR2	LUT value for color2.
15:8	LUT_COLOR1	LUT value for color1.
7:0	LUT_COLOR0	LUT value for color0.

0x05394000 VPE_DMA_P_HIST_START

Type: Write Only
Clock: CC_VPE_CLK
Reset State: N/A

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_START register kicks off histogram generation.

VPE_DMA_P_HIST_START

Bits	Name	Description
31:0	HIST_START	A write to this register kicks off histogram generation. Actual accumulation begins at the start of next ROI. Histogram accumulation can be started only when histogram reset sequence is not currently active.

0x05394004 VPE_DMA_P_HIST_FRAME_CNT

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_FRAME_CNT register is used to program the frame count for histogram accumulation.

VPE_DMA_P_HIST_FRAME_CNT

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5:0	FRAME_CNT	Program the number of frames over which the histogram data has to be collected. If the frame count programmed is more than what each 24-bit bin can support, the bin count will saturate at the maximum value. Here are some max. frame counts that can be programmed for different image sizes for a 24-bit bin. XGA (1024 x 768) - 21 WSVGA (1024 x 600) - 27 WVGA (800 x 480) - 43 VGA (640 x 480) - 54

0x05394008 VPE_DMA_P_HIST_BIT_MASK

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_BIT_MASK register specifies which MSBs need to be masked before histogram binning.

VPE_DMA_P_HIST_BIT_MASK

Bits	Name	Description
31	BIT_MASK_POLARITY	If set to (1) masked bits are compared to '1' else compared to '0'
30:2	RESERVED_BITS30_2	

VPE_DMA_P_HIST_BIT_MASK (cont.)

Bits	Name	Description
1:0	BIT_MASK	Select which MSBs of the input color component have to be masked before histogram binning. The five unmasked MSBs will be used for bin address generation if the polarity of all the masked bits matches BIT_MASK_POLARITY. 0x0: No masking (default) 0x1: Mask one MSB 0x2: Mask two MSBs 0x3: Mask three MSBs

0x0539400C VPE_DMA_P_HIST_RESET_SEQ_START

Type: Write Only
Clock: CC_VPE_CLK
Reset State: N/A

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_RESET_SEQ_START kicks off a reset sequence.

VPE_DMA_P_HIST_RESET_SEQ_START

Bits	Name	Description
31:0	RESET_SEQ_START	Writing to this register kicks off a reset sequence.This reset sequence clears all RAM locations and RAM rd/wr pointers. The reset sequence can be initiated only when histogram generation is not currently active. Note: Functional clock gating will shut off the clock to DMA_P sub-blocks when a ROI is not being processed. So DMA_P clock should be forced ON for the reset sequence to complete.

0x05394010 VPE_DMA_P_HIST_CONTROL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_CONTROL register controls histogram operation.

VPE_DMA_P_HIST_CONTROL

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	AUTO_CLEAR_EN	When set (1), the bin from which data has been read is cleared automatically.

0x05394014 VPE_DMA_P_HIST_INTR_STATUS

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_INTR_STATUS register provides histogram interrupt status.

VPE_DMA_P_HIST_INTR_STATUS

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	HIST_DONE	When set (1) implies histogram generation is complete.
0	RESET_SEQ_DONE	When set (1) implies the reset sequence is complete.

0x05394018 VPE_DMA_P_HIST_INTR_CLEAR

Type: Write Only
Clock: CC_VPE_CLK
Reset State: N/A

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_INTR_CLEAR is used to clear the interrupts generated by histogram block.

VPE_DMA_P_HIST_INTR_CLEAR

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	HIST_DONE	Write (1) to this bit to clear the status.
0	RESET_SEQ_DONE	Write (1) to this bit to clear the status.

0x0539401C VPE_DMA_P_HIST_INTR_ENABLE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_INTR_ENABLE is used to enable the interrupt sources within the histogram block.

VPE_DMA_P_HIST_INTR_ENABLE

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	HIST_DONE	Write (1) to this bit to enable the interrupt source.
0	RESET_SEQ_DONE	Write (1) to this bit to enable the interrupt source.

0x05394100+4*n VPE_DMA_P_HIST_R_DATAn, n=[0..31]

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_R_DATAn register provides the histogram data corresponding to the color component R.

VPE_DMA_P_HIST_R_DATAn

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	HIST_R_DATA	Reading this register provides histogram bin data for component R.

0x05394200+4*n VPE_DMA_P_HIST_G_DATAn, n=[0..31]

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_G_DATAn register provides the histogram data corresponding to the color component G.

VPE_DMA_P_HIST_G_DATAn

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	HIST_G_DATA	Reading this register provides histogram bin data for component G.

0x05394300+4*n VPE_DMA_P_HIST_B_DATAn, n=[0..31]

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_DMA_P_HIST_B_DATAn register provides the histogram data corresponding to the color component B.

VPE_DMA_P_HIST_B_DATAn

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	HIST_B_DATA	Reading this register provides histogram bin data for component B.

14.16.9 DMA_S registers

0x053A0000 VPE_DMA_S_CONFIG

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_S_CONFIG

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:25	IBUF_FORMAT	0x0: RGB888 format (Default) 0x1: RGB565 format 0x2: xRGB8888 format 0x3: Undefined
24	DITHER_EN	Dither enable.
23:22	RESERVED_BIT23_22	
21	RESERVED_BIT21	
20:19	OUT_SEL	DMA channel output interface select. 0x0: AHB (EBI2 Cannot be selected if DMA_E drives EBI2) 0x1: MDDI 0x2: LCDC (Not supported in DMA_S)
18	BIT_MASK_POLARITY	Select the bit mask polarity. 0x0: Masked bits are set to '0' 0x1: Masked bits are set to '1'
17	RESERVED_BIT17	
16	COMP2_BIT_FLIP_EN	When set (1) flips all the bits of component2.
15	COMP1_BIT_FLIP_EN	When set (1) flips all the bits of component1.
14	COMP0_BIT_FLIP_EN	When set (1) flips all the bits of component0.
13:8	PACK_PATTERN	Packing pattern used by the packer. 0x21: Data packed as RGB (default) 0x24: Data packed as RBG 0x12: Data packed as BGR 0x18: Data packed as BRG 0x6: Data packed as GBR 0x9: Data packed as GRB
7	RESERVED_BIT7	
6	EBI2_SPLIT_PIX	Set (1) to split one pixel (in 888 format) in to two 12-bit writes. This bit should be set only if the output interface is AHB.
5:4	COMP2_OUT_BITS	Number of bits for component 2 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
3:2	COMP1_OUT_BITS	Number of bits for component 1 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
1:0	COMP0_OUT_BITS	Number of bits for component 0 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).

0x053A0004 VPE_DMA_S_SIZE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_S_SIZE register defines the secondary DMA output width and height in pixels

VPE_DMA_S_SIZE

Bits	Name	Description
31:27	RESERVED_BITS31_27	This field has no function and should be set to zero for future compatibility
26:16	DMA_H	DMA output image height (in pixels).
15:11	RESERVED_BITS15_11	This field has no function and should be set to zero for future compatibility
10:0	DMA_W	DMA output image width (in pixels).

0x053A0008 VPE_DMA_S_IBUF_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_S_IBUF_ADDR register defines the secondary DMA IBUF address.

VPE_DMA_S_IBUF_ADDR

Bits	Name	Description
31:0	IBUF_ADDR	Intermediate buffer base address (byte-aligned).

0x053A000C VPE_DMA_S_IBUF_Y_STRIDE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_S_IBUF_Y_STRIDE register defines the line jump value (in bytes) in the intermediate buffer

VPE_DMA_S_IBUF_Y_STRIDE

Bits	Name	Description
31:14	RESERVED_BITS31_14	This field has no function and should be set to zero for future compatibility
13:0	IBUF_Y_STRIDE	Y-stride (or) line jump value in bytes in the intermediate buffer. Irrespective of whether the data in IBUF is contiguous or non-contiguous, line jump value has to be provided since all the DMA requests are line requests.

0x053A0010 VPE_DMA_S_OUT_XY

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_S_OUT_XY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:16	DMA_OUT_Y	Screen y coordinate (pixel) where the first line of a ROI will be written.
15:11	RESERVED_BITS15_11	
10:0	DMA_OUT_X	Screen x coordinate (pixel) where the first pixel of a ROI will be written.

0x053A0014 VPE_DMA_S_LINE_COUNT

Type: Read
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_S_LINE_COUNT

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:0	LINE_COUNT	Provides the line count or write pointer value. This value is w.r.t. display height and not ROI height.

0x053A0018 VPE_DMA_S_LINE_IRQ

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_S_LINE_IRQ defines the line count or write_pointer value at which an interrupt has to be generated..

VPE_DMA_S_LINE_IRQ

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	IRQ_LINE	Specify the line count or write pointer value at which an interrupt has to be generated. Specify this value w.r.t. display height and not ROI height.

0x053A001C VPE_DMA_S_MASK_PATTERN

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_S_MASK_PATTERN register defines the pattern that will be used when bit masking is enabled.

VPE_DMA_S_MASK_PATTERN

Bits	Name	Description
31:24	RESERVED_BITS31_24	

VPE_DMA_S_MASK_PATTERN (cont.)

Bits	Name	Description
23:0	BIT_MASK_PATTERN	This pattern is used to mask the pixel bits when bit masking is enabled. If a pattern bit is set (1) the corresponding pixel bit is masked. The pattern is specified as {C2, C1, C0} where each color component is loosely packed according to the output format in to 8-bits and LSB aligned.

0x053A0020 VPE_DMA_S_PROFILE_EN

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_S_PROFILE_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	EN	Enable the ROI cycle counter for profiling

0x053A0024 VPE_DMA_S_PROFILE_COUNT

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_S_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	TOTAL_CYCLE	Total cycle count (in AXI cycles) in a ROI, from ROI start to last pixel out of Packer (DMA_S goes back to Idle). This count will be reset automatically at the beginning of each ROI start.

14.16.10 DMA_E registers

0x053B0000 VPE_DMA_E_CONFIG

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_E_CONFIG

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:25	IBUF_FORMAT	0x0: RGB888 format (Default) 0x1: RGB565 format 0x2: xRGB8888 format 0x3: Undefined
24	DITHER_EN	Dither enable.
23:22	RESERVED_BIT23_22	
21	RESERVED_BIT21	
20:19	OUT_SEL	DMA channel output interface select. Note: DMA_E cannot drive EBI2 when OUT_SEL in VPE_DMA_S_CONFIG holds a value 0x0 (EBI2) 0x0: AHB (EBI2 Cannot be selected if DMA_S drives EBI2) 0x1: MDDI 0x2: LCDC (Not supported in DMA_E)
18	BIT_MASK_POLARITY	Select the bit mask polarity. 0x0: Masked bits are set to '0' 0x1: Masked bits are set to '1'
17	RESERVED_BIT17	
16	COMP2_BIT_FLIP_EN	When set (1) flips all the bits of component2.
15	COMP1_BIT_FLIP_EN	When set (1) flips all the bits of component1.
14	COMP0_BIT_FLIP_EN	When set (1) flips all the bits of component0.
13:8	PACK_PATTERN	Packing pattern used by the packer. 0x21: Data packed as RGB (default) 0x24: Data packed as RBG 0x12: Data packed as BGR 0x18: Data packed as BRG 0x6: Data packed as GBR 0x9: Data packed as GRB
7	RESERVED_BIT7	

VPE_DMA_E_CONFIG (cont.)

Bits	Name	Description
6	EBI2_SPLIT_PIX	Set (1) to split one pixel (in 888 format) in to two 12-bit writes. This bit should be set only if the output interface is AHB.
5:4	COMP2_OUT_BITS	Number of bits for component 2 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
3:2	COMP1_OUT_BITS	Number of bits for component 1 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
1:0	COMP0_OUT_BITS	Number of bits for component 0 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).

0x053B0004 VPE_DMA_E_SIZE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_E_SIZE register defines the external DMA output width and height in pixels

VPE_DMA_E_SIZE

Bits	Name	Description
31:27	RESERVED_BITS31_27	This field has no function and should be set to zero for future compatibility
26:16	DMA_H	DMA output image height (in pixels).
15:11	RESERVED_BITS15_11	This field has no function and should be set to zero for future compatibility
10:0	DMA_W	DMA output image width (in pixels).

0x053B0008 VPE_DMA_E_IBUF_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_E_IBUF_ADDR register defines the external DMA IBUF address.

VPE_DMA_E_IBUF_ADDR

Bits	Name	Description
31:0	IBUF_ADDR	Intermediate buffer base address (byte-aligned).

0x053B000C VPE_DMA_E_IBUF_Y_STRIDE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_E_IBUF_Y_STRIDE register defines the line jump value (in bytes) in the intermediate buffer

VPE_DMA_E_IBUF_Y_STRIDE

Bits	Name	Description
31:14	RESERVED_BITS31_14	This field has no function and should be set to zero for future compatibility
13:0	IBUF_Y_STRIDE	Y-stride (or) line jump value in bytes in the intermediate buffer. Irrespective of whether the data in IBUF is contiguous or non-contiguous, line jump value has to be provided since all the DMA requests are line requests.

0x053B0010 VPE_DMA_E_OUT_XY

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_E_OUT_XY

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:16	DMA_OUT_Y	Screen y coordinate (pixel) where the first line of a ROI will be written.
15:11	RESERVED_BITS15_11	

VPE_DMA_E_OUT_XY (cont.)

Bits	Name	Description
10:0	DMA_OUT_X	Screen x coordinate (pixel) where the first pixel of a ROI will be written.

0x053B0014 VPE_DMA_E_LINE_COUNT

Type: Read
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_E_LINE_COUNT

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:0	LINE_COUNT	Provides the line count or write pointer value. This value is w.r.t. display height and not ROI height.

0x053B0018 VPE_DMA_E_LINE_IRQ

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_E_LINE_IRQ defines the line count or write_pointer value at which an interrupt has to be generated..

VPE_DMA_E_LINE_IRQ

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	IRQ_LINE	Specify the line count or write pointer value at which an interrupt has to be generated. Specify this value w.r.t. display height and not ROI height.

0x053B001C VPE_DMA_E_MASK_PATTERN

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_E_MASK_PATTERN register defines the pattern that will be used when bit masking is enabled.

VPE_DMA_E_MASK_PATTERN

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	BIT_MASK_PATTERN	This pattern is used to mask the pixel bits when bit masking is enabled. If a pattern bit is set (1) the corresponding pixel bit is masked. The pattern is specified as {C2, C1, C0} where each color component is loosely packed according to the output format in to 8-bits and LSB aligned.

0x053B0020 VPE_DMA_E_PROFILE_EN

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_E_PROFILE_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	EN	Enable the ROI cycle counter for profiling

0x053B0024 VPE_DMA_E_PROFILE_COUNT

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_DMA_E_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	TOTAL_CYCLE	Total cycle count (in AXI cycles) in a ROI, from ROI start to last pixel out of Packer (DMA_E goes back to Idle). This count will be reset automatically at the beginning of each ROI start.

14.16.11 TV Out registers

0x053C0000 VPE_TV_OUT_CTL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_TV_OUT_CTL register is a control register for the TVOUT.

VPE_TV_OUT_CTL

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2	ALPHA_ON	Alpha processing enable. 0x1: Enable 0x0: Disable
1	SOBEL_EN	Sobel filter enable. 0x1: Enable 0x0: Disable
0	TV_OUT_EN	TV_OUT module enable. 0x1: Enable 0x0: Disable

0x053C0004 VPE_TV_OUT_FIR_COEFF

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_TV_OUT_FIR_COEFF register contains the coefficients for the top, bottom, and center taps of the flicker filter.

VPE_TV_OUT_FIR_COEFF

Bits	Name	Description
31:28	RESERVED_BITS31_28	
27:16	TOP_BOTTOM	Coefficient for the top and bottom taps of the flicker filter. 0x0: Disable filter.
15:12	RESERVED_BITS15_12	
11:0	DC_OFFSET	Coefficient for the center tap of the flicker filter. 0xFFF: Disable filter.

0x053C0008 VPE_TV_OUT_BUF_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_TV_OUT_BUF_ADDR register contains the starting 29-bit address of the video frame buffer.

VPE_TV_OUT_BUF_ADDR

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:0	FRAME_POINTER	The pointer for the next video frame buffer should be updated after the start of frame output signal is detected. The new address will take effect on the next start of frame.

0x053C000C VPE_TV_OUT_CC_DATA

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_TV_OUT_CC_DATA register contains the CC data for the TV_OUT.

VPE_TV_OUT_CC_DATA

Bits	Name	Description
31:16	CC_DATA_EVEN	CC data for the even field. Driven to the TV encoder at the next start of frame.
15:0	CC_DATA_ODD	CC data for the odd field. Driven to the TV encoder at the next start of frame.

0x053C0010 VPE_TV_OUT_SOBEL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_TV_OUT_SOBEL register contains the 8-bit sobel threshold value.

VPE_TV_OUT_SOBEL

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	BUFFER_BYPASS	This field defines the filter threshold for determining if the original or filtered luma values are used.

0x053C0018 VPE_TV_OUT_Y_CLAMP

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_TV_OUT_Y_CLAMP register contains the 16-bit luna clamp value.

VPE_TV_OUT_Y_CLAMP

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	Y_MAX	8-bit upper luma clamp value
15:8	RESERVED_BITS15_8	

VPE_TV_OUT_Y_CLAMP (cont.)

Bits	Name	Description
7:0	Y_MIN	8-bit lower luma clamp value.

0x053C001C VPE_TV_OUT_CB_CLAMP

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_TV_OUT_CB_CLAMP register contains the 16-bit Cb clamp value.

VPE_TV_OUT_CB_CLAMP

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	CB_MAX	8-bit upper Cb clamp value
15:8	RESERVED_BITS15_8	
7:0	CB_MIN	8-bit lower Cb clamp value.

0x053C0020 VPE_TV_OUT_CR_CLAMP

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_TV_OUT_CR_CLAMP register contains the 16-bit Cr clamp value.

VPE_TV_OUT_CR_CLAMP

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	CR_MAX	8-bit upper Cr clamp value
15:8	RESERVED_BITS15_8	
7:0	CR_MIN	8-bit lower Cr clamp value.

0x053C0100 VPE_TV_OUT_STATUS

Type: Read/Write.
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_TV_OUT_STATUS register is used to indicate the start and end of a TV OUT frame has happened. The value is cleared only if after a register write.

VPE_TV_OUT_STATUS

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	TV_EOF	End of frame.
0	TV_SOF	Start of frame.

14.16.12 Test MISR registers

0x053D0000 VPE_TEST_MODE_CLK

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_TEST_MODE_CLK register is used to select the test points for a specified VPE block.

VPE_TEST_MODE_CLK

Bits	Name	Description
31:9	RESERVED_BITS31_10	This field has no function and should be set to zero for future compatibility.

VPE_TEST_MODE_CLK (cont.)

Bits	Name	Description
8:4	BLOCK_ID	These bits select the test points for the specified VPE block into the test bus. 0x0: Disabled 0x1: Tile fetch 0x2: Upsample 0x3: CSC 0x4: Rotate 0x5: Blend 0x6: Scale 0x7: packer1a 0x8: packer1b 0x9: Downsample 0xA: Dither 0xB: Deinterlace 0xC: MDDI1 0xD: MDDI2 0xE: Unused_1 0xF: TVOUT 0x10: Unused_2 0x11: Command 0x12: ahb2ahb_slive 0x13: ahb2ahb_master 0x14: BG Tile fetch 0x15: BG Upsample 0x16: SEE_1234ABCD 0x17: mgen2maxi_xin0 0x18: mgen2maxi_xin1 0x19: mgen2maxi_xin2 0x1A: mgen2maxi_arb
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within vpe_core and mgen2maxi blocks.

0x053D0004 VPE_TEST_MISR_RESET_CLK

Type: Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_TEST_MISR_RESET_CLK register is used to reset the MISR state.

VPE_TEST_MISR_RESET_CLK

Bits	Name	Description
31:1	RESERVED_BITS31_1	This field has no function and should be set to zero for future compatibility.

VPE_TEST_MISR_RESET_CLK (cont.)

Bits	Name	Description
0	MISR_SW_RESET	A write of '1' to this address will reset the MISR state. It is a self clearing reset. The reset must be asserted after VPE_TEST_MISR_MODE_CLK is set to a non-zero value. 0x1: MISR reset.

0x053D0008 VPE_TEST_EXPORT_MISR_CLK

Type: Read-Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_TEST_EXPORT_MISR_CLK register controls what is sent on the testbus. A value of '0' (reset value) will send the data that is going into the MISR on the testbus. A value of '1' will send the current MISR state onto the testbus. The latter option is typically used for debug purposes. For example, if your final MISR signature failed, you might want to know where it failed (i.e., right in the beginning or somewhere else')

VPE_TEST_EXPORT_MISR_CLK

Bits	Name	Description
31:1	RESERVED_BITS31_1	Field has no function and should be set to zero for future compatibility.
0	MISR_EXPORT	When clear(0), testbus is driven by what is sent into the MISR. (i.e., What is the result of the MUXing of all the input data streams with VPE_TEST_ MODE_CLK) When set (1), testbus is driven by the current state of the MISR (debug typically)

0x053D000C VPE_TEST_MISR_CURR_VAL_CLK

Type: Read-Only
Clock: CC_VPE_CLK
Reset State: Undefined

A read from the address in the VPE_TEST_MISR_CURR_VAL_CLK register will return the current MISR state for this block. Keep in mind that this could change every cycle depending on how it is used.

VPE_TEST_MISR_CURR_VAL_CLK

Bits	Name	Description
31:0	MISR_VAL	It holds the current MISR state.

0x053D0100 VPE_TEST_MODE_HCLK

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_TEST_MODE_HCLK register selects the test points for the specified VPE block.

VPE_TEST_MODE_HCLK

Bits	Name	Description
31:7	RESERVED_BITS31_7	This field has no function and should be set to zero for future compatibility.
6:4	BLOCK_ID	These bits select the test points for the specified VPE block into the test bus. 0x0: Disabled 0x1: MDDI1 0x2: MDDI2 0x3: AHBM
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within a VPE block.

0x053D0104 VPE_TEST_MISR_RESET_HCLK

Type: Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_TEST_MISR_RESET_HCLK is used to reset the MISR state.

VPE_TEST_MISR_RESET_HCLK

Bits	Name	Description
31:1	RESERVED_BITS31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_SW_RESET	A write of '1' to this address will reset the MISR state. It is a self clearing reset. The reset must be asserted after VPE_TEST_MISR_MODE_HCLK is set to a non-zero value. 0x1: MISR reset.

0x053D0108 VPE_TEST_EXPORT_MISR_HCLK

Type: Read-Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_TEST_EXPORT_MISR_HCLK register controls what is sent on the testbus. A value of '0' (reset value) will send the data that is going into the MISR on the testbus. A value of '1' will send the current MISR state onto the testbus. The latter option is typically used for debug purposes. For example, if your final MISR signature failed, you might want to know where it failed (i.e., right in the beginning or somewhere else).

VPE_TEST_EXPORT_MISR_HCLK

Bits	Name	Description
31:1	RESERVED_BITS31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., What is the result of the MUXing of all the input data streams with VPE_TEST_MODE_HCLK) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x053D010C VPE_TEST_MISR_CURR_VAL_HCLK

Type: Read-Only
Clock: CC_VPE_CLK
Reset State: Undefined

A read of the address in the VPE_TEST_MISR_CURR_VAL_HCLK register will return the current MISR state for this block. Keep in mind that this could change every cycle depending on how it is used.

VPE_TEST_MISR_CURR_VAL_HCLK

Bits	Name	Description
31:0	MISR_VAL	This field holds the current MISR state.

0x053D0200 VPE_TEST_MODE_DCLK

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_TEST_MODE_DCLK register selects the test points for the specified VPE block.

VPE_TEST_MODE_DCLK

Bits	Name	Description
31:7	RESERVED_BITS31_7	This field has no function and should be set to zero for future compatibility.

VPE_TEST_MODE_DCLK (cont.)

Bits	Name	Description
6:4	BLOCK_ID	These bits select the test points for the specified VPE block into the test bus. 0x0: Disabled 0x1: LCDC
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within a VPE block.

0x053D0204 VPE_TEST_MISR_RESET_DCLK

Type: Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_TEST_MISR_RESET_DCLK is used to reset the MISR state.

VPE_TEST_MISR_RESET_DCLK

Bits	Name	Description
31:1	RESERVED_BITS31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_SW_RESET	A write of '1' to this address will reset the MISR state. It is a self clearing reset. The reset must be asserted after VPE_TEST_MISR_MODE_DCLK is set to a non-zero value. 0x1: MISR reset.

0x053D0208 VPE_TEST_EXPORT_MISR_DCLK

Type: Read-Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_TEST_EXPORT_MISR_DCLK register controls what is sent on the testbus. A value of '0' (reset value) will send the data that is going into the MISR on the testbus. A value of '1' will send the current MISR state onto the testbus. The latter option is typically used for debug purposes. For example, if your final MISR signature failed, you might want to know where it failed (i.e., right in the beginning or somewhere else')

VPE_TEST_EXPORT_MISR_DCLK

Bits	Name	Description
31:1	RESERVED_BITS31_1	This field has no function and should be set to zero for future compatibility.

VPE_TEST_EXPORT_MISR_DCLK (cont.)

Bits	Name	Description
0	MISR_EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., What is the result of the MUXing of all the input data streams with VPE_TEST_MODE_DCLK) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x053D020C VPE_TEST_MISR_CURR_VAL_DCLK

Type: Read-Only
Clock: CC_VPE_CLK
Reset State: Undefined

A read from this address will return the current MISR state for this block. Keep in mind that this could change every cycle depending on how it is used.

VPE_TEST_MISR_CURR_VAL_DCLK

Bits	Name	Description
31:0	MISR_VAL	This field holds the current MISR state.

0x053D0210 VPE_TEST_CAPTURED_DCLK

Type: Read-Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is set to 1 by hardware when a capture strobe is sent to the MISR. If the micro reads a '1' from this register, it means that it can read the captured MISR value from VPE_TEST_CAPT_MISR_VAL_DCLK register. The microprocessor can write a '0' into this register to clear it.

VPE_TEST_CAPTURED_DCLK

Bits	Name	Description
31:1	RESERVED_BITS31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., What is the result of the MUXing of all the input data streams with VPE_TEST_MODE_DCLK) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x053D0214 VPE_TEST_MISR_CAPT_VAL_DCLK

Type: Read-Only
Clock: CC_VPE_CLK
Reset State: Undefined

A read from this address will return the captured MISR state for this block

VPE_TEST_MISR_CAPT_VAL_DCLK

Bits	Name	Description
31:0	MISR_VAL	This field holds the captured MISR state.

14.16.13 LCDC registers

0x053E0000 VPE_LCDC_EN

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_EN register is used to enable the LCD controller.

VPE_LCDC_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	This field has no function and should be set to zero for future compatibility.
0	LCDC_EN	Enable timing generation and kick start LCDC operation. Note: If LCDC is disabled by SW in the middle of a frame period, internally the hardware will disable LCDC only at the end of the current frame (just before next Vsync).

0x053E0004 VPE_LCDC_HSYNC_CTL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_HSYNC_CTL register defines HSYNC parameters like period and width.

VPE_LCDC_HSYNC_CTL

Bits	Name	Description
31:28	RESERVED_BITS31_28	This field has no function and should be set to zero for future compatibility.
27:16	HSYNC_PERIOD	HSYNC period in dot_clk cycles. This is the time between start of hsync pulse and the start of next hsync pulse. Note: hsync_period = Width + h_porch where, Width = Output image width h_porch = (h_back_porch + h_front_porch) h_back_porch starts at the beginning of hsync pulse Please refer to the panel data sheet or VESA specs to obtain accurate values for hsync parameters.
15:12	RESERVED_BITS15_12	This field has no function and should be set to zero for future compatibility
11:0	HSYNC_PULSE_WIDTH	HSYNC pulse width in dot_clk cycles.

0x053E0008 VPE_LCDC_VSYNC_PERIOD

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_VSYNC_PERIOD register defines the VSYNC period.

VPE_LCDC_VSYNC_PERIOD

Bits	Name	Description
31:24	RESERVED_BITS31_24	This field has no function and should be set to zero for future compatibility.

VPE_LCDC_VSYNC_PERIOD (cont.)

Bits	Name	Description
23:0	VSYNC_PERIOD	VSYNC period in dot_clk cycles. This is the time between start of vsync pulse and the start of next vsync pulse. Note: vsync_period = Height + v_porch where, Height = Output image height v_porch = (v_back_porch + v_front_porch) v_back_porch starts at the beginning of vsync pulse Please refer to the panel data sheet or VESA specs to obtain accurate values for vsync parameters.

0x053E000C VPE_LCDC_VSYNC_PULSE_WIDTH

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_VSYNC_PULSE_WIDTH register defines the VSYNC pulse width.

VPE_LCDC_VSYNC_PULSE_WIDTH

Bits	Name	Description
31:24	RESERVED_BITS31_24	This field has no function and should be set to zero for future compatibility.
23:0	VSYNC_PULSE_WIDTH	VSYNC pulse width in dot_clk cycles.

0x053E0010 VPE_LCDC_DISPLAY_HCTL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_DISPLAY_HCTL register defines the horizontal display region (active + inactive) which can be obtained from hsync period and horizontal blanking (back and front porch) parameters.

VPE_LCDC_DISPLAY_HCTL

VPE_LCDC_DISPLAY_HCTL

Bits	Name	Description
31:28	RESERVED_BITS31_28	This field has no function and should be set to zero for future compatibility
27:16	DISPLAY_END_X	Defines the time period between the start of hsync pulse and the last displayed pixel position in dot_clk cycles. Note: display_end_x = hsync_period - h_front_porch - 1 where, h_porch (dot cycles) = hsync_period - Width h_porch = (h_back_porch + h_front_porch)
15:12	RESERVED_BITS15_12	This field has no function and should be set to zero for future compatibility
11:0	DISPLAY_START_X	Defines the time period between the start of hsync pulse and the first displayed pixel position in dot_clk cycles. Note: display_start_x = h_back_porch where, h_porch (dot cycles) = hsync_period - Width h_porch = (h_back_porch + h_front_porch)

0x053E0014 VPE_LCDC_DISPLAY_V_START

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_DISPLAY_V_START register defines the vertical display region (active + inactive) which can be obtained from vsync period and vertical blanking (back and front porch) parameters.

VPE_LCDC_DISPLAY_V_START

Bits	Name	Description
31:24	RESERVED_BITS31_24	This field has no function and should be set to zero for future compatibility
23:0	DISPLAY_START_Y	Defines the time period between the start of vsync pulse and the first displayed line position in dot_clk cycles. Note: display_start_y = v_back_porch where, v_porch = vsync_period - Height v_porch = (v_back_porch + v_front_porch)

0x053E0018 VPE_LCDC_DISPLAY_V_END

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_DISPLAY_V_END register defines the vertical display region (active + inactive) which can be obtained from vsync period and vertical blanking (back and front porch) parameters.

VPE_LCDC_DISPLAY_V_END

Bits	Name	Description
31:24	RESERVED_BITS31_24	This field has no function and should be set to zero for future compatibility
23:0	DISPLAY_END_Y	Defines the time period between the start of vsync pulse and the last displayed line position in dot_clk cycles. Note: display_end_y = vsync_period - v_front_porch - 1 where, v_porch = vsync_period - Height v_porch = (v_back_porch + v_front_porch)

0x053E001C VPE_LCDC_ACTIVE_HCTL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_ACTIVE_HCTL register defines the horizontal parameters of LCDC active display area.

VPE_LCDC_ACTIVE_HCTL

Bits	Name	Description
31	ACTIVE_H_EN	Horizontal active region enable
30:28	RESERVED_BITS30_28	This field has no function and should be set to zero for future compatibility
27:16	ACTIVE_END_X	Defines the time period between the start of hsync pulse and the last active pixel position in dot_clk cycles (a value between 'display_start_x' and 'display_end_x').

VPE_LCDC_ACTIVE_HCTL (cont.)

Bits	Name	Description
15:12	RESERVED_BITS15_12	This field has no function and should be set to zero for future compatibility.
11:0	ACTIVE_START_X	Defines the time period between the start of hsync pulse and the first active pixel position in dot_clk cycles (a value between 'display_start_x' and 'display_end_x').

0x053E0020 VPE_LCDC_ACTIVE_V_START

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_ACTIVE_V_START register defines the vertical parameters of LCDC active display area.

VPE_LCDC_ACTIVE_V_START

Bits	Name	Description
31	ACTIVE_V_EN	Vertical active region enable
30:24	RESERVED_BITS30_24	This field has no function and should be set to zero for future compatibility
23:0	ACTIVE_START_Y	Defines the time period between the start of vsync pulse and the first active line position in dot_clk cycles (a value between 'display_start_y' and 'display_end_y').

0x053E0024 VPE_LCDC_ACTIVE_V_END

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_ACTIVE_V_END register defines the vertical parameters of LCDC active display area.

VPE_LCDC_ACTIVE_V_END

Bits	Name	Description
31:24	RESERVED_BITS31_24	This field has no function and should be set to zero for future compatibility
23:0	ACTIVE_END_Y	Defines the time period between the start of vsync pulse and the last active line position in dot_clk cycles (a value between 'display_start_y' and 'display_end_y').

0x053E0028 VPE_LCDC_BORDER_CLR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_BORDER_CLR register defines border (inactive) area color for LCD display.

VPE_LCDC_BORDER_CLR

Bits	Name	Description
31:24	RESERVED_BITS31_24	This field has no function and should be set to zero for future compatibility
23:0	BORDER_COLOR	Define 24-bit border (background) color value of the inactive region of display. This color value should be packed loose for parallel LCDC and should match the output format, pack pattern and packing alignment defined in VPE_DMA_P_CONFIG. The border color programmed should be packed tight for MDDI based LCDC.

0x053E002C VPE_LCDC_UNDERFLOW_CTL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_UNDERFLOW_CTL register defines the displayed color in case of data underflow and enables the auto recovery mechanism.

VPE_LCDC_UNDERFLOW_CTL

Bits	Name	Description
31	ERR_RECOVERY_EN	Enable auto recovery during error conditions like underflow etc. 0x0: Disable 0x1: Enable (default)
30:24	RESERVED_BITS30_24	This field has no function and should be set to zero for future compatibility
23:0	UNDERFLOW_COLOR	Define the 24 bit color value to be displayed in case of underflow. This color value should be packed loose for parallel LCDC and should match the output format, pack pattern and packing alignment defined in VPE_DMA_P_CONFIG. The border color programmed should be packed tight for MDDI based LCDC.

0x053E0030 VPE_LCDC_HSYNC_SKEW

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_HSYNC_SKEW defines the relative skew between HSYNC and VSYNC active edges.

VPE_LCDC_HSYNC_SKEW

Bits	Name	Description
31:12	RESERVED_BITS31_12	This field has no function and should be set to zero for future compatibility
11:0	HSYNC_SKEW	Define the number of dot_clk cycles HSYNC active edge is delayed from VSYNC active edge

0x053E0034 VPE_LCDC_TEST_CTL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_TEST_CTL controls test pattern generation and defines its parameters.

VPE_LCDC_TEST_CTL

Bits	Name	Description
31	TEST_PATTERN_EN	Enable hardware test pattern generation (color rectangles)
30:16	RESERVED_BITS30_16	This field has no function and should be set to zero for future compatibility
15:8	TPG_VAR1	Color rectangle height (y)
7:0	TPG_VAR0	Color rectangle width (x)

0x053E0038 VPE_LCDC_CTL_POLARITY

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_LCDC_CTL_POLARITY register defines the polarity of control signals to the LCD panel.

VPE_LCDC_CTL_POLARITY

Bits	Name	Description
31:3	RESERVED_BITS31_3	This field has no function and should be set to zero for future compatibility.
2	DEN_NEG	Data enable polarity 0x0: enable active high (default) 0x1: enable active low
1	VSYNC_NEG	VSYNC polarity: 0x0: VSYNC active high (default) 0x1: VSYNC active low
0	HSYNC_NEG	HSYNC polarity: 0x0: HSYNC active high (default) 0x1: HSYNC active low

14.16.14 mgen2maxi Block Control

0x05300400 VPE_AXI_VERSION

Type: Read
Clock: CC_VPE_CLK
Reset State: 0x0000_001d

mgen2maxi core version.

VPE_AXI_VERSION

Bits	Name	Description
31:8	RESERVED_BITS31_8	Reserved bit(s). Read back zero(s).
7:0	VERSION	Hardware version of the MGEN2MAXI core which is embedded in this core. 0x1D: RESET_VAL

0x05300404 VPE_AXI_XBAR_LIM

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x4210_7070

The maximum number of pending data for each client. The programming of the VPE registers must be done while VPE is idle. I.e after VPE interrupt and before the start of the next frame.

VPE_AXI_XBAR_LIM

Bits	Name	Description
31:31	RESERVED_BITS31_31	Reserved bit(s). Read back zero(s).
30:26	AXI_XBAR_IN_WR_LIM	The maximum number of pending writes. Must be <= the HW parameter that limits the same. Range [0,16]. 0x10: RESET_VAL
25:21	AXI_XBAR_IN_RD_BG_LIM	The maximum number of pending reads from Background Tile Fetch. Must be <= the HW parameter that limits the same. Range [0,16]. 0x10: RESET_VAL
20:16	AXI_XBAR_IN_RD_FG_LIM	The maximum number of pending reads from Frontground Tile Fetch. Must be <= the HW parameter that limits the same. Range [0,16]. 0x10: RESET_VAL
15:15	RESERVED_BITS15_15	Reserved bit(s). Read back zero(s).
14:13	AXI_XBAR_OUT_MAX_WR_BURST	The maximum number of write beats minus 1 allowed on the AXI bus (arbiter outputs). Must be < the HW parameter that limits the same. Range [0,3] 0x3: RESET_VAL
12:8	AXI_XBAR_OUT_WR_LIM	The maximum number of pending writes from each arbiter, 5 bits per arbiter. Must be <= the HW parameter that limits the same. Range [0,16] 0x10: RESET_VAL
7:7	RESERVED_BITS7_7	Reserved bit(s). Read back zero(s).

VPE_AXI_XBAR_LIM (cont.)

Bits	Name	Description
6:5	AXI_XBAR_OUT_MAX_RD_BURST	The maximum number of read beats minus 1 allowed on the AXI bus (arbiter outputs). Must be < the HW parameter that limits the same. Range [0,3] 0x3: RESET_VAL
4:0	AXI_XBAR_OUT_RD_LIM	The maximum number of pending reads from each arbiter, 5 bits per arbiter. Must be <= the HW parameter that limits the same. Range [0,16] 0x10: RESET_VAL

0x05300408 VPE_AXI_ARB_1

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0666

Arbitration control. The programming of the VPE registers must be done while VPE is idle. I.e after VPE interrupt and before the start of the next frame.

VPE_AXI_ARB_1

Bits	Name	Description
31:25	RESERVED_BITS31_25	Reserved bit(s). Read back zero(s).
24:19	AXI_PRIORITY_LIST	A list of client numbers, with the highest priority client number on the left side (MSBs). The total width required is NUM_CLIENTS x clog2(NUM_CLIENTS). For 3 clients, that's 3x2=6 bits. Client Number: 0xA: Background Tile Fetch Read 0x1: Write 0x0: Frontground Tile Fetch Read 0x0: RESET_VAL
18:18	AXI_FIXED_PRIOR_EN	Enables fixed priority arbitration, 1 bit per arbiter. If enabled, the other fields are ignored (non-slave-aware and no consecutive client limit) 0x0: RESET_VAL
17:12	AXI_AREQPRIORITY	Request priority, 2 bits per client. This value is driven onto AXI bus only, not used internally for client arbitration. 0x0: RESET_VAL
11:0	AXI_ATYPE	The value to drive on ATYPE signals, 4 bits per client. For example: 0x48: Normal, Cacheable, Writeback, Write-allocate, Non-shared 0x49: Normal, Cacheable, Writeback, Write-allocate, Shared 0x666: RESET_VAL

0x0530040C VPE_AXI_ARB_2

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

Arbitration control. The programming of the VPE registers must be done while VPE is idle. I.e after VPE interrupt and before the start of the next frame.

VPE_AXI_ARB_2

Bits	Name	Description
31:23	RESERVED_BITS31_23	Reserved bit(s). Read back zero(s).
22:8	AXI_CLIENT_LIM	Client limits, 5 bits per client. For 3 clients, this requires 15 bits. Each client limit is the maximum number of consecutive grants minus 1 to give that client before allowing requests from other clients. This is used for both slave-aware and last-client-granted arbitration, but not fixed priority arbitration. NOTE: A client may receive more consecutive grants if no other clients are making requests to the same arbiter. 0x0: RESET_VAL
7:7	RESERVED_BITS7_7	Reserved bit(s). Read back zero(s).
6:4	AXI_AOOOWR	Out of order enable for writes, 1 bit per client. If zero, the AXI bus and slaves must ensure that all writes from this client are completed in the order they are requested from the client. 0x0: RESET_VAL
3:3	RESERVED_BITS3_3	Reserved bit(s). Read back zero(s).
2:0	AXI_AOOORD	Out of order enable for reads, 1 bit per client. If zero, the AXI bus and slaves must ensure that all reads from that client are completed in the order they are requested from the client. 0x0: RESET_VAL

0x05300410 VPE_AXI_ERROR_CTL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_f011

AXI error handling control. The programming of the VPE registers must be done while VPE is idle. I.e after VPE interrupt and before the start of the next frame.

VPE_AXI_ERROR_CTL

Bits	Name	Description
31:16	RESERVED_BITS31_16	Reserved bit(s). Read back zero(s).

VPE_AXI_ERROR_CTL (cont.)

Bits	Name	Description
15:12	AXI_WDTIMEOUT_LOG2	This field (shared by all arbiters) contains log2 (write data timeout), i.e., the bit number of the timeout counter which, when 1, will trigger the timeout. For example, 15 here means the timeout is 32768 AXI clock cycles. This field is ignored when AXI_HALT_ON_WDTIMEOUT=0. 0xF: RESET_VAL
11:9	RESERVED_BITS11_9	Reserved bit(s). Read back zero(s).
8:8	AXI_HALT_ON_WDTIMEOUT	1 bit per arb. When set (1), write data timeout is enabled, for AXI safety without write data buffering. If required write data is not provided to AXI within the time limit. 0x0: RESET_VAL
7:5	RESERVED_BITS7_5	Reserved bit(s). Read back zero(s).
4:4	AXI_HALT_ON_WR_ERR	1 bit per arb. When set (1), a write error response from AXI (on bresp) acts like a HALT_REQ and also disables all ARB-XIN interfaces - instead, fake write data to AXI (zero write enables) and discard read data from AXI. SW should wait for HALT_ACK and then reset the core. 0x1: RESET_VAL
3:1	RESERVED_BITS3_1	Reserved bit(s). Read back zero(s).
0:0	AXI_HALT_ON_RD_ERR	1 bit per arb. When set (1), an read error response from AXI (on rresp) acts like a HALT_REQ and also disables all ARB-XIN interfaces - instead, fake write data to AXI (zero write enables) and discard read data from AXI. SW should wait for HALT_ACK and then reset the core. 0x1: RESET_VAL

0x05300414 VPE_AXI_ERROR_INFO

Type: Read
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

AXI error information.

VPE_AXI_ERROR_INFO

Bits	Name	Description
31:17	RESERVED_BITS31_17	Reserved bit(s). Read back zero(s).
16:16	AXI_WDTIMEOUT_HALT	Write data timeout. Remain high until AXI reset. 0x0: RESET_VAL
15:13	RESERVED_BITS15_13	Reserved bit(s). Read back zero(s).

VPE_AXI_ERROR_INFO (cont.)

Bits	Name	Description
12:12	AXI_ERR_TYPE	The type of the last error that occurred. 0x0: axi_rresp 0x1: axi_bresp (has priority over rresp if happen same time) 0x0: RESET_VAL
11:10	RESERVED_BITS11_10	Reserved bit(s). Read back zero(s).
9:8	AXI_ERR_RESP	The value of axi_rresp or axi_bresp when the last error occured. 0x0: RESET_VAL
7:6	RESERVED_BITS7_6	Reserved bit(s). Read back zero(s).
5:4	AXI_ERR_MID	The value on axi_rmid or axi_bmid when the last error occured. 0x0: RESET_VAL
3:0	AXI_ERR_TID	The value on axi_rtid or axi_btid when the last error occured. 0x0: RESET_VAL

0x05300418 VPE_AXI_TEST_CTL

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

AXI test/profiling control. The programming of the VPE registers must be done while VPE is idle. I.e after VPE interrupt and before the start of the next frame.

VPE_AXI_TEST_CTL

Bits	Name	Description
31:29	RESERVED_BITS31_29	Reserved bit(s). Read back zero(s).
28:28	AXI_RD_LAT_REP_EN	1 bit per arb. when enabled, each beat of read data is replaced with the read access latency (of AXI cycles from axi_avalid=1 till read data returned with axi_rvalid=1) 0x0: RESET_VAL
27:25	RESERVED_BITS27_25	Reserved bit(s). Read back zero(s).
24:24	AXI_MISR_RES	1 bit per arb, need to write 1 and then write 0. Make sure it is high for at least 2 clock cycles and then write 0 before frame start. 0x0: RESET_VAL
23:21	RESERVED_BITS23_21	Reserved bit(s). Read back zero(s).
20:20	AXI_MISR_EN	1 bit per arb 0x0: RESET_VAL
19:17	RESERVED_BITS19_17	Reserved bit(s). Read back zero(s).

VPE_AXI_TEST_CTL (cont.)

Bits	Name	Description
16:16	AXI_MISR_WD	1 bit per arb, to select misr input 0x0: read data (coming back from AXI) 0x1: write data (going to AXI) 0x0: RESET_VAL
15:13	RESERVED_BITS15_13	Reserved bit(s). Read back zero(s).
12:12	AXI_CTR_EN	Enable all profiling counters 0x0: RESET_VAL
11:9	RESERVED_BITS11_9	Reserved bit(s). Read back zero(s).
8:8	AXI_CTR_RES	Reset all profiling counters. Make sure it is high for at least 2 clock cycles and then write 0 before frame start. 0x0: RESET_VAL
7:6	RESERVED_BITS7_6	Reserved bit(s). Read back zero(s).
5:4	AXI_TEST_ARB_SEL	Select which arbiter to drive VPE_AXI_TEST_OUT. 0x0: RESET_VAL
3:0	AXI_TEST_OUT_SEL	Select which test data is read via VPE_AXI_TEST_OUT. 0x0: num read bursts (32 bits) 0x1: total read BW (32 bits - up to 68GB) 0x8: max outstanding reads (8 bits) 0x9: avg wait for read accept (10 bits over 128 reads) 0x40: min read latency (16 bits) 0x41: max read latency (16 bits) 0x48: avg read latency (16 bits over 1K read beats) 0x3E8: num write bursts (32 bits) 0x3E9: total write BW (32 bits - up to 68GB) 0x3F2: max outstanding writes (8 bits) 0x3F3: avg wait for write accept (10 bits over 128 writes) 0x44C: MISR signature word 0 0x44D: MISR signature word 1 0x456: MISR signature word 2 0x457: MISR signature word 3 0x0: RESET_VAL

0x0530041C VPE_AXI_TEST_OUT

Type: Read
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

AXI test/profiling data.

VPE_AXI_TEST_OUT

Bits	Name	Description
31:0	AXI_TEST_OUT	The output selected by the *_SEL fields in the VPE_AXI_TEST_CTL reg. This is independent of the test bus, which is not accessible by SW unless other SW registers are created for that purpose. 0x0: RESET_VAL

14.17 MM SS FPB XPU Registers (0x05400000 MMSS_APU_BASE)

This section contains the Multimedia Subsystem FPB XPU registers.

0x05400000+4*n MMSS_FPB_APU_RGn_ACR, n=[0..18]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 00, i.e., a single VMID, full access vs. no access permission type APU. These registers include a single 5 bit "owner" VMID field.

MMSS_FPB_APU_RGn_ACR

Bits	Name	Description
31:26	RESERVED31_26	Reserved.
25	RESERVED25	Reserved
24	RESERVED24	Reserved
23:21	RESERVED23_21	Reserved
20:16	RESERVED20_16	Reserved
15:10	RESERVED15_10	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | APU_APU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a "valid" bit for the RWVMID field
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies "owner" VMID with full read/write access to the registers in the associated resource group.

0x05400F80 MMSS_FPB_APU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

APU Configuration Register: This register includes fields governing various APU behaviors.

MMSS_FPB_APU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set APU_ESR. APU_EAR and APU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set APU_ESR. APU_EAR and APU_ESYNR0 updated with address and syndrome of error.
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x05400F84 MMSS_FPB_APU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

MMSS_FPB_APU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x05400F88 MMSS_FPB_APU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the APU_ESYNRn registers, which are merely the "syndrome" of an error indicated by APU_ESR.

MMSS_FPB_APU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x05400F8C MMSS_FPB_APU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

MMSS_FPB_APU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x05400F90 MMSS_FPB_APU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

MMSS_FPB_APU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x05400F94 MMSS_FPB_APU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

MMSS_FPB_APU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x05400FF4 MMSS_FPB_APU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

MMSS_FPB_APU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved

MMSS_FPB_APU_REV (cont.)

Bits	Name	Description
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x05400FF8 MMSS_FPB_APU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x00001012

APU ID Register: Read-only register that defines various configuration attributes of the APU instance.

MMSS_FPB_APU_IDR

Bits	Name	Description
31:29	RESERVED31_21	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.

MMSS_FPB_APU_IDR (cont.)

Bits	Name	Description
9	RESERVED9	Reserved
8:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x05400FFC MMSS_FPB_APU_APU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

MMSS_FPB_APU_APU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APUs (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

14.18 MM SS System FPB Registers (0x05700000 MMSS_SFPB_CFG_BASE)

This section contains the System FPB registers.

14.18.1 Configuration registers

0x05700000 MMSS_SFPB_CTRL_STATUS

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000

The SFPB_CTRL_STATUS register is a general configuration register.

MMSS_SFPB_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0)
11	RPM_ARM7_IRQ_EN	SW: RW, HW: R ARM7InterruptEnable When set, the ARM7 receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	SC_IRQ_EN	SW: RW, HW: R ScorpionInterruptEnable When set, the Scorpion receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

MMSS_SFPB_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x7: Select the M0 ahb2ahb bridge test bus.

0x05700044 MMSS_SFPB_PORT_EN

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFF

The SFPB_PORT_EN register is a SFPB master port enable register.

MMSS_SFPB_PORT_EN

Bits	Name	Description
31:1	RESERVED_BIT31_1	
0	M0_PORT_EN	SW:RW, HW:R M0PortEnable When cleared (0), M0 bridge is prevented from arbitting on the system_fpb bus. Power up value is set(1)

14.18.2 Bus error registers and additional configure registers

0x05700050 MMSS_SFPB_ERROR_STAT

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000000

The SFPB_ERROR_STAT register is the bus error status register.

MMSS_SFPB_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the channel ID that caused the detected error when CID is valid for the master of the access. If not, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Master0
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	

MMSS_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the SFPB_ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x05700054 MMSS_SFPB_ERROR_ADDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x00000000

The SFPB_ERROR_ADDR register contains the bus error address.

MMSS_SFPB_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when SFPB_ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x05700058 MMSS_SFPB_GPREG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000

The SFPB_GPREG register is a configurable general purpose register.

MMSS_SFPB_GPREG

Bits	Name	Description
16:13	MMSS_AHB_ARB_DEF_MASTER	SW:RW, HW:R Default Master configuration to MMSS AHB Arbiter It contains 4bits, Only Master 0 and Master 1 are available for support for now as there are only 2 masters hooked-up. others - Reserved (should be written with 0) This also helps in changing the default master when a master port is disabled and avoiding any un-necessary hgrant assertion to disabled default master. 0x0: Master 0 is default master 0x1: Master 1 is default master
12:11	MMSS_AHB_ARB_MATER_PORT_EN	SW:RW, HW:R SW configured master port enable Bit 0 is dedicated to enable/disable the MMSS AHB Arbiter Master0 request. Bit1 is dedicated to enable/disable the MMSS AHB Arbiter Master1 request. 0x1: Enable 0x0: DisableWhen Disabled, Arbiter will not see the HBUSREQ coming from the master, as it is blocked by this bit.
10	FABRIC_TIMEOUT_EN	SW:RW, HW:R This bit enables the use of the timeout register. 0x0: watchdog timer for ahb2msm bus is disabled. This is the default value after reset. The ahb2msm bus inside mmss_fpb will hang the bus if it is not able to respond to ahb request. 0x1: watchdog timer for ahb2msm bus is enabled. The register defined below will set the counter, after which the bus will issue error response.
9:2	FABRIC_TIMEOUT_VAL	SW:RW, HW:R These 8 bits set the value for the timeout register. This register sets the number of cycles after which the ahb2msm bus will issue a error response if it is not able to respond to the ahb request and it will not hang the bus after the programmed number of clock cycles. The default value of this register is 00001111 after reset. also bits 5:2 are inverted. If you program this register to 00001001, you are setting the timeout_val for msm_bus to be 00000110. 0xF: upon reset
1:0	MMSS_TESTBUS_SELECTION	SW:RW, HW:R This bit selects what value to be driven on the MMSS test bus (sfpb_mmss_test_bus). 0x0: 00000000 0x1: AAAAAAAA 0x2: 55555555 0x3: Drives MMSS Internal test bus onto sfpb_mmss_test_bus

0x0570005C MMSS_SFPB_XPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFFFFFF

The SFPB_XPU_ACR register is a SFPB Access Control Register for configure register protection.

MMSS_SFPB_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R SFPB XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the SFPB configure space, including this register itself. Power up value is set (1)

0x05700060 MMSS_SFPB_HW_CLK_GATING_CFG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0000

The SFPB_HW_CLK_GATING_CFG register is for hardware clock gating configuration register.

MMSS_SFPB_HW_CLK_GATING_CFG

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	HYSTERESIS_CNT_SW	SW: RW, HW: R Hysteresis Conter Value The value of this field is for SW to set the hysteresis counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)
3:0	WAKE_CNT_SW	SW: RW, HW: R Wakeup Conter Value The value of this field is for SW to set the wakeup counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)

14.19 VCAP Registers (0x05900000 VCAP_BASE)

This section contains the VCAP registers.

0x05900000 VCAP_VCAP_HW_VERSION

Type: Read
Clock: UNDEFINED
Reset State: 0x10000000

VCAP_SYS block HW Version

VCAP_VCAP_HW_VERSION

Bits	Name	Description
31:28	MAJOR	READ ONLY Major Version 1
27:16	MINOR	READ ONLY Minor Version 0
15:0	STEP	READ ONLY Step Version 0

0x05900004 VCAP_VCAP_INT_STATUS

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

Interrupt Status for VCAP_VC interrupt. VCAP module has 3 major interrupts (VC, VP and VBIF). VP(I2P) interrupt has its own interrupt signal, so this register doesn't include it. VCA_VC interrupt signal includes VCAP_VC and VBIF. Interrupt clear/mask are not in this space and they are each sub block’s register space.

VCAP_VCAP_INT_STATUS

Bits	Name	Description
31:5	UNUSED_1	
4	VCAP_VBIF_INTERRUT_STATUS	READ ONLY Indicates VBIF interrupt occurs
3:1	UNUSED_2	
0	VCAP_VC_INTERRUT_STATUS	READ ONLY Indicates VC interrupt occurs

0x05900010 VCAP_VCAP_VC_CLK_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x03010301

VCAP_VC module's clock control register.

VCAP_VC has upper pipe and lower pipe. Clock for upper pipe should be always on when VCAP_VC is enabled while lower pipe clock can be dynamically controlled.

VC0 is connected to upper pipe and VC1 is connected to lower pipe.

VCAP_VCAP_VC_CLK_CTRL

Bits	Name	Description
31:26	UNUSED_1	
25:24	VC1_STRETCH	This registers defines the number of extra active clock cycles when clock is halted. - 0x0 : 2 clock cycles - 0x1 : 4 clock cycles - 0x2 : 8 clock cycles - 0x3 : 16 clock cycles
23:21	UNUSED_2	
20	VC1_FORCE_OFF	If this register is set, clock is turned off and this register takes precedence over FORCE_ON.
19:17	UNUSED_3	
16	VC1_FORCE_ON	If this register is set, clock is turned on
15:10	UNUSED_4	
9:8	VC0_STRETCH	This registers defines the number of extra active clock cycles when clock is halted. - 0x0 : 2 clock cycles - 0x1 : 4 clock cycles - 0x2 : 8 clock cycles - 0x3 : 16 clock cycles
7:5	UNUSED_5	
4	VC0_FORCE_OFF	If this register is set, clock is turned off and this register takes precedence over FORCE_ON.
3:1	UNUSED_6	
0	VC0_FORCE_ON	If this register is set, clock is turned on

0x05900014 VCAP_VCAP_VP_CLK_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x03010301

VCAP_VP(I2P) module's clock control register.

VCAP_VP has upper pipe and lower pipe. Clock for upper pipe should be always on when VCAP_VP is enabled while lower pipe clock can be dynamically controlled.

VP0 is connected to upper pipe and VP1 is connected to lower pipe.

VCAP_VCAP_VP_CLK_CTRL

Bits	Name	Description
31:26	UNUSED_1	
25:24	VP1_STRETCH	This registers defines the number of extra active clock cycles when clock is halted. - 0x0 : 2 clock cycles - 0x1 : 4 clock cycles - 0x2 : 8 clock cycles - 0x3 : 16 clock cycles
23:21	UNUSED_2	
20	VP1_FORCE_OFF	If this register is set, clock is turned off and this register takes precedence over FORCE_ON.
19:17	UNUSED_3	
16	VP1_FORCE_ON	If this register is set, clock is turned on
15:10	UNUSED_4	
9:8	VP0_STRETCH	This registers defines the number of extra active clock cycles when clock is halted. - 0x0 : 2 clock cycles - 0x1 : 4 clock cycles - 0x2 : 8 clock cycles - 0x3 : 16 clock cycles
7:5	UNUSED_5	
4	VP0_FORCE_OFF	If this register is set, clock is turned off and this register takes precedence over FORCE_ON.
3:1	UNUSED_6	
0	VP0_FORCE_ON	If this register is set, clock is turned on

0x05900018 VCAP_VCAP_VBIF_CLK_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x03010301

VCAP VBIF has two client interfaces which are VCAP clock domain. One is driven by VCAP_VC and the other is driven by VCAP_VP. This register controls these two clocks.

VCAP_VCAP_VBIF_CLK_CTRL

Bits	Name	Description
31:26	UNUSED_1	
25:24	VP_VBIF_STRETCH	This registers defines the number of extra active clock cycles when clock is halted. - 0x0 : 2 clock cycles - 0x1 : 4 clock cycles - 0x2 : 8 clock cycles - 0x3 : 16 clock cycles
23:21	UNUSED_2	
20	VP_VBIF_FORCE_OFF	If this register is set, clock is turned off and this register takes precedence over FORCE_ON.
19:17	UNUSED_3	
16	VP_VBIF_FORCE_ON	If this register is set, clock is turned on
15:10	UNUSED_4	
9:8	VC_VBIF_STRETCH	This registers defines the number of extra active clock cycles when clock is halted. - 0x0 : 2 clock cycles - 0x1 : 4 clock cycles - 0x2 : 8 clock cycles - 0x3 : 16 clock cycles
7:5	UNUSED_5	
4	VC_VBIF_FORCE_OFF	If this register is set, clock is turned off and this register takes precedence over FORCE_ON.
3:1	UNUSED_6	
0	VC_VBIF_FORCE_ON	If this register is set, clock is turned on

0x0590001C VCAP_VCAP_CMN_CLK_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x03010301

VCAP has system clock domain as well as event clock domain. System clock is for register/timestamp logic and event clock is for test/debug bus

VCAP_VCAP_CMN_CLK_CTRL

Bits	Name	Description
31:26	UNUSED_1	
25:24	EVENT_STRETCH	This registers defines the number of extra active clock cycles when clock is halted. - 0x0 : 2 clock cycles - 0x1 : 4 clock cycles - 0x2 : 8 clock cycles - 0x3 : 16 clock cycles
23:21	UNUSED_2	
20	EVENT_FORCE_OFF	If this register is set, clock is turned off and this register takes precedence over FORCE_ON.
19:17	UNUSED_3	
16	EVENT_FORCE_ON	If this register is set, clock is turned on
15:10	UNUSED_4	
9:8	SYS_STRETCH	This registers defines the number of extra active clock cycles when clock is halted. - 0x0 : 2 clock cycles - 0x1 : 4 clock cycles - 0x2 : 8 clock cycles - 0x3 : 16 clock cycles
7:5	UNUSED_5	
4	SYS_FORCE_OFF	If this register is set, clock is turned off and this register takes precedence over FORCE_ON.
3:1	UNUSED_6	
0	SYS_FORCE_ON	If this register is set, clock is turned on

0x05900020 VCAP_VCAP_CLK_STATUS

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

This status register indicates each clock is active or not.

- 0x0 : Clock is idle

- 0x1 : Clock is active

VCAP_VCAP_CLK_STATUS

Bits	Name	Description
31	UNUSED_1	
30	AHB_EVENT_CLK_ACTIVE	READ ONLY AHB_EVENT_CLK status
29	AXI_EVENT_CLK_ACTIVE	READ ONLY AXI_EVENT_CLK status
28	VCAP_EVENT_CLK_ACTIV E	READ ONLY VCAP_EVENT_CLK status
27:25	UNUSED_2	
24	VCAP_SYS_CLK_ACTIVE	READ ONLY VCAP_SYS_CLK status
23:21	UNUSED_3	
20	VP_VBIF_CLK_ACTIVE	READ ONLY VP_VBIF_CLK status
19:17	UNUSED_4	
16	VC_VBIF_CLK_ACTIVE	READ ONLY VC_VBIF_CLK status
15:13	UNUSED_5	
12	VCAP_VP1_CLK_ACTIVE	READ ONLY VCAP_VP1_CLK status
11:9	UNUSED_6	
8	VCAP_VP0_CLK_ACTIVE	READ ONLY VCAP_VP0_CLK status
7:5	UNUSED_7	
4	VCAP_VC1_CLK_ACTIVE	READ ONLY VCAP_VC1_CLK status
3:1	UNUSED_8	
0	VCAP_VC0_CLK_ACTIVE	READ ONLY VCAP_VC0_CLK status

0x05900024 VCAP_VCAP_SW_RESET_REQ

Type: Write
Clock: UNDEFINED
Reset State: 0x00000000

VCAP supports SW reset for VCAP_VC/VCAP_VP modules which are AXI interface client. So, SW reset handshaking mechanism should be implemented to make sure there is no pending AXI transactions in VBIF.

SW reset sequence.

- 1. Set VCAP_SW_RESET_REQ for each module.

- 2. Poll corresponding VCAP_SW_RESET_STATUS bit is 0

- 3. Reprogramming if it is required.

VCAP_VC SW registers are not reset by SW_RESET but

VCAP_VP SW registers are reset by SW_RESET.

VCAP_VCAP_SW_RESET_REQ

Bits	Name	Description
31:5	UNUSED_1	
4	VCAP_VP_SW_RESET_REQ	WRITE ONLY Generate SW reset triggering signal for VCAP_VP module.
3:1	UNUSED_2	
0	VCAP_VC_SW_RESET_REQ	WRITE ONLY Generate SW reset triggering signal for VCAP_VP module.

0x05900028 VCAP_VCAP_SW_RESET_STATUS

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

This register indicates SW reset request status.

- 0x0 : SW reset sequence is completed or idle

- 0x1 : SW reset sequence is in progress

VCAP_VCAP_SW_RESET_STATUS

Bits	Name	Description
31:5	UNUSED_1	
4	VCAP_VP_SW_RESET_STATUS	READ ONLY VCAP_VP SW reset status
3:1	UNUSED_2	
0	VCAP_VC_SW_RESET_STATUS	READ ONLY VCAP_VC SW reset status

0x05900030 VCAP_VCAP_TIMESTAMP_REG1

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP captures timestamp value that is from LPASS for Audio/Video synchronization purpose. This register is first level timestamp value

VCAP_VCAP_TIMESTAMP_REG1

Bits	Name	Description
31:0	TIMESTAMP_VALUE	READ ONLY This register captures LPASS timestamp value when vsync is coming from external HDMI receiver

0x05900034 VCAP_VCAP_TIMESTAMP_REG2

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP captures timestamp value that is from LPASS for Audio/Video synchronization purpose. This register is second level timestamp value

VCAP_VCAP_TIMESTAMP_REG2

Bits	Name	Description
31:0	TIMESTAMP_VALUE	READ ONLY This register captures VCAP_TIMESTAMP_REG1 value when frame done interrupt is coming from VCAP_VC module

0x05900040 VCAP_VCAP_VC_VBIF_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Control VCAP_VC’s VBIF client interface signals

VCAP_VCAP_VC_VBIF_CTRL

Bits	Name	Description
31:9	UNUSED_1	

VCAP_VCAP_VC_VBIF_CTRL (cont.)

Bits	Name	Description
8	VC_CPRIV	AXI Privileged/User attribute on AXI I/F ports dynamically. Indicates if the transaction is user versus privileged mode access. Used to determine access permissions to the MMU.If the signal is asserted, it indicates a privileged mode access
7:6	UNUSED_2	
5:4	VC_CPRIORITYLVL	Request priority Level signal. In APQ8064 project, this feature has not been implemented in VBIF.
3:2	UNUSED	
1:0	VC_CREQPRIORITY	Request priority signal on AXI I/F ports - 2'b00 : the lowest priority level - 2'b11 : the highest priority level

0x05900044 VCAP_VCAP_VP_VBIF_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Control VCAP_VP's VBIF client interface signals

VCAP_VCAP_VP_VBIF_CTRL

Bits	Name	Description
31:9	UNUSED_1	
8	VP_CPRIV	AXI Privileged/User attribute on AXI I/F ports dynamically. Indicates if the transaction is user versus privileged mode access. Used to determine access permissions to the MMU. If the signal is asserted, it indicates a privileged mode access
7:6	UNUSED_2	
5:4	VP_CPRIORITYLVL	Request priority Level signal. In APQ8064 project, this feature has not been implemented in VBIF.
3:2	UNUSED	
1:0	VP_CREQPRIORITY	Request priority signal on AXI I/F ports - 2'b00 : the lowest priority level - 2'b11 : the highest priority level

0x05900048 VCAP_VCAP_VBIF_CLIENT_STATUS

Type: Read
Clock: UNDEFINED
Reset State: 0x00001111

VBIF client interface status.

Note: Whenever VCAP_I2P_INTERRUPT_STATUS.PICTURE_DONE occurs, SW should check this register's bit 8 is 1. PICTURE_DONE status means picture processing is done from I2P core perspective, it doesn't mean memory writes are passed out VCAP core. In order to make sure memory write is actually done, SW should check VP_WRITES_DONE status bit. VCAP_VC's interrupt status reflects VBIF write done status so SW does not need to check this status bit but SW should check this status for VCAP_VP's interrupt since I2P design (external IP) cannot be modified.

VCAP_VCAP_VBIF_CLIENT_STATUS

Bits	Name	Description
31:13	UNUSED_1	
12	VP_READS_DONE	READ ONLY VCAP_VP read request status. - 0x0 : Read is still progressing. - 0x1 : There is not any pending read request
11:9	UNUSED_2	
8	VP_WRITES_DONE	READ ONLY VCAP_VP write request status. - 0x0 : Write is still progressing. - 0x1 : There is not any pending write request
7:5	UNUSED_3	
4	VC_READS_DONE	READ ONLY VCAP_VC read request status. VCAP_VC doesn't have read functionality, so it should be always 1. - 0x0 : Read is still progressing. - 0x1 : There is not any pending read request
3:1	UNUSED_4	
0	VC_WRITES_DONE	READ ONLY VCAP_VC write request status. - 0x0 : Write is still progressing. - 0x1 : There is not any pending write request

0x05900100 VCAP_VCAP_DEBUGBUS_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Debug bus control

VCAP_VCAP_DEBUGBUS_CTRL

Bits	Name	Description
31:28	VBIF_TEST_BUS2_DATA_SEL	vbif_test_bus2_data_sel to determine which data stream to output on debugbus
27	UNUSED_1	
26	VBIF_TEST_BUS2_ARB_EN	vbif_test_bus2_arb_en to enable the arbiter selection
25:24	VBIF_TEST_BUS2_XIN_EN	vbif_test_bus2_xin_en selects one XIN block with signals belonging to AXI clock VBIF_TEST_BUS2_DATA_SEL selects which data to output
23:20	VBIF_TEST_BUS1_DATA_SEL	vbif_test_bus1_data_sel : to select which data stream to output on debugbus
19:18	UNUSED_2	
17:16	VBIF_TEST_BUS1_XIN_EN	vbif_test_bus1_xin_en to select one XIN block with signals which corresponds to VCAP_CLK
15:14	VBIF_AHB_TEST_BUS_EN	vbif_ahb_test_bus_en
13:12	AHB2AHB_TEST_BUS_EN	ahb2ahb_test_bus connection
11:10	UNUSED_3	
9:4	DEBUGBUS_SEL	Debug bus select. 0-29 I2P debug signals, 30-39 - AXI debug signals, 40, 41 - AHB debug signals, 43-63 - VC debug signals, Programming this field to 0x3D will output fixed pattern
3:1	UNUSED_4	
0	DEBUGBUS_EN	Enable DebugBus. 0 = disable, 1=enable

0x05900104 VCAP_VCAP_DEBUGBUS

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

Debug bus status

VCAP_VCAP_DEBUGBUS

Bits	Name	Description
31:0	DEBUGBUS	READ ONLY Debug bus read only field. Along with the debug bus going out of vcap, the bus status can be read here as well

14.19.1 VCAP_I2P SWI Register Set

VCAP_I2P Registers

0x05900400 VCAP_VCAP_I2P_OUTPUT_STATUS

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

output status

VCAP_VCAP_I2P_OUTPUT_STATUS

Bits	Name	Description
31	CORE_ACTIVE	READ ONLY - 0: core inactive 1:core active
30:27	UNUSED_1	
26:16	OUTPUT_ROW_MIN1	READ ONLY current row being output
15:11	UNUSED_2	
10:0	OUTPUT_COLUMN_MIN1	READ ONLY current horizontal offset being output

0x05900404 VCAP_VCAP_I2P_INTERRUPT_STATUS

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

interrupt status

VCAP_VCAP_I2P_INTERRUPT_STATUS

Bits	Name	Description
31:26	UNUSED_1	

VCAP_VCAP_I2P_INTERRUPT_STATUS (cont.)

Bits	Name	Description
25	REGISTER_READ_ERROR	- 1 if register read from invalid address
24	REGISTER_WRITE_ERROR	- 1 if register write to invalid address
23:21	UNUSED_2	
20	OUTPUT_UNDERFLOW_ERROR	if direct video out is used, if output interface is starved of data due a stall in i2p gc
19	UNUSED_3	
18	INPUT_OVERFLOW_ERROR	if direct video input port attempts to input data which is not accepted due to stall in i2p_gc
17	INPUT_HEIGHT_ERROR	- 1: hardware interface input field picture boundary not aligned
16	INPUT_WIDTH_ERROR	- 1: hardware interface input field row boundary not aligned
15:9	UNUSED_4	
8	FILM_MODE_CHANGE	- 1: film mode state / cadence changed
7:2	UNUSED	
1	LAST_CONFIG	- 1: when start picture occurs and (load_new_config=0 or config_base_add=-16)
0	PICTURE_DONE	- 1: picture done. SW needs to check VCAP_VBIF_CLIENT_STATUS.VP_WRITES_DONE status bit if SW really wants to make sure all memory write is done from VCAP level. PICTURE_DONE interrupt is generated when picture is done from I2P core perspective, in other words, there might be pending request in VBIF side.

0x05900408 VCAP_VCAP_I2P_INTERRUPT_ENABLE

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

interrupt enable

VCAP_VCAP_I2P_INTERRUPT_ENABLE

Bits	Name	Description
31:26	UNUSED_1	
25	ENABLE_REGISTER_READ_ERROR	if set, i2p_irq will pulse high whenever register read error occurs
24	ENABLE_REGISTER_WRITE_ERROR	if set, i2p_irq will pulse high whenever register write error occurs
23:21	UNUSED_2	

VCAP_VCAP_I2P_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
20	ENABLE_OUTPUT_UNDERFLOW_ERROR	if set, i2p_irq will pulse high whenever output underflow occurs
19	UNUSED_3	
18	ENABLE_INPUT_OVERFLOW_ERROR	if set, i2p_irq will pulse high whenever input overflow occurs
17	ENABLE_INPUT_HEIGHT_ERROR	if set, i2p_irq will pulse high whenever input height error occurs
16	ENABLE_INPUT_WIDTH_ERROR	if set, i2p_irq will pulse high whenever input width error occurs
15:9	UNUSED_4	
8	ENABLE_FILM_MODE_CHANGE	if set, i2p_irq will pulse high whenever film state or cadenc change
7:2	UNUSED	
1	ENABLE_LAST_CONFIG	if set, i2p_irq will pulse high whenever last config occurs
0	ENABLE_PICTURE_DONE	if set, i2p_irq will pulse high whenever picture done occurs

0x0590040C VCAP_VCAP_I2P_INTERRUPT_CLEAR

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

interrupt clear

VCAP_VCAP_I2P_INTERRUPT_CLEAR

Bits	Name	Description
31:26	UNUSED_1	
25	CLEAR_REGISTER_READ_ERROR	writing a ’1’ clears the status field
24	CLEAR_REGISTER_WRITE_ERROR	writing a ’1’ clears the status field
23:21	UNUSED_2	
20	CLEAR_OUTPUT_UNDERFLOW_ERROR	writing a ’1’ clears the status field
19	UNUSED_3	
18	CLEAR_INPUT_OVERFLOW_ERROR	writing a ’1’ clears the status field

VCAP_VCAP_I2P_INTERRUPT_CLEAR (cont.)

Bits	Name	Description
17	CLEAR_INPUT_HEIGHT_ERROR	writing a ’1’ clears the status field
16	CLEAR_INPUT_WIDTH_ERROR	writing a ’1’ clears the status field
15:9	UNUSED_4	
8	CLEAR_FILM_MODE_CHANGE	writing a ’1’ clears the status field
7:2	UNUSED	
1	CLEAR_LAST_CONFIG	writing a ’1’ clears the status field
0	CLEAR_PICTURE_DONE	writing a ’1’ clears the status field

0x05900410 VCAP_VCAP_I2P_SOFT_RESET

Type: Read/Write

VCAP_VCAP_I2P_CLOCK_ENABLE

Bits	Name	Description
31:1	UNUSED	
0	FORCE_CLOCK_ENABLE	- 0: auto clock gating is used, 1: force clock to be permanently enabled

0x05900480 VCAP_VCAP_I2P_INPUT_CONFIGURATION

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

input configuration

VCAP_VCAP_I2P_INPUT_CONFIGURATION

Bits	Name	Description
31:29	UNUSED_1	
28	INPUT_CHROMA_HALF_STRIDE	if set, chroma row stride is half luma row stride
27:20	INPUT_ROW_STRIDE	row stride of t(2) luma frame store
19:14	UNUSED_2	
13	INPUT_CHROMA_SIGNED	internal pipeline works on unsigned chroma. If this bit is set, MSb of chroma input will be inverted
12	INPUT_CHROMA_QUASI_422	if set, i2p_gc will read from 4:2:2 source but chroma output to balance logic is processed as if it was 4:2:0
11	INPUT_CHROMA_FORMAT	- 0: chroma_420 input field. 1: chroma_422 input field
10	INPUT_STORE_INTERVEAVED	- 0: field picture store 1: interleaved frame store
9:8	INPUT_STORE_FORMAT	input field store format 00: YUVPL12Y8 YUV PL12 Y8 ’0x0’ = Normal operation (all four input fields used) 01: YUVPL12Y10 YUV PL12 Y10 (10-bit data chroma interleaved) 10: YUVYV12Y8 YUV YV12 Y8 (8-bit data separate chroma planes) 11: YUVYV12Y10 YV12 Y10 (10-bit data separate chroma planes)
7:6	UNUSED_3	
5:4	INPUT_SEQUENCE	’0x1’ = 1st field : output frame is not generated (analysis blocks disabled). If noise reduction is enabled, input field is written to t(-1) without modification. If noise reduction is disabled, and hardware input interface is used, input field written to t(2). ’0x2’ = 2nd field : output frame generated. Field t(2) used in place of t(0), field t(1) used in place of t(-1). Noise reduction block outputs result unmodified. Film mode and motion estimation blocks initialize stores. ’0x3’ = 3rd field : normal operation, with the exception that field t(1) used in place of t(-1)(8-bit data chroma interleaved)
3:1	UNUSED_4	
0	INPUT_HARDWARE_INTERFACE	- 0: t(2) read from memory. 1: t(2) input via hardware interface

0x05900484 VCAP_VCAP_I2P_NOISE_REDUCTION_CONFIGURATION

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

noise reduction configuration

VCAP_VCAP_I2P_NOISE_REDUCTION_CONFIGURATION

Bits	Name	Description
31:28	UNUSED_1	
27:20	NR_ROW_STRIDE	Row stride of t(1), t(0) and t(-1) luma frame store (in 128-bit words, a value of 0 = 4096 byte row stride), if noise reduction is enabled. If noise reduction is disabled, this field isn't used.
19:11	UNUSED_2	
10	NR_STORE_INTERLEAVED	- 0: field picture store. 1: interleaved frame store.if NR is enabled, this field applies to t(1) t(0) t(-1)
9	UNUSED_3	
8	NR_STORE_FORMAT	- 0: YUVPL12Y8 YUV PL12 Y8 (8-bit data chroma interleaved) 1: YUVPL12Y10 YUV PL12 Y10 (10-bit data chroma interleaved)
7:2	UNUSED_4	
1	CYCLE_BUFFERS	If this bit is ’0’, and auto configuration is used, base addresses for nr_t(2), t(1), t(0), and t(-1) will be loaded as part of the auto-configuration process. If this bit is ’0’, and auto-configuration is not used, software is responsible for setting-up base addresses for nr_t(2), t(1), t(0) and t(-1). If this bit is ’1’, and noise reduction is disabled, at the end of a picture (at the same time that picture done interrupt is generated) base address t(0) copied to t(-1) base address t(1) copied to t(0) base address t(2) copied to t(1) If this bit is ’1’, and noise reduction is enabled, at the end of a picture (at the same time that picture done interrupt is generated) base address t(0) copied to t(-1) base address t(1) copied to t(0) base address nr_t(2) copied to t(1) (where at the end of the picture, nr_t(2) will contain noise reduced version of t(2)). If this bit is ’1’, auto-configuration will not load base addresses for t(-1), t(0) or t(1) In 1 field delay mode, t(1)/nr_t(2) copied to t(0), t(-1) is copied to t(-2). In 0 field delay mode, t(0)/nr_t(2) copied to t(-1), t(-2) is copied to t(-3).
0	NOISE_REDUCTION_ENABLE	- 0: noise reduction disabled 1: noise reduction enabled

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

output configuration

VCAP_VCAP_I2P_OUTPUT_CONFIGURATION

Bits	Name	Description
31:29	UNUSED_1	
28	OUTPUT_CHROMA_HALF_STRIDE	If this bit is '1', chroma row stride is half luma row stride (In which case, luma row stride must be multiple of 32-bytes, so that chroma stride is still a multiple of 16-bytes). If this bit is '0', chroma row stride is same as luma row stride
27:20	OUTPUT_ROW_STRIDE	Row stride of output luma frame store (in 128-bit words, a value of 0 = 4096 byte row stride), if output to memory is enabled. If hardware output is used, this field isn't used
19:15	UNUSED_2	
14	OUTPUT_CHROMA_SPATIAL	- 0: interpolate chroma based on luma, 1: force chroma interpolation to spatial only
13	OUTPUT_CHROMA_SIGNED	if this bit is set, MSb of chroma output will be inverted to convert unsigned offset chroma to signed chroma
12	SWAP_CHROMA	if set, chroma order at input (Cb/Cr) will be swapped at output (Cr/Cb)
11	OUTPUT_CHROMA_FORMAT	Defines chroma format of output (if input and output chroma formats are different, balance and filter logic will do the chroma format conversion) 0: CHROMA_420 Output frame 4:2:0 1: CHROMA_422 Output frame 4:2:2
10	UNUSED_3	
9:8	OUTPUT_STORE_FORMAT	- 00: YUVPL12Y8 YUV PL12 Y8 (8-bit data chroma interleaved) 01: YUVPL12Y10 YUV PL12 Y10 (10-bit data chroma interleaved) 10: YUVYV12Y8 YUV YV12 Y8 (8-bit data separate chroma planes) 11: YUVYV12Y10 YV12 Y10 (10-bit data separate chroma planes
7:6	OUTPUT_FIELD_DELAY	defines output field delay 00: 2_FIELD 2 field delay mode 01: 1_FIELD 1 field delay mode 10: 0_FIELD 0 field delay mode 11: RESERVED
5:4	OUTPUT_MODE	Modifies what data is output 00: DISABLED Disable output 01: PROGRESSIVE Output progressive frame (including data from field t0) 10: INTER_FIELD Output only interpolated data, into a field store 11: INTER_FRAME Output only interpolated data, into a frame store
3:1	UNUSED_4

CONTROL

VCAP_VCAP_I2P_CONTROL

Bits	Name	Description
31:19	UNUSED_1	
18	START_SEQUENCE	If this flag is set to 1, starts picture initialization sequence (see INPUT_SEQUENCE field of INPUT_CONFIGURATION register)
17	LOAD_NEW_CONFIG	’0’ = Auto-configuration disabled ’1’ = Auto-configuration enabled : At the end of the picture, if ’CONFIG_BASE_ADDRESS’ is not equal to -16, then : If CYCLE_BUFFERS = ’0’, 5 128-bit words are read from memory and used to load register 0x090 to 0x0DC If CYCLE_BUFFERS = ’1’ and noise reduction disabled, 2 128-bit words are read from memory and used to load register 0x0C0 to 0x0DC. In 1 field delay mode, rather than using the first word to load t(2) base addresses, the first word will load t(1) base address registers. In 0 field delay mode, rather than using the first word to load t(2) base addresses, the first word will load t(0) base address registers If CYCLE_BUFFERS = ’1’ and noise reduction enabled, 3 128-bit words are read from memory and used to load register 0x0B4 to 0x0DC. In 1 field delay mode, rather than using the 2ndt word to load t(2) base addresses, the 2nd word will load t(1) base address registers. In 0 field delay mode, rather than using the 2nd word to load t(2) base addresses, the 2nd word will load t(0) base address registers
16	START_PROCESSING	- 0: No effect - i2p gc remains inactive. 1: i2p_gc initiates read requests to start processing new picture
15:11	UNUSED_2	
10:8	BALANCE_MODE	controls balance logic mode operation 000: AUTO The combined results of all analysis blocks used 001: SPACE_TIME Spatial/temporal/motion analysis used (film mode ignored) 010: SPATIAL Spatial analysis result only used (temporal and film mode ignored) 011: TEMPORAL Temporal analysis result only used (spatial and film mode ignored) 100: FAST_SPATIAL DO NOT USE (use 0 field delay config in output config register) 101: WEAVE_FM Weave based on field selected by film mode 110: WEAVE_T1 Weave t(0) with t(1) (all analysis results ignored) 111: WEAVE_TM1 Weave t(0) with t(-1) (all analysis results ignored)
7:1	UNUSED	
0	INPUT_BOTTOM_FIELD	’0’ = t(2) and t(0) are top fields (t(1) and t(-1) are bottom fields) ’1’ = t(2) and t(0) are bottom fields (t(1) and t(-1) are top fields) N.B. Even in 0/1 field delay mode, INPUT_BOTTOM_FIELD will indicate if t(0) is a top or bottom field

0x059004DC VCAP_VCAP_I2P_CONFIG_BASE_ADDRESS

Type: Read/Write
Clock: UNDEFINED
Reset State: 0xFFFFFFF0

CONFIG_BASE_ADDRESS

VCAP_VCAP_I2P_CONFIG_BASE_ADDRESS

Bits	Name	Description
31:4	CONFIG_BASE_ADDRESS	Base address used if auto-configuration is enabled at the end of picture If 'LOAD_NEW_CONFIG' = '1', 'CORE_ACTIVE' = '0', and this register is not = 0xFFFFFFF0, then either two (CYCLE_BUFFERS, NR off), three (CYCLE_BUFFERS, NR on) or five (not CYCLE_BUFFERS) 128-bit words will be read from memory to set-up configuration registers for processing a new picture. If 'CYCLE_BUFFERS' field of NOISE_REDUCTION_CONFIGURATION register = '1', if NOISE_REDUCTION_ENABLE = 1 base addresses for t(2), nr_t(2) and output frame are loaded (base addresses for t(1), t(0) and t(-1) are shifted from previous picture). If 'CYCLE_BUFFERS' field of NOISE_REDUCTION_CONFIGURATION register = '1', if NOISE_REDUCTION_ENABLE = 0 base addresses for t(2) and output frame are loaded. In 1 field delay mode, t(1) base address registers are loaded, and t(0), t(- 1) and t(-2) are shifted. In 0 field delay mode, t(0) base address registers are loaded, and t(-1), t(-2) and t(-3) are shifted. If 'CYCLE_BUFFERS' = '0' base addresses for all four input fields, noise reduced field and the output frame are loaded. This loading process will also load a new value into this register, so that a new configuration can be loaded at the end of the new picture. If the new configuration isn't set-up yet, this register can be loaded with -16, and then loaded at a later stage when configuration is set-up

MIXED_ROW_POINTER

VCAP_VCAP_I2P_MIXED_ROW_POINTER

Bits	Name	Description
31:5	UNUSED	
4:0	MIXED_ROW_POINTER	For every 128 rows of a frame, there are 32-bits of state information stored. For contact switching this information should be capable of being able to be saved/restored. Rather than mapping all registers into the address space, this register defines which word can be read from MIXED_ROW_DATA register. After every read/write to MIXED_ROW_DATA register, MIXED_ROW_POINTER increments

0x0590051C VCAP_VCAP_I2P_MIXED_ROW_DATA

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

MIXED_ROW_DATA

VCAP_VCAP_I2P_MIXED_ROW_DATA

Bits	Name	Description
31:0	MIXED_ROW_DATA	There are 32-bits of state information stored for every 128 frame rows of a picture. This information needs to be capable of being saved/restored on a context switch. Rather than mapping all registers into address space, indirect addressing is used, where MIXED_ROW_POINTER defines which set of 32-bits of state information are read/written. After each read/write to this register MIXED_ROW_POINTER increments, so that a set of repeated reads/writes to this register can read/restore all the state information

VCAP_VCAP_I2P_NOISE_REDUCTION_LUMA_CONFIG

Bits	Name	Description
31:28	UNUSED_1	
27:24	LUMA_MAX_BLEND_RATIO	Controls the maximum blending ratio which can be applied by noise reduction (0 = 50:50, 15 = 31:1)
23:20	UNUSED_2	
19	UPDATE_LUMA_SCALE_DIFF	When this field is set, at the end of a field, LUMA_SCALE_DIFF can be updated based on average motion
18	UPDATE_LUMA_DIFF_LIMIT	When this bit is set, at the end of a field, LUMA_DIFF_LIMIT can be updated based on average motion
17	UPDATE_LUMA_SCALE_MOTION	When this field is set, at the end of a field, LUMA_SCALE_MOTION can be updated based on average motion
16	UPDATE_LUMA_BLEND_LIMIT	When this bit is set, at the end of a field, LUMA_BLEND_LIMIT can be updated based on average motion

VCAP_VCAP_I2P_NOISE_REDUCTION_LUMA_CONFIG (cont.)

Bits	Name	Description
15:12	LUMA_SCALE_DIFF_RATIO	Defines proportion of average_motion to use to set luma_scale_diff, if update of UPDATE_LUMA_SCALE_DIFF is set. A value between 1 and 15 corresponds ramp from 100:0 to 50:50 over scaled average motion*1/16 up to scaled average motion*15/16. A value of 0 corresponds to scaled average motion*16/16
11:8	LUMA_DIFF_LIMIT_RATIO	Defines proportion of scaled average motion to use to set LUMA_DIFF_LIMIT to, if UPDATE_LUMA_DIFF_LIMIT is set. Defines a value between scaled average motion*-8/16 up to scaled average motion*7/16 (where result is signed and clipped to range -128 to 127)
7:4	LUMA_SCALE_MOTION_RATIO	Defines proportion of average_motion to use to set luma_scale_motion, if update of UPDATE_LUMA_SCALE_MOTION is set. A value between 1 and 15 corresponds ramp from 100:0 to 50:50 over scaled average motion*1/16 up to scaled average motion*15/16. A value of 0 corresponds to scaled average motion*16/16
3:0	LUMA_BLEND_LIMIT_RATIO	Defines proportion of scaled average motion to use to set LUMA_BLEND_LIMIT to, if UPDATE_LUMA_BLEND_LIMIT is set. Defines a value between scaled average motion*0/16 up to scaled average motion*15/16 (where maximum result limited to 255).

0x05900628 VCAP_VCAP_I2P_NOISE_REDUCTION_CHROMA_CONFIG

Type: Read/Write
Clock: UNDEFINED

Bits	Name	Description
31:19	UNUSED_1	
18:16	VMOTION_ACTIVE_SYM_THRESHOLD	If sym_fact greater than threshold and vmotion_fields >=2, process pixel as spatial
15	UNUSED_2	
14:12	VMOTION_SPATIAL_THRESHOLD	If spatial greater than threshold, consider pixel for vertical motion
11	UNUSED_3	
10:8	VMOTION_TEMP_SYM_THRESHOLD	If temporal_motion*sym_fact greater than threshold, consider pixel for vertical motion
7:5	UNUSED_4	
4	VMOTION_REPEAT_THRESHOLD	Pixel repeat threshold = 3 (when 0) or 7 (when 1)
3	UNUSED	
2:0	VMOTION_PIXELS_FIELD	Threshold for number of pixels/field to trigger vertical motion

0x05900690 VCAP_VCAP_I2P_BALANCE_VMOTION_STATE

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_BALANCE_VMOTION_STATE

Bits	Name	Description
31:30	VMOTION_ACTIVE_FIELDS	This register indicates how many fields vertical motion has been active for (the register state should be saved and restored on switching states)

VCAP_VCAP_I2P_BALANCE_VMOTION_STATE (cont.)

Bits	Name	Description
29:0	VMOTION_PIXELS	READ ONLY This is a read only field which indicates how many pixels in the last field contributed to vertical motion detection (Field is reset to 0 at start of each field)

0x05900694 VCAP_VCAP_I2P_BALANCE_AVERAGE_BLEND

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_BALANCE_AVERAGE_BLEND

Bits	Name	Description
31:0	BALANCE_SPACE_TIME_BLEND	IIR accumulated average of space/time blend (updated only when space/time selection made)

0x059006C0 VCAP_VCAP_I2P_DIFF_TP1Y0_TP2YM1

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_TP1Y0_TP2YM1

Bits	Name	Description
31:0	DIFF_TP1Y0_TP2YM1	READ ONLY Accumulated pixel differenceA

0x059006C4 VCAP_VCAP_I2P_DIFF_TP1Y0_TP2YP1

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_TP1Y0_TP2YP1

Bits	Name	Description
31:0	DIFF_TP1Y0_TP2YP1	READ ONLY Accumulated pixel differenceB

0x059006C8 VCAP_VCAP_I2P_DIFF_T0YM1_TP1Y0

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_T0YM1_TP1Y0

Bits	Name	Description
31:0	DIFF_T0YM1_TP1Y0	READ ONLY Accumulated pixel differenceC

0x059006CC VCAP_VCAP_I2P_DIFF_T0YP1_TP1Y0

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_T0YP1_TP1Y0

Bits	Name	Description
31:0	DIFF_T0YP1_TP1Y0	READ ONLY Accumulated pixel differenceD

0x059006D0 VCAP_VCAP_I2P_DIFF_T0YM1_TP2YM1

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_T0YM1_TP2YM1

Bits	Name	Description
31:0	DIFF_T0YM1_TP2YM1	READ ONLY Accumulated pixel differenceE

0x059006D4 VCAP_VCAP_I2P_DIFF_TM1Y0_TP1Y0

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_TM1Y0_TP1Y0

Bits	Name	Description
31:0	DIFF_TM1Y0_TP1Y0	READ ONLY Accumulated pixel differenceF

0x059006D8 VCAP_VCAP_I2P_DIFF_T0YP1_TP2YP1

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_T0YP1_TP2YP1

Bits	Name	Description
31:0	DIFF_T0YP1_TP2YP1	READ ONLY Accumulated pixel differenceG

0x059006E0 VCAP_VCAP_I2P_DIFF_UP_2

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_UP_2

Bits	Name	Description
31:0	DIFF_UP_2	READ ONLY Accumulated pixel differencem2

0x059006E4 VCAP_VCAP_I2P_DIFF_UP_1

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_UP_1

Bits	Name	Description
31:0	DIFF_UP_1	READ ONLY Accumulated pixel differencem1

0x059006E8 VCAP_VCAP_I2P_DIFF_0_VERT

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_0_VERT

Bits	Name	Description
31:0	DIFF_0_VERT	READ ONLY Accumulated pixel difference0

0x059006EC VCAP_VCAP_I2P_DIFF_DOWN_1

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_DOWN_1

Bits	Name	Description
31:0	DIFF_DOWN_1	READ ONLY Accumulated pixel difference1

0x059006F0 VCAP_VCAP_I2P_DIFF_DOWN_2

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DIFF_DOWN_2

Bits	Name	Description
31:0	DIFF_DOWN_2	READ ONLY Accumulated pixel difference2

0x059006F8 VCAP_VCAP_I2P_VMOTION_HISTORY

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_VMOTION_HISTORY

Bits	Name	Description
31:22	UNUSED_1	
21:20	HIST_UP_DOWN	Increments if DIFF_DOWN was smaller then DIFF_UP in picture (else decrements to 0)
19:18	UNUSED_2	
17:16	HIST_DOWN_2	Increments if DIFF_DOWN_2 was smallest difference in picture (else decrements to 0)
15:14	UNUSED_3	
13:12	HIST_DOWN_3	Increments if DIFF_DOWN_1 was smallest difference in picture (else decrements to 0)
11:10	UNUSED_4	
9:8	HIST_0_VERT	Increments if DIFF_0_VERT was smallest difference in picture (else decrements to 0)
7:6	UNUSED_5	
5:4	HIST_UP_1	Increments if DIFF_UP_1 was smallest difference in picture (else decrements to 0)
3:2	UNUSED_6	
1:0	HIST_UP_2	Increments if DIFF_UP_2 was smallest difference in picture (else decrements to 0)

0x059006FC VCAP_VCAP_I2P_PIXEL_DIFF_CONFIG

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_PIXEL_DIFF_CONFIG

Bits	Name	Description
31:4	UNUSED	
3:0	PIXEL_DIFF_BORDER	Defines number of frame rows at top and bottom of picture which are not included when calculating pixel differences (PIXEL_DIFF_BORDER is multiplied by 8, so can define between 0 and 120 frame lines excluded from top and bottom of picture)

0x05900700 VCAP_VCAP_I2P_LINE_STORE_LUMA_SIGNATURE

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_LINE_STORE_LUMA_SIGNATURE

Bits	Name	Description
31:0	LS_LUMA_SIGNATURE	READ ONLY CRC calculated from output of 10 luma line stores, updated at end of each picture

0x05900704 VCAP_VCAP_I2P_LINE_STORE_CHROMA_SIGNATURE

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_LINE_STORE_CHROMA_SIGNATURE

Bits	Name	Description
31:0	LS_CHROMA_SIGNATURE	READ ONLY - 32-bit CRC calculated from output of 10 chroma line stores (5 Cr and 5 Cb), updated at end of picture

0x05900708 VCAP_VCAP_I2P_MEM_SIGNATURE_CONTROL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_MEM_SIGNATURE_CONTROL

Bits	Name	Description
31:11	UNUSED_1	
10:8	MEM_WRITE_SIGNATURE_CONTROL	Selects which memory write buffer to calculate write signature from 000: OUT_LUMA Luma output 001: OUT_CB Cb output 010: OUT_CR Cr output 011: NOISE_LUMA Noise reduction luma write 100: NOISE_CHROMA Noise reduction chroma write 101: MOTION Motion estimation writes
7:4	UNUSED_2	

VCAP_VCAP_I2P_MEM_SIGNATURE_CONTROL (cont.)

Bits	Name	Description
3:0	MEM_READ_SIGNATURE_CONTROL	Selects which read buffer to calculate memory read signature from 0000: T2_LUMA t(2) Luma 0001: T2_CB t(2) Cb 0010: T2_CR t(2) Cr 0011: T1_LUMA t(1) Luma 0100: T1_CB t(1] Cb 0101: T1_CR t(1) Cr 0110: T0_LUMA t(0) Luma 0111: T0_CB t(0) Cb 1000: T0_CR t(0) Cr 1001: TM1_LUMA t(-1) Luma 1010: TM1_CB t(-1) Cb 1011: TM1_CR t(-1) Cr 1100: MOTION Motion estimation 1110: CONFIG

0x0590070C VCAP_VCAP_I2P_MEM_READ_SIGNATURE

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_MEM_READ_SIGNATURE

Bits	Name	Description
31:0	MEM_READ_SIGNATURE	READ ONLY - 32-bit CRC calculated from words read from TAG defined by MEM_READ_SIGNATURE_CONTROL. Updates at end of picture

0x05900710 VCAP_VCAP_I2P_FILTER_SIGNATURE

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_FILTER_SIGNATURE

Bits	Name	Description
31:0	FILTER_SIGNATURE	READ ONLY - 32-bit CRC on pixels out of balance logic filter, updated at end of picture

0x05900714 VCAP_VCAP_I2P_MEM_WRITE_SIGNATURE

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_MEM_WRITE_SIGNATURE

Bits	Name	Description
31:0	MEM_WRITE_SIGNATURE	READ ONLY - 32-bit CRC calculated from words read from TAG defined by MEM_WRITE_SIGNATURE_CONTROL. Updates at end of picture

0x05900720 VCAP_VCAP_I2P_LINE_STORE_LUMA_SIGNATURE_RAW

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_LINE_STORE_LUMA_SIGNATURE_RAW

Bits	Name	Description
31:0	LS_LUMA_SIGNATURE_RAW	READ ONLY CRC calculated from output of 10 luma line stores, updates every pixel

0x05900724 VCAP_VCAP_I2P_LINE_STORE_CHROMA_SIGNATURE_RAW

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_LINE_STORE_CHROMA_SIGNATURE_RAW

Bits	Name	Description
31:0	LS_CHROMA_SIGNATURE_RAW	READ ONLY - 32-bit CRC calculated from output of 10 chroma line stores (5 Cr and 5 Cb), updates every pixel

0x0590072C VCAP_VCAP_I2P_MEM_READ_SIGNATURE_RAW

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_MEM_READ_SIGNATURE_RAW

Bits	Name	Description
31:0	MEM_READ_SIGNATURE_RAW	READ ONLY MEM_READ_SIGNATURE_RAW 32-bit CRC calculated from words read from TAG defined by MEM_SIGNATURE_CONTROL, updates every word

0x05900730 VCAP_VCAP_I2P_FILTER_SIGNATURE_RAW

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_FILTER_SIGNATURE_RAW

Bits	Name	Description
31:0	FILTER_SIGNATURE_RAW	READ ONLY - 32-bit CRC on pixels out of balance logic filter, updates every pixel

0x05900734 VCAP_VCAP_I2P_MEM_WRITE_SIGNATURE_RAW

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_MEM_WRITE_SIGNATURE_RAW

Bits	Name	Description
31:0	MEM_WRITE_SIGNATURE_RAW	READ ONLY - 32-bit CRC calculated from words written from TAG defined by MEM_WRITE_SIGNATURE_CONTROL, updates every word

0x05900748 VCAP_VCAP_I2P_CORE_FLOW_STATUS

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_CORE_FLOW_STATUS

Bits	Name	Description
31	CORE_ACTIVE_STATUS	READ ONLY Core is processing a picture

VCAP_VCAP_I2P_CORE_FLOW_STATUS (cont.)

Bits	Name	Description
30	MEM_ACTIVE_STATUS	READ ONLY Memory controller still has read/writes pending
29	MEM_CONFIG_PEND_STATUS	READ ONLY Memory controller has config word to send to registers
28	MEM_READ_ACTIVE_STATUS	READ ONLY Memory controller still has reads to issue for current picture
27:26	PIXEL_STATE_STATUS	READ ONLY Line store output state (0 = Idle, 1=Start, 2=Active, 3=End)
25	LS_NR_ENABLE_STATUS	READ ONLY Pixel from line store to noise reduction accepted
24	LS_MOTION_ENABLE_STATUS	READ ONLY Pixel from line store to motion estimation accepted
23	LS_BALANCE_ENABLE_STATUS	READ ONLY Pixel from line store to balance logic accepted
22	LS_BALANCE_VALID_STATUS	READ ONLY Pixel from line store to balance logic valid
21:18	UNUSED	
17	OF_MEM_ENABLE_STATUS	READ ONLY Word from balance logic to memory controller accepted
16	OF_MEM_VALID_STATUS	READ ONLY Word from balance logic to memory controller valid
15	MOTION_MEM_ENABLE_STATUS	READ ONLY Word from motion estimation to memory controller accepted
14	MOTION_MEM_VALID_STATUS	READ ONLY Word from motion estimation to memory controller valid
13	NR_MEM_ENABLE_STATUS	READ ONLY Word from noise reduction to memory controller accepted
12	NR_MEM_VALID_STATUS	READ ONLY Word from noise reduction to memory controller valid
11	MEM_CONFIG_ENABLE_STATUS	READ ONLY Word from memory controller to config registers accepted
10	MEM_CONFIG_VALID_STATUS	READ ONLY Word from memory controllers to config registers valid
9	MEM_MOTION_ENABLE_STATUS	READ ONLY Word from memory controller to motion estimation accepted
8	MEM_MOTION_VALID_STATUS	READ ONLY Word from memory controller to motion estimation valid

VCAP_VCAP_I2P_CORE_FLOW_STATUS (cont.)

Bits	Name	Description
7	MEM_LS_ENABLE_STATUS	READ ONLY Word from memory controller to line store accepted
6	MEM_LS_VALID_STATUS	READ ONLY Word from memory controller to line store valid
5	MEM_ENABLE_STATUS	READ ONLY Memory command accepted
4	MEM_VALID_STATUS	READ ONLY Memory command valid
3	OUT_PIXEL_ENABLE_STATUS	READ ONLY Output pixel accepted
2	OUT_PIXEL_VALID_STATUS	READ ONLY Output pixel valid
1	INP_PIXEL_ENABLE_STATUS	READ ONLY Input pixel accepted
0	INP_PIXEL_VALID_STATUS	READ ONLY Input pixel available

0x0590074C VCAP_VCAP_I2P_LINE_STORE_STATUS

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_LINE_STORE_STATUS

Bits	Name	Description
31:28	UNUSED	
27:26	LS_PIXEL_STATE	READ ONLY Line store output state (0 = Idle, 1=Start, 2=Active, 3=End)
25	LS_NR_ENABLE_LS	READ ONLY Pixel from line store to noise reduction accepted
24	LS_MOTION_ENABLE_LS	READ ONLY Pixel from line store to motion estimation accepted
23	LS_BALANCE_ENABLE_LS	READ ONLY Pixel from line store to balance logic accepted
22	LS_BALANCE_VALID_LS	READ ONLY Pixel from line store to balance logic valid
21:11	LS_PIXEL_Y_OFFSET	READ ONLY Y offset out of line store block

VCAP_VCAP_I2P_LINE_STORE_STATUS (cont.)

Bits	Name	Description
10:0	LS_PIXEL_X_OFFSET	READ ONLY X offset out of line store block

0x05900750 VCAP_VCAP_I2P_SPLIT_SCREEN_CONTROL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_SPLIT_SCREEN_CONTROL

Bits	Name	Description
31:3	UNUSED	
2	SPLIT_SIMPLE_BOB	If split screen enabled, 0 = simple weave, 1 = simple bob
1	SPLIT_SIMPLE_LEFT	If split screen enabled, 0 = simple bob/weave on left, 1 = simple bob/weave on right
0	SPLIT_SCREEN_ENABLE	’1’ = Split screen display enabled (half screen = simple bob/weave)

0x059007C0 VCAP_VCAP_I2P_CORE_ID_REG

Type: Read
Clock: UNDEFINED
Reset State: 0x1002002E

VCAP_VCAP_I2P_CORE_ID_REG

Bits	Name	Description
31:24	GROUP_ID	READ ONLY I2P family of products
23:16	CORE_ID	READ ONLY I2P_GC allocated ID of 2
15:0	CONFIG	READ ONLY bit 0 = Pixel resolution (0 = 8-bit, 1 = 10-bit) bit 1 = Chroma stores (0 = 1 chroma store, 1 = 4 chroma stores) bits 7:4 = Log of max width supported

0x059007D0 VCAP_VCAP_I2P_CORE_REV_REG

Type: Read
Clock: UNDEFINED
Reset State: 0x00010101

VCAP_VCAP_I2P_CORE_REV_REG

Bits	Name	Description
31:24	DESIGNER	READ ONLY
23:16	MAJOR_REV	READ ONLY
15:8	MINOR_REV	READ ONLY
7:0	MAINTENANCE_REV	READ ONLY

0x059007E0 VCAP_VCAP_I2P_DESIGNER1

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DESIGNER1

Bits	Name	Description
31:0	DESIGNER1	READ ONLY

0x059007F0 VCAP_VCAP_I2P_DESIGNER2

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

VCAP_VCAP_I2P_DESIGNER2

Bits	Name	Description
31:0	DESIGNER2	READ ONLY

14.19.2 VCAP_VC SWI Register Set

VCAP_VC Registers

0x05900800 VCAP_VCAP_VC_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register has the configuration register for VCAP VC block

VCAP_VCAP_VC_CTRL

Bits	Name	Description
31:11	UNUSED	
10	FIELD_WRITTEN_INTR	- 0= Frame done interrupt will fire every frame for interlace resolutions. 1=Frame done interrupt will fire every field for interlace resolutions.
9	FIELD_VSYNC_INTR	- 0= Vsync interrupt will fire every frame for interlace resolutions. 1=Vsync interrupt will fire every field for interlace resolutions.
8	CAP_VSYNC_ONLY	- 0 = Hsync and Vsync needs to be aligned for capture to start. 1= Capture starts on Vsync. Hsync alignment is not changed
7:4	BUF_EN	Enable the third, fourth and fifth buffer if required. 0 = only 2 buffers used to write to the memory Y_ADDR_1, YADDR_2 for Y and RGB, C_ADDR_1 and C_ADDR_2 for Chroma. 1 = Third Buffer Y_ADDR_3 is used for Y or RGB and C_ADDR_3 is used for Chroma. 2= Fourth Buffer Y_ADDR_4 is used for Y or RGB and C_ADDR_4 is used for Chroma. 3= fifth Buffer Y_ADDR_5 is used for Y or RGB and C_ADDR_5 is used for Chroma. 4= Sixth Buffer Y_ADDR_6 is used for Y or RGB and C_ADDR_6 is used for Chroma.
3	INT_EN	This field will indicate if the capture is progressive or interlace format. 0= progressive, 1= Interlace
2	FRAME_OVERWRITE_EN	Configure if the buffer needs to be overwritten or the frames dropped in case software does not pick up the frames captured by hardware. 0 = Frames will be dropped in case the BUF1_WRITTEN_INT and BUF2_WRITTEN_INT and optionally BUF3_WRITTEN_EN fields in STATUS_1 register are not cleared. 1 = Captured frames will overwrite the buffers in case the BUF1_WRITTEN_INT and BUF2_WRITTEN_INT and optionally BUF3_WRITTEN_EN fields in STATUS register are not cleared.
1	Y_RGB_SEL	Configure the input data type. 0= YCrCb, 1= RGB
0	ENABLE	Enable VCAP_VC block. 0=disable, 1= enable. Before enabling the VCAP VC it is required to apply soft reset

0x05900804 VCAP_VCAP_VC_NPL_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to control VCAP_NPL

VCAP_VCAP_VC_NPL_CTRL

Bits	Name	Description
31:9	UNUSED_1	
8	SW_RESET	Soft reset the NPL block. 0 = normal operation, 1= Soft reset
7:4	SDL_SEL	Delayed clock for capture. 0 = No_delay, programming this field from 0x1 to 0xF gives delay in steps of approximately 0.59ns.
3	UNUSED_2	
2	CLK_INV	Invert the clock, 0=non-inverted clock used to capture the data, 1= Inverted Clock is used to capture the data
1:0	CLK_SEL	Select the clocks 00=No CLock, 01 = shadow test clock, 10 = Delayed clock (When SDL_SEL is programmed to 0 io_clk will be output without delay), 11= Inverted clock

0x05900808 VCAP_VCAP_VC_IN_CRTL1

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x0A418820

This register has the mux control for DATA0,DATA1,DATA2,DATA3,DATA4 and DATA5

VCAP_VCAP_VC_IN_CRTL1

Bits	Name	Description
31:30	UNUSED	
29:25	SEL_DATA5	Select the Data bit 5 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 5, 0x1 = input data 1 is mapped to data bit 5, 0x2 = input data 2 is mapped to data bit 5 and so on.
24:20	SEL_DATA4	Select the Data bit 4 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 4, 0x1 = input data 1 is mapped to data bit 4, 0x2 = input data 2 is mapped to data bit 4 and so on.

VCAP_VCAP_VC_IN_CRTL1 (cont.)

Bits	Name	Description
19:15	SEL_DATA3	Select the Data bit 3 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 3, 0x1 = input data 1 is mapped to data bit 3, 0x2 = input data 2 is mapped to data bit 3 and so on.
14:10	SEL_DATA2	Select the Data bit 2 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 2, 0x1 = input data 1 is mapped to data bit 2, 0x2 = input data 2 is mapped to data bit 2 and so on.
9:5	SEL_DATA1	Select the Data bit 1 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 1, 0x1 = input data 1 is mapped to data bit 1, 0x2 = input data 2 is mapped to data bit 1 and so on.
4:0	SEL_DATA0	Select the Data bit 0 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 0, 0x1 = input data 1 is mapped to data bit 0, 0x2 = input data 2 is mapped to data bit 0 and so on.

0x0590080C VCAP_VCAP_VC_IN_CRTL2

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x16A4A0E6

This register has the mux control for DATA6,DATA7,DATA8,DATA9,DATA10 and DATA11

VCAP_VCAP_VC_IN_CRTL2

Bits	Name	Description
31:30	UNUSED	
29:25	SEL_DATA11	Select the Data bit 11 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 11, 0x1 = input data 1 is mapped to data bit 11, 0x2 = input data 2 is mapped to data bit 11 and so on.
24:20	SEL_DATA10	Select the Data bit 10 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 10, 0x1 = input data 1 is mapped to data bit 10, 0x2 = input data 2 is mapped to data bit 10 and so on.
19:15	SEL_DATA9	Select the Data bit 9 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 9, 0x1 = input data 1 is mapped to data bit 9, 0x2 = input data 2 is mapped to data bit 9 and so on.
14:10	SEL_DATA8	Select the Data bit 8 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 8, 0x1 = input data 1 is mapped to data bit 8, 0x2 = input data 2 is mapped to data bit 8 and so on.

VCAP_VCAP_VC_IN_CRTL2 (cont.)

Bits	Name	Description
9:5	SEL_DATA7	Select the Data bit 7 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 7, 0x1 = input data 1 is mapped to data bit 7, 0x2 = input data 2 is mapped to data bit 7 and so on.
4:0	SEL_DATA6	Select the Data bit 6 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 6, 0x1 = input data 1 is mapped to data bit 6, 0x2 = input data 2 is mapped to data bit 6 and so on.

0x05900810 VCAP_VCAP_VC_IN_CRTL3

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x2307B9AC

This register has the mux control for DATA12,DATA13,DATA14,DATA15,DATA16 and DATA17

VCAP_VCAP_VC_IN_CRTL3

Bits	Name	Description
31:30	UNUSED	
29:25	SEL_DATA17	Select the Data bit 17 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 17, 0x1 = input data 1 is mapped to data bit 17, 0x2 = input data 2 is mapped to data bit 17 and so on.
24:20	SEL_DATA16	Select the Data bit 16 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 16, 0x1 = input data 1 is mapped to data bit 16, 0x2 = input data 2 is mapped to data bit 16 and so on.
19:15	SEL_DATA15	Select the Data bit 15 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 15, 0x1 = input data 1 is mapped to data bit 15, 0x2 = input data 2 is mapped to data bit 15 and so on.
14:10	SEL_DATA14	Select the Data bit 14 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 14, 0x1 = input data 1 is mapped to data bit 14, 0x2 = input data 2 is mapped to data bit 14 and so on.
9:5	SEL_DATA13	Select the Data bit 13 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 13, 0x1 = input data 1 is mapped to data bit 13, 0x2 = input data 2 is mapped to data bit 13 and so on.

VCAP_VCAP_VC_IN_CRTL3 (cont.)

Bits	Name	Description
4:0	SEL_DATA12	Select the Data bit 12 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 12, 0x1 = input data 1 is mapped to data bit 12, 0x2 = input data 2 is mapped to data bit 12 and so on.

0x05900814 VCAP_VCAP_VC_IN_CRTL4

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x2F6AD272

This register has the mux control for DATA18,DATA19,DATA20,DATA21,DATA22 and DATA23

VCAP_VCAP_VC_IN_CRTL4

Bits	Name	Description
31:30	UNUSED	
29:25	SEL_DATA23	Select the Data bit 23 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 23, 0x1 = input data 1 is mapped to data bit 23, 0x2 = input data 2 is mapped to data bit 23 and so on.
24:20	SEL_DATA22	Select the Data bit 22 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 22, 0x1 = input data 1 is mapped to data bit 22, 0x2 = input data 2 is mapped to data bit 22 and so on.
19:15	SEL_DATA21	Select the Data bit 21 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 21, 0x1 = input data 1 is mapped to data bit 21, 0x2 = input data 2 is mapped to data bit 21 and so on.
14:10	SEL_DATA20	Select the Data bit 20 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 20, 0x1 = input data 1 is mapped to data bit 20, 0x2 = input data 2 is mapped to data bit 20 and so on.
9:5	SEL_DATA19	Select the Data bit 19 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 19, 0x1 = input data 1 is mapped to data bit 19, 0x2 = input data 2 is mapped to data bit 19 and so on.
4:0	SEL_DATA18	Select the Data bit 18 from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to data bit 18, 0x1 = input data 1 is mapped to data bit 18, 0x2 = input data 2 is mapped to data bit 18 and so on.

0x05900818 VCAP_VCAP_VC_IN_CRTL5

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00006B38

This register had the mux control for VSYNC, HSYNC and DE

VCAP_VCAP_VC_IN_CRTL5

Bits	Name	Description
31:15	UNUSED	
14:10	SEL_DATA26	Select the HSYNC from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to HSYNC, 0x1 = input data 1 is mapped to HSYNC, 0x2 = input data 2 is mapped to HSYNC and so on.
9:5	SEL_DATA25	Select the VSYNC from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to VSYNC, 0x1 = input data 1 is mapped to VSYNC, 0x2 = input data 2 is mapped to VSYNC and so on.
4:0	SEL_DATA24	Select the DATA_ENABLE (DE) from incoming 27 bit bus. Entries from 0 - 27 are valid options for this field. 0x0= input data 0 is mapped to DE, 0x1 = input data 1 is mapped to DE, 0x2 = input data 2 is mapped to DE and so on.

0x0590081C VCAP_VCAP_VC_POL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to select the polarity for incoming hsync vsync and DE

VCAP_VCAP_VC_POL

Bits	Name	Description
31:9	UNUSED_1	
8	DE_POL	Data enable polarity, 0 = Active Hi, 1 = active lo
7:5	UNUSED_2	
4	HSYNC_POL	Hsync polarity, 0 = Active Hi, 1= active lo
3:1	UNUSED	
0	VSYNC_POL	Vsync polarity, 0 = Active Hi, 1= active lo

0x05900820 VCAP_VCAP_VC_V_H_TOTAL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to configure the Horizontal and vertical totals for the timing engine in the parser block. THis will be used to detect various errors specified in STATUS registers. These fields are programmed as per the timing spec of input resolution, either spec-ed in CEA or VESA spec

VCAP_VCAP_VC_V_H_TOTAL

Bits	Name	Description
31:28	UNUSED_1	
27:16	HTOTAL	Horizontal total for a given resolution. The unit for this field is in number of pixels for a given resolution
15:12	UNUSED_2	
11:0	VTOTAL	Vertical total for a given resolution. The unit for this field is in number of lines for a given resolution

0x05900824 VCAP_VCAP_VC_H_ACTIVE

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to configure the Horizontal active window in pixels for the timing engine in the parser block. THis will be used to detect various errors specified in STATUS registers. These fields are programmed as per the timing spec of input resolution, either spec-ed in CEA or VESA spec

VCAP_VCAP_VC_H_ACTIVE

Bits	Name	Description
31:28	UNUSED_1	
27:16	END	Horizontal active window end in pixels
15:12	UNUSED_2	
11:0	START	Horizontal active window start in pixels

0x05900828 VCAP_VCAP_VC_V_ACTIVE

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to configure the Vertical active window in lines for the timing engine in the parser block. This will be used to detect various errors specified in STATUS registers. These fields are programmed as per the timing spec of input resolution, either spec-ed in CEA or VESA spec

VCAP_VCAP_VC_V_ACTIVE

Bits	Name	Description
31:28	UNUSED_1	
27:16	END	Vertical active window end in lines
15:12	UNUSED_2	
11:0	START	Vertical active window start in lines

0x05900830 VCAP_VCAP_VC_V_ACTIVE_F2

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to configure the Vertical active window in lines for the timing engine in the parser block for interlace format. This will be used to detect various errors specified in STATUS registers. These fields are programmed as per the timing spec of input resolution, either spec-ed in CEA or VESA spec

VCAP_VCAP_VC_V_ACTIVE_F2

Bits	Name	Description
31:28	UNUSED_1	
27:16	END	Vertical active window end in lines for Field 2 of interlace format.
15:12	UNUSED_2	
11:0	START	Vertical active window start in lines for Field 2 of interlace format.

0x05900834 VCAP_VCAP_VC_VSYNC_VPOS

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to configure the Vertical position in lines of vsync. THis will be used by timing engine in the parser block to detect various errors specified in STATUS registers. These fields are programmed as per the timing spec of input resolution, either spec-ed in CEA or VESA spec

VCAP_VCAP_VC_VSYNC_VPOS

Bits	Name	Description
31:28	UNUSED_1	
27:16	END	Vertical end line of VSYNC
15:12	UNUSED_2	
11:0	START	Vertical start line of VSYNC

0x05900840 VCAP_VCAP_VC_HSYNC_HPOS

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to configure the horizontal position in pixels of hsync. This will be used by timing engine in the parser block to detect various errors specified in STATUS registers. These fields are programmed as per the timing spec of input resolution, either spec-ed in CEA or VESA spec

VCAP_VCAP_VC_HSYNC_HPOS

Bits	Name	Description
31:28	UNUSED_1	
27:16	END	Horizontal end pixel of HSYNC
15:12	UNUSED_2	
11:0	START	Horizontal start pixel of HSYNC

0x05900838 VCAP_VCAP_VC_VSYNC_F2_VPOS

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to configure the Vertical position in lines of vsync for Field 2 of interlace format. THis will be used by timing engine in the parser block to detect various errors specified in STATUS registers. These fields are programmed as per the timing spec of input resolution, either spec-ed in CEA or VESA spec

VCAP_VCAP_VC_VSYNC_F2_VPOS

Bits	Name	Description
31:28	UNUSED_1	
27:16	END	Vertical end line of VSYNC for Field 2 of interlace format.
15:12	UNUSED_2	
11:0	START	Vertical start line of VSYNC for Field 2 of interlace format.

0x0590083C VCAP_VCAP_VC_VSYNC_F2_HPOS

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to configure the Horizontal position in pixel of vsync for Field 2 of interlace format. THis will be used by timing engine in the parser block to detect various errors specified in STATUS registers. These fields are programmed as per the timing spec of input resolution, either spec-ed in CEA or VESA spec

VCAP_VCAP_VC_VSYNC_F2_HPOS

Bits	Name	Description
31:28	UNUSED_1	
27:16	END	Horizontal end pixel of VSYNC for Field 2 of interlace format.
15:12	UNUSED_2	
11:0	START	Horizontal start pixel of VSYNC for Field 2 of interlace format.

0x05900848 VCAP_VCAP_VC_BUF_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00007711

This register is used to program the maximum pending requests for Y and C

VCAP_VCAP_VC_BUF_CTRL

Bits	Name	Description
31:15	UNUSED_1	

VCAP_VCAP_VC_BUF_CTRL (cont.)

Bits	Name	Description
14:12	C_BURST_SIZE	C burst size. Max burst = 0x3. Burst programed to 0x0 is burst of 1. Burst programmed to 0x1 is burst of 2.Burst programed to 0x2 is burst of 3. Burst programed to 0x3 is burst of 4. Burst programmed to 0x7 is burst of 8. Only burst sizes of 1,2,3,4 and 8 are supported.
11	UNUSED_2	
10:8	Y_BURST_SIZE	Y burst size. Max burst = 0x7, Burst programed to 0x0 is burst of 1. Burst programmed to 0x1 is burst of 2.Burst programed to 0x2 is burst of 3. Burst programed to 0x3 is burst of 4. Burst Programmed to 0x7 is burst of 8. Only burst sizes of 1,2,3,4 and 8 are supported.
7:4	C_PENDING_REQ	Maximum Pending requests for C
3:0	Y_PENDING_REQ	Maximum Pending requests for Y

0x0590084C VCAP_VCAP_VC_Y_STRIDE

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the Stride for Y

VCAP_VCAP_VC_Y_STRIDE

Bits	Name	Description
31:15	UNUSED	
14:0	STRIDE	Stride for Y plane. Address calculation will be offset + line*stride.

0x05900850 VCAP_VCAP_VC_C_STRIDE

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the Stride for C

VCAP_VCAP_VC_C_STRIDE

Bits	Name	Description
31:15	UNUSED	
14:0	STRIDE	Stride for C plane. Address calculation will be offset + line*stride.

0x05900854 VCAP_VCAP_VC_Y_ADDR_1

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the first Y/RGB data buffer to be sent through VBIF to memory. This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_Y_ADDR_1

Bits	Name	Description
31:0	OFFSET	Starting address for first Y/RGB data buffer. This field is double buffered, the changes will be effective after the next vsync.

0x05900858 VCAP_VCAP_VC_C_ADDR_1

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the first C data buffer to be sent through VBIF to memory. This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_C_ADDR_1

Bits	Name	Description
31:0	OFFSET	Starting address for first C data. This field is double buffered, the changes will be effective after the next vsync.

0x0590085C VCAP_VCAP_VC_Y_ADDR_2

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the second Y/RGB data buffer to be sent through VBIF to memory. This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_Y_ADDR_2

Bits	Name	Description
31:0	OFFSET	Starting address for second Y/RGB data buffer. This field is double buffered, the changes will be effective after the next vsync.

0x05900860 VCAP_VCAP_VC_C_ADDR_2

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the second C data buffer to be sent through VBIF to memory. This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_C_ADDR_2

Bits	Name	Description
31:0	OFFSET	Starting address for second C data. This field is double buffered, the changes will be effective after the next vsync.

0x05900864 VCAP_VCAP_VC_Y_ADDR_3

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the third Y/RGB data buffer to be sent through VBIF to memory. This buffer is only used when BUF_EN bit of CTRL register is programmed to 3. This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_Y_ADDR_3

Bits	Name	Description
31:0	OFFSET	Starting address for third Y/RGB data buffer. This field is double buffered, the changes will be effective after the next vsync.

0x05900868 VCAP_VCAP_VC_C_ADDR_3

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the third C data buffer to be sent through VBIF to memory. This buffer is only used when BUF_THREE_EN bit of CTRL register is programmed to 3.This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_C_ADDR_3

Bits	Name	Description
31:0	OFFSET	Starting address for third C data. This field is double buffered, the changes will be effective after the next vsync.

0x0590086C VCAP_VCAP_VC_Y_ADDR_4

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the fourth Y/RGB data buffer to be sent through VBIF to memory. This buffer is only used when BUF_THREE_EN bit of CTRL register is programmed to 4.This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_Y_ADDR_4

Bits	Name	Description
31:0	OFFSET	Starting address for fourth Y/RGB data buffer. This field is double buffered, the changes will be effective after the next vsync.

0x05900870 VCAP_VCAP_VC_C_ADDR_4

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the fourth C data buffer to be sent through VBIF to memory. This buffer is only used when BUF_THREE_EN bit of CTRL register is programmed to 4.This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_C_ADDR_4

Bits	Name	Description
31:0	OFFSET	Starting address for fourth C data. This field is double buffered, the changes will be effective after the next vsync.

0x05900874 VCAP_VCAP_VC_Y_ADDR_5

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the fifth Y/RGB data buffer to be sent through VBIF to memory. This buffer is only used when BUF_THREE_EN bit of CTRL register is programmed to 5. This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_Y_ADDR_5

Bits	Name	Description
31:0	OFFSET	Starting address for fifth Y/RGB data buffer. This field is double buffered, the changes will be effective after the next vsync.

0x05900878 VCAP_VCAP_VC_C_ADDR_5

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the fifth C data buffer to be sent through VBIF to memory. This buffer is only used when BUF_THREE_EN bit of CTRL reigster is programmed to 5.This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_C_ADDR_5

Bits	Name	Description
31:0	OFFSET	Starting address for fifth C data. This field is double buffered, the changes will be effective after the next vsync.

0x0590087C VCAP_VCAP_VC_Y_ADDR_6

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the sixth Y/RGB data buffer to be sent through VBIF to memory. This buffer is only used when BUF_THREE_EN bit of CTRL reigster is programmed to 6. This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_Y_ADDR_6

Bits	Name	Description
31:0	OFFSET	Starting address for sixth Y/RGB data buffer. This field is double buffered, the changes will be effective after the next vsync.

0x05900880 VCAP_VCAP_VC_C_ADDR_6

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the start address of the sixth C data buffer to be sent through VBIF to memory. This buffer is only used when BUF_THREE_EN bit of CTRL reigster is programmed to 6.This is 128 bits aligned i.e., last 4 bits will be zero-ed out

VCAP_VCAP_VC_C_ADDR_6

Bits	Name	Description
31:0	OFFSET	Starting address for sixth C data. This field is double buffered, the changes will be effective after the next vsync.

0x05900884 VCAP_VCAP_VC_INT_MASK

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Interrupt Control

VCAP_VCAP_VC_INT_MASK

Bits	Name	Description
31:13	UNUSED_1	
12	VSYNC_SEQ_ERR_MASK	This field is used to mask the VSYNC_SEQ_ERR_INT interrupt
11	NPL_OVERFLOW_MASK	This field is used to mask the NPL_OVERFLOW_INT interrupt which reflects the interrupt for NPL fifo overflow
10	LBUF_OVERFLOW_MASK	This field is used to mask the BUF_ERROR_INT in STATUS register
9	PARSER_ERR_MASK	This field is used to mask the parser error interrupt.
8:7	UNUSED_2	
6	BUF6_WRITTEN_MASK	This field is used to mask the buffer 6 written indication interrupt
5	BUF5_WRITTEN_MASK	This field is used to mask the buffer 5 written indication interrupt
4	BUF4_WRITTEN_MASK	This field is used to mask the buffer 4 written indication interrupt
3	BUF3_WRITTEN_MASK	This field is used to mask the buffer 3 written indication interrupt
2	BUF2_WRITTEN_MASK	This field is used to mask the buffer 2 written indication interrupt
1	BUF1_WRITTEN_MASK	This field is used to mask the buffer 1 written indication interrupt
0	VSYNC_INT_MASK	This field is used to mask the VSYNC_INT interrupt

0x05900888 VCAP_VCAP_VC_INT_CLEAR

Type: Write
Clock: UNDEFINED
Reset State: 0x00000000

Interrupt Control

VCAP_VCAP_VC_INT_CLEAR

Bits	Name	Description
31:13	UNUSED_1	
12	VSYNC_SEQ_ERR_ACK	WRITE ONLY This field is used to clear the VSYNC_SEQ_ERR_INT in status register.
11	NPL_OVERLFOW_ACK	WRITE ONLY This field is used to clear the NPL_OVERFLOW_INT in status register.
10	LBUF_OVERFLOW_ACK	WRITE ONLY This field is used to clear the BUF_ERROR_INT status in STATUS register
9	PARSER_ERR_ACK	WRITE ONLY This field is used to clear the PARSER_ERR_INT in status register which reflects error while parsing, AKA, Vsync/Line/Pixel error
8:7	UNUSED_2	
6	BUF6_WRITTEN_ACK	WRITE ONLY This field is used to clear the Buffer 6 written interrupt status. Acknowledging will indicate the SW has picked up the buffer 6
5	BUF5_WRITTEN_ACK	WRITE ONLY This field is used to clear the Buffer 5 written interrupt status. Acknowledging will indicate the SW has picked up the buffer 5
4	BUF4_WRITTEN_ACK	WRITE ONLY This field is used to clear the Buffer 4 written interrupt status. Acknowledging will also indicate the SW has picked up the buffer 4
3	BUF3_WRITTEN_ACK	WRITE ONLY This field is used to clear the Buffer 3 written interrupt status. Acknowledging will indicate the SW has picked up the buffer 3
2	BUF2_WRITTEN_ACK	WRITE ONLY This field is used to clear the Buffer 2 written interrupt status. Acknowledging will indicate the SW has picked up the buffer 2
1	BUF1_WRITTEN_ACK	WRITE ONLY This field is used to clear the Buffer 1 written interrupt status. Acknowledging will also indicate the SW has picked up the buffer 1
0	VSYNC_INT_ACK	WRITE ONLY This field is used to clear the vsync interrupt status

0x0590088C VCAP_VCAP_VC_STATUS

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to read various error conditions and interrupts

VCAP_VCAP_VC_STATUS

Bits	Name	Description
31	PIXEL_ERROR	READ ONLY This is read only field, Value of 1 indicated that the pixel error has occurred meaning the captured active horizontal window is not as per the parameters programmed in VCAP_VC_H_ACTIVE register
30	LINE_ERROR	READ ONLY This is read only field, Value of 1 indicates that the line error has occurred meaning, the captured active vertical window is not as per the parameters programed in VCAP_VC_V_ACTIVE register
29	VSYNC_ERROR	READ ONLY This is read only field, Value of 1 indicates that either VSYNC is not captured in the expected line/time, or it is not captured at all when expected
28:13	UNUSED_1	
12	VSYNC_SEQ_ERR_INT	READ ONLY This interrupt indicates that the Vsync happened before the frame done interrupt
11	NPL_OVERFLOW_INT	READ ONLY This interrupt indicates that fifo in the VCAP_NPL module has overflowed.
10	LBUF_OVERFLOW_INT	READ ONLY This interrupt indicates that the latency buffer is overflowed. In this scenario, The whole engine needs to be soft reset.
9	PARSER_ERR_INT	READ ONLY This interrupt indicates that there is an error encountered by capturing the incoming frame data. Parser error interrupt reflects either, Vsync error i.e., Vsync not capture in expected line/time, Pixel error i.e., active line captured is not as per the active line width programmed, line error i.e., Total number of active lines captured are not as per the number of active lines programmed, Fields VSYNC_ERROR, LINE_ERROR and PIXEL_ERROR of STATUS_1 register will indicate which type of error happened.
8:7	UNUSED_2	

VCAP_VCAP_VC_STATUS (cont.)

Bits	Name	Description
6	BUF6_WRITTEN_INT	READ ONLY This interrupt indicates that Buffer 3 with starting address programmed in Y_ADDR_6/C_ADDR_6 registers has been written in the memory and is ready to be picked up. Software will clear this interrupt by writing 1 to BUF6_WRITTEN_ACK field in INT_CLEAR register. If this interrupt is not cleared hardware will conclude that the buffer is not picked up by software. It will then either overwrite the present buffer or drop the currently captured frame depending on the mode programmed in FRAME_OVERWRITE_EN field on CTRL register.
5	BUF5_WRITTEN_INT	READ ONLY This interrupt indicates that Buffer 2 with starting address programmed in Y_ADDR_5/C_ADDR_5 registers has been written in the memory and is ready to be picked up. Software will clear this interrupt by writing 1 to BUF5_WRITTEN_ACK field in INT_CLEAR register. If this interrupt is not cleared hardware will conclude that the buffer is not picked up by software. It will then either overwrite the present buffer or drop the currently captured frame depending on the mode programmed in FRAME_OVERWRITE_EN field on CTRL register.
4	BUF4_WRITTEN_INT	READ ONLY This interrupt indicates that Buffer 1 with starting address programmed in Y_ADDR_4/C_ADDR_4 registers has been written in the memory and is ready to be picked up. Software will clear this interrupt by writing 1 to BUF4_WRITTEN_ACK field in INT_CLEAR register. If this interrupt is not cleared hardware will conclude that the buffer is not picked up by software. It will then either overwrite the present buffer or drop the currently captured frame depending on the mode programmed in FRAME_OVERWRITE_EN field on CTRL register.
3	BUF3_WRITTEN_INT	READ ONLY This interrupt indicates that Buffer 3 with starting address programmed in Y_ADDR_3/C_ADDR_3 registers has been written in the memory and is ready to be picked up. Software will clear this interrupt by writing 1 to BUF3_WRITTEN_ACK field in INT_CTRL register. If this interrupt is not cleared hardware will conclude that the buffer is not picked up by software. It will then either overwrite the present buffer or drop the currently captured frame depending on the mode programmed in FRAME_OVERWRITE_EN field on CTRL register.
2	BUF2_WRITTEN_INT	READ ONLY This interrupt indicates that Buffer 2 with starting address programmed in Y_ADDR_2/C_ADDR_2 registers has been written in the memory and is ready to be picked up. Software will clear this interrupt by writing 1 to BUF2_WRITTEN_ACK field in INT_CTRL register. If this interrupt is not cleared hardware will conclude that the buffer is not picked up by software. It will then either overwrite the present buffer or drop the currently captured frame depending on the mode programmed in FRAME_OVERWRITE_EN field on CTRL register.

VCAP_VCAP_VC_STATUS (cont.)

Bits	Name	Description
1	BUF1_WRITTEN_INT	READ ONLY This interrupt indicates that Buffer 1 with starting address programmed in Y_ADDR_1/C_ADDR_1 registers has been written in the memory and is ready to be picked up. Software will clear this interrupt by writing 1 to BUF1_WRITTEN_ACK field in INT_CTRL register. If this interrupt is not cleared hardware will conclude that the buffer is not picked up by software. It will then either overwrite the present buffer or drop the currently captured frame depending on the mode programmed in FRAME_OVERWRITE_EN field on CTRL register.
0	VSYNC_INT	READ ONLY This interrupt indicates that the vsync is captured in the incoming stream of data from external HDMI receiver part. This interrupt is frame based, i.e., in case of interlace or progressive inputs it will indicate every frame captured.

0x05900890 VCAP_VCAP_VC_BIST_CTRL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to configure the bist for vcap_vc

VCAP_VCAP_VC_BIST_CTRL

Bits	Name	Description
31:16	UNUSED_1	
15:8	PAT_SEL	Pattern select for bist. 0x0=All Black color, 0x1= pattern from BPAT field of VCAP_VC_BIST_PATTERN register is selected, 0x2= Ramp, 0x3= All White, 0x4 = color bar pattern
7:1	UNUSED_2	
0	BIST_EN	This field enables the bist circuit. 0=disable, 1= enable

0x05900894 VCAP_VCAP_VC_BIST_PATTERN

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the bist pattern

VCAP_VCAP_VC_BIST_PATTERN

Bits	Name	Description
31:24	UNUSED	
23:0	BPAT	This field is used to program the pattern to be sent out when bist is enabled. THis pattern will go out when PAT_SEL field of BIST_CTRL register is programmed to 0x1

0x05900898 VCAP_VCAP_VC_VSYNC_ERROR_WIN

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the VSYNC window error detection for Progressive formats and Field 1 of interlace formats

VCAP_VCAP_VC_VSYNC_ERROR_WIN

Bits	Name	Description
31:28	UNUSED_1	
27:16	VSYNC_ERR_END	End line of the Vsync window error detection
15:12	UNUSED_2	
11:0	VSYNC_ERR_START	Start line of the Vsync window error detection

0x0590089C VCAP_VCAP_VC_VSYNC_F2_ERROR_WIN

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used to program the VSYNC window error detection for field 2 of interlace formats

VCAP_VCAP_VC_VSYNC_F2_ERROR_WIN

Bits	Name	Description
31:28	UNUSED_1	
27:16	VSYNC_ERR_END	End line of the Vsync window error detection
15:12	UNUSED_2	
11:0	VSYNC_ERR_START	Start line of the Vsync window error detection

0x059008A0 VCAP_VCAP_VC_VC_DEBUG

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

This register is used for debug purposes

VCAP_VCAP_VC_VC_DEBUG

Bits	Name	Description
31:0	DEBUG	Debug field for VCAP_VC

14.19.3 VBIF core Register Set

VBIF core Control Registers

0x05900C00 VCAP_VCAP_VBIF_VERSION

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

Hardware version of the VBIF core which is embedded in this core.

VCAP_VCAP_VBIF_VERSION

Bits	Name	Description
31:16	UNUSED	
15:0	VBIF_VERSION	READ ONLY Hardware version of the VBIF core which is embedded in this core. Read-only field.

0x05900CB0 VCAP_VCAP_VBIF_IN_RD_LIM_CONF0

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00001010

The maximum number of pending reads from each Client is programmable.

VCAP_VCAP_VBIF_IN_RD_LIM_CONF0

Bits	Name	Description
31:16	UNUSED	
15:8	IN_RD_LIM_C1	The maximum number of pending reads from Client 1. Must be <= the HW parameter that XBAR_IN_RD_LIM
7:0	IN_RD_LIM_C0	The maximum number of pending reads from Client 0. Must be <= the HW parameter that XBAR_IN_RD_LIM

0x05900CC0 VCAP_VCAP_VBIF_IN_WR_LIM_CONF0

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00001010

The maximum number of pending writes from each Client is programmable.

VCAP_VCAP_VBIF_IN_WR_LIM_CONF0

Bits	Name	Description
31:16	UNUSED	
15:8	IN_WR_LIM_C1	The maximum number of pending writes from Client 1. Must be <= the HW parameter that XBAR_IN_WR_LIM
7:0	IN_WR_LIM_C0	The maximum number of pending writes from Client 0. Must be <= the HW parameter that XBAR_IN_WR_LIM

0x05900CD0 VCAP_VCAP_VBIF_OUT_RD_LIM_CONF0

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000010

The maximum number of pending reads from each AXI is programmable.

VCAP_VCAP_VBIF_OUT_RD_LIM_CONF0

Bits	Name	Description
31:8	UNUSED	
7:0	OUT_RD_LIM_A0	The maximum number of pending reads from AXI 0. Must be <= the HW parameter that XBAR_OUT_RD_LIM

0x05900CD4 VCAP_VCAP_VBIF_OUT_WR_LIM_CONF0

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000010

The maximum number of pending reads from each AXI is programmable.

VCAP_VCAP_VBIF_OUT_WR_LIM_CONF0

Bits	Name	Description
31:8	UNUSED	
7:0	OUT_WR_LIM_A0	The maximum number of pending writes from AXI 0. Must be <= the HW parameter that XBAR_OUT_WR_LIM

0x05900CD8 VCAP_VCAP_VBIF_DDR_OUT_MAX_BURST

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000707

The maximum burst length from any DDR AXI is programmable.

The client bursts will be broken up according to these limits, although the client will not be aware of it.

VCAP_VCAP_VBIF_DDR_OUT_MAX_BURST

Bits	Name	Description
31:16	UNUSED	
15:8	DDR_OUT_MAX_WR_BURST	The maximum number of write beats minus 1 allowed on the AXI bus (arbiter outputs). Must be < the HW parameter that XBAR_OUT_WR_BURST
7:0	DDR_OUT_MAX_RD_BURST	The maximum number of read beats minus 1 allowed on the AXI bus (arbiter outputs). Must be < the HW parameter that XBAR_OUT_RD_BURST

0x05900CE0 VCAP_VCAP_VBIF_ISO_SYNC

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Enables iso-sync operation between client and arbiter, 1-bit per client. Client & AXI clocks must be iso-sync and have balanced clock trees.

VCAP_VCAP_VBIF_ISO_SYNC

Bits	Name	Description
31:2	UNUSED	
1	ISO_SYNC_C1	Enables for Client 1 0x0: Disable 0x1: Enable
0	ISO_SYNC_C0	Enables for Client 0 0x0: Disable 0x1: Enable

0x05900CF0 VCAP_VCAP_VBIF_ARB_CTL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000001

Each arbiter can be programmed to utilize fixed priority, slave-aware or Round-Robin arbitration

VCAP_VCAP_VBIF_ARB_CTL

Bits	Name	Description
31:5	UNUSED_1	
4	ROUND_ROBIN_ARB_EN_A0	Enables Round-Robin arbitration for AXI port 0. If enabled, Slave-Aware and Longest-Time-Waiting arbitrations are ignored. 0x0: Disable 0x1: Enable
3:1	UNUSED_2	
0	FIXED_ARB_EN_A0	Enables fixed priority arbitration for AXI port 0. If enabled, the other arbitrations are ignored 0x0: Disable 0x1: Enable

0x05900CF4 VCAP_VCAP_VBIF_DDR_ARB_CONF0

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Client limits for DDR AXI, 5 bits per client.

Each client limit is the maximum number of consecutive grants minus 1 to give that client before allowing requests from other clients.

This is used for slave-aware, round-robin and longest-time-waiting arbitration, but not fixed priority arbitration.

VCAP_VCAP_VBIF_DDR_ARB_CONF0

Bits	Name	Description
31:10	UNUSED	
9:5	DDR_CLIENT_LIM_C1	Client limits for Client 1
4:0	DDR_CLIENT_LIM_C0	Client limits for Client 0

0x05900D00 VCAP_VCAP_VBIF_FIXED_ARB_CONF0

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000010

A list of Client number for Fixed arbitration

The highest priority client number on highest number of register name.

For example, If total number of clients is 12, and client2 has highest priority

should be wirte 2 into FIXED_ARB_LIST_11. and ignore LIST_12	15. Bits	
31:8	UNUSED	
7:4	FIXED_ARB_LIST_1	A list of Client number for Fixed arbitration
3:0	FIXED_ARB_LIST_0	A list of Client number for Fixed arbitration

VCAP_VCAP_VBIF_FIXED_ARB_CONF0

Bits	Name	Description

0x05900D60 VCAP_VCAP_VBIF_OUT_AXI_AMEMTYPE_CONF0

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000022

When a request is finally granted, this AXI signal is controlled on a per-client basis.

This is driven to AXI port but does not directly impact VBIF functionality.

VCAP_VCAP_VBIF_OUT_AXI_AMEMTYPE_CONF0

Bits	Name	Description
31:7	UNUSED_1	
6:4	AXI_AMEMTYPE_C1	AMEMTYPE signal for Client 1
3	UNUSED_2	
2:0	AXI_AMEMTYPE_C0	AMEMTYPE signal for Client 0

0x05900D68 VCAP_VCAP_VBIF_OUT_AXI_APROTNS

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000003

When a request is finally granted, this AXI signal is controlled on a per-client basis.

This is driven to AXI port but does not directly impact VBIF functionality.

VCAP_VCAP_VBIF_OUT_AXI_APROTNS

Bits	Name	Description
31:2	UNUSED	
1	AXI_APROTNS_C1	APROTNS signal for Client 1
0	AXI_APROTNS_C0	APROTNS signal for Client 0

0x05900D6C VCAP_VCAP_VBIF_OUT_AXI_AINST

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

When a request is finally granted, this AXI signal is controlled on a per-client basis.

This is driven to AXI port but does not directly impact VBIF functionality.

VCAP_VCAP_VBIF_OUT_AXI_AINST

Bits	Name	Description
31:2	UNUSED	
1	AXI_AINST_C1	AINST signal for Client 1

VCAP_VCAP_VBIF_OUT_AXI_AINST (cont.)

Bits	Name	Description
0	AXI_AINST_C0	AINST signal for Client 0

0x05900D70 VCAP_VCAP_VBIF_OUT_AXI_ASHARED

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

When a request is finally granted, this AXI signal is controlled on a per-client basis.

This is driven to AXI port but does not directly impact VBIF functionality.

VCAP_VCAP_VBIF_OUT_AXI_ASHARED

Bits	Name	Description
31:2	UNUSED	
1	AXI_ASHARED_C1	ASHARED signal for Client 1
0	AXI_ASHARED_C0	ASHARED signal for Client 0

0x05900D74 VCAP_VCAP_VBIF_OUT_AXI_AINNERSHARED

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

When a request is finally granted, this AXI signal is controlled on a per-client basis.

This is driven to AXI port but does not directly impact VBIF functionality.

VCAP_VCAP_VBIF_OUT_AXI_AINNERSHARED

Bits	Name	Description
31:2	UNUSED	
1	AXI_AINNERSHARED_C1	AINNERSHARED signal for Client 1
0	AXI_AINNERSHARED_C0	AINNERSHARED signal for Client 0

0x05900D78 VCAP_VCAP_VBIF_OUT_AXI_AOOO_EN

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Enable signal for controlling AOOOWR/AOOORD signals on AXI protocol, this signal is controlled on a per-client basis.

Actually, AOOOWR/RD signals are controlled by parent core (via client I/F port) dynamically.

But, it can be controlled by SW for performance test, debugging, etc

If enable this register, ignore Cooo value of client port and SW value applies to AOOO signal.

VCAP_VCAP_VBIF_OUT_AXI_AOOO_EN

Bits	Name	Description
31:2	UNUSED	
1	AXI_AOOO_EN_C1	SW AOOOAOOO_EN signal for Client 1
0	AXI_AOOO_EN_C0	SW AOOO enable signal for Client 0

0x05900D7C VCAP_VCAP_VBIF_OUT_AXI_AOOO

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

When a request is finally granted and AXI_AOOO_EN is enabled, this AXI signal is controlled on a per-client basis.

If AXI_AOOO_EN is disable, ignore this value.

VCAP_VCAP_VBIF_OUT_AXI_AOOO

Bits	Name	Description
31:18	UNUSED_1	
17	AXI_AOOORD_C1	AOOORD signal for Client 1 if AXI_AOOO_EN_C1
16	AXI_AOOORD_C0	AOOORD signal for Client 0 if AXI_AOOO_EN_C0
15:2	UNUSED_2	
1	AXI_AOOOWR_C1	AOOOWR signal for Client 1 if AXI_AOOO_EN_C1
0	AXI_AOOOWR_C0	AOOOWR signal for Client 0 if AXI_AOOO_EN_C0

0x05900D80 VCAP_VCAP_VBIF_OUT_AXI_ANOALLOCATE

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

When a request is finally granted, this AXI signal is controlled on a per-client basis.

This is driven to AXI port but does not directly impact VBIF functionality.

VCAP_VCAP_VBIF_OUT_AXI_ANOALLOCATE

Bits	Name	Description
31:2	UNUSED	
1	AXI_ANOALLOCATE_C1	ANOALLOCATE signal for Client 1
0	AXI_ANOALLOCATE_C0	ANOALLOCATE signal for Client 0

0x05900D84 VCAP_VCAP_VBIF_WD_TIMEOUT

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Write Data Timeout function. enable bit per Client.

Each Client block generate a interrupt when write data timeout with enabled.

VCAP_VCAP_VBIF_WD_TIMEOUT

Bits	Name	Description
31:20	UNUSED_1	
19:16	WD_TIMEOUT_LOG2	This field (shared by all Clients) contains log2(write data timeout), i.e., the bit number of the timeout counter which, when 1, will trigger the timeout. For example, 15 here means the timeout is 32768 AXI clock cycles. This field is ignored when AXI_WD_TIMEOUT_EN=0
15:2	UNUSED_2	
1	WD_TIMEOUT_EN_C1	Write Data Timeout enable for Client 1
0	WD_TIMEOUT_EN_C0	Write Data Timeout enable for Client 0

0x05900D90 VCAP_VCAP_VBIF_PND_ERR

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

Pending error status. per client

When error is happened and not masked, this register is set to 1.

But masked, not appear in this register.

VCAP_VCAP_VBIF_PND_ERR

Bits	Name	Description
31:2	UNUSED	
1	CLIENT_PND_ERR_C1	READ ONLY Indicates than an error in Client 1 occurred since the last reset or ERR_CLR was set.
0	CLIENT_PND_ERR_C0	READ ONLY Indicates than an error in Client 0 occurred since the last reset or ERR_CLR was set.

0x05900D94 VCAP_VCAP_VBIF_SRC_ERR

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

Source error status. per client

When error is happened, this register is set to 1 even if masked.

VCAP_VCAP_VBIF_SRC_ERR

Bits	Name	Description
31:2	UNUSED	
1	CLIENT_SRC_ERR_C1	READ ONLY Indicates than an error in Client 1 occurred since the last reset or ERR_CLR was set.
0	CLIENT_SRC_ERR_C0	READ ONLY Indicates than an error in Client 0 occurred since the last reset or ERR_CLR was set.

0x05900D98 VCAP_VCAP_VBIF_ERR_MASK

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Error Mask. per client.

When this mask register is set to 1, error is not propagated to Interrupt signal port.

But, can check the error within SRC_ERR register and ERR_INFO register.

VCAP_VCAP_VBIF_ERR_MASK

Bits	Name	Description
31:2	UNUSED	
1	CLIENT_ERR_MASK_C1	Error mask for Client 1
0	CLIENT_ERR_MASK_C0	Error mask for Client 0

0x05900D9C VCAP_VCAP_VBIF_ERR_CLR

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Error clear (interrupt clear). per client

After Client error has been captured, this field should be written to 1 in order to clear the previous error and enable future errors to be captured.

NOT need to write to 0, This field will be changed to 0 automatically when error is cleared.

VCAP_VCAP_VBIF_ERR_CLR

Bits	Name	Description
31:2	UNUSED	
1	CLIENT_ERR_CLR_C1	Error Clear for Client 1
0	CLIENT_ERR_CLR_C0	Error Clear for Client 0

0x05900DA0 VCAP_VCAP_VBIF_ERR_INFO

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

Error informations. only the first error is captured. The error must be cleared to enable future errors to be captured.

VCAP_VCAP_VBIF_ERR_INFO

Bits	Name	Description
31:24	UNUSED	
23:16	CLIENT_TID	READ ONLY The value on Client TID when the last error occurred.
15:8	CLIENT_MID	READ ONLY The value on Client MID when the last error occurred.
7:6	AXI_RESP	READ ONLY The value of AXI_RRSP or AXI_BRSP when the last error occurred.
5:4	ERR_TYPE	READ ONLY The type of the last error. Read only 0x0: axi_rresp 0x1: axi_bresp 0x2: WD_timeout 0x3: MMU_translation
3:0	CLIENT_SEL	select number of Client to can read follow error info. (type, resp, mid and tid) For example, if this field is 3, can read error information about Client 3 error.

0x05900DB0 VCAP_VCAP_VBIF_AXI_TEST_CTL

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

AXI test bus control

VCAP_VCAP_VBIF_AXI_TEST_CTL

Bits	Name	Description
31:21	UNUSED_1	
20	AXI_RD_LAT_REP_EN_A0	when enabled, each beat of read data is replaced with the read access latency - number of AXI cycles from axi_avalid=1 till read data returned with axi_rvalid=1
19:17	UNUSED_2	
16	AXI_MISR_RES_A0	Reset MISR for AXI 0. Need to write 1 and then write 0. Make sure it is high for at least one axi clock rising edge.

VCAP_VCAP_VBIF_AXI_TEST_CTL (cont.)

Bits	Name	Description
15:13	UNUSED_3	
12	AXI_MISR_EN_A0	Enable MISR for AXI 0
11:9	UNUSED_4	
8	AXI_MISR_WD_A0	Select MISR input for AXI 0. - 0 - read data, 1 - write data
7	AXI_CTR_EN	Enable all profiling counters
6	AXI_CTR_RES	Reset all profiling counters (they are also reset by AXI_RESET). Make sure it is high for at least one axi_clk rising edge.
5:4	AXI_TEST_ARB_SEL	Select which AXI to drive AXI_TEST_OUT
3:0	AXI_TEST_OUT_SEL	Select which test data is read via AXI_TEST_OUT

0x05900DB4 VCAP_VCAP_VBIF_AXI_TEST_OUT

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

Test bus

VCAP_VCAP_VBIF_AXI_TEST_OUT

Bits	Name	Description
31:0	AXI_TEST_OUT_BUS	READ ONLY The output selected by the TEST_OUT_SEL and TEST_ARB_SEL fields in the AXI_TEST_CTL reg. This is independent of the test bus, which is not accessible by SW unless other SW registers are created for that purpose.

14.20 VCAP SMMU Registers (0x07200000 SMMU_VCAP_BASE)

This section contains the VCAP SMMU registers.

14.20.1 SMMU Global Registers

14.20.1.1 SMMU VMID/CBNDX mapping registers

0x072FF000+ 0x4*n VCAP_SMMU_VCAP_M2VCBRn, n=[0..15]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

VCAP_SMMU_VCAP_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

VCAP_SMMU_VCAP_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

VCAP_SMMU_VCAP_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.20.1.2 SMMU context bank access control registers

0x072FF800+ 0x4*n VCAP_SMMU_VCAP_CBACRn, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

VCAP_SMMU_VCAP_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.20.1.3 SMMU TLB software access registers

0x072FFE00 VCAP_SMMU_VCAP_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

VCAP_SMMU_VCAP_TLBRSW

Bits	Name	Description
31:10	RESERVED	

VCAP_SMMU_VCAP_TLBRSW (cont.)

Bits	Name	Description
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB
7:0	INDEX	TLB index to be read.

0x072FFE80 VCAP_SMMU_VCAP_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

VCAP_SMMU_VCAP_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

VCAP_SMMU_VCAP_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

VCAP_SMMU_VCAP_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
1	PW	(privileged write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
0	PR	(privileged read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

0x072FFE84 VCAP_SMMU_VCAP_TLBTR1

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

VCAP_SMMU_VCAP_TLBTR1

Bits	Name	Description
31:12	PA	Physical address [31:12] field of the TLB entry
11:5	RESERVED	
4:0	VMID	VMID [4:0]field of the TLB entry)

0x072FFE88 VCAP_SMMU_VCAP_TLBTR2

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

VCAP_SMMU_VCAP_TLBTR2

Bits	Name	Description
31:12	VA	virtual address field [31:12] of the TLB entry
11	RESERVED	
10	NG	(not global field from page table entry) Indicates whether the page is private to the specified ASID (NG=1) or global to all ASIDs within the VMID using this context bank (NG=0)
9	NSTID	(non-secure tag ID field of the TLB entry) Indicates whether the TLB entry belongs to the secure world (NSTID=0) or the non-secure world (NSTID=1) This field is comned against the incoming NS-prot attribute of the master request as part of TLB hit/miss determination
8	V	valid field of the TLB entry
7:0	ASID	ASID[7:0] field of the TLB entry

0x072FFE8C VCAP_SMMU_VCAP_TESTBUSCR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

Governs which signals (if any) from the system SMMU core or wrapper design hierarchy are sent out to the system via a testbus for diagnostic, and also to the system profiling and diagnostic monitor (SPDM).

VCAP_SMMU_VCAP_TESTBUSCR

Bits	Name	Description
31:28	SPDM3SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[3]
27:24	SPDM2SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[2]
23:20	SPDM1SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[1]
19:16	SPDM0SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[0]
15:14	TBHSEL	Testbus highselect It governs which set of signals are to testbus[31:16] TBSLSEL = 0b00 - Bits 15:0 from nuleus bus TBSLSEL = 0b01 - Bits 31:16 from nuleus bus TBSLSEL = 0b10 - Bits 15:0 from wrapper group selected by SMMU_TESTBUSCR[WGSEL] TBSLSEL = 0b11 - Bits 31:16 from wrapper group selected by SMMU_TESTBUSCR[WGSEL

VCAP_SMMU_VCAP_TESTBUSCR (cont.)

Bits	Name	Description

9:8	WGSEL	Wrapper group select It selects a particular group of signals from the SMMU wrapper hierarchy WGSEL = 0b00 - wrapper signal group 0 WGSEL = 0b01 - wrapper signal group 1 WGSEL = 0b10 - wrapper signal group 2 WGSEL = 0b11 - reserved
7:2	RESERVED_1	
1	SPDMBE	SPDM test enable Reset state : 0
0	TBE	Testbus enable, which governs whether the testbus is driven with all 0s or with the configured signals Reset state : 0

0x072FFEFC VCAP_SMMU_VCAP_VR0

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: 32'h0000_0000

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

VCAP_SMMU_VCAP_VR0

Bits	Name	Description
31:3	RESERVED	

VCAP_SMMU_VCAP_VR0 (cont.)

Bits	Name	Description
2	DCPPT	Disable client pipelining for client operations in pass-through mode Reset state : 0
1	DCPBP	Disable client pipelining for client operations in bypass mode Reset state : 0
0	DCP	Disable client pipelining Reset state : 0

0x072FFF00 VCAP_SMMU_VCAP_TLBIALL

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries.

VCAP_SMMU_VCAP_TLBIALL

Bits	Name	Description
31:0	EXEC	Writing any value to this register invalidates all TLB entries, as specified by the contents of SMMU_CR[TLBIALLCFG]

0x072FFF04 VCAP_SMMU_VCAP_TLBIVMID

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries matching the IVMID value. Precise function is governed by SMMU_CR[TLBIALLCFG].

VCAP_SMMU_VCAP_TLBIVMID

Bits	Name	Description
31:5	RESERVED	
4:0	IVMID	Designates VMID[4:0] value of entries to be invalidated.

14.20.1.4 SMMU configuration registers

0x072FFF80 VCAP_SMMU_VCAP_CR

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

VCAP_SMMU_VCAP_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management among multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1

VCAP_SMMU_VCAP_CR (cont.)

Bits	Name	Description
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.20.1.5 SMMU error report registers

0x072FFF84 VCAP_SMMU_VCAP_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

VCAP_SMMU_VCAP_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x072FFF88 VCAP_SMMU_VCAP_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

VCAP_SMMU_VCAP_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR, SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x072FFF8C VCAP_SMMU_VCAP_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

VCAP_SMMU_VCAP_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR, SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	

VCAP_SMMU_VCAP_ESRRESTORE (cont.)

Bits	Name	Description
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x072FFF90 VCAP_SMMU_VCAP_ESYNR0

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

VCAP_SMMU_VCAP_ESYNR0

0x072FFFF8 VCAP_SMMU_VCAP_IDR

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper

VCAP_SMMU_VCAP_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x072FFFFC VCAP_SMMU_VCAP_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

VCAP_SMMU_VCAP_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.20.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.20.2.1 SMMU context bank control registers

0x07200000+0x1000*n VCAP_SMMU_VCAP_CBn_SCTLR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

VCAP_SMMU_VCAP_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.

VCAP_SMMU_VCAP_CBn_SCTLR (cont.)

Bits	Name	Description
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determine access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07200004+ 0x1000*n VCAP_SMMU_VCAP_CBn_ACTLR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

VCAP_SMMU_VCAP_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved

VCAP_SMMU_VCAP_CBn_ACTLR (cont.)

Bits	Name	Description
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

VCAP_SMMU_VCAP_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

VCAP_SMMU_VCAP_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

0x07200008+ 0x1000*n VCAP_SMMU_VCAP_CBn_CONTEXTIDR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context ID register holds the ASID associated with this context bank

VCAP_SMMU_VCAP_CBn_CONTEXTIDR

Bits	Name	Description
31:8	RESERVED	
7:0	ASID	Specifies the 8 bit ASID value assigned to this context bank. The ASID can be included in the key comparison of TLB entries. .

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table control register, which specifies the size of the virtual address space that uses TTBR0.

VCAP_SMMU_VCAP_CBn_TTBCR

Bits	Name	Description
31:6	RESERVED_2	
5	PD1	Page disable 1; if this bit is set, hardware table walks attempting to use TTBR1will result in a first level descriptor translation fault. If clear, TTBR1 contents are used.
4	PD0	Page disable 0; if this bit is set, hardware table walks attempting to use TTBR0 will result in a first level descriptor translation fault. If clear, TTBR0 contents are used.
3	RESERVED_1	
2:0	N	N[2:0] specifies the number of upper order virtual address bits which must be 0 in order for translations to use the table pointed to by TTBR0. If any of these bits are non-zero, TTBR1 is used for the lookup. If N is 0, only TTBR0 is used.

0x0720001C+ 0x1000*n VCAP_SMMU_VCAP_CBn_PAR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

The physical address register captures the physical address value resulting from the execution of a VA-to-PA command

Field definitions vary according to whether or not there is a context fault associated with the requested translation

VCAP_SMMU_VCAP_CBn_PAR

Bits	Name	Description
31:12	PAR_FAULT_INFO_312	
11	RESERVED_2	
10:9	PAR_FAULT_INFO_72	
8	RESERVED_1	
7:1	PAR_FAULT_INFO_71	Encoding varies according to value in FAULT field.
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07200020+0x1000*n VCAP_SMMU_VCAP_CBn_FSR, n=[0..2]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

VCAP_SMMU_VCAP_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"
30	SS	(stalled status) Indicates whether or not the System MMU is currently stalled due to an exception within this context bank SMMU_CBn_FSR[SS] does not get updated by direct writes to SMMU_CBn_FSR If stalled, software must execute an SMMU_CBn_RESUME command to either retry or terminate the stalled access SMMU_CBn_FSR[SS] will be cleared as a result Reset state : 0
29:17	RESERVED	
16	SL	(second-level) Indicates whether or not the context fault is associated with the second-level page table entry

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB lock control register governs the TLB locking mechanism and TLB invalidate operations.Write access to this register is governed by SMMU_CR[TLBLKCRWE]

When SMMU_CR[TLBLKCRWE] is 0, writes to SMMU_CBn_TLBLKCR are ignored

Read access is still permitted

SROT can set SMMU_CR[TLBLKCRWE] to 1 to allow operating environment(s) to manage the TLB locking mechanism

Management amongst multiple operating environments must be coordinated via semaphore

VCAP_SMMU_VCAP_CBn_TLBLKCR

Bits	Name	Description
31:24	RESERVED_2	
23:16	VICTIM	VICTIM[7:0] Indicates the TLB index at which the next normal (non-locking) allocation will occur Note that this is a "global" field Updating this field using the SMMU_CBn_TLBLKCR of any particular context bank affects the value of this field for all context
15:8	FLOOR	FLOOR[7:0] Indicates the TLB index from which round-robin replacement on normal (non-locking) allocations occurs TLB entries at indices below this value are locked Note that this is a "global" field Updating this field using the SMMU_CBn_TLBLKCR of any particular context bank affects the value of this field for all context banks
7:4	RESERVED_1

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

JPEGD_SMMU_JPEGD_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

JPEGD_SMMU_JPEGD_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

JPEGD_SMMU_JPEGD_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.21.1.2 SMMU context bank access control registers

0x073FF800+ 0x4*n JPEGD_SMMU_JPEGD_CBACRn, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

JPEGD_SMMU_JPEGD_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.21.1.3 SMMU TLB software access registers

0x073FFE00 JPEGD_SMMU_JPEGD_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

JPEGD_SMMU_JPEGD_TLBRSW

Bits	Name	Description
31:10	RESERVED	
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB

JPEGD_SMMU_JPEGD_TLBRSW (cont.)

Bits	Name	Description
7:0	INDEX	TLB index to be read.

0x073FFE80 JPEGD_SMMU_JPEGD_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

JPEGD_SMMU_JPEGD_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

JPEGD_SMMU_JPEGD_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

JPEGD_SMMU_JPEGD_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
1	PW	(privileged write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
0	PR	(privileged read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

0x073FFE84 JPEGD_SMMU_JPEGD_TLBTR1

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

0x073FFEFC JPEGD_SMMU_JPEGD_VR0

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: 32'h0000_0000

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

JPEGD_SMMU_JPEGD_VR0

Bits	Name	Description
31:3	RESERVED	

JPEGD_SMMU_JPEGD_VR0 (cont.)

Bits	Name	Description
2	DCPPT	Disable client pipelining for client operations in pass-through mode Reset state : 0
1	DCPBP	Disable client pipelining for client operations in bypass mode Reset state : 0
0	DCP	Disable client pipelining Reset state : 0

0x073FFF00 JPEGD_SMMU_JPEGD_TLBIALL

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries.

JPEGD_SMMU_JPEGD_TLBIALL

Bits	Name	Description
31:0	EXEC	Writing any value to this register invalidates all TLB entries, as specified by the contents of SMMU_CR[TLBIALLCFG]

0x073FFF04 JPEGD_SMMU_JPEGD_TLBIVMID

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries matching the IVMID value. Precise function is governed by SMMU_CR[TLBIALLCFG].

JPEGD_SMMU_JPEGD_TLBIVMID

Bits	Name	Description
31:5	RESERVED	
4:0	IVMID	Designates VMID[4:0] value of entries to be invalidated.

14.21.1.4 SMMU configuration registers

0x073FFF80 JPEGD_SMMU_JPEGD_CR

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

JPEGD_SMMU_JPEGD_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking ,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management among multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1

JPEGD_SMMU_JPEGD_CR (cont.)

Bits	Name	Description
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.21.1.5 SMMU error report registers

0x073FFF84 JPEGD_SMMU_JPEGD_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

JPEGD_SMMU_JPEGD_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x073FFF88 JPEGD_SMMU_JPEGD_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

JPEGD_SMMU_JPEGD_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR, SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x073FFF8C JPEGD_SMMU_JPEGD_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

JPEGD_SMMU_JPEGD_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR, SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	

JPEGD_SMMU_JPEGD_ESRRESTORE (cont.)

Bits	Name	Description
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x073FFFF8 JPEGD_SMMU_JPEGD_IDR

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper

JPEGD_SMMU_JPEGD_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x073FFFFC JPEGD_SMMU_JPEGD_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

JPEGD_SMMU_JPEGD_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.21.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.21.2.1 SMMU context bank control registers

0x07300000+0x1000*n JPEGD_SMMU_JPEGD_CBn_SCTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

JPEGD_SMMU_JPEGD_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.

JPEGD_SMMU_JPEGD_CBn_SCTLR (cont.)

Bits	Name	Description
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determine access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07300004+ 0x1000*n JPEGD_SMMU_JPEGD_CBn_ACTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

JPEGD_SMMU_JPEGD_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved

JPEGD_SMMU_JPEGD_CBn_ACTLR (cont.)

Bits	Name	Description
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

JPEGD_SMMU_JPEGD_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk. Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

JPEGD_SMMU_JPEGD_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

Translation table control register, which specifies the size of the virtual address space that uses TTBR0.

JPEGD_SMMU_JPEGD_CBn_TTBCR

Bits	Name	Description
31:6	RESERVED_2	
5	PD1	Page disable 1; if this bit is set, hardware table walks attempting to use TTBR1will result in a first level descriptor translation fault. If clear, TTBR1 contents are used.
4	PD0	Page disable 0; if this bit is set, hardware table walks attempting to use TTBR0 will result in a first level descriptor translation fault. If clear, TTBR0 contents are used.
3	RESERVED_1	
2:0	N	N[2:0] specifies the number of upper order virtual address bits which must be 0 in order for translations to use the table pointed to by TTBR0. If any of these bits are non-zero, TTBR1 is used for the lookup. If N is 0, only TTBR0 is used.

0x0730001C+ 0x1000*n JPEGD_SMMU_JPEGD_CBn_PAR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

The physical address register captures the physical address value resulting from the execution of a VA-to-PA command

Field definitions vary according to whether or not there is a context fault associated with the requested translation

JPEGD_SMMU_JPEGD_CBn_PAR

Bits	Name	Description
31:12	PAR_FAULT_INFO_312	
11	RESERVED_2	
10:9	PAR_FAULT_INFO_72	
8	RESERVED_1	
7:1	PAR_FAULT_INFO_71	Encoding varies according to value in FAULT field.
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07300020+0x1000*n JPEGD_SMMU_JPEGD_CBn_FSR, n=[0..1]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

.

JPEGD_SMMU_JPEGD_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"
30	SS	(stalled status) Indicates whether or not the System MMU is currently stalled due to an exception within this context bank SMMU_CBn_FSR[SS] does not get updated by direct writes to SMMU_CBn_FSR If stalled, software must execute an SMMU_CBn_RESUME command to either retry or terminate the stalled access SMMU_CBn_FSR[SS] will be cleared as a result Reset state : 0

The TLB resume command causes the SMMU to resume operation after a stalled access..

JPEGD_SMMU_JPEGD_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.22 VPE SMMU Registers (0x07400000 SMMU_VPE_BASE)

This section contains the VPE SMMU registers.

14.22.1 SMMU Global Registers

14.22.1.1 SMMU VMID/CBNDX mapping registers

0x074FF000+ 0x4*n VPE_SMMU_VPE_M2VCBRn, n=[0..1]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

VPE_SMMU_VPE_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

VPE_SMMU_VPE_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

VPE_SMMU_VPE_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.22.1.2 SMMU context bank access control registers

0x074FF800+ 0x4*n VPE_SMMU_VPE_CBACRn, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

VPE_SMMU_VPE_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.22.1.3 SMMU TLB software access registers

0x074FFE00 VPE_SMMU_VPE_TLBRSW

Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

VPE_SMMU_VPE_TLBRSW

Bits	Name	Description
31:10	RESERVED	
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB

VPE_SMMU_VPE_TLBRSW (cont.)

Bits	Name	Description
7:0	INDEX	TLB index to be read.

0x074FFE80 VPE_SMMU_VPE_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

VPE_SMMU_VPE_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

VPE_SMMU_VPE_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

VPE_SMMU_VPE_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
1	PW	(privileged write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
0	PR	(privileged read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

0x074FFE84 VPE_SMMU_VPE_TLBTR1

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

VPE_SMMU_VPE_TLBTR1

Bits	Name	Description
31:12	PA	Physical address [31:12] field of the TLB entry

0	TBE	Testbus enable, which governs whether the testbus is driven with all 0s or with the configured signals Reset state : 0

0x074FFEFC VPE_SMMU_VPE_VR0

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: 32'h0000_0000

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

VPE_SMMU_VPE_VR0

Bits	Name	Description
31:3	RESERVED	

VPE_SMMU_VPE_VR0 (cont.)

Bits	Name	Description
2	DCPPT	Disable client pipelining for client operations in pass-through mode Reset state : 0
1	DCPBP	Disable client pipelining for client operations in bypass mode Reset state : 0
0	DCP	Disable client pipelining Reset state : 0

0x074FFF00 VPE_SMMU_VPE_TLBIALL

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries.

VPE_SMMU_VPE_TLBIALL

Bits	Name	Description
31:0	EXEC	Writing any value to this register invalidates all TLB entries, as specified by the contents of SMMU_CR[TLBIALLCFG]

0x074FFF04 VPE_SMMU_VPE_TLBIVMID

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries matching the IVMID value. Precise function is governed by SMMU_CR[TLBIALLCFG].

VPE_SMMU_VPE_TLBIVMID

Bits	Name	Description
31:5	RESERVED	
4:0	IVMID	Designates VMID[4:0] value of entries to be invalidated.

14.22.1.4 SMMU configuration registers

0x074FFF80 VPE_SMMU_VPE_CR

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

VPE_SMMU_VPE_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking ,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management amounst multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1

VPE_SMMU_VPE_CR (cont.)

Bits	Name	Description
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.22.1.5 SMMU error report registers

0x074FFF84 VPE_SMMU_VPE_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

VPE_SMMU_VPE_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x074FFF88 VPE_SMMU_VPE_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

VPE_SMMU_VPE_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x074FFF8C VPE_SMMU_VPE_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

VPE_SMMU_VPE_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR, SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	

VPE_SMMU_VPE_ESRRESTORE (cont.)

Bits	Name	Description
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x074FFF90 VPE_SMMU_VPE_ESYNR0

Type: Read/Write
Clock: AXI_BUS_CLOCK

14.22.1.7 SMMU implementation parameter register

0x074FFFF8 VPE_SMMU_VPE_IDR

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper

VPE_SMMU_VPE_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x074FFFFC VPE_SMMU_VPE_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

VPE_SMMU_VPE_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.22.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.22.2.1 SMMU context bank control registers

0x07400000+0x1000*n VPE_SMMU_VPE_CBn_SCTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

VPE_SMMU_VPE_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.

VPE_SMMU_VPE_CBn_SCTLR (cont.)

Bits	Name	Description
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determining access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07400004+ 0x1000*n VPE_SMMU_VPE_CBn_ACTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

VPE_SMMU_VPE_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved

VPE_SMMU_VPE_CBn_ACTLR (cont.)

Bits	Name	Description
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

VPE_SMMU_VPE_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

VPE_SMMU_VPE_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

11	RESERVED_2	
10:9	PAR_FAULT_INFO_72	
8	RESERVED_1	
7:1	PAR_FAULT_INFO_71	Encoding varies according to value in FAULT field.
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07400020+0x1000*n VPE_SMMU_VPE_CBn_FSR, n=[0..1]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

.

VPE_SMMU_VPE_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"
30	SS	(stalled status) Indicates whether or not the System MMU is currently stalled due to an exception within this context bank SMMU_CBn_FSR[SS] does not get updated by direct writes to SMMU_CBn_FSR If stalled, software must execute an SMMU_CBn_RESUME command to either retry or terminate the stalled access SMMU_CBn_FSR[SS] will be cleared as a result Reset state : 0

2	TLBIASIDCFG	(TLBIASID configuration) TLBIASIDCFG = 0 - flash-invalidate SMMU_CBn_TLBIASID commands flash-invalidate the entire TLB, without regard to locking, security, VMID, and/or ASID values TLBIASIDCFG = 1 - selective SMMU_CBn_TLBIASID commands invalidate only entries that match all of the following conditions VMID field of TLB entry matches VMID value associated with the context bank ASID field of TLB entry matches ASID value designated by the SMMU_CBn_TLBIASID command TLB entry is not global (NG field is 1) NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIASID command
1	TLBIALLCFG	(TLBIALL configuration) TLBIALLCFG = 0 - flash-invalidate SMMU_CBn_TLBIALL commands flash-invalidate the entire TLB, without regard to locking, security, and/or VMID value TLBIALLCFG = 1 - selective SMMU_CBn_TLBIALL commands invalidate only entries that match all of the following conditions VMID field of TLB entry matches VMID value associated with the context bank NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIALL command Entry is unlocked
0	LKE	(lock enable) Governs whether or not TLB entries established by VA-to-PA commands upon TLB misses are locked LKE = 0 (normal, non-locking) Allocate VA-to-PA TLB entry (if TLB miss) at the index specified by SMMU_CBn_TLBLKCR[VICTIM] Allocation is disabled if SMMU_CBn_ACTLR[DNLV2PA] is 1 Increment SMMU_CBn_TLBLKCR[VICTIM] by 1 (only if new entry allocated) Wrap back to the value of SMMU_CBn_TLBLKCR[FLOOR] when the last entry is written LKE = 1 (locking) Search TLB for specified VA and invalidate if found Provides atomicity between the invalidate and the new allocation within the locked region Allocate VA-to-PA TLB entry at the index specified by data operand bits 7:0 of the VA-to-PA command This value must be less than SMMU_CBn_TLBLKCR[FLOOR] in order for it to remain locked Allocation occurs even if non-locking allocation is disabled due to SMMU_CBn_ACTLR[DNLV2PA] = 1

0x07400040+ 0x1000*n VPE_SMMU_VPE_CBn_V2PSR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The VA-to-PA status register records the hit/miss status and TLB index or V2Pxx and TLB invalidate commands.

VPE_SMMU_VPE_CBn_V2PSR

Bits	Name	Description
31:16	RESERVED_2	
15:8	INDEX	INDEX[7:0] Indicates the index of the TLB entry associated with the last SMMU_CBn_V2Pxx or SMMU_CBn_TLBIVA command If SMMU_CBn_V2PSR[HIT] is 0, then SMMU_CBn_V2PSR[INDEX] is the index to which the entry was allocated (if allocated at all) If SMMU_CBn_V2PSR[HIT] is 1, then SMMU_CBn_V2PSR[INDEX] is the index of the entry which hit
7:1	RESERVED_1	
0	HIT	Indicates whether or not there was a TLB hit (prior to allocation, if any) on the last SMMU_CBn_V2Pxx or SMMU_CBn_TLBIVA command

0x07400044+ 0x1000*n VPE_SMMU_VPE_CBn_TLBFLPTER, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB first level PTE register holds the first level page table entry value for subsequent use when TLB entry is written by software via SMMU_CBn_TLBWSW.

This register (together with SMMU_CBn_TLBSLPTER) is used as the source of the translation information for VA-to-PA operations when the MMU is enabled (SMMU_CBn_SCTLR[M] = 1) and the operations are configured for software table update (SMMU_CBn_ACTLR[V2PCFG] = 0b01)

Field definitions vary according to the type of PTE (fault, page, section, or supersection), and come directly from the ARMv7 architecture's PTE formats

VPE_SMMU_VPE_CBn_TLBFLPTER

Bits	Name	Description
31:10	FL_PTE_HI	

VPE_SMMU_VPE_CBn_TLBFLPTER (cont.)

Bits	Name	Description
9:5	RESERVED	
4:2	FL_PTE_LO	The actual contents of the PTE vary depending on the TYPE
1:0	TYPE	This field should be set to 0b00 or 0b11 to indicate that the translation should result in a context fault, and the rest of the fields are defined as indicated in this section If this field is not 0b00 or 0b11, then the PTE is of some other type (see other sections for the field definitions for those types)

0x07400048+ 0x1000*n VPE_SMMU_VPE_CBn_TLBSLPTER, n=[0..1]

Type: Read/Write

The TLB second level PTE register holds the second level page table entry value for subsequent use when TLB entry is written by software via SMMU_CBn_TLBWSW.

Field definitions vary according to the type of PTE (fault, 64KB or 4KB), and come directly from the ARMv7 architecture's PTE format

VPE_SMMU_VPE_CBn_TLBSLPTER

Bits	Name	Description
31:2	SL_PTE	The actual contents of the PTE vary depending on the TYPE
1:0	TYPE	0x0: fault

0x0740004C+ 0x1000*n VPE_SMMU_VPE_CBn_BFBCR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The burst fetch buffer configuration register governs the operation of the "burst fill" feature of the SMMU.

VPE_SMMU_VPE_CBn_BFBCR

Bits	Name	Description
31:12	STRIDE	(stride amount) 4KB-aligned value to be added to virtual address on demand TLB miss for filling subsequent BFB Stride of minimum 4KB alignment useful for preventing stride burst fetch until final PTE of the demand BFB entry is used
11:8	SLVIC	(second-level victim) Indicates the SLBFB index at which the next round-robin allocation will occur
7:4	FLVIC	(first-level victim) Indicates the FLBFB index at which the next round-robin allocation will occur
3	RESERVED	
2	SFVS	(stride-fetch victim selection) SFVS. = 0 (replace normal round-robin victim-selected entry) Useful when stride is larger than the VA space represented by the four PTEs in the demand BFB entry, but the client access pattern is for more than just the initial PTE in that demand BFB entry SFVS. = 1 (replace same BFB used by demand VA for which the stride burst is being performed) Useful when stride is the same as the VA space represented by an individual PTE in the demand BFB entry (such that the stride won't miss against the BFB until the last PTE of the demand BFB entry is accessed), and/or when the client access pattern only uses the initial PTE in the demand BFB entry
1	BFBSFE	(burst fetch buffer stride fetch enable) Enables stride burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Stride burst fetch is for the block of four PTEs associated with VA+stride VA is the "demanded" VA from the client (or VA-to-PA command) Stride value is specified by SMMU_CBn_BFBCR[STRIDE] Stride burst fetch only occurs if demand access for VA misses in TLB (could hit in BFB) and address VA+stride misses in both TLB and BFB
0	BFBDFE	(burst fetch buffer demand fetch enable) Enables demand burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Demand burst fetch is for the block of four PTEs associated with the "demanded" VA from the client (or VA-to-PA command) Demand burst fetch only occurs if demand access misses in both TLB and BFB

Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB resume command causes the SMMU to resume operation after a stalled access..

VPE_SMMU_VPE_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.23 MDP4 0 SMMU Registers (0x07500000 SMMU_MDP4_0_BASE)

This section contains the MDP4 0 SMMU registers.

14.23.1 SMMU Global Registers

14.23.1.1 SMMU VMID/CBNDX mapping registers

0x075FF000+ 0x4*n MDP4_0_SMMU_MDP0_M2VCBRn, n=[0..15]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

MDP4_0_SMMU_MDP0_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

MDP4_0_SMMU_MDP0_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

MDP4_0_SMMU_MDP0_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.23.1.2 SMMU context bank access control registers

0x075FF800+ 0x4*n MDP4_0_SMMU_MDP0_CBACRn, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

MDP4_0_SMMU_MDP0_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.23.1.3 SMMU TLB software access registers

0x075FFE00 MDP4_0_SMMU_MDP0_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

MDP4_0_SMMU_MDP0_TLBRSW

Bits	Name	Description
31:10	RESERVED	
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB

MDP4_0_SMMU_MDP0_TLBRSW (cont.)

Bits	Name	Description
7:0	INDEX	TLB index to be read.

0x075FFE80 MDP4_0_SMMU_MDP0_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

MDP4_0_SMMU_MDP0_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

MDP4_0_SMMU_MDP0_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

MDP4_0_SMMU_MDP0_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
1	PW	(privileged write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
0	PR	(privileged read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: 32'h0000_0000

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

MDP4_0_SMMU_MDP0_VR0

Bits	Name	Description
31:3	RESERVED	

MDP4_0_SMMU_MDP0_VR0 (cont.)

Bits	Name	Description
2	DCPPT	Disable client pipelining for client operations in pass-through mode Reset state : 0

0	DCP	Disable client pipelining Reset state : 0

0x075FFF00 MDP4_0_SMMU_MDP0_TLBIALL

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries.

MDP4_0_SMMU_MDP0_TLBIALL

Bits	Name	Description
31:0	EXEC	Writing any value to this register invalidates all TLB entries, as specified by the contents of SMMU_CR[TLBIALLCFG]

0x075FFF04 MDP4_0_SMMU_MDP0_TLBIVMID

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries matching the IVMID value. Precise function is governed by SMMU_CR[TLBIALLCFG].

MDP4_0_SMMU_MDP0_TLBIVMID

Bits	Name	Description
31:5	RESERVED	
4:0	IVMID	Designates VMID[4:0] value of entries to be invalidated.

14.23.1.4 SMMU configuration registers

0x075FFF80 MDP4_0_SMMU_MDP0_CR

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

MDP4_0_SMMU_MDP0_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking ,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management amounst multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1

MDP4_0_SMMU_MDP0_CR (cont.)

Bits	Name	Description
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.23.1.5 SMMU error report registers

0x075FFF84 MDP4_0_SMMU_MDP0_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

MDP4_0_SMMU_MDP0_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x075FFF88 MDP4_0_SMMU_MDP0_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

MDP4_0_SMMU_MDP0_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x075FFF8C MDP4_0_SMMU_MDP0_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

MDP4_0_SMMU_MDP0_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	

MDP4_0_SMMU_MDP0_ESRRESTORE (cont.)

14.23.1.7 SMMU implementation parameter register

0x075FFFF8 MDP4_0_SMMU_MDP0_IDR

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper

MDP4_0_SMMU_MDP0_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x075FFFFC MDP4_0_SMMU_MDP0_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

MDP4_0_SMMU_MDP0_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.23.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.23.2.1 SMMU context bank control registers

0x07500000+0x1000*n MDP4_0_SMMU_MDP0_CBn_SCTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

MDP4_0_SMMU_MDP0_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.

MDP4_0_SMMU_MDP0_CBn_SCTLR (cont.)

Bits	Name	Description
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determining access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07500004+ 0x1000*n MDP4_0_SMMU_MDP0_CBn_ACTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

MDP4_0_SMMU_MDP0_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved

MDP4_0_SMMU_MDP0_CBn_ACTLR (cont.)

Bits	Name	Description
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

MDP4_0_SMMU_MDP0_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

MDP4_0_SMMU_MDP0_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

The physical address register captures the physical address value resulting from the execution of a VA-to-PA command

Field definitions vary according to whether or not there is a context fault associated with the requested translation

MDP4_0_SMMU_MDP0_CBn_PAR

Bits	Name	Description
31:12	PAR_FAULT_INFO_312	
11	RESERVED_2	
10:9	PAR_FAULT_INFO_72	
8	RESERVED_1	
7:1	PAR_FAULT_INFO_71	Encoding varies according to value in FAULT field.
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07500020+0x1000*n MDP4_0_SMMU_MDP0_CBn_FSR, n=[0..1]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

MDP4_0_SMMU_MDP0_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"
30	SS	(stalled status) Indicates whether or not the System MMU is currently stalled due to an exception within this context bank SMMU_CBn_FSR[SS] does not get updated by direct writes to SMMU_CBn_FSR If stalled, software must execute an SMMU_CBn_RESUME command to either retry or terminate the stalled access SMMU_CBn_FSR[SS] will be cleared as a result Reset state : 0
29:17	RESERVED

The VA-to-PA status register records the hit/miss status and TLB index or V2Pxx and TLB invalidate commands.

MDP4_0_SMMU_MDP0_CBn_V2PSR

Bits	Name	Description
31:16	RESERVED_2	
15:8	INDEX	INDEX[7:0] Indicates the index of the TLB entry associated with the last SMMU_CBn_V2Pxx or SMMU_CBn_TLBIVA command If SMMU_CBn_V2PSR[HIT] is 0, then SMMU_CBn_V2PSR[INDEX] is the index to which the entry was allocated (if allocated at all) If SMMU_CBn_V2PSR[HIT] is 1, then SMMU_CBn_V2PSR[INDEX] is the index of the entry which hit
7:1	RESERVED_1	
0	HIT	Indicates whether or not there was a TLB hit (prior to allocation, if any) on the last SMMU_CBn_V2Pxx or SMMU_CBn_TLBIVA command

0x07500044+ 0x1000*n MDP4_0_SMMU_MDP0_CBn_TLBFLPTER, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB first level PTE register holds the first level page table entry value for subsequent use when TLB entry is written by software via SMMU_CBn_TLBWSW.

This register (together with SMMU_CBn_TLBSLPTER) is used as the source of the translation information for VA-to-PA operations when the MMU is enabled (SMMU_CBn_SCTLR[M] = 1) and the operations are configured for software table update (SMMU_CBn_ACTLR[V2PCFG] = 0b01)

Field definitions vary according to the type of PTE (fault, page, section, or supersection), and come directly from the ARMv7 architecture's PTE formats

MDP4_0_SMMU_MDP0_CBn_TLBFLPTER

Bits	Name	Description
31:10	FL_PTE_HI	

MDP4_0_SMMU_MDP0_CBn_TLBFLPTER (cont.)

Bits	Name	Description
9:5	RESERVED	
4:2	FL_PTE_LO	The actual contents of the PTE vary depending on the TYPE
1:0	TYPE	This field should be set to 0b00 or 0b11 to indicate that the translation should result in a context fault, and the rest of the fields are defined as indicated in this section If this field is not 0b00 or 0b11, then the PTE is of some other type (see other sections for the field definitions for those types)

0x07500048+ 0x1000*n MDP4_0_SMMU_MDP0_CBn_TLBSLPTER, n=[0..1]

Reset State: Undefined

The burst fetch buffer configuration register governs the operation of the "burst fill" feature of the SMMU.

MDP4_0_SMMU_MDP0_CBn_BFBCR

Bits	Name	Description
31:12	STRIDE	(stride amount) 4KB-aligned value to be added to virtual address on demand TLB miss for filling subsequent BFB Stride of minimum 4KB alignment useful for preventing stride burst fetch until final PTE of the demand BFB entry is used
11:8	SLVIC	(second-level victim) Indicates the SLBFB index at which the next round-robin allocation will occur
7:4	FLVIC	(first-level victim) Indicates the FLBFB index at which the next round-robin allocation will occur
3	RESERVED	
2	SFVS	(stride-fetch victim selection) SFVS. = 0 (replace normal round-robin victim-selected entry) Useful when stride is larger than the VA space represented by the four PTEs in the demand BFB entry, but the client access pattern is for more than just the initial PTE in that demand BFB entry SFVS. = 1 (replace same BFB used by demand VA for which the stride burst is being performed) Useful when stride is the same as the VA space represented by an individual PTE in the demand BFB entry (such that the stride won't miss against the BFB until the last PTE of the demand BFB entry is accessed), and/or when the client access pattern only uses the initial PTE in the demand BFB entry
1	BFBSFE	(burst fetch buffer stride fetch enable) Enables stride burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Stride burst fetch is for the block of four PTEs associated with VA+stride VA is the "demanded" VA from the client (or VA-to-PA command) Stride value is specified by SMMU_CBn_BFBCR[STRIDE] Stride burst fetch only occurs if demand access for VA misses in TLB (could hit in BFB) and address VA+stride misses in both TLB and BFB
0	BFBDFE	(burst fetch buffer demand fetch enable) Enables demand burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Demand burst fetch is for the block of four PTEs associated with the "demanded" VA from the client (or VA-to-PA command) Demand burst fetch only occurs if demand access misses in both TLB and BFB

The TLB resume command causes the SMMU to resume operation after a stalled access..

MDP4_0_SMMU_MDP0_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.24 MDP4 1 SMMU Registers (0x07600000 SMMU_MDP4_1_BASE)

This section contains the MDPF4 1 SMMU registers.

14.24.1 SMMU Global Registers

14.24.1.1 SMMU VMID/CBNDX mapping registers

0x076FF000+ 0x4*n MDP4_1_SMMU_MDP1_M2VCBRn, n=[0..15]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

MDP4_1_SMMU_MDP1_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

MDP4_1_SMMU_MDP1_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

MDP4_1_SMMU_MDP1_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.24.1.2 SMMU context bank access control registers

0x076FF800+ 0x4*n MDP4_1_SMMU_MDP1_CBACRn, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

MDP4_1_SMMU_MDP1_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.24.1.3 SMMU TLB software access registers

0x076FFE00 MDP4_1_SMMU_MDP1_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

MDP4_1_SMMU_MDP1_TLBRSW

Bits	Name	Description
31:10	RESERVED	
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB

MDP4_1_SMMU_MDP1_TLBRSW (cont.)

Bits	Name	Description

0x076FFE80 MDP4_1_SMMU_MDP1_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

MDP4_1_SMMU_MDP1_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

MDP4_1_SMMU_MDP1_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

MDP4_1_SMMU_MDP1_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
1	PW	(privileged write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
0	PR	(privileged read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

2	DCPPT	Disable client pipelining for client operations in pass-through mode Reset state : 0
1	DCPBP	Disable client pipelining for client operations in bypass mode Reset state : 0
0	DCP	Disable client pipelining Reset state : 0

0x076FFF00 MDP4_1_SMMU_MDP1_TLBIALL

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries.

MDP4_1_SMMU_MDP1_TLBIALL

Bits	Name	Description
31:0	EXEC	Writing any value to this register invalidates all TLB entries, as specified by the contents of SMMU_CR[TLBIALLCFG]

0x076FFF04 MDP4_1_SMMU_MDP1_TLBIVMID

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries matching the IVMID value. Precise function is governed by SMMU_CR[TLBIALLCFG].

MDP4_1_SMMU_MDP1_TLBIVMID

Bits	Name	Description
31:5	RESERVED	
4:0	IVMID	Designates VMID[4:0] value of entries to be invalidated.

14.24.1.4 SMMU configuration registers

0x076FFF80 MDP4_1_SMMU_MDP1_CR

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

MDP4_1_SMMU_MDP1_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking ,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management amounst multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1

MDP4_1_SMMU_MDP1_CR (cont.)

Bits	Name	Description
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.24.1.5 SMMU error report registers

0x076FFF84 MDP4_1_SMMU_MDP1_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

MDP4_1_SMMU_MDP1_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x076FFF88 MDP4_1_SMMU_MDP1_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

MDP4_1_SMMU_MDP1_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x076FFF8C MDP4_1_SMMU_MDP1_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

MDP4_1_SMMU_MDP1_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	

MDP4_1_SMMU_MDP1_ESRRESTORE (cont.)

14.24.1.7 SMMU implementation parameter register

0x076FFFF8 MDP4_1_SMMU_MDP1_IDR

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper

MDP4_1_SMMU_MDP1_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x076FFFFC MDP4_1_SMMU_MDP1_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

MDP4_1_SMMU_MDP1_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.24.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.24.2.1 SMMU context bank control registers

0x07600000+0x1000*n MDP4_1_SMMU_MDP1_CBn_SCTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

MDP4_1_SMMU_MDP1_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.

MDP4_1_SMMU_MDP1_CBn_SCTLR (cont.)

Bits	Name	Description
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determining access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07600004+ 0x1000*n MDP4_1_SMMU_MDP1_CBn_ACTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

MDP4_1_SMMU_MDP1_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved

MDP4_1_SMMU_MDP1_CBn_ACTLR (cont.)

Bits	Name	Description
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

MDP4_1_SMMU_MDP1_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

MDP4_1_SMMU_MDP1_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

The physical address register captures the physical address value resulting from the execution of a VA-to-PA command

Field definitions vary according to whether or not there is a context fault associated with the requested translation

MDP4_1_SMMU_MDP1_CBn_PAR

Bits	Name	Description
31:12	PAR_FAULT_INFO_312	
11	RESERVED_2	
10:9	PAR_FAULT_INFO_72	
8	RESERVED_1	
7:1	PAR_FAULT_INFO_71	Encoding varies according to value in FAULT field.
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07600020+0x1000*n MDP4_1_SMMU_MDP1_CBn_FSR, n=[0..1]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

MDP4_1_SMMU_MDP1_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"
30	SS	(stalled status) Indicates whether or not the System MMU is currently stalled due to an exception within this context bank SMMU_CBn_FSR[SS] does not get updated by direct writes to SMMU_CBn_FSR If stalled, software must execute an SMMU_CBn_RESUME command to either retry or terminate the stalled access SMMU_CBn_FSR[SS] will be cleared as a result Reset state : 0
29:17	RESERVED

Bits	Name	Description
2	TLBIASIDCFG	(TLBIASID configuration) TLBIASIDCFG = 0 - flash-invalidate SMMU_CBn_TLBIASID commands flash-invalidate the entire TLB, without regard to locking, security, VMID, and/or ASID values TLBIASIDCFG = 1 - selective SMMU_CBn_TLBIASID commands invalidate only entries that match all of the following conditions VMID field of TLB entry matches VMID value associated with the context bank ASID field of TLB entry matches ASID value designated by the SMMU_CBn_TLBIASID command TLB entry is not global (NG field is 1) NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIASID command
1	TLBIALLCFG	(TLBIALL configuration) TLBIALLCFG = 0 - flash-invalidate SMMU_CBn_TLBIALL commands flash-invalidate the entire TLB, without regard to locking, security, and/or VMID value TLBIALLCFG = 1 - selective SMMU_CBn_TLBIALL commands invalidate only entries that match all of the following conditions VMID field of TLB entry matches VMID value associated with the context bank NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIALL command Entry is unlocked
0	LKE	(lock enable) Governs whether or not TLB entries established by VA-to-PA commands upon TLB misses are locked LKE = 0 (normal, non-locking) Allocate VA-to-PA TLB entry (if TLB miss) at the index specified by SMMU_CBn_TLBLKCR[VICTIM] Allocation is disabled if SMMU_CBn_ACTLR[DNLV2PA] is 1 Increment SMMU_CBn_TLBLKCR[VICTIM] by 1 (only if new entry allocated) Wrap back to the value of SMMU_CBn_TLBLKCR[FLOOR] when the last entry is written LKE = 1 (locking) Search TLB for specified VA and invalidate if found Provides atomicity between the invalidate and the new allocation within the locked region Allocate VA-to-PA TLB entry at the index specified by data operand bits 7:0 of the VA-to-PA command This value must be less than SMMU_CBn_TLBLKCR[FLOOR] in order for it to remain locked Allocation occurs even if non-locking allocation is disabled due to SMMU_CBn_ACTLR[DNLV2PA] = 1

0x07600040+0x1000*n MDP4_1_SMMU_MDP1_CBn_V2PSR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The VA-to-PA status register records the hit/miss status and TLB index or V2Pxx and TLB invalidate commands.

MDP4_1_SMMU_MDP1_CBn_V2PSR

Bits	Name	Description
31:16	RESERVED_2	
15:8	INDEX	INDEX[7:0] Indicates the index of the TLB entry associated with the last SMMU_CBn_V2Pxx or SMMU_CBn_TLBIVA command If SMMU_CBn_V2PSR[HIT] is 0, then SMMU_CBn_V2PSR[INDEX] is the index to which the entry was allocated (if allocated at all) If SMMU_CBn_V2PSR[HIT] is 1, then SMMU_CBn_V2PSR[INDEX] is the index of the entry which hit
7:1	RESERVED_1	
0	HIT	Indicates whether or not there was a TLB hit (prior to allocation, if any) on the last SMMU_CBn_V2Pxx or SMMU_CBn_TLBIVA command

0x07600044+0x1000*n MDP4_1_SMMU_MDP1_CBn_TLBFLPTER, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB first level PTE register holds the first level page table entry value for subsequent use when TLB entry is written by software via SMMU_CBn_TLBWSW.

This register (together with SMMU_CBn_TLBSLPTER) is used as the source of the translation information for VA-to-PA operations when the MMU is enabled (SMMU_CBn_SCTLR[M] = 1) and the operations are configured for software table update (SMMU_CBn_ACTLR[V2PCFG] = 0b01)

Field definitions vary according to the type of PTE (fault, page, section, or supersection), and come directly from the ARMv7 architecture's PTE formats

MDP4_1_SMMU_MDP1_CBn_TLBFLPTER

Bits	Name	Description
31:10	FL_PTE_HI	

MDP4_1_SMMU_MDP1_CBn_TLBFLPTER (cont.)

Bits	Name	Description
9:5	RESERVED	
4:2	FL_PTE_LO	The actual contents of the PTE vary depending on the TYPE
1:0	TYPE	This field should be set to 0b00 or 0b11 to indicate that the translation should result in a context fault, and the rest of the fields are defined as indicated in this section If this field is not 0b00 or 0b11, then the PTE is of some other type (see other sections for the field definitions for those types)

0x07600048+ 0x1000*n MDP4_1_SMMU_MDP1_CBn_TLBSLPTER, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB second level PTE register holds the second level page table entry value for subsequent use when TLB entry is written by software via SMMU_CBn_TLBWSW.

Field definitions vary according to the type of PTE (fault, 64KB or 4KB), and come directly from the ARMv7 architecture's PTE format

.

MDP4_1_SMMU_MDP1_CBn_TLBSLPTER

Bits	Name	Description
31:2	SL_PTE	The actual contents of the PTE vary depending on the TYPE
1:0	TYPE	0x0: fault

0x0760004C+ 0x1000*n MDP4_1_SMMU_MDP1_CBn_BFBCR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The burst fetch buffer configuration register governs the operation of the "burst fill" feature of the SMMU.

MDP4_1_SMMU_MDP1_CBn_BFBCR

Bits	Name	Description
31:12	STRIDE	(stride amount) 4KB-aligned value to be added to virtual address on demand TLB miss for filling subsequent BFB Stride of minimum 4KB alignment useful for preventing stride burst fetch until final PTE of the demand BFB entry is used
11:8	SLVIC	(second-level victim) Indicates the SLBFB index at which the next round-robin allocation will occur
7:4	FLVIC	(first-level victim) Indicates the FLBFB index at which the next round-robin allocation will occur
3	RESERVED	
2	SFVS	(stride-fetch victim selection) SFVS. = 0 (replace normal round-robin victim-selected entry) Useful when stride is larger than the VA space represented by the four PTEs in the demand BFB entry, but the client access pattern is for more than just the initial PTE in that demand BFB entry SFVS. = 1 (replace same BFB used by demand VA for which the stride burst is being performed) Useful when stride is the same as the VA space represented by an individual PTE in the demand BFB entry (such that the stride won't miss against the BFB until the last PTE of the demand BFB entry is accessed), and/or when the client access pattern only uses the initial PTE in the demand BFB entry
1	BFBSFE	(burst fetch buffer stride fetch enable) Enables stride burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Stride burst fetch is for the block of four PTEs associated with VA+stride VA is the "demanded" VA from the client (or VA-to-PA command) Stride value is specified by SMMU_CBn_BFBCR[STRIDE] Stride burst fetch only occurs if demand access for VA misses in TLB (could hit in BFB) and address VA+stride misses in both TLB and BFB
0	BFBDFE	(burst fetch buffer demand fetch enable) Enables demand burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Demand burst fetch is for the block of four PTEs associated with the "demanded" VA from the client (or VA-to-PA command) Demand burst fetch only occurs if demand access misses in both TLB and BFB

Reset State: Undefined

The TLB resume command causes the SMMU to resume operation after a stalled access..

MDP4_1_SMMU_MDP1_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.25 Rotator SMMU Registers (0x07700000 SMMU_ROTATOR_BASE)

This section contains the Rotator SMMU registers.

14.25.1 SMMU Global Registers

14.25.1.1 SMMU VMID/CBNDX mapping registers

0x077FF000+ 0x4*n ROT_SMMU_ROT_M2VCBRn, n=[0..1]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

ROT_SMMU_ROT_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

ROT_SMMU_ROT_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

ROT_SMMU_ROT_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.25.1.2 SMMU context bank access control registers

0x077FF800+ 0x4*n ROT_SMMU_ROT_CBACRn, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

ROT_SMMU_ROT_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.25.1.3 SMMU TLB software access registers

0x077FFE00 ROT_SMMU_ROT_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

ROT_SMMU_ROT_TLBRSW

Bits	Name	Description
31:10	RESERVED	
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB

ROT_SMMU_ROT_TLBRSW (cont.)

Bits	Name	Description
7:0	INDEX	TLB index to be read.

0x077FFE80 ROT_SMMU_ROT_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

ROT_SMMU_ROT_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

ROT_SMMU_ROT_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

ROT_SMMU_ROT_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
1	PW	(privileged write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
0	PR	(privileged read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

0x077FFE84 ROT_SMMU_ROT_TLBTR1

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

ROT_SMMU_ROT_TLBTR1

Bits	Name	Description
31:12	PA	Physical address [31:12] field of the TLB entry
11:5	RESERVED	
4:0	VMID	VMID [4:0]field of the TLB entry)

0x077FFE88 ROT_SMMU_ROT_TLBTR2

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

ROT_SMMU_ROT_TLBTR2

Bits	Name	Description
31:12	VA	virtual address field [31:12] of the TLB entry
11	RESERVED	
10	NG	(not global field from page table entry) Indicates whether the page is private to the specified ASID (NG=1) or global to all ASIDs within the VMID using this context bank (NG=0)
9	NSTID	(non-secure tag ID field of the TLB entry) Indicates whether the TLB entry belongs to the secure world (NSTID=0) or the non-secure world (NSTID=1) This field is comned against the incoming NS-prot attribute of the master request as part of TLB hit/miss determination
8	V	valid field of the TLB entry
7:0	ASID	ASID[7:0] field of the TLB entry

0x077FFE8C ROT_SMMU_ROT_TESTBUSCR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

Governs which signals (if any) from the system SMMU core or wrapper design hierarchy are sent out to the system via a testbus for diagnostic, and also to the system profiling and diagnostic monitor(SPDM).

ROT_SMMU_ROT_TESTBUSCR

Bits	Name	Description
31:28	SPDM3SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[3]
27:24	SPDM2SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[2]
23:20	SPDM1SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[1]
19:16	SPDM0SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[0]
15:14	TBHSEL	Testbus highselect It governs which set of signals are to testbus[31:16] TBSLSEL = 0b00 - Bits 15:0 from nuleus bus TBSLSEL = 0b01 - Bits 31:16 from nuleus bus TBSLSEL = 0b10 - Bits 15:0 from wrapper group selected by SMMU_TESTBUSCR[WGSEL] TBSLSEL = 0b11 - Bits 31:16 from wrapper group selected by SMMU_TESTBUSCR[WGSEL

0x077FFEFC ROT_SMMU_ROT_VR0

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: 32'h0000_0000

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

ROT_SMMU_ROT_VR0

Bits	Name	Description
31:3	RESERVED	

ROT_SMMU_ROT_VR0 (cont.)

Bits	Name	Description
2	DCPPT	Disable client pipelining for client operations in pass-through mode Reset state : 0
1	DCPBP	Disable client pipelining for client operations in bypass mode Reset state : 0
0	DCP	Disable client pipelining Reset state : 0

0x077FFF00 ROT_SMMU_ROT_TLBIALL

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries.

ROT_SMMU_ROT_TLBIALL

Bits	Name	Description
31:0	EXEC	Writing any value to this register invalidates all TLB entries, as specified by the contents of SMMU_CR[TLBIALLCFG]

0x077FFF04 ROT_SMMU_ROT_TLBIVMID

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries matching the IVMID value. Precise function is governed by SMMU_CR[TLBIALLCFG].

ROT_SMMU_ROT_TLBIVMID

Bits	Name	Description
31:5	RESERVED	
4:0	IVMID	Designates VMID[4:0] value of entries to be invalidated.

14.25.1.4 SMMU configuration registers

0x077FFF80 ROT_SMMU_ROT_CR

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

ROT_SMMU_ROT_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking ,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management amounst multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1

ROT_SMMU_ROT_CR (cont.)

Bits	Name	Description
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.25.1.5 SMMU error report registers

0x077FFF84 ROT_SMMU_ROT_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

ROT_SMMU_ROT_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x077FFF88 ROT_SMMU_ROT_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

ROT_SMMU_ROT_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x077FFF8C ROT_SMMU_ROT_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

ROT_SMMU_ROT_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	

ROT_SMMU_ROT_ESRRESTORE (cont.)

Bits	Name	Description
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x077FFF90 ROT_SMMU_ROT_ESYNR0

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

ROT_SMMU_ROT_ESYNR0

Bits	Name	Description
31:24	ATID	ATID[7:0] field of errant request

14.25.1.7 SMMU implementation parameter register

0x077FFFF8 ROT_SMMU_ROT_IDR

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper

ROT_SMMU_ROT_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x077FFFFC ROT_SMMU_ROT_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

ROT_SMMU_ROT_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.25.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.25.2.1 SMMU context bank control registers

0x07700000+0x1000*n ROT_SMMU_ROT_CBn_SCTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

ROT_SMMU_ROT_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.

ROT_SMMU_ROT_CBn_SCTLR (cont.)

Bits	Name	Description
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determining access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07700004+ 0x1000*n ROT_SMMU_ROT_CBn_ACTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

ROT_SMMU_ROT_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved

ROT_SMMU_ROT_CBn_ACTLR (cont.)

Bits	Name	Description
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

ROT_SMMU_ROT_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

ROT_SMMU_ROT_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

0x07700008+ 0x1000*n ROT_SMMU_ROT_CBn_CONTEXTIDR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context ID register holds the ASID associated with this context bank

ROT_SMMU_ROT_CBn_CONTEXTIDR

Bits	Name	Description
31:8	RESERVED	
7:0	ASID	Specifies the 8 bit ASID value assigned to this context bank. The ASID can be included in the key comparison of TLB entries. .

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table control register, which specifies the size of the virtual address space that uses TTBR0.

ROT_SMMU_ROT_CBn_TTBCR

Bits	Name	Description
31:6	RESERVED_2	
5	PD1	Page disable 1; if this bit is set, hardware table walks attempting to use TTBR1will result in a first level descriptor translation fault. If clear, TTBR1 contents are used.
4	PD0	Page disable 0; if this bit is set, hardware table walks attempting to use TTBR0 will result in a first level descriptor translation fault. If clear, TTBR0 contents are used.
3	RESERVED_1	
2:0	N	N[2:0] specifies the number of upper order virtual address bits which must be 0 in order for translations to use the table pointed to by TTBR0. If any of these bits are non-zero, TTBR1 is used for the lookup. If N is 0, only TTBR0 is used.

0x0770001C+ 0x1000*n ROT_SMMU_ROT_CBn_PAR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

The physical address register captures the physical address value resulting from the execution of a VA-to-PA command

Field definitions vary according to whether or not there is a context fault associated with the requested translation

ROT_SMMU_ROT_CBn_PAR

Bits	Name	Description
31:12	PAR_FAULT_INFO_312	
11	RESERVED_2	
10:9	PAR_FAULT_INFO_72	
8	RESERVED_1	
7:1	PAR_FAULT_INFO_71	Encoding varies according to value in FAULT field.
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07700020+0x1000*n ROT_SMMU_ROT_CBn_FSR, n=[0..1]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

ROT_SMMU_ROT_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"
30	SS	(stalled status) Indicates whether or not the System MMU is currently stalled due to an exception within this context bank SMMU_CBn_FSR[SS] does not get updated by direct writes to SMMU_CBn_FSR If stalled, software must execute an SMMU_CBn_RESUME command to either retry or terminate the stalled access SMMU_CBn_FSR[SS] will be cleared as a result Reset state : 0
29:17	RESERVED

Bits	Name	Description
31:16	RESERVED_2	
15:8	INDEX	INDEX[7:0] Indicates the index of the TLB entry associated with the last SMMU_CBn_V2Pxx or SMMU_CBn_TLBIVA command If SMMU_CBn_V2PSR[HIT] is 0, then SMMU_CBn_V2PSR[INDEX] is the index to which the entry was allocated (if allocated at all) If SMMU_CBn_V2PSR[HIT] is 1, then SMMU_CBn_V2PSR[INDEX] is the index of the entry which hit
7:1	RESERVED_1	
0	HIT	Indicates whether or not there was a TLB hit (prior to allocation, if any) on the last SMMU_CBn_V2Pxx or SMMU_CBn_TLBIVA command

0x07700044+0x1000*n ROT_SMMU_ROT_CBn_TLBFLPTER, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB first level PTE register holds the first level page table entry value for subsequent use when TLB entry is written by software via SMMU_CBn_TLBWSW.

This register (together with SMMU_CBn_TLBSLPTER) is used as the source of the translation information for VA-to-PA operations when the MMU is enabled (SMMU_CBn_SCTLR[M] = 1) and the operations are configured for software table update (SMMU_CBn_ACTLR[V2PCFG] = 0b01)

Field definitions vary according to the type of PTE (fault, page, section, or supersection), and come directly from the ARMv7 architecture's PTE formats

ROT_SMMU_ROT_CBn_TLBFLPTER

Bits	Name	Description
31:10	FL_PTE_HI	

ROT_SMMU_ROT_CBn_TLBFLPTER (cont.)

Bits	Name	Description
9:5	RESERVED	
4:2	FL_PTE_LO	The actual contents of the PTE vary depending on the TYPE
1:0	TYPE	This field should be set to 0b00 or 0b11 to indicate that the translation should result in a context fault, and the rest of the fields are defined as indicated in this section If this field is not 0b00 or 0b11, then the PTE is of some other type (see other sections for the field definitions for those types)

0x07700048+ 0x1000*n ROT_SMMU_ROT_CBn_TLBSLPTER, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB second level PTE register holds the second level page table entry value for subsequent use when TLB entry is written by software via SMMU_CBn_TLBWSW.

Field definitions vary according to the type of PTE (fault, 64KB or 4KB), and come directly from the ARMv7 architecture's PTE format

ROT_SMMU_ROT_CBn_TLBSLPTER

Bits	Name	Description
31:2	SL_PTE	The actual contents of the PTE vary depending on the TYPE
1:0	TYPE	0x0: fault

0x0770004C+ 0x1000*n ROT_SMMU_ROT_CBn_BFBCR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The burst fetch buffer configuration register governs the operation of the "burst fill" feature of the SMMU.

ROT_SMMU_ROT_CBn_BFBCR

Bits	Name	Description
31:12	STRIDE	(stride amount) 4KB-aligned value to be added to virtual address on demand TLB miss for filling subsequent BFB Stride of minimum 4KB alignment useful for preventing stride burst fetch until final PTE of the demand BFB entry is used
11:8	SLVIC	(second-level victim) Indicates the SLBFB index at which the next round-robin allocation will occur
7:4	FLVIC	(first-level victim) Indicates the FLBFB index at which the next round-robin allocation will occur
3	RESERVED	
2	SFVS	(stride-fetch victim selection) SFVS. = 0 (replace normal round-robin victim-selected entry) Useful when stride is larger than the VA space represented by the four PTEs in the demand BFB entry, but the client access pattern is for more than just the initial PTE in that demand BFB entry SFVS. = 1 (replace same BFB used by demand VA for which the stride burst is being performed) Useful when stride is the same as the VA space represented by an individual PTE in the demand BFB entry (such that the stride won't miss against the BFB until the last PTE of the demand BFB entry is accessed), and/or when the client access pattern only uses the initial PTE in the demand BFB entry
1	BFBSFE	(burst fetch buffer stride fetch enable) Enables stride burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Stride burst fetch is for the block of four PTEs associated with VA+stride VA is the "demanded" VA from the client (or VA-to-PA command) Stride value is specified by SMMU_CBn_BFBCR[STRIDE] Stride burst fetch only occurs if demand access for VA misses in TLB (could hit in BFB) and address VA+stride misses in both TLB and BFB
0	BFBDFE	(burst fetch buffer demand fetch enable) Enables demand burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Demand burst fetch is for the block of four PTEs associated with the "demanded" VA from the client (or VA-to-PA command) Demand burst fetch only occurs if demand access misses in both TLB and BFB

0x07700800+ 0x1000*n ROT_SMMU_ROT_CBn_TLBIALL, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate all command register invalidates all TLB entries matching the VMID associated with this context bank. Data operand is ignored.

ROT_SMMU_ROT_CBn_TLBIALL

Bits	Name	Description
31:0	RESERVED	

0x07700804+ 0x1000*n ROT_SMMU_ROT_CBn_TLBIASID, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate by ASID command register invalidates TLB entries matching the specified ASID and matching the VMID associated with this context bank.Invalidates TLB entries which are associated with the designated ASID and which are associated with the VMID associated with the specified context bank

SMMU_CBn_TLBLKCR[TLBIASIDCFG] governs whether command flash-invalidates entire TLB array or just the entries matching the VMID, ASID, and security state

TLBIASIDCFG = 0 - flash-invalidate

SMMU_CBn_TLBIASID command flash-invalidates the entire TLB, without regard to locking, security, VMID, and/or ASID values

TLBIASIDCFG = 1 - selective

SMMU_CBn_TLBIASID command invalidates only entries that match all of the following conditions

VMID field of TLB entry matches VMID value associated with the context bank from SMMU_CBACRn[CBVMID]

ASID field of TLB entry matches ASID value designated by the SMMU_CBn_TLBIASID command data operand

TLB entry is not global (NG field is 1)

NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIASID command

Locking is not considered (matching entries are invalidated even if locked)

ASID field of command specifies the ASID value of the TLB entries to be invalidated

ROT_SMMU_ROT_CBn_TLBIASID

Bits	Name	Description
31:8	RESERVED	
7:0	ASID	Actual ASID value

0x07700808+0x1000*n ROT_SMMU_ROT_CBn_TLBIVA, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate by VA command invalidates TLB entries matching the designated VA, ASID and the VMID associated with this context bank.

Matching entry determined as follows:

VMID field of TLB entry matches VMID value associated with the context bank from SMMU_CBACRn[CBVMID]

ASID field of TLB entry matches ASID value designated by the SMMU_CBn_TLBIVA command data operand (or TLB entry is global - NG field is 0)

VA field of TLB entry matches VA value designated by the SMMU_CBn_TLBIVA command data operand

NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIVA command

Locking is not considered (matching entry is invalidated even if locked)

Data operand specifies the VA and ASID value of the TLB entry to be invalidated

ROT_SMMU_ROT_CBn_TLBIVA

Bits	Name	Description
31:12	VA	VA[31:12]
11:8	RESERVED	
7:0	ASID	ASID[7:0] value

0x0770080C+0x1000*n ROT_SMMU_ROT_CBn_TLBIVAA, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate by VA all ASIDS command invalidates TLB entries matching the designated VA and the VMID associated with this context bank, regardless of ASID.Invalidates TLB entries which are associated with the designated VA, regardless of ASID, and which are associated with the VMID associated with the specified context bank

SMMU_CBn_TLBLKCR[TLBIVAACFG] governs whether command flash-invalidates entire TLB array or just the non-locked entries matching the VMID, ASID, and security state

TLBIVAACFG = 0 - flash-invalidate

SMMU_CBn_TLBIVAA command flash-invalidates the entire TLB, without regard to locking, security, address, and/or VMID value

TLBIVAACFG = 1 - selective

SMMU_CBn_TLBIVAA command invalidates only entries that match all of the following conditions

VMID field of TLB entry matches VMID value associated with the context bank from SMMU_CBACRn[CBVMID]

VA field of TLB entry matches VA designated by the SMMU_CBn_TLBIVAA command data operand

NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIALL command

Entry is unlocked

ROT_SMMU_ROT_CBn_TLBIVAA

Bits	Name	Description

This VA-to-PA command translates the given virtual address value to the corresponding physical address, using the access permission type "privileged read". If the translation is successful, the resulting physical address is placed in the SMMU_CBn_PAR. Searches TLB (and optionally the page table) for the translation of the specified VA

VMID is as configured for the context bank via SMMU_CBACRn[CBVMID]

ASID is as specified in SMMU_CBn_CONTEXTIDR[ASID]

Result recorded in SMMU_CBn_PAR

SMMU_CBn_TLBLKCR[LKE] governs whether or not TLB entries allocated by SMMU_CBn_V2Pxx commands are locked in the TLB

SMMU_CBn_ACTLR[V2PCFG] governs the operation of SMMU_CBn_V2Pxx commands that miss in the TLB

Either pass-through as if MMU were disabled, or signal TLB Miss context fault, or use SMMU_CBn_TLBFLPTER/TLBSLPTER as PTE, or perform hardware table walk to access PTE

SMMU_CBn_ACTLR[DNLV2PA] governs whether non-locking SMMU_CBn_V2Pxx commands that miss in the TLB will allocate a new entry

Data operand specifies the VA to be translated (and optionally the TLB index at which to allocate the entry, if locking)

ROT_SMMU_ROT_CBn_V2PRR

Bits	Name	Description
31:12	VA	VA[31:12] to be translated
11:8	RESERVED	
7:0	INDEX	INDEX[7:0] (index) TLB index at which the new entry should be allocated when locking is enabled (SMMU_CBn_TLBLKCR[LKE] is 1)

0x07700814+0x1000*n ROT_SMMU_ROT_CBn_V2PPW, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This VA-to-PA command translates the given virtual address value to the corresponding physical address, using the access permission type "privileged write". If the translation is successful, the resulting physical address is placed in the SMMU_CBn_PAR. Searches TLB (and optionally the page table) for the translation of the specified VA

VMID is as configured for the context bank via SMMU_CBACRn[CBVMID]

ASID is as specified in SMMU_CBn_CONTEXTIDR[ASID]

Result recorded in SMMU_CBn_PAR

SMMU_CBn_TLBLKCR[LKE] governs whether or not TLB entries allocated by SMMU_CBn_V2Pxx commands are locked in the TLB

SMMU_CBn_ACTLR[V2PCFG] governs the operation of SMMU_CBn_V2Pxx commands that miss in the TLB

Either pass-through as if MMU were disabled, or signal TLB Miss context fault, or use SMMU_CBn_TLBFLPTER/TLBSLPTER as PTE, or perform hardware table walk to access PTE

SMMU_CBn_ACTLR[DNLV2PA] governs whether non-locking SMMU_CBn_V2Pxx commands that miss in the TLB will allocate a new entry

Data operand specifies the VA to be translated (and optionally the TLB index at which to allocate the entry, if locking)

ROT_SMMU_ROT_CBn_V2PPW

Bits	Name	Description
31:12	VA	VA[31:12] to be translated
11:8	RESERVED

11:8	RESERVED	

ROT_SMMU_ROT_CBn_V2PUW (cont.)

Bits	Name	Description
7:0	INDEX	INDEX[7:0] (index) TLB index at which the new entry should be allocated when locking is enabled (SMMU_CBn_TLBLKCR[LKE] is 1)

0x07700820+ 0x1000*n ROT_SMMU_ROT_CBn_RESUME, n=[0..1]

Type: Write/command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB resume command causes the SMMU to resume operation after a stalled access..

ROT_SMMU_ROT_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.26 IJPEG SMMU Registers (0x07800000 SMMU_JPEG_BASE)

This section contains IJPEG SMMU registers.

14.26.1 SMMU Global Registers

14.26.1.1 SMMU VMID/CBNDX mapping registers

0x078FF000+ 0x4*n IJPEG_SMMU_IJPEG_M2VCBRn, n=[0..1]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

IJPEG_SMMU_IJPEG_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

IJPEG_SMMU_IJPEG_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

IJPEG_SMMU_IJPEG_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.26.1.2 SMMU context bank access control registers

0x078FF800+ 0x4*n IJPEG_SMMU_IJPEG_CBACRn, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

IJPEG_SMMU_IJPEG_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.26.1.3 SMMU TLB software access registers

0x078FFE00 IJPEG_SMMU_IJPEG_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

IJPEG_SMMU_IJPEG_TLBRSW

Bits	Name	Description
31:10	RESERVED	

IJPEG_SMMU_IJPEG_TLBRSW (cont.)

Bits	Name	Description
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB
7:0	INDEX	TLB index to be read.

0x078FFE80 IJPEG_SMMU_IJPEG_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

IJPEG_SMMU_IJPEG_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

IJPEG_SMMU_IJPEG_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

IJPEG_SMMU_IJPEG_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

0x078FFE84 IJPEG_SMMU_IJPEG_TLBTR1

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

IJPEG_SMMU_IJPEG_TLBTR1

Bits	Name	Description
31:12	PA	Physical address [31:12] field of the TLB entry
11:5	RESERVED	
4:0	VMID	VMID [4:0]field of the TLB entry)

0x078FFE88 IJPEG_SMMU_IJPEG_TLBTR2

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

IJPEG_SMMU_IJPEG_TLBTR2

Bits	Name	Description
31:12	VA	virtual address field [31:12] of the TLB entry
11	RESERVED	
10	NG	(not global field from page table entry) Indicates whether the page is private to the specified ASID (NG=1) or global to all ASIDs within the VMID using this context bank (NG=0)
9	NSTID	(non-secure tag ID field of the TLB entry) Indicates whether the TLB entry belongs to the secure world (NSTID=0) or the non-secure world (NSTID=1) This field is comned against the incoming NS-prot attribute of the master request as part of TLB hit/miss determination
8	V	valid field of the TLB entry
7:0	ASID	ASID[7:0] field of the TLB entry

0x078FFE8C IJPEG_SMMU_IJPEG_TESTBUSCR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

Governs which signals (if any) from the system SMMU core or wrapper design hierarchy are sent out to the system via a testbus for diagnostic, and also to the system profiling and diagnostic monitor(SPDM).

IJPEG_SMMU_IJPEG_TESTBUSCR

Bits	Name	Description
31:28	SPDM3SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[3]
27:24	SPDM2SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[2]
23:20	SPDM1SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[1]
19:16	SPDM0SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[0]
15:14	TBHSEL	Testbus highselect It governs which set of signals are to testbus[31:16] TBSLSEL = 0b00 - Bits 15:0 from nuleus bus TBSLSEL = 0b01 - Bits 31:16 from nuleus bus TBSLSEL = 0b10 - Bits 15:0 from wrapper group selected by SMMU_TESTBUSCR[WGSEL] TBSLSEL = 0b11 - Bits 31:16 from wrapper group selected by SMMU_TESTBUSCR[WGSEL

0x078FFEFC IJPEG_SMMU_IJPEG_VR0

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: 32'h0000_0000

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

IJPEG_SMMU_IJPEG_VR0

Bits	Name	Description
31:3	RESERVED	

IJPEG_SMMU_IJPEG_VR0 (cont.)

Bits	Name	Description
2	DCPPT	Disable client pipelining for client operations in pass-through mode Reset state : 0
1	DCPBP	Disable client pipelining for client operations in bypass mode Reset state : 0
0	DCP	Disable client pipelining Reset state : 0

0x078FFF00 IJPEG_SMMU_IJPEG_TLBIALL

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries.

IJPEG_SMMU_IJPEG_TLBIALL

Bits	Name	Description
31:0	EXEC	Writing any value to this register invalidates all TLB entries, as specified by the contents of SMMU_CR[TLBIALLCFG]

0x078FFF04 IJPEG_SMMU_IJPEG_TLBIVMID

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries matching the IVMID value. Precise function is governed by SMMU_CR[TLBIALLCFG].

IJPEG_SMMU_IJPEG_TLBIVMID

Bits	Name	Description
31:5	RESERVED	
4:0	IVMID	Designates VMID[4:0] value of entries to be invalidated.

14.26.1.4 SMMU configuration registers

0x078FFF80 IJPEG_SMMU_IJPEG_CR

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

IJPEG_SMMU_IJPEG_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking ,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management amounst multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1

IJPEG_SMMU_IJPEG_CR (cont.)

Bits	Name	Description
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.26.1.5 SMMU error report registers

0x078FFF84 IJPEG_SMMU_IJPEG_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

IJPEG_SMMU_IJPEG_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x078FFF88 IJPEG_SMMU_IJPEG_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

IJPEG_SMMU_IJPEG_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x078FFF8C IJPEG_SMMU_IJPEG_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

IJPEG_SMMU_IJPEG_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper

IJPEG_SMMU_IJPEG_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x078FFFFC IJPEG_SMMU_IJPEG_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

IJPEG_SMMU_IJPEG_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.26.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.26.2.1 SMMU context bank control registers

0x07800000+0x1000*n IJPEG_SMMU_IJPEG_CBn_SCTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

IJPEG_SMMU_IJPEG_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.

IJPEG_SMMU_IJPEG_CBn_SCTLR (cont.)

Bits	Name	Description
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determining access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07800004+ 0x1000*n IJPEG_SMMU_IJPEG_CBn_ACTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

IJPEG_SMMU_IJPEG_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved

IJPEG_SMMU_IJPEG_CBn_ACTLR (cont.)

Bits	Name	Description
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

IJPEG_SMMU_IJPEG_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

IJPEG_SMMU_IJPEG_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

31:8	RESERVED	
7:0	ASID	Specifies the 8 bit ASID value assigned to this context bank. The ASID can be included in the key comparison of TLB entries. .

0x07800010+ 0x1000*n IJPEG_SMMU_IJPEG_CBn_TTBR0, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table base register, specifies the physical base address and attributes of this context bank's page table. TTBR0 is used for low order virtual addresses, typically private pages for a given process.

IJPEG_SMMU_IJPEG_CBn_TTBR0

Bits	Name	Description
31:7	PA	BIts 31:7 of the physical address of the base of the page table. The actual LSB of the base address is bit 14-N, where N is set in register TTCR
6	IRGN0	LSB of IRGN[1:0]. See description of IRGN above
5	NOS	Not outer shareable Governs the AINNERSHARED attribute for HTW access
4:3	ORGN	ORGN[1:0] outer cache policy for HTW accesses Encoding is as for IRGN
2	RESERVED	
1	SH	shareable Governs the ASHARED attribute of the HTW access.
0	IRGN1	Together with IRGN0 defines the inner cache policy for the accesses to this page table. AMEMTYPE[2:0] for HTW accesses is derived from the IRGN and ORGN fields. IRGN1 IRGN0 0 0 - non-cacheable 0 1 - copy back, write allocate 1 0 - write through, write no allocate 1 1 - copy back, write no allocate

0x07800014+ 0x1000*n IJPEG_SMMU_IJPEG_CBn_TTBR1, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table base register, specifies the physical base address and attributes of this context bank's page table. TTBR1 is used for high order virtual addresses, typically global pages for a given VMID, or kernal mappings.

The context bank auxiliary control register controls various implementation specific features.

IJPEG_SMMU_IJPEG_CBn_TTBR1

Bits	Name	Description
31:14	PA	BIts 31:14 of the physical address of the base of the page table.
13:7	RESERVED_2	
6	IRGN0	LSB of IRGN[1:0]. See description of IRGN above
5	NOS	Not outer shareable Governs the AINNERSHARED attribute for HTW access
4:3	ORGN	ORGN[1:0] outer cache policy for HTW accesses Encoding is as for IRGN
2	RESERVED_1	
1	SH	shareable Governs the ASHARED attribute of the HTW access.
0	IRGN1	Together with IRGN0 defines the inner cache policy for the accesses to this page table. AMEMTYPE[2:0] for HTW accesses is derived from the IRGN and ORGN fields. IRGN1 IRGN0 0 0 - non-cacheable 0 1 - copy back, write allocate 1 0 - write through, write no allocate 1 1 - copy back, write no allocate

0x07800018+ 0x1000*n IJPEG_SMMU_IJPEG_CBn_TTBCR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table control register, which specifies the size of the virtual address space that uses TTBR0.

IJPEG_SMMU_IJPEG_CBn_TTBCR

Bits	Name	Description
31:6	RESERVED_2	
5	PD1	Page disable 1; if this bit is set, hardware table walks attempting to use TTBR1will result in a first level descriptor translation fault. If clear, TTBR1 contents are used.
4	PD0	Page disable 0; if this bit is set, hardware table walks attempting to use TTBR0 will result in a first level descriptor translation fault. If clear, TTBR0 contents are used.
3	RESERVED_1	
2:0	N	N[2:0] specifies the number of upper order virtual address bits which must be 0 in order for translations to use the table pointed to by TTBR0. If any of these bits are non-zero, TTBR1 is used for the lookup. If N is 0, only TTBR0 is used.

0x0780001C+ 0x1000*n IJPEG_SMMU_IJPEG_CBn_PAR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

The physical address register captures the physical address value resulting from the execution of a VA-to-PA command

Field definitions vary according to whether or not there is a context fault associated with the requested translation

IJPEG_SMMU_IJPEG_CBn_PAR

Bits	Name	Description
31:12	PAR_FAULT_INFO_312	
11	RESERVED_2	
10:9	PAR_FAULT_INFO_72	
8	RESERVED_1	
7:1	PAR_FAULT_INFO_71	Encoding varies according to value in FAULT field.
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07800020+0x1000*n IJPEG_SMMU_IJPEG_CBn_FSR, n=[0..1]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

IJPEG_SMMU_IJPEG_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"
30	SS	(stalled status) Indicates whether or not the System MMU is currently stalled due to an exception within this context bank SMMU_CBn_FSR[SS] does not get updated by direct writes to SMMU_CBn_FSR If stalled, software must execute an SMMU_CBn_RESUME command to either retry or terminate the stalled access SMMU_CBn_FSR[SS] will be cleared as a result Reset state : 0
29:17	RESERVED	
16	SL	(second-level) Indicates whether or not the context fault is associated with the second-level page table entry

IJPEG_SMMU_IJPEG_CBn_FSR (cont.)

Bits	Name	Description
15:8	RESERVED_2	
7	MHF	(multi-hit fault) Context fault due to multi-hit in TLB (programming error or soft hardware error)

Clock: AXI_BUS_CLOCK
Reset State: Undefined

The burst fetch buffer configuration register governs the operation of the "burst fill" feature of the SMMU.

IJPEG_SMMU_IJPEG_CBn_BFBCR

Bits	Name	Description
31:12	STRIDE	(stride amount) 4KB-aligned value to be added to virtual address on demand TLB miss for filling subsequent BFB Stride of minimum 4KB alignment useful for preventing stride burst fetch until final PTE of the demand BFB entry is used
11:8	SLVIC	(second-level victim) Indicates the SLBFB index at which the next round-robin allocation will occur
7:4	FLVIC	(first-level victim) Indicates the FLBFB index at which the next round-robin allocation will occur
3	RESERVED	
2	SFVS	(stride-fetch victim selection) SFVS. = 0 (replace normal round-robin victim-selected entry) Useful when stride is larger than the VA space represented by the four PTEs in the demand BFB entry, but the client access pattern is for more than just the initial PTE in that demand BFB entry SFVS. = 1 (replace same BFB used by demand VA for which the stride burst is being performed) Useful when stride is the same as the VA space represented by an individual PTE in the demand BFB entry (such that the stride won't miss against the BFB until the last PTE of the demand BFB entry is accessed), and/or when the client access pattern only uses the initial PTE in the demand BFB entry
1	BFBSFE	(burst fetch buffer stride fetch enable) Enables stride burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Stride burst fetch is for the block of four PTEs associated with VA+stride VA is the "demanded" VA from the client (or VA-to-PA command) Stride value is specified by SMMU_CBn_BFBCR[STRIDE] Stride burst fetch only occurs if demand access for VA misses in TLB (could hit in BFB) and address VA+stride misses in both TLB and BFB
0	BFBDFE	(burst fetch buffer demand fetch enable) Enables demand burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Demand burst fetch is for the block of four PTEs associated with the "demanded" VA from the client (or VA-to-PA command) Demand burst fetch only occurs if demand access misses in both TLB and BFB

0x07800800+ 0x1000*n IJPEG_SMMU_IJPEG_CBn_TLBIALL, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK

The TLB invalidate all command register invalidates all TLB entries matching the VMID associated with this context bank. Data operand is ignored.

IJPEG_SMMU_IJPEG_CBn_TLBIALL

Bits	Name	Description
31:0	RESERVED	

0x07800804+ 0x1000*n IJPEG_SMMU_IJPEG_CBn_TLBIASID, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate by ASID command register invalidates TLB entries matching the specified ASID and matching the VMID associated with this context bank.Invalidates TLB entries which are associated with the designated ASID and which are associated with the VMID associated with the specified context bank

SMMU_CBn_TLBLKCR[TLBIASIDCFG] governs whether command flash-invalidates entire TLB array or just the entries matching the VMID, ASID, and security state

TLBIASIDCFG = 0 - flash-invalidate

SMMU_CBn_TLBIASID command flash-invalidates the entire TLB, without regard to locking, security, VMID, and/or ASID values

TLBIASIDCFG = 1 - selective

SMMU_CBn_TLBIASID command invalidates only entries that match all of the following conditions

VMID field of TLB entry matches VMID value associated with the context bank from SMMU_CBACRn[CBVMID]

ASID field of TLB entry matches ASID value designated by the SMMU_CBn_TLBIASID command data operand

TLB entry is not global (NG field is 1)

NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIASID command

Locking is not considered (matching entries are invalidated even if locked)

ASID field of command specifies the ASID value of the TLB entries to be invalidated

IJPEG_SMMU_IJPEG_CBn_TLBIASID

Bits	Name	Description
31:8	RESERVED	
7:0	ASID	Actual ASID value

7:0	INDEX	INDEX[7:0] (index) TLB index at which the new entry should be allocated when locking is enabled (SMMU_CBn_TLBLKCR[LKE] is 1)

0x07800820+ 0x1000*n IJPEG_SMMU_IJPEG_CBn_RESUME, n=[0..1]

Type: Write/command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB resume command causes the SMMU to resume operation after a stalled access..

IJPEG_SMMU_IJPEG_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.27 VFE SMMU Registers (0x07900000 SMMU_VFE_BASE)

This section contains VFE SMMU registers.

14.27.1 SMMU Global Registers

14.27.1.1 SMMU VMID/CBNDX mapping registers

0x079FF000+ 0x4*n VFE_SMMU_VFE_M2VCBRn, n=[0..15]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

VFE_SMMU_VFE_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

VFE_SMMU_VFE_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

VFE_SMMU_VFE_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.27.1.2 SMMU context bank access control registers

0x079FF800+ 0x4*n VFE_SMMU_VFE_CBACRn, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

VFE_SMMU_VFE_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.27.1.3 SMMU TLB software access registers

0x079FFE00 VFE_SMMU_VFE_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

VFE_SMMU_VFE_TLBRSW

Bits	Name	Description
31:10	RESERVED	

VFE_SMMU_VFE_TLBRSW (cont.)

Bits	Name	Description
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB
7:0	INDEX	TLB index to be read.

0x079FFE80 VFE_SMMU_VFE_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

VFE_SMMU_VFE_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

VFE_SMMU_VFE_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

VFE_SMMU_VFE_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
1	PW	(privileged write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
0	PR	(privileged read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

0x079FFE84 VFE_SMMU_VFE_TLBTR1

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

VFE_SMMU_VFE_TLBTR1

Bits	Name	Description
31:12	PA	Physical address [31:12] field of the TLB entry
11:5	RESERVED	
4:0	VMID	VMID [4:0]field of the TLB entry)

0x079FFE88 VFE_SMMU_VFE_TLBTR2

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

VFE_SMMU_VFE_TLBTR2

Bits	Name	Description
31:12	VA	virtual address field [31:12] of the TLB entry
11	RESERVED	
10	NG	(not global field from page table entry) Indicates whether the page is private to the specified ASID (NG=1) or global to all ASIDs within the VMID using this context bank (NG=0)
9	NSTID	(non-secure tag ID field of the TLB entry) Indicates whether the TLB entry belongs to the secure world (NSTID=0) or the non-secure world (NSTID=1) This field is comned against the incoming NS-prot attribute of the master request as part of TLB hit/miss determination
8	V	valid field of the TLB entry
7:0	ASID	ASID[7:0] field of the TLB entry

0x079FFE8C VFE_SMMU_VFE_TESTBUSCR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

Governs which signals (if any) from the system SMMU core or wrapper design hierarchy are sent out to the system via a testbus for diagnostic, and also to the system profiling and diagnostic monitor(SPDM).

VFE_SMMU_VFE_TESTBUSCR

Bits	Name	Description
31:28	SPDM3SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[3]
27:24	SPDM2SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[2]
23:20	SPDM1SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[1]
19:16	SPDM0SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[0]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: 32'h0000_0000

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

0x079FFF00 VFE_SMMU_VFE_TLBIALL

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries.

VFE_SMMU_VFE_TLBIALL

Bits	Name	Description
31:0	EXEC	Writing any value to this register invalidates all TLB entries, as specified by the contents of SMMU_CR[TLBIALLCFG]

0x079FFF04 VFE_SMMU_VFE_TLBIVMID

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries matching the IVMID value. Precise function is governed by SMMU_CR[TLBIALLCFG].

VFE_SMMU_VFE_TLBIVMID

Bits	Name	Description
31:5	RESERVED	
4:0	IVMID	Designates VMID[4:0] value of entries to be invalidated.

14.27.1.4 SMMU configuration registers

0x079FFF80 VFE_SMMU_VFE_CR

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

VFE_SMMU_VFE_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking ,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management amounst multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1

VFE_SMMU_VFE_CR (cont.)

Bits	Name	Description
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.27.1.5 SMMU error report registers

0x079FFF84 VFE_SMMU_VFE_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

VFE_SMMU_VFE_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x079FFF88 VFE_SMMU_VFE_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

VFE_SMMU_VFE_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x079FFF8C VFE_SMMU_VFE_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

VFE_SMMU_VFE_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	

VFE_SMMU_VFE_ESRRESTORE (cont.)

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper

VFE_SMMU_VFE_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x079FFFFC VFE_SMMU_VFE_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

VFE_SMMU_VFE_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.27.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.27.2.1 SMMU context bank control registers

0x07900000+0x1000*n VFE_SMMU_VFE_CBn_SCTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

VFE_SMMU_VFE_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.

VFE_SMMU_VFE_CBn_SCTLR (cont.)

Bits	Name	Description
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determining access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07900004+ 0x1000*n VFE_SMMU_VFE_CBn_ACTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

VFE_SMMU_VFE_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved

VFE_SMMU_VFE_CBn_ACTLR (cont.)

Bits	Name	Description
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

VFE_SMMU_VFE_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

VFE_SMMU_VFE_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

2	RESERVED_1	
1	SH	shareable Governs the ASHARED attribute of the HTW access.
0	IRGN1	Together with IRGN0 defines the inner cache policy for the accesses to this page table. AMEMTYPE[2:0] for HTW accesses is derived from the IRGN and ORGN fields. IRGN1 IRGN0 0 0 - non-cacheable 0 1 - copy back, write allocate 1 0 - write through, write no allocate 1 1 - copy back, write no allocate

0x07900018+ 0x1000*n VFE_SMMU_VFE_CBn_TTBCR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table control register, which specifies the size of the virtual address space that uses TTBR0.

VFE_SMMU_VFE_CBn_TTBCR

Bits	Name	Description
31:6	RESERVED_2	
5	PD1	Page disable 1; if this bit is set, hardware table walks attempting to use TTBR1will result in a first level descriptor translation fault. If clear, TTBR1 contents are used.
4	PD0	Page disable 0; if this bit is set, hardware table walks attempting to use TTBR0 will result in a first level descriptor translation fault. If clear, TTBR0 contents are used.
3	RESERVED_1	
2:0	N	N[2:0] specifies the number of upper order virtual address bits which must be 0 in order for translations to use the table pointed to by TTBR0. If any of these bits are non-zero, TTBR1 is used for the lookup. If N is 0, only TTBR0 is used.

0x0790001C+ 0x1000*n VFE_SMMU_VFE_CBn_PAR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

The physical address register captures the physical address value resulting from the execution of a VA-to-PA command

Field definitions vary according to whether or not there is a context fault associated with the requested translation

VFE_SMMU_VFE_CBn_PAR

Bits	Name	Description
31:12	PAR_FAULT_INFO_312	
11	RESERVED_2	
10:9	PAR_FAULT_INFO_72	
8	RESERVED_1	
7:1	PAR_FAULT_INFO_71	Encoding varies according to value in FAULT field.
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07900020+0x1000*n VFE_SMMU_VFE_CBn_FSR, n=[0..1]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

VFE_SMMU_VFE_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"
30	SS	(stalled status) Indicates whether or not the System MMU is currently stalled due to an exception within this context bank SMMU_CBn_FSR[SS] does not get updated by direct writes to SMMU_CBn_FSR If stalled, software must execute an SMMU_CBn_RESUME command to either retry or terminate the stalled access SMMU_CBn_FSR[SS] will be cleared as a result Reset state : 0
29:17	RESERVED

0x07900804+ 0x1000*n VFE_SMMU_VFE_CBn_TLBIASID, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate by ASID command register invalidates TLB entries matching the specified ASID and matching the VMID associated with this context bank.Invalidates TLB entries which are associated with the designated ASID and which are associated with the VMID associated with the specified context bank

SMMU_CBn_TLBLKCR[TLBIASIDCFG] governs whether command flash-invalidates entire TLB array or just the entries matching the VMID, ASID, and security state

TLBIASIDCFG = 0 - flash-invalidate

SMMU_CBn_TLBIASID command flash-invalidates the entire TLB, without regard to locking, security, VMID, and/or ASID values

TLBIASIDCFG = 1 - selective

SMMU_CBn_TLBIASID command invalidates only entries that match all of the following conditions

VMID field of TLB entry matches VMID value associated with the context bank from SMMU_CBACRn[CBVMID]

ASID field of TLB entry matches ASID value designated by the SMMU_CBn_TLBIASID command data operand

TLB entry is not global (NG field is 1)

NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIASID command

Locking is not considered (matching entries are invalidated even if locked)

ASID field of command specifies the ASID value of the TLB entries to be invalidated

VFE_SMMU_VFE_CBn_TLBIASID

Bits	Name	Description
31:8	RESERVED	
7:0	ASID	Actual ASID value

0x07900808+ 0x1000*n VFE_SMMU_VFE_CBn_TLBIVA, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate by VA command invalidates TLB entries matching the designated VA, ASID and the VMID associated with this context bank.

Matching entry determined as follows:

VMID field of TLB entry matches VMID value associated with the context bank from SMMU_CBACRn[CBVMID]

ASID field of TLB entry matches ASID value designated by the SMMU_CBn_TLBIVA command data operand (or TLB entry is global - NG field is 0)

VA field of TLB entry matches VA value designated by the SMMU_CBn_TLBIVA command data operand

NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIVA command

Locking is not considered (matching entry is invalidated even if locked)

Data operand specifies the VA and ASID value of the TLB entry to be invalidated

VFE_SMMU_VFE_CBn_TLBIVA

Bits	Name	Description
31:12	VA	VA[31:12]
11:8	RESERVED	
7:0	ASID	ASID[7:0] value

0x0790080C+ 0x1000*n VFE_SMMU_VFE_CBn_TLBIVAA, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate by VA all ASIDS command invalidates TLB entries matching the designated VA and the VMID associated with this context bank, regardless of ASID.Invalidates TLB entries which are associated with the designated VA, regardless of ASID, and which are associated with the VMID associated with the specified context bank

SMMU_CBn_TLBLKCR[TLBIVAACFG] governs whether command flash-invalidates entire TLB array or just the non-locked entries matching the VMID, ASID, and security state

TLBIVAACFG = 0 - flash-invalidate

SMMU_CBn_TLBIVAA command flash-invalidates the entire TLB, without regard to locking, security, address, and/or VMID value

TLBIVAACFG = 1 - selective

SMMU_CBn_TLBIVAA command invalidates only entries that match all of the following conditions

VMID field of TLB entry matches VMID value associated with the context bank from SMMU_CBACRn[CBVMID]

VA field of TLB entry matches VA designated by the SMMU_CBn_TLBIVAA command data operand

NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIALL command

Entry is unlocked

VFE_SMMU_VFE_CBn_TLBIVAA

Bits	Name	Description

Reset State: Undefined

This VA-to-PA command translates the given virtual address value to the corresponding physical address, using the access permission type "privileged read". If the translation is successful, the resulting physical address is placed in the SMMU_CBn_PAR. Searches TLB (and optionally the page table) for the translation of the specified VA

VMID is as configured for the context bank via SMMU_CBACRn[CBVMID]

ASID is as specified in SMMU_CBn_CONTEXTIDR[ASID]

Result recorded in SMMU_CBn_PAR

SMMU_CBn_TLBLKCR[LKE] governs whether or not TLB entries allocated by SMMU_CBn_V2Pxx commands are locked in the TLB

SMMU_CBn_ACTLR[V2PCFG] governs the operation of SMMU_CBn_V2Pxx commands that miss in the TLB

Either pass-through as if MMU were disabled, or signal TLB Miss context fault, or use SMMU_CBn_TLBFLPTER/TLBSLPTER as PTE, or perform hardware table walk to access PTE

SMMU_CBn_ACTLR[DNLV2PA] governs whether non-locking SMMU_CBn_V2Pxx commands that miss in the TLB will allocate a new entry

Data operand specifies the VA to be translated (and optionally the TLB index at which to allocate the entry, if locking)

VFE_SMMU_VFE_CBn_V2PRR

Bits	Name	Description
31:12	VA	VA[31:12] to be translated
11:8	RESERVED	
7:0	INDEX	INDEX[7:0] (index) TLB index at which the new entry should be allocated when locking is enabled (SMMU_CBn_TLBLKCR[LKE] is 1)

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This VA-to-PA command translates the given virtual address value to the corresponding physical address, using the access permission type "user read". If the translation is successful, the resulting physical address is placed in the SMMU_CBn_PAR.

Searches TLB (and optionally the page table) for the translation of the specified VA

VMID is as configured for the context bank via SMMU_CBACRn[CBVMID]

ASID is as specified in SMMU_CBn_CONTEXTIDR[ASID]

Result recorded in SMMU_CBn_PAR

SMMU_CBn_TLBLKCR[LKE] governs whether or not TLB entries allocated by SMMU_CBn_V2Pxx commands are locked in the TLB

SMMU_CBn_ACTLR[V2PCFG] governs the operation of SMMU_CBn_V2Pxx commands that miss in the TLB

Either pass-through as if MMU were disabled, or signal TLB Miss context fault, or use SMMU_CBn_TLBFLPTER/TLBSLPTER as PTE, or perform hardware table walk to access PTE

SMMU_CBn_ACTLR[DNLV2PA] governs whether non-locking SMMU_CBn_V2Pxx commands that miss in the TLB will allocate a new entry

Data operand specifies the VA to be translated (and optionally the TLB index at which to allocate the entry, if locking)

VFE_SMMU_VFE_CBn_V2PUR

Bits	Name	Description
31:12	VA	VA[31:12] to be translated
11:8	RESERVED	
7:0	INDEX	INDEX[7:0] (index) TLB index at which the new entry should be allocated when locking is enabled (SMMU_CBn_TLBLKCR[LKE] is 1)

0x0790081C+ 0x1000*n VFE_SMMU_VFE_CBn_V2PUW, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This VA-to-PA command translates the given virtual address value to the corresponding physical address, using the access permission type "user write". If the translation is successful, the resulting physical address is placed in the SMMU_CBn_PAR.

Searches TLB (and optionally the page table) for the translation of the specified VA

VMID is as configured for the context bank via SMMU_CBACRn[CBVMID]

ASID is as specified in SMMU_CBn_CONTEXTIDR[ASID]

Result recorded in SMMU_CBn_PAR

SMMU_CBn_TLBLKCR[LKE] governs whether or not TLB entries allocated by SMMU_CBn_V2Pxx commands are locked in the TLB

SMMU_CBn_ACTLR[V2PCFG] governs the operation of SMMU_CBn_V2Pxx commands that miss in the TLB

.Either pass-through as if MMU were disabled, or signal TLB Miss context fault, or use SMMU_CBn_TLBFLPTER/TLBSLPTER as PTE, or perform hardware table walk to access PTE

SMMU_CBn_ACTLR[DNLV2PA] governs whether non-locking SMMU_CBn_V2Pxx commands that miss in the TLB will allocate a new entry

Data operand specifies the VA to be translated (and optionally the TLB index at which to allocate the entry, if locking)

VFE_SMMU_VFE_CBn_V2PUW

Bits	Name	Description
31:12	VA	VA[31:12] to be translated
11:8	RESERVED	

VFE_SMMU_VFE_CBn_V2PUW (cont.)

Bits	Name	Description
7:0	INDEX	INDEX[7:0] (index) TLB index at which the new entry should be allocated when locking is enabled (SMMU_CBn_TLBLKCR[LKE] is 1)

0x07900820+ 0x1000*n VFE_SMMU_VFE_CBn_RESUME, n=[0..1]

Type: Write/command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB resume command causes the SMMU to resume operation after a stalled access..

VFE_SMMU_VFE_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.28 VCODEC A SS1080P 0 SMMU Registers (0x07A00000 SMMU_SS1080P_0_BASE)

This section contains VCODEC A SS1080P 0 SMMU registers.

14.28.1 SMMU Global Registers

14.28.1.1 SMMU VMID/CBNDX mapping registers

0x07AFF000+0x4*n SS1080P_0_SMMU_VCODEC_A_M2VCBRn, n=[0..15]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

SS1080P_0_SMMU_VCODEC_A_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

SS1080P_0_SMMU_VCODEC_A_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

SS1080P_0_SMMU_VCODEC_A_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.28.1.2 SMMU context bank access control registers

0x07AFF800+0x4*n SS1080P_0_SMMU_VCODEC_A_CBACRn, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

SS1080P_0_SMMU_VCODEC_A_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.28.1.3 SMMU TLB software access registers

0x07AFFE00 SS1080P_0_SMMU_VCODEC_A_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

SS1080P_0_SMMU_VCODEC_A_TLBRSW

Bits	Name	Description
31:10	RESERVED	

SS1080P_0_SMMU_VCODEC_A_TLBRSW (cont.)

Bits	Name	Description
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB
7:0	INDEX	TLB index to be read.

0x07AFFE80 SS1080P_0_SMMU_VCODEC_A_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

SS1080P_0_SMMU_VCODEC_A_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

SS1080P_0_SMMU_VCODEC_A_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

SS1080P_0_SMMU_VCODEC_A_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
1	PW	(privileged write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
0	PR	(privileged read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

0x07AFFE84 SS1080P_0_SMMU_VCODEC_A_TLBTR1

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

SS1080P_0_SMMU_VCODEC_A_TLBTR1

Bits	Name	Description
31:12	PA	Physical address [31:12] field of the TLB entry
11:5	RESERVED	
4:0	VMID	VMID [4:0]field of the TLB entry)

0x07AFFE88 SS1080P_0_SMMU_VCODEC_A_TLBTR2

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

SS1080P_0_SMMU_VCODEC_A_TLBTR2

Bits	Name	Description
31:12	VA	virtual address field [31:12] of the TLB entry
11	RESERVED	
10	NG	(not global field from page table entry) Indicates whether the page is private to the specified ASID (NG=1) or global to all ASIDs within the VMID using this context bank (NG=0)
9	NSTID	(non-secure tag ID field of the TLB entry) Indicates whether the TLB entry belongs to the secure world (NSTID=0) or the non-secure world (NSTID=1) This field is comned against the incoming NS-prot attribute of the master request as part of TLB hit/miss determination
8	V	valid field of the TLB entry
7:0	ASID	ASID[7:0] field of the TLB entry

0x07AFFE8C SS1080P_0_SMMU_VCODEC_A_TESTBUSCR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

Governs which signals (if any) from the system SMMU core or wrapper design hierarchy are sent out to the system via a testbus for diagnostic, and also to the system profiling and diagnostic monitor(SPDM).

SS1080P_0_SMMU_VCODEC_A_TESTBUSCR

Bits	Name	Description
31:28	SPDM3SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[3]
27:24	SPDM2SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[2]
23:20	SPDM1SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[1]
19:16	SPDM0SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[0]
15:14	TBHSEL	Testbus highselect It governs which set of signals are to testbus[31:16] TBSLSEL = 0b00 - Bits 15:0 from nuleus bus TBSLSEL = 0b01 - Bits 31:16 from nuleus bus TBSLSEL = 0b10 - Bits 15:0 from wrapper group selected by SMMU_TESTBUSCR[WGSEL] TBSLSEL = 0b11 - Bits 31:16 from wrapper group selected by SMMU_TESTBUSCR[WGSEL

SS1080P_0_SMMU_VCODEC_A_TESTBUSCR (cont.)

Bits	Name	Description
13:12	TBSLSEL	Testbus low select It governs which set of signals are to testbus[15:0] TBSLSEL = 0b00 - Bits 15:0 from nuleus bus TBSLSEL = 0b01 - Bits 31:16 from nuleus bus TBSLSEL = 0b10 - Bits 15:0 from wrapper group selected by SMMU_TESTBUSCR[WGSEL] TBSLSEL = 0b11 - Bits 31:16 from wrapper group selected by SMMU_TESTBUSCR[WGSEL
11:10	RESERVED_2	
9:8	WGSEL	Wrapper group select It selects a particular group of signals from the SMMU wrapper hierarchy WGSEL = 0b00 - wrapper signal group 0 WGSEL = 0b01 - wrapper signal group 1 WGSEL = 0b10 - wrapper signal group 2 WGSEL = 0b11 - reserved
7:2	RESERVED_1	
1	SPDMBE	SPDM test enable Reset state : 0
0	TBE	Testbus enable, which governs whether the testbus is driven with all 0s or with the configured signals Reset state : 0

0x07AFFEFC SS1080P_0_SMMU_VCODEC_A_VR0

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: 32'h0000_0000

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

0x07AFFFFC SS1080P_0_SMMU_VCODEC_A_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

SS1080P_0_SMMU_VCODEC_A_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.28.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.28.2.1 SMMU context bank control registers

0x07A00000+ 0x1000*n SS1080P_0_SMMU_VCODEC_A_CBn_SCTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

SS1080P_0_SMMU_VCODEC_A_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determining access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07A00004+ 0x1000*n SS1080P_0_SMMU_VCODEC_A_CBn_ACTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

SS1080P_0_SMMU_VCODEC_A_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	

SS1080P_0_SMMU_VCODEC_A_CBn_ACTLR (cont.)

Bits	Name	Description
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)

SS1080P_0_SMMU_VCODEC_A_CBn_ACTLR (cont.)

Bits	Name	Description
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

SS1080P_0_SMMU_VCODEC_A_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

SS1080P_0_SMMU_VCODEC_A_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

SS1080P_0_SMMU_VCODEC_A_CBn_TTBCR

Bits	Name	Description
31:6	RESERVED_2	
5	PD1	Page disable 1; if this bit is set, hardware table walks attempting to use TTBR1will result in a first level descriptor translation fault. If clear, TTBR1 contents are used.
4	PD0	Page disable 0; if this bit is set, hardware table walks attempting to use TTBR0 will result in a first level descriptor translation fault. If clear, TTBR0 contents are used.
3	RESERVED_1	
2:0	N	N[2:0] specifies the number of upper order virtual address bits which must be 0 in order for translations to use the table pointed to by TTBR0. If any of these bits are non-zero, TTBR1 is used for the lookup. If N is 0, only TTBR0 is used.

0x07A0001C+0x1000*n SS1080P_0_SMMU_VCODEC_A_CBn_PAR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

The physical address register captures the physical address value resulting from the execution of a VA-to-PA command

Field definitions vary according to whether or not there is a context fault associated with the requested translation

.

.

SS1080P_0_SMMU_VCODEC_A_CBn_PAR

Bits	Name	Description

SS1080P_0_SMMU_VCODEC_A_CBn_PAR (cont.)

Bits	Name	Description
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07A00020+ 0x1000*n SS1080P_0_SMMU_VCODEC_A_CBn_FSR, n=[0..1]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

SS1080P_0_SMMU_VCODEC_A_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"

Reset State: Undefined

The burst fetch buffer configuration register governs the operation of the "burst fill" feature of the SMMU.

SS1080P_0_SMMU_VCODEC_A_CBn_BFBCR

Bits	Name	Description
31:12	STRIDE	(stride amount) 4KB-aligned value to be added to virtual address on demand TLB miss for filling subsequent BFB Stride of minimum 4KB alignment useful for preventing stride burst fetch until final PTE of the demand BFB entry is used
11:8	SLVIC	(second-level victim) Indicates the SLBFB index at which the next round-robin allocation will occur
7:4	FLVIC	(first-level victim) Indicates the FLBFB index at which the next round-robin allocation will occur
3	RESERVED	
2	SFVS	(stride-fetch victim selection) SFVS. = 0 (replace normal round-robin victim-selected entry) Useful when stride is larger than the VA space represented by the four PTEs in the demand BFB entry, but the client access pattern is for more than just the initial PTE in that demand BFB entry SFVS. = 1 (replace same BFB used by demand VA for which the stride burst is being performed) Useful when stride is the same as the VA space represented by an individual PTE in the demand BFB entry (such that the stride won't miss against the BFB until the last PTE of the demand BFB entry is accessed), and/or when the client access pattern only uses the initial PTE in the demand BFB entry

SS1080P_0_SMMU_VCODEC_A_CBn_BFBCR (cont.)

Bits	Name	Description
1	BFBSFE	(burst fetch buffer stride fetch enable) Enables stride burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Stride burst fetch is for the block of four PTEs associated with VA+stride VA is the "demanded" VA from the client (or VA-to-PA command) Stride value is specified by SMMU_CBn_BFBCR[STRIDE] Stride burst fetch only occurs if demand access for VA misses in TLB (could hit in BFB) and address VA+stride misses in both TLB and BFB
0	BFBDFE	(burst fetch buffer demand fetch enable) Enables demand burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Demand burst fetch is for the block of four PTEs associated with the "demanded" VA from the client (or VA-to-PA command) Demand burst fetch only occurs if demand access misses in both TLB and BFB

0x07A00800+ 0x1000*n SS1080P_0_SMMU_VCODEC_A_CBn_TLBIALL, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate all command register invalidates all TLB entries matching the VMID associated with this context bank. Data operand is ignored.

SS1080P_0_SMMU_VCODEC_A_CBn_TLBIALL

Bits	Name	Description
31:0	RESERVED	

0x07A00804+ 0x1000*n SS1080P_0_SMMU_VCODEC_A_CBn_TLBIASID, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate by ASID command register invalidates TLB entries matching the specified ASID and matching the VMID associated with this context bank.Invalidates TLB entries which are associated with the designated ASID and which are associated with the VMID associated with the specified context bank

SMMU_CBn_TLBLKCR[TLBIASIDCFG] governs whether command flash-invalidates entire TLB array or just the entries matching the VMID, ASID, and security state

TLBIASIDCFG = 0 - flash-invalidate

SMMU_CBn_TLBIASID command flash-invalidates the entire TLB, without regard to locking, security, VMID, and/or ASID values

TLBIASIDCFG = 1 - selective

SMMU_CBn_TLBIASID command invalidates only entries that match all of the following conditions

VMID field of TLB entry matches VMID value associated with the context bank from SMMU_CBACRn[CBVMID]

ASID field of TLB entry matches ASID value designated by the SMMU_CBn_TLBIASID command data operand

TLB entry is not global (NG field is 1)

NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIASID command

Locking is not considered (matching entries are invalidated even if locked)

ASID field of command specifies the ASID value of the TLB entries to be invalidated

SS1080P_0_SMMU_VCODEC_A_CBn_TLBIASID

Bits	Name	Description
31:8	RESERVED	
7:0	ASID	Actual ASID value

0x07A00808+ 0x1000*n SS1080P_0_SMMU_VCODEC_A_CBn_TLBIVA, n=[0..1]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate by VA command invalidates TLB entries matching the designated VA, ASID and the VMID associated with this context bank.

Matching entry determined as follows:

VMID field of TLB entry matches VMID value associated with the context bank from SMMU_CBACRn[CBVMID]

ASID field of TLB entry matches ASID value designated by the SMMU_CBn_TLBIVA command data operand (or TLB entry is global - NG field is 0)

VA field of TLB entry matches VA value designated by the SMMU_CBn_TLBIVA command data operand

NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIVA command

Locking is not considered (matching entry is invalidated even if locked)

Data operand specifies the VA and ASID value of the TLB entry to be invalidated

SS1080P_0_SMMU_VCODEC_A_CBn_TLBIVA

Bits	Name	Description
31:12	VA	VA[31:12]

Type: Write/command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB resume command causes the SMMU to resume operation after a stalled access..

SS1080P_0_SMMU_VCODEC_A_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	

SS1080P_0_SMMU_VCODEC_A_CBn_RESUME (cont.)

Bits	Name	Description
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.29 VCODEC B SS1080P 1 SMMU Registers (0x07B00000 SMMU_SS1080P_1_BASE)

This section contains VCODEC B SS1080P 1 SMMU registers.

14.29.1 SMMU Global Registers

14.29.1.1 SMMU VMID/CBNDX mapping registers

0x07BFF000+0x4*n SS1080P_1_SMMU_VCODEC_B_M2VCBRn, n=[0..15]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

SS1080P_1_SMMU_VCODEC_B_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

SS1080P_1_SMMU_VCODEC_B_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

SS1080P_1_SMMU_VCODEC_B_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.29.1.2 SMMU context bank access control registers

0x07BFF800+0x4*n SS1080P_1_SMMU_VCODEC_B_CBACRn, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

SS1080P_1_SMMU_VCODEC_B_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.29.1.3 SMMU TLB software access registers

0x07BFFE00 SS1080P_1_SMMU_VCODEC_B_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

SS1080P_1_SMMU_VCODEC_B_TLBRSW

Bits	Name	Description
31:10	RESERVED	

SS1080P_1_SMMU_VCODEC_B_TLBRSW (cont.)

Bits	Name	Description
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB
7:0	INDEX	TLB index to be read.

0x07BFFE80 SS1080P_1_SMMU_VCODEC_B_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

SS1080P_1_SMMU_VCODEC_B_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

SS1080P_1_SMMU_VCODEC_B_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

SS1080P_1_SMMU_VCODEC_B_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
1	PW	(privileged write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
0	PR	(privileged read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

0x07BFFE84 SS1080P_1_SMMU_VCODEC_B_TLBTR1

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

SS1080P_1_SMMU_VCODEC_B_TLBTR1

Bits	Name	Description
31:12	PA	Physical address [31:12] field of the TLB entry
11:5	RESERVED	
4:0	VMID	VMID [4:0]field of the TLB entry)

0x07BFFE88 SS1080P_1_SMMU_VCODEC_B_TLBTR2

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

These registers hold the result of a TLBRSW command.

SS1080P_1_SMMU_VCODEC_B_TLBTR2

Bits	Name	Description
31:12	VA	virtual address field [31:12] of the TLB entry
11	RESERVED	
10	NG	(not global field from page table entry) Indicates whether the page is private to the specified ASID (NG=1) or global to all ASIDs within the VMID using this context bank (NG=0)
9	NSTID	(non-secure tag ID field of the TLB entry) Indicates whether the TLB entry belongs to the secure world (NSTID=0) or the non-secure world (NSTID=1) This field is comned against the incoming NS-prot attribute of the master request as part of TLB hit/miss determination
8	V	valid field of the TLB entry
7:0	ASID	ASID[7:0] field of the TLB entry

0x07BFFE8C SS1080P_1_SMMU_VCODEC_B_TESTBUSCR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

Governs which signals (if any) from the system SMMU core or wrapper design hierarchy are sent out to the system via a testbus for diagnostic, and also to the system profiling and diagnostic monitor(SPDM).

SS1080P_1_SMMU_VCODEC_B_TESTBUSCR

Bits	Name	Description
31:28	SPDM3SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[3]
27:24	SPDM2SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[2]
23:20	SPDM1SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[1]
19:16	SPDM0SEL	It selects one of 16 signals to be sent to SPDM on spdmbus[0]

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

SS1080P_1_SMMU_VCODEC_B_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking ,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management amounst multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X

SS1080P_1_SMMU_VCODEC_B_CR (cont.)

Bits	Name	Description
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.29.1.5 SMMU error report registers

0x07BFFF84 SS1080P_1_SMMU_VCODEC_B_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

SS1080P_1_SMMU_VCODEC_B_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x07BFFF88 SS1080P_1_SMMU_VCODEC_B_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

SS1080P_1_SMMU_VCODEC_B_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x07BFFF8C SS1080P_1_SMMU_VCODEC_B_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

SS1080P_1_SMMU_VCODEC_B_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper.

SS1080P_1_SMMU_VCODEC_B_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported

SS1080P_1_SMMU_VCODEC_B_IDR (cont.)

Bits	Name	Description
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x07BFFFFC SS1080P_1_SMMU_VCODEC_B_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

SS1080P_1_SMMU_VCODEC_B_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.29.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.29.2.1 SMMU context bank control registers

0x07B00000+0x1000*n SS1080P_1_SMMU_VCODEC_B_CBn_SCTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

SS1080P_1_SMMU_VCODEC_B_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determining access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07B00004+ 0x1000*n SS1080P_1_SMMU_VCODEC_B_CBn_ACTLR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

SS1080P_1_SMMU_VCODEC_B_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	

SS1080P_1_SMMU_VCODEC_B_CBn_ACTLR (cont.)

Bits	Name	Description
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)

SS1080P_1_SMMU_VCODEC_B_CBn_ACTLR (cont.)

Bits	Name	Description
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

SS1080P_1_SMMU_VCODEC_B_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

SS1080P_1_SMMU_VCODEC_B_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table base register, specifies the physical base address and attributes of this context bank's page table. TTBR0 is used for low order virtual addresses, typically private pages for a given process.

SS1080P_1_SMMU_VCODEC_B_CBn_TTBR0

Bits	Name	Description
31:7	PA	BIts 31:7 of the physical address of the base of the page table. The actual LSB of the base address is bit 14-N, where N is set in register TTCR
6	IRGN0	LSB of IRGN[1:0]. See description of IRGN above
5	NOS	Not outer shareable Governs the AINNERSHARED attribute for HTW access
4:3	ORGN	ORGN[1:0] outer cache policy for HTW accesses Encoding is as for IRGN
2	RESERVED	
1	SH	shareable Governs the ASHARED attribute of the HTW access.
0	IRGN1	Together with IRGN0 defines the inner cache policy for the accesses to this page table. AMEMTYPE[2:0] for HTW accesses is derived from the IRGN and ORGN fields. IRGN1 IRGN0 0 0 - non-cacheable 0 1 - copy back, write allocate 1 0 - write through, write no allocate 1 1 - copy back, write no allocate

0x07B00014+ 0x1000*n SS1080P_1_SMMU_VCODEC_B_CBn_TTBR1, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table base register, specifies the physical base address and attributes of this context bank's page table. TTBR1 is used for high order virtual addresses, typically global pages for a given VMID, or kernal mappings.

The context bank auxiliary control register controls various implementation specific features.

SS1080P_1_SMMU_VCODEC_B_CBn_TTBR1

Bits	Name	Description
31:14	PA	BIts 31:14 of the physical address of the base of the page table.
13:7	RESERVED_2	
6	IRGN0	LSB of IRGN[1:0]. See description of IRGN above
5	NOS	Not outer shareable Governs the AINNERSHARED attribute for HTW access
4:3	ORGN	ORGN[1:0] outer cache policy for HTW accesses Encoding is as for IRGN
2	RESERVED_1	
1	SH	shareable Governs the ASHARED attribute of the HTW access.
0	IRGN1	Together with IRGN0 defines the inner cache policy for the accesses to this page table. AMEMTYPE[2:0] for HTW accesses is derived from the IRGN and ORGN fields. IRGN1 IRGN0 0 0 - non-cacheable 0 1 - copy back, write allocate 1 0 - write through, write no allocate 1 1 - copy back, write no allocate

SS1080P_1_SMMU_VCODEC_B_CBn_PAR (cont.)

Bits	Name	Description
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07B00020+ 0x1000*n SS1080P_1_SMMU_VCODEC_B_CBn_FSR, n=[0..1]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g., translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data.

This prevents inadvertent clearing of new faults when writing the register to clear an old fault.

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus.

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR.

SS1080P_1_SMMU_VCODEC_B_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"

31:2	SL_PTE	The actual contents of the PTE vary depending on the TYPE
1:0	TYPE	0x0: fault

0x07B0004C+0x1000*n SS1080P_1_SMMU_VCODEC_B_CBn_BFBCR, n=[0..1]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The burst fetch buffer configuration register governs the operation of the "burst fill" feature of the SMMU.

SS1080P_1_SMMU_VCODEC_B_CBn_BFBCR

Bits	Name	Description
31:12	STRIDE	(stride amount) 4KB-aligned value to be added to virtual address on demand TLB miss for filling subsequent BFB Stride of minimum 4KB alignment useful for preventing stride burst fetch until final PTE of the demand BFB entry is used
11:8	SLVIC	(second-level victim) Indicates the SLBFB index at which the next round-robin allocation will occur
7:4	FLVIC	(first-level victim) Indicates the FLBFB index at which the next round-robin allocation will occur
3	RESERVED	
2	SFVS	(stride-fetch victim selection) SFVS. = 0 (replace normal round-robin victim-selected entry) Useful when stride is larger than the VA space represented by the four PTEs in the demand BFB entry, but the client access pattern is for more than just the initial PTE in that demand BFB entry SFVS. = 1 (replace same BFB used by demand VA for which the stride burst is being performed) Useful when stride is the same as the VA space represented by an individual PTE in the demand BFB entry (such that the stride won't miss against the BFB until the last PTE of the demand BFB entry is accessed), and/or when the client access pattern only uses the initial PTE in the demand BFB entry

SS1080P_1_SMMU_VCODEC_B_CBn_BFBCR (cont.)

Bits	Name	Description
1	BFBSFE	(burst fetch buffer stride fetch enable) Enables stride burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Stride burst fetch is for the block of four PTEs associated with VA+stride VA is the "demanded" VA from the client (or VA-to-PA command) Stride value is specified by SMMU_CBn_BFBCR[STRIDE] Stride burst fetch only occurs if demand access for VA misses in TLB (could hit in BFB) and address VA+stride misses in both TLB and BFB
0	BFBDFE	(burst fetch buffer demand fetch enable) Enables demand burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Demand burst fetch is for the block of four PTEs associated with the "demanded" VA from the client (or VA-to-PA command) Demand burst fetch only occurs if demand access misses in both TLB and BFB

0x07B00800+ 0x1000*n SS1080P_1_SMMU_VCODEC_B_CBn_TLBIALL, n=[0..1]

Reset State: Undefined

The TLB resume command causes the SMMU to resume operation after a stalled access.

SS1080P_1_SMMU_VCODEC_B_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.30 3D Graphics SMMU Registers (0x07C00000 SMMU_GFX3D_BASE)

This section contains 3D Graphics SMMU registers.

14.30.1 SMMU Global Registers

14.30.1.1 SMMU VMID/CBNDX mapping registers

0x07CFF000+0x4*n GFX3D_SMMU_GFX3D_M2VCBRn, n=[0..31]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

GFX3D_SMMU_GFX3D_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

GFX3D_SMMU_GFX3D_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

GFX3D_SMMU_GFX3D_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.30.1.2 SMMU context bank access control registers

0x07CFF800+0x4*n GFX3D_SMMU_GFX3D_CBACRn, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

GFX3D_SMMU_GFX3D_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.30.1.3 SMMU TLB software access registers

0x07CFFE00 GFX3D_SMMU_GFX3D_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

GFX3D_SMMU_GFX3D_TLBRSW

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: 32'h0000_0000

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

0x07CFFF00 GFX3D_SMMU_GFX3D_TLBIALL

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries.

GFX3D_SMMU_GFX3D_TLBIALL

Bits	Name	Description
31:0	EXEC	Writing any value to this register invalidates all TLB entries, as specified by the contents of SMMU_CR[TLBIALLCFG]

0x07CFFF04 GFX3D_SMMU_GFX3D_TLBIVMID

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries matching the IVMID value. Precise function is governed by SMMU_CR[TLBIALLCFG].

GFX3D_SMMU_GFX3D_TLBIVMID

Bits	Name	Description
31:5	RESERVED	
4:0	IVMID	Designates VMID[4:0] value of entries to be invalidated.

14.30.1.4 SMMU configuration registers

0x07CFFF80 GFX3D_SMMU_GFX3D_CR

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

GFX3D_SMMU_GFX3D_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking ,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management amounst multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1

GFX3D_SMMU_GFX3D_CR (cont.)

Bits	Name	Description
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.30.1.5 SMMU error report registers

0x07CFFF84 GFX3D_SMMU_GFX3D_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

GFX3D_SMMU_GFX3D_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x07CFFF88 GFX3D_SMMU_GFX3D_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

GFX3D_SMMU_GFX3D_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x07CFFF8C GFX3D_SMMU_GFX3D_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

GFX3D_SMMU_GFX3D_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	

GFX3D_SMMU_GFX3D_ESRRESTORE (cont.)

Bits	Name	Description
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper

GFX3D_SMMU_GFX3D_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10

GFX3D_SMMU_GFX3D_IDR (cont.)

Bits	Name	Description
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x07CFFFFC GFX3D_SMMU_GFX3D_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

GFX3D_SMMU_GFX3D_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.30.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.30.2.1 SMMU context bank control registers

0x07C00000+ 0x1000*n GFX3D_SMMU_GFX3D_CBn_SCTLR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

GFX3D_SMMU_GFX3D_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determining access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07C00004+ 0x1000*n GFX3D_SMMU_GFX3D_CBn_ACTLR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

GFX3D_SMMU_GFX3D_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	

GFX3D_SMMU_GFX3D_CBn_ACTLR (cont.)

Bits	Name	Description
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)

GFX3D_SMMU_GFX3D_CBn_ACTLR (cont.)

Bits	Name	Description
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

GFX3D_SMMU_GFX3D_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

GFX3D_SMMU_GFX3D_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table base register, specifies the physical base address and attributes of this context bank's page table. TTBR0 is used for low order virtual addresses, typically private pages for a given process.

GFX3D_SMMU_GFX3D_CBn_TTBR0

Bits	Name	Description
31:7	PA	BIts 31:7 of the physical address of the base of the page table. The actual LSB of the base address is bit 14-N, where N is set in register TTCR
6	IRGN0	LSB of IRGN[1:0]. See description of IRGN above
5	NOS	Not outer shareable Governs the AINNERSHARED attribute for HTW access
4:3	ORGN	ORGN[1:0] outer cache policy for HTW accesses Encoding is as for IRGN
2	RESERVED	
1	SH	shareable Governs the ASHARED attribute of the HTW access.
0	IRGN1	Together with IRGN0 defines the inner cache policy for the accesses to this page table. AMEMTYPE[2:0] for HTW accesses is derived from the IRGN and ORGN fields. IRGN1 IRGN0 0 0 - non-cacheable 0 1 - copy back, write allocate 1 0 - write through, write no allocate 1 1 - copy back, write no allocate

0x07C00014+ 0x1000*n GFX3D_SMMU_GFX3D_CBn_TTBR1, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table base register, specifies the physical base address and attributes of this context bank's page table. TTBR1 is used for high order virtual addresses, typically global pages for a given VMID, or kernal mappings.

The context bank auxiliary control register controls various implementation specific features.

GFX3D_SMMU_GFX3D_CBn_TTBR1

Bits	Name	Description
31:14	PA	BIts 31:14 of the physical address of the base of the page table.
13:7	RESERVED_2	
6	IRGN0	LSB of IRGN[1:0]. See description of IRGN above
5	NOS	Not outer shareable Governs the AINNERSHARED attribute for HTW access
4:3	ORGN	ORGN[1:0] outer cache policy for HTW accesses Encoding is as for IRGN
2	RESERVED_1	
1	SH	shareable Governs the ASHARED attribute of the HTW access.
0	IRGN1	Together with IRGN0 defines the inner cache policy for the accesses to this page table. AMEMTYPE[2:0] for HTW accesses is derived from the IRGN and ORGN fields. IRGN1 IRGN0 0 0 - non-cacheable 0 1 - copy back, write allocate 1 0 - write through, write no allocate 1 1 - copy back, write no allocate

0x07C00018+ 0x1000*n GFX3D_SMMU_GFX3D_CBn_TTBCR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table control register, which specifies the size of the virtual address space that uses TTBR0.

.

GFX3D_SMMU_GFX3D_CBn_TTBCR

Bits	Name	Description
31:6	RESERVED_2	
5	PD1	Page disable 1; if this bit is set, hardware table walks attempting to use TTBR1will result in a first level descriptor translation fault. If clear, TTBR1 contents are used.
4	PD0	Page disable 0; if this bit is set, hardware table walks attempting to use TTBR0 will result in a first level descriptor translation fault. If clear, TTBR0 contents are used.
3	RESERVED_1	
2:0	N	N[2:0] specifies the number of upper order virtual address bits which must be 0 in order for translations to use the table pointed to by TTBR0. If any of these bits are non-zero, TTBR1 is used for the lookup. If N is 0, only TTBR0 is used.

0x07C0001C+0x1000*n GFX3D_SMMU_GFX3D_CBn_PAR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

The physical address register captures the physical address value resulting from the execution of a VA-to-PA command

Field definitions vary according to whether or not there is a context fault associated with the requested translation

.

.

GFX3D_SMMU_GFX3D_CBn_PAR

Bits	Name	Description
31:12	PAR_FAULT_INFO_312	
11	RESERVED_2	
10:9	PAR_FAULT_INFO_72	
8	RESERVED_1	
7:1	PAR_FAULT_INFO_71	Encoding varies according to value in FAULT field.

GFX3D_SMMU_GFX3D_CBn_PAR (cont.)

Bits	Name	Description
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07C00020+ 0x1000*n GFX3D_SMMU_GFX3D_CBn_FSR, n=[0..2]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

.

GFX3D_SMMU_GFX3D_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"

The burst fetch buffer configuration register governs the operation of the "burst fill" feature of the SMMU.

GFX3D_SMMU_GFX3D_CBn_BFBCR

Bits	Name	Description
31:12	STRIDE	(stride amount) 4KB-aligned value to be added to virtual address on demand TLB miss for filling subsequent BFB Stride of minimum 4KB alignment useful for preventing stride burst fetch until final PTE of the demand BFB entry is used
11:8	SLVIC	(second-level victim) Indicates the SLBFB index at which the next round-robin allocation will occur
7:4	FLVIC	(first-level victim) Indicates the FLBFB index at which the next round-robin allocation will occur
3	RESERVED	
2	SFVS	(stride-fetch victim selection) SFVS. = 0 (replace normal round-robin victim-selected entry) Useful when stride is larger than the VA space represented by the four PTEs in the demand BFB entry, but the client access pattern is for more than just the initial PTE in that demand BFB entry SFVS. = 1 (replace same BFB used by demand VA for which the stride burst is being performed) Useful when stride is the same as the VA space represented by an individual PTE in the demand BFB entry (such that the stride won't miss against the BFB until the last PTE of the demand BFB entry is accessed), and/or when the client access pattern only uses the initial PTE in the demand BFB entry

GFX3D_SMMU_GFX3D_CBn_BFBCR (cont.)

Bits	Name	Description
1	BFBSFE	(burst fetch buffer stride fetch enable) Enables stride burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Stride burst fetch is for the block of four PTEs associated with VA+stride VA is the "demanded" VA from the client (or VA-to-PA command) Stride value is specified by SMMU_CBn_BFBCR[STRIDE] Stride burst fetch only occurs if demand access for VA misses in TLB (could hit in BFB) and address VA+stride misses in both TLB and BFB
0	BFBDFE	(burst fetch buffer demand fetch enable) Enables demand burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Demand burst fetch is for the block of four PTEs associated with the "demanded" VA from the client (or VA-to-PA command) Demand burst fetch only occurs if demand access misses in both TLB and BFB

Reset State: Undefined

The TLB resume command causes the SMMU to resume operation after a stalled access..

GFX3D_SMMU_GFX3D_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	

GFX3D_SMMU_GFX3D_CBn_RESUME (cont.)

Bits	Name	Description
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.31 3D Graphics 1 SMMU Registers (0x07D00000 SMMU_GFX3D1_BASE)

This section contains 3D Graphics 1 SMMU registers.

14.31.1 SMMU Global Registers

14.31.1.1 SMMU VMID/CBNDX mapping registers

0x07DFF000+0x4*n GFX3D1_SMMU_GFX3D1_M2VCBRn, n=[0..31]

Type: Read/Write
Clock: AXI_CLK
Reset State: Undefined

SMMU_M2VCBRm registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

GFX3D1_SMMU_GFX3D1_M2VCBRn

Bits	Name	Description
31:28	RESERVED_2	
27:25	BPMEMTYPE	(bypass memory type) Supplies the AMEMTYPE attributes for client requests which bypass the System MMU when SMMU_M2VCBRn[BPMTCFG] = 1 See reference section for AMEMTYPE encoding definitions
24	BPMTCFG	(bypass memory type configuration) Governs the memory type (AMEMTYPE) attributes of client requests which bypass the System MMU BPMTCFG = 0 - use AMEMTYPE Bypass requests use AMEMTYPE signal supplied by client master BPMTCFG = 1 - use SMMU_M2VCBRn[BPMEMTYPE] Bypass requests use SMMU_M2VCBRn[BPMEMTYPE] Reset state : 0
23:22	NSCFG	(non-secure configuration) Governs the incoming security designation of client requests NSCFG = 0b00 - use APROTNS Use APROTNS signal supplied by client master NSCFG = 0b01 - reserved NSCFG = 0b10 - secure System MMU ignores APROTNS; treats all requests as secure NSCFG = 0b11 - non-secure System MMU ignores APROTNS; treats all requests as non-secure Reset state : 0

GFX3D1_SMMU_GFX3D1_M2VCBRn (cont.)

Bits	Name	Description
21:20	BPSHCFG	(bypass shareability configuration) Governs the shareability realm (ASHARED and AINNERSHARED) attributes of client requests which bypass the System MMU BPSHCFG = 0b00 - use ASHARED and AINNERSHARED Bypass requests use ASHARED and AINNERSHARED signals supplied by client master BPSHCFG = 0b01 - outer-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 0 BPSHCFG = 0b10 - inner-shareable Bypass requests set ASHARED = 1, AINNERSHARED = 1 BPSHCFG = 0b11 - non-shareable Bypass requests set ASHARED = 0, AINNERSHARED = 0 Reset state : 0
19	BPRCNSH	(bypass redirect cacheable-non-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache Reset state : 0
18	BPRCISH	(bypass redirect cacheable-inner-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0
17	BPRCOSH	(bypass redirect cacheable-outer-shareable) Governs whether or not client accesses that bypass the System MMU and which are cacheable and outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache Reset state : 0

GFX3D1_SMMU_GFX3D1_M2VCBRn (cont.)

Bits	Name	Description
16	BYPASSD	Bypass disable for this index Governs whether or not client port accesses using this mapping table entry are actually permitted to "bypass" the System MMU when such bypass is indicated (either due to CBNDX = 255 or due to the master asserting the "SMMU bypass" input) This field is ignored (and operates as if it were 0) if SMMU_CR[CLIENTPD] is 1 BYPASSD = 0 - bypass enabled Bypass requests truly bypass the System MMU and "pass-through" to the fabric (no translation, access control, or attribute generation) No cycle of latency for System MMU context bank access Bypass request not considered an error Bypass request error not recorded in SMMU_ESR[BYPASS] Bypass error not reported to requesting master SMMU_rpuErrIrptReq interrupt output not asserted Client accesses still reference M2VCBMT to get VMID value for presentation to fabric BYPASSD = 1 - bypass disabled System MMU terminates the access as RAZ/WI Bypass request is considered an error Bypass request error is recorded in SMMU_ESR[BYPASS] If SMMU_CR[RPUERE] is 1, then bypass error reported to requesting master according to the client port bus protocol If SMMU_CR[RPUEIE] is 1, then SMMU_rpuErrIrptReq interrupt output asserted
15:8	CBNDX	Context bank index Context bank index associated with the M2VCBMT index CBNDX = 255 indicates no context bank assigned ("bypass")
7:5	RESERVED_1	
4:0	VMID	Virtual machine ID VMID value associated with the M2VCBMT index Must be programmed consistently with the SMMU_CBACRn[CBVMID] field for the context bank designated by SMMU_M2VCBRm[CBNDX]

14.31.1.2 SMMU context bank access control registers

0x07DFF800+0x4*n GFX3D1_SMMU_GFX3D1_CBACRn, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Governs configuration port access to the associated context bank registers.

GFX3D1_SMMU_GFX3D1_CBACRn

Bits	Name	Description
31:24	IRPTNDX	(interrupt index) Interrupt output number used for context faults associated with this context bank (use SMMU_contextFaultIrptReq[IRPTNDX])
23:21	RESERVED	
20:16	CBVMID	(context bank VMID) Specifies the VMID with which the client masters using the context bank are associated Must be programmed consistently with the M2VCBMT entries that are configured to use the associated context bank This field is used by configuration port commands that need the context bank's VMID value in order to access the TLB (e.g., SMMU_CBn_TLBIVMID, SMMU_CBn_V2Pxx)
15:10	RESERVED_2	
9	RWGE	Read/write global enable. Setting this bit allows access to the context bank registers from any VMID
8	RWE	Read/write enable. Indicates that the RWVMID field is valid.
7:5	RESERVED_1	
4:0	RWVMID	Specifies owner VMID with full read/write access to the registers in the associated context bank "n".

14.31.1.3 SMMU TLB software access registers

0x07DFFE00 GFX3D1_SMMU_GFX3D1_TLBRSW

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Writing to this address requests that the TLB entry at INDEX be read into the SMMU_TLBTRn registers

GFX3D1_SMMU_GFX3D1_TLBRSW

Bits	Name	Description
31:10	RESERVED	

GFX3D1_SMMU_GFX3D1_TLBRSW (cont.)

Bits	Name	Description
9:8	TLBBFBS	This field selects the TLB, TFBFB, SLBFB 0x0: Selecting TLB 0x1: Not defined 0x2: Selecting FL BFB 0x3: Selecting SL BFB
7:0	INDEX	TLB index to be read.

0x07DFFE80 GFX3D1_SMMU_GFX3D1_TLBTR0

Type: Read /Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

This register holds part of TLB entry read by the last TLBRSW command.

GFX3D1_SMMU_GFX3D1_TLBTR0

Bits	Name	Description
31:23	RESERVED_4	
22:20	DPSIZC	3 bit decode page size field from CAM-side of TLB CAM-RAM) Same determination and encoding as for DPSIZR The CAM-side copy of this field is used for hit/miss determination in the TLB CAM array
19	RESERVED_3	
18:16	DPSIZR	(3 bit decode page size field from RAM-side of TLB CAM-RAM) Determined from the size fields of the page table entry Encodes the page size as follows: all other values reserved/unused The RAM-side copy of this field is used for virtual ’ physical address formation 0x0: 4KB page 0x1: 64KB page 0x3: 1MB page 0x7: 16MB page
15:12	RESERVED_2	
11	MT2	(memory type bit 2) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[2] attribute bus on the request output of the System MMU

GFX3D1_SMMU_GFX3D1_TLBTR0 (cont.)

Bits	Name	Description
10	MT1	(memory type bit 1) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[1] attribute bus on the request output of the System MMU
9	MT0	(memory type bit 0) Determined from SMMU_CBn_PRRR, SMMU_CBn_NMRR, SMMU_CBn_SCTLR[TRE], and the TEX[0], C and B fields of the page table entry Indicates the memory type and cache policy of the page This field becomes the AMEMTYPE[0] attribute bus on the request output of the System MMU
8	SH	(shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's outer-shareable realm This field becomes the ASHARED attribute on the request output of the System MMU
7	ISH	(inner-shareable) Determined from SMMU_CBn_PRRR, together with SMMU_CBn_SCTLR[TRE] and the TEX[0], C, B, and SH fields of the page table entry Indicates whether or not hardware must enforce cache coherency for the page, with respect to agents that are members of the requesting master's inner-shareable realm This field becomes the AINNERSHARED attribute on the request output of the System MMU
6	NSDESC	(non-secure descriptor) This TLB entry field is a modified version of the corresponding bit of the page table entry Qualified by the NS-prot attribute of the incoming request which prompted the allocation of the TLB entry, such that if the incoming NS-prot attribute was 1 (non-secure), then the NS-desc field of the page table entry was ignored, and the NS-desc field of the TLB entry was forced to 1 Indicates whether the associated memory page contains secure (NS-desc=0) or non-secure (NS-desc=1) information This field becomes the NS-prot attribute on the request output of the System MMU
5	RESERVED_1	

GFX3D1_SMMU_GFX3D1_TLBTR0 (cont.)

Bits	Name	Description
4	XN	(execute never permission) This TLB entry field comes directly from the corresponding bit of the page table entry
3	UW	(user write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
2	UR	(user read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
1	PW	(privileged write permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]
0	PR	(privileged read permission) Determined from AP[2:0] fields of page table entry, together with SMMU_CBn_SCTLR[AFE]

0x07DFFE84 GFX3D1_SMMU_GFX3D1_TLBTR1

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: 32'h0000_0000

Note that the DCPBP/DCPPP bits prevent the pipelining of the next transaction when the current transaction is a bypass/pass-through transaction. That is, they add one more cycle of delay between the current and next transactions.

Also note that when we are in global bypass (SMMU_CR[CLIENTPD]=1), these bits should have NO effect, or at least no effect between client transactions, they can have an effect between config and client transactions is appropriate. We must be able to continue to perform fully pipelined transactions when the client port is disabled altogether.

0x07DFFF00 GFX3D1_SMMU_GFX3D1_TLBIALL

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries.

GFX3D1_SMMU_GFX3D1_TLBIALL

Bits	Name	Description
31:0	EXEC	Writing any value to this register invalidates all TLB entries, as specified by the contents of SMMU_CR[TLBIALLCFG]

0x07DFFF04 GFX3D1_SMMU_GFX3D1_TLBIVMID

Type: Write/Command
Clock: AXI_BUS_CLOCK
Reset State: undefined

Invalidates all TLB entries matching the IVMID value. Precise function is governed by SMMU_CR[TLBIALLCFG].

GFX3D1_SMMU_GFX3D1_TLBIVMID

Bits	Name	Description
31:5	RESERVED	
4:0	IVMID	Designates VMID[4:0] value of entries to be invalidated.

14.31.1.4 SMMU configuration registers

0x07DFFF80 GFX3D1_SMMU_GFX3D1_CR

Type: Read/Write
Clock: AXI_BUS_CLOCK

Global configuration register.

GFX3D1_SMMU_GFX3D1_CR

Bits	Name	Description
31:10	RESERVED_2	
9	RESERVED_1	Reset state : 0
8	TLBIVMIDCFG	TLBIVMID configuration control. When set to 0,flash-invalidate, SMMU_TLBIVMID commands flash-invalidate the entire TLB, without regard to locking ,security and VMID value. When set to 1, selective, SMMU_TLBIVMID invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and VMID field matching the VMID specified by SMMU_TLBIVMID command. Reset state : X
7	TLBIALLCFG	TLBIALL configuration control. When set to 0, flash-invalidate, SMMU_TLBIALL commands flash-invalidate the entire TLB, without regard to locking and/or security. When set to 1, selective, SMMU_TLBIALL invalidates only entries that have NSTID field matching HPROTNS of SMMU_TLBIALL command, and are unlocked. Reset state : X
6	TLBLKCRWE	TLBLKCR write enable. When set to 0, writes to SMMU_CBn_TLBLKCR are ignored. When set to 1, allows operating environments to manage the TLB locking mechanism directly. Management amounst multiple operating environments must be coordinated externally between themselves. Reset state : X
5	STALLD	Global disable for stall mode. When set to 1, context bank stall modes are ignored and operate as terminate mode. Reset state : X
4	CLIENTPD	Client port disable. When set, all client accesses are forced to bypass the system MMU. There is no translation. access control, or attribute generation. This bit overrides individual SMMU_M2VCBRn[BYPASSD] settings; client requests are bypassed, even if SMMU_M2VCBRn[BYPASSD] is set to 1. Bypass request errors are not recorded in SMMU_ESR, nor reported to requesting masters. The SMMU_rpuErrIrptReq interrupt output signal is not asserted. Reset state : 1

GFX3D1_SMMU_GFX3D1_CR (cont.)

Bits	Name	Description
3	DCDEE	When set to 0, configuration port decode errors do not set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn are not updated. When set to 1, configuration port decode errors set SMMU_ESR[CFG], SMMU_EAR and SMMU_ESYNRn updated with address and syndrome of error. Reset state : X
2	RPUEIE	When set, configuration port errors and client port bypass errors are reported directly to the interrupt controller via the SMMU_rputErrIrptReq interrupt output signal. Interrupt output is asserted if SMMU_CR[RPUIE_EN] is 1 and ANY bit is set in SMMU_ESR register. Reset state : 0
1	RPUERE	When set, SMMU reports configuration port errors and client port bypass errors to the requesting bus master, according to the respective port's bus protocol. All error types reported via AXI port will use decode error, rather than slave error. Regardless of the value of this field both configuration port errors and client port bypass request errors are terminated by the SMMU as RAZ/WI, and are recorded in SMMU_ESR register. Reset state : X
0	RPUE	When set, all configuration port accesses are checked against SMMUX_RPU_ACR and/or the SMMUX_CBACRn registers for access permissions. Reset state : 0

14.31.1.5 SMMU error report registers

0x07DFFF84 GFX3D1_SMMU_GFX3D1_EAR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: unknown

When there is an error, holds the physical address of the errant transaction.

GFX3D1_SMMU_GFX3D1_EAR

Bits	Name	Description
31:0	PA	Physical address[31:0]

0x07DFFF88 GFX3D1_SMMU_GFX3D1_ESR

Type: Read/Write to clear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

This register has read/write clear access. Reads return the value in the register, a write with a 1 set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

GFX3D1_SMMU_GFX3D1_ESR

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED	
1	BYPASS	When set, indicates an error due to a client port bypass request (CBNDX = 255 or "SMMU_Bypass" input asserted. This is only considered an error when SMMU_CR[CLIENTPD] == 0 and SMMU_M2VCBRn[BYPASSD] == 1. Bypass request errors are the only client port errors that are recorded in SMMU_ESR. All other faults associated with client port accesses using a particular M2VCBMT entry and associated context bank are recorded within that context bank's SMMU_CBn_FSR and reported directly to that context's managing processor, using the bit of SMMU_contextFaultIrptReq interrupt output bus selected by SMMU_M2VCBRn[IRPTNDX].
0	CFG	When set, indicates an error associated with a configuration port request.

0x07DFFF8C GFX3D1_SMMU_GFX3D1_ESRRESTORE

Type: Write
Clock: RPM_BUS_CLK
Reset State: Undefined

This register is an aliased address for SMMU_ESR, but it allows direct write access. In this way, diagnostic software can cause an error to be generated and reported.

GFX3D1_SMMU_GFX3D1_ESRRESTORE

Bits	Name	Description
31	MULTI	When set to 1, indicates that an additional error occurred while SMMU_ESR was non-zero. The SMMU_EAR ,SMMU_ESYNRn and SMMU_ESR registers (with the exception of this bit) lock upon the first error, and must be cleared to unlock.
30:2	RESERVED

0x07DFFFF8 GFX3D1_SMMU_GFX3D1_IDR

Type: Read
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Reports the parameter information for the SMMU core and wrapper

GFX3D1_SMMU_GFX3D1_IDR

Bits	Name	Description
31:24	NIRPT	NIRPT[7:0] Indicates number of context fault interrupt outputs (minus 1) supported by the System MMU Value can range from 0 - 255 (1 - 256 context fault interrupt outputs)
23:16	NCB	NCB[7:0] Indicates number of context banks (minus 1) supported by the System MMU Value can range from 0 - 254 (1 - 255 context banks)
15:12	TLBSIZE	TLBSIZE[3:0] Indicates log2(number of TLB entries) That is, number of TLB entries = 2 ** TLBSIZE
11	RESERVED	
10	HUM	Indicates whether or not TLB hit-under-miss behavior is supported
9	HTW	Indicates whether or not the System MMU supports hardware table walk If hardware table walk not supported (HTW=0), then software cannot set SMMU_CBn_ACTLR[TLBMCFG] to 0b10

GFX3D1_SMMU_GFX3D1_IDR (cont.)

Bits	Name	Description
8:0	NM2VCBMT	NM2VCBMT[8:0] Indicates number of M2VCBMT entries, with a maximum of 512 The bit width of the M2VCBMTIindex input (maximum value is 9) is equal to log base 2 of NM2VCBMT Allows for up to 7-bit MID field, plus NS-prot or other fields to select mapping [

0x07DFFFFC GFX3D1_SMMU_GFX3D1_RPU_ACR

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Using the incoming HVMID, this register controls access to the global register space.

GFX3D1_SMMU_GFX3D1_RPU_ACR

Bits	Name	Description
31:0	RWE	Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the entire block of registers within the SMMU's 4KB global address space, including this register itself. A VMID identified by this register is also permitted global access to all context banks. In practice, this register designates the VMID(s) that can act as SROT.

14.31.2 SMMU Context Bank Registers

There are a configurable number (1 to 9) of context banks in the SMMU. Each context bank consists of a set of registers in a unique 4KB address space.

14.31.2.1 SMMU context bank control registers

0x07D00000+ 0x1000*n GFX3D1_SMMU_GFX3D1_CBn_SCTLR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank System Control Register controls various architected SMMU features

GFX3D1_SMMU_GFX3D1_CBn_SCTLR

Bits	Name	Description
31:5	RESERVED_2	
4	BE	Governs the order byte order or "endianness" of the page table entries. When set to 0, page table entries are in little endian format, so that their least significant byte is in byte 0 of the 32 bit entry. When set to 1, page table entries are in big endian format, so that their most significant byte is in byte 0 of the 32 bit entry.
3	RESERVED_1	Reserved for HAF, Hardware access flag. This bit governs whether the access flag is managed by hardware or software. The SMMU supports software access flag management only, so this bit is read-only and internally driven to 0.
2	AFE	Access flag enable. When AFE = 0, the access flag field is not supported and the AP[0] page table entry field acts as a bit of the overall AP[2:0] field to determining access permissions. When AFE = 1, the AP[0] page table entry field becomes the access flag, and the reduced number of access permission combinations is specified by AP2:1], and SMMU hardware will signal an Access Flag fault if a request targets a page for which the access flag is 0.
1	TRE	TEX remap enable. This bit governs the mapping of the page table entry TEX[2:0],C,B and SH fields into an SMMU TLB entry, and thus the translation of the AMEMTYPE[2:0], ASHARED and AINNERSHARED bus attributes. When TRE = 0, the TLB value is determined directly from the page table entry fields.
0	M	MMU enable bit. When set to 1, this context bank is enabled for translating requests. When set to 0, accesses bypass the TLB, and there is no address translation, access permission checking or attribute mapping. Incoming master requests are passed through unchanged.

0x07D00004+ 0x1000*n GFX3D1_SMMU_GFX3D1_CBn_ACTLR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The context bank auxiliary control register controls various implementation specific features.

GFX3D1_SMMU_GFX3D1_CBn_ACTLR

Bits	Name	Description
31:19	RESERVED	
18	RESERVED_2	

GFX3D1_SMMU_GFX3D1_CBn_ACTLR (cont.)

Bits	Name	Description
17:16	V2PCFG	VA-to-PA configuration. Governs operation of VA-to-PA commands that miss in the TLB 0x0: terminate (Record TLB Miss context fault in SMMU_CBn_PAR) 0x1: software table update (Translate based on values in SMMU_CBn_TLBFLPTER and SMMU_CBn_TLBSLPTER) 0x2: hardware table walk (Translate based on value of PTE read from page table in memory) 0x3: reserved
15	TIPCF	Governs whether or not all subsequent requests using this context bank should be terminated if a prior context fault has occurred and has not yet been cleared from SMMU_CBn_FSR Accesses to other context banks proceed as normal 0x0: do not terminate (System MMU will attempt to process subsequent requests despite the presence of an existing context fault in SMMU_CBn_FSR. SMMU_CBn_FSR will be set if the subsequent access also encounters a context fault) 0x1: terminate (All subsequent accesses terminated by the System MMU as RAZ/WI, even if SMMU_CBn_ACTLR[TLBMCFG, CFCFG] configured for stall mode. SMMU_CBn_FSR set when access is terminated due to TIPCF = 1. Presence of SMMU_CBn_FSR when SMMU_CBn_ACTLR is 1 implies that the later exceptions must have been simply the forced terminations due to the prior context fault. Error optionally reported to the requesting master, according to the client port bus protocol, f SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus if SMMU_CBn_ACTLR is 1.)

GFX3D1_SMMU_GFX3D1_CBn_ACTLR (cont.)

Bits	Name	Description
14	CFCFG	(context fault configuration) Governs the behavior of all context faults except TLB miss TLB miss context faults are governed by SMMU_CBn_ACTLR[TLBMCFG] 0x0: terminate (Access terminates at the System MMU as RAZ/WI. Context fault exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x1: stall (Requesting master's access stalled while System MMU waits for managing processor to resolve context fault. Context fault exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode)

GFX3D1_SMMU_GFX3D1_CBn_ACTLR (cont.)

Bits	Name	Description
13:12	TLBMCFG	(TLB miss configuration) Governs the behavior of client accesses that miss in the TLB 0x0: pass-through (Access passed through to targeted slave without translation, attribute control, or access permission checking. Effectively, behavior is as if SMMU_CBn_SCTLR = 0 i.e., MMU disabled for this context bank. TLB miss not considered a context fault. TLB miss exception not recorded in SMMU_CBn_FSR. TLB miss exception not reported to requesting master. SMMU_contextFaultIrptReq interrupt output not asserted) 0x1: terminate (Access terminates at the System MMU as RAZ/WI,TLB miss exception recorded in SMMU_CBn_FSR. Error optionally reported to the requesting master, according to the client port bus protocol, if SMMU_CBn_ACTLR is 1. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1) 0x2: stall (Requesting master's access stalled while System MMU waits for managing processor to update TLB. TLB miss exception recorded in SMMU_CBn_FSR. Error not reported to requesting master regardless of value of SMMU_CBn_ACTLR. Interrupt optionally asserted via SMMU_M2VCBRn-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus, if SMMU_CBn_ACTLR is 1. In practice, software should set SMMU_CBn_ACTLR to 1 whenever using stall mode, as the interrupt is the means of notifying the managing processor to resolve the stall and resume. To resume, the managing processor must write to SMMU_CBn_RESUME upon resolving the TLB miss, in order for System MMU to retry or terminate the stalled operation and proceed. If SMMU_CR is 1 stall mode disabled, then setting this field to 0b10 causes the System MMU to operate as if this field were 0b01, i.e., terminate mode) 0x3: HTW (Hardware table walk . Requesting master's access stalled while System MMU accesses page table. The is TLB updated and requesting master's access resumed after obtaining valid entry from page table. If translation fault, then access either terminates or stalls according to setting of SMMU_CBn_ACTLR)
11	DNLV2PA	(disable non-locking VA-to-PA allocation) Governs whether or not TLB misses due to non-locking VA-to-PA commands will allocate a new entry This field is ignored for locking VA-to-PA operations (SMMU_CBn_TLBLKCR[LKE] = 1)
10	DNA	(disable normal allocation) Governs whether or not TLB misses due to client port accesses will allocate a new entry
9:8	PRIVCFG	0x0: apriv (System MMU uses APRIV signal supplied by master as user/supervisor indicator 1 = supervisor) 0x1: reserved 0x2: User (System MMU ignores APRIV; treats all requests using this context bank as user) 0x3: Supervisor (System MMU ignores APRIV; treats all requests using this context bank as supervisor)

GFX3D1_SMMU_GFX3D1_CBn_ACTLR (cont.)

Bits	Name	Description
7:5	RESERVED_1	
4	RCNSH	(redirect cacheable-non-shareable) Governs whether or not cacheable accesses that are non-shareable are redirected to the Scorpion-MP L2 slave port, in order that they may use the Scorpion-MP L2 cache, even though the locations are not being coherently shared with Scorpion-MP
3	RCISH	(redirect cacheable-inner-shareable) Governs whether or not cacheable accesses that are inner-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
2	RCOSH	(redirect cacheable-outer-shareable) Governs whether or not cacheable accesses that are outer-shareable are redirected to the Scorpion-MP L2 slave port, in order to access the Scorpion-MP coherent L2 cache
1	CFEIE	(context fault error interrupt enable) Governs whether or not client port request context faults are reported directly to the interrupt controller via the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus Interrupt output is asserted if SMMU_CBn_ACTLR[CFEIE] is 1 and any context fault bits are set in SMMU_CBn_FSR Such interrupts would generally be directed to the interrupt controller of whichever processor is currently managing this context bank of the System MMU Reset state : 0
0	CFERE	(context fault error report enable) Governs whether or not client port request context faults that are configured for terminate mode (or that are explicitly terminated after stall mode) are reported to the requesting master, according to the client port bus protocol All error types reported via AXI port will use decode error rather than slave error All context faults are recorded in SMMU_CBn_FSR, regardless of the value of this field.

Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table base register, specifies the physical base address and attributes of this context bank's page table. TTBR1 is used for high order virtual addresses, typically global pages for a given VMID, or kernal mappings.

The context bank auxiliary control register controls various implementation specific features.

GFX3D1_SMMU_GFX3D1_CBn_TTBR1

Bits	Name	Description
31:14	PA	BIts 31:14 of the physical address of the base of the page table.
13:7	RESERVED_2	
6	IRGN0	LSB of IRGN[1:0]. See description of IRGN above
5	NOS	Not outer shareable Governs the AINNERSHARED attribute for HTW access
4:3	ORGN	ORGN[1:0] outer cache policy for HTW accesses Encoding is as for IRGN
2	RESERVED_1	
1	SH	shareable Governs the ASHARED attribute of the HTW access.
0	IRGN1	Together with IRGN0 defines the inner cache policy for the accesses to this page table. AMEMTYPE[2:0] for HTW accesses is derived from the IRGN and ORGN fields. IRGN1 IRGN0 0 0 - non-cacheable 0 1 - copy back, write allocate 1 0 - write through, write no allocate 1 1 - copy back, write no allocate

0x07D00018+ 0x1000*n GFX3D1_SMMU_GFX3D1_CBn_TTBCR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

Translation table control register, which specifies the size of the virtual address space that uses TTBR0.

.

GFX3D1_SMMU_GFX3D1_CBn_TTBCR

Bits	Name	Description
31:6	RESERVED_2	
5	PD1	Page disable 1; if this bit is set, hardware table walks attempting to use TTBR1will result in a first level descriptor translation fault. If clear, TTBR1 contents are used.
4	PD0	Page disable 0; if this bit is set, hardware table walks attempting to use TTBR0 will result in a first level descriptor translation fault. If clear, TTBR0 contents are used.
3	RESERVED_1	
2:0	N	N[2:0] specifies the number of upper order virtual address bits which must be 0 in order for translations to use the table pointed to by TTBR0. If any of these bits are non-zero, TTBR1 is used for the lookup. If N is 0, only TTBR0 is used.

0x07D0001C+0x1000*n GFX3D1_SMMU_GFX3D1_CBn_PAR, n=[0..2]

Type: Read/Write
Clock: AXI_BUS_CLOCK
Reset State: undefined

The physical address register captures the physical address value resulting from the execution of a VA-to-PA command

Field definitions vary according to whether or not there is a context fault associated with the requested translation

.

GFX3D1_SMMU_GFX3D1_CBn_PAR (cont.)

Bits	Name	Description
0	FAULT	(fault status) This field will be 1 when a context fault is associated with the requested translation, and 0, when there is no context fault associated with the requested translation.

0x07D00020+ 0x1000*n GFX3D1_SMMU_GFX3D1_CBn_FSR, n=[0..2]

Type: Read/WriteClear
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The Fault Status Register records status information for client accesses that encounter exceptions within the context bank, e.g. translation faults.This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data

This prevents inadvertent clearing of new faults when writing the register to clear an old fault

The presence of an asserted value on any bit in this register (except the SS bit) is what prompts the assertion (when enabled by SMMU_CBn_ACTLR[CFEIE]) of the SMMU_M2VCBRn[IRPTNDX]-selected bit of the SMMU_contextFaultIrptReq[n-1:0] interrupt output bus

Therefore, these bits must be cleared by the interrupt handler

This is contrasted with the fields in the SMMU_CBn_FSYNRn registers, which are merely the "syndrome" of the fault indicated by SMMU_CBn_FSR

.

GFX3D1_SMMU_GFX3D1_CBn_FSR

Bits	Name	Description
31	MULTI	(multiple faults) Indicates additional context fault occurred while SMMU_CBn_FSR still non-zero SMMU_CBn_FAR and SMMU_CBn_FSYNRn registers (and SMMU_CBn_FSR itself, except for the SS and MULTI bits) "lock" upon first context fault; SMMU_CBn_FSR must be cleared to unlock Status, address, and syndrome of errors that occur while SMMU_CBn_FSR is non-zero are "lost"

The burst fetch buffer configuration register governs the operation of the "burst fill" feature of the SMMU.

GFX3D1_SMMU_GFX3D1_CBn_BFBCR

Bits	Name	Description
31:12	STRIDE	(stride amount) 4KB-aligned value to be added to virtual address on demand TLB miss for filling subsequent BFB Stride of minimum 4KB alignment useful for preventing stride burst fetch until final PTE of the demand BFB entry is used
11:8	SLVIC	(second-level victim) Indicates the SLBFB index at which the next round-robin allocation will occur
7:4	FLVIC	(first-level victim) Indicates the FLBFB index at which the next round-robin allocation will occur
3	RESERVED	
2	SFVS	(stride-fetch victim selection) SFVS. = 0 (replace normal round-robin victim-selected entry) Useful when stride is larger than the VA space represented by the four PTEs in the demand BFB entry, but the client access pattern is for more than just the initial PTE in that demand BFB entry SFVS. = 1 (replace same BFB used by demand VA for which the stride burst is being performed) Useful when stride is the same as the VA space represented by an individual PTE in the demand BFB entry (such that the stride won't miss against the BFB until the last PTE of the demand BFB entry is accessed), and/or when the client access pattern only uses the initial PTE in the demand BFB entry

GFX3D1_SMMU_GFX3D1_CBn_BFBCR (cont.)

Bits	Name	Description
1	BFBSFE	(burst fetch buffer stride fetch enable) Enables stride burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Stride burst fetch is for the block of four PTEs associated with VA+stride VA is the "demanded" VA from the client (or VA-to-PA command) Stride value is specified by SMMU_CBn_BFBCR[STRIDE] Stride burst fetch only occurs if demand access for VA misses in TLB (could hit in BFB) and address VA+stride misses in both TLB and BFB
0	BFBDFE	(burst fetch buffer demand fetch enable) Enables demand burst fetch of four aligned-contiguous PTEs into BFB due to TLB miss Demand burst fetch is for the block of four PTEs associated with the "demanded" VA from the client (or VA-to-PA command) Demand burst fetch only occurs if demand access misses in both TLB and BFB

0x07D00800+ 0x1000*n GFX3D1_SMMU_GFX3D1_CBn_TLBIALL, n=[0..2]

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate all command register invalidates all TLB entries matching the VMID associated with this context bank. Data operand is ignored.

GFX3D1_SMMU_GFX3D1_CBn_TLBIALL

Bits	Name	Description
31:0	RESERVED

Type: Write
Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB invalidate by ASID command register invalidates TLB entries matching the specified ASID and matching the VMID associated with this context bank.Invalidates TLB entries which are associated with the designated ASID and which are associated with the VMID associated with the specified context bank

SMMU_CBn_TLBLKCR[TLBIASIDCFG] governs whether command flash-invalidates entire TLB array or just the entries matching the VMID, ASID, and security state

TLBIASIDCFG = 0 - flash-invalidate

SMMU_CBn_TLBIASID command flash-invalidates the entire TLB, without regard to locking, security, VMID, and/or ASID values

TLBIASIDCFG = 1 - selective

SMMU_CBn_TLBIASID command invalidates only entries that match all of the following conditions

VMID field of TLB entry matches VMID value associated with the context bank from SMMU_CBACRn[CBVMID]

ASID field of TLB entry matches ASID value designated by the SMMU_CBn_TLBIASID command data operand

TLB entry is not global (NG field is 1)

NSTID field of TLB entry matches APROTNS of SMMU_CBn_TLBIASID command

Locking is not considered (matching entries are invalidated even if locked)

ASID field of command specifies the ASID value of the TLB entries to be invalidated

GFX3D1_SMMU_GFX3D1_CBn_TLBIASID

Bits	Name	Description
31:8	RESERVED	
7:0	ASID	Actual ASID value

Clock: AXI_BUS_CLOCK
Reset State: Undefined

The TLB resume command causes the SMMU to resume operation after a stalled access..

GFX3D1_SMMU_GFX3D1_CBn_RESUME

Bits	Name	Description
31:1	RESERVED	

GFX3D1_SMMU_GFX3D1_CBn_RESUME (cont.)

Bits	Name	Description
0	TNR	Terminate/not retry When TNR is written as 0, indicates that the stalled access should be retried by the system MMU. When written as 1, indicates that this stalled transaction is terminated by the system MMU. The error is optionally reported to the requesting master, using the client port bus protocol, if SMMU_CNn_ACTLR[CFERE] == 1. Interrupt optionally remains asserted via SMMU_M2VCBRn[IRPTINDX] selected SMMU_contextFaultIrptReq bit, only if SMMU_CBn_ACTLR[CFEIE] is 1, and only if SMMU_CBn_FSR has not been cleared by software priori to issuing this command..

14.32 System FPB SMMU Registers (0x07F00000 SMMU_SFPB_CFG_DUMMY_BASE)

This section contains System FPB SMMU registers.

14.32.1 System FPB Registers

14.32.1.1 Configuration registers

0x07F00000 SMMU_SFPB_CFG_SFPB_CTRL_STATUS

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000

The SFPB_CTRL_STATUS register is a general configuration register.

SMMU_SFPB_CFG_SFPB_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0)
11	RPM_ARM7_IRQ_EN	SW: RW, HW: R ARM7InterruptEnable When set, the ARM7 receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	SC_IRQ_EN	SW: RW, HW: R ScorpionInterruptEnable When set, the Scorpion receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

SMMU_SFPB_CFG_SFPB_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x7: Select the M0 ahb2ahb bridge test bus.

0x07F00004+0x4*a SMMU_SFPB_CFG_SFPB_AHB2AHB_CFG_Ma, a=[0..0]

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x09

The SFPB_AHB2AHB_CFG_Ma register is to configure the AHB2AHB bridge of master Ma. The AHB2AHB bridge is instantiated if the AHB interface is async (Generic: MASTER_ASYNC_IF(a) = ’1’). Otherwise this register is reserved.

SMMU_SFPB_CFG_SFPB_AHB2AHB_CFG_Ma

Bits	Name	Description
30:6	RESERVED_BITS30_6	
5:4	M_AHB2AHB_TEST_EN	SW: RW, HW: R Test enable for the Sa lite_bridge. Power up value is 00 0x0: DISABLED 0x1: Select slave side test signals 0x2: Select master side test signals 0x3: RESERVED_PROGRAMMING
3	M_WPOST_EN	SW: RW, HW: R MaWritePostEnable When set (1), the ahb2ahb bridge will support posting of write data. When cleared (0), each write request must complete across the bus before the next is accepted. Power up value is set (1)
2	M_HALT_ACK	SW:R, HW:W Indicates the Ma acknowledgement of halt_req asserted by software. Power up value is clear (0).

SMMU_SFPB_CFG_SFPB_AHB2AHB_CFG_Ma (cont.)

Bits	Name	Description
1	M_HALT_REQ	SW:RW, HW:R Software should write to this register to request the Ma lite_bridge master to cleanly halt. Power up value is clear (0).
0	M_IDLE	SW:R, HW:W Indicates that the Ma lite bridge master FSM is in IDLE state. Power up value is set (1).

0x07F00044 SMMU_SFPB_CFG_SFPB_PORT_EN

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFF

The SFPB_PORT_EN register is a SFPB master port enable register.

SMMU_SFPB_CFG_SFPB_PORT_EN

Bits	Name	Description
31:1	RESERVED_BIT31_1	
0	M0_PORT_EN	SW:RW, HW:R M0PortEnable When cleared (0), M0 bridge is prevented from arbitting on the system_fpb bus. Power up value is set(1)

14.32.1.2 Bus error registers and additional configure registers

0x07F00050 SMMU_SFPB_CFG_SFPB_ERROR_STAT

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x000000

The SFPB_ERROR_STAT register is the bus error status register.

SMMU_SFPB_CFG_SFPB_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	

SMMU_SFPB_CFG_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the channel ID that caused the detected error when CID is valid for the master of the access. If not, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Master0
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

SMMU_SFPB_CFG_SFPB_ERROR_STAT (cont.)

Bits	Name	Description
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the SFPB_ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x07F00054 SMMU_SFPB_CFG_SFPB_ERROR_ADDR

Type: Read
Clock: CC_SFPB_CLK
Reset State: 0x00000000

The SFPB_ERROR_ADDR register contains the bus error address.

SMMU_SFPB_CFG_SFPB_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when SFPB_ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x07F00058 SMMU_SFPB_CFG_SFPB_GPREG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0

The SFPB_GPREG register is a configurable general purpose register.

SMMU_SFPB_CFG_SFPB_GPREG

Bits	Name	Description
0	GPREG_RESERVED	SW: RW, HW: R Reserved. Power up value is 0.

0x07F0005C SMMU_SFPB_CFG_SFPB_XPU_ACR

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0xFFFFFFFF

The SFPB_XPU_ACR register is a SFPB Access Control Register for configure register protection.

SMMU_SFPB_CFG_SFPB_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R SFPB XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the SFPB configure space, including this register itself. Power up value is set (1)

0x07F00060 SMMU_SFPB_CFG_SFPB_HW_CLK_GATING_CFG

Type: Read/Write
Clock: CC_SFPB_CLK
Reset State: 0x0000

The SFPB_HW_CLK_GATING_CFG register is for hardward clock gating configuration register.

SMMU_SFPB_CFG_SFPB_HW_CLK_GATING_CFG

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	HYSTERESIS_CNT_SW	SW: RW, HW: R Hysteresis Conter Value The value of this field is for SW to set the hysteresis counter for hardward clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)
3:0	WAKE_CNT_SW	SW: RW, HW: R Wakeup Conter Value The value of this field is for SW to set the wakeup counter for hardward clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)

15 PCIE20 Registers

15.1 Overview

Table 15-1 PCIE20 Bases

Base Name	Parent	Address
PCIE20_DEVICE_VENDORID	PCIE20_BASE	0x1B500000

0x1B50000C PCIE20_BIST_HEAD_LAT_CACH

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00010000

BIST, Header Type, Latency Timer, Cache Line Size

PCIE20_BIST_HEAD_LAT_CACH

Bits	Name	Description
31:24	BIST	READ ONLY BIST
23	MFD	READ ONLY MultiFunction Device
22:16	HEAD_TYP	READ ONLY Header Type
15:8	MSTR_LAT_TIM	READ ONLY Master Latency Timer, Not Applicable for PCIe hence hardwired to 0
7:0	CACH_LN_SZE	Cache Line Size, No impact on write, write is allowed only for legacy purpose

0x1B500010 PCIE20_BAR_ADR_0

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Base Address Register 0

PCIE20_BAR_ADR_0

Bits	Name	Description
31:4	BAR0_BASE_ADDR	BAR0 base address bits (for a 64-bit BAR, the remaining upper address bits are in BAR1). The BAR0 Mask value determines which address bits are masked/RO.
3	BAR0_PREFETCHABLE	READ ONLY If BAR0 is a memory BAR, bit 3 indicates if the memory region is prefetchable: . 0 = Non-prefetchable 1 = Prefetchable If BAR0 is an I/O BAR, bit 3 is the second least significant bit of the base address.
2:1	BAR0_TYPE	READ ONLY If BAR0 is a memory BAR, bits [2:1] determine the BAR type: . 00 = 32-bit BAR . 10 = 64-bit BAR If BAR0 is an I/O BAR, bit 2 the least significant bit of the base address and bit 1 is 0.
0	BAR0_MEM_INDICATOR	READ ONLY - 0 = BAR0 is a memory BAR . 1 = BAR0 is an I/O BAR

0x1B500014 PCIE20_BAR_ADR_1

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Base Address Register 1

PCIE20_BAR_ADR_1

Bits	Name	Description
31:4	BAR1_BASE_ADDR	BAR1 base address bits (for a 64-bit BAR, the remaining upper address bits are in BAR1, lower 32 bits in BAR0 Register). If BAR0 is only 32 bit then BAR1 can be programmed separately as 32 bit BAR Register
3	BAR1_PREFETCHABLE	READ ONLY If BAR1 is a memory BAR, bit 3 indicates if the memory region is prefetchable: . 0 = Non-prefetchable . 1 = Prefetchable If BAR1 is an I/O BAR, bit 3 is the second least significant bit of the base address.
2:1	BAR1_TYPE	READ ONLY If BAR1 is a memory BAR, bits [2:1] determine the BAR type: . 00 = 32-bit BAR . 10 = 64-bit BAR If BAR1 is an I/O BAR, bit 2 the least significant bit of the base address and bit 1 is 0.
0	BAR1_MEM_INDICATOR	READ ONLY - 0 = BAR1 is a memory BAR. 1 = BAR1 is an I/O BAR

0x1B500018 PCIE20_BUS_NUM_REG

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Bus Number Registers

PCIE20_BUS_NUM_REG

Bits	Name	Description
31:24	SEC_LAT_TIMER	READ ONLY Secondary Latency Timer, Not Applicable for PCI Express hence hardwired to 0
23:16	SUBORD_BUS_NUM	Subordinate Bus Number
15:8	SEC_BUS_NUM	Secondary Bus Number
7:0	PRIM_BUS_NUM	Primary Bus Number

0x1B50001C PCIE20_IOBASE_LIMIT_SEC_STATUS

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

IO Base,Limit and Secondary Status Register

PCIE20_IOBASE_LIMIT_SEC_STATUS

Bits	Name	Description
31	DET_PAR_ERR	Detected Parity Error
30	RCVD_SYS_ERR	Received System Error
29	RCVD_MSTR_ABORT	Received Master Abort
28	RCVD_TRGT_ABORT	Received Target Error
27	SGNLD_TRGT_ABORT	Signaled Target Error
26:25	DEVSEL_TIMING	READ ONLY DEVSEL Timing, Not Applicable for PCI Express hence hardwired to 0
24	MSTR_DATA_PRTY_ERR	Mastered Data Parity Error
23	FAST_B2B_CAP	READ ONLY Fast Back to Back Capable, Not Applicable for PCI Express hence hardwired to 0

PCIE20_IOBASE_LIMIT_SEC_STATUS (cont.)

Bits	Name	Description
22	RSVD1	READ ONLY Reserved
21	C66MHZ_CAPA	READ ONLY - 66MHz Capable, Not Applicable for PCI Express hence hardwired to 0
20:16	RSVD2	READ ONLY Reserved
15:12	IO_SPACE_LIMIT	IO_Space_Limit
11:9	RSVD3	READ ONLY Reserved
8	IODECODE_32	READ ONLY - 32 or 16 Bit IO Space
7:4	IO_SPACE_BASE	IO_Space_Limit
3:1	RSVD4	READ ONLY Reserved
0	IODECODE_32_0	READ ONLY - 32 or 16 Bit IO Space

0x1B500020 PCIE20_MEM_BASE_LIMIT

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Memory Base and Limit Register

PCIE20_MEM_BASE_LIMIT

Bits	Name	Description
31:20	MEM_LIMIT_ADDR	Memory Limit Address
19:16	RSVD1	READ ONLY Reserved
15:4	MEM_BASE_ADDR	Memory Base Address
3:0	RSVD2	READ ONLY Reserved

0x1B500024 PCIE20_PREF_MEM_BASE_LIMIT

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00010001

Prefetchable Memory Base and Limit Register

PCIE20_PREF_MEM_BASE_LIMIT

Bits	Name	Description
31:20	PREF_MEM_ADDR	Upper 12 bits of 32-bit Prefetchable Memory End Address
19:17	RSVD1	READ ONLY Reserved
16	MEMDECODE_64	READ ONLY - 64-Bit Memory Addressing
15:4	UPPPREF_MEM_ADDR	Upper 12 bits of 32-bit Prefetchable Memory start Address
3:1	RSVD2	READ ONLY Reserved
0	MEMDECODE_64_0	READ ONLY - 64-Bit Memory Addressing

0x1B500028 PCIE20_UPPER_32BIT_PREF_BASEADDR

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Upper 32 Bit Prefetchable Base Address Register

PCIE20_UPPER_32BIT_PREF_BASEADDR

Bits	Name	Description
31:0	ADDRUPP	Upper 32 Bits of Base Address of Prefetchable Memory Space, Used only if 64 Bit Prefetchable Addressing is enabled

0x1B50002C PCIE20_UPPER_32BIT_PREF_LIMITADDR

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Upper 32 Bit Prefetchable Limit Address Register

PCIE20_UPPER_32BIT_PREF_LIMITADDR

Bits	Name	Description
31:0	ADDRUPP_LIMIT	Upper 32 Bits of Limit Address of Prefetchable Memory Space, Used only if 64 Bit Prefetchable Addressing is enabled

0x1B500030 PCIE20_IO_BASE_LIMIT

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

IO Base and Limit Register

PCIE20_IO_BASE_LIMIT

Bits	Name	Description
31:16	UPP16_IOLIMIT	Upper 16 IO Limit Address
15:0	UPP16_IOBASE	Upper 16 IO Base Address

0x1B500034 PCIE20_CAPPTR

Type: Read
Clock: UNDEFINED
Reset State: 0x00000040

CapPtr

PCIE20_CAPPTR

Bits	Name	Description
31:8	RESERVE1	READ ONLY Reserved
7:0	CAPTR	READ ONLY First Capability Pointer

0x1B500038 PCIE20_EXP_ROM_ADDR

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

Expansion ROM Base Address

PCIE20_EXP_ROM_ADDR

Bits	Name	Description
31:11	ADDR	Expansion ROM Address
10:1	RSVD	READ ONLY Reserved Bits
0	EXP_ROM_EN	Expansion ROM Enable

0x1B50003C PCIE20_BRIDGE_INT

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x000001FF

Bridge Control and Int Pin and line

PCIE20_BRIDGE_INT

Bits	Name	Description
31:28	RSVD1	READ ONLY Reserved
27	DT_SERR_EN	READ ONLY Discard Timer SERR Enable Status
26	DT_STS	READ ONLY Discard Timer Status
25	SEC_DT	READ ONLY Secondary Discard Timer
24	PRI_DT	READ ONLY Primary Discard Timer
23	FAST_B2B_EN	READ ONLY Fast Back-to-Back Transactions Enable
22	SEC_BUS_RST	Secondary Bus Reset
21	MST_ABT_MOD	READ ONLY Master Abort Mode
20	VGA_16B_DEC	VGA 16-Bit Decode
19	VGA_EN	VGA Enable
18	ISA_EN	ISA Enable
17	SERR_EN	SERR Enable
16	PERR_RESP_EN	Parity Error Response Enable

PCIE20_BRIDGE_INT (cont.)

Bits	Name	Description
15:8	INT_PIN	READ ONLY Interrupt Pin
7:0	INT_LIN	Interrupt Line

0x1B500040 PCIE20_CFG_PWR_CAP

Type: Read
Clock: UNDEFINED
Reset State: 0xDBC35001

Power, ID

PCIE20_CFG_PWR_CAP

Bits	Name	Description
31:27	PME_SP	READ ONLY PME Support, writable through the DBI.
26	D2_SP	READ ONLY D2 Support, writable through the DBI.
25	D1_SP	READ ONLY D1 Support, writable through the DBI.
24:22	AUX_CUR	READ ONLY AUX Current, writable through the DBI.
21	DSI	READ ONLY Device Specific Initialization (DSI), writable through the DBI.
20	RSVD1	READ ONLY Reserved
19	PME_CLK	READ ONLY PME Clock, hardwired to 0
18:16	PMC_VER	READ ONLY Power Management specification version, writable through the DBI
15:8	PM_NX_PTR	READ ONLY Next Capability Pointer
7:0	CAP_ID	READ ONLY Capability ID

0x1B500044 PCIE20_PWR_CSR

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

PM Control Status

PCIE20_PWR_CSR

Bits	Name	Description
31:24	DATA1	READ ONLY Data register for additional information (not supported)
23	BP_CCE	READ ONLY Bus Power/Clock Control Enable, hardwired to 0
22	B2B3_SP	READ ONLY B2/B3 Support, hardwired to 0
21:16	RSVD1	READ ONLY Reserved
15	PME_STATUS	PME Status
14:13	DATA_SCALE	READ ONLY Data Scale (not supported)
12:9	DATA_SEL	READ ONLY Data Select (not supported)
8	PME_EN	PME Enable (sticky bit)
7:4	RSVD2	READ ONLY Reserved
3	NSR	READ ONLY No Soft Reset, writable through the DBI
2	RSVD3	READ ONLY Reserved
1:0	PW_STATE	Power State

0x1B500050 PCIE20_MSG_CTR

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00807005

MSI cap structure

PCIE20_MSG_CTR

Bits	Name	Description
31:25	RSVD1	READ ONLY Reserved
24	PVM_EN	READ ONLY MSI Per Vector Masking (PVM) supported
23	MSI_64_EN	READ ONLY - 64-bit Address Capable, writable through the DBI
22:20	MME	Multiple Message Enable
19:17	MMC	READ ONLY Multiple Message Capable, writable through the DBI
16	MSI_EN	MSI Enabled
15:8	MSI_NX_PTR	READ ONLY Next Capability Pointer
7:0	CAP_ID	READ ONLY MSI Capability ID

0x1B500054 PCIE20_MSI_L32

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

MSI Lower 32-bit address register

PCIE20_MSI_L32

Bits	Name	Description
31:2	ADDR	Lower 32 Bit Address
1:0	RSVD	READ ONLY Reserved

0x1B500058 PCIE20_MSI_U32

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

MSI Upper 32-bit address register

PCIE20_MSI_U32

Bits	Name	Description
31:0	ADDR	Upper 32 Bit Address, Optional, used only if 'MSI_64_EN = 1

0x1B50005C PCIE20_MSI_DATA

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

MSI Data Register

PCIE20_MSI_DATA

Bits	Name	Description
31:16	RSVD	READ ONLY Reserved
15:0	MSI_DATA_F	MSI Data

0x1B500060 PCIE20_MSI_MASK

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00000000

MSI Mask Bit Register

PCIE20_MSI_MASK

Bits	Name	Description
31:0	MSI_MASKBITS	MSI Mask Bit Register

0x1B500064 PCIE20_MSI_PEND

Type: Read
Clock: UNDEFINED
Reset State: 0x00000000

MSI Pending Bit Register

PCIE20_MSI_PEND

Bits	Name	Description
31:0	MSI_PENDBITS	READ ONLY MSI Pending Bit Register

0x1B500070 PCIE20_PCIE_CAP

Type: Read
Clock: UNDEFINED
Reset State: 0x00420010

PCIE cap structure

PCIE20_PCIE_CAP

Bits	Name	Description
31:30	RSVD1	READ ONLY Reserved
29:25	IM_NUM	READ ONLY Interrupt Message Number
24	SLOT	READ ONLY Slot Implemented
23:20	DEV_TYPE	READ ONLY Device/Port Type
19:16	PCIE_VER	READ ONLY PCI Express Capability Version
15:8	PCIE_NX_PTR	READ ONLY Next Capability Pointer
7:0	CAP_ID	READ ONLY Capability ID

0x1B500074 PCIE20_DEV_CAP

Type: Read
Clock: UNDEFINED
Reset State: 0x00008000

PCIE Device Capabilities

PCIE20_DEV_CAP

Bits	Name	Description
31:29	RSVD2	READ ONLY Reserved
28	FLR_EN	READ ONLY Function Level Reset Capability
27:26	CAPT_SLOW_PWRLIMIT_SCALE	READ ONLY Captured Slow Power Scale Value, for Upstream Port Only
25:18	CAPT_SLOW_PWRLIMIT_VALUE	READ ONLY Captured Slow Power Limit Value, for Upstream Port Only
17:16	RSVD1	READ ONLY Reserved
15	ROLEBASED_ERRRPT	READ ONLY Role Based Error Reporting
14:12	UNDEFINED	READ ONLY Undefined from PCIe 1.1 onwards
11:9	DEFAULT_EP_L1_ACCPT_LATENCY	READ ONLY Endpoint L1 Acceptable Latency
8:6	DEFAULT_EP_L0S_ACCPT_LATENCY	READ ONLY Endpoint L0s Acceptable Latency
5	EXTTAGFIELD_SUPPORT	READ ONLY Value derived from DEFAULT_EXT_TAG_FIELD_SUPPORTED
4:3	PHANTOMFUNC	READ ONLY Phantom Function Support, NOT SUPPORTED PRESENTLY
2:0	MAX_PAYLOAD_SIZE	READ ONLY Automatically derived from CX_MAX_MTU

0x1B500078 PCIE20_DEV_CAS

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x00002010

PCIE Device Control and Status

PCIE20_DEV_CAS

Bits	Name	Description
31:22	RSVD	READ ONLY Reserved

PCIE20_DEV_CAS (cont.)

Bits	Name	Description
21	TRANS_PEND	READ ONLY Transaction Pending
20	AUXP_DET	READ ONLY Aux Power Detected
19	UR_DET	Unsupported Request Detected
18	FT_DET	Fatal Error Detected
17	NFT_DET	Non-Fatal Error Detected
16	COR_DET	Correctable Error Detected
15	INIT_FLR	READ ONLY Reserved
14:12	MRRS	Max_Read_Request_Size
11	NOSNP_EN	Enable No Snoop
10	AUXPM_EN	AUX Power PM Enable
9	PHFUN_EN	Phantom Function Enable
8	EXTAG_EN	Extended Tag Field Enable
7:5	MPS	Max_Payload_Size
4	EN_RO	Enable Relaxed Ordering
3	UR_RE	Unsupported Request Reporting Enable
2	FT_RE	Fatal Error Reporting Enable
1	NFT_RE	Non-Fatal Error Reporting Enable
0	COR_RE	Correctable Error Reporting Enable

0x1B500700 PCIE20_LAT_REL_TIM

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x006D0024

Ack Latency and Replay Timer Register

PCIE20_LAT_REL_TIM

Bits	Name	Description
31:16	REPLAY_TIME_LIMIT	The replay timer expires when it reaches this limit. The core initiates a replay upon reception of a Nak or when the replay timer expires. The default value depends on number of bytes (NB) per cycle, which depends on which version of the core you are using (1 = 250 MHz, 2 = 125 MHz). The default is then updated based on the Negotiated Link Width and Max_Payload_Size. Note: If operating at 5 Gb/s, then an additional 153/'CX_NB is added. This is for additional internal processing for received TLPs and transmitted DLLPs.
15:0	LATENCY_TIME_LIMIT	The Ack/Nak latency timer expires when it reaches this limit. The default value depends on number of bytes (NB) per cycle, which depends on which version of the core you are using (1 = 250 MHz, 2 = 125 MHz). The default is then updated based on the Negotiated Link Width and Max_Payload_Size. Note: If operating at 5 Gb/s, then an additional 51/'CX_NB is added. This is for additional internal processing for received TLPs and transmitted DLLPs.

0x1B500704 PCIE20_VENDOR_SPECIFIC_DLLP

Type: Read/Write
Clock: UNDEFINED
Reset State: 0xFFFFFFFF

Vendor Specific DLLP Register

PCIE20_VENDOR_SPECIFIC_DLLP

Bits	Name	Description
31:0	VEN_DLLP_REG	Used to send a specific PCI Express DLLP. The application writes the 8-bit DLLP Type and 24-bits of Payload data into this register, then sets bit 0 of the Port Link Control Register on page 765 to send the DLLP.

0x1B500708 PCIE20_PT_LNK_R

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x070000DE

Port Force Link Register

PCIE20_PT_LNK_R

Bits	Name	Description
31:24	LOW_POWER_ENTR_CNT	The Power Management state will wait for this many clock cycles for the associated completion of a CfgWr to D-state register to go low-power. This register is intended for applications that do not let the core handle a completion for configuration request to the PMCSCR register. Note: Only used in the DM core (in EP mode), EP core, and the Upstream Port of a Switch.
23:22	RSVD1	READ ONLY Reserved
21:16	LINK_STATE	The Link state that the core will be forced to when bit 15 (Force Link) is set. State encoding is defined in xmlh_ltssm.v.
15	FORCE_LINK	Forces the Link to the state specified by the Link State field. The Force Link pulse will trigger Link re-negotiation. * Reading from this self-clearing register field always returns a 0.
14:8	RSVD0	READ ONLY Reserved
7:0	LINK_NUM	Link Number. Not used for Endpoint

0x1B50070C PCIE20_ACK_FREQ_ASPM

Type: Read/Write
Clock: UNDEFINED
Reset State: 0x1B2C2C00

Ack Frequency and L0-L1 ASPM Control Register

PCIE20_ACK_FREQ_ASPM

Bits	Name	Description
31	RSVD	READ ONLY Reserved
30	L1_ENTR_WO_L0S	Enter ASPM L1 without receive in L0s. Allow core to enter ASPM L1 even when link partner did not go to L0s (receive is not in L0s). When not set, core goes to ASPM L1 only after idle period during which both receive and transmit are in L0s.
29:27	L1_ENTR_LAT	L1 Entrance Latency. Values correspond to: 000: 1 us 001: 2 us 010: 4 us 011: 8 us 100: 16 us 101: 32 us 110 or 111: 64 us
26:24	L0S_ENTR_LAT	L0s Entrance Latency. Values correspond to: 000: 1 us 001: 2 us 010: 3 us - 011: 4 us 100: 5 us 101: 6 us 110 or 111: 7 us

PCIE20_ACK_FREQ_ASPM (cont.)

Bits	Name	Description
23:16	COMMOM_CLK_N_FTS	This is the N_FTS when common clock is used. The number of Fast Training Sequence ordered sets to be transmitted when transitioning from L0s to L0. The maximum number of FTS ordered-sets that a component can request is 255.
15:8	N_FTS	The number of Fast Training Sequence ordered sets to be transmitted when transitioning from L0s to L0. The maximum number of FTS ordered-sets that a component can request is 255. Note: The core does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s.
7:0	ACK_FREQ	Ack Frequency. The core accumulates the number of pending Acks specified here (up to 255) before sending an Ack DLLP See Effect of Link Layer Flow Control and ACK/NAK DLLPs on page 1274 for more details.

15.3 PCIE20 ELBI Registers (0x1B502000 PCIE20_ELBI_BASE)

This section contains the description for the External Local Bus Interface (ELBI) Registers added to the Synopsys PCIe2.0 Controller.

The Registers are accessed through a dedicated Configuration AXI Slave port called DBI. It is the same port used to access the Synopsys Controller PCIe registers too.

ELBI Registers support only DWord (4 byte) aligned writes and reads on the Configuration Bus interface.

15.3.1 PCIE20 control registers

PCIE20 ELBI Control registers configure the operational state, SW reset, interrupts and others.

The ELBI register file is clock by core_clock but the accesses to it are made through dbi_clk.

0x1B502000 PCIE20_ELBI_VERSION

Type: Read
Clock: DBI_CLK
Reset State: 0X01002107

PCIe 2.0 version register reflects the core version and hardware development stages (P/Q/R).

The APQ8064 1.0 release is using the pcie20_avenger_p3q1r9 tag, which shows up as p2q1r7 in this register.

PCIE20_ELBI_VERSION

Bits	Name	Description
31:24	MAJOR_VER	Major Version 0x1: APQ8064
23:16	MINOR_VER	Minor Version
15:12	P_INDEX	Hardware development P index
11:8	Q_INDEX	Hardware development Q index
7:0	R_INDEX	Hardware development R index

0x1B502004 PCIE20_ELBI_SYS_CTRL

Type: Read/Write
Clock: DBI_CLK
Reset State: 0X00000000

PCIE20 System Control register.

PCIE20_ELBI_SYS_CTRL

Bits	Name	Description
31:7	RESERVED_31_7	Reserved
6	INIT_RST	Write '1' to pulse ‘app_init_rst’ to the controller, causing a Hot Reset of the downstream device. Writing '0' has no effect. Reading returns '0'.
5	UNLOCK_MSG	Write '1' to pulse ‘app_unlock_msg’ to the controller, causing an unlock message on the PCIe link Writing '0' has no effect. Reading returns '0'.
4	PME_TURNOFF_MSG	Write '1' to pulse ‘apps_pm_xmt_turnoff’ to the controller, causing a PME_Turnoff message on the PCIe link. Writing '0' has no effect. Reading returns '0'.
3:1	RESERVED_3_1	Reserved
0	LTSSM_EN	Enable/Disable the Link Training State Machine (LTSSM) in the controller core. See ‘app_ltssm_enable’ in the controller data book. This bit is important to be enabled to start the controller and is part of the power up sequence. 0x0: LTSSM disabled 0x1: LTSSM enabled

0x1B502008 PCIE20_ELBI_SYS_STTS

Type: Read
Clock: DBI_CLK
Reset State: 0X00000000

PCIE20 Status register.

PCIE20_ELBI_SYS_STTS

Bits	Name	Description
31:21	RESERVED_31_21	Reserved
20:18	PM_CURNT_STATE	Reflects the ‘pm_curnt_state’ signal.
17:12	XMLH_LTSSM_STATE	Reflects the ‘xmlh_ltssm_state’ signal.
11	XMLH_IN_RL0S	Reflects the ‘xmlh_in_rl0s’ signal.
10	XMLH_LINK_UP	Reflects the ‘xmlh_link_up’ signal.
9	CFG_HW_AUTO_SP_DIS	Reflects the ‘cfg_hw_auto_sp_dis’ signal.
8	CPL_TIMEOUT	Indication of a PCIe completion timeout, (by ‘radm_cpl_timeout’ signal). Note: registered bit. Has to be cleared using PCIE20_ELBI_SYS_CLR register.

PCIE20_ELBI_SYS_STTS (cont.)

Bits	Name	Description
7:6	RESERVED_7_6	Reserved
5	GM_RSP_CMPSR_ERR	Error indicated by ;gm_cmposer_lookup_err' signal. This error is considered fatal and should never happen. Note: registered bit. Has to be cleared using PCIE20_ELBI_SYS_CLR register.
4	RADMX_RSP_CMPSR_ERR	Error indicated by ;radmx_cmposer_lookup_err' signal. This error is considered fatal and should never happen. Note: registered bit. Has to be cleared using PCIE20_ELBI_SYS_CLR register
3	RESERVED_3	Reserved
2	BLK_TLP	Power Management Indication to the Application to stop scheduling new TLPs (transactions). See 'pm_xtlh_block_tlp' signal in Synopsys databook for more info.
1	PME_TO_ACK	This bit indicates that a PME_TO_Ack Message received by the core. See 'radm_pm_to_ack' signal in the Synopsys databook. Note: registered bit. Has to be cleared using PCIE20_ELBI_SYS_CLR register
0	LINK_REQ_RST_NOT	This indicates the core is requesting a reset due to link down. See 'link_req_rst_not' signal in controller data book. 0x1: Active 0x0: Core Requesting Reset

0x1B50200C PCIE20_ELBI_SYS_CLR

Type: Write
Clock: DBI_CLK
Reset State: 0X00000000

PCIE20 Clear register. This is Write only register, thus reads always return a zero

PCIE20_ELBI_SYS_CLR

Bits	Name	Description
31:9	RESERVED_31_9	Reserved
8	CPL_TIMEOUT	Write '1' to clears CPL_TIMEOUT status bit Writing '0' has no effect. Reading returns '0'.
7:6	RESERVED_7_6	Reserved
5	GM_RSP_CMPSR_ERR	Write '1' to clears GM_RSP_CMPSR_ERR status bit Writing '0' has no effect. Reading returns '0'.

PCIE20_ELBI_SYS_CLR (cont.)

Bits	Name	Description
4	RADMX_RSP_CMPSR_ERR	Write '1' to clears RADMX_RSP_CMPSR_ERR status bit Writing '0' has no effect. Reading returns '0'.
3:2	RESERVED_3_2	Reserved
1	PME_TO_ACK	Writing 0x1 to this bit clears the PME_TO_Ack Message received indication in the PCIE20_ELBI_SYS_CLR register.
0	RESERVED_0	Reserved

0x1B502020 PCIE20_ELBI_TESTBUS_CTRL

Type: Read/Write
Clock: DBI_CLK
Reset State: 0X00000000

PCIE20 Testbus control register.

PCIE20_ELBI_TESTBUS_CTRL

Bits	Name	Description
31:3	RESERVED_31_3	Reserved
2:0	DIAG_CTRL_BUS	Bits driving the ‘diag_ctrl_bus[2:0]’ signal to the controller. See Data Book for details

0x1B502030+4*n PCIE20_ELBI_DEBUG_INFO_n, n=[0..1]

Type: Read
Clock: DBI_CLK
Reset State: 0X00000000

PCIE20 debug bus status register (cxpl_debug_info).

PCIE20_ELBI_DEBUG_INFO_n

Bits	Name	Description
31:0	BUS	bits [32*n+31:32*n] of the ‘cxpl_debug_info’ signal.

0x1B502040+4*n PCIE20_ELBI_TB_DIAG_n, n=[0..17]

Type: Read
Clock: DBI_CLK
Reset State: 0X00000000

PCIE20 diagnostics bus status register (diag_status_bus).

PCIE20_ELBI_TB_DIAG_n

Bits	Name	Description
31:0	BUS	bits [32*(n+1)-1:32*n] of the ‘diag_status_bus’ signal.

15.4 PCIE20 PARF Registers (0x1B600000 PCIE20_PARF_BASE)

This section contains the description for the PCIe Auxiliary Register File (PARF) Registers added to the Synopsys PCIe2.0 Controller.

The Registers are accessed through a dedicated Configuration AHB Slave port.

PARF Registers support only DWord (4 byte) aligned writes and reads on the PARF Bus interface.

PCIE20 Auxiliary Register File (PARF) registers configure the PHY, PCS and Controller parameter values.

The PARF is clocked separately from the PCIe 2.0 core and is available even when core_clk is turned off or not available, thus allowing configuration of the various parameters while holding the PHY and/or Controller in reset.

0x1B600000 PCIE20_PARF_SYS_CTRL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0X00000000

PCIE20 System Control register.

PCIE20_PARF_SYS_CTRL

Bits	Name	Description
31:24	RESERVED_31_24	Reserved

PCIE20_PARF_SYS_CTRL (cont.)

Bits	Name	Description
23:16	TESTBUS_SELECTOR	Test bus selector chooses different chunks of the two testbuses provided by the Synopsys core, check the Controller databook for description of cxpl_debug_info' & diag_status_bus. x14 : {20'h0 , diag_status_bus[32*(17+1)-21: 32*17]} 0x0: None (Zero) 0x1: cxpl_debug_info[31:0] 0x2: cxpl_debug_info[63:32] 0x3: diag_status_bus[32*_1 (0+1-1 : 32* 0]) 0x4: diag_status_bus[32*_2 (1+1-1 : 32* 1]) 0x5: diag_status_bus[32*_3 (2+1-1 : 32* 2]) 0x6: diag_status_bus[32*_4 (3+1-1 : 32* 3]) 0x7: diag_status_bus[32*_5 (4+1-1 : 32* 4]) 0x0: diag_status_bus[32*_6 (5+1-1 : 32* 5]) 0x0: diag_status_bus[32*_7 (6+1-1 : 32* 6]) 0x0: diag_status_bus[32*_8 (7+1-1 : 32* 7]) 0x0: diag_status_bus[32*_9 (8+1-1 : 32* 8]) 0x0: diag_status_bus[32*_10 (9+1-1 : 32* 9]) 0x0: diag_status_bus[32*_11 (10+1-1 : 32*10]) 0x0: diag_status_bus[32*_12 (11+1-1 : 32*11]) 0x0: diag_status_bus[32*_13 (12+1-1 : 32*12]) 0x8: diag_status_bus[32*_14 (13+1-1 : 32*13]) 0x9: diag_status_bus[32*_15 (14+1-1 : 32*14]) 0xA: diag_status_bus[32*_16 (15+1-1 : 32*15]) 0xB: diag_status_bus[32*_17 (16+1-1 : 32*16])
15	RESERVED_15	Reserved
14	PHY_P2_IN_L1_DIS	Do not Enter P2 when in L1 state. Enabling this bit shortens L1 exit latency but consumes more power in L1 state. This is only relevant when using the CLK_RST module. This bit may be changed only when the controller is in reset. 0x1: Disable P2 when in L1 0x0: Enable P2 when in L1
13	MST_WAKEUP_EN	Enable Master Access avoiding the core from L1. This is required to be Enabled when using L1 Clock Removal or placing PHY in P2 while in L1. Leaving this disabled while power conserving functions enabled, may result in incorrect behavior. When Enabled, the core will not enter L1 state if a Master access is attempted. This is only relevant when using the CLK_RST module. This bit may be changed only when the controller is in reset. 0x1: Enable Master Wakeup 0x0: Disable Master Wakeup

PCIE20_PARF_SYS_CTRL (cont.)

Bits	Name	Description
12	SLV_WAKEUP_EN	Enable Slave Access waking the core out of L1. This is required to be Enabled when using L1 Clock Removal or placing PHY in P2 while in L1. Leaving this disabled during power conserving functions enabled, may result in a stuck access to the Core. When Enabled, the core will exit L1 state if a Slave access is attempted. This is only relevant when using the CLK_RST module. This bit may be changed only when the controller is in reset. 0x1: Enable SLV Wakeup 0x0: Disable SLV Wakeup
11	DBI_WAKEUP_EN	Enable DBI Config Access waking the core out of L1. This is required to be Enabled when using L1 Clock Removal or placing PHY in P2 while in L1. Leaving this disabled during power conserving functions enabled, may result in a stuck config access to the Core. When Enabled, the core will exit L1 state if a DBI Config access is attempted. This is only relevant when using the CLK_RST module. This bit may be changed only when the controller is in reset. 0x1: Enable DBI Wakeup 0x0: Disable DBI Wakeup
10:9	RESERVED_10_9	Reserved
8	ACLK_REQ_OVERRIDE	Override the HW generated ACLK Request value by the SW generated ACLK_REQ value in this register. This feature was removed in APQ8064. 0x1: Override HW value 0x0: Use HW value
7	ACLK_REQ	SW generated ACLK Request value. May be used to override the HW value. This feature was removed in APQ8064. 0x1: ACLK Requested 0x0: ACLK Not Requested
6	CORE_CLK_CGC_DIS	Disable the Core clock CGC that gates Pipe clock from propagating to Core clock. This is only relevant when using the CLK_RST module. This bit may be changed only when the controller is in reset. 0x1: Disable CGC 0x0: CGC Enabled
5	AUX_CLK_MUX_DIS	Disable the AUX Clock Mux that chooses Chip Sleep clock instead of Pipe Clock. This is only relevant when using the CLK_RST module. This bit may be changed only when the controller is in reset. 0x1: Disable Mux 0x0: Mux Enabled

PCIE20_PARF_SYS_CTRL (cont.)

Bits	Name	Description
4	AUX_PWR_DET	Controls the 'sys_aux_pwr_det' signal to the controller core. See 'sys_aux_pwr_det' in Synopsys data book. This bit may be changed only when the controller is in reset. 0x0: Auxiliary power is off 0x1: Auxiliary power is on
3	AUX_CLK_DIS	Disable Aux Clock usage. Enabling this bit will prevent using Aux (Sleep) clock when in L0s, L1, L2 states. This is only relevant when using the CLK_RST module. This bit may be changed only when the controller is in reset. 0x1: Disable Aux Clock 0x0: Use Aux Clock
2	L23_CLK_RMV_DIS	Do not Gate off the Pipe clock and replace it with Aux (Sleep) Clock. Enabling this bit leaves the Pipe clock always active and thus consumes more power in L23 states. This is only relevant when using the CLK_RST module. This bit may be changed only when the controller is in reset. 0x1: Disable Clock Removal 0x0: Enable Clock Removal
1	L1_CLK_RMV_DIS	Do not Gate off the Pipe clock and replace it with Aux (Sleep) Clock. Enabling this bit leaves the Pipe clock always active and thus consumes more power in L0s & L1 states. This is only relevant when using the CLK_RST module. This bit may be changed only when the controller is in reset. 0x1: Disable Clock Removal 0x0: Enable Clock Removal
0	CLK_RST_MDL_EN	Enable Clock Reset Module. Enabling this causes Pcie 2.0 to use Clocks and Resets (CLK_RST) module. When not using the Clocks and Resets module, the SW is responsible to provide PHY Reset indications from the Chip Clock Controller. Otherwise it will be provided by the Pcie 2.0 controller to the PHY. When not using the Clocks and Resets module, the Pcie 2.0 module does not use the Aux (Sleep) clock from the chip, does not gate the Pipe clock during L0s, L1, L2 states and does not put the PHY in P2 while in L1. If Clocks and Resets module is used, other bits in this register may be of additional interest. Changing this bit is only allowed while PCIe PHY, PCIe Core and PCIe Power Resets are asserted by the Chip Clock Controller module. 0x1: Enable Clocks Resets 0x0: Disable Clocks Resets

0x1B600004 PCIE20_PARF_PHY_LATENCY

Type: Read/Write
Clock: AHB_CLK
Reset State: 0X00000006

PCIE20 PHY Latency for transmitting ELECIDLE prior to resetting the core by the clk_rst module. This is used by the CLK_RST module after a link down event.

This register may be set only when the controller is in reset.

PCIE20_PARF_PHY_LATENCY

Bits	Name	Description
31:8	RESERVED_31_8	Reserved
7:0	PHY_LATENCY	PHY Latency Value

0x1B600008 PCIE20_PARF_BRIDGE_ERR_MAP

Type: Read/Write
Clock: AHB_CLK
Reset State: 0X00000000

PCIE20 AXI Error mapping configuration.

This register may be set only when the controller is in reset.

PCIE20_PARF_BRIDGE_ERR_MAP

Bits	Name	Description
31:18	RESERVED_31_18	Reserved
17:16	AXI_MSTR_ERR_MAP	AXI master error mapping (AXI error responses to PCIe error completions). See 'mstr_resp_err_map' description in controller data book.
15:6	RESERVED_15_6	Reserved
5:0	AXI_SLV_ERR_MAP	AXI slave error mapping (PCIe error completions to AXI error responses). See 'slv_resp_err_map' description in controller data book.

0x1B600010 PCIE20_PARF_DB_CTRL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0X00000000

PCIe 2.0 presence detect debouncer control register. This register also controls the hysteresis counters for the Master, Slave and DBI access wakeup from L1 mechanism.

PCIE20_PARF_DB_CTRL

Bits	Name	Description
31:7	RESERVED_31_7	Reserved
6	MST_WKP_BLOCK	Enable/Disable debouncing on Master wakeup de-assertion. Blocking eventually ignores the debouncer delay and allows immediate removal detection. This bit may be changed only when the controller is in reset. 0x1: blocked 0x0: passed
5	SLV_WKP_BLOCK	Enable/Disable debouncing on Slave wakeup de-assertion. Blocking eventually ignores the debouncer delay and allows immediate removal detection. This bit may be changed only when the controller is in reset. 0x1: blocked 0x0: passed
4	DBI_WKP_BLOCK	Enable/Disable debouncing on DBI wakeup de-assertion. Blocking eventually ignores the debouncer delay and allows immediate removal detection. This bit may be changed only when the controller is in reset. 0x1: blocked 0x0: passed
3:2	RESERVED_3_2	Reserved
1	RMVL_DBNCR_BLOCK	Enable/Disable debouncing on card removal. Blocking eventually ignores the debouncer delay and allows immediate removal detection. 0x1: blocked 0x0: passed
0	INSR_DBNCR_BLOCK	Enable/Disable debouncing on card insertion. Blocking eventually ignores the debouncer delay and allows immediate insertion detection. 0x1: blocked 0x0: passed

0x1B600014 PCIE20_PARF_PREDET_DB_INSR

Type: Read/Write
Clock: AHB_CLK
Reset State: 0X00010000

PCIe 2.0 presence detect debouncer counter for card-insertion events.

This register may be set only when the controller is in reset.

PCIE20_PARF_PREDET_DB_INSR

Bits	Name	Description
31:0	INSR_DBNCR_VAL	Debouncing value for card insertion: presence detect assertion is passed to controller only after this number clock cycles

0x1B600018 PCIE20_PARF_PREDET_DB_RMVL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0X00010000

PCIe 2.0 presence detect debouncer counter for card-removal events.

This register may be set only when the controller is in reset.

PCIE20_PARF_PREDET_DB_RMVL

Bits	Name	Description
31:0	RMVL_DBNCR_VAL	Debouncing value for card removal: presence detect de-assertion is passed to controller only after this number clock cycles

0x1B60001C PCIE20_PARF_WKP_DB_RMVL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0X00101010

PCIe 2.0 Hysteresis counter values for de-assertion of Exit L1 Requests as a result of a bus access taking place.

This register may be set only when the controller is in reset.

PCIE20_PARF_WKP_DB_RMVL

Bits	Name	Description
31:24	RESERVED_31_24	Reserved
23:16	MST_DBNCR_VAL	Hysteresis counter value for Exit L1 Request de-assertion after a Master access
15:8	SLV_DBNCR_VAL	Hysteresis counter value for Exit L1 Request de-assertion after a Slave access
7:0	DBI_DBNCR_VAL	Hysteresis counter value for Exit L1 Request de-assertion after a DBI access

0x1B600020 PCIE20_PARF_PM_CTRL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0X00000000

PCIE20 Power Management Control register.

PCIE20_PARF_PM_CTRL

Bits	Name	Description
31:3	RESERVED_31_3	Reserved
2	READY_ENTR_L23	Application indication that system is ready to enter L2/L3 power states. Check 'app_ready_entr_l23' signal in the controller databook. 0x0: not ready 0x1: ready
1	REQ_EXIT_L1	Application request to the controller to exit L1 power state. Check 'app_req_exit_l1' signal in the controller databook. 0x0: De-assert Exit Request 0x1: Assert Exit Request
0	REQ_ENTR_L1	Application request to the controller to enter L1 power state. Check 'app_req_entr_l1' signal in the controller databook. 0x0: De-assert Enter Request 0x1: Assert Enter Request

0x1B600024 PCIE20_PARF_PM_STTS

Type: Read
Clock: AHB_CLK
Reset State: 0X00000000

PCIE20 Power Management Status register.

PCIE20_PARF_PM_STTS

Bits	Name	Description
31:8	RESERVED_31_8	Reserved
7	PM_LINKST_L2_EXIT	Reflects 'pm_linkst_l2_exit' indication from the Power Management controller. See controller databook for more info
6	PM_LINKST_IN_L2	Reflects 'pm_linkst_in_l2' indication from the Power Management controller. See controller databook for more info

PCIE20_PARF_PM_STTS (cont.)

Bits	Name	Description
5	PM_LINKST_IN_L1	Reflects 'pm_linkst_in_l1' indication from the Power Management controller. See controller databook for more info
4	PM_PME_EN	Reflects 'pm_pme_en' indication from the Power Management controller. See controller databook for more info
3	PM_STATUS	Reflects 'pm_status' indication from the Power Management controller. See controller databook for more info
2:0	PM_DSTATE	Reflects 'pm_dstate' indication from the Power Management controller. See controller databook for more info.

0x1B600030 PCIE20_PARF_PCS_CTRL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x00000000

PCIE20 PCS Control register.

PCIE20_PARF_PCS_CTRL

Bits	Name	Description
31:2	RESERVED_31_2	Reserved
1	TX2RX_LOOPBACK_EN	Force the PHY into TX2RX loopback state. Data from the transmit pre-driver is looped back to the receive slicers. This bit may be changed only when the controller & PHY are in reset. 0x0: Normal mode 0x1: TX2RX loopback
0	COMMON_CLOCKS	When asserted, indicates that the controller requires the reference clock to remain active. see 'pcs_common_clocks' in the phy databook. This bit may be changed only when the controller and PHY are in reset.

0x1B600034 PCIE20_PARF_PCS_DEEMPH

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x00151520

PCIE20 PCS De-emphasis control register.

This register may be set only when the controller and PHY are in reset.

PCIE20_PARF_PCS_DEEMPH

Bits	Name	Description
31:22	RESERVED_31_22	Reserved
21:16	TX_DEEMPH_GEN1	Sets the Tx driver de-emphasis value in the case where 'pipe0_tx_deemph' is set to 0x1, and the PHY is running at Gen1 rate. See PHY data book.
15:14	RESERVED_15_14	Reserved
13:8	TX_DEEMPH_GEN2_3_5DB	Sets the Tx driver de-emphasis value in the case where 'pipe0_tx_deemph' is set to 0x1, and the PHY is running at Gen2 rate. See PHY data book.
7:6	RESERVED_7_6	Reserved
5:0	TX_DEEMPH_GEN2_6DB	Sets the Tx driver de-emphasis value in the case where 'pipe0_tx_deemph' is set to 0x0, and the PHY is running at Gen2 rate. See PHY data book.

0x1B600038 PCIE20_PARF_PCS_SWING

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x00007979

PCIE20 PCS voltage swing control register.

This register may be set only when the controller and PHY are in reset.

PCIE20_PARF_PCS_SWING

Bits	Name	Description
31:15	RESERVED_31_15	Reserved
14:8	TX_SWING_FULL	Sets the TX launch amplitude when 'pipe0_tx_swing' is set to 0x0 (default state). See PHY data book.
7	RESERVED_7	Reserved
6:0	TX_SWING_LOW	Sets the TX launch amplitude when 'pipe0_tx_swing' is set to 0x1 (low-swing state). See PHY data book.

0x1B600040 PCIE20_PARF_PHY_CTRL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0X00000900

PCIE20 PHY control register.

his register may be set only when the controller and PHY are in reset.

PCIE20_PARF_PHY_CTRL

Bits	Name	Description
31:21	RESERVED_31_21	Reserved
20:16	PHY_TX0_TERM_OFFST	Transmitter Termination Offset See 'phy_tx0_term_offset' in PHY data book.
15:13	RESERVED_15_13	Reserved
12:8	PHY_LOS_LEVEL	Loss-of-Signal Detector Sensitivity Level Control. See 'phy_los_level' PHY data book.
7:5	RESERVED_7_5	Reserved
4	PHY_RTUNE_REQ	Write 0x1 to trigger a resistor tune request. See 'phy_rtune_req' in PHY data book.
3	RESERVED_3	Reserved
2	PHY_TEST_BURNIN	Drives PHY reserved pin 'phy_test_burnin'
1	PHY_TEST_BYPASS	Drives PHY reserved pin 'phy_test_bypass'
0	PHY_TEST_PWR_DOWN	Force the entire PHY into its lowest power state by turning everything completely off. This is used to conserve power. See 'phy_test_powerdown' in PHY data book. 0x0: PHY power on 0x1: PHY power-down

0x1B600044 PCIE20_PARF_PHY_STTS

Type: Read
Clock: AHB_CLK
Reset State: 0X00000000

PCIE20 PHY control register.

PCIE20_PARF_PHY_STTS

Bits	Name	Description
31:5	RESERVED_31_5	RESERVED

PCIE20_PARF_PHY_STTS (cont.)

Bits	Name	Description
4	PHY_RTUNE_ACK	While asserted high, Resistor calibration is in process. See 'phy_rtune_ack' in PHY data book. SW is responsible to read this bit twice for detecting the correct value, since this bit is a level signal which is not synchronized to AHB clock domain. The reason there is no sychronization is that there's no AHB clock available most of the time.
3:0	RESERVED_3_0	RESERVED

0x1B60004C PCIE20_PARF_PHY_REFCLK

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0001019

PCIE20 PHY reference clock control register.

his register may be set only when the controller and PHY are in reset.

PCIE20_PARF_PHY_REFCLK

Bits	Name	Description
31:17	RESERVED_31_17	Reserved
16	REF_SSP_EN	Indicates to PHY that external reference clock is stable and ready for use. This bit must be enabled in order to use the controller and is described in the power up sequence. See 'phy_ref_ssp_en' in PHY data book. 0x1: Refclk stable 0x0: No Refclk
15:13	RESERVED_15_13	Reserved
12	REF_USE_PAD	Chooses the source for the reference clock for the PHY. See 'phy_ref_use_pad' in PHY databook. 0x1: Refclk from pad 0x0: Refclk from alt
11:9	RESERVED_11_9	Reserved
8	REFCLK_DIV2	Divides the reference clock frequency by 2, when higher than 100 MHz. See 'phy_ref_clkdiv2' in PHY data book. 0x1: divide refclk 0x0: don't divide
7	RESERVED_7	Reserved

PCIE20_PARF_PHY_REFCLK (cont.)

Bits	Name	Description
6:0	MPLL_MULTIPLIER	Multiplies the reference clock to a frequency suitable for intended operating speed. See 'phy_mpll_multiplier' in PHY data book.

0x1B600050 PCIE20_PARF_CONFIG_BITS

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x00000000

PCIE20 Config Bits.

PCIE20_PARF_CONFIG_BITS

Bits	Name	Description
31:27	BITS31_27	Reserved For Configuration Bits
26:24	PHY_RX0_EQ	This field controls the value of PHY_RX0_EQ to the PHY
23:0	BITS23_0	Reserved For Configuration Bits

16 RIVA Registers

16.1 Overview

Table 16-1 RIVA Bases

Base Name	Parent	Address
RIVA_BASE2	RIVA_BASE	0x03000000

16.2 RIVA Registers (0x03100000 RIVA_BASE)

This section contains RIVA registers.

16.2.1 A2XB Registers

0x3000000 A2XB_A2XB_CFG

Type: read-write
Reset State: 0x00000020

This register's value configures general A2XB features.

A2XB_A2XB_CFG

Bits	Name	Description
21:16	MSTR_SPLIT_TIMEOUT	Shows the split timeout status of each of the CDAHB masters (one bit per master). When set signifies that the master has been split for longer than the timeout limit and therefore has seen a split timeout. The bits are sticky so that if more than one timeout happen the new timed out masters get OR-ed in with the previous value.
15:10	MSTR_SPLIT_STAT	Shows the split status of each of the CDAHB masters (one bit per master). When set signifies that the master has been split by A2XB. There are four reasons for a master being split: 1. Command Queue is full so request could not be accepted 2. Write data Queue is full so write data could not be accepted 3. Read request is pending and A2XB is waiting on AXI read completion 4. A write by another master is pending due to <2> so a new write command cannot be accepted
9:2	SPLIT_LIMIT	Configures the split timeout limit in the AHB slave in thousands of cycles. If a master is split for more than the configured limit a split timeout error interrupt will be generated. Reset State: 0x00000008
1	BUSY_OFF	Purely a debug feature. A bug in the busy generation logic has the potential to hang every master in Riva. Should this type of bug be encountered, setting this bit to 1 will ensure that busy is always low, thereby preventing masters from getting hung waiting for completion of writes. Please note that this will likely cause data coherency issues between masters. Reset State: 0x00000000

A2XB_A2XB_CFG (cont.)

Bits	Name	Description
0	ENABLE	Set to enable the A2XB bridge functionality. This register is actually on the PMU and this read only bit just reflects the status of the corresponding PMU register. requests not destined to internal A2XB registers will generate an AHB error response. Reset State: 0x00000000

0x3000004 A2XB_INT_MSK

Type: read-write
Reset State: 0x0000000F

The value of this register is used to mask interrupt sources.

A2XB_INT_MSK

Bits	Name	Description
3	A2XB_AXI_HALT_REQ_SET_INT_MSK	When clear it masks off the a2xb_axi_halt_req_set interrupt request. Reset State: 0x00000001
2	A2XB_SPLIT_TIMEOUT_ERR_INT_MSK	When clear it masks off the a2xb_split_timeout_err interrupt request. Reset State: 0x00000001
1	A2XB_RD_ERR_INT_MSK	When clear it masks off the a2xb_rd_err interrupt request. Reset State: 0x00000001
0	A2XB_WR_ERR_INT_MSK	When clear it masks off the a2xb_wr_err interrupt request. Reset State: 0x00000001

0x3000008 A2XB_INT_SRC_MSKD

Type: read-only
Reset State: 0x00000000

The value of this register is the masked interrupt source. It is the logical AND of the INT_SRC with INT_MSK

A2XB_INT_SRC_MSKD

Bits	Name	Description
3	A2XB_AXI_HALT_REQ_SET_INT_MSKD	This field is the masked a2xb_axi_halt_req_set_int Reset State: 0x00000000

A2XB_INT_SRC_MSKD (cont.)

Bits	Name	Description
2	A2XB_SPLIT_TIMEOUT_ERR_INT_MSKD	This field is the masked a2xb_split_timeout_err_int Reset State: 0x00000000
1	A2XB_RD_ERR_INT_MSKD	This field is the masked a2xb_rd_err_int Reset State: 0x00000000
0	A2XB_WR_ERR_INT_MSKD	This field is the masked a2xb_wr_err_int Reset State: 0x00000000

0x300000C A2XB_INT_SRC

Type: read-only
Reset State: 0x00000000

The value of this register is the interrupt source.

A2XB_INT_SRC

Bits	Name	Description
3	A2XB_AXI_HALT_REQ_SET_INT	This field is set when A2XB receives a halt request from the AXI fabric. This is a fatal error that will require a full A2XB reset to recover. Upon receiving the halt request, the A2XB will immediately unsplit any split masters, will flush all its buffers, will discard any data incoming on its AXI port side and will from then on return error responses to any AHB transaction destined to the fabric. Local access to A2XB CSRs will still work normally. Reset State: 0x00000000
2	A2XB_SPLIT_TIMEOUT_ERR_INT	This field is set when the A2XB GAS detects that a master has been split for longer than the timeout limit. This is a fatal error that will require at least a full A2XB reset to recover. On occurrence, A2XB will immediately unsplit any split masters, will flush all its buffers, will discard any data incoming on its AXI port side and will from then on return error responses to any AHB transaction destined to the fabric. Local access to A2XB CSRs will still work normally. Reset State: 0x00000000
1	A2XB_RD_ERR_INT	This field is set when A2XB receives an error response from the AXI fabric on any data beat of a read transaction. Data following the first beat with an error and belonging to the same transfer will be discarded and when the AHB master returns to complete its read it will be able to complete only as many beats as completed without an AXI error (if any) and will then receive an AHB error response on the beat that incurred the AXI error. Reset State: 0x00000000

A2XB_INT_SRC (cont.)

Bits	Name	Description
0	A2XB_WR_ERR_INT	This field is set when A2XB receives an error response from the AXI fabric for a write transaction. Since the AHB protocol provides no way to notify the originating master of errors incurred on posted writes, this interrupt will be the only indication that a write error occurred. Reset State: 0x00000000

0x3000010 A2XB_INT_CLR

Type: write-only
Reset State: 0x00000000

The value of this register is used to clear interrupt sources.

A2XB_INT_CLR

Bits	Name	Description
3	A2XB_AXI_HALT_REQ_SET_INT_CLR	This field when set will clear the halt request set interrupt indication. This only clears the interrupt request, A2XB reset will be required to return to normal operation. Reset State: 0x00000000
2	A2XB_SPLIT_TIMEOUT_ERR_INT_CLR	This field when set will clear the split timeout error interrupt. This only clears the interrupt request, A2XB reset will be required to return to normal operation. Reset State: 0x00000000
1	AXI_RD_ERR_INT_CLR	This field when set will clear the AXI read error interrupt. Reset State: 0x00000000
0	AXI_WR_ERR_INT_CLR	This field when set will clear the AXI write error interrupt. Reset State: 0x00000000

0x3000014 A2XB_TSTBUS_CTRL

Type: read-write
Reset State: 0x00000001

The value of this register is used to control a mux that selects which set of internal A2XB signals gets put on the chip-wide test bus.

A2XB_TSTBUS_CTRL

Bits	Name	Description
29:28	CTRL_SEL	Controls the different testbus configurations on the a2xb main control module. 3 different testbus configs are available 0x0: CFG_0 0x1: CFG_1 0x2: CFG_2 Reset State: 0x00000000
24	CSR_SEL	Controls the different testbus configurations on the a2xb_csr module. 2 different testbus configs are available 0x0: CFG_0 0x1: CFG_1 Reset State: 0x00000000
10:8	AXIM_SEL	Controls the different testbus configurations on the a2xb_axim module. 7 different testbus configs are available 0x0: CFG_0 0x1: CFG_1 0x2: CFG_2 0x3: CFG_3 0x4: CFG_4 0x5: CFG_5 0x6: CFG_6 Reset State: 0x00000000
5:4	AHB_SEL	Controls the different testbus configurations on the a2xb_ahb module. 3 different configs are available 0x0: CFG_0 0x1: CFG_1 0x2: CFG_2 Reset State: 0x00000000
3:1	SEL	Controls which of the internal a2xb local testbusses gets put out on the actual A2XB testbus output 0x0: MIX 0x1: AHB 0x2: AXIM 0x3: CMDFIFO 0x4: WRFIFO 0x5: RDFIFO 0x6: CSR 0x6: CTRL Reset State: 0x00000000
0	EN	Enable. When enabled the flop that drives the A2XB testbus will update its value every cycle, otherwise the flop outputs will remain constant. Reset State: 0x00000001

0x3000018 A2XB_TSTBUS

Type: read-only

This register provides bits [31:0] of the A2XB testbus.

A2XB_TSTBUS

Bits	Name	Description
31:0	VALUE	

0x300001C A2XB_ERR_INFO

Type: read-only

Records which AHB master IDs have received AXI write or read error responses for any of their transfers. Once set, the bit can only be cleared by resetting the A2XB.

A2XB_ERR_INFO

Bits	Name	Description
11	MID_6_RD_ERR	Set if AHB MID 6 got an AXI read error response in any of its transfers.
10	MID_5_RD_ERR	Set if AHB MID 5 got an AXI read error response in any of its transfers.
9	MID_4_RD_ERR	Set if AHB MID 4 got an AXI read error response in any of its transfers.
8	MID_3_RD_ERR	Set if AHB MID 3 got an AXI read error response in any of its transfers.
7	MID_2_RD_ERR	Set if AHB MID 2 got an AXI read error response in any of its transfers.
6	MID_1_RD_ERR	Set if AHB MID 1 got an AXI read error response in any of its transfers.
5	MID_6_WR_ERR	Set if AHB MID 6 got an AXI write error response in any of its transfers.
4	MID_5_WR_ERR	Set if AHB MID 5 got an AXI write error response in any of its transfers.
3	MID_4_WR_ERR	Set if AHB MID 4 got an AXI write error response in any of its transfers.
2	MID_3_WR_ERR	Set if AHB MID 3 got an AXI write error response in any of its transfers.
1	MID_2_WR_ERR	Set if AHB MID 2 got an AXI write error response in any of its transfers.
0	MID_1_WR_ERR	Set if AHB MID 1 got an AXI write error response in any of its transfers.

0x3000020 A2XB_REVISION

Type: read-only
Reset State: 0x00000045

This register's value represents the A2XB RTL revision present in the hardware.

A2XB_REVISION

Bits	Name	Description
31:0	REVID	Revision ID. Corresponds to the label number of A2XB (revision of .info file) Reset State: 0x00000045

0x3000024 A2XB_SPARE

Type: read-write
Reset State: 0x00000000

This register defines a few control spare bits to be used for bug fixing

A2XB_SPARE

Bits	Name	Description
7:0	SPARE	Spare bits to be used for bug fixing. Reset State: 0x00000000

16.2.2 ccahb

0x3000000 CCAHB_CCAHB_BT_PL

Type: read-write
Reset State: 0x00000005

ccahb Arbiter arbitration priority level for bt master. In the ccahb arbitration scheme, the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CCAHB_CCAHB_BT_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for bt master.The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the ccahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000004 CCAHB_CCAHB_FM_PL

Type: read-write
Reset State: 0x00000005

ccahb Arbiter arbitration priority level for fm master. In the ccahb arbitration scheme, the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CCAHB_CCAHB_FM_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for fm master.The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the ccahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000008 CCAHB_CCAHB_RRI_PL

Type: read-write
Reset State: 0x00000001

ccahb Arbiter arbitration priority level for rri master. In the ccahb arbitration scheme, the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CCAHB_CCAHB_RRI_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rri master.The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the ccahb arbiter will prevent a master from disabling itself. Reset State: 0x00000001

0x300000C CCAHB_CCAHB_DXE_PL

Type: read-write
Reset State: 0x00000001

ccahb Arbiter arbitration priority level for dxe master. In the ccahb arbitration scheme, the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CCAHB_CCAHB_DXE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dxe master.The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the ccahb arbiter will prevent a master from disabling itself. Reset State: 0x00000001

0x3000010 CCAHB_CCAHB_CCPU_PL

Type: read-write
Reset State: 0x00000004

ccahb Arbiter arbitration priority level for ccpu master. In the ccahb arbitration scheme, the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CCAHB_CCAHB_CCPU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for ccpu master.The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the ccahb arbiter will prevent a master from disabling itself. Reset State: 0x00000004

0x3000014 CCAHB_CCAHB_A2AB_PL

Type: read-write
Reset State: 0x00000001

ccahb Arbiter arbitration priority level for a2ab master. In the ccahb arbitration scheme, the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CCAHB_CCAHB_A2AB_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for a2ab master.The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the ccahb arbiter will prevent a master from disabling itself. Reset State: 0x00000001

0x3000018 CCAHB_CCAHB_TIC_PL

Type: read-write
Reset State: 0x00000005

ccahb Arbiter arbitration priority level for tic master. In the ccahb arbitration scheme, the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CCAHB_CCAHB_TIC_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for tic master.The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the ccahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x300001C CCAHB_CCAHB_CBR_PL

Type: read-write
Reset State: 0x00000005

ccahb Arbiter arbitration priority level for cbr master. In the ccahb arbitration scheme, the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CCAHB_CCAHB_CBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for cbr master.The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the ccahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000048 CCAHB_CCAHB_DFLT_MST

Type: read-write
Reset State: 0x00000000

This register identifies the default master for the ccahb

CCAHB_CCAHB_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY 0x1: BT 0x2: FM 0x3: RRI 0x4: DXE 0x5: CCPU 0x6: A2AB 0x7: TIC 0x8: CBR Reset State: 0x00000000

0x3000090 CCAHB_CCAHB_VERSION

Type: read-only
Reset State: 0x3230382A

ASCII value for each number in the version, followed by '*'. For example 32_30_31_2A represents the version 2.01*.

CCAHB_CCAHB_VERSION

Bits	Name	Description
31:24	CCAHB_COMP_VERSION_BYTE0	Reset State: 0x00000032
23:16	CCAHB_COMP_VERSION_BYTE1	Reset State: 0x00000030
15:8	CCAHB_COMP_VERSION_BYTE2	Reset State: 0x00000038
7:0	CCAHB_COMP_VERSION_BYTE3	Reset State: 0x0000002A

16.2.3 ccu_qgic_ci

0x3000000 CCU_QGIC_CI_GICC_CTLR

Type: read-write
Reset State: 0x00000000

The GICC_CTLR configures the generic interrupt controller CPU interface.

CCU_QGIC_CI_GICC_CTLR

Bits	Name	Description
4	SBPR	Controls which binary point register is used to calculate pre-emption.0: BANKED (secure interrupts use the secure Binary Point Register, non-secure interrupts use the non-secure Binary Point Register)1: RESTRICTED (all interrupts use the secure Binary Point Register) Reset State: 0x00000000
3	S_DEST	Controls destination of secure interrupts.0: IRQ1: FIQ Reset State: 0x00000000
2	S_ACK	Controls the side effect behavior of a secure read request to the Interrupt Acknowledge Register in the case where the highest priority pending interrupt is non-secure.0: DISABLE ACK OF NS PENDING1: ENABLE ACK OF NS PENDING Reset State: 0x00000000
1	ENABLE_NS	For secure software, a read/writable alias of non secure software enable bit (bit 0 of this same register in non secure space).0: CLR1: SET Reset State: 0x00000000
0	ENABLE	For non-secure software, this bit enables/disables non secure interrupts. For secure software, this bit enables/disables secure interrupts.0: CLR1: SET Reset State: 0x00000000

0x3000004 CCU_QGIC_CI_GICC_PMR

Type: read-write
Reset State: 0x00000000

The GICC_PMR register configures the generic interrupt controller CPU interface Priority Mask. The Priority Mask can be used to limit the interrupts that can cause an interrupt request to the CPU based on priority levels.

CCU_QGIC_CI_GICC_PMR

Bits	Name	Description
7:0	LEVEL	Set the Priority Mask Level. The CPU interface asserts an interrupt request to CPU if the priority of the highest Pending interrupt sent by the interrupt Distributor is strictly higher than at least the mask set in Priority Mask Register. Reset State: 0x00000000

0x3000008 CCU_QGIC_CI_GICC_BPR

Type: read-write
Reset State: 0x00000000

The GICC_BPR register configures the generic interrupt controller CPU interface Binary Point. The Binary Point is used to limit interrupts that can cause an interrupt request to the CPU based on the interrupts priority and the interrupt priority that currently being serviced by the CPU (if there is one). If the CPU is not servicing an interrupt, the Binary Point register is not used.

CCU_QGIC_CI_GICC_BPR

Bits	Name	Description
2:0	VAL	The VAL setting is used to determine the priority bits used for preemption according to Table 11-9 Interpretation of Binary Point Register value. Reset State: 0x00000000

0x300000C CCU_QGIC_CI_GICC_IAR

Type: read-write
Reset State: 0x00000000

The GICC_IAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn. Performing this read has the side effect of causing the Distributor to change the interrupt from the Pending state to the Active or Active and Pending state.

CCU_QGIC_CI_GICC_IAR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. Reset State: 0x00000000

CCU_QGIC_CI_GICC_IAR (cont.)

Bits	Name	Description
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, and the security state of any outstanding interrupts, as described in Table 11-9 Interpretation of Binary Point Register value. Reset State: 0x00000000

0x3000010 CCU_QGIC_CI_GICC_EOIR

Type: read-write
Reset State: 0x00000000

The GICC_EOIR (End Of Interrupt) register is written to indicate when software has finished handling an interrupt. Writing to this register will set the interrupt to Inactive or Pending (if prior to writing to this register, the interrupt was both Active and Pending) in the Distributor. The value written must be the interrupt ID, and the CPU Source ID for sgis, of the interrupt that is being completed. The security status of the write to this register (NS-prot) must match the security status (NS-int) of the interrupt ID, according to Table 17-9 (GICC_EIOR security (and source CPU) match definition), in order for the interrupt to be successfully cleared.

CCU_QGIC_CI_GICC_EOIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. As described in Table 17-9, the CPU Source ID must match an active interrupt in order for the GICC_EOIR to take effect. The CPU_ID is written must match that delivered to software when GICC_IAR is read. Reset State: 0x00000000
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICC_IAR register. If the security settings match the Active state in the Distributor for the corresponding interrupt will be cleared. Reset State: 0x00000000

0x3000014 CCU_QGIC_CI_GICC_RPR

Type: read-write
Reset State: 0x00000000

The GICC_RPR (Running Priority) register provides access to the highest priority of all the Active interrupts on this CPU. The priority value returned is sensitive to the security status (NS-int) of the interrupt currently running and the NS-prot.

CCU_QGIC_CI_GICC_RPR

Bits	Name	Description
7:0	VAL	Running Priority Reset State: 0x00000000

0x3000018 CCU_QGIC_CI_GICC_HPPIR

Type: read-write
Reset State: 0x00000000

The GICC_HPPIR register provides access to the highest priority pending interrupt to the CPU Interface.

CCU_QGIC_CI_GICC_HPPIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. Reset State: 0x00000000
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, and the security state of any outstanding interrupts, as described in Table 11-9 Interpretation of Binary Point Register value. Reset State: 0x00000000

0x300001C CCU_QGIC_CI_GICC_ABPR

Type: read-write
Reset State: 0x00000000

The GICC_ABPR register provides a copy of the non-secure binary point register for use by secure software. See the definition of the GICC_BPR register for details on the use of this register.

CCU_QGIC_CI_GICC_ABPR

Bits	Name	Description
2:0	VAL	Same as the GICC_BPR register - affects only non-secure interrupts. Reset State: 0x00000000

0x30000FC CCU_QGIC_CI_GICC_IIDR

Type: read-write
Reset State: 0x00000000

The GICC_IIDR register provides information about the generic interrupt controller CPU Interface version and device implementer information.

CCU_QGIC_CI_GICC_IIDR

Bits	Name	Description
31:20	PART_NUM	Part Number: 0x390 Reset State: 0x00000000
19:16	ARCH_VERSION	Architecture Version : 0x1 Reset State: 0x00000000
15:12	REVISION	Revision number: 0x0 Reset State: 0x00000000
11:0	IMPLEMENTOR	Bits[11:8] contain the implementers JEP106 continuation code, 0x0 Bit[7] is always 0 Bits[6:0] contain bits [6:0] of the implementers JEP106 code, Reset State: 0x00000000

16.2.4 ccu_qgic_di

0x3000000 CCU_QGIC_DI_GICD_CTLR

Type: read-write
Reset State: 0x00000000

The GICD_CTLR register controls if the Distributor responds to external interrupt stimulus changes.

CCU_QGIC_DI_GICD_CTLR

Bits	Name	Description
1	ENABLE_NS	This bit is an alias of the enable_ns bit.0: CLR1: SET Reset State: 0x00000000
0	ENABLE	This bit is the enable bit for both Secure and Non-secure software. Secure software accesses enable_s at this location. Non-secure software accesses enable_ns.0: CLR1: SET Reset State: 0x00000000

0x3000004 CCU_QGIC_DI_GICD_TYPER

Type: read-write
Reset State: 0x00000000

The GICD_TYPER register provides information about the configuration of the GIC.

CCU_QGIC_DI_GICD_TYPER

Bits	Name	Description
15:11	LSPI	Returns the number of Lockable Shared Peripheral Interrupts (LSPIs) that the generic interrupt controller contains. Reset State: 0x00000000
10	TZ	TrustZone support. Generic interrupt controller supports TrustZone, always reads back 0x1. Reset State: 0x00000000
9:8	RESERVED_BITS9_TO_8	Reserved Reset State: 0x00000000
7:5	CPU_NUM	Returns the number of CPU interfaces that the generic interrupt controller provides. Reset State: 0x00000000
4:0	IT_LINES	Returns the number of INTIDs, to the nearest 32, that the Distributor provides. Reset State: 0x00000000

0x3000008 CCU_QGIC_DI_GICD_IIDR

Type: read-write
Reset State: 0x00000070

The GICD_IIDR register provides information the implementor of the Distributor and the revision of the Distributor.

CCU_QGIC_DI_GICD_IIDR

Bits	Name	Description
15:12	REVISION	Returns the revision number of the Distributor, 0x0 Reset State: 0x00000000
11:0	IMPLEMENTOR	Returns JEP106 ID number, 0b 01110000 Reset State: 0x00000070

0x3000020 CCU_QGIC_DI_GICD_ANSACR

Type: read-write
Reset State: 0x00000000

The auxiliary non-secure access control register (GICD_ANSACR) is used to control non-secure access to GICD_CGCR.

CCU_QGIC_DI_GICD_ANSACR

Bits	Name	Description
0	GICD_CGCR	0x0: SEC (Dis-allows non-secure access.1: NS Allows non-secure access.) Reset State: 0x00000000

0x3000024 CCU_QGIC_DI_GICD_CGCR

Type: read-write
Reset State: 0x00000000

The clock gate control register (GICD_CGCR) is used to control localized clock gating over-ride logic. Setting bits in GICD_CGCR disables the corresponding local clock gating logic. The local clock gating logic normally turns off a local (small subset) clock tree automatically if there is no need for the clock. If any error is found in the gating logic, these bits can be used to over-ride it.

CCU_QGIC_DI_GICD_CGCR

Bits	Name	Description
16	TOP	0x1: DISABLE0: ENABLE Controls the top level clock gate (which gates entire GIC.) Reset State: 0x00000000
15:4	RESERVED_15_TO_4	Reserved Reset State: 0x00000000
3	DI_SGI_STATE	0x1: DISABLE0: ENABLE Controls the clock gate for Distributor interrupt state data base registers for SGI interrupts. Reset State: 0x00000000
2	DI_PPI_SPI_STATE	0x1: DISABLE0: ENABLE Controls the clock gate for Distributor interrupt state data base registers for PPI and SPI interrupts. Reset State: 0x00000000
1	DI_DEMET	0x1: DISABLE0: ENABLE Controls the clock gate for Distributor interrupt input demet registers. Reset State: 0x00000000
0	DI_RD	0x1: DISABLE0: ENABLE Controls the clock gate for Distributor CRIF Read Data. Reset State: 0x00000000

0x3000080+0x4*n CCU_QGIC_DI_GICD_ISRn, n=[0..8]

Type: read-write
Reset State: 0x00000000

Each bit in an GICD_ISR register controls the security state of an interrupt, to be either secure or non-secure. You can only access these registers with secure read or secure write accesses. NOTE: The GICD_ISR register at address offset 0x0080 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

CCU_QGIC_DI_GICD_ISRn

Bits	Name	Description
31:0	INT_NS	0x0: SEC (Assigns INTID N to the Secure state.1: NS Assigns INTID N to the Non-secure state.) Reset State: 0x00000000

0x3000100+0x4*n CCU_QGIC_DI_GICD_ISENABLERn, n=[0..8]

Type: read-write
Reset State: 0x00000000

Each bit in an GICD_ISENABLER register controls the enabling of an interrupt. Reading this register returns the currently enabled interrupts subject to NS-int dependent access rules. NOTE The GICD_ISENABLER register at address offset 0x0100 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

CCU_QGIC_DI_GICD_ISENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ICENABLER register.1: SET Enables INTID N.) Reset State: 0x00000000

0x3000180+0x4*n CCU_QGIC_DI_GICD_ICENABLERn, n=[0..8]

Type: read-write
Reset State: 0x00000000

Each bit in an GICD_ICENABLER register controls the disabling of an interrupt. Reading this register returns the currently enabled interrupts subject to NS-int dependent access rules. NOTE The GICD_ICENABLER register at address offset 0x0180 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

CCU_QGIC_DI_GICD_ICENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ISENABLER register.1: CLR Enables INTID N.) Reset State: 0x00000000

0x3000200+0x4*n CCU_QGIC_DI_GICD_ISPENDRn, n=[0..8]

Type: read-write
Reset State: 0x00000000

Each bit in an GICD_ISPENDR register controls the enabling of an interrupt. Reading this register returns the currently pending interrupts subject to NS-int dependent access rules. NOTE The GICD_ISPENDR register at address offset 0x0200 is repeated once per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

CCU_QGIC_DI_GICD_ISPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ICPENDR register.1: SET Sets INTID N to the Pending state.) Reset State: 0x00000000

0x3000280+0x4*n CCU_QGIC_DI_GICD_ICPENDRn, n=[0..8]

Type: read-write
Reset State: 0x00000000

Each bit in an GICD_ICPENDR register controls the disabling of an interrupt. Reading this register returns the currently pending interrupts subject to NS-int dependent access rules. NOTE The GICD_ICPENDR register at address offset 0x0280 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

CCU_QGIC_DI_GICD_ICPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (No effect. Use GICD_ISPENDR register.1: CLR Clears INTID N. from the pending state.) Reset State: 0x00000000

0x3000300+0x4*n CCU_QGIC_DI_GICD_IACTIVERn, n=[0..8]

Type: read-write
Reset State: 0x00000000

Each bit in the GICD_IACTIVER register provides the active status of an interrupt. NOTE The GICD_IACTIVER register at address offset 0x0300 is repeated once per CPU Interface. It is only accessible from the designated CPU and provides information for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

CCU_QGIC_DI_GICD_IACTIVERn

Bits	Name	Description
31:0	INT	0x0: CLR1: SET Reset State: 0x00000000

0x3000400+0x4*n CCU_QGIC_DI_GICD_IPRIORITYRn, n=[0..71]

Type: read-write
Reset State: 0x00000000

Each field in the GICD_IPRIORITYR registers controls the priority level of an interrupt. NOTE The GICD_IPRIORITYR registers at address offsets 0x0400 to 0x41C are repeated once per CPU Interface. These are only accessible from the designated CPU and control the priority levels for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupt priority levels.

CCU_QGIC_DI_GICD_IPRIORITYRn

Bits	Name	Description
31:24	INT3	see below Reset State: 0x00000000
23:16	INT2	see below Reset State: 0x00000000
15:8	INT1	see below Reset State: 0x00000000
7:0	INT0	All bits cleared (0x0) is the highest priorty. All bits set (0xFF) is the lowest priority. For non-secure write access, the MSB is always set (0x1). For non-secure read access, the MSB is always clear (0x0). Non-secure entities cant use the highest priorities without secure software setting such a priority. The highest priorities are typically reserved for secure software. Reset State: 0x00000000

0x3000800+0x4*n CCU_QGIC_DI_GICD_ITARGETSRn, n=[0..71]

Type: read-write
Reset State: 0x00000000

Each field in the GICD_ITARGETSR registers controls the destination CPU(s) of an interrupt.

NOTE The GICD_ITARGETSR registers at address offsets 0x0800 to 0x81C are not actually implemented. These are place holders PPI and SGI interrupts. PPI interrupts, being private, only have one destination CPU. SGI interrupts are generated by the QGIC_DI_SOFT_INT register only. The remaining registers control the SPI interrupt destinations.

CCU_QGIC_DI_GICD_ITARGETSRn

Bits	Name	Description
31:24	INT3	see below Reset State: 0x00000000
23:16	INT2	see below Reset State: 0x00000000
15:8	INT1	see below Reset State: 0x00000000
7:0	INT0	Each bit represents one of 8 CPUs. Bit 0 represents the zeroth CPU, bit 7 represents the seventh CPU. Setting this field to 0 will disable the interrupt as no CPU will see it set. Reset State: 0x00000000

0x3000C00+0x4*n CCU_QGIC_DI_GICD_ICFGRn, n=[0..17]

Type: read-write
Reset State: 0x00000000

Each field in the GICD_ICFGR registers allows: control of type of an SPI: level-sensitive / edge-sensitive reading the type of PPIs and sgis.

NOTE The GICD_ICFGR registers at address offsets 0x0C00 to 0xC04 are repeated once per CPU Interface. These are only accessible from the designated CPU and allow read access for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

CCU_QGIC_DI_GICD_ICFGRn

Bits	Name	Description
31:30	INT15	see below Reset State: 0x00000000
29:28	INT14	see below Reset State: 0x00000000
27:26	INT13	see below Reset State: 0x00000000
25:24	INT12	see below Reset State: 0x00000000
23:22	INT11	see below Reset State: 0x00000000
21:20	INT10	see below Reset State: 0x00000000
19:18	INT9	see below Reset State: 0x00000000
17:16	INT8	see below Reset State: 0x00000000
15:14	INT7	see below Reset State: 0x00000000
13:12	INT6	see below Reset State: 0x00000000
11:10	INT5	see below Reset State: 0x00000000
9:8	INT4	see below Reset State: 0x00000000
7:6	INT3	see below Reset State: 0x00000000
5:4	INT2	see below Reset State: 0x00000000
3:2	INT1	see below Reset State: 0x00000000
1:0	INT0	0x0: LVL N to N 01 : LVL 1 to N 10 : EDGE N to N 11 : EDGE 1 to N These bits behave differently for each of the three interrupt types as follows: For SGI, read back as 0b10 - SGI interrupts are edge-sensitive and use the N-N model. For PPI/SPI, read/writable as 0b01 or 0b11 - PPI/SPI interrupts can be edge or level sensitive and use the 1-N model. Reset State: 0x00000000

0x3000F00 CCU_QGIC_DI_GICD_SGIR

Type: read-write
Reset State: 0x00000000

The GICD_SGIR register provides the method by which software may cause interrupts to become pending for designated target CPU(s). The generic interrupt controller maintains an internal database of all outstanding software interrupt requests pended to each CPU Interface and rotates through them in Round Robin fashion. Signaling the same interrupt a second time before it is serviced will result in only one interrupt from the source CPU to the target CPU(s).

CCU_QGIC_DI_GICD_SGIR

Bits	Name	Description
25:24	T_FILTER	Target Filter 00 : LIST (Use the T_LIST as is) 01 : OTHERS (Send to all CPUs except the CPU MID making the request, ignoring T_LIST) 10 : MID (Send to only the CPU MID making the request, ignoring T_LIST) 11 : NA (Reserved) Reset State: 0x00000000
23:16	T_LIST	Target List. Each bit set represents a CPU target for the INT_ID, subject to the T_FILTER field. Reset State: 0x00000000
15	SATT	Security ATTribute. This bit is only programmable by secure Software. See0: SECURE (Secure interrupt is issued)1: NONSECURE (Non-secure interrupt is issued). Reset State: 0x00000000
14:4	RESERVED_BITS14_TO_4	Reserved Reset State: 0x00000000
3:0	INT_ID	The INT ID number (0-15) of the SGI to be set as pending. See the SGI pending truth table for security status Table 11-4 (SATT vs. NS-prot) for information on the conditions that allow an SGI to be set pending. Reset State: 0x00000000

0x3000FD0 CCU_QGIC_DI_GICD_PIDR0

Type: read-write
Reset State: 0x00000090

The GICD_PIDR0 provides access to generic interrupt controller peripheral identification.

CCU_QGIC_DI_GICD_PIDR0

Bits	Name	Description
7:0	PART_NUM	Returns lower byte of the generic interrupt controller part number 0xB390, 0x90 Reset State: 0x00000090

0x3000FF0 CCU_QGIC_DI_GICD_CIDR0

Type: read-write
Reset State: 0x0000000D

The GICD_CIDR0 provides access to generic interrupt controller component identification.

CCU_QGIC_DI_GICD_CIDR0

Bits	Name	Description
7:0	COMP_ID_0	Reads back as 0x0D. Reset State: 0x0000000D

0x3000FF4 CCU_QGIC_DI_GICD_CIDR1

Type: read-write
Reset State: 0x000000F0

The GICD_CIDR0 provides access to generic interrupt controller component identification.

CCU_QGIC_DI_GICD_CIDR1

Bits	Name	Description
7:0	COMP_ID_0	Reads back as 0xF0. Reset State: 0x000000F0

0x3000FF8 CCU_QGIC_DI_GICD_CIDR2

Type: read-write
Reset State: 0x00000005

The GICD_CIDR0 provides access to generic interrupt controller component identification.

CCU_QGIC_DI_GICD_CIDR2

Bits	Name	Description
7:0	COMP_ID_0	Reads back as 0x05. Reset State: 0x00000005

0x3000FFC CCU_QGIC_DI_GICD_CIDR3

Type: read-write
Reset State: 0x000000B1

The GICD_CIDR0 provides access to generic interrupt controller component identification.

CCU_QGIC_DI_GICD_CIDR3

Bits	Name	Description
7:0	COMP_ID_0	Reads back as 0xB1. Reset State: 0x000000B1

16.2.5 ccu

0x3000000 CCU_CCU_TMR1

Type: read-write
Reset State: 0x00000000

The CCU_TMR1 runs on 32 KHz clock. This is a free-running timer once enabled by writing to the CCU_TIMERS_CTL register. An interrupt is generated when the timer reaches the CCU_TMRMTH1 registers match count.

CCU_CCU_TMR1

Bits	Name	Description
31:0	TMR1_COUNT	Count for ticks of 32 KHz clock Reset State: 0x00000000

0x3000004 CCU_CCU_TMR2

Type: read-write
Reset State: 0x00000000

The CCU_TMR2 runs on 32 KHz clock. This is a free-running timer once enabled by writing to the CCU_TIMERS_CTL register. An interrupt is generated when the timer reaches the CCU_TMRMTH2 registers match count.

CCU_CCU_TMR2

Bits	Name	Description
31:0	TMR2_COUNT	Count for ticks of 32 KHz clock Reset State: 0x00000000

0x3000008 CCU_CCU_TMRMTH1

Type: read-write
Reset State: 0xFFFFFFFF

The CCU_TMRMTH1 is programmed with match count for CCU_TMR1 reg. Match between the count and timer will result in interrupt generation to GIC.

CCU_CCU_TMRMTH1

Bits	Name	Description
31:0	TMR1_MATCH	Count to match with 32 KHz timer Reset State: 0xFFFFFFFF

0x300000C CCU_CCU_TMRMTH2

Type: read-write
Reset State: 0xFFFFFFFF

The CCU_TMRMTH2 is programmed with match count for CCU_TMR2 reg. Match between the count and timer will result in interrupt generation to GIC.

CCU_CCU_TMRMTH2

Bits	Name	Description
31:0	TMR2_MATCH	Count to match with 32 KHz timer Reset State: 0xFFFFFFFF

0x3000010 CCU_CCU_SYSTMR

Type: read-write
Reset State: 0x00000000

The CCU_SYSTMR runs on chip XO clock. This timer can be enabled by writing to the CCU_TIMERS_CTL reg. This is mainly for software system debug purposes.

CCU_CCU_SYSTMR

Bits	Name	Description
31:0	SYSTMR_COUNT	Count for clock ticks Reset State: 0x00000000

0x3000014 CCU_CCU_WDGTMR

Type: read-write
Reset State: 0x00000000

The CCU_WDGTMR runs on AHB_CLK. Basically, when the watch dog timer is enabled, this timer keeps ++ at every millisecond. Once it reaches watch dog THR0, an interrupt is generated when it reaches THR1 another interrupt is generated (higher priority). On reaching THR3, another higher priority interrupt is generated. Typically this is used to reset the chip.

CCU_CCU_WDGTMR

Bits	Name	Description
31:30	ENABLE_DISABLE	Watch dog timer and the corresponding interrupts are enabled only when these bits are 10, 01 is disable. Any other combination will not be accepted and if software writes 00 or 11, the status is maintained. Reset State: 0x00000000
29:24	PROTECTION_VECTOR	This is write only register. When it is read ZEROs are returned. Writes to the watch dog register can happen (including the enable/disable) only when this field matches the CCU_WDGTHR 0[25:24],THR1[25:24],THR2[25:24] Reset State: 0x00000000
23:0	TIMER_COUNT	When enabled, it keeps ++ at every millisecond. Software can write to it only when the protection vector matches the concat of the 2 bit protection bits from the watch dog threshold register. The protection vector can't be 00 or 3f Reset State: 0x00000000

0x3000018 CCU_CCU_WDGTHR0

Type: read-write
Reset State: 0x00000000

The CCU_WDGTHR0 runs on AHB_CLK. This register contains THR0 for watch dog timer (CCU_WDGTMR).

CCU_CCU_WDGTHR0

Bits	Name	Description
27:26	PROTECTION_FIELD	This register is writable only when this field is 11 Reset State: 0x00000000
25:24	PROTECTION_VECTOR	2 bits of the protection_vector0 of watch dog timer. Reset State: 0x00000000
23:0	THRESHOLD	Contains the watch dog THR0. It is writable by software only when its protection field =11 Reset State: 0x00000000

0x300001C CCU_CCU_WDGTHR1

Type: read-write
Reset State: 0x00000000

The CCU_WDGTHR1 runs on AHB_CLK. This register contains THR1 for watch dog timer (CCU_WDGTMR).

CCU_CCU_WDGTHR1

Bits	Name	Description
27:26	PROTECTION_FIELD	This register is writable only when this field is 10 Reset State: 0x00000000
25:24	PROTECTION_VECTOR	2 bits of the protection_vector1 of watch dog timer. Reset State: 0x00000000
23:0	THRESHOLD	Contains the watch dog THR1. It is writable by software only when its protection field =10 Reset State: 0x00000000

0x3000020 CCU_CCU_WDGTHR2

Type: read-write
Reset State: 0x00000000

The CCU_WDGTHR2 runs on AHB_CLK. This register contains THR2 for watch dog timer (CCU_WDGTMR).

CCU_CCU_WDGTHR2

Bits	Name	Description
27:26	PROTECTION_FIELD	This register is writable only when this field is 01 Reset State: 0x00000000

CCU_CCU_WDGTHR2 (cont.)

Bits	Name	Description
25:24	PROTECTION_VECTOR	2 bits of the protection_vector2 of watch dog timer. Reset State: 0x00000000
23:0	THRESHOLD	Contains the watch dog THR2. It is writable by software only when its protection field =01 Reset State: 0x00000000

0x3000024 CCU_CCU_WDG_CFG

Type: read-write
Reset State: 0x00000000

This register controls the number of AHB clock ticks per micro-second used by CCU_WDGTMR.

CCU_CCU_WDG_CFG

Bits	Name	Description
7:0	CCU_WDGTMR_ONE_USEC_LIMIT	Count for ticks of 32 KHz clock Reset State: 0x00000000

0x3000028 CCU_CCU_TIMERS_CTL

Type: read-write
Reset State: 0x00000000

This register controls the enables for TMR1, TMR2 and SYSTMR.

CCU_CCU_TIMERS_CTL

Bits	Name	Description
2	SYSTMR_ENABLE	0x0: Disable Timer (Default 1: Enable Timer) Reset State: 0x00000000
1	TMR2_ENABLE	0x0: Disable Timer 1: Enable Timer (Default) Reset State: 0x00000000
0	TMR1_ENABLE	0x0: Disable Timer 1: Enable Timer (Default) Reset State: 0x00000000

0x300002C CCU_CCU_SPARE_TEST_CTL

Type: read-write
Reset State: 0x00000000

Spare test control register.

CCU_CCU_SPARE_TEST_CTL

Bits	Name	Description
31:12	SPARE	[31:16] ccu_a2ab_timeout_value; A2AB transaction timeout time in units of 0x1FF clock cycles; 0x0 means the timeout timer is disabled [15:12] Spare Bits Reset State: 0x00000000
11	CCU_TESTMUX_SW_TRIGGER_EN	when set, enables software overwrite of a testbus signal Reset State: 0x00000000
10	CCU_TESTMUX_SW_TRIGGER_SEL	0x1: overwrite will happen for testbus bit 0, 1b1: overwrite will happen for testbus bit 28 Reset State: 0x00000000
9	CCU_TESTMUX_SW_TRIGGER_VALUE	The value that will be put out on the selected testbus signal Reset State: 0x00000000
8	ECAHB_VITALS_TESTBUS_ENABLE	ecahb_vitals_testbus_enable Reset State: 0x00000000
7	ECAHB_TESTBUS_ENABLE	ecahb_testbus_enable Reset State: 0x00000000
6:4	A2AB_TESTBUS_SEL	a2ab_testbus_sel Reset State: 0x00000000
3	CDAHB_VITALS_TESTBUS_ENABLE	cdahb_vitals_testbus_enable Reset State: 0x00000000
2	CDAHB_TESTBUS_ENABLE	cdahb_testbus_enable Reset State: 0x00000000
1	CCAHB_VITALS_TESTBUS_ENABLE	ccahb_vitals_testbus_enable Reset State: 0x00000000
0	CCAHB_TESTBUS_ENABLE	ccahb_testbus_enable Reset State: 0x00000000

0x3000030 CCU_CCU_SPARE_INT_CTL

Type: read-write
Reset State: 0x00000000

Spare Int control register.

CCU_CCU_SPARE_INT_CTL

Bits	Name	Description
31:5	SPARE	Spare Bits Reset State: 0x00000000

CCU_CCU_SPARE_INT_CTL (cont.)

Bits	Name	Description
4:2	TRC_MAIN_CTRL_STE	Tracer main control state machine state Reset State: 0x00000000
1:0	TRC_CMEM_WRCTL_STE	Tracer cmem interface write control state machine state Reset State: 0x00000000

0x3000034 CCU_CCU_ROM_BASE_ADDR1

Type: read-write
Reset State: 0x00000000

Base Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

CCU_CCU_ROM_BASE_ADDR1

Bits	Name	Description
27:21	BA3	patch3_base_addr Reset State: 0x00000000
20:14	BA2	patch2_base_addr Reset State: 0x00000000
13:7	BA1	patch1_base_addr Reset State: 0x00000000
6:0	BA0	patch0_base_addr Reset State: 0x00000000

0x3000038 CCU_CCU_ROM_BASE_ADDR2

Type: read-write
Reset State: 0x00000000

Base Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

CCU_CCU_ROM_BASE_ADDR2

Bits	Name	Description
27:21	BA7	patch7_base_addr Reset State: 0x00000000
20:14	BA6	patch6_base_addr Reset State: 0x00000000
13:7	BA5	patch5_base_addr Reset State: 0x00000000

CCU_CCU_ROM_BASE_ADDR2 (cont.)

Bits	Name	Description
6:0	BA4	patch4_base_addr Reset State: 0x00000000

0x300003C CCU_CCU_ROM_START_ADDR1

Type: read-write
Reset State: 0x00000000

Start Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

CCU_CCU_ROM_START_ADDR1

Bits	Name	Description
31:16	SA1	patch1_start_addr Reset State: 0x00000000
15:0	SA0	patch0_start_addr Reset State: 0x00000000

0x3000040 CCU_CCU_ROM_START_ADDR2

Type: read-write
Reset State: 0x00000000

Start Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

CCU_CCU_ROM_START_ADDR2

Bits	Name	Description
31:16	SA3	patch3_start_addr Reset State: 0x00000000
15:0	SA2	patch2_start_addr Reset State: 0x00000000

0x3000044 CCU_CCU_ROM_START_ADDR3

Type: read-write
Reset State: 0x00000000

Start Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

CCU_CCU_ROM_START_ADDR3

Bits	Name	Description
31:16	SA5	patch5_start_addr Reset State: 0x00000000
15:0	SA4	patch4_start_addr Reset State: 0x00000000

0x3000048 CCU_CCU_ROM_START_ADDR4

Type: read-write
Reset State: 0x00000000

Start Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

CCU_CCU_ROM_START_ADDR4

Bits	Name	Description
31:16	SA7	patch7_start_addr Reset State: 0x00000000
15:0	SA6	patch6_start_addr Reset State: 0x00000000

0x300004C CCU_CCU_ROM_END_ADDR1

Type: read-write
Reset State: 0x00000000

End Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

CCU_CCU_ROM_END_ADDR1

Bits	Name	Description
31:16	EA1	patch1_end_addr Reset State: 0x00000000
15:0	EA0	patch0_end_addr Reset State: 0x00000000

0x3000050 CCU_CCU_ROM_END_ADDR2

Type: read-write
Reset State: 0x00000000

End Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

CCU_CCU_ROM_END_ADDR2

Bits	Name	Description
31:16	EA3	patch3_end_addr Reset State: 0x00000000
15:0	EA2	patch2_end_addr Reset State: 0x00000000

0x3000054 CCU_CCU_ROM_END_ADDR3

Type: read-write
Reset State: 0x00000000

End Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

CCU_CCU_ROM_END_ADDR3

Bits	Name	Description
31:16	EA5	patch5_end_addr Reset State: 0x00000000
15:0	EA4	patch4_end_addr Reset State: 0x00000000

0x3000058 CCU_CCU_ROM_END_ADDR4

Type: read-write
Reset State: 0x00000000

End Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

CCU_CCU_ROM_END_ADDR4

Bits	Name	Description
31:16	EA7	patch7_end_addr Reset State: 0x00000000
15:0	EA6	patch6_end_addr Reset State: 0x00000000

0x300005C CCU_CCU_VERSION

Type: read-write
Reset State: 0x00020002

This register indicates the version number of the Common SS for FPGA builds.

CCU_CCU_VERSION

Bits	Name	Description
19:16	CHIP_VERSION	Chip Version Number. Reset State: 0x00000002
15:0	VERSION_NUM	Version Number reference to the build. Reset State: 0x00000002

0x3000060 CCU_CCU_SOFT_RESET

Type: read-write
Reset State: 0x00000000

This register controls Soft Reset control of Common SS modules. Set high to reset.

CCU_CCU_SOFT_RESET

Bits	Name	Description
17	TESTMUX_SOFT_RESET	Soft Reset for Testmux. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
16	PMU_SLP_SOFT_RESET	Soft Reset for PMU. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
15	PMU_TCXO_SOFT_RESET	Soft Reset for PMU. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
14	PMU_AHB_SOFT_RESET	Soft Reset for PMU. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
13	LTE_SOFT_RESET	Soft Reset for LTE. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
12	FM_SOFT_RESET	Soft Reset for FM. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000

CCU_CCU_SOFT_RESET (cont.)

Bits	Name	Description
11	BT_SOFT_RESET	Soft Reset for FM. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
10	TIC_SOFT_RESET	Soft Reset for TIC. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
9	ROM_SOFT_RESET	Soft Reset for ROM. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
8	SPDM_SOFT_RESET	Soft Reset for SPDM. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
7	CDAHB_SOFT_RESET	Soft Reset for CDAHB. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
6	CCAHB_SOFT_RESET	Soft Reset for CCHB. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
5	A2XB_SOFT_RESET	Soft Reset for A2XB. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
4	A2AB_SOFT_RESET	Soft Reset for A2AB. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
3	RRI_SOFT_RESET	Soft Reset for RRI. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
2	DXE_SOFT_RESET	Soft Reset for DXE. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
1	CMEM_SOFT_RESET	Soft Reset for CMEM. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000
0	CCPU_SOFT_RESET	Soft Reset for CCPU. Asserts the reset when set. Needs to be cleared by SW. Reset State: 0x00000000

0x3000064 CCU_CCU_ENABLE_CLK

Type: read-write
Reset State: 0x00007FFF

This register enables the clock to Common SS modules. If set, the clock is enabled.

CCU_CCU_ENABLE_CLK

Bits	Name	Description
15	TESTMUX_ROOT_CLK_ENABLE	Enable clock for testmux Reset State: 0x00000000
14	PMU_TCXO_ENABLE_CLK	Enable clock for pmu_tcxo Reset State: 0x00000001
13	LTE_ENABLE_CLK	Enable clock for lte Reset State: 0x00000001
12	FM_ENABLE_CLK	Enable clock for fm Reset State: 0x00000001
11	BT_ENABLE_CLK	Enable clock for bt Reset State: 0x00000001
10	TIC_ENABLE_CLK	Enable clock for tic Reset State: 0x00000001
9	ROM_ENABLE_CLK	Enable clock for rom Reset State: 0x00000001
8	SPDM_ENABLE_CLK	Enable clock for spdm Reset State: 0x00000001
7	CDAHB_ENABLE_CLK	Enable clock for cdahb Reset State: 0x00000001
6	CCAHB_ENABLE_CLK	Enable clock for ccahb Reset State: 0x00000001
5	A2XB_ENABLE_CLK	Enable clock for a2xb Reset State: 0x00000001
4	A2AB_ENABLE_CLK	Enable clock for a2ab Reset State: 0x00000001
3	RRI_ENABLE_CLK	Enable clock for rri Reset State: 0x00000001
2	DXE_ENABLE_CLK	Enable clock for dxe Reset State: 0x00000001
1	CMEM_ENABLE_CLK	Enable clock for cmem Reset State: 0x00000001
0	CCPU_ENABLE_CLK	Enable clock for ccpu Reset State: 0x00000001

0x3000068 CCU_CCU_DISABLE_CLK_GATING

Type: read-write
Reset State: 0x0000C5F0

Controls clock gating in the module. If set, clock gating to the module and in the module is disabled.

CCU_CCU_DISABLE_CLK_GATING

Bits	Name	Description
16	TESTMUX_CLKGATE_DISABLE	Disable clock gating for testmux Reset State: 0x00000000
15	PMU_TCXO_DISABLE_CLK_GATING	Disable clk gating for pmu tcxo Reset State: 0x00000001
14	PMU_DISABLE_CLK_GATING	Disable clk gating for pmu Reset State: 0x00000001
13	LTE_DISABLE_CLK_GATING	Disable clk gating for lte Reset State: 0x00000000
12	FM_DISABLE_CLK_GATING	Disable clk gating for fm Reset State: 0x00000000
11	BT_DISABLE_CLK_GATING	Disable clk gating for bt Reset State: 0x00000000
10	TIC_DISABLE_CLK_GATING	Disable clk gating for tic Reset State: 0x00000001
9	AXI_FABRIC_DISABLE_CLK_GATING	Disable clk gating for AXI Fabric clock Reset State: 0x00000000
8	SPDM_DISABLE_CLK_GATING	Disable clk gating for spdm Reset State: 0x00000001
7	CDAHB_DISABLE_CLK_GATING	Disable clk gating for cdahb Reset State: 0x00000001
6	CCAHB_DISABLE_CLK_GATING	Disable clk gating for ccahb Reset State: 0x00000001
5	A2XB_DISABLE_CLK_GATING	Disable clk gating for a2xb Reset State: 0x00000001
4	A2AB_DISABLE_CLK_GATING	Disable clk gating for a2ab Reset State: 0x00000001
3	RRI_DISABLE_CLK_GATING	Disable clk gating for rri Reset State: 0x00000000
2	DXE_DISABLE_CLK_GATING	Disable clk gating for dxe Reset State: 0x00000000

CCU_CCU_DISABLE_CLK_GATING (cont.)

Bits	Name	Description
1	CMEM_DISABLE_CLK_GATING	Disable clk gating for cmem Reset State: 0x00000000
0	CCPU_DISABLE_CLK_GATING	Disable clk gating for ccpu Reset State: 0x00000000

0x300006C CCU_CCU_GCU_DISABLE_CLK_GATING

Type: read-write
Reset State: 0x000000F0

Controls clock gating in the module. If set, clock gating to the module and in the module is disabled.

CCU_CCU_GCU_DISABLE_CLK_GATING

Bits	Name	Description
13	LTE_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for lte Reset State: 0x00000000
12	FM_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for fm Reset State: 0x00000000
11	BT_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for bt Reset State: 0x00000000
10	TIC_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for tic Reset State: 0x00000000
9	ROM_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for rom Reset State: 0x00000000
8	SPDM_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for spdm Reset State: 0x00000000
7	CDAHB_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for cdahb Reset State: 0x00000001
6	CCAHB_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for ccahb Reset State: 0x00000001
5	A2XB_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for a2xb Reset State: 0x00000001
4	A2AB_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for a2ab Reset State: 0x00000001
3	RRI_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for rri Reset State: 0x00000000

CCU_CCU_GCU_DISABLE_CLK_GATING (cont.)

Bits	Name	Description
2	DXE_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for dxe Reset State: 0x00000000
1	CMEM_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for cmem Reset State: 0x00000000
0	CCPU_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for ccpu Reset State: 0x00000000

0x3000070 CCU_CCU_CRCM_CONTROL

Type: read-write
Reset State: 0x00000000

This register represents CRCM control signals

CCU_CCU_CRCM_CONTROL

Bits	Name	Description
2	WMAC_SYNC_RST_CLK_EN_OVERRIDE	wmac_sync_rst_clk_en_override to CRCM Reset State: 0x00000000
1	CMEM_MEM_CLK_ENABLED	cmem_mem_clk_enabled to CMEM Reset State: 0x00000000
0	CMEM_TEST_CLK_GATE_DISABLE	cmem_test_clk_gate_disable to CRCM Reset State: 0x00000000

0x3000074 CCU_CCU_TESTBUS_CONTROL

Type: read-write
Reset State: 0x00000000

This register represents testbus control

CCU_CCU_TESTBUS_CONTROL

Bits	Name	Description
7:4	CCU_TESTBUS_SEL	Select signals for CCU testbus Reset State: 0x00000000
3:0	MODULE_SEL	Select module for testbus: 4'd0: CCU 4'd1: CMEM 4'd2: DXE 4'd3: RRI 4'd4: A2AB 4'd5: A2XB 4'd6: CCAHB 4'd7: CDAHB 4'd8: SPDM 4'd9: ROM 4'd9-15: unused Reset State: 0x00000000

0x3000078 CCU_CCU_TESTBUS_LOWER

Type: read-only
Reset State: 0x00000000

Holds the lower 32 bits of the Common SS testbus.

CCU_CCU_TESTBUS_LOWER

Bits	Name	Description
31:0	TESTBUS_LOWER	lower 32 bits of the testbus. Reset State: 0x00000000

0x300007C CCU_CCU_TESTBUS_UPPER

Type: read-only
Reset State: 0x00000000

Holds the upper 13 bits of the Common SS testbus

CCU_CCU_TESTBUS_UPPER

Bits	Name	Description
12:0	TESTBUS_UPPER	upper 13 bits of the testbus Reset State: 0x00000000

0x3000080 CCU_CCU_RRI_SW_REG_REINIT

Type: command
Reset State: 0x00000000

CCU_RRI_SW_REG_REINIT

CCU_CCU_RRI_SW_REG_REINIT

Bits	Name	Description
0	RRI_SW_REG_REINIT_P	Write a one to initiate the reg-reinit process. Write only Reset State: 0x00000000

0x3000084 CCU_CCU_RRI_SW_REG_REINIT_ADDR

Type: read-write
Reset State: 0x00000000

CCU_RRI_SW_REG_REINIT_ADDR

CCU_CCU_RRI_SW_REG_REINIT_ADDR

Bits	Name	Description
31:2	RRI_SW_REG_REINIT_ADDR	The starting (word) address of the software triggered register re-configuration table. Reset State: 0x00000000

0x3000088 CCU_CCU_RRI_POLL_CMD_ERR_ADDR

Type: read-only
Reset State: 0x00000000

CCU_RRI_POLL_CMD_ERR_ADDR

CCU_CCU_RRI_POLL_CMD_ERR_ADDR

Bits	Name	Description
31:2	RRI_POLL_CMD_ERR_ADDR	the poll cmd address when it reaches retry timeout error. Read Only Reset State: 0x00000000

0x300008C CCU_CCU_RRI_MISC_CFG

Type: read-write
Reset State: 0x00000000

CCU_RRI_MISC_CFG

CCU_CCU_RRI_MISC_CFG

Bits	Name	Description
19:15	RRI_CCU_ENCODED_FSM	rri_ccu_encoded_fsm, Read Only Reset State: 0x00000000
14:11	CCU_RRI_TESTBUS_SEL	Testbus select for RRI Reset State: 0x00000000
10	CCU_RRI_GOTO_IDLE	When set, force RRI FSM to go back to idle. Default to 0 Reset State: 0x00000000
9	CCU_RRI_ERR_STATE_CFG	When set, RRI FSM will continue to finish the process when error occurs. When cleared, RRI FSM will go to error state and software has to write to the ccu_rri_err_exit bit to clear the error. Default to 0. Reset State: 0x00000000

CCU_CCU_RRI_MISC_CFG (cont.)

Bits	Name	Description
8	CCU_RRI_ERR_EXIT	Write 1 for RRI FSM to go back to IDLE from error state. Always read 0. Reset State: 0x00000000
7:0	CCU_RRI_ONE_USEC_LIMIT	Value in number of clock cycles to generate the 1microseconds pulse. Reset State: 0x00000000

0x3000090 CCU_CCU_TIC_CTL

Type: read-write
Reset State: 0x00000000

TIC related control.

CCU_CCU_TIC_CTL

Bits	Name	Description
0	CCU_TIC_BUS_SELECT	0x0: Riva TIC is hooked up to the CCAHB 1: Riva TIC is hooked up to the CDAHB Reset State: 0x00000000

0x3000094 CCU_CCU_MISC_CTL

Type: read-write
Reset State: 0x00000000

CCU Controller related misc control.

CCU_CCU_MISC_CTL

Bits	Name	Description
6	CCU_CCPU_WRAP8_DISABLE	When set it disables the wrap8 logic implemented in CCPU for Riva 2.0 Reset State: 0x00000000
5	CCPU_CMEM_TIMEOUT_CHK_EN	CCPU CMEM Timeout check enable Reset State: 0x00000000
4	CCPU_STATUS_COUNT_RESET	Signal to reset CCPU Status count Reset State: 0x00000000
3	CCPU_STATUS_COUNT_EN	Signal to enable CCPU Status count Reset State: 0x00000000

CCU_CCU_MISC_CTL (cont.)

Bits	Name	Description
2	ITCM_ENABLE	0x0: ITCM interface on ARM9 disabled 1: ITCM interface on ARM9 enabled Reset State: 0x00000000
1	GAS2CRIF_WR_CLK_GATE_DISABLE	0x0: GICs CRIF wr_clk gating not disabled 1: GICs CRIF wr_clk gating disabled Reset State: 0x00000000
0	GAS2CRIF_NS_SELECT	0x0: GICs CRIF accesses are Secure 1: GICs CRIF accesses are Non-Secure Reset State: 0x00000000

0x3000098 CCU_CCU_CCPU_STALL_COUNT

Type: read-only
Reset State: 0x00000000

CCPU Stall counter value

CCU_CCU_CCPU_STALL_COUNT

Bits	Name	Description
31:0	CCPU_STALL_COUNT	CCPU Stall Counter value Reset State: 0x00000000

0x300009C CCU_CCU_CCPU_ACTIVE_COUNT

Type: read-only
Reset State: 0x00000000

CCPU Active counter value.

CCU_CCU_CCPU_ACTIVE_COUNT

Bits	Name	Description
31:0	CCPU_ACTIVE_COUNT	CCPU Active Counter value Reset State: 0x00000000

0x3000100 CCU_CCU_CCPU_INVALID_ADDR

Type: read-only
Reset State: 0x00000000

CCPU Last Invalid Addr.

CCU_CCU_CCPU_INVALID_ADDR

Bits	Name	Description
31:0	CCPU_INVALID_ADDR	CCPU Last Invalid Addr Reset State: 0x00000000

0x3000104 CCU_CCU_CCPU_LAST_ADDR0

Type: read-only
Reset State: 0x00000000

CCPU Last Address 0. The last 3 addresses the ARM9 has requested over the memory bus

CCU_CCU_CCPU_LAST_ADDR0

Bits	Name	Description
31:0	CCPU_LAST_ADDR0	CCPU Last Address 0 Reset State: 0x00000000

0x3000108 CCU_CCU_CCPU_LAST_ADDR1

Type: read-only
Reset State: 0x00000000

CCPU Last Address 1. The last 3 addresses the ARM9 has requested over the memory bus

CCU_CCU_CCPU_LAST_ADDR1

Bits	Name	Description
31:0	CCPU_LAST_ADDR1	CCPU Last Address 1 Reset State: 0x00000000

0x300010C CCU_CCU_CCPU_LAST_ADDR2

Type: read-only
Reset State: 0x00000000

CCPU Last Address 2. The last 3 addresses the ARM9 has requested over the memory bus.

CCU_CCU_CCPU_LAST_ADDR2

Bits	Name	Description
31:0	CCPU_LAST_ADDR2	CCPU Last Address 2 Reset State: 0x00000000

0x3000110 CCU_CCU_A2AB_ERR_ADDR

Type: read-only
Reset State: 0x00000000

A2AB error address register.

CCU_CCU_A2AB_ERR_ADDR

Bits	Name	Description
31:0	A2AB_CCU_AHB_ERR_ADDR	a2ab_ccu_ahb_err_addr, can be cleared by writing to A2AB_CTL register Reset State: 0x00000000

0x3000114 CCU_CCU_A2AB_CTL

Type: read-write
Reset State: 0x00000000

A2AB control register.

CCU_CCU_A2AB_CTL

Bits	Name	Description
0	A2AB_AHB_ERR_CLEAR	Write 1 to clear CCU_A2AB_ERR_ADDR register and generate ccu_a2ab_ahb_err_clear signal. software needs to clear this bit to de-assert the clear signal. Reset State: 0x00000000

0x3000118 CCU_CCU_A2AB_CFG

Type: read-write
Reset State: 0x00000000

A2AB config register.

CCU_CCU_A2AB_CFG

Bits	Name	Description
3:0	CCU_A2AB_CFG_HREADY_LIMIT	A2AB input config signal Reset State: 0x00000000

0x30001F0 CCU_CCU_CCPU_DBG_STATUS

Type: read-only
Reset State: 0x00000003

CCPU irq_n & fiq_n status

CCU_CCU_CCPU_DBG_STATUS

Bits	Name	Description
7:5	FIQ_COUNT	Count negedges of fiq_n Reset State: 0x00000000
4:2	IRQ_COUNT	Count negedges of irq_n Reset State: 0x00000000
1	FIQ_N	fiq_n raw status Reset State: 0x00000001
0	IRQ_N	irq_n raw status Reset State: 0x00000001

0x3000200 CCU_CCU_CCPU_TO_MSM_MB_INT_STAT

Type: read-only
Reset State: 0x00000000

Register indicating for which mailboxes an interrupt to the APQ is pending.

CCU_CCU_CCPU_TO_MSM_MB_INT_STAT

Bits	Name	Description
11:0	MBX_INT_STATUS	Each bit stands for the corresponding mailbox. When set, an interrupt from that Mailbox is pending Reset State: 0x00000000

0x3000204 CCU_CCU_MSM_TO_CCPU_MB_INT_STAT

Type: read-only
Reset State: 0x00000000

Register indicating for which mailboxes an interrupt to the cCPU is pending

CCU_CCU_MSM_TO_CCPU_MB_INT_STAT

Bits	Name	Description
3:0	MBX_INT_STATUS	Each bit stands for the corresponding mailbox. When set, an interrupt from that Mailbox is pending Reset State: 0x00000000

0x3000208 CCU_CCU_MB0_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB0_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to Zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x300020C CCU_CCU_MB0_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB0_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb0_control register. This value gets cleared on a mb0 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset. Reset State: 0x00000000

0x3000210 CCU_CCU_MB1_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB1_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to Zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x3000214 CCU_CCU_MB1_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB1_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb1_control register. This value gets cleared on a mb1 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000218 CCU_CCU_MB2_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB2_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to Zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x300021C CCU_CCU_MB2_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB2_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb2_control register. This value gets cleared on a mb2 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000220 CCU_CCU_MB3_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB3_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to Zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x3000224 CCU_CCU_MB3_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB3_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb3_control register. This value gets cleared on a mb3 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000228 CCU_CCU_MB4_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB4_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ When set to one: APQ to cCPU Hard Coded to Zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x300022C CCU_CCU_MB4_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB4_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb4_control register. This value gets cleared on a mb4 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000230 CCU_CCU_MB5_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB5_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to Zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x3000234 CCU_CCU_MB5_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB5_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb5_control register. This value gets cleared on a mb5 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000238 CCU_CCU_MB6_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB6_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to Zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x300023C CCU_CCU_MB6_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB6_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb6_control register. This value gets cleared on a mb6 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000240 CCU_CCU_MB7_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB7_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to Zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x3000244 CCU_CCU_MB7_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB7_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb7_control register. This value gets cleared on a mb7 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000248 CCU_CCU_MB8_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB8_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to Zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x300024C CCU_CCU_MB8_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB8_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb8_control register. This value gets cleared on a mb8 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000250 CCU_CCU_MB9_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB9_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to Zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x3000254 CCU_CCU_MB9_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB9_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb9_control register. This value gets cleared on a mb9 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000258 CCU_CCU_MB10_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB10_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x300025C CCU_CCU_MB10_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB10_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb10_control register. This value gets cleared on a mb10 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000260 CCU_CCU_MB11_CONTROL

Type: read-write
Reset State: 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB11_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to zero: ReadOnly Reset State: 0x00000000
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x3000264 CCU_CCU_MB11_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB11_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb11_control register. This value gets cleared on a mb11 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000268 CCU_CCU_MB12_CONTROL

Type: read-write
Reset State: 0x00000002

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB12_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to one: ReadOnly Reset State: 0x00000001
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x300026C CCU_CCU_MB12_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB12_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb12_control register. This value gets cleared on a mb12 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000270 CCU_CCU_MB13_CONTROL

Type: read-write
Reset State: 0x00000002

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB13_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to one: ReadOnly Reset State: 0x00000001
0	MB_RESET	When set, all to this MB -elated parameters, including the counters, are cleared. Reset State: 0x00000000

0x3000274 CCU_CCU_MB13_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB13_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb13_control register. This value gets cleared on a mb13 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000278 CCU_CCU_MB14_CONTROL

Type: read-write
Reset State: 0x00000002

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB14_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to one: ReadOnly Reset State: 0x00000001
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x300027C CCU_CCU_MB14_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB14_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb14_control register. This value gets cleared on a mb14 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000280 CCU_CCU_MB15_CONTROL

Type: read-write
Reset State: 0x00000002

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the APQ.

CCU_CCU_MB15_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30-bit value from sender to receiver Reset State: 0x00000000
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to APQ. When set to one: APQ to cCPU Hard Coded to one: ReadOnly Reset State: 0x00000001
0	MB_RESET	When set, all to this MB-related parameters, including the counters, are cleared. Reset State: 0x00000000

0x3000284 CCU_CCU_MB15_CONTROL_COUNTERS

Type: read-only
Reset State: 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

CCU_CCU_MB15_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3-bit value indicating the number of times a none reset write operation has been performed on the mb15_control register. This value gets cleared on a mb15 reset. Reset State: 0x00000000
2:0	READ_CNT	A 3-bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset Reset State: 0x00000000

0x3000288 CCU_CCU_MUTEX0

Type: read-write
Reset State: 0x00000101

General purpose semaphore and/or mutex register

CCU_CCU_MUTEX0

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	THe Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount Reset State: 0x00000001

0x300028C CCU_CCU_MUTEX1

Type: read-write
Reset State: 0x00000101

General purpose semaphore and/or mutex register

CCU_CCU_MUTEX1

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	The Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount Reset State: 0x00000001

0x3000290 CCU_CCU_MUTEX2

Type: read-write
Reset State: 0x00000101

General purpose semaphore and/or mutex register

CCU_CCU_MUTEX2

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	THe Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount Reset State: 0x00000001

0x3000294 CCU_CCU_MUTEX3

Type: read-write
Reset State: 0x00000101

General purpose semaphore and/or mutex register

CCU_CCU_MUTEX3

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	THe Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount Reset State: 0x00000001

0x3000298 CCU_CCU_MUTEX4

Type: read-write
Reset State: 0x00000101

General purpose semaphore and/or mutex register

CCU_CCU_MUTEX4

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	THe Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount Reset State: 0x00000001

0x300029C CCU_CCU_MUTEX5

Type: read-write
Reset State: 0x00000101

General purpose semaphore and/or mutex register

CCU_CCU_MUTEX5

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	THe Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount Reset State: 0x00000001

0x30002A0 CCU_CCU_MUTEX6

Type: read-write
Reset State: 0x00000101

General purpose semaphore and/or mutex register

CCU_CCU_MUTEX6

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	THe Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount Reset State: 0x00000001

0x30002A4 CCU_CCU_MUTEX7

Type: read-write
Reset State: 0x00000101

General purpose semaphore and/or mutex register

CCU_CCU_MUTEX7

Bits	Name	Description
31	RESET	When set, both CURRENTCOUNT and MAXCOUNT fields get initialized with the value written to the MAXCOUNT field. This bit will not get set on a write operation. Reset State: 0x00000000
15:8	MAXCOUNT	THe Max count of semaphores available. Can only be set when the Reset bit is written with value 1. Reset State: 0x00000001
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount Reset State: 0x00000001

0x30002A8 CCU_CCU_TRACE_CONTROL1

Type: read-write
Reset State: 0x00000000

Trace function enable/disable control

CCU_CCU_TRACE_CONTROL1

Bits	Name	Description
1	CCU_TRC_BUF_CFG	0x0: captured samples write is blocked when buffer is full, 1 = overwrite mode enabled Reset State: 0x00000000
0	CCU_TRC_ENABLE	When set, the trace function is enabled Reset State: 0x00000000

0x30002AC CCU_CCU_TRACE_CONTROL2

Type: read-write
Reset State: 0x3FFF0000

Trace function sample storage location in cMEM control

CCU_CCU_TRACE_CONTROL2

Bits	Name	Description
29:16	CCU_TRC_END_ADDR	trace buffer cMEM ending address Reset State: 0x00003FFF
13:0	CCU_TRC_START_ADDR	trace buffer cMEM starting address Reset State: 0x00000000

0x30002B0 CCU_CCU_TRC_WFT_CAPTURE_CTRL

Type: read-write
Reset State: 0x00000000

Wait for Trigger capture control

CCU_CCU_TRC_WFT_CAPTURE_CTRL

Bits	Name	Description
31:30	CCU_WFT_CAPTURE_MODE	0x0: no capture of samples, 01 = capture samples every clock, 10 = capture only when signals selected by capture mask have changed states, 11 = reserved Reset State: 0x00000000
29:0	CCU_WFT_CAPTURE_MASK	Wait For trigger capture mask Reset State: 0x00000000

0x30002B4 CCU_CCU_TRC_WFT_STATE_CTRL

Type: read-write
Reset State: 0x00000000

Wait for Trigger state control

CCU_CCU_TRC_WFT_STATE_CTRL

Bits	Name	Description
31:16	CCU_MAX_CAPTURE_COUNT	Maximum number of samples to be captured after entering this state. A value of 0 indicates unlimited samples Reset State: 0x00000000
15:5	CCU_SPARE2	Reserved Reset State: 0x00000000

CCU_CCU_TRC_WFT_STATE_CTRL (cont.)

Bits	Name	Description
4:0	CCU_TS_TRANSITION_ENABLE	These enables indicate to which other TSs the trigger state machine is allowed to jump when the corresponding trigger is seen. When multiple enabled triggers come in at the same time, the lowest TS gets priority Bit 0: When set, transition to TS1 enabled when TS1 trigger is seen Bit 1: When set, transition to TS2 enabled when TS2 trigger is seen Bit 2: When set, transition to TS3 enabled when TS3 trigger is seen Bit 3: When set, transition to TS4 enabled when TS4 trigger is seen Bit 4: When set, transition to TS5 enabled when TS5 trigger is seen Reset State: 0x00000000

0x30002B8 CCU_CCU_TRC_TS1_CAPTURE_CTRL

Type: read-write
Reset State: 0x00000000

Trigger State 1 capture control

CCU_CCU_TRC_TS1_CAPTURE_CTRL

Bits	Name	Description
31:30	CCU_TS1_CAPTURE_MODE	0x0: no capture of samples, 01 = capture samples every clock, 10 = capture only when signals selected by capture mask have changed states, 11 = reserved Reset State: 0x00000000
29:0	CCU_TS1_CAPTURE_MASK	TS1 capture mask Reset State: 0x00000000

0x30002BC CCU_CCU_TRC_TS1_STATE_CTRL

Type: read-write
Reset State: 0x00000000

Trigger State 1 state control

CCU_CCU_TRC_TS1_STATE_CTRL

Bits	Name	Description
31:16	CCU_MAX_CAPTURE_COUNT	Maximum number of samples to be captured after entering this state. A value of 0 indicates unlimited samples Reset State: 0x00000000
15:5	CCU_SPARE2	Reserved Reset State: 0x00000000

CCU_CCU_TRC_TS1_STATE_CTRL (cont.)

Bits	Name	Description
4:0	CCU_TS_TRANSITION_ENABLE	These enables indicate to which other TSs the trigger state machine is allowed to jump when the corresponding trigger is seen. When multiple enabled triggers come in at the same time, the lowest TS gets priority Bit 0: When set, transition to TS1 enabled when TS1 trigger is seen Bit 1: When set, transition to TS2 enabled when TS2 trigger is seen Bit 2: When set, transition to TS3 enabled when TS3 trigger is seen Bit 3: When set, transition to TS4 enabled when TS4 trigger is seen Bit 4: When set, transition to TS5 enabled when TS5 trigger is seen Reset State: 0x00000000

0x30002C0 CCU_CCU_TRC_TS1_TRIGGER_MASK

Type: read-write
Reset State: 0x00000000

TS1 Trigger Mask control

CCU_CCU_TRC_TS1_TRIGGER_MASK

Bits	Name	Description
29:0	CCU_TRIGGER_MASK	All bits set to 1 in this mask, selects the signals in the test bus for which a trigger value is defined. All bits set to 0 indicate testbus signals that are don't cares, and will not be used for this trigger. Reset State: 0x00000000

0x30002C4 CCU_CCU_TRC_TS1_TRIGGER_VALUE

Type: read-write
Reset State: 0x00000000

TS1 Trigger value control

CCU_CCU_TRC_TS1_TRIGGER_VALUE

Bits	Name	Description
29:0	CCU_TRIGGER_VALUE	For each bit that is a 1 in the ts1 trigger mask, the value in of the corresponding bit in this register indicates the trigger value of the testbus signal. Reset State: 0x00000000

0x30002C8 CCU_CCU_TRC_TS2_CAPTURE_CTRL

Type: read-write
Reset State: 0x00000000

Trigger State 2 capture control

CCU_CCU_TRC_TS2_CAPTURE_CTRL

Bits	Name	Description
31:30	CCU_TS2_CAPTURE_MODE	0x0: no capture of samples, 01 = capture samples every clock, 10 = capture only when signals selected by capture mask have changed states, 11 = reserved Reset State: 0x00000000
29:0	CCU_TS2_CAPTURE_MASK	TS1 capture mask Reset State: 0x00000000

0x30002CC CCU_CCU_TRC_TS2_STATE_CTRL

Type: read-write
Reset State: 0x00000000

Trigger State 2 state control

CCU_CCU_TRC_TS2_STATE_CTRL

Bits	Name	Description
31:16	CCU_MAX_CAPTURE_COUNT	Maximum number of samples to be captured after entering this state. A value of 0 indicates unlimited samples Reset State: 0x00000000
15:5	CCU_SPARE2	Reserved Reset State: 0x00000000
4:0	CCU_TS_TRANSITION_ENABLE	These enables indicate to which other TSs the trigger state machine is allowed to jump when the corresponding trigger is seen. When multiple enabled triggers come in at the same time, the lowest TS gets priority Bit 0: When set, transition to TS1 enabled when TS1 trigger is seen Bit 1: When set, transition to TS2 enabled when TS2 trigger is seen Bit 2: When set, transition to TS3 enabled when TS3 trigger is seen Bit 3: When set, transition to TS4 enabled when TS4 trigger is seen Bit 4: When set, transition to TS5 enabled when TS5 trigger is seen Reset State: 0x00000000

0x30002D0 CCU_CCU_TRC_TS2_TRIGGER_MASK

Type: read-write
Reset State: 0x00000000

TS2 Trigger Mask control

CCU_CCU_TRC_TS2_TRIGGER_MASK

Bits	Name	Description
29:0	CCU_TRIGGER_MASK	All bits set to 1 in this mask, selects the signals in the test bus for which a trigger value is defined. All bits set to 0 indicate testbus signals that are don't cares, and will not be used for this trigger. Reset State: 0x00000000

0x30002D4 CCU_CCU_TRC_TS2_TRIGGER_VALUE

Type: read-write
Reset State: 0x00000000

TS2 Trigger value control

CCU_CCU_TRC_TS2_TRIGGER_VALUE

Bits	Name	Description
29:0	CCU_TRIGGER_VALUE	For each bit that is a 1 in the ts2 trigger mask, the value in of the corresponding bit in this register indicates the trigger value of the testbus signal. Reset State: 0x00000000

0x30002D8 CCU_CCU_TRC_TS3_CAPTURE_CTRL

Type: read-write
Reset State: 0x00000000

Trigger State 3 capture control

CCU_CCU_TRC_TS3_CAPTURE_CTRL

Bits	Name	Description
31:30	CCU_TS3_CAPTURE_MODE	0x0: no capture of samples, 01 = capture samples every clock, 10 = capture only when signals selected by capture mask have changed states, 11 = reserved Reset State: 0x00000000

CCU_CCU_TRC_TS3_CAPTURE_CTRL (cont.)

Bits	Name	Description
29:0	CCU_TS3_CAPTURE_MASK	TS1 capture mask Reset State: 0x00000000

0x30002DC CCU_CCU_TRC_TS3_STATE_CTRL

Type: read-write
Reset State: 0x00000000

Trigger State 3 state control

CCU_CCU_TRC_TS3_STATE_CTRL

Bits	Name	Description
31:16	CCU_MAX_CAPTURE_COUNT	Maximum number of samples to be captured after entering this state. A value of 0 indicates unlimited samples Reset State: 0x00000000
15:5	CCU_SPARE2	Reserved Reset State: 0x00000000
4:0	CCU_TS_TRANSITION_ENABLE	These enables indicate to which other TSs the trigger state machine is allowed to jump when the corresponding trigger is seen. When multiple enabled triggers come in at the same time, the lowest TS gets priority Bit 1: When set, transition to TS1 enabled when TS1 trigger is seen Bit 2: When set, transition to TS2 enabled when TS2 trigger is seen Bit 3: When set, transition to TS3 enabled when TS3 trigger is seen Bit 4: When set, transition to TS4 enabled when TS4 trigger is seen Bit 5: When set, transition to TS5 enabled when TS5 trigger is seen Reset State: 0x00000000

0x30002E0 CCU_CCU_TRC_TS3_TRIGGER_MASK

Type: read-write
Reset State: 0x00000000

TS3 Trigger Mask control

CCU_CCU_TRC_TS3_TRIGGER_MASK

Bits	Name	Description
29:0	CCU_TRIGGER_MASK	All bits set to 1 in this mask, selects the signals in the test bus for which a trigger value is defined. All bits set to 0 indicate testbus signals that are don't cares, and will not be used for this trigger. Reset State: 0x00000000

0x30002E4 CCU_CCU_TRC_TS3_TRIGGER_VALUE

Type: read-write
Reset State: 0x00000000

TS3 Trigger value control

CCU_CCU_TRC_TS3_TRIGGER_VALUE

Bits	Name	Description
29:0	CCU_TRIGGER_VALUE	For each bit that is a 1 in the ts3 trigger mask, the value in of the corresponding bit in this register indicates the trigger value of the testbus signal. Reset State: 0x00000000

0x30002E8 CCU_CCU_TRC_TS4_CAPTURE_CTRL

Type: read-write
Reset State: 0x00000000

Trigger State 4 capture control

CCU_CCU_TRC_TS4_CAPTURE_CTRL

Bits	Name	Description
31:30	CCU_TS4_CAPTURE_MODE	0x0: no capture of samples, 01 = capture samples every clock, 10 = capture only when signals selected by capture mask have changed states, 11 = reserved Reset State: 0x00000000
29:0	CCU_TS4_CAPTURE_MASK	TS1 capture mask Reset State: 0x00000000

0x30002EC CCU_CCU_TRC_TS4_STATE_CTRL

Type: read-write
Reset State: 0x00000000

Trigger State 4 state control

CCU_CCU_TRC_TS4_STATE_CTRL

Bits	Name	Description
31:16	CCU_MAX_CAPTURE_COUNT	Maximum number of samples to be captured after entering this state. A value of 0 indicates unlimited samples Reset State: 0x00000000

CCU_CCU_TRC_TS4_STATE_CTRL (cont.)

Bits	Name	Description
15:5	CCU_SPARE2	Reserved Reset State: 0x00000000
4:0	CCU_TS_TRANSITION_ENABLE	These enables indicate to which other TSs the trigger state machine is allowed to jump when the corresponding trigger is seen. When multiple enabled triggers come in at the same time, the lowest TS gets priority Bit 1: When set, transition to TS1 enabled when TS1 trigger is seen Bit 2: When set, transition to TS2 enabled when TS2 trigger is seen Bit 3: When set, transition to TS3 enabled when TS3 trigger is seen Bit 4: When set, transition to TS4 enabled when TS4 trigger is seen Bit 5: When set, transition to TS5 enabled when TS5 trigger is seen Reset State: 0x00000000

0x30002F0 CCU_CCU_TRC_TS4_TRIGGER_MASK

Type: read-write
Reset State: 0x00000000

TS4 Trigger Mask control

CCU_CCU_TRC_TS4_TRIGGER_MASK

Bits	Name	Description
29:0	CCU_TRIGGER_MASK	All bits set to 1 in this mask, selects the signals in the test bus for which a trigger value is defined. All bits set to 0 indicate testbus signals that are don't cares, and will not be used for this trigger. Reset State: 0x00000000

0x30002F4 CCU_CCU_TRC_TS4_TRIGGER_VALUE

Type: read-write
Reset State: 0x00000000

TS4 Trigger value control

CCU_CCU_TRC_TS4_TRIGGER_VALUE

Bits	Name	Description
29:0	CCU_TRIGGER_VALUE	For each bit that is a 1 in the ts4 trigger mask, the value in of the corresponding bit in this register indicates the trigger value of the testbus signal. Reset State: 0x00000000

0x30002F8 CCU_CCU_TRC_TS5_CAPTURE_CTRL

Type: read-write
Reset State: 0x00000000

Trigger State 5 capture control

CCU_CCU_TRC_TS5_CAPTURE_CTRL

Bits	Name	Description
31:30	CCU_TS5_CAPTURE_MODE	0x0: no capture of samples, 01 = capture samples every clock, 10 = capture only when signals selected by capture mask have changed states, 11 = reserved Reset State: 0x00000000
29:0	CCU_TS5_CAPTURE_MASK	TS1 capture mask Reset State: 0x00000000

0x30002FC CCU_CCU_TRC_TS5_STATE_CTRL

Type: read-write
Reset State: 0x00000000

Trigger State 5 state control

CCU_CCU_TRC_TS5_STATE_CTRL

Bits	Name	Description
31:16	CCU_MAX_CAPTURE_COUNT	Maximum number of samples to be captured after entering this state. A value of 0 indicates unlimited samples Reset State: 0x00000000
15:5	CCU_SPARE2	Reserved Reset State: 0x00000000
4:0	CCU_TS_TRANSITION_ENABLE	These enables indicate to which other TSs the trigger state machine is allowed to jump when the corresponding trigger is seen. When multiple enabled triggers come in at the same time, the lowest TS gets priority Bit 0: When set, transition to TS1 enabled when TS1 trigger is seen Bit 1: When set, transition to TS2 enabled when TS2 trigger is seen Bit 2: When set, transition to TS3 enabled when TS3 trigger is seen Bit 3: When set, transition to TS4 enabled when TS4 trigger is seen Bit 4: When set, transition to TS5 enabled when TS5 trigger is seen Reset State: 0x00000000

0x3000300 CCU_CCU_TRC_TS5_TRIGGER_MASK

Type: read-write
Reset State: 0x00000000

TS5 Trigger Mask control

CCU_CCU_TRC_TS5_TRIGGER_MASK

Bits	Name	Description
29:0	CCU_TRIGGER_MASK	All bits set to 1 in this mask, selects the signals in the test bus for which a trigger value is defined. All bits set to 0 indicate testbus signals that are don't cares, and will not be used for this trigger. Reset State: 0x00000000

0x3000304 CCU_CCU_TRC_TS5_TRIGGER_VALUE

Type: read-write
Reset State: 0x00000000

TS5 Trigger value control

CCU_CCU_TRC_TS5_TRIGGER_VALUE

Bits	Name	Description
29:0	CCU_TRIGGER_VALUE	For each bit that is a 1 in the ts5 trigger mask, the value in of the corresponding bit in this register indicates the trigger value of the testbus signal. Reset State: 0x00000000

0x3000310 CCU_CCU_DXE_INT_SELECT

Type: read-write
Reset State: 0x00000000

Select the DXE interrupts to generate the xfer done and rx data avail apss interrupts

CCU_CCU_DXE_INT_SELECT

Bits	Name	Description
22:16	RX_DATA_AVAIL_DXE_CHANNEL_SELECT	Bit 16: when set, dxe channel 0 interrupt is ORed into riva_apps_wlan_rx_data_avail interrupt. Bit 17: when set, dxe channel 1 interrupt is ORed into riva_apps_wlan_rx_data_avail interrupt. Bit 18: when set, dxe channel 2 interrupt is ORed into riva_apps_wlan_rx_data_avail interrupt. Bit 19: when set, dxe channel 3 interrupt is ORed into riva_apps_wlan_rx_data_avail interrupt. Bit 20: when set, dxe channel 4 interrupt is ORed into riva_apps_wlan_rx_data_avail interrupt. Bit 21: when set, dxe channel 5 interrupt is ORed into riva_apps_wlan_rx_data_avail interrupt. Bit 22: when set, dxe channel 6 interrupt is ORed into riva_apps_wlan_rx_data_avail interrupt. Reset State: 0x00000000
6:0	XFER_DONE_DXE_CHANNEL_SELECT	Bit 0: when set, dxe channel 0 interrupt is ORed into riva_apps_wlan_data_xfer_done interrupt. Bit 1: when set, dxe channel 1 interrupt is ORed into riva_apps_wlan_data_xfer_done interrupt. Bit 2: when set, dxe channel 2 interrupt is ORed into riva_apps_wlan_data_xfer_done interrupt. Bit 3: when set, dxe channel 3 interrupt is ORed into riva_apps_wlan_data_xfer_done interrupt. Bit 4: when set, dxe channel 4 interrupt is ORed into riva_apps_wlan_data_xfer_done interrupt. Bit 5: when set, dxe channel 5 interrupt is ORed into riva_apps_wlan_data_xfer_done interrupt. Bit 6: when set, dxe channel 6 interrupt is ORed into riva_apps_wlan_data_xfer_done interrupt. Reset State: 0x00000000

0x3000314 CCU_CCU_DXE_INT_SELECT_STATUS

Type: read-only
Reset State: 0x00000000

The pending DXE interrupts that generate the xfer done and rx data avail apss interrupts

CCU_CCU_DXE_INT_SELECT_STATUS

Bits	Name	Description
22:16	RX_DATA_AVAIL_DXE_CHANNEL_STATUS	Bit 16: when set, dxe channel 0 interrupt is setting riva_apps_wlan_rx_data_avail interrupt. Bit 17: when set, dxe channel 1 interrupt is setting riva_apps_wlan_rx_data_avail interrupt. Bit 18: when set, dxe channel 2 interrupt is setting riva_apps_wlan_rx_data_avail interrupt. Bit 19: when set, dxe channel 3 interrupt is setting riva_apps_wlan_rx_data_avail interrupt. Bit 20: when set, dxe channel 4 interrupt is setting riva_apps_wlan_rx_data_avail interrupt. Bit 21: when set, dxe channel 5 interrupt is setting riva_apps_wlan_rx_data_avail interrupt. Bit 22: when set, dxe channel 6 interrupt is setting riva_apps_wlan_rx_data_avail interrupt. Reset State: 0x00000000

CCU_CCU_DXE_INT_SELECT_STATUS (cont.)

Bits	Name	Description
6:0	XFER_DONE_DXE_CHANNEL_STATUS	Bit 0: when set, dxe channel 0 interrupt is setting riva_apps_wlan_data_xfer_done interrupt. Bit 1: when set, dxe channel 1 interrupt is setting riva_apps_wlan_data_xfer_done interrupt. Bit 2: when set, dxe channel 2 interrupt is setting riva_apps_wlan_data_xfer_done interrupt. Bit 3: when set, dxe channel 3 interrupt is setting riva_apps_wlan_data_xfer_done interrupt. Bit 4: when set, dxe channel 4 interrupt is setting riva_apps_wlan_data_xfer_done interrupt. Bit 5: when set, dxe channel 5 interrupt is setting riva_apps_wlan_data_xfer_done interrupt. Bit 6: when set, dxe channel 6 interrupt is setting riva_apps_wlan_data_xfer_done interrupt. Reset State: 0x00000000

0x3000318 CCU_CCU_ASIC_INT_ENABLE

Type: read-write
Reset State: 0x00000000

The interrupt enables for generating apss interrupt: riva_apss_asic_interrupt

CCU_CCU_ASIC_INT_ENABLE

Bits	Name	Description
22	DXE_CHANNEL6_ENABLE	When set, dxe channel 6 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
21	DXE_CHANNEL5_ENABLE	When set, dxe channel 5 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
20	DXE_CHANNEL4_ENABLE	When set, dxe channel 4 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
19	DXE_CHANNEL3_ENABLE	When set, dxe channel 3 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
18	DXE_CHANNEL2_ENABLE	When set, dxe channel 2 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
17	DXE_CHANNEL1_ENABLE	When set, dxe channel 1 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
16	DXE_CHANNEL0_ENABLE	When set, dxe channel 0 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000

CCU_CCU_ASIC_INT_ENABLE (cont.)

Bits	Name	Description
15:12	CCU_SPARE	Reserved Reset State: 0x00000000
11	MAC_HOST_INTR_EN	When set, it enables the MAC-HOST interrupt (generated from MCU register: MAC_HOST_INT_(MASKED)_STATUS) Reset State: 0x00000000
10	ADU_ERR_WQ10_WQ13_DAVAIL_INTR_EN	When set, it enables the ADU error WQ10 or WQ13 data available interrupt. Reset State: 0x00000000
9	DPU_ERR_WQ8_WQ9_DAVAIL_INTR_EN	When set, it enables the DPU error WQ8 or WQ9 data available interrupt. Reset State: 0x00000000
8	MTU_TIMER_3_INTR_EN	When set, it enables the MTU timer 3 timeout interrupt. Reset State: 0x00000000
7	MTU_TIMER_2_INTR_EN	When set, it enables the MTU timer 2 timeout interrupt. Reset State: 0x00000000
6:3	SYS_MB_INTR_EN	When each bit is set, it enables the corresponding SYS MB interrupt. Bit3: MCU MB0 Bit4: MCU MB1, etc Reset State: 0x00000000
2	DPU_MIC_ERR_INTR_EN	When set, it enables the DPU MIC error interrupt. Reset State: 0x00000000
1	WATCHDOG_INTR_2_EN	When set, it enables the watchdog timer 2 event interrupt. Reset State: 0x00000000
0	CCU_SPARE2	Reserved Reset State: 0x00000000

0x300031C CCU_CCU_ASIC_INT_STATUS

Type: read-only
Reset State: 0x00000000

The (enable masked) status of all inputs generating apss interrupt: riva_apss_asic_interrupt

CCU_CCU_ASIC_INT_STATUS

Bits	Name	Description
22	DXE_CHANNEL6_STATUS	When set, dxe channel 6 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
21	DXE_CHANNEL5_STATUS	When set, dxe channel 5 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000

CCU_CCU_ASIC_INT_STATUS (cont.)

Bits	Name	Description
20	DXE_CHANNEL4_STATUS	When set, dxe channel 4 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
19	DXE_CHANNEL3_STATUS	When set, dxe channel 3 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
18	DXE_CHANNEL2_STATUS	When set, dxe channel 2 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
17	DXE_CHANNEL1_STATUS	When set, dxe channel 1 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
16	DXE_CHANNEL0_STATUS	When set, dxe channel 0 interrupt will set riva_apss_asic_intr interrupt. Reset State: 0x00000000
11	MAC_HOST_INTR	When set, the MAC-HOST interrupt (generated from MCU register: MAC_HOST_INT_(MASKED)_STATUS is pending Reset State: 0x00000000
10	ADU_ERR_WQ10_WQ13_DAVAIL_INTR	When set, it indicates that the ADU error WQ10 or WQ13 data available interrupt occurs. Reset State: 0x00000000
9	DPU_ERR_WQ8_WQ9_DAVAIL_INTR	When set, it indicates that the DPU error WQ8 or WQ9 data available interrupt occurs. Reset State: 0x00000000
8	MTU_TIMER_3_INTR	When set, it indicates that the MTU timer 3 timeout interrupt occurs. Reset State: 0x00000000
7	MTU_TIMER_2_INTR	When set, it indicates that the MTU timer 2 timeout interrupt occurs. Reset State: 0x00000000
6:3	SYS_MB_INTR	When each bit is set, it indicates that the corresponding SYS MB interrupt occurs. Reset State: 0x00000000
2	DPU_MIC_ERR_INTR	When set, it indicates that a DPU MIC error interrupt occurs. Reset State: 0x00000000
1	WATCHDOG_2_EVENT_INTR	When set, it indicates that the watchdog timer 2 event interrupt occurs. Reset State: 0x00000000

0x3000320 CCU_TESTMUX_CONTROL1

Type: read-write
Reset State: 0x00000000

The register contains several controls for the testmux module. The output of the testmux module feeds into two testbusses: one going to the trace module, the other one going to the riva testbus (leaving Riva)

CCU_TESTMUX_CONTROL1

Bits	Name	Description
20:16	RIVA_TRACE_TESTBUS_SEL	This controls the selection of the testbus going to the trace module 5'h00: No testbus selected: output is zero 5'h01: Width reduced AHB clock domain testbus 5'h02: Width reduced phydbg clock domain testbus 5'h03: Width reduced 19.2 clock domain testbus 5'h04: Width reduced mac phy clock domain testbus 5'h04: Width reduced 32m clock domain testbus 5'h05 - 5'h1e: Reserved 5'h1f: Value: 29'h01234567 Reset State: 0x00000000
12:8	RIVA_TESTBUS_SEL	This control the testbus selection of the signals on the riva testbus, leaving riva 5'h00: No testbus selected: output is zero 5'h01: Width reduced AHB clock domain testbus 5'h02: Width reduced phydbg clock domain testbus 5'h03: Width reduced 19.2 clock domain testbus 5'h04: Width reduced mac phy clock domain testbus 5'h04: Width reduced 32m clock domain testbus 5'h05 - 5'h1e: Reserved 5'h1f: Value: 32'h76543210 Reset State: 0x00000000
0	TESTMUX_TRC_ENABLE	When set, the test muxing logic generating testbus inputs into the trace module is enabled Reset State: 0x00000000

0x3000324 CCU_TESTMUX_CONTROL2

Type: read-write
Reset State: 0x00000000

The register contains several controls for the testmux module. The output of the testmux module feeds into two testbusses: one going to the trace module, the other one going to the riva testbus (leaving Riva)

CCU_TESTMUX_CONTROL2

Bits	Name	Description
29:28	A32MCLK_TESTBUS_BUSRED_SEL	Selects the bus width reduction bit shifting option for the 32m testbus Reset State: 0x00000000

CCU_TESTMUX_CONTROL2 (cont.)

Bits	Name	Description
25:24	MAC160CLK_TESTBUS_BUSRED_SEL	Selects the bus width reduction bit shifting option for the mac phy clock domain testbus Reset State: 0x00000000
21:20	A19P2CLK_TESTBUS_BUSRED_SEL	Selects the bus width reduction bit shifting option for the 19.2 clock domain testbus Reset State: 0x00000000
17:16	A19P2CLK_TESTBUS_SEL	Selects the 19.2 clock domain testbus Reset State: 0x00000000
13:12	PHYDBGCLK_TESTBUS_BUSRED_SEL	phydbgclk_testbus_busred_sel Reset State: 0x00000000
9:8	PHYDBGCLK_TESTBUS_SEL	phydbgclk_testbus_sel Reset State: 0x00000000
5:4	AHBCLK_TESTBUS_BUSRED_SEL	ahbclk_testbus_busred_sel Reset State: 0x00000000
3:0	AHBCLK_TESTBUS_SEL	ahbclk_testbus_sel Reset State: 0x00000000

16.2.7 cdahb

0x3000000 CDAHB_CDAHB_RRI_PL

Type: read-write
Reset State: 0x00000001

cdahb Arbiter arbitration priority level for rri master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CDAHB_CDAHB_RRI_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rri master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000001

0x3000004 CDAHB_CDAHB_FDBR_PL

Type: read-write
Reset State: 0x00000005

cdahb Arbiter arbitration priority level for fdbr master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CDAHB_CDAHB_FDBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for fdbr master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000008 CDAHB_CDAHB_CCPU_PL

Type: read-write
Reset State: 0x00000005

cdahb Arbiter arbitration priority level for ccpu master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CDAHB_CDAHB_CCPU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for ccpu master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x300000C CDAHB_CDAHB_DBR_PL

Type: read-write
Reset State: 0x00000001

cdahb Arbiter arbitration priority level for dbr master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CDAHB_CDAHB_DBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dbr master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000001

0x3000010 CDAHB_CDAHB_TIC_PL

Type: read-write
Reset State: 0x00000005

cdahb Arbiter arbitration priority level for tic master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CDAHB_CDAHB_TIC_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for tic master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000005

0x3000014 CDAHB_CDAHB_DXE_PL

Type: read-write
Reset State: 0x00000001

cdahb Arbiter arbitration priority level for dxe master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority, the winning master will be selected using a round-robin algorithm.

CDAHB_CDAHB_DXE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dxe master. and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Please note that the cdahb arbiter will prevent a master from disabling itself. Reset State: 0x00000001

0x3000048 CDAHB_CDAHB_DFLT_MST

Type: read-write
Reset State: 0x00000000

This register identifies the default master for the cdahb

CDAHB_CDAHB_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY 0x1: RRI 0x2: FDBR 0x3: CCPU 0x4: DBR 0x5: TIC 0x6: DXE Reset State: 0x00000000

0x3000090 CDAHB_CDAHB_VERSION

Type: read-only
Reset State: 0x3230382A

ASCII value for each number in the version, followed by '*'. For example 32_30_31_2A represents the version 2.01*.

CDAHB_CDAHB_VERSION

Bits	Name	Description
31:24	CDAHB_COMP_VERSION_BYTE3	Reset State: 0x00000032

CDAHB_CDAHB_VERSION (cont.)

Bits	Name	Description
23:16	CDAHB_COMP_VERSION_BYTE2	Reset State: 0x00000030
15:8	CDAHB_COMP_VERSION_BYTE1	Reset State: 0x00000038
7:0	CDAHB_COMP_VERSION_BYTE0	Reset State: 0x0000002A

16.2.8 cmem

0x3000000 CMEM_CMEM_INT

Type: read-only
Reset State: 0x00000000

Interrupts in CMEM.

CMEM_CMEM_INT

Bits	Name	Description
23:20	INVALID_MASTER_ID_DAHB	AHB master ID that has caused invalid address access in DAHB Reset State: 0x00000000
19:16	INVALID_MASTER_ID_CAHB	AHB master ID that has caused invalid address access in CAHB Reset State: 0x00000000
3	CMEM_ACPU_INVALID_RADDR_INT	Invalid read address access from CPU port interrupt. Reset State: 0x00000000
2	CMEM_ACPU_INVALID_WADDR_INT	Invalid write address access from CPU port interrupt. Reset State: 0x00000000
1	CMEM_DAHB_INVALID_ADDR_INT	Invalid address access from DAHB port interrupt. Reset State: 0x00000000
0	CMEM_CAHB_INVALID_ADDR_INT	Invalid address access from CAHB port interrupt. Reset State: 0x00000000

0x3000004 CMEM_CMEM_INT_EN

Type: read-write
Reset State: 0x00000000

Enable assertion of interrupt

CMEM_CMEM_INT_EN

Bits	Name	Description
3	CMEM_ACPU_INVALID_RADDR_INT_EN	Enable invalid read address access from CPU interrupt. Reset State: 0x00000000
2	CMEM_ACPU_INVALID_WADDR_INT_EN	Enable invalid write address access from CPU interrupt. Reset State: 0x00000000
1	CMEM_DAHB_INVALID_ADDR_INT_EN	Enable invalid address access from DAHB interrupt. Reset State: 0x00000000
0	CMEM_CAHB_INVALID_ADDR_INT_EN	Enable invalid address access from CAHB interrupt. Reset State: 0x00000000

0x3000008 CMEM_CMEM_INT_CLR

Type: read-write
Reset State: 0x00000000

Clear the interrupts status bit.

CMEM_CMEM_INT_CLR

Bits	Name	Description
3	CMEM_ACPU_INVALID_RADDR_INT_CLR	Clear invalid read address access from CPU interrupt. Reset State: 0x00000000
2	CMEM_ACPU_INVALID_WADDR_INT_CLR	Clear invalid write address access from CPU interrupt. Reset State: 0x00000000
1	CMEM_DAHB_INVALID_ADDR_INT_CLR	Clear invalid address access from DAHB interrupt. Reset State: 0x00000000
0	CMEM_CAHB_INVALID_ADDR_INT_CLR	Clear invalid address access from CAHB interrupt. Reset State: 0x00000000

0x300000C CMEM_CMEM_MEM_CFG

Type: read-write
Reset State: 0x00280000

Memory rdOnly

CMEM_CMEM_MEM_CFG

Bits	Name	Description
31:16	CMEM_LRAM_KBYTES	Memory configuration Reset State: 0x00000028
3:0	MEM_CFG	Reset State: 0x00000000

0x3000010 CMEM_CMEM_TRANSBLK_CODE

Type: read-write
Reset State: 0x00000000

Unlock the access to transblk_start_addr, transblk_end_addr and transblk_port_en registers by writing 32'hA1A602E7

CMEM_CMEM_TRANSBLK_CODE

Bits	Name	Description
31:0	CMEM_TRANSBLK_CODE	Transaction blocking write-access code. Reset State: 0x00000000

0x3000014 CMEM_CMEM_TRANSBLK_START_ADDR

Type: read-write
Reset State: 0x00000000

Starting address of transfer block region in memory.

CMEM_CMEM_TRANSBLK_START_ADDR

Bits	Name	Description
31:10	CMEM_TRANSBLK_START_ADDR	starting address of transfer block region in kbytes Reset State: 0x00000000

0x3000018 CMEM_CMEM_TRANSBLK_END_ADDR

Type: read-write
Reset State: 0x00000000

Ending address of transfer block region in memory.

CMEM_CMEM_TRANSBLK_END_ADDR

Bits	Name	Description
31:10	CMEM_TRANSBLK_END_ADDR	ending address of transfer block region in kbytes Reset State: 0x00000000

0x300001C CMEM_CMEM_TRANSBLK_PORT_EN

Type: read-write
Reset State: 0x00000000

transfer block enable for each port.

CMEM_CMEM_TRANSBLK_PORT_EN

Bits	Name	Description
23:20	CMEM_TRANSBLK_MSTID1	second AHB master ID blocked from accessing blocked region. valid only when cmem_transblk_mstid1_vld is set to 1. Reset State: 0x00000000
19:16	CMEM_TRANSBLK_MSTID0	first AHB master ID blocked from accessing blocked region. valid only when cmem_transblk_mstid0_vld is set to 1. Reset State: 0x00000000
3	CMEM_TRANSBLK_MSTID1_VLD	cmem_transblk_mstid1 is valid Reset State: 0x00000000
2	CMEM_TRANSBLK_MSTID0_VLD	cmem_transblk_mstid0 is valid Reset State: 0x00000000
1:0	CMEM_TRANSBLK_PORT_EN	transfer block enable for each port Reset State: 0x00000000

0x3000020 CMEM_CMEM_ARB_POLICY

Type: read-write
Reset State: 0x00000000

Arbitration policy when two AHB ports are active

CMEM_CMEM_ARB_POLICY

Bits	Name	Description
28:24	CMEM_ACPU_PRTY	CPU port priority for each 5 SRAM block.Bit 1 corresponds to SRAM_1. Reset State: 0x00000000

CMEM_CMEM_ARB_POLICY (cont.)

Bits	Name	Description
20:16	CMEM_DAHB_PRTY	DAHB port priority for each 5 SRAM block.Bit 1 corresponds to SRAM_1. Reset State: 0x00000000
12:8	CMEM_CAHB_PRTY	CAHB port priority for each 5 SRAM block.Bit 1 corresponds to SRAM_1. Reset State: 0x00000000
5:1	CMEM_LRAM_ARB_POLICY	Arbitration for each 5 SRAM block.Bit 1 corresponds to SRAM_1(128KB).Obsolete. Reset State: 0x00000000
0	CMEM_AHB_ARB_POLICY	Arbitration policy. 0x0: PRR 0x1: SRR Reset State: 0x00000000

0x3000024 CMEM_CMEM_TEST_OUT_SEL

Type: read-write
Reset State: 0x00000000

testbus output selection.

CMEM_CMEM_TEST_OUT_SEL

Bits	Name	Description
31:0	TEST_OUT_SEL	testbus output selection. bit[2:0] - cmem_test_sel. 0 - sel aap0 (CAHB) 1 - sel aap1 (DAHB) 2 - sel mmx 3 - sel lram bit[6:4] - aap_test_sel bit[10:8] - mmx_test_sel bit[14:12] - lram_test_sel bit[18:16] - ahb_dec_test_sel bit[22:20] - regs_test_sel bit[26:24] - cpu_dec_test_sel bit[28] - cmem_test_en Reset State: 0x00000000

0x3000028 CMEM_CMEM_ACC

Type: read-write
Reset State: 0x00000000

acc[7:0] control to 1mbit RAMs

CMEM_CMEM_ACC

Bits	Name	Description
7:0	ACC	acc[7:0] control to 1mbit RAMs. Obsolete. Reset State: 0x00000000

0x300002C CMEM_CMEM_CAHB_INVALID_ADDR

Type: read-only
Reset State: 0x00000000

The last invalid address CAHB port accessed

CMEM_CMEM_CAHB_INVALID_ADDR

Bits	Name	Description
31:0	CMEM_CAHB_INVALID_ADDR	Stored invalid address that CAHB port access recently. Reset State: 0x00000000

0x3000030 CMEM_CMEM_DAHB_INVALID_ADDR

Type: read-only
Reset State: 0x00000000

The last invalid address DAHB port accessed

CMEM_CMEM_DAHB_INVALID_ADDR

Bits	Name	Description
31:0	CMEM_DAHB_INVALID_ADDR	Stored invalid address that DAHB port access recently. Reset State: 0x00000000

0x3000034 CMEM_CMEM_ACPU_INVALID_ADDR

Type: read-only
Reset State: 0x00000000

The last invalid address CPU port accessed

CMEM_CMEM_ACPU_INVALID_ADDR

Bits	Name	Description
31:0	CMEM_ACPU_INVALID_ADDR	Stored invalid address that CPU port access recently. Reset State: 0x00000000

0x3000038 CMEM_CMEM_CNT_CTRL

Type: read-write
Reset State: 0x00000000

This register controls the cmem counters

CMEM_CMEM_CNT_CTRL

Bits	Name	Description
1	CMEM_CNT_CLR	Clear the cmem counters to 0. Reset State: 0x00000000
0	CMEM_CNT_EN	Enable the cmem counters to increment. Reset State: 0x00000000

0x300003C CMEM_CMEM_CAHB_BUSY_CNT

Type: read-only
Reset State: 0x00000000

32-bit of cmem_cahb_busy_cnt

CMEM_CMEM_CAHB_BUSY_CNT

Bits	Name	Description
31:0	CMEM_CAHB_BUSY_CNT	Number of AHB clock cycle while CAHB port is busy. Reset State: 0x00000000

0x3000040 CMEM_CMEM_CAHB_IDLE_CNT

Type: read-only
Reset State: 0x00000000

32-bit of cmem_cahb_idle_cnt

CMEM_CMEM_CAHB_IDLE_CNT

Bits	Name	Description
31:0	CMEM_CAHB_IDLE_CNT	Number of AHB clock cycle while CAHB port is idle. Reset State: 0x00000000

0x3000044 CMEM_CMEM_CAHB_ACTIVE_CNT

Type: read-only
Reset State: 0x00000000

32-bit of cmem_cahb_active_cnt

CMEM_CMEM_CAHB_ACTIVE_CNT

Bits	Name	Description
31:0	CMEM_CAHB_ACTIVE_CNT	Number of AHB clock cycle while CAHB port is busy and active. Reset State: 0x00000000

0x3000048 CMEM_CMEM_DAHB_BUSY_CNT

Type: read-only
Reset State: 0x00000000

32-bit of cmem_dahb_busy_cnt

CMEM_CMEM_DAHB_BUSY_CNT

Bits	Name	Description
31:0	CMEM_DAHB_BUSY_CNT	Number of AHB clock cycle while DAHB port is busy. Reset State: 0x00000000

0x300004C CMEM_CMEM_DAHB_IDLE_CNT

Type: read-only
Reset State: 0x00000000

32-bit of cmem_dahb_idle_cnt

CMEM_CMEM_DAHB_IDLE_CNT

Bits	Name	Description
31:0	CMEM_DAHB_IDLE_CNT	Number of AHB clock cycle while DAHB port is idle. Reset State: 0x00000000

0x3000050 CMEM_CMEM_DAHB_ACTIVE_CNT

Type: read-only
Reset State: 0x00000000

32-bit of cmem_dahb_active_cnt

CMEM_CMEM_DAHB_ACTIVE_CNT

Bits	Name	Description
31:0	CMEM_DAHB_ACTIVE_CNT	Number of AHB clock cycle while DAHB port is busy and active. Reset State: 0x00000000

0x3000054 CMEM_CMEM_ACPU_BUSY_CNT

Type: read-only
Reset State: 0x00000000

32-bit of cmem_acpu_busy_cnt

CMEM_CMEM_ACPU_BUSY_CNT

Bits	Name	Description
31:0	CMEM_ACPU_BUSY_CNT	Number of ACPU clock cycle while CPU memory port is busy. Reset State: 0x00000000

0x3000058 CMEM_CMEM_ACPU_IDLE_CNT

Type: read-only
Reset State: 0x00000000

32-bit of cmem_acpu_idle_cnt

CMEM_CMEM_ACPU_IDLE_CNT

Bits	Name	Description
31:0	CMEM_ACPU_IDLE_CNT	Number of ACPU clock cycle while CPU memory port is busy. Reset State: 0x00000000

0x300005C CMEM_CMEM_ACPU_ACTIVE_CNT

Type: read-only
Reset State: 0x00000000

32-bit of cmem_acpu_active_cnt

CMEM_CMEM_ACPU_ACTIVE_CNT

Bits	Name	Description
31:0	CMEM_ACPU_ACTIVE_CNT	Number of ACPU clock cycle while CPU memory port is busy and active. Reset State: 0x00000000

0x3000060 CMEM_CMEM_TESTBUS_HI

Type: read-only
Reset State: 0x00000000

The upper 13-bit of cmem_testbus

CMEM_CMEM_TESTBUS_HI

Bits	Name	Description
12:0	CMEM_TESTBUS_HI	Upper 13-bit of cmem_testbus. cmem_testbus[44:32]. Reset State: 0x00000000

0x3000064 CMEM_CMEM_TESTBUS_LO

Type: read-only
Reset State: 0x00000000

The lower 32-bit of cmem_testbus

CMEM_CMEM_TESTBUS_LO

Bits	Name	Description
31:0	CMEM_TESTBUS_LO	Lower 32-bit of cmem_testbus. cmem_testbus[31:0]. Reset State: 0x00000000

0x3000068 CMEM_CMEM_CLK_GATE

Type: read-write
Reset State: 0x00010104

disable control for top cmem clock gates

CMEM_CMEM_CLK_GATE

Bits	Name	Description
23:16	GAS_BUSY_MSK	number of cycles that gas_busy enables the clock after it is de-asserted. Reset State: 0x00000001
15:8	AHB_BUSY_MSK	number of cycles that ahb_busy enables the clock after it is de-asserted. Reset State: 0x00000001
7	DAHB_ABORT_HAPPENED	indication of abort happened. Reset State: 0x00000000
6	DAHB_ABORT_CLR	clear abort_happened Reset State: 0x00000000
5	CAHB_ABORT_HAPPENED	indication of abort happened. Reset State: 0x00000000
4	CAHB_ABORT_CLR	clear abort_happened Reset State: 0x00000000
3	CMEM_RD_CLK_GATE_DISABLE	Disable read path clock gate. Reset State: 0x00000000
2	CMEM_MEM_CLK_GATE_DISABLE	Disable top clock gate for memory clock. Reset State: 0x00000001
1	CMEM_ACPU_CLK_GATE_DISABLE	Disable top clock gate for 40/80MHz ACPU clock. Reset State: 0x00000000
0	CMEM_AHB_CLK_GATE_DISABLE	Disable top clock gate for 40MHz AHB clock. Reset State: 0x00000000

0x300006C CMEM_CMEM_CAHB_RX_CTL

Type: read-write
Reset State: 0x00000000

various control for CAHB rx fifo and data path

CMEM_CMEM_CAHB_RX_CTL

Bits	Name	Description
2	CMEM_RX_CLR_ON_CMD_EN	when the bit is set, rx path is cleared when new transaction starts. Reset State: 0x00000000
1	CMEM_RX_CLR	clear the RX FIFO and the read data path Reset State: 0x00000000
0	CMEM_RX_FIFO_CLR	clear the RX FIFO Reset State: 0x00000000

0x3000070 CMEM_CMEM_DAHB_RX_CTL

Type: read-write
Reset State: 0x00000000

various control for DAHB rx fifo and data path

CMEM_CMEM_DAHB_RX_CTL

Bits	Name	Description
2	CMEM_RX_CLR_ON_CMD_EN	when the bit is set, rx path is cleared when new transaction starts. Reset State: 0x00000000
1	CMEM_RX_CLR	clear the RX FIFO and the read data path Reset State: 0x00000000
0	CMEM_RX_FIFO_CLR	clear the RX FIFO Reset State: 0x00000000

16.2.9 DXE_0

0x3000000 DXE_0_DMA_CSR

Type: read-write
Reset State: 0x00004E50

The DMA Control and status Register (DMA_CSR) is used for configuration settings that, in general, apply to all the DMA channels.

DXE_0_DMA_CSR

Bits	Name	Description
31:18	RESERVED	Reserved. Writes ignored, reads will return 0.
16	H2H_SYNC_EN	When set, DXE will wait for confirmation from MIF that H2H written data has made it all the way out to memory before continuing with the transfers. This will slow things down but guarantee that the data is always consistent no matter what MIF port is used to write it or read it back. When clear, as long as the data is read from the same MIF port from which it was written, MIF will guarantee that data coherency without the need to wait. Reset State: 0x00000000
15	PAUSED	This status bit will be set when as a result of setting the pause request bit (PAUSE), the state machine has completed any ongoing chunk transfer, released the AHB interfaces, and entered the pause state. This will bit be cleared when as a result of clearing the pause request bit (PAUSE), the state machine has gone back to processing any outstanding transfers or else it has gone back to the IDLE state to wait for new transfer requests.
14	ECTR_EN	Event Counter Enable. When set the event counters will be enabled. Reset State: 0x00000001
13:9	B2H_TSTMP_OFF	Timestamp Offset. This bit field specifies the offset (multiple of 4 bytes) to be used for writing the start and end timestamps in the BD for B2H type transfers Reset State: 0x00000007
8:4	H2B_TSTMP_OFF	Timestamp Offset. This bit field specifies the offset (multiple of 4 bytes) to be used for writing the start and end timestamps in the BD for H2B transfers. Reset State: 0x00000005
3	TSTMP_EN	Timestamp Enable. When set, this bit enables the writing of start and end timestamps for H2B and B2H transfers. The timestamps will be written in the BD at the offset specified by the setting of the TMSTMP_OFF bit field as two consecutive 32-bit starting with the start timestamp. When this bit is cleared no timestamps will be written to the BD. Reset State: 0x00000000
2	RESET	Soft reset for DMA engine
1	PAUSE	Pause the DMA engine. The engine will stop as soon as the next chunk transfer is complete so no data will be lost. It will also release the AHB interfaces. No progress will be made until software clears this bit. Reset State: 0x00000000
0	EN	Enables the DMA engine Reset State: 0x00000000

0x3000004 DXE_0_DMA_ENCH

Type: write-only

This register is write-only and provides a convenient way for software to enable one or more channels with a single register write. When writing to this register, each data bit set HIGH causes the corresponding CH_CSR[EN] bit in the channel to be set thereby enabling the channel. Data bits that are low have no effect in their corresponding channel CSR[EN] bits.

DXE_0_DMA_ENCH

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_EN	Enable channel 6.
5	CH5_EN	Enable channel 5.
4	CH4_EN	Enable channel 4.
3	CH3_EN	Enable channel 3.
2	CH2_EN	Enable channel 2.
1	CH1_EN	Enable channel 1.
0	CH0_EN	Enable channel 0.

0x3000008 DXE_0_DMA_CH_EN

Type: read-only

This register is read-only and indicates which DMA channels are enabled. Each bit in this register reflects the status of the corresponding EN bit in each of the channels' CHn_CSRs. As such, used in combination with DMA_DONE, it provides a convenient way for software to determine which channels are available for a new DMA operation.

DXE_0_DMA_CH_EN

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_EN	Enable (EN) bit status for DMA Channel 6 in CH6_CSR.
5	CH5_EN	Enable (EN) bit status for DMA Channel 5 in CH5_CSR.
4	CH4_EN	Enable (EN) bit status for DMA Channel 4 in CH4_CSR.
3	CH3_EN	Enable (EN) bit status for DMA Channel 3 in CH3_CSR.
2	CH2_EN	Enable (EN) bit status for DMA Channel 2 in CH2_CSR.
1	CH1_EN	Enable (EN) bit status for DMA Channel 1 in CH1_CSR.
0	CH0_EN	Enable (EN) bit status for DMA Channel 0 in CH0_CSR.

0x300000C DXE_0_DMA_CH_DONE

Type: read-only

This register is read-only and indicates which DMA channels are done with their programmed transfer, each bit in this register reflects the status of the corresponding DONE bit in each of the channels' CHn_CSRs. As such, it provides a convenient way for software to determine which channels have finished their programmed DMA operation.

DXE_0_DMA_CH_DONE

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_DONE	Done (DONE) bit for DMA Channel 6 in CH6_CSR.
5	CH5_DONE	Done (DONE) bit for DMA Channel 5 in CH5_CSR.
4	CH4_DONE	Done (DONE) bit for DMA Channel 4 in CH4_CSR.
3	CH3_DONE	Done (DONE) bit for DMA Channel 3 in CH3_CSR.
2	CH2_DONE	Done (DONE) bit for DMA Channel 2 in CH2_CSR.
1	CH1_DONE	Done (DONE) bit for DMA Channel 1 in CH1_CSR.
0	CH0_DONE	Done (DONE) bit for DMA Channel 0 in CH0_CSR.

0x3000010 DXE_0_DMA_CH_ERR

Type: read-only

This register is read-only and indicates which DMA channels have errors, each bit in this register reflects the status of the corresponding ERR bit in each of the channels' CHn_CSRs. As such, it provides a convenient way for software to determine which channels have incurred errors during operation.

DXE_0_DMA_CH_ERR

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_ERR	Error (ERR) bit for DMA Channel 6 in CH6_CSR.
5	CH5_ERR	Error (ERR) bit for DMA Channel 5 in CH5_CSR.
4	CH4_ERR	Error (ERR) bit for DMA Channel 4 in CH4_CSR.
3	CH3_ERR	Error (ERR) bit for DMA Channel 3 in CH3_CSR.
2	CH2_ERR	Error (ERR) bit for DMA Channel 2 in CH2_CSR.
1	CH1_ERR	Error (ERR) bit for DMA Channel 1 in CH1_CSR.
0	CH0_ERR	Error (ERR) bit for DMA Channel 0 in CH0_CSR.

0x3000014 DXE_0_DMA_CH_STOP

Type: read-only

This register is read-only and indicates which DMA channels have been stopped by software request, each bit in this register reflects the status of the corresponding STOP bit in each of the channels' CHn_CSRs. As such, it provides a convenient way for software to determine which channels have incurred stops during operation.

DXE_0_DMA_CH_STOP

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_STOP	Stop (STOP) bit for DMA Channel 6 in CH6_CSR.
5	CH5_STOP	Stop (STOP) bit for DMA Channel 5 in CH5_CSR.
4	CH4_STOP	Stop (STOP) bit for DMA Channel 4 in CH4_CSR.
3	CH3_STOP	Stop (STOP) bit for DMA Channel 3 in CH3_CSR.
2	CH2_STOP	Stop (STOP) bit for DMA Channel 2 in CH2_CSR.
1	CH1_STOP	Stop (STOP) bit for DMA Channel 1 in CH1_CSR.
0	CH0_STOP	Stop (STOP) bit for DMA Channel 0 in CH0_CSR.

0x3000018 DXE_0_INT_MSK

Type: read-write
Reset State: 0x00000000

The Interrupt Mask register defines the functionality of DXE's all-channel combined interrupt output. A bit set to one in the mask enables the generation of the interrupt for that source channel, a zero disables the generation of an interrupt.

DXE_0_INT_MSK

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_INTEN	Interrupt Enable. Enable DMA Channel 6 Interrupts. Reset State: 0x00000000
5	CH5_INTEN	Interrupt Enable. Enable DMA Channel 5 Interrupts. Reset State: 0x00000000
4	CH4_INTEN	Interrupt Enable. Enable DMA Channel 4 Interrupts. Reset State: 0x00000000
3	CH3_INTEN	Interrupt Enable. Enable DMA Channel 3 Interrupts. Reset State: 0x00000000

DXE_0_INT_MSK (cont.)

Bits	Name	Description
2	CH2_INTEN	Interrupt Enable. Enable DMA Channel 2 Interrupts. Reset State: 0x00000000
1	CH1_INTEN	Interrupt Enable. Enable DMA Channel 1 Interrupts. Reset State: 0x00000000
0	CH0_INTEN	Interrupt Enable. Enable DMA Channel 0 Interrupts. Reset State: 0x00000000

0x300001C DXE_0_INT_SRC_MSKD

Type: read-only

This read-only register is the bitwise AND of INT_SRC_RAW with INT_MSK. If any of its bits is a one, the DXE will generate an interrupt request to the interrupt controller.

DXE_0_INT_SRC_MSKD

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_INT	ED, Done or Error interrupt request by CH6 after masking with INT_MSK[6].
5	CH5_INT	ED, Done or Error interrupt request by CH5 after masking with INT_MSK[5].
4	CH4_INT	ED, Done or Error interrupt request by CH4 after masking with INT_MSK[4].
3	CH3_INT	ED, Done or Error interrupt request by CH3 after masking with INT_MSK[3].
2	CH2_INT	ED, Done or Error interrupt request by CH2 after masking with INT_MSK[2].
1	CH1_INT	ED, Done or Error interrupt request by CH1 after masking with INT_MSK[1].
0	CH0_INT	ED, Done or Error interrupt request by CH0 after masking with INT_MSK[0].

0x3000020 DXE_0_INT_SRC_RAW

Type: read-only

This read-only register combines the sources of all types of error interrupt requests: descriptor, done and error types. It is basically the bitwise OR of INT_ED_SRC, INT_DONE_SRC and INT_ERR_SRC

DXE_0_INT_SRC_RAW

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_INT	ED, Done or Error interrupt requested by CH6.
5	CH5_INT	ED, Done or Error interrupt requested by CH5.
4	CH4_INT	ED, Done or Error interrupt requested by CH4.
3	CH3_INT	ED, Done or Error interrupt requested by CH3.
2	CH2_INT	ED, Done or Error interrupt requested by CH2.
1	CH1_INT	ED, Done or Error interrupt requested by CH1.
0	CH0_INT	ED, Done or Error interrupt requested by CH0.

0x3000024 DXE_0_INT_ED_SRC

Type: read-only

This read-only register combines the sources of all external descriptor requested interrupts. It is the "raw" unmasked value from the channel registers.

DXE_0_INT_ED_SRC

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_ED_INT	External descriptor interrupt requested by CH6.
5	CH5_ED_INT	External descriptor interrupt requested by CH5.
4	CH4_ED_INT	External descriptor interrupt requested by CH4.
3	CH3_ED_INT	External descriptor interrupt requested by CH3.
2	CH2_ED_INT	External descriptor interrupt requested by CH2.
1	CH1_ED_INT	External descriptor interrupt requested by CH1.
0	CH0_ED_INT	External descriptor interrupt requested by CH0.

0x3000028 DXE_0_INT_DONE_SRC

Type: read-only

This read-only register combines the sources of all done interrupt requests. It is the "raw" unmasked value from the channel registers.

DXE_0_INT_DONE_SRC

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_DONE_INT	Done interrupt requested by CH6.
5	CH5_DONE_INT	Done interrupt requested by CH5.
4	CH4_DONE_INT	Done interrupt requested by CH4.
3	CH3_DONE_INT	Done interrupt requested by CH3.
2	CH2_DONE_INT	Done interrupt requested by CH2.
1	CH1_DONE_INT	Done interrupt requested by CH1.
0	CH0_DONE_INT	Done interrupt requested by CH0.

0x300002C DXE_0_INT_ERR_SRC

Type: read-only

This read-only register combines the sources of all error interrupt requests. It is the "raw" unmasked value from the channel registers.

DXE_0_INT_ERR_SRC

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_ERR_INT	Error interrupt requested by CH6.
5	CH5_ERR_INT	Error interrupt requested by CH5.
4	CH4_ERR_INT	Error interrupt requested by CH4.
3	CH3_ERR_INT	Error interrupt requested by CH3.
2	CH2_ERR_INT	Error interrupt requested by CH2.
1	CH1_ERR_INT	Error interrupt requested by CH1.
0	CH0_ERR_INT	Error interrupt requested by CH0.

0x3000030 DXE_0_INT_CLR

Type: write-only

This register is write-only and is used to clear interrupt request form either all or specific individual channels. When writing to this register, each data bit set HIGH causes the corresponding bits in the channel CSR to be cleared. All ED, DONE and ERROR source will be cleared at once. Data bits that are low have no effect on the corresponding bit in the channel CSR register.

DXE_0_INT_CLR

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_INT_CLR	Clear all interrupt sources in CH6.
5	CH5_INT_CLR	Clear all interrupt sources in CH5.
4	CH4_INT_CLR	Clear all interrupt sources in CH4.
3	CH3_INT_CLR	Clear all interrupt sources in CH3.
2	CH2_INT_CLR	Clear all interrupt sources in CH2.
1	CH1_INT_CLR	Clear all interrupt sources in CH1.
0	CH0_INT_CLR	Clear all interrupt sources in CH0.

0x3000034 DXE_0_INT_ED_CLR

Type: write-only

This register is write-only and is used to clear external descriptor interrupt requests simultaneously from either all or specific individual channels. When writing to this register, each data bit set HIGH causes the corresponding bits in the channel CSR to be cleared. Data bits that are low have no effect on the corresponding bit in the channel CSR register.

DXE_0_INT_ED_CLR

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_INT_ED_CLR	Clear ED interrupt source in CH6.
5	CH5_INT_ED_CLR	Clear ED interrupt source in CH5.
4	CH4_INT_ED_CLR	Clear ED interrupt source in CH4.
3	CH3_INT_ED_CLR	Clear ED interrupt source in CH3.
2	CH2_INT_ED_CLR	Clear ED interrupt source in CH2.
1	CH1_INT_ED_CLR	Clear ED interrupt source in CH1.
0	CH0_INT_ED_CLR	Clear ED interrupt source in CH0.

0x3000038 DXE_0_INT_DONE_CLR

Type: write-only

This register is write-only and is used to clear DONE interrupt requests simultaneously from either all or specific individual channels. When writing to this register, each data bit set HIGH causes the

corresponding bits in the channel CSR to be cleared. Data bits that are low have no effect on the corresponding bit in the channel CSR register.

DXE_0_INT_DONE_CLR

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_INT_DONE_CLR	Clear DONE interrupt source in CH6.
5	CH5_INT_DONE_CLR	Clear DONE interrupt source in CH5.
4	CH4_INT_DONE_CLR	Clear DONE interrupt source in CH4.
3	CH3_INT_DONE_CLR	Clear DONE interrupt source in CH3.
2	CH2_INT_DONE_CLR	Clear DONE interrupt source in CH2.
1	CH1_INT_DONE_CLR	Clear DONE interrupt source in CH1.
0	CH0_INT_DONE_CLR	Clear DONE interrupt source in CH0.

0x300003C DXE_0_INT_ERR_CLR

Type: write-only

This register is write-only and is used to clear ERROR interrupt requests simultaneously from either all or specific individual channels. When writing to this register, each data bit set HIGH causes the corresponding bits in the channel CSR to be cleared. Data bits that are low have no effect on the corresponding bit in the channel CSR register.

DXE_0_INT_ERR_CLR

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CH6_INT_ERR_CLR	Clear ERROR interrupt source in CH6.
5	CH5_INT_ERR_CLR	Clear ERROR interrupt source in CH5.
4	CH4_INT_ERR_CLR	Clear ERROR interrupt source in CH4.
3	CH3_INT_ERR_CLR	Clear ERROR interrupt source in CH3.
2	CH2_INT_ERR_CLR	Clear ERROR interrupt source in CH2.
1	CH1_INT_ERR_CLR	Clear ERROR interrupt source in CH1.
0	CH0_INT_ERR_CLR	Clear ERROR interrupt source in CH0.

0x3000040 DXE_0_DMA_CH_PRES

Type: read-only
Reset State: 0x0000007F

This register is read-only and indicates which DMA channels exist in the hardware.

DXE_0_DMA_CH_PRES

Bits	Name	Description
31	CH31_PRES	Channel 31 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
30	CH30_PRES	Channel 30 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
29	CH29_PRES	Channel 29 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
28	CH28_PRES	Channel 28 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
27	CH27_PRES	Channel 27 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
26	CH26_PRES	Channel 26 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
25	CH25_PRES	Channel 25 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
24	CH24_PRES	Channel 24 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
23	CH23_PRES	Channel 23 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
22	CH22_PRES	Channel 22 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
21	CH21_PRES	Channel 21 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000

DXE_0_DMA_CH_PRES (cont.)

Bits	Name	Description
20	CH20_PRES	Channel 20 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
19	CH19_PRES	Channel 19 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
18	CH18_PRES	Channel 18 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
17	CH17_PRES	Channel 17 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
16	CH16_PRES	Channel 16 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
15	CH15_PRES	Channel 15 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
14	CH14_PRES	Channel 14 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
13	CH13_PRES	Channel 13 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
12	CH12_PRES	Channel 12 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
11	CH11_PRES	Channel 11 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
10	CH10_PRES	Channel 10 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
9	CH9_PRES	Channel 9 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
8	CH8_PRES	Channel 8 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000
7	CH7_PRES	Channel 7 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000000

DXE_0_DMA_CH_PRES (cont.)

Bits	Name	Description
6	CH6_PRES	Channel 6 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000001
5	CH5_PRES	Channel 5 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000001
4	CH4_PRES	Channel 4 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000001
3	CH3_PRES	Channel 3 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000001
2	CH2_PRES	Channel 2 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000001
1	CH1_PRES	Channel 1 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000001
0	CH0_PRES	Channel 0 Present. When high signifies that the channel exists in this implementation of the HW. Reset State: 0x00000001

0x3000044 DXE_0_TSTBUS_CTRL

Type: read-write
Reset State: 0x0000000B

The Value of this register is used to control a mux that selects which set of internal DXE signals gets put on the chip-wide test bus.

DXE_0_TSTBUS_CTRL

Bits	Name	Description
31:5	RESERVED	Reserved. Writes ignored, reads will return 0.

DXE_0_TSTBUS_CTRL (cont.)

Bits	Name	Description
4:1	SEL	Controls which of the following sets gets put into the DXE testbus: 0x0: MIX 0x1: DE 0x2: ARB 0x3: GAM 0x4: GBI 0x5: GAS 0x6: FIFO_CTRL 0x7: FIFO_IN 0x8: FIFO_OUT Reset State: 0x00000005
0	EN	Enable. When enabled the flop that drives the DXE testbus will update its value every cycle, otherwise the flop outputs will remain constant. Reset State: 0x00000001

0x3000048 DXE_0_TSTBUS_LOW

Type: read-only

This register provides bits [31:0] of the DXE testbus.

DXE_0_TSTBUS_LOW

Bits	Name	Description
31:0	VALUE	

0x300004C DXE_0_TSTBUS_HIGH

Type: read-only

This register provides bits [44:32] of the DXE testbus.

DXE_0_TSTBUS_HIGH

Bits	Name	Description
31:0	VALUE	

0x3000050 DXE_0_PF_BD

Type: read-only
Reset State: 0x00000000

This read-only register contains the index of any prefetched BD index. The index is only meaningful if the accompanying valid bit is set.

DXE_0_PF_BD

Bits	Name	Description
31:17	RESERVED	Reserved. Writes ignored, reads will return 0. Reset State: 0x00000000
16	VALID	Valid. When set indicates that the INDEX bit field contains a valid BD index pointer. Reset State: 0x00000000
15:0	INDEX	BD Index.

0x3000054 DXE_0_PF_PDU

Type: read-only
Reset State: 0x00000000

This read-only register contains the index of any prefetched PDU index. The index is only meaningful if the accompanying valid bit is set.

DXE_0_PF_PDU

Bits	Name	Description
31:17	RESERVED	Reserved. Reads will return 0. Reset State: 0x00000000
16	VALID	Valid. When set indicates that the INDEX bit field contains a valid PDU index pointer. Reset State: 0x00000000
15:0	INDEX	PDU Index.

0x3000058 DXE_0_REVISION

Type: read-only
Reset State: 0x0000001D

This register's value represents the DXE RTL revision present in the hardware.

DXE_0_REVISION

Bits	Name	Description
31:0	REVID	Revision ID. Corresponds to the label number of DXE (revision of.info file) Reset State: 0x0000001D

0x300005C DXE_0_BMU_SB_QDAT_AVAIL

Type: read-only

This read-only register provides the status of BMU WQ data available sideband signals as seen by DXE.

DXE_0_BMU_SB_QDAT_AVAIL

Bits	Name	Description
31:24	RSVD	Reserved.
23:0	QDAT_AV	BMU WQ Data Aavailable.

0x3000060 DXE_0_BMU_SB_PDU_AVAIL

Type: read-only

This read-only register provides the status of BMU PDU available sideband signals as seen by DXE.

DXE_0_BMU_SB_PDU_AVAIL

Bits	Name	Description
31:10	RSVD	Reserved.
9:0	PDU_AV	BMU BD/PDU Aavailable.

0x3000064 DXE_0_STATE

Type: read-only

This read-only register provides key DXE state machine status to help debug.

DXE_0_STATE

Bits	Name	Description
31	RX_SPAVAIL	Space is available in one or more of the UIF RX endpoints
30	TX_MGMT_DAVAIL	Data is available in the UIF TX management endpoint
29	TX_DAT_DAVAIL	Data is available in the UIF TX data endpoint
28	WQ_DAVAIL	Data is available in selected BMU WQ
27	PDU_AVAIL	PDUs are available for current threshold
26:25	XFER_IDX	Id of the transfer size source that turned out to be the minimum and therefore picked as size of current transfer

DXE_0_STATE (cont.)

Bits	Name	Description
24:17	XFER_SZ	Calculated max transfer size from minimum of chunk size and space or data available in either source PDU, destination PDU, or UIF endpoint.
16:12	SEL_CH	Currently Selected Channel.
11:10	PFSM	State of prefetch engine state machine
9:8	DFSM	State of DPDMA state machine
7:6	SFSM	State of SPDMA state machine

DXE_0_STATE (cont.)

Bits	Name	Description
5:0	MFSM	State of main state machine 0x0: IDLE 0x1: H2H_START 0x2: H2H_RD 0x3: H2H_WR 0x4: H2H_UPDATE 0x5: LD_DESC 0x6: CKEDVAL 0x7: CLREDVAL 0x8: WB_CTRL 0x9: WB_SZ 0xA: WB_SADR 0xB: WB_DADR 0xC: WB_DESC 0xD: PAUSE 0xE: B2H_START 0xF: B2H_POPWQ 0x10: B2H_GET_BD_INFO 0x11: B2H_RD_BD 0x12: B2H_WR_BD 0x13: B2H_RD_PDU 0x14: B2H_WR_PDU 0x15: B2H_NXT_PDU 0x16: B2H_UPNCK_PDU 0x17: B2H_WR_TSTMP 0x18: B2H_REL_PKT 0x19: H2B_START 0x1A: H2B_GET_PDU 0x1B: H2B_RD_PDU 0x1C: H2B_WR_PDU 0x1D: H2B_LNK_PDU 0x1E: H2B_UPDT_BD1 0x1F: H2B_UPDT_BD2 0x20: H2B_PUSHWQ 0x21: ABORT 0x22: ERROR 0x23: H2B_WR_TSTMP 0x24: WR_TOT_XFER_LEN 0x25: H2B_BD_TMPLT_RD 0x26: H2B_BD_TMPLT_WR

0x3000068 DXE_0_ARB_CH_MSK

Type: read-only

This register is read-only and indicates which enabled DMA channels have been masked from active arbitration by some blocking condition

DXE_0_ARB_CH_MSK

Bits	Name	Description
31:7	RSVD	Reserved. Reads return 0
6	CH6_MSKD	When set indicates that CH6 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress..
5	CH5_MSKD	When set indicates that CH5 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress..
4	CH4_MSKD	When set indicates that CH4 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress..
3	CH3_MSKD	When set indicates that CH3 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress..
2	CH2_MSKD	When set indicates that CH2 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress..
1	CH1_MSKD	When set indicates that CH1 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress..
0	CH0_MSKD	When set indicates that CH0 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress..

0x300006C DXE_0_UIF_SB

Type: read-only

This read-only register provides the status of important UIF sideband signals

DXE_0_UIF_SB

Bits	Name	Description
31:22	RSVD	Reserved. Writes ignored, reads will return 0.

DXE_0_UIF_SB (cont.)

Bits	Name	Description
21:14	RX_SPACE_REM_DAT_REM	Provides the number of dwords that can be written to the active Rx endpoint
13	RX4_SPAVAIL	When high means that there is space available in the Rx1 endpoint
12	RX3_SPAVAIL	When high means that there is space available in the Rx1 endpoint
11	RX2_SPAVAIL	When high means that there is space available in the Rx1 endpoint
10	RX1_SPAVAIL	When high means that there is space available in the Rx1 endpoint
9:2	TX_DAT_REM	Provides the number of dwords available in the active Tx endpoint
1	TX_MGMT_DAVAIL	When high means that there is data available in the Tx management endpoint
0	TX_DAT_DAVAIL	When high means that there is data available in the Tx data endpoint

0x3000070 DXE_0_TIMESTAMP

Type: read-only
Reset State: 0x00000046

This read-only register provides the current value of the MTU timestamp

DXE_0_TIMESTAMP

Bits	Name	Description
31:0	TSTMP	Reset State: 0x00000046

0x3000074 DXE_0_ARB_CH_MSK_CLR

Type: write-only

This write-only register provides for a way to forcibly unmask currently masked channels and return them to active participation in the arbitration

DXE_0_ARB_CH_MSK_CLR

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored. Reads return 0
6	CH6_MSK_CLR	Writing a one clears the arbiter mask for channel 6 thereby returning the channel to active arbitration. Reads always return 0.
5	CH5_MSK_CLR	Writing a one clears the arbiter mask for channel 5 thereby returning the channel to active arbitration. Reads always return 0.

DXE_0_ARB_CH_MSK_CLR (cont.)

Bits	Name	Description
4	CH4_MSK_CLR	Writing a one clears the arbiter mask for channel 4 thereby returning the channel to active arbitration. Reads always return 0.
3	CH3_MSK_CLR	Writing a one clears the arbiter mask for channel 3 thereby returning the channel to active arbitration. Reads always return 0.
2	CH2_MSK_CLR	Writing a one clears the arbiter mask for channel 2 thereby returning the channel to active arbitration. Reads always return 0.
1	CH1_MSK_CLR	Writing a one clears the arbiter mask for channel 1 thereby returning the channel to active arbitration. Reads always return 0.
0	CH0_MSK_CLR	Writing a one clears the arbiter mask for channel 0 thereby returning the channel to active arbitration. Reads always return 0.

0x3000078 DXE_0_CTR_PRES

Type: read-only
Reset State: 0x0000007F

This register is read-only and indicates how many counters actually exist in this implementation of the hardware.

DXE_0_CTR_PRES

Bits	Name	Description
31	CTR31_PRES	Counter 31 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
30	CTR30_PRES	Counter 30 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
29	CTR29_PRES	Counter 29 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
28	CTR28_PRES	Counter 28 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
27	CTR27_PRES	Counter 27 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
26	CTR26_PRES	Counter 26 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000

DXE_0_CTR_PRES (cont.)

Bits	Name	Description
25	CTR25_PRES	Counter 25 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
24	CTR24_PRES	Counter 24 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
23	CTR23_PRES	Counter 23 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
22	CTR22_PRES	Counter 22 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
21	CTR21_PRES	Counter 21 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
20	CTR20_PRES	Counter 20 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
19	CTR19_PRES	Counter 19 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
18	CTR18_PRES	Counter 18 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
17	CTR17_PRES	Counter 17 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
16	CTR16_PRES	Counter 16 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
15	CTR15_PRES	Counter 15 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
14	CTR14_PRES	Counter 14 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
13	CTR13_PRES	Counter 13 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
12	CTR12_PRES	Counter 12 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000

DXE_0_CTR_PRES (cont.)

Bits	Name	Description
11	CTR11_PRES	Counter 11 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
10	CTR10_PRES	Counter 10 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
9	CTR9_PRES	Counter 9 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
8	CTR8_PRES	Counter 8 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
7	CTR7_PRES	Counter 7 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000000
6	CTR6_PRES	Counter 6 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000001
5	CTR5_PRES	Counter 5 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000001
4	CTR4_PRES	Counter 4 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000001
3	CTR3_PRES	Counter 3 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000001
2	CTR2_PRES	Counter 2 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000001
1	CTR1_PRES	Counter 1 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000001
0	CTR0_PRES	Counter 0 Present. When high signifies that the counter exists in this implementation of the HW. Reset State: 0x00000001

0x300007C DXE_0_CTR_CLR

Type: write-only

This register is write-only and is used to reset the count from one or more specific event counters. When writing to this register, each data bit set HIGH causes the count value in the corresponding counter to be cleared. Data bits that are low have no effect on the corresponding counter.

DXE_0_CTR_CLR

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored, reads return 0
6	CTR6_CLR	Zero the count value in CTR6.
5	CTR5_CLR	Zero the count value in CTR5.
4	CTR4_CLR	Zero the count value in CTR4.
3	CTR3_CLR	Zero the count value in CTR3.
2	CTR2_CLR	Zero the count value in CTR2.
1	CTR1_CLR	Zero the count value in CTR1.
0	CTR0_CLR	Zero the count value in CTR0.

0x3000080 DXE_0_BD_TMPLTL

Type: read-write

The BD template base address high register holds the low bits of the base address for the BD templates store. DXE supports up to 4 templates and automatically calculates the address of the selected template based on the base address and the values programmed in CHn_CTRL[BDT_IDX] as follows: BD_TMPLT_ADDR = BD_TMPLT_BASE + (128 * CHn_CTRL[BDT_IDX])

DXE_0_BD_TMPLTL

Bits	Name	Description
31:0	BASEL	BD Template Base Low Address.

0x3000084 DXE_0_BD_TMPLTH

Type: read-write

The BD template base address high register holds the high bits of the base address for the BD templates store. Please see the description of CH_SADRL for more info.

DXE_0_BD_TMPLTH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.

DXE_0_BD_TMPLTH (cont.)

Bits	Name	Description
1:0	BASEH	Base Address High. BD template base address. With the current address mapping in Virgo these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in BD_TMPLTL) go untranslated through the target interface or if they use the interface's address translation windows. This applies only to PCI and PCIe interfaces. Since the BD templates should in almost all cases be stored in internal chip memory (MIF) this bit field should almost always be set to zero. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000088 DXE_0_BDT_DAT_START

Type: read-write
Reset State: 0x00000040

The BD template data start offset register holds the offset used to start writing payload data when the DXE is in H2B mode and the BD template feature has been enabled. In this mode, at the start of every new packet transfer, DXE will copy only enough bytes from the BD template to fill the space between byte 0 of the BD and the data start offset. Once this much of the BD template has been transferred, DXE will start reading data from the programmed source address and writing it into the BD starting at the programmed offset. Due to limitations of other modules in the chip, it's imperative that the value in this register allow for any header data to fit completely within the BD of the packet. That is, the total of adding the value contained in the BD template field "MPDU Header length" to the value in this register needs to be less than or equal to 127 in order to avoid problems. Further, it is necessary that the value of this register match the "MPDU Header Offset" field programmed in the BD template. DXE makes no attempt to check this is really the case.

DXE_0_BDT_DAT_START

Bits	Name	Description
31:7	RSVD	Reserved. Writes ignored. Reads always return zeroes.
6:0	OFFSET	Data start offset. Reset State: 0x00000040

0x3000200 DXE_0_COUNTER0

Type: read-write
Reset State: 0x00000000

This register can be configured to count whole packets in the H2B or B2H direction or to count the number of transfers (descriptors) for H2H transactions. For now this counter is hardwired to always count all transfers completing on channel 0, but will eventually be able to count events happening on any channel and also only count transfers with the INC bit set in the CH_CSR (Not implemented yet).

The value gets cleared at reset and the counter can also be cleared or preset to any starting value by directly writing to it. As a convenience to the programmer the CTR_CLR register has been provided to quickly clear the value in one or more of the event counters.

DXE_0_COUNTER0

Bits	Name	Description

This register can be configured to count whole packets in the H2B or B2H direction or to count the number of transfers (descriptors) for H2H transactions. For now this counter is hardwired to always count all transfers completing on channel 6, but will eventually be able to count events happening on any channel and also only count transfers with the INC bit set in the CH_CSR (Not implemented yet)
to any starting value by directly writing to it. As a convenience to the programmer the CTR_CLR register has been provided to quickly clear the value in one or more of the event counters.

DXE_0_COUNTER6

Bits	Name	Description
31:16	RSVD	Reset State: 0x00000000
15:0	CNT	Reset State: 0x00000000

0x3000400 DXE_0_CH0_CTRL

Type: read-write
Reset State: 0x10000708

Serves to configure channel 0 operation

DXE_0_CH0_CTRL

Bits	Name	Description
31	SWAP	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bit field in the DXE descriptor control word is located at DXE_DESC_CTRL[20]
30:29	BDT_IDX	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: BD_TMPLT_ADRR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX]) The corresponding bit field in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	Descriptor Format. This bit field is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADRH_DFLT, DADRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT 0x1: LONG Reset State: 0x00000001

DXE_0_CH0_CTRL (cont.)

Bits	Name	Description
27	ABORT	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hardware once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, software should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result. Reset State: 0x00000000
26	ENDIANNESS	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND 0x1: LTLEND Reset State: 0x00000000
25:22	CTR_SEL	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bit field selects the counter that will be incremented at the end of the transfer. By default the value in this bit field is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on. Reset State: 0x00000000
21	EDVEN	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1) Reset State: 0x00000000
20	EDEN	External Descriptor Enable. Use External Descriptor Linked List Reset State: 0x00000000
19	INE_DONE	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE Reset State: 0x00000000
18	INE_ERR	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR Reset State: 0x00000000

DXE_0_CH0_CTRL (cont.)

Bits	Name	Description
17	INE_ED	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED Reset State: 0x00000000
16	STOP	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted. Reset State: 0x00000000
15:13	PRIO	This field sets the channel priority.
12:9	BTHLD_SEL	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 0x1: RSVD1 0x2: THLD2 0x3: THLD3 0x4: THLD4 0x5: THLD5 0x6: THLD6 0x7: THLD7 0x8: THLD8 0x9: THLD9 0xA: THLD10 0xB: RSVD11 0xC: RSVD12 0xD: RSVD13 0xE: RSVD14 0xF: RSVD15 Reset State: 0x00000003

DXE_0_CH0_CTRL (cont.)

Bits	Name	Description
8	PDU_REL	0x0: Don't release BD and PDUs when done. 0x0: KEEP 0x1: RELEASE Reset State: 0x00000001
7	PIQ	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interpreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, software must ensure that the CH_DESCL[QID] bit field is set to a valid queue ID and that the CH_DESCL[BASE] bit field is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the description of the QID bit field in the CH_DESCL register description. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
6	DIQ	Destination Is Queue. When set the destination address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, software must ensure that the DADR[QID] bit field is set to a valid queue ID and that the DADR[BASE] bit field is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
5	SIQ	Source Is Queue. When set the source address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, software must ensure that the SADR[QID] bit field is set to a valid queue ID and that the SADR[BASE] bit field is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000

DXE_0_CH0_CTRL (cont.)

Bits	Name	Description
4	BDH	BD Handling bit. The behavior depends on the setting of XTYPE. desc for BDT_IDX). ignored. Reset State: 0x00000000
3	EOP	End of Packet bit. For H2B transfers marks the end of a packet cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored. Reset State: 0x00000001
2:1	XTYPE	Transfer Type. Specifies the type of transfer to perform: will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H 0x1: B2B 0x2: H2B 0x3: B2H
0	EN	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled:. the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost. Reset State: 0x00000000

0x3000404 DXE_0_CH0_STATUS

Type: read-write
Reset State: 0x00000000

Serves to report the status of the programmed channel operation.

DXE_0_CH0_STATUS

Bits	Name	Description
31:16	RSVD	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bit fields accordingly.
11	STOP_REQ	Stop Request. Software has requested that the channel stop it operation after the current descriptor has been processed. Once this happens the STOPD bit field will be set to one and the channel will be disabled.

DXE_0_CH0_STATUS (cont.)

Bits	Name	Description
10:6	ERR_CODE	Used to identify the source or cause of an error. 0x0: NONE 0x1: SAHB_ERR 0x2: H2H_RD_BUS_ERR 0x3: H2H_WR_BUS_ERR 0x4: PRG_INV_XTYPE 0x5: BERR_POPWQ 0x6: BERR_PUSHWQ 0x7: BERR_RLSS 0x8: BERR_GETPDU 0x9: PRG_INV_WQ 0xA: PRG_INV_H2H_SRC_QID 0xB: PRG_INV_H2H_DST_QID 0xC: PRG_INV_B2H_SRC_QID 0xD: PRG_INV_B2H_DST_QID 0xE: PRG_INV_B2H_SRC_IDX 0xF: PRG_INV_H2B_SRC_QID 0x10: PRG_INV_H2B_DST_QID 0x11: PRG_INV_H2B_DST_IDX 0x12: PRG_INV_H2B_SZ 0x13: PRG_INV_SADR 0x14: PRG_INV_DADR 0x15: PRG_INV_EDADR 0x16: PRG_INV_SRC_WQID 0x17: PRG_INV_DST_WQID 0x18: PRG_XTYPE_MSMTCH 0x19: PKT_ERR 0x1A: ABORT 0x1B: PDU_CNT_OVFL Reset State: 0x00000000
5	ERR	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor. Reset State: 0x00000000
3	MSKD	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition. Reset State: 0x00000000
2	DONE	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled. Reset State: 0x00000000
1	BUSY	Channel busy. HIgh when the channel is enabled and currently active (won internal arbitration) Reset State: 0x00000000

DXE_0_CH0_STATUS (cont.)

Bits	Name	Description
0	EN	Channel Enabled. Copy of CH_CTRL[EN]. Reset State: 0x00000000

0x3000408 DXE_0_CH0_SZ

Type: read-write

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

DXE_0_CH0_SZ

Bits	Name	Description
31:28	CHK_SZ	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.
13:0	TOT_SZ	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x300040C DXE_0_CH0_SADRL

Type: read-write

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the source, addresses can have arbitrary byte-alignment When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bit fields: The SQID bit field

used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF source endpoint/FIFO

SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical address to use to fetch it directly from memory.

and SQID matches UIF/EIF), software should program the SAHB base address of the UIF source endpoint in the BASE bit field and the queue ID to match in the SWQID bit field, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and SQID fields are consistent and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, software should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

   ADDR[31:7] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document) of SQID field

DXE_0_CH0_SADRL

Bits	Name	Description
31:7	BASE	Base Address. This bit field provides the base address of the source UIF TX endpoint or EIF inbound FIFO. The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH0_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. This bit field provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: RSVD_25 0x1A: RSVD_26 0x1B: RSVD_27 0x1C: RSVD_28 0x1D: RSVD_29 0x1E: RSVD_30 0x1F: RSVD_31

0x3000410 DXE_0_CH0_SADRH

Type: read-write

The channel source address high register holds the high bits of the source address for a transfer. Please see the description of CH_SADRL for more info.

DXE_0_CH0_SADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000414 DXE_0_CH0_DADRL

Type: read-write

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bit fields: The DQID bit field used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF destination endpoint/FIFO.

and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), software should program the SAHB base address of the UIF destination endpoint in the BASE bit field and the queue ID to match in the DQID bit field, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and DQID fields are

consistent and refer to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, software should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

BMU_BASE + BD_INDEX[15:0]

   ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

   ADDR[31:0] = address mapping to destination interface address map + Interface uarch document) of DQID field

DXE_0_CH0_DADRL

Bits	Name	Description
31:7	BASE	Base Address. This bit field provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU software may use any value can be used but zero is suggested). The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH0_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. This bit field provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 0x1: RSVD_1 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: BMU_25 0x1A: BMU_26 0x1B: BMU_SINK_WQ 0x1C: UIF_RX_1_EP 0x1D: UIF_RX_2_EP 0x1E: UIF_RX_3_EP 0x1F: UIF_RX_4_EP

0x3000418 DXE_0_CH0_DADRH

Type: read-write

The channel destination address high register holds the high bits of the destination address for a transfer. Please see the description of CH_DADRL for more info.

DXE_0_CH0_DADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	This register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x300041C DXE_0_CH0_DESCL

Type: read-write

The Channel 0 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bit field similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bit fields and the value is just interpreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bit fields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

DXE_0_CH0_DESCL

Bits	Name	Description
31:7	BASE	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Please refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: x100 = 0x0E02_5100>>7 = 0x1C_04A2

DXE_0_CH0_DESCL (cont.)

Bits	Name	Description
6:0	SQID	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case software also needs to program the correct base address of the source UIF endpoint in the BASE bit field. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x3000420 DXE_0_CH0_DESCH

Type: read-write

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list.

DXE_0_CH0_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. Please note that if the source of the descriptor is either of the UIF endpoints (CH_CTRL[PIQ]=1) then the value in ADDRH has to be 0 or else the descriptor read could end up mapping to the XIF or PIF. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000424 DXE_0_CH0_LST_DESCL

Type: read-only

The read-only Channel 0 Current/last Linked List Descriptor Pointer register contains the low 32-bits of the address of the descriptor currently being processed or of the last descriptor processed if the channel is disabled.

explained for the CH_DESCL register.

DXE_0_CH0_LST_DESCL

Bits	Name	Description
31:7	BASE	See description of CH_DESCL[BASE].
6:0	SQID	See description of CH_DESCL[SQID]. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x3000428 DXE_0_CH0_LST_DESCH

Type: read-only

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list. Note that The meaning of the value and bit fields is the same as was explained for the CH_DESCL register.

DXE_0_CH0_LST_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address.

0x300042C DXE_0_CH0_BD

Type: read-only

DXE_0_CH0_BD

Bits	Name	Description
31:24	RSVD	Reserved. Always returns 0 when read.
23	VAL	Valid. BD has been loaded and is valid.
22:16	PDU_CNT	PDU count of packet.
15:0	IDX	Index of BD. To get actual physical address must be added to BD/PDU base.

0x3000430 DXE_0_CH0_HEAD

Type: read-only
Reset State: 0x00000000

Address of head of packet.

DXE_0_CH0_HEAD

Bits	Name	Description
31:27	RSVD	Reserved. Reset State: 0x00000000
26	DESCVAL	Descriptor valid. Signifies descriptor has already been loaded. Used to prevent reloading of a descriptor. Reset State: 0x00000000
25:21	DWQID	Destination WQ ID. Original BMU, UIF or EIF destination queue. Valid only when CH_CSR[DIQ]=1 Reset State: 0x00000000
20:16	SWQID	Source WQ ID. Original BMU, UIF or EIF source queue. Valid only when CH_CSR[SIQ]=1 Reset State: 0x00000000
15:0	IDX	Index of Head. Must be added to BD/PDU base for actual physical address.

0x3000434 DXE_0_CH0_TAIL

Type: read-only
Reset State: 0x00000000

Address of tail of packet.

DXE_0_CH0_TAIL

Bits	Name	Description
31:16	RSVD	Reserved. Reset State: 0x00000000
15:0	IDX	Index of Tail. Must be added to BD/PDU base for actual physical address

0x3000438 DXE_0_CH0_PDU

Type: read-only
Reset State: 0x00000000

PDU info register.

DXE_0_CH0_PDU

Bits	Name	Description
31	RSVD	Reserved. Always returns 0 when read. Reset State: 0x00000000
30:24	PDU_CNT	Current PDU count.
23:8	IDX	Index of current PDU. Must be added to BD/PDU base for actual physical address
7:0	FST_OFF	First PDU offset.

0x300043C DXE_0_CH0_TSTMP

Type: read-only
Reset State: 0x00000000

Contains last sampled value of the system timestamp

DXE_0_CH0_TSTMP

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x3000440 DXE_0_CH1_CTRL

Type: read-write
Reset State: 0x10400708

Serves to configure channel 1 operation

DXE_0_CH1_CTRL

Bits	Name	Description
31	SWAP	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bit field in the DXE descriptor control word is located at DXE_DESC_CTRL[20]

DXE_0_CH1_CTRL (cont.)

Bits	Name	Description
30:29	BDT_IDX	BD Template Index. by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: CH_CTRL[BDT_IDX]) The corresponding bit field in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	Descriptor Format. descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADRH_DFLT, DADRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT 0x1: LONG Reset State: 0x00000001
27	ABORT	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hardware once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, software should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result. Reset State: 0x00000000
26	ENDIANNESS	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND 0x1: LTLEND Reset State: 0x00000000
25:22	CTR_SEL	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bit field selects the counter that will be incremented at the end of the transfer. By default the value in this bit field is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on. Reset State: 0x00000001

DXE_0_CH1_CTRL (cont.)

Bits	Name	Description
21	EDVEN	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1) Reset State: 0x00000000
20	EDEN	External Descriptor Enable. Use External Descriptor Linked List Reset State: 0x00000000
19	INE_DONE	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE Reset State: 0x00000000
18	INE_ERR	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR Reset State: 0x00000000
17	INE_ED	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED Reset State: 0x00000000
16	STOP	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted. Reset State: 0x00000000
15:13	PRIO	This field sets the channel priority. 0: Lowest Priority.

DXE_0_CH1_CTRL (cont.)

Bits	Name	Description
12:9	BTHLD_SEL	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bit field is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 0x1: RSVD1 0x2: THLD2 0x3: THLD3 0x4: THLD4 0x5: THLD5 0x6: THLD6 0x7: THLD7 0x8: THLD8 0x9: THLD9 0xA: THLD10 0xB: RSVD11 0xC: RSVD12 0xD: RSVD13 0xE: RSVD14 0xF: RSVD15 Reset State: 0x00000003
8	PDU_REL	0x0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP 0x1: RELEASE Reset State: 0x00000001

DXE_0_CH1_CTRL (cont.)

Bits	Name	Description
7	PIQ	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interepreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, software must ensure that the CH_DESCL[QID] bit field is set to a valid queue ID and that the CH_DESCL[BASE] bit field is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the descripiton of the QID bit field in the CH_DESCL register description. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
6	DIQ	Destination Is Queue. When set the destination address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, software must ensure that the DADR[QID] bit field is set to a valid queue ID and that the DADR[BASE] bit field is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
5	SIQ	Source Is Queue. When set the source address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, software must ensure that the SADR[QID] bit field is set to a valid queue ID and that the SADR[BASE] bit field is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000

DXE_0_CH1_CTRL (cont.)

Bits	Name	Description
4	BDH	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored. Reset State: 0x00000000
3	EOP	End of Packet bit. For H2B transfers marks the end of a packet Please note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored. Reset State: 0x00000001
2:1	XTYPE	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H 0x1: B2B 0x2: H2B 0x3: B2H
0	EN	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled:. 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost. Reset State: 0x00000000

0x3000444 DXE_0_CH1_STATUS

Type: read-write
Reset State: 0x00000000

Serves to report the status of the programmed channel operation.

DXE_0_CH1_STATUS

Bits	Name	Description
31:16	RSVD	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bit fields accordingly.
11	STOP_REQ	Stop Request. Software has requested that the channel stop it operation after the current descriptor has been processed. Once this happens the STOPD bit field will be set to one and the channel will be disabled.

DXE_0_CH1_STATUS (cont.)

Bits	Name	Description
10:6	ERR_CODE	Used to identify the source or cause of an error. 0x0: NONE 0x1: SAHB_ERR 0x2: H2H_RD_BUS_ERR 0x3: H2H_WR_BUS_ERR 0x4: PRG_INV_XTYPE 0x5: BERR_POPWQ 0x6: BERR_PUSHWQ 0x7: BERR_RLSS 0x8: BERR_GETPDU 0x9: PRG_INV_WQ 0xA: PRG_INV_H2H_SRC_QID 0xB: PRG_INV_H2H_DST_QID 0xC: PRG_INV_B2H_SRC_QID 0xD: PRG_INV_B2H_DST_QID 0xE: PRG_INV_B2H_SRC_IDX 0xF: PRG_INV_H2B_SRC_QID 0x10: PRG_INV_H2B_DST_QID 0x11: PRG_INV_H2B_DST_IDX 0x12: PRG_INV_H2B_SZ 0x13: PRG_INV_SADR 0x14: PRG_INV_DADR 0x15: PRG_INV_EDADR 0x16: PRG_INV_SRC_WQID 0x17: PRG_INV_DST_WQID 0x18: PRG_XTYPE_MSMTCH 0x19: PKT_ERR 0x1A: ABORT 0x1B: PDU_CNT_OVFL Reset State: 0x00000000
5	ERR	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor. Reset State: 0x00000000
3	MSKD	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition. Reset State: 0x00000000
2	DONE	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled. Reset State: 0x00000000
1	BUSY	Channel busy. HIgh when the channel is enabled and currently active (won internal arbitration) Reset State: 0x00000000

DXE_0_CH1_STATUS (cont.)

Bits	Name	Description
0	EN	Channel Enabled. Copy of CH_CTRL[EN]. Reset State: 0x00000000

0x3000448 DXE_0_CH1_SZ

Type: read-write

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

DXE_0_CH1_SZ

Bits	Name	Description
31:28	CHK_SZ	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.
13:0	TOT_SZ	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x300044C DXE_0_CH1_SADRL

Type: read-write

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the source, addresses can have arbitrary byte-alignment When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bit fields: The SQID bit field

used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical addresss to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), software should program the SAHB base address of the UIF source endpoint in the BASE bit field and the queue ID to match in the SWQID bit field, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and SQID fields are consistend and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, software should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

   ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

   ADDR[31:7] = Any value will do but zero preferred

   ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0):   ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

   ADDR[31:7] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)

   ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

DXE_0_CH1_SADRL

Bits	Name	Description
31:7	BASE	Base Address. For this case, this bit field provides the base address of the source UIF TX endpoint or EIF inbound FIFO. The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd Please consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH1_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bit field provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: RSVD_25 0x1A: RSVD_26 0x1B: RSVD_27 0x1C: RSVD_28 0x1D: RSVD_29 0x1E: RSVD_30 0x1F: RSVD_31

0x3000450 DXE_0_CH1_SADRH

Type: read-write

The channel source address high register holds the high bits of the source address for a transfer. Please see the description of CH_SADRL for more info.

DXE_0_CH1_SADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000454 DXE_0_CH1_DADRL

Type: read-write

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bit fields: The DQID bit field used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), software should program the SAHB base address of the UIF destination endpoint in the BASE bit field and the queue ID to match in the DQID bit field, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and DQID fields are consistent and refer

to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, software should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0):   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

   ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

   ADDR[31:5] = Any value will do but zero preferred

   ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0):   ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

   ADDR[31:5] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)

   ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

DXE_0_CH1_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bit field provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU software may use any value can be used but zero is suggested). The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd Please consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH1_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. is set. For this case, this bit field provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 0x1: RSVD_1 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: BMU_25 0x1A: BMU_26 0x1B: BMU_SINK_WQ 0x1C: UIF_RX_1_EP 0x1D: UIF_RX_2_EP 0x1E: UIF_RX_3_EP 0x1F: UIF_RX_4_EP

0x3000458 DXE_0_CH1_DADRH

Type: read-write

The channel destination address high register holds the high bits of the destination address for a transfer. Please see the description of CH_DADRL for more info.

DXE_0_CH1_DADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	This register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x300045C DXE_0_CH1_DESCL

Type: read-write

The Channel 1 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bit field similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bit fields and the value is just intrepreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bit fields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

DXE_0_CH1_DESCL

Bits	Name	Description
31:7	BASE	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Please refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: base = UIF base + TD_and_TM_offset = 0x0E02_5000 + x100 = 0x0E02_5100>>7 = 0x1C_04A2

DXE_0_CH1_DESCL (cont.)

Bits	Name	Description
6:0	SQID	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case software also needs to program the correct base address of the source UIF endpoint in the BASE bit field. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x3000460 DXE_0_CH1_DESCH

Type: read-write

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list.

DXE_0_CH1_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. Please note that if the source of the descriptor is either of the UIF endpoints (CH_CTRL[PIQ]=1) then the value in ADDRH has to be 0 or else the descriptor read could end up mapping to the XIF or PIF. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000464 DXE_0_CH1_LST_DESCL

Type: read-only

The read-only Channel 1 Current/last Linked List Descriptor Pointer register contains the low 32-bits of the address of the descriptor currently being processed or of the last descriptor processed if the channel is disabled.

The meaning of the value and bit fields with regards to CH_CTRL[PIQ] is the same as was explained for the CH_DESCL register.

DXE_0_CH1_LST_DESCL

Bits	Name	Description
31:7	BASE	See description of CH_DESCL[BASE].
6:0	SQID	See description of CH_DESCL[SQID]. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x3000468 DXE_0_CH1_LST_DESCH

Type: read-only

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list. Note that The meaning of the value and bit fields is the same as was explained for the CH_DESCL register.

DXE_0_CH1_LST_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address.

0x300046C DXE_0_CH1_BD

Type: read-only

DXE_0_CH1_BD

Bits	Name	Description
31:24	RSVD	Reserved. Always returns 0 when read.
23	VAL	Valid. BD has been loaded and is valid.
22:16	PDU_CNT	PDU count of packet.
15:0	IDX	Index of BD. To get actual physical address must be added to BD/PDU base.

0x3000470 DXE_0_CH1_HEAD

Type: read-only
Reset State: 0x00000000

Address of head of packet.

DXE_0_CH1_HEAD

Bits	Name	Description
31:27	RSVD	Reserved. Reset State: 0x00000000
26	DESCVAL	Descriptor valid. Signifies descriptor has already been loaded. Used to prevent reloading of a descriptor. Reset State: 0x00000000
25:21	DWQID	Destination WQ ID. Original BMU, UIF or EIF destination queue. Valid only when CH_CSR[DIQ]=1 Reset State: 0x00000000
20:16	SWQID	Source WQ ID. Original BMU, UIF or EIF source queue. Valid only when CH_CSR[SIQ]=1 Reset State: 0x00000000
15:0	IDX	Index of Head. Must be added to BD/PDU base for actual physical address.

0x3000474 DXE_0_CH1_TAIL

Type: read-only
Reset State: 0x00000000

Address of tail of packet.

DXE_0_CH1_TAIL

Bits	Name	Description
31:16	RSVD	Reserved. Reset State: 0x00000000
15:0	IDX	Index of Tail. Must be added to BD/PDU base for actual physical address

0x3000478 DXE_0_CH1_PDU

Type: read-only
Reset State: 0x00000000

PDU info register.

All its fields are working fields that get modified as the programmed operation progresses.

DXE_0_CH1_PDU

Bits	Name	Description
31	RSVD	Reserved. Always returns 0 when read. Reset State: 0x00000000
30:24	PDU_CNT	Current PDU count.
23:8	IDX	Index of current PDU. Must be added to BD/PDU base for actual physical address
7:0	FST_OFF	First PDU offset.

0x300047C DXE_0_CH1_TSTMP

Type: read-only
Reset State: 0x00000000

Contains last sampled value of the system timestamp

DXE_0_CH1_TSTMP

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x3000480 DXE_0_CH2_CTRL

Type: read-write
Reset State: 0x10800708

Serves to configure channel 2 operation

DXE_0_CH2_CTRL

Bits	Name	Description
31	SWAP	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bit field in the DXE descriptor control word is located at DXE_DESC_CTRL[20]

DXE_0_CH2_CTRL (cont.)

Bits	Name	Description
30:29	BDT_IDX	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: BD_TMPLT_ADRR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX]) The corresponding bit field in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	Descriptor Format. This bit field is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADRH_DFLT, DADRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT 0x1: LONG Reset State: 0x00000001
27	ABORT	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hardware once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, software should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result. Reset State: 0x00000000
26	ENDIANNESS	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND 0x1: LTLEND Reset State: 0x00000000
25:22	CTR_SEL	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bit field selects the counter that will be incremented at the end of the transfer. By default the value in this bit field is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on. Reset State: 0x00000002

DXE_0_CH2_CTRL (cont.)

Bits	Name	Description
21	EDVEN	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1) Reset State: 0x00000000
20	EDEN	External Descriptor Enable. Use External Descriptor Linked List Reset State: 0x00000000
19	INE_DONE	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE Reset State: 0x00000000
18	INE_ERR	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR Reset State: 0x00000000
17	INE_ED	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED Reset State: 0x00000000
16	STOP	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted. Reset State: 0x00000000
15:13	PRIO	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.

DXE_0_CH2_CTRL (cont.)

Bits	Name	Description
12:9	BTHLD_SEL	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bit field is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 0x1: RSVD1 0x2: THLD2 0x3: THLD3 0x4: THLD4 0x5: THLD5 0x6: THLD6 0x7: THLD7 0x8: THLD8 0x9: THLD9 0xA: THLD10 0xB: RSVD11 0xC: RSVD12 0xD: RSVD13 0xE: RSVD14 0xF: RSVD15 Reset State: 0x00000003
8	PDU_REL	0x0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP 0x1: RELEASE Reset State: 0x00000001

DXE_0_CH2_CTRL (cont.)

Bits	Name	Description
7	PIQ	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interepreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, software must ensure that the CH_DESCL[QID] bit field is set to a valid queue ID and that the CH_DESCL[BASE] bit field is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the descripiton of the QID bit field in the CH_DESCL register description. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
6	DIQ	Destination Is Queue. When set the destination address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, software must ensure that the DADR[QID] bit field is set to a valid queue ID and that the DADR[BASE] bit field is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
5	SIQ	Source Is Queue. When set the source address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, software must ensure that the SADR[QID] bit field is set to a valid queue ID and that the SADR[BASE] bit field is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000

DXE_0_CH2_CTRL (cont.)

Bits	Name	Description
4	BDH	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored. Reset State: 0x00000000
3	EOP	End of Packet bit. For H2B transfers marks the end of a packet Please note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored. Reset State: 0x00000001
2:1	XTYPE	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H 0x1: B2B 0x2: H2B 0x3: B2H
0	EN	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled:. 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost. Reset State: 0x00000000

0x3000484 DXE_0_CH2_STATUS

Type: read-write
Reset State: 0x00000000

Serves to report the status of the programmed channel operation.

DXE_0_CH2_STATUS

Bits	Name	Description
31:16	RSVD	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bit fields accordingly.
11	STOP_REQ	Stop Request. Software has requested that the channel stop it operation after the current descriptor has been processed. Once this happens the STOPD bit field will be set to one and the channel will be disabled.

DXE_0_CH2_STATUS (cont.)

Bits	Name	Description
10:6	ERR_CODE	Used to identify the source or cause of an error. 0x0: NONE 0x1: SAHB_ERR 0x2: H2H_RD_BUS_ERR 0x3: H2H_WR_BUS_ERR 0x4: PRG_INV_XTYPE 0x5: BERR_POPWQ 0x6: BERR_PUSHWQ 0x7: BERR_RLSS 0x8: BERR_GETPDU 0x9: PRG_INV_WQ 0xA: PRG_INV_H2H_SRC_QID 0xB: PRG_INV_H2H_DST_QID 0xC: PRG_INV_B2H_SRC_QID 0xD: PRG_INV_B2H_DST_QID 0xE: PRG_INV_B2H_SRC_IDX 0xF: PRG_INV_H2B_SRC_QID 0x10: PRG_INV_H2B_DST_QID 0x11: PRG_INV_H2B_DST_IDX 0x12: PRG_INV_H2B_SZ 0x13: PRG_INV_SADR 0x14: PRG_INV_DADR 0x15: PRG_INV_EDADR 0x16: PRG_INV_SRC_WQID 0x17: PRG_INV_DST_WQID 0x18: PRG_XTYPE_MSMTCH 0x19: PKT_ERR 0x1A: ABORT 0x1B: PDU_CNT_OVFL Reset State: 0x00000000
5	ERR	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor. Reset State: 0x00000000
3	MSKD	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition. Reset State: 0x00000000
2	DONE	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled. Reset State: 0x00000000
1	BUSY	Channel busy. HIgh when the channel is enabled and currently active (won internal arbitration) Reset State: 0x00000000

DXE_0_CH2_STATUS (cont.)

Bits	Name	Description
0	EN	Channel Enabled. Copy of CH_CTRL[EN]. Reset State: 0x00000000

0x3000488 DXE_0_CH2_SZ

Type: read-write

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

DXE_0_CH2_SZ

Bits	Name	Description
31:28	CHK_SZ	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.
13:0	TOT_SZ	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x300048C DXE_0_CH2_SADRL

Type: read-write

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the source, addresses can have arbitrary byte-alignment When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bit fields: The SQID bit field

used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical addresss to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), software should program the SAHB base address of the UIF source endpoint in the BASE bit field and the queue ID to match in the SWQID bit field, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and SQID fields are consistend and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, software should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

   ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

   ADDR[31:7] = Any value will do but zero preferred

   ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0):   ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

   ADDR[31:7] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)

   ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

DXE_0_CH2_SADRL

Bits	Name	Description
31:7	BASE	Base Address. For this case, this bit field provides the base address of the source UIF TX endpoint or EIF inbound FIFO. The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd Please consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH2_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bit field provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: RSVD_25 0x1A: RSVD_26 0x1B: RSVD_27 0x1C: RSVD_28 0x1D: RSVD_29 0x1E: RSVD_30 0x1F: RSVD_31

0x3000490 DXE_0_CH2_SADRH

Type: read-write

The channel source address high register holds the high bits of the source address for a transfer. Please see the description of CH_SADRL for more info.

DXE_0_CH2_SADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000494 DXE_0_CH2_DADRL

Type: read-write

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bit fields: The DQID bit field used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), software should program the SAHB base address of the UIF destination endpoint in the BASE bit field and the queue ID to match in the DQID bit field, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and DQID fields are consistent and refer

to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, software should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0):   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

   ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

   ADDR[31:5] = Any value will do but zero preferred

   ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0):   ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

   ADDR[31:5] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)

   ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

DXE_0_CH2_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bit field provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU software may use any value can be used but zero is suggested). The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd Please consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH2_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. is set. For this case, this bit field provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 0x1: RSVD_1 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: BMU_25 0x1A: BMU_26 0x1B: BMU_SINK_WQ 0x1C: UIF_RX_1_EP 0x1D: UIF_RX_2_EP 0x1E: UIF_RX_3_EP 0x1F: UIF_RX_4_EP

0x3000498 DXE_0_CH2_DADRH

Type: read-write

The channel destination address high register holds the high bits of the destination address for a transfer. Please see the description of CH_DADRL for more info.

DXE_0_CH2_DADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	This register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x300049C DXE_0_CH2_DESCL

Type: read-write

The Channel 2 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bit field similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bit fields and the value is just intrepreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bit fields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

DXE_0_CH2_DESCL

Bits	Name	Description
31:7	BASE	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Please refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: base = UIF base + TD_and_TM_offset = 0x0E02_5000 + x100 = 0x0E02_5100>>7 = 0x1C_04A2

DXE_0_CH2_DESCL (cont.)

Bits	Name	Description
6:0	SQID	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case software also needs to program the correct base address of the source UIF endpoint in the BASE bit field. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x30004A0 DXE_0_CH2_DESCH

Type: read-write

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list.

DXE_0_CH2_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. Please note that if the source of the descriptor is either of the UIF endpoints (CH_CTRL[PIQ]=1) then the value in ADDRH has to be 0 or else the descriptor read could end up mapping to the XIF or PIF. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x30004A4 DXE_0_CH2_LST_DESCL

Type: read-only

The read-only Channel 2 Current/last Linked List Descriptor Pointer register contains the low 32-bits of the address of the descriptor currently being processed or of the last descriptor processed if the channel is disabled.

The meaning of the value and bit fields with regards to CH_CTRL[PIQ] is the same as was explained for the CH_DESCL register.

DXE_0_CH2_LST_DESCL

Bits	Name	Description
31:7	BASE	See description of CH_DESCL[BASE].
6:0	SQID	See description of CH_DESCL[SQID]. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x30004A8 DXE_0_CH2_LST_DESCH

Type: read-only

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list. Note that The meaning of the value and bit fields is the same as was explained for the CH_DESCL register.

DXE_0_CH2_LST_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address.

0x30004AC DXE_0_CH2_BD

Type: read-only

DXE_0_CH2_BD

Bits	Name	Description
31:24	RSVD	Reserved. Always returns 0 when read.
23	VAL	Valid. BD has been loaded and is valid.
22:16	PDU_CNT	PDU count of packet.
15:0	IDX	Index of BD. To get actual physical address must be added to BD/PDU base.

0x30004B0 DXE_0_CH2_HEAD

Type: read-only
Reset State: 0x00000000

Address of head of packet.

DXE_0_CH2_HEAD

Bits	Name	Description
31:27	RSVD	Reserved. Reset State: 0x00000000
26	DESCVAL	Descriptor valid. Signifies descriptor has already been loaded. Used to prevent reloading of a descriptor. Reset State: 0x00000000
25:21	DWQID	Destination WQ ID. Original BMU, UIF or EIF destination queue. Valid only when CH_CSR[DIQ]=1 Reset State: 0x00000000
20:16	SWQID	Source WQ ID. Original BMU, UIF or EIF source queue. Valid only when CH_CSR[SIQ]=1 Reset State: 0x00000000
15:0	IDX	Index of Head. Must be added to BD/PDU base for actual physical address.

0x30004B4 DXE_0_CH2_TAIL

Type: read-only
Reset State: 0x00000000

Address of tail of packet.

DXE_0_CH2_TAIL

Bits	Name	Description
31:16	RSVD	Reserved. Reset State: 0x00000000
15:0	IDX	Index of Tail. Must be added to BD/PDU base for actual physical address

0x30004B8 DXE_0_CH2_PDU

Type: read-only
Reset State: 0x00000000

PDU info register.

All its fields are working fields that get modified as the programmed operation progresses.

DXE_0_CH2_PDU

Bits	Name	Description
31	RSVD	Reserved. Always returns 0 when read. Reset State: 0x00000000
30:24	PDU_CNT	Current PDU count.
23:8	IDX	Index of current PDU. Must be added to BD/PDU base for actual physical address
7:0	FST_OFF	First PDU offset.

0x30004BC DXE_0_CH2_TSTMP

Type: read-only
Reset State: 0x00000000

Contains last sampled value of the system timestamp

DXE_0_CH2_TSTMP

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x30004C0 DXE_0_CH3_CTRL

Type: read-write
Reset State: 0x10C00708

Serves to configure channel 3 operation

DXE_0_CH3_CTRL

Bits	Name	Description
31	SWAP	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bit field in the DXE descriptor control word is located at DXE_DESC_CTRL[20]

DXE_0_CH3_CTRL (cont.)

Bits	Name	Description
30:29	BDT_IDX	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: BD_TMPLT_ADRR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX]) The corresponding bit field in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	Descriptor Format. This bit field is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADRH_DFLT, DADRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT 0x1: LONG Reset State: 0x00000001
27	ABORT	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hardware once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, software should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result. Reset State: 0x00000000
26	ENDIANNESS	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND 0x1: LTLEND Reset State: 0x00000000
25:22	CTR_SEL	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bit field selects the counter that will be incremented at the end of the transfer. By default the value in this bit field is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on. Reset State: 0x00000003

DXE_0_CH3_CTRL (cont.)

Bits	Name	Description
21	EDVEN	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1) Reset State: 0x00000000
20	EDEN	External Descriptor Enable. Use External Descriptor Linked List Reset State: 0x00000000
19	INE_DONE	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE Reset State: 0x00000000
18	INE_ERR	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR Reset State: 0x00000000
17	INE_ED	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED Reset State: 0x00000000
16	STOP	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted. Reset State: 0x00000000
15:13	PRIO	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.

DXE_0_CH3_CTRL (cont.)

Bits	Name	Description
12:9	BTHLD_SEL	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bit field is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 0x1: RSVD1 0x2: THLD2 0x3: THLD3 0x4: THLD4 0x5: THLD5 0x6: THLD6 0x7: THLD7 0x8: THLD8 0x9: THLD9 0xA: THLD10 0xB: RSVD11 0xC: RSVD12 0xD: RSVD13 0xE: RSVD14 0xF: RSVD15 Reset State: 0x00000003
8	PDU_REL	0x0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP 0x1: RELEASE Reset State: 0x00000001

DXE_0_CH3_CTRL (cont.)

Bits	Name	Description
7	PIQ	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interepreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, software must ensure that the CH_DESCL[QID] bit field is set to a valid queue ID and that the CH_DESCL[BASE] bit field is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the descripiton of the QID bit field in the CH_DESCL register description. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
6	DIQ	Destination Is Queue. When set the destination address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, software must ensure that the DADR[QID] bit field is set to a valid queue ID and that the DADR[BASE] bit field is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
5	SIQ	Source Is Queue. When set the source address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, software must ensure that the SADR[QID] bit field is set to a valid queue ID and that the SADR[BASE] bit field is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000

DXE_0_CH3_CTRL (cont.)

Bits	Name	Description
4	BDH	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored. Reset State: 0x00000000
3	EOP	End of Packet bit. For H2B transfers marks the end of a packet Please note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored. Reset State: 0x00000001
2:1	XTYPE	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H 0x1: B2B 0x2: H2B 0x3: B2H
0	EN	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled:. 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost. Reset State: 0x00000000

0x30004C4 DXE_0_CH3_STATUS

Type: read-write
Reset State: 0x00000000

Serves to report the status of the programmed channel operation.

DXE_0_CH3_STATUS

Bits	Name	Description
31:16	RSVD	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bit fields accordingly.
11	STOP_REQ	Stop Request. Software has requested that the channel stop it operation after the current descriptor has been processed. Once this happens the STOPD bit field will be set to one and the channel will be disabled.

DXE_0_CH3_STATUS (cont.)

Bits	Name	Description
10:6	ERR_CODE	Used to identify the source or cause of an error. 0x0: NONE 0x1: SAHB_ERR 0x2: H2H_RD_BUS_ERR 0x3: H2H_WR_BUS_ERR 0x4: PRG_INV_XTYPE 0x5: BERR_POPWQ 0x6: BERR_PUSHWQ 0x7: BERR_RLSS 0x8: BERR_GETPDU 0x9: PRG_INV_WQ 0xA: PRG_INV_H2H_SRC_QID 0xB: PRG_INV_H2H_DST_QID 0xC: PRG_INV_B2H_SRC_QID 0xD: PRG_INV_B2H_DST_QID 0xE: PRG_INV_B2H_SRC_IDX 0xF: PRG_INV_H2B_SRC_QID 0x10: PRG_INV_H2B_DST_QID 0x11: PRG_INV_H2B_DST_IDX 0x12: PRG_INV_H2B_SZ 0x13: PRG_INV_SADR 0x14: PRG_INV_DADR 0x15: PRG_INV_EDADR 0x16: PRG_INV_SRC_WQID 0x17: PRG_INV_DST_WQID 0x18: PRG_XTYPE_MSMTCH 0x19: PKT_ERR 0x1A: ABORT 0x1B: PDU_CNT_OVFL Reset State: 0x00000000
5	ERR	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor. Reset State: 0x00000000
3	MSKD	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition. Reset State: 0x00000000
2	DONE	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled. Reset State: 0x00000000
1	BUSY	Channel busy. HIgh when the channel is enabled and currently active (won internal arbitration) Reset State: 0x00000000

DXE_0_CH3_STATUS (cont.)

Bits	Name	Description
0	EN	Channel Enabled. Copy of CH_CTRL[EN]. Reset State: 0x00000000

0x30004C8 DXE_0_CH3_SZ

Type: read-write

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

DXE_0_CH3_SZ

Bits	Name	Description
31:28	CHK_SZ	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.
13:0	TOT_SZ	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x30004CC DXE_0_CH3_SADRL

Type: read-write

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the source, addresses can have arbitrary byte-alignment When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bit fields: The SQID bit field

used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical addresss to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), software should program the SAHB base address of the UIF source endpoint in the BASE bit field and the queue ID to match in the SWQID bit field, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and SQID fields are consistend and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, software should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

   ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

   ADDR[31:7] = Any value will do but zero preferred

   ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0):   ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

   ADDR[31:7] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)

   ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

DXE_0_CH3_SADRL

Bits	Name	Description
31:7	BASE	Base Address. For this case, this bit field provides the base address of the source UIF TX endpoint or EIF inbound FIFO. The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd Please consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH3_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bit field provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: RSVD_25 0x1A: RSVD_26 0x1B: RSVD_27 0x1C: RSVD_28 0x1D: RSVD_29 0x1E: RSVD_30 0x1F: RSVD_31

0x30004D0 DXE_0_CH3_SADRH

Type: read-write

The channel source address high register holds the high bits of the source address for a transfer. Please see the description of CH_SADRL for more info.

DXE_0_CH3_SADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x30004D4 DXE_0_CH3_DADRL

Type: read-write

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bit fields: The DQID bit field used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), software should program the SAHB base address of the UIF destination endpoint in the BASE bit field and the queue ID to match in the DQID bit field, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and DQID fields are consistent and refer

to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, software should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0):   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

   ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

   ADDR[31:5] = Any value will do but zero preferred

   ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0):   ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

   ADDR[31:5] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)

   ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

DXE_0_CH3_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bit field provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU software may use any value can be used but zero is suggested). The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd Please consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH3_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bit field provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 0x1: RSVD_1 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: BMU_25 0x1A: BMU_26 0x1B: BMU_SINK_WQ 0x1C: UIF_RX_1_EP 0x1D: UIF_RX_2_EP 0x1E: UIF_RX_3_EP 0x1F: UIF_RX_4_EP

0x30004D8 DXE_0_CH3_DADRH

Type: read-write

The channel destination address high register holds the high bits of the destination address for a transfer. Please see the description of CH_DADRL for more info.

DXE_0_CH3_DADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	This register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x30004DC DXE_0_CH3_DESCL

Type: read-write

The Channel 3 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bit field similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bit fields and the value is just intrepreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bit fields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

DXE_0_CH3_DESCL

Bits	Name	Description
31:7	BASE	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Please refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: base = UIF base + TD_and_TM_offset = 0x0E02_5000 + x100 = 0x0E02_5100>>7 = 0x1C_04A2

DXE_0_CH3_DESCL (cont.)

Bits	Name	Description
6:0	SQID	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case software also needs to program the correct base address of the source UIF endpoint in the BASE bit field. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x30004E0 DXE_0_CH3_DESCH

Type: read-write

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list.

DXE_0_CH3_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. Please note that if the source of the descriptor is either of the UIF endpoints (CH_CTRL[PIQ]=1) then the value in ADDRH has to be 0 or else the descriptor read could end up mapping to the XIF or PIF. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x30004E4 DXE_0_CH3_LST_DESCL

Type: read-only

The read-only Channel 3 Current/last Linked List Descriptor Pointer register contains the low 32-bits of the address of the descriptor currently being processed or of the last descriptor processed if the channel is disabled.

The meaning of the value and bit fields with regards to CH_CTRL[PIQ] is the same as was explained for the CH_DESCL register.

DXE_0_CH3_LST_DESCL

Bits	Name	Description
31:7	BASE	See description of CH_DESCL[BASE].
6:0	SQID	See description of CH_DESCL[SQID]. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x30004E8 DXE_0_CH3_LST_DESCH

Type: read-only

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list. Note that The meaning of the value and bit fields is the same as was explained for the CH_DESCL register.

DXE_0_CH3_LST_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address.

0x30004EC DXE_0_CH3_BD

Type: read-only

DXE_0_CH3_BD

Bits	Name	Description
31:24	RSVD	Reserved. Always returns 0 when read.
23	VAL	Valid. BD has been loaded and is valid.
22:16	PDU_CNT	PDU count of packet.
15:0	IDX	Index of BD. To get actual physical address must be added to BD/PDU base.

0x30004F0 DXE_0_CH3_HEAD

Type: read-only
Reset State: 0x00000000

Address of head of packet.

DXE_0_CH3_HEAD

Bits	Name	Description
31:27	RSVD	Reserved. Reset State: 0x00000000
26	DESCVAL	Descriptor valid. Signifies descriptor has already been loaded. Used to prevent reloading of a descriptor. Reset State: 0x00000000
25:21	DWQID	Destination WQ ID. Original BMU, UIF or EIF destination queue. Valid only when CH_CSR[DIQ]=1 Reset State: 0x00000000
20:16	SWQID	Source WQ ID. Original BMU, UIF or EIF source queue. Valid only when CH_CSR[SIQ]=1 Reset State: 0x00000000
15:0	IDX	Index of Head. Must be added to BD/PDU base for actual physical address.

0x30004F4 DXE_0_CH3_TAIL

Type: read-only
Reset State: 0x00000000

Address of tail of packet.

DXE_0_CH3_TAIL

Bits	Name	Description
31:16	RSVD	Reserved. Reset State: 0x00000000
15:0	IDX	Index of Tail. Must be added to BD/PDU base for actual physical address

0x30004F8 DXE_0_CH3_PDU

Type: read-only
Reset State: 0x00000000

PDU info register.

All its fields are working fields that get modified as the programmed operation progresses.

DXE_0_CH3_PDU

Bits	Name	Description
31	RSVD	Reserved. Always returns 0 when read. Reset State: 0x00000000
30:24	PDU_CNT	Current PDU count.
23:8	IDX	Index of current PDU. Must be added to BD/PDU base for actual physical address
7:0	FST_OFF	First PDU offset.

0x30004FC DXE_0_CH3_TSTMP

Type: read-only
Reset State: 0x00000000

Contains last sampled value of the system timestamp

DXE_0_CH3_TSTMP

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x3000500 DXE_0_CH4_CTRL

Type: read-write
Reset State: 0x11000708

Serves to configure channel 4 operation

DXE_0_CH4_CTRL

Bits	Name	Description
31	SWAP	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bit field in the DXE descriptor control word is located at DXE_DESC_CTRL[20]

DXE_0_CH4_CTRL (cont.)

Bits	Name	Description
30:29	BDT_IDX	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: BD_TMPLT_ADRR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX]) The corresponding bit field in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	Descriptor Format. This bit field is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADRH_DFLT, DADRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT 0x1: LONG Reset State: 0x00000001
27	ABORT	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hardware once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, software should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result. Reset State: 0x00000000
26	ENDIANNESS	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND 0x1: LTLEND Reset State: 0x00000000
25:22	CTR_SEL	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bit field selects the counter that will be incremented at the end of the transfer. By default the value in this bit field is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on. Reset State: 0x00000004

DXE_0_CH4_CTRL (cont.)

Bits	Name	Description
21	EDVEN	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1) Reset State: 0x00000000
20	EDEN	External Descriptor Enable. Use External Descriptor Linked List Reset State: 0x00000000
19	INE_DONE	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE Reset State: 0x00000000
18	INE_ERR	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR Reset State: 0x00000000
17	INE_ED	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED Reset State: 0x00000000
16	STOP	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted. Reset State: 0x00000000
15:13	PRIO	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.

DXE_0_CH4_CTRL (cont.)

Bits	Name	Description
12:9	BTHLD_SEL	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bit field is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 0x1: RSVD1 0x2: THLD2 0x3: THLD3 0x4: THLD4 0x5: THLD5 0x6: THLD6 0x7: THLD7 0x8: THLD8 0x9: THLD9 0xA: THLD10 0xB: RSVD11 0xC: RSVD12 0xD: RSVD13 0xE: RSVD14 0xF: RSVD15 Reset State: 0x00000003
8	PDU_REL	0x0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP 0x1: RELEASE Reset State: 0x00000001

DXE_0_CH4_CTRL (cont.)

Bits	Name	Description
7	PIQ	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interepreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, software must ensure that the CH_DESCL[QID] bit field is set to a valid queue ID and that the CH_DESCL[BASE] bit field is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the descripiton of the QID bit field in the CH_DESCL register description. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
6	DIQ	Destination Is Queue. When set the destination address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, software must ensure that the DADR[QID] bit field is set to a valid queue ID and that the DADR[BASE] bit field is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
5	SIQ	Source Is Queue. When set the source address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, software must ensure that the SADR[QID] bit field is set to a valid queue ID and that the SADR[BASE] bit field is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000

DXE_0_CH4_CTRL (cont.)

Bits	Name	Description
4	BDH	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored. Reset State: 0x00000000
3	EOP	End of Packet bit. For H2B transfers marks the end of a packet Please note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored. Reset State: 0x00000001
2:1	XTYPE	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H 0x1: B2B 0x2: H2B 0x3: B2H
0	EN	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled:. 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost. Reset State: 0x00000000

0x3000504 DXE_0_CH4_STATUS

Type: read-write
Reset State: 0x00000000

Serves to report the status of the programmed channel operation.

DXE_0_CH4_STATUS

Bits	Name	Description
31:16	RSVD	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bit fields accordingly.
11	STOP_REQ	Stop Request. Software has requested that the channel stop it operation after the current descriptor has been processed. Once this happens the STOPD bit field will be set to one and the channel will be disabled.

DXE_0_CH4_STATUS (cont.)

Bits	Name	Description
10:6	ERR_CODE	Used to identify the source or cause of an error. 0x0: NONE 0x1: SAHB_ERR 0x2: H2H_RD_BUS_ERR 0x3: H2H_WR_BUS_ERR 0x4: PRG_INV_XTYPE 0x5: BERR_POPWQ 0x6: BERR_PUSHWQ 0x7: BERR_RLSS 0x8: BERR_GETPDU 0x9: PRG_INV_WQ 0xA: PRG_INV_H2H_SRC_QID 0xB: PRG_INV_H2H_DST_QID 0xC: PRG_INV_B2H_SRC_QID 0xD: PRG_INV_B2H_DST_QID 0xE: PRG_INV_B2H_SRC_IDX 0xF: PRG_INV_H2B_SRC_QID 0x10: PRG_INV_H2B_DST_QID 0x11: PRG_INV_H2B_DST_IDX 0x12: PRG_INV_H2B_SZ 0x13: PRG_INV_SADR 0x14: PRG_INV_DADR 0x15: PRG_INV_EDADR 0x16: PRG_INV_SRC_WQID 0x17: PRG_INV_DST_WQID 0x18: PRG_XTYPE_MSMTCH 0x19: PKT_ERR 0x1A: ABORT 0x1B: PDU_CNT_OVFL Reset State: 0x00000000
5	ERR	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor. Reset State: 0x00000000
3	MSKD	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition. Reset State: 0x00000000
2	DONE	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled. Reset State: 0x00000000
1	BUSY	Channel busy. HIgh when the channel is enabled and currently active (won internal arbitration) Reset State: 0x00000000

DXE_0_CH4_STATUS (cont.)

Bits	Name	Description
0	EN	Channel Enabled. Copy of CH_CTRL[EN]. Reset State: 0x00000000

0x3000508 DXE_0_CH4_SZ

Type: read-write

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

DXE_0_CH4_SZ

Bits	Name	Description
31:28	CHK_SZ	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.
13:0	TOT_SZ	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x300050C DXE_0_CH4_SADRL

Type: read-write

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the source, addresses can have arbitrary byte-alignment When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bit fields: The SQID bit field

used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical addresss to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), software should program the SAHB base address of the UIF source endpoint in the BASE bit field and the queue ID to match in the SWQID bit field, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and SQID fields are consistend and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, software should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

   ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

   ADDR[31:7] = Any value will do but zero preferred

   ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0):   ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

   ADDR[31:7] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)

   ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

DXE_0_CH4_SADRL

Bits	Name	Description
31:7	BASE	Base Address. For this case, this bit field provides the base address of the source UIF TX endpoint or EIF inbound FIFO. The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd Please consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH4_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bit field provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: RSVD_25 0x1A: RSVD_26 0x1B: RSVD_27 0x1C: RSVD_28 0x1D: RSVD_29 0x1E: RSVD_30 0x1F: RSVD_31

0x3000510 DXE_0_CH4_SADRH

Type: read-write

The channel source address high register holds the high bits of the source address for a transfer. Please see the description of CH_SADRL for more info.

DXE_0_CH4_SADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000514 DXE_0_CH4_DADRL

Type: read-write

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bit fields: The DQID bit field used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), software should program the SAHB base address of the UIF destination endpoint in the BASE bit field and the queue ID to match in the DQID bit field, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and DQID fields are consistent and refer

to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, software should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0):   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

   ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

   ADDR[31:5] = Any value will do but zero preferred

   ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0):   ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

   ADDR[31:5] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)

   ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

DXE_0_CH4_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bit field provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU software may use any value can be used but zero is suggested). The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd Please consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH4_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bit field provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 0x1: RSVD_1 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: BMU_25 0x1A: BMU_26 0x1B: BMU_SINK_WQ 0x1C: UIF_RX_1_EP 0x1D: UIF_RX_2_EP 0x1E: UIF_RX_3_EP 0x1F: UIF_RX_4_EP

0x3000518 DXE_0_CH4_DADRH

Type: read-write

The channel destination address high register holds the high bits of the destination address for a transfer. Please see the description of CH_DADRL for more info.

DXE_0_CH4_DADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	This register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x300051C DXE_0_CH4_DESCL

Type: read-write

The Channel 4 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bit field similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bit fields and the value is just intrepreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bit fields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

DXE_0_CH4_DESCL

Bits	Name	Description
31:7	BASE	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Please refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: base = UIF base + TD_and_TM_offset = 0x0E02_5000 + x100 = 0x0E02_5100>>7 = 0x1C_04A2

DXE_0_CH4_DESCL (cont.)

Bits	Name	Description
6:0	SQID	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case software also needs to program the correct base address of the source UIF endpoint in the BASE bit field. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x3000520 DXE_0_CH4_DESCH

Type: read-write

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list.

DXE_0_CH4_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. Please note that if the source of the descriptor is either of the UIF endpoints (CH_CTRL[PIQ]=1) then the value in ADDRH has to be 0 or else the descriptor read could end up mapping to the XIF or PIF. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000524 DXE_0_CH4_LST_DESCL

Type: read-only

The read-only Channel 4 Current/last Linked List Descriptor Pointer register contains the low 32-bits of the address of the descriptor currently being processed or of the last descriptor processed if the channel is disabled.

The meaning of the value and bit fields with regards to CH_CTRL[PIQ] is the same as was explained for the CH_DESCL register.

DXE_0_CH4_LST_DESCL

Bits	Name	Description
31:7	BASE	See description of CH_DESCL[BASE].
6:0	SQID	See description of CH_DESCL[SQID]. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x3000528 DXE_0_CH4_LST_DESCH

Type: read-only

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list. Note that The meaning of the value and bit fields is the same as was explained for the CH_DESCL register.

DXE_0_CH4_LST_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address.

0x300052C DXE_0_CH4_BD

Type: read-only

DXE_0_CH4_BD

Bits	Name	Description
31:24	RSVD	Reserved. Always returns 0 when read.
23	VAL	Valid. BD has been loaded and is valid.
22:16	PDU_CNT	PDU count of packet.
15:0	IDX	Index of BD. To get actual physical address must be added to BD/PDU base.

0x3000530 DXE_0_CH4_HEAD

Type: read-only
Reset State: 0x00000000

Address of head of packet.

DXE_0_CH4_HEAD

Bits	Name	Description
31:27	RSVD	Reserved. Reset State: 0x00000000
26	DESCVAL	Descriptor valid. Signifies descriptor has already been loaded. Used to prevent reloading of a descriptor. Reset State: 0x00000000
25:21	DWQID	Destination WQ ID. Original BMU, UIF or EIF destination queue. Valid only when CH_CSR[DIQ]=1 Reset State: 0x00000000
20:16	SWQID	Source WQ ID. Original BMU, UIF or EIF source queue. Valid only when CH_CSR[SIQ]=1 Reset State: 0x00000000
15:0	IDX	Index of Head. Must be added to BD/PDU base for actual physical address.

0x3000534 DXE_0_CH4_TAIL

Type: read-only
Reset State: 0x00000000

Address of tail of packet.

DXE_0_CH4_TAIL

Bits	Name	Description
31:16	RSVD	Reserved. Reset State: 0x00000000
15:0	IDX	Index of Tail. Must be added to BD/PDU base for actual physical address

0x3000538 DXE_0_CH4_PDU

Type: read-only
Reset State: 0x00000000

PDU info register.

All its fields are working fields that get modified as the programmed operation progresses.

DXE_0_CH4_PDU

Bits	Name	Description
31	RSVD	Reserved. Always returns 0 when read. Reset State: 0x00000000
30:24	PDU_CNT	Current PDU count.
23:8	IDX	Index of current PDU. Must be added to BD/PDU base for actual physical address
7:0	FST_OFF	First PDU offset.

0x300053C DXE_0_CH4_TSTMP

Type: read-only
Reset State: 0x00000000

Contains last sampled value of the system timestamp

DXE_0_CH4_TSTMP

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x3000540 DXE_0_CH5_CTRL

Type: read-write
Reset State: 0x11400708

Serves to configure channel 5 operation

DXE_0_CH5_CTRL

Bits	Name	Description
31	SWAP	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bit field in the DXE descriptor control word is located at DXE_DESC_CTRL[20]

DXE_0_CH5_CTRL (cont.)

Bits	Name	Description
30:29	BDT_IDX	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: BD_TMPLT_ADRR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX]) The corresponding bit field in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	Descriptor Format. This bit field is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADRH_DFLT, DADRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT 0x1: LONG Reset State: 0x00000001
27	ABORT	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hardware once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, software should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result. Reset State: 0x00000000
26	ENDIANNESS	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND 0x1: LTLEND Reset State: 0x00000000
25:22	CTR_SEL	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bit field selects the counter that will be incremented at the end of the transfer. By default the value in this bit field is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on. Reset State: 0x00000005

DXE_0_CH5_CTRL (cont.)

Bits	Name	Description
21	EDVEN	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1) Reset State: 0x00000000
20	EDEN	External Descriptor Enable. Use External Descriptor Linked List Reset State: 0x00000000
19	INE_DONE	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE Reset State: 0x00000000
18	INE_ERR	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR Reset State: 0x00000000
17	INE_ED	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED Reset State: 0x00000000
16	STOP	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted. Reset State: 0x00000000
15:13	PRIO	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.

DXE_0_CH5_CTRL (cont.)

Bits	Name	Description
12:9	BTHLD_SEL	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bit field is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 0x1: RSVD1 0x2: THLD2 0x3: THLD3 0x4: THLD4 0x5: THLD5 0x6: THLD6 0x7: THLD7 0x8: THLD8 0x9: THLD9 0xA: THLD10 0xB: RSVD11 0xC: RSVD12 0xD: RSVD13 0xE: RSVD14 0xF: RSVD15 Reset State: 0x00000003
8	PDU_REL	0x0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP 0x1: RELEASE Reset State: 0x00000001

DXE_0_CH5_CTRL (cont.)

Bits	Name	Description
7	PIQ	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interepreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, software must ensure that the CH_DESCL[QID] bit field is set to a valid queue ID and that the CH_DESCL[BASE] bit field is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the descripiton of the QID bit field in the CH_DESCL register description. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
6	DIQ	Destination Is Queue. When set the destination address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, software must ensure that the DADR[QID] bit field is set to a valid queue ID and that the DADR[BASE] bit field is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
5	SIQ	Source Is Queue. When set the source address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, software must ensure that the SADR[QID] bit field is set to a valid queue ID and that the SADR[BASE] bit field is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000

DXE_0_CH5_CTRL (cont.)

Bits	Name	Description
4	BDH	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored. Reset State: 0x00000000
3	EOP	End of Packet bit. For H2B transfers marks the end of a packet Please note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored. Reset State: 0x00000001
2:1	XTYPE	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H 0x1: B2B 0x2: H2B 0x3: B2H
0	EN	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled:. 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost. Reset State: 0x00000000

0x3000544 DXE_0_CH5_STATUS

Type: read-write
Reset State: 0x00000000

Serves to report the status of the programmed channel operation.

DXE_0_CH5_STATUS

Bits	Name	Description
31:16	RSVD	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bit fields accordingly.
11	STOP_REQ	Stop Request. Software has requested that the channel stop it operation after the current descriptor has been processed. Once this happens the STOPD bit field will be set to one and the channel will be disabled.

DXE_0_CH5_STATUS (cont.)

Bits	Name	Description
10:6	ERR_CODE	Used to identify the source or cause of an error. 0x0: NONE 0x1: SAHB_ERR 0x2: H2H_RD_BUS_ERR 0x3: H2H_WR_BUS_ERR 0x4: PRG_INV_XTYPE 0x5: BERR_POPWQ 0x6: BERR_PUSHWQ 0x7: BERR_RLSS 0x8: BERR_GETPDU 0x9: PRG_INV_WQ 0xA: PRG_INV_H2H_SRC_QID 0xB: PRG_INV_H2H_DST_QID 0xC: PRG_INV_B2H_SRC_QID 0xD: PRG_INV_B2H_DST_QID 0xE: PRG_INV_B2H_SRC_IDX 0xF: PRG_INV_H2B_SRC_QID 0x10: PRG_INV_H2B_DST_QID 0x11: PRG_INV_H2B_DST_IDX 0x12: PRG_INV_H2B_SZ 0x13: PRG_INV_SADR 0x14: PRG_INV_DADR 0x15: PRG_INV_EDADR 0x16: PRG_INV_SRC_WQID 0x17: PRG_INV_DST_WQID 0x18: PRG_XTYPE_MSMTCH 0x19: PKT_ERR 0x1A: ABORT 0x1B: PDU_CNT_OVFL Reset State: 0x00000000
5	ERR	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor. Reset State: 0x00000000
3	MSKD	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition. Reset State: 0x00000000
2	DONE	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled. Reset State: 0x00000000
1	BUSY	Channel busy. HIgh when the channel is enabled and currently active (won internal arbitration) Reset State: 0x00000000

DXE_0_CH5_STATUS (cont.)

Bits	Name	Description
0	EN	Channel Enabled. Copy of CH_CTRL[EN]. Reset State: 0x00000000

0x3000548 DXE_0_CH5_SZ

Type: read-write

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

DXE_0_CH5_SZ

Bits	Name	Description
31:28	CHK_SZ	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.
13:0	TOT_SZ	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x300054C DXE_0_CH5_SADRL

Type: read-write

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the source, addresses can have arbitrary byte-alignment When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bit fields: The SQID bit field

used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical addresss to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), software should program the SAHB base address of the UIF source endpoint in the BASE bit field and the queue ID to match in the SWQID bit field, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and SQID fields are consistend and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, software should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

   ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

   ADDR[31:7] = Any value will do but zero preferred

   ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0):   ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

   ADDR[31:7] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)

   ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

DXE_0_CH5_SADRL

Bits	Name	Description
31:7	BASE	Base Address. For this case, this bit field provides the base address of the source UIF TX endpoint or EIF inbound FIFO. The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd Please consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH5_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. set. For this case, this bit field provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: RSVD_25 0x1A: RSVD_26 0x1B: RSVD_27 0x1C: RSVD_28 0x1D: RSVD_29 0x1E: RSVD_30 0x1F: RSVD_31

0x3000550 DXE_0_CH5_SADRH

Type: read-write

The channel source address high register holds the high bits of the source address for a transfer. Please see the description of CH_SADRL for more info.

DXE_0_CH5_SADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000554 DXE_0_CH5_DADRL

Type: read-write

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bit fields: The DQID bit field used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), software should program the SAHB base address of the UIF destination endpoint in the BASE bit field and the queue ID to match in the DQID bit field, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and DQID fields are consistent and refer

to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, software should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0):   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

   ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

   ADDR[31:5] = Any value will do but zero preferred

   ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0):   ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

   ADDR[31:5] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)

   ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

DXE_0_CH5_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bit field provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU software may use any value can be used but zero is suggested). The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd Please consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH5_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bit field provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 0x1: RSVD_1 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: BMU_25 0x1A: BMU_26 0x1B: BMU_SINK_WQ 0x1C: UIF_RX_1_EP 0x1D: UIF_RX_2_EP 0x1E: UIF_RX_3_EP 0x1F: UIF_RX_4_EP

0x3000558 DXE_0_CH5_DADRH

Type: read-write

The channel destination address high register holds the high bits of the destination address for a transfer. Please see the description of CH_DADRL for more info.

DXE_0_CH5_DADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	This register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x300055C DXE_0_CH5_DESCL

Type: read-write

The Channel 5 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bit field similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bit fields and the value is just intrepreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bit fields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

DXE_0_CH5_DESCL

Bits	Name	Description
31:7	BASE	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Please refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: base = UIF base + TD_and_TM_offset = 0x0E02_5000 + x100 = 0x0E02_5100>>7 = 0x1C_04A2

DXE_0_CH5_DESCL (cont.)

Bits	Name	Description
6:0	SQID	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case software also needs to program the correct base address of the source UIF endpoint in the BASE bit field. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x3000560 DXE_0_CH5_DESCH

Type: read-write

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list.

DXE_0_CH5_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. Please note that if the source of the descriptor is either of the UIF endpoints (CH_CTRL[PIQ]=1) then the value in ADDRH has to be 0 or else the descriptor read could end up mapping to the XIF or PIF. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000564 DXE_0_CH5_LST_DESCL

Type: read-only

The read-only Channel 5 Current/last Linked List Descriptor Pointer register contains the low 32-bits of the address of the descriptor currently being processed or of the last descriptor processed if the channel is disabled.

The meaning of the value and bit fields with regards to CH_CTRL[PIQ] is the same as was explained for the CH_DESCL register.

DXE_0_CH5_LST_DESCL

Bits	Name	Description
31:7	BASE	See description of CH_DESCL[BASE].
6:0	SQID	See description of CH_DESCL[SQID]. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x3000568 DXE_0_CH5_LST_DESCH

Type: read-only

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list. Note that The meaning of the value and bit fields is the same as was explained for the CH_DESCL register.

DXE_0_CH5_LST_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address.

0x300056C DXE_0_CH5_BD

Type: read-only

DXE_0_CH5_BD

Bits	Name	Description
31:24	RSVD	Reserved. Always returns 0 when read.
23	VAL	Valid. BD has been loaded and is valid.
22:16	PDU_CNT	PDU count of packet.
15:0	IDX	Index of BD. To get actual physical address must be added to BD/PDU base.

0x3000570 DXE_0_CH5_HEAD

Type: read-only
Reset State: 0x00000000

Address of head of packet.

DXE_0_CH5_HEAD

Bits	Name	Description
31:27	RSVD	Reserved. Reset State: 0x00000000
26	DESCVAL	Descriptor valid. Signifies descriptor has already been loaded. Used to prevent reloading of a descriptor. Reset State: 0x00000000
25:21	DWQID	Destination WQ ID. Original BMU, UIF or EIF destination queue. Valid only when CH_CSR[DIQ]=1 Reset State: 0x00000000
20:16	SWQID	Source WQ ID. Original BMU, UIF or EIF source queue. Valid only when CH_CSR[SIQ]=1 Reset State: 0x00000000
15:0	IDX	Index of Head. Must be added to BD/PDU base for actual physical address.

0x3000574 DXE_0_CH5_TAIL

Type: read-only
Reset State: 0x00000000

Address of tail of packet.

DXE_0_CH5_TAIL

Bits	Name	Description
31:16	RSVD	Reserved. Reset State: 0x00000000
15:0	IDX	Index of Tail. Must be added to BD/PDU base for actual physical address

0x3000578 DXE_0_CH5_PDU

Type: read-only
Reset State: 0x00000000

PDU info register.

All its fields are working fields that get modified as the programmed operation progresses.

DXE_0_CH5_PDU

Bits	Name	Description
31	RSVD	Reserved. Always returns 0 when read. Reset State: 0x00000000
30:24	PDU_CNT	Current PDU count.
23:8	IDX	Index of current PDU. Must be added to BD/PDU base for actual physical address
7:0	FST_OFF	First PDU offset.

0x300057C DXE_0_CH5_TSTMP

Type: read-only
Reset State: 0x00000000

Contains last sampled value of the system timestamp

DXE_0_CH5_TSTMP

Bits	Name	Description
31:0	VALUE	Reset State: 0x00000000

0x3000580 DXE_0_CH6_CTRL

Type: read-write
Reset State: 0x11800708

Serves to configure channel 6 operation

DXE_0_CH6_CTRL

Bits	Name	Description
31	SWAP	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bit field in the DXE descriptor control word is located at DXE_DESC_CTRL[20]

DXE_0_CH6_CTRL (cont.)

Bits	Name	Description
30:29	BDT_IDX	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: BD_TMPLT_ADRR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX]) The corresponding bit field in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	Descriptor Format. This bit field is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADRH_DFLT, DADRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT 0x1: LONG Reset State: 0x00000001
27	ABORT	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hardware once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, software should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result. Reset State: 0x00000000
26	ENDIANNESS	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND 0x1: LTLEND Reset State: 0x00000000
25:22	CTR_SEL	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bit field selects the counter that will be incremented at the end of the transfer. By default the value in this bit field is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on. Reset State: 0x00000006

DXE_0_CH6_CTRL (cont.)

Bits	Name	Description
21	EDVEN	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1) Reset State: 0x00000000
20	EDEN	External Descriptor Enable. Use External Descriptor Linked List Reset State: 0x00000000
19	INE_DONE	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE Reset State: 0x00000000
18	INE_ERR	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR Reset State: 0x00000000
17	INE_ED	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED Reset State: 0x00000000
16	STOP	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted. Reset State: 0x00000000
15:13	PRIO	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.

DXE_0_CH6_CTRL (cont.)

Bits	Name	Description
12:9	BTHLD_SEL	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bit field is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 0x1: RSVD1 0x2: THLD2 0x3: THLD3 0x4: THLD4 0x5: THLD5 0x6: THLD6 0x7: THLD7 0x8: THLD8 0x9: THLD9 0xA: THLD10 0xB: RSVD11 0xC: RSVD12 0xD: RSVD13 0xE: RSVD14 0xF: RSVD15 Reset State: 0x00000003
8	PDU_REL	0x0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP 0x1: RELEASE Reset State: 0x00000001

DXE_0_CH6_CTRL (cont.)

Bits	Name	Description
7	PIQ	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interepreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, software must ensure that the CH_DESCL[QID] bit field is set to a valid queue ID and that the CH_DESCL[BASE] bit field is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the descripiton of the QID bit field in the CH_DESCL register description. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
6	DIQ	Destination Is Queue. When set the destination address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, software must ensure that the DADR[QID] bit field is set to a valid queue ID and that the DADR[BASE] bit field is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000
5	SIQ	Source Is Queue. When set the source address is interepreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, software must ensure that the SADR[QID] bit field is set to a valid queue ID and that the SADR[BASE] bit field is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT 0x1: QUEUE Reset State: 0x00000000

DXE_0_CH6_CTRL (cont.)

Bits	Name	Description
4	BDH	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored. Reset State: 0x00000000
3	EOP	End of Packet bit. For H2B transfers marks the end of a packet Please note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored. Reset State: 0x00000001
2:1	XTYPE	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. space to BMU space transfer. translation. translation. DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H 0x1: B2B 0x2: H2B 0x3: B2H
0	EN	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled:. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost. Reset State: 0x00000000

0x3000584 DXE_0_CH6_STATUS

Type: read-write
Reset State: 0x00000000

Serves to report the status of the programmed channel operation.

DXE_0_CH6_STATUS

Bits	Name	Description
31:16	RSVD	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bit fields accordingly.
11	STOP_REQ	Stop Request. Software has requested that the channel stop it operation after the current descriptor has been processed. Once this happens the STOPD bit field will be set to one and the channel will be disabled.

DXE_0_CH6_STATUS (cont.)

Bits	Name	Description
10:6	ERR_CODE	Used to identify the source or cause of an error. 0x0: NONE 0x1: SAHB_ERR 0x2: H2H_RD_BUS_ERR 0x3: H2H_WR_BUS_ERR 0x4: PRG_INV_XTYPE 0x5: BERR_POPWQ 0x6: BERR_PUSHWQ 0x7: BERR_RLSS 0x8: BERR_GETPDU 0x9: PRG_INV_WQ 0xA: PRG_INV_H2H_SRC_QID 0xB: PRG_INV_H2H_DST_QID 0xC: PRG_INV_B2H_SRC_QID 0xD: PRG_INV_B2H_DST_QID 0xE: PRG_INV_B2H_SRC_IDX 0xF: PRG_INV_H2B_SRC_QID 0x10: PRG_INV_H2B_DST_QID 0x11: PRG_INV_H2B_DST_IDX 0x12: PRG_INV_H2B_SZ 0x13: PRG_INV_SADR 0x14: PRG_INV_DADR 0x15: PRG_INV_EDADR 0x16: PRG_INV_SRC_WQID 0x17: PRG_INV_DST_WQID 0x18: PRG_XTYPE_MSMTCH 0x19: PKT_ERR 0x1A: ABORT 0x1B: PDU_CNT_OVFL Reset State: 0x00000000
5	ERR	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor. Reset State: 0x00000000
3	MSKD	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition. Reset State: 0x00000000
2	DONE	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled. Reset State: 0x00000000
1	BUSY	Channel busy. HIgh when the channel is enabled and currently active (won internal arbitration) Reset State: 0x00000000

DXE_0_CH6_STATUS (cont.)

Bits	Name	Description
0	EN	Channel Enabled. Copy of CH_CTRL[EN]. Reset State: 0x00000000

0x3000588 DXE_0_CH6_SZ

Type: read-write

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

DXE_0_CH6_SZ

Bits	Name	Description
31:28	CHK_SZ	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.
13:0	TOT_SZ	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x300058C DXE_0_CH6_SADRL

Type: read-write

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the source, addresses can have arbitrary byte-alignment When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bit fields: The SQID bit field

used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF source endpoint/FIFO.
ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical addresss to use to fetch it directly from memory.
(CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), software should program the SAHB base address of the UIF source endpoint in the BASE bit field and the queue ID to match in the SWQID bit field, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and SQID fields are consistend and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, software should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.
transfers the address must conform to the following format:
(CH_CSR[SIQ] = 0):
BD_INDEX[15:0]
(CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):
   ADDR[31:7] = Any value will do but zero preferred
   ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field format:
   ADDR[31:0] = address mapping to source interface
endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):
   ADDR[31:7] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)
or EIF as specified in description of SQID field

DXE_0_CH6_SADRL

Bits	Name	Description
31:7	BASE	Base Address. For this case, this bit field provides the base address of the source UIF TX endpoint or EIF inbound FIFO. The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH6_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. set. For this case, this bit field provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: RSVD_25 0x1A: RSVD_26 0x1B: RSVD_27 0x1C: RSVD_28 0x1D: RSVD_29 0x1E: RSVD_30 0x1F: RSVD_31

0x3000590 DXE_0_CH6_SADRH

Type: read-write

The channel source address high register holds the high bits of the source address for a transfer. Please see the description of CH_SADRL for more info.

DXE_0_CH6_SADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x3000594 DXE_0_CH6_DADRL

Type: read-write

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bit fields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bit fields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bit fields: The DQID bit field used to specify the queue ID, and the BASE bit field used to provide the base address for the UIF or EIF destination endpoint/FIFO.
a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.
destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), software should program the SAHB base address of the UIF destination endpoint in the BASE bit field and the queue ID to match in the DQID bit field, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. software should make sure that the BASE and DQID fields are consistent and refer to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bit fields lose their special meaning and DXE will just use the full 32-bits programmed into the

register as the address to write the data. For this case, software should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:
   ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]
   ADDR[6:0] = 7'd0
DQID matching one of the BMU queues):
do but zero preferred
description of QID field
following format:
   ADDR[31:0] = address mapping to destination interface
endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):
   ADDR[31:5] = UIF RX endpoint base or EIF inboud FIFO base (see address map + Interface uarch document)
or EIF as specified in description of DQID field

DXE_0_CH6_DADRL

Bits	Name	Description
31:7	BASE	Base Address. For this case, this bit field provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU software may use any value can be used but zero is suggested). The correct base address (with 1Kb granularity) for the source interface can be found in the address map document located here (sys control tab): //depot/hardware/ip/internal/nova/docs/arch/Address Map Drawing.vsd interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

DXE_0_CH6_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. is set. For this case, this bit field provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 0x1: RSVD_1 0x2: BMU_2 0x3: BMU_3 0x4: BMU_4 0x5: BMU_5 0x6: BMU_6 0x7: BMU_7 0x8: BMU_8 0x9: BMU_9 0xA: BMU_10 0xB: BMU_11 0xC: BMU_12 0xD: BMU_13 0xE: BMU_14 0xF: BMU_15 0x10: BMU_16 0x11: BMU_17 0x12: BMU_18 0x13: BMU_19 0x14: BMU_20 0x15: BMU_21 0x16: BMU_22 0x17: BMU_23 0x18: BMU_24 0x19: BMU_25 0x1A: BMU_26 0x1B: BMU_SINK_WQ 0x1C: UIF_RX_1_EP 0x1D: UIF_RX_2_EP 0x1E: UIF_RX_3_EP 0x1F: UIF_RX_4_EP

0x3000598 DXE_0_CH6_DADRH

Type: read-write

The channel destination address high register holds the high bits of the destination address for a transfer. Please see the description of CH_DADRL for more info.

DXE_0_CH6_DADRH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	This register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x300059C DXE_0_CH6_DESCL

Type: read-write

The Channel 6 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bit field similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bit fields and the value is just interpreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bit fields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

DXE_0_CH6_DESCL

Bits	Name	Description
31:7	BASE	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Please refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: 0x0E02_5000 + x100 = 0x0E02_5100>>7 = 0x1C_04A2

DXE_0_CH6_DESCL (cont.)

Bits	Name	Description
6:0	SQID	This bit field only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case software also needs to program the correct base address of the source UIF endpoint in the BASE bit field. 0x0: UIF_TX_DATA_EP 0x1: UIF_TX_MGMT_EP

0x30005A0 DXE_0_CH6_DESCH

Type: read-write

The channel destination address high register holds the high bits of the address of the next descriptor to be loaded in the linked list.

DXE_0_CH6_DESCH

Bits	Name	Description
31:2	RSVD	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bit field encoding descriptions for an explanation. Please note that if the source of the descriptor is either of the UIF endpoints (CH_CTRL[PIQ]=1) then the value in ADDRH has to be 0 or else the descriptor read could end up mapping to the XIF or PIF. 0x0: ADDR_XTLN 0x1: PIF_NO_XTLN 0x2: XIF_NO_XTLN 0x3: RSVD

0x30005A4 DXE_0_CH6_LST_DESCL

Type: read-only

The read-only Channel 6 Current/last Linked List Descriptor Pointer register contains the low 32-bits of the address of the descriptor currently being processed or of the last descriptor processed if the channel is disabled.
CH_CTRL[PIQ] is the same as was explained for the CH_DESCL register.

DXE_0_CH6_LST_DESCL

LTE_CXM_CXM_CP_INTERRUPT_STROBE_2_PERIODICITY

Bits	Name	Description
23:0	CXM_INTERRUPT_STOBE_2_PERIODICITY	When Strobe i is in periodic mode, stobe i should generate a strobe with periodicity defined by CxM_Interrupt_Stobe_i_Periodicity. The same clock as the CxM-Timer is used here. S/R by CxM-SW. Reset State: 0x00000000

0x30000E8 LTE_CXM_CXM_CP_INTERRUPT_STROBE_3_PERIODICITY

Type: read-write
Reset State: 0x00000000

CxM_Interrupt_Stobe_3_Periodicity. to WCN_PRIORITY

LTE_CXM_CXM_CP_INTERRUPT_STROBE_3_PERIODICITY

Bits	Name	Description
23:0	CXM_INTERRUPT_STOBE_3_PERIODICITY	When Strobe i is in periodic mode, stobe i should generate a strobe with periodicity defined by CxM_Interrupt_Stobe_i_Periodicity. The same clock as the CxM-Timer is used here. S/R by CxM-SW. Reset State: 0x00000000

0x30000EC LTE_CXM_CXM_WCN_PRIORITY_ENABLES

Type: read-write
Reset State: 0x00000010

Following registers are related to WCN_PRIORITY

LTE_CXM_CXM_WCN_PRIORITY_ENABLES

Bits	Name	Description
6	CXM_FRAME_SYNC_SEL	CxM_frame_sync_sel Reset State: 0x00000000

LTE_CXM_CXM_WCN_PRIORITY_ENABLES (cont.)

Bits	Name	Description
5	CXM_WCN_PRIORITY_OVERWRITE_VALUE	CxM_WCN_Priority_overwrite_value Reset State: 0x00000000
4	CXM_WCN_PRIORITY_OVERWRITE_ENABLE	CxM_WCN_Priority_overwrite_enable Reset State: 0x00000001
3	CXM_WCN_PRIORITY_VALUE2	CxM_WCN_Priority_Value2 Reset State: 0x00000000
2	CXM_WCN_PRIORITY_ENABLE2	CxM_WCN_Priority_Enable2 Reset State: 0x00000000
1	CXM_WCN_PRIORITY_VALUE1	CxM_WCN_Priority_Value1 Reset State: 0x00000000
0	CXM_WCN_PRIORITY_ENABLE1	CxM_WCN_Priority_Enable1 Reset State: 0x00000000

0x30000F0 LTE_CXM_CXM_WCN_PRIORITY_THRESHOLD1

Type: read-write
Reset State: 0x00000000

CXM_WCN_Priority_Threshold1

LTE_CXM_CXM_WCN_PRIORITY_THRESHOLD1

Bits	Name	Description
31:0	CXM_WCN_PRIORITY_THRESHOLD1	This register is used together with CxM_WCN_Priority_Enable1, CxM_WCN_Priority_Enable2, CxM_WCN_Priority_Value1, CxM_WCN_Priority_Value2, etc. Reset State: 0x00000000

0x30000F4 LTE_CXM_CXM_WCN_PRIORITY_THRESHOLD2

Type: read-write
Reset State: 0x00000000

CXM_WCN_Priority_Threshold2

LTE_CXM_CXM_WCN_PRIORITY_THRESHOLD2

Bits	Name	Description
31:0	CXM_WCN_PRIORITY_THRESHOLD2	This register is used together with CxM_WCN_Priority_Enable1, CxM_WCN_Priority_Enable2, CxM_WCN_Priority_Value1, CxM_WCN_Priority_Value2, etc. Reset State: 0x00000000

0x30000F8 LTE_CXM_CXM_LTE_ACTIVE_FRAME_SYNC_VALUE

Type: read-only
Reset State: 0x00000000

This register "polls" the frame_sync input and LTE_active input values.

LTE_CXM_CXM_LTE_ACTIVE_FRAME_SYNC_VALUE

Bits	Name	Description
1	I_RIVA_LTE_ACTIVE	This register captures the i_riva_lte_active input signal value. Reset State: 0x00000000
0	I_RIVA_LTE_FRAME_SYNC	This register captures the i_riva_lte_frame_sync input signal value. Reset State: 0x00000000

16.2.11 AGC

0x3000000 AGC_AGC_RESET

Type: read-write
Reset State: 0x0001

Soft reset of the AGC state machine.

AGC_AGC_RESET

Bits	Name	Description
0	RESET	Reset bit. 0x0: NORMAL 0x1: RESET Reset State: 0x0001

0x3000004 AGC_DIS_MODE

Type: read-write
Reset State: 0x0000

Disables detection of OFDM (11a,11g)/OFDM-MIMO, Barker/CCK (11b) packets or double bandwidth 11a/MIMO packets. Useful to reduce misdetect probability in a pure 11a or 11b environment.

AGC_DIS_MODE

Bits	Name	Description
3	DISABLE_11AC80	Disable quadruple bandwidth bit for 11ac80 MHz packets. 0x0: ENABLE 0x1: DISABLE Reset State: 0x0000
2	DISABLE_11N40	Disable double bandwidth bit for 11n40 MHz packets. 0x0: ENABLE 0x1: DISABLE Reset State: 0x0000
1	DISABLE_11B	Disable 11b bit. 0x0: ENABLE 0x1: DISABLE Reset State: 0x0000
0	DISABLE_11AG	Disable 11a/g bit. 0x0: ENABLE 0x1: DISABLE Reset State: 0x0000

0x3000008 AGC_RX_OVERRIDE

Type: read-write
Reset State: 0x0000

This register allows the EN_RX (Receive Enable) outputs of the BBIC, the standby input and the powerdown inputs of the built-in ADC to be software- controlled. These outputs are used to enable the AD converters and RF ASICs for debugging and calibration purposes. The power down bits are used to put all of the ADCs in power down mode (for instance in beacon power save mode) or part of its ADCs to be powered down (for instance a product not using all of the antenna).

AGC_RX_OVERRIDE

Bits	Name	Description
4:4	ENRX_VAL	Enable values for receive chain 0 to 0. For these values to take effect, the corresponding override bits should be set. Reset State: 0x0000

AGC_RX_OVERRIDE (cont.)

Bits	Name	Description
0:0	STBY_VAL	ADC standby values for receive chain 0 to 0. Note that the standby values are asserted low, and de-asserted high. For these values to take effect, the corresponding override bits should be set. Reset State: 0x0000

0x300000C AGC_PHY_LOOPBACK

Type: read-write
Reset State: 0x0008

Configures support for PHY loopback.

AGC_PHY_LOOPBACK

Bits	Name	Description
3	DIG_LOOPBACK	Enables the loopback digitally. Reset State: 0x0001
2	PMI_EN	Enables loop backed data to go out the PMI to the MAC. Reset State: 0x0000
1:0	MODE	Sets the PHY loopback mode. PHY loopback can be enabled statically, where it is always in loopback mode, or dynamically where it only enters loopback mode when we're transmitting. 0x0: DISABLED 0x1: STATIC_EN 0x2: DYN_EN Reset State: 0x0000

0x3000010 AGC_CONFIG_XBAR

Type: read-write
Reset State: 0x0000

Sets the configuration for the digital / analog crossbar. This will configure how a particular analog receive chain is mapped to a particular digital RX processing chain. In addition, it will also configure how a particular digital TX processing chain is connected to a particular analog transmit chain. An analog chain includes the baseband analog + the corresponding RF chain. Although there are separate controls for txxbar and rxxbar, for normal mode of operation, they should be set the same. Please refer to the System Engineering Specification on the edge portal for the configuration and connectivity of xbar. Note that no analog chain other than analog chain 2 can feed the digital chain 2 and hence there is no xbar functionality on digital chain 2

AGC_CONFIG_XBAR

Bits	Name	Description
15	PHYDBG_SEL	PHYDBG input select. Used for playing PHYDBG data into RX ADC path. Reset State: 0x0000
14	IQSWAP_EN	Enables swapping of the I and Q rails of the ADC. Reset State: 0x0000

0x3000014 AGC_CW_DETECT

Type: read-write
Reset State: 0x000B

At packet detection, the PHY detects narrowband interference to avoid false alarms caused by narrowband interference. This type of interference could arise as the result of LO leakage, LO interference of other IEEE802.11 devices in the vicinity of the receiver and other, intentional radiators, such as Bluetooth devices. of factors the explanation of which is beyond the scope of this guide. When CW is found the packet detection is ignored since it is most likely that the packet detectors triggered on the CW interference. The CW frequency is used to set a CW notch filter inside the RXFIR to cancel out that interference in the future, until a different CW interferer is found or until a timer expires.

AGC_CW_DETECT

Bits	Name	Description
6	CW_EN_RXB_DATA	Enables CW notch processing when the AGC is in states 9 or 11. 0x0: DISABLE 0x1: ENABLE Reset State: 0x0000
5	CW_EN_RXB	Enables CW notch processing when the AGC is in states 2,3 or 7. 0x0: DISABLE 0x1: ENABLE Reset State: 0x0000
4	CW_EN_RXA_DATA	Enables CW notch processing when the AGC is in states 8 or 10. 0x0: DISABLE 0x1: ENABLE Reset State: 0x0000
3	CW_EN_RXA	Enables CW notch processing when the AGC is in states 2,3 or 6. 0x0: DISABLE 0x1: ENABLE Reset State: 0x0001

AGC_CW_DETECT (cont.)

Bits	Name	Description
2	DC_DIS	Disables the use of the Rxfir with a DC notch. Note that this bit field should be set in conjunction with the RACTL's rxfir_scaling_coeff register. 0x0: ENABLE 0x1: DISABLE Reset State: 0x0000
1	RADAR_DETECT_DIS	0x1: DISABLE 0x0: ENABLE Reset State: 0x0001
0	PKT_DETECT_DIS	0x1: DISABLE 0x0: ENABLE Reset State: 0x0001

0x3000018 AGC_CW_NOTCH_TIMEOUT

Type: read-write
Reset State: 0x0064

The CW notch filter applies a notch to the receiver input signal at a frequency as measured by the CW detector. The notch is applied until the CW detector passes a different value to the notch filter, or until the notch filter's built-in timer expires. When this timer expires the input signal bypasses the notch filter altogether. The timeout value of the timer is defined in this register.

AGC_CW_NOTCH_TIMEOUT

Bits	Name	Description
8	DIS	Setting this field to 1 is equivalent to setting an infinite timeout value. When set, the cw notch index will remain the same until is set to a different value. Reset State: 0x0000
7:0	VAL	Timeout value. This value is multiplied by 2^19 to get the number of 80 MHz clock cycles that make up the timeout time. 0x1: MINIMUM 0x64: DEFAULT 0xFF: MAXIMUM Reset State: 0x0064

0x300001C AGC_GAIN_MODE

Type: read-write
Reset State: 0x0000

AGC_GAIN_MODE

Bits	Name	Description
1	MULT_STEP	This bit defines if only a single COARSE_STEP or SAT_STEP is made or if multiple steps are possible. 0x0: SING 0x1: MULT Reset State: 0x0000
0	USE_RXFIR_PWR	Setting this field to 1 will cause the gain computation to come from the power measured in the RXFIR power detector instead of the ADC power detector. Reset State: 0x0000

0x3000020 AGC_TESTBUS

Type: read-write
Reset State: 0x0000

Selects the inputs to the test bus.

AGC_TESTBUS

Bits	Name	Description
5:0	AGC_RXTMUX_TMUXSEL	RX test multiplexer select lines. 0x0: AGC_40_0 0x1: AGC_40_1 0x2: AGC_40_2 0x3: AGC_40_3 0x8: AGC_80_0 0x9: AGC_80_1 0xA: AGC_80_2 0xB: AGC_80_3 0xC: AGC_80_4 0xD: AGC_80_5 0xE: AGC_80_6 0x18: AGC_80_40_0 0x19: AGC_80_40_1 0x1A: AGC_80_40_2 0x1B: AGC_80_40_3 0x1C: AGC_80_40_4 0x1D: AGC_80_40_5 0x20: RXB_40_0 0x21: RXB_40_1 0x22: RXB_40_2 0x23: RXB_40_3 0x24: RXB_40_4 0x25: RXB_40_5 0x26: RXB_40_6 0x27: RXB_40_7 Reset State: 0x0000

0x3000024 AGC_GAINSET0

Type: read-write
Reset State: 0x0000

Allows to break AGC gain setting loop and manually override AGC setting of chain 0. For debugging purposes.

AGC_GAINSET0

Bits	Name	Description
7	OVERRIDE	Override bit. 0x0: NORMAL 0x1: OVERRIDE Reset State: 0x0000

AGC_GAINSET0 (cont.)

Bits	Name	Description
6:0	GAIN	Gain setting. Reset State: 0x0000

0x3000028 AGC_GAINSET_WRITE

Type: command
Reset State: 0x0000

When a 1 is written to this register, the gain registers of the RFIC(s) are loaded with the values stored in bit [3:0] of registers GAINSET0.. 0, provided that the override bit [4] these registers is set. At the moment that these registers are written, the gain that is programmed in the RFIC receivers will remain at its previously programmed value. Writing to this register enforces a write of the gain values to the RFIC gain registers, which would otherwise happen only when the AGC decides to change gain when a packet is received or a strong signal clips the RF front end, or when the AGC is reset (through RX_RESET signal, SLEEP signal, packet transmission or by writing to AGC_RESET register. On the chains on which the override bit is not set, the current gain remains unchanged. This register is provided for debugging purposes. This register cannot be read back

AGC_GAINSET_WRITE

Bits	Name	Description
0	OVERRIDE	Gain write pulse bit. 0x0: NORMAL 0x1: OVERRIDE Reset State: 0x0000

0x300002C AGC_STAT_CTRL

Type: read-write
Reset State: 0x0001

Control for AGC specific stat info

AGC_STAT_CTRL

Bits	Name	Description
0	RSSI_TYPE	0x0: ADC 0x1: RXFIR Reset State: 0x0001

0x3000030 AGC_SUBBAND_CONFIG

Type: read-write
Reset State: 0x0000

Sets subband configuration.

AGC_SUBBAND_CONFIG

Bits	Name	Description
3:2	STG3_SUBBAND	Selects the subband location for the stage 3 RxFIR filter. 0x0: LOWER 0x1: UPPER 0x2: CENTER 0x3: RESERVED Reset State: 0x0000
1:0	STG2_SUBBAND	Selects the subband location for the stage 2 RxFIR filter. 0x0: LOWER 0x1: UPPER 0x2: CENTER 0x3: RESERVED Reset State: 0x0000

0x3000034 AGC_CHANNEL_FREQ

Type: read-write
Reset State: 0x096C

This stores the channel frequency in MHz is stored used to calculate re-sampler offset for 11b operation. This register needs to be reprogrammed every time the MAC switches to a different RF channel. Width is 13 bits, so 11b mode can also operate in 5 GHz band, if the need arises.

AGC_CHANNEL_FREQ

Bits	Name	Description
12:0	FREQ	Channel frequency 0x96C: CH1 0x971: CH2 0x976: CH3 0x97B: CH4 0x980: CH5 0x985: CH6 0x98A: CH7 0x98F: CH8 0x994: CH9 0x999: CH10 0x99E: CH11 0x9A3: CH12 0x9A8: CH13 0x9B4: CH14 Reset State: 0x096C

0x3000038 AGC_N_ACTIVE

Type: read-write
Reset State: 0x0001

Specifies number of receive chains used to receive a packet.

AGC_N_ACTIVE

Bits	Name	Description
0:0	NUMBER	Receive chains. Reset State: 0x0001

0x300003C AGC_N_LISTEN

Type: read-write
Reset State: 0x0011

Specifies number of receive chains used to listen for a packet.

AGC_N_LISTEN

Bits	Name	Description
4:4	RF_ANT_EN	If number of listen chains is 0, then this specifies which RF antennas to enable during listen mode. Reset State: 0x0001
0:0	NUMBER	Listen chains. Reset State: 0x0001

0x3000040 AGC_N_MEASURE

Type: read-write
Reset State: 0x0001

Specifies number of receive chains that is switched on to measure power on.

AGC_N_MEASURE

Bits	Name	Description
0:0	NUMBER	Measure chains. Reset State: 0x0001

0x3000044 AGC_N_CAPTURE

Type: read-write
Reset State: 0x0011

Specifies number of receive chains used to capture a packet.

AGC_N_CAPTURE

Bits	Name	Description
4:4	RF_ANT_EN	If number of capture chains is 0, then this specifies which RF antennas to enable during capture mode. Reset State: 0x0001
0:0	NUMBER	Receive chains. Reset State: 0x0001

0x3000048 AGC_CCA_MODE

Type: read-write
Reset State: 0x0B6D

Determines how the CCA signal from the PHY to the MAC is generated.

AGC_CCA_MODE

Bits	Name	Description
11:9	SB3	Clear Channel Assessment Mode for channel subband 3 0x0: CLEAR 0x1: BUSY 0x2: GI 0x3: ED_OR_GI 0x4: GI_OR_CS_AND_CD 0x5: ED_OR_GI_AND_CS_AND_CD Reset State: 0x0005
8:6	SB2	Clear Channel Assessment Mode for channel subband 2 0x0: CLEAR 0x1: BUSY 0x2: GI 0x3: ED_OR_GI 0x4: GI_OR_CS_AND_CD 0x5: ED_OR_GI_AND_CS_AND_CD Reset State: 0x0005
5:3	SB1	Clear Channel Assessment Mode for channel subband 1 0x0: CLEAR 0x1: BUSY 0x2: GI 0x3: ED_OR_GI 0x4: GI_OR_CS_AND_CD 0x5: ED_OR_GI_AND_CS_AND_CD Reset State: 0x0005
2:0	SB0	Clear Channel Assessment Mode for channel subband 0 0x0: CLEAR 0x1: BUSY 0x2: GI 0x3: ED_OR_GI 0x4: GI_OR_CS_AND_CD 0x5: ED_OR_GI_AND_CS_AND_CD Reset State: 0x0005

0x300004C AGC_CCA_GI_DET_CFG

Type: read-write
Reset State: 0x5FBF

AGC_CCA_GI_DET_CFG

Bits	Name	Description
14:8	TH_SGI	Reset State: 0x005F
7:1	TH_LGI	Reset State: 0x005F
0	DIS	Reset State: 0x0001

0x3000050 AGC_TH_CD20

Type: read-write
Reset State: 0x0000

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds this threshold, then the carrier detect flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

AGC_TH_CD20

Bits	Name	Description
6:0	TH	CD Threshold. Default value (0 = -?? dB below max level). Reset State: 0x0000

0x3000054 AGC_TH_CD40

Type: read-write
Reset State: 0x0000

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds this threshold, then the carrier detect flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

AGC_TH_CD40

Bits	Name	Description
6:0	TH	CD Threshold. Default value (0 = -?? dB below max level). Reset State: 0x0000

0x3000058 AGC_TH_CD80

Type: read-write
Reset State: 0x0000

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds this threshold, then the carrier detect flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

AGC_TH_CD80

Bits	Name	Description
6:0	TH	CD Threshold. Default value (0 = -?? dB below max level). Reset State: 0x0000

0x300005C AGC_TH_CS20

Type: read-write
Reset State: 0x0012

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds the carrier detect threshold, and the received energy also exceeds the carrier sense threshold, then the carrier sense flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

AGC_TH_CS20

Bits	Name	Description
6:0	TH	CS Threshold Default value (-82 dBm) Reset State: 0x0012

0x3000060 AGC_TH_CS40

Type: read-write
Reset State: 0x0012

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds the carrier detect threshold, and the received energy also exceeds the carrier sense threshold, then the carrier sense flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

AGC_TH_CS40

Bits	Name	Description
6:0	TH	CS Threshold Default value (-82 dBm) Reset State: 0x0012

0x3000064 AGC_TH_CS80

Type: read-write
Reset State: 0x0012

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds the carrier detect threshold, and the received energy also exceeds the carrier sense threshold, then the carrier sense flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

AGC_TH_CS80

Bits	Name	Description
6:0	TH	CS Threshold Default value (-82 dBm) Reset State: 0x0012

0x3000068 AGC_TH_EDET

Type: read-write
Reset State: 0x2626

If the RSSI on receive chain 0 exceeds this threshold then the energy detect flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

AGC_TH_EDET

Bits	Name	Description
14:8	TH20	ED Threshold. Default value (-62 dBm) Reset State: 0x0026
6:0	TH40	ED Threshold. Default value (-62 dBm) Reset State: 0x0026

0x300006C AGC_D_AGC_A

Type: read-write
Reset State: 0x000A

This latency is the sum of three components. The ADC latency, the latency through the FIR and CAL module and the latency for AGC 11a processing, which is determined by interference locator processing latency. Ranges from 0 to 1.575 micro seconds.

AGC_D_AGC_A

Bits	Name	Description
5:0	DELAY	Propagation time in 80/40MHz dynamic clocks. Reset State: 0x000A

0x3000070 AGC_D_AGC_B

Type: read-write
Reset State: 0x0006

This latency is the sum of two components. The ADC latency, and the latency through the FIR and CAL module. Ranges from 0 to 1.575 micro seconds.

AGC_D_AGC_B

Bits	Name	Description
5:0	DELAY	Propagation time in 50ns units. Default value is 6, corresponding to 300ns. Reset State: 0x0006

0x3000074 AGC_RSSI_OFFSET0

Type: read-write
Reset State: 0x003A

This register holds an offset value (determined at manufacturing time) that is used to translate rssi values to dBm values as measured at the antenna input. The same offset is used to correct both the ADC and FIR RSSI.

AGC_RSSI_OFFSET0

Bits	Name	Description
7:0	OFFSET	Offset is a 2cc encoded number that is added to the rssi computed by the power module. Reset State: 0x003A

0x3000078 AGC_RSSI_BT_OFFSET0

Type: read-write
Reset State: 0x0000

When a Bluetooth transmission takes place the RSSI on one of the receive antennae is reduced. This register is used to compensate for that attenuation change so that the reported RSSI is the true dBm number at the antenna.

AGC_RSSI_BT_OFFSET0

Bits	Name	Description
7:0	OFFSET	Offset is a 2cc encoded number that is added to the rssi computed by the power module. Reset State: 0x0000

0x300007C AGC_CLIP_COUNT

Type: write-only

Debug Counter. Counts transitions between CORR state and GAIN_SETTLE state due to ADC clip events.

AGC_CLIP_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x3000080 AGC_SAT_COUNT

Type: write-only

Debug Counter. Counts transitions between CORR state and GAIN_SETTLE state due to RF sat events.

AGC_SAT_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x3000084 AGC_PIP_COUNT

Type: write-only

Debug Counter. Counts the number of packet in packet detection (power_jum_det during some of the states)

AGC_PIP_COUNT

Bits	Name	Description
7:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x3000088 AGC_NOT_AVALID_20M_COUNT

Type: write-only

BTCF not_avalid signal

AGC_NOT_AVALID_20M_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x300008C AGC_NOT_AVALID_40M_COUNT

Type: write-only

BTCF not_avalid signal

AGC_NOT_AVALID_40M_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x3000090 AGC_RXA_HDR_INVALID_20M_COUNT

Type: write-only

BTCF not_avalid signal

AGC_RXA_HDR_INVALID_20M_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x3000094 AGC_RXA_HDR_INVALID_40M_COUNT

Type: write-only

BTCF not_avalid signal

AGC_RXA_HDR_INVALID_40M_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x3000098 AGC_RXB_NO_B_PKT_DET_COUNT

Type: write-only

AGC_RXB_NO_B_PKT_DET_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x300009C AGC_RXB_INV_HDR_COUNT

Type: write-only

AGC_RXB_INV_HDR_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30000A0 AGC_RXB_ILL_HDR_COUNT

Type: write-only

AGC_RXB_ILL_HDR_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30000A4 AGC_COARSE_DCO_UPDATE_COUNTER

Type: write-only

AGC_COARSE_DCO_UPDATE_COUNTER

Bits	Name	Description
7:0	VALUE	Coarse DCO measurement update counter.

0x30000A8 AGC_FALSE_AC_ABORT_COUNT

Type: write-only

Counts number of aborts of legacy packets that occur due to clip events in potential VHT-STS.

AGC_FALSE_AC_ABORT_COUNT

Bits	Name	Description
7:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30000AC AGC_LATE_AC_DET_COUNT

Type: write-only

Counts number of late 11AC detects that cause missed VHT-STS gain commands.

AGC_LATE_AC_DET_COUNT

Bits	Name	Description
7:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30000B0 AGC_CCA_PKTDET_STATUS

Type: read-only

Samples the current value of the CCA and pktdet flags

AGC_CCA_PKTDET_STATUS

Bits	Name	Description
6	LSIG_TXOP	
5	EARLY_PKTDET_N	
4	PKTDET_N	
3:0	CCA	

0x30000B4 AGC_SAMPLE_ADC_I0

Type: read-only

AGC_SAMPLE_ADC_I0

Bits	Name	Description
11	OVFL	Overflow bit. 0x0: NO_OVFL 0x1: OVFL
10:0	ADC	ADC output, offset binary encoded ADC Chain 0 i output.

0x30000B8 AGC_SAMPLE_ADC_Q0

Type: read-only

AGC_SAMPLE_ADC_Q0

Bits	Name	Description
11	OVFL	Overflow bit. 0x0: NO_OVFL 0x1: OVFL
10:0	ADC	ADC output, offset binary encoded ADC Chain 0 q output.

0x30000BC AGC_ADC_RSSI0

Type: read-only

Read out RSSI measured right after ADC0 while not receiving a packet. Invalid bit indicates that RSSI is not current, since a packet is being received. The value is the RSSI stored just before the AGC detected the packet.

AGC_ADC_RSSI0

Bits	Name	Description
8	NAV_BUSY	NAV status which helps software to allow/ignore the sampled rssi value for 11k measurements. 0x0: IDLE 0x1: BUSY
7	INVALID	RSSI0 not current 0x0: VALID 0x1: INVALID
6:0	RSSI	RSSI measurement on Chain 0 ranging from 0 (lowest RSSI) to 113 (highest RSSI), measured in dB.

0x30000C0 AGC_FIR_RSSI0

Type: read-only

Read out RSSI measured after FIR while not receiving a packet. Invalid bit indicates that RSSI is not current, since a packet is being received. The value is the RSSI stored just before the AGC detected the packet.

AGC_FIR_RSSI0

Bits	Name	Description
8	NAV_BUSY	NAV status which helps software to allow/ignore the sampled rssi value for 11k measurements. 0x0: IDLE 0x1: BUSY
7	INVALID	RSSI0 not current 0x0: VALID 0x1: INVALID
6:0	RSSI	RSSI measurement on Chain 0 ranging from 0 (lowest RSSI) to 113 (highest RSSI), measured in dB.

0x30000C4 AGC_COARSE_DCO_CHAIN0_REAL

Type: read-only
Reset State: 0x0000

This register stores the measured DC offset value from the AGC_POWER module if the value exceeds the th_dco_cal parameter during CORR state and (rx_gain == INIT_GAIN)

AGC_COARSE_DCO_CHAIN0_REAL

Bits	Name	Description
9:0	VALUE	Value of DC offset on the real component of chain 0 measured by the AGC_POWER module Reset State: 0x0000

0x30000C8 AGC_COARSE_DCO_CHAIN0_IMAG

Type: read-only
Reset State: 0x0000

This register stores the measured DC offset value from the AGC_POWER module if the value exceeds the th_dco_cal parameter during CORR state and (rx_gain == INIT_GAIN)

AGC_COARSE_DCO_CHAIN0_IMAG

Bits	Name	Description
9:0	VALUE	Value of DC offset on the imag component of chain 0 measured by the AGC_POWER module Reset State: 0x0000

0x30000CC AGC_INIT_GAIN

Type: read-write
Reset State: 0x0046

Initial gain setting in 1dB steps.

AGC_INIT_GAIN

Bits	Name	Description
6:0	GAIN	Gain setting in 1dB steps. Reset State: 0x0046

0x30000D0 AGC_MAX_GAIN

Type: read-write
Reset State: 0x0046

maximum gain that can be commanded to RF ASIC.

AGC_MAX_GAIN

Bits	Name	Description
6:0	GAIN	For RFIC operation the 7 bits denote 1 dB steps. Reset State: 0x0046

0x30000D4 AGC_GAIN_OFFSET0

Type: read-write
Reset State: 0x0000

receiver gain offset in 1dB steps per chain

AGC_GAIN_OFFSET0

Bits	Name	Description
4:0	VAL	Reset State: 0x0000

0x30000D8 AGC_TR_SW_GAIN_THRESH0

Type: read-write
Reset State: 0x0000

The T/R switch is driven to transmit mode whenever the commanded gain index is below this threshold. Setting this to 0 effectively disables this.

AGC_TR_SW_GAIN_THRESH0

Bits	Name	Description
6:0	GAIN	Reset State: 0x0000

0x30000DC AGC_SAT_STEP

Type: read-write
Reset State: 0x0070

The sat_step field is used to specify the step used to gain the RF Front end down if the RF is saturated. The same value is used to step up the gain if the signal energy is below TH_NO_SIGNAL. This gain step is specified in multiples of 2dB from 0 dB to 128 dB. The enable field is used to switch this functionality on or off.

AGC_SAT_STEP

Bits	Name	Description
7	IGNORE_ADC_CLIP	Normally, a sat step is only taken if a digital (or ADC) clip is also seen at the same time, but if you set this bit to 1, then only the RF sat flag is used. Reset State: 0x0000
6	SAT_STEP_EN	Allow AGC to make gain step when in Vega mode RF front end is in saturation. 0x0: DISABLE 0x1: ENABLE Reset State: 0x0001
5:0	SAT_STEP	Coarse gain step. Default value is 25, or 50dB step for Vega mode Reset State: 0x0030

0x30000E0 AGC_COARSE_STEP_HT

Type: read-write
Reset State: 0x0514

Coarse gain step. Used to step gain down if one chain's ADCs clip. Used to step up if the signal energy is below TH_NO_SIGNAL. Specified in multiples of 4dB steps, from 0 dB to 60 dB.

AGC_COARSE_STEP_HT

Bits	Name	Description
14	VHT_STS_FINE_GAIN_SET_DIS	Enable VHT-STS fine gain setting 0x1: DISABLE 0x0: ENABLE Reset State: 0x0000
13	VHT_STS_COARSE_GAIN_SET_DIS	Enable VHT-STS coarse gain setting 0x1: DISABLE 0x0: ENABLE Reset State: 0x0000
12	HT_STS_GAIN_SET_DIS	Enable HT-STS gain setting 0x1: DISABLE 0x0: ENABLE Reset State: 0x0000
11:6	VHTSTS_STEP	Coarse gain step for 2nd STF in mixed mode packets. Reset State: 0x0014
5:0	HTSTS_STEP	Coarse gain step. Reset State: 0x0014

0x30000E4 AGC_COARSE_STEP

Type: read-write
Reset State: 0x0056

Coarse gain step. Used to step gain down if one chain's ADCs clip. Used to step up if the signal energy is below TH_NO_SIGNAL. Specified in multiples of 4dB steps, from 0 dB to 60 dB.

AGC_COARSE_STEP

Bits	Name	Description
6	COARSE_STEP_EN	Allow AGC to make coarse gain step when digital clip is detected. 0x0: DISABLE 0x1: ENABLE Reset State: 0x0001
5:0	COARSE_STEP	Coarse gain step. Reset State: 0x0016

0x30000E8 AGC_MAX_POWER_DIFF

Type: read-write
Reset State: 0x0004

The value in this register specifies maximum power difference. If the received power on all any antenna is this much less than the power on the strongest antenna, then the AGC limits the gain for the chain with the less power to that corresponding with a power of the strongest power minus the value in this register. This threshold avoids gaining up receive chains with weak signal and thereby blowing up noise. antenna.

AGC_MAX_POWER_DIFF

Bits	Name	Description
3:0	DIFFERENCE	Maximum power difference in 4 dB steps. From 0.. 14*4=56 dB Reset State: 0x0004

0x30000EC AGC_TARGET_BO_ACTIVE

Type: read-write
Reset State: 0x0020

Target Backoff for Listen chains. The gain is set this amount of dBs below the gain that would fully saturate the receiver. The backoff is specified in 0.5 dB steps.

AGC_TARGET_BO_ACTIVE

Bits	Name	Description
5:0	BACK_OFF	Backoff value. Default backoff is 32, or 16 dB. Reset State: 0x0020

0x30000F0 AGC_TARGET_BO_INACTIVE

Type: read-write
Reset State: 0x0024

Target Backoff for Receive chains, that are not listen chains. The gain is set this amount of dBs below the gain that would fully saturate the receiver. This backoff is typically higher than that of listen antennas to accommodate the unknown up-fading on the inactive receive chains. The backoff is specified in 0.5 dB steps.

AGC_TARGET_BO_INACTIVE

Bits	Name	Description
5:0	BACK_OFF	Backoff value. Default backoff is 36, i.e., 18 dB. Reset State: 0x0024

0x30000F4 AGC_TH_CLIP_HIGH

Type: read-write
Reset State: 0x0734

If the output of any of the ADCs is greater than this value the clip flag of the corresponding ADC is asserted.

AGC_TH_CLIP_HIGH

Bits	Name	Description
10:0	THRESHOLD	Clip threshold in offset binary. Example: if the 2's complement threshold is 400(0x190), then the 11-bit offset binary code is 400 + 1024 = 1424, +800 corresponds to 1824 Reset State: 0x0734

0x30000F8 AGC_TH_CLIP_LOW

Type: read-write
Reset State: 0x00CC

If the output of any of the ADCs is less than this value the clip flag of the corresponding ADC is asserted.

AGC_TH_CLIP_LOW

Bits	Name	Description
10:0	THRESHOLD	Clip threshold in offset binary. Example: if the 2's complement threshold is -400, then the 11-bit offset binary code is -400 + 1024 = 624. -800 corresponds to 224 Reset State: 0x00CC

0x30000FC AGC_TH_SIGNAL_HIGH

Type: read-write
Reset State: 0x00B4

AGC compares power with this threshold. If power is higher, a coarse gain reduction is done. In steps of 16384 (2^14).

AGC_TH_SIGNAL_HIGH

Bits	Name	Description
7:0	THRESHOLD	Power threshold. Default value 110 (1802240). Reset State: 0x00B4

0x3000100 AGC_TH_SIGNAL_LOW

Type: read-write
Reset State: 0x0050

AGC compares power with this threshold. If power is lower, a coarse gain reduction is done if the ADCs clip. Specified in steps of 1024 (2^10).

AGC_TH_SIGNAL_LOW

Bits	Name	Description
7:0	THRESHOLD	Power threshold. Default value 60 (61440). Reset State: 0x0050

0x3000104 AGC_TH_HTSTS_CLIP

Type: read-write
Reset State: 0x006E

Minimum ADC power during HT-STS needed for clip detection.

AGC_TH_HTSTS_CLIP

Bits	Name	Description
7:0	THRESHOLD	Power threshold. Default value 110 (1802240). Reset State: 0x006E

0x3000108 AGC_TH_VHTSTS_CLIP

Type: read-write
Reset State: 0x006E

Minimum ADC power during VHT-STS needed for clip detection.

AGC_TH_VHTSTS_CLIP

Bits	Name	Description
7:0	THRESHOLD	Power threshold. Default value 110 (1802240). Reset State: 0x006E

0x300010C AGC_TH_POWER_CLIP

Type: read-write
Reset State: 0x003F

Used to do extra gain reduction if an antenna is clipping, but there is no time to do a coarse step.

AGC_TH_POWER_CLIP

Bits	Name	Description
5:0	THLD	Power clip threshold. Reset State: 0x003F

0x3000110 AGC_SAT_DELAY

Type: read-write
Reset State: 0x000A

AGC_SAT_DELAY

Bits	Name	Description
5:0	TIME	Reset State: 0x000A

0x3000114 AGC_CLIP_WINDOW

Type: read-write
Reset State: 0x0000

AGC_CLIP_WINDOW

Bits	Name	Description
11:6	THRESHOLD	Threshold for the minimum number of clips needed in the window for a true clip to be detected. Reset State: 0x0000
5:0	TIME	Window size in 80MHz clocks that clips are monitored. Reset State: 0x0000

0x3000118 AGC_TH_NO_SIGNAL

Type: read-write
Reset State: 0x0001

Decision Threshold for absence of signal energy, which will result in the AGC stepping up the gain, if it is not already at its maximum setting.

AGC_TH_NO_SIGNAL

Bits	Name	Description
7:0	THRESHOLD	Detection threshold. Default value 1. Reset State: 0x0001

0x300011C AGC_TH_DCO_CAL

Type: read-write
Reset State: 0x000A

This register holds the RSSI threshold to trigger capture of the DCO value measured by AGC_POWER during CORR state

AGC_TH_DCO_CAL

Bits	Name	Description
6:0	THLD	Coarse DCO measurement threshold. Reset State: 0x000A

0x3000120 AGC_DET_DATA_SHIFT

Type: read-write
Reset State: 0x0005

Right shift the data by this amount

AGC_DET_DATA_SHIFT

Bits	Name	Description
3:2	DET11A	Right shift the det11a detector input by this amount Reset State: 0x0001
1:0	DET11B	Right shift the det11b detector input by this amount Reset State: 0x0001

0x3000124 AGC_TH_RXB_PWR_HIGH

Type: read-write
Reset State: 0x0005

This threshold is used to by the AGC to set the digital AGC shift value for det11b and RXB.

AGC_TH_RXB_PWR_HIGH

Bits	Name	Description
5:0	THLD	11B Digital AGC power setting threshold. Reset State: 0x0005

0x3000128 AGC_TH_CW_LOW

Type: read-write
Reset State: 0x0020

The CW detect threshold is set to this value if non of the RSSI values exceeds the th_cw_rssi threshold.

AGC_TH_CW_LOW

Bits	Name	Description
7:0	THRESHOLD	CW detect threshold. Reset State: 0x0020

0x300012C AGC_TH_CW_HIGH

Type: read-write
Reset State: 0x00C8

The CW interference detect threshold is set to this value if one or more of the RSSI values exceeds the th_cw_rssi threshold.

AGC_TH_CW_HIGH

Bits	Name	Description
7:0	THRESHOLD	CW detect threshold. Reset State: 0x00C8

0x3000130 AGC_TH_CW_RSSI

Type: read-write
Reset State: 0x000E

If one of the RSSI values exceeds this threshold, the cd detect threshold is set to th_cw_high. Otherwise the CW detect threshold is set to the_cw_low. The CW detect threshold is updated when an RXA packet or an RXB packet is received.

AGC_TH_CW_RSSI

Bits	Name	Description
6:0	THRESHOLD	RSSI threshold. Reset State: 0x000E

0x3000134 AGC_CW_MODE_DELAY

Type: read-write
Reset State: 0x7D00

Specifies various delays for several operating modes of the CW detector

AGC_CW_MODE_DELAY

Bits	Name	Description
15:8	RADAR_DET_DELAY	Delay before starting cs_det after a pulse detect Reset State: 0x007D

0x3000138 AGC_TH_D0_A

Type: read-write
Reset State: 0x0087

This registers sets the correlation threshold above which the AGC decides an 802.11a packet is being received.

AGC_TH_D0_A

Bits	Name	Description
7:0	THRESHOLD	Reset State: 0x0087

0x300013C AGC_TH_D0_A_LOW

Type: read-write
Reset State: 0x0078

This registers sets the correlation threshold above which the AGC decides an 802.11a packet with high SNR is being received. The purpose of this register is to have a more sensitive and hence faster packet detection, since high SNR signals require two coarse gain steps, which are time consuming.

AGC_TH_D0_A_LOW

Bits	Name	Description
7:0	THRESHOLD	Reset State: 0x0078

0x3000140 AGC_TH_D0_B

Type: read-write
Reset State: 0x008C

This registers sets the correlation threshold above which the AGC decides an 802.11b packet is being received. It can be set lower than the threshold for 11a packets since there is a longer time interval to correlate over.

AGC_TH_D0_B

Bits	Name	Description
7:0	THRESHOLD	Reset State: 0x008C

0x3000144 AGC_TH_D0_B_TF_EST

Type: read-write
Reset State: 0x0050

This registers sets the correlation threshold above which the AGC decides an 802.11b packet is being received during the timing and frequency estimation state. This is a reconfirmation test which reduces the false alarm rate of the AGC for 11b packets. It is generally set lower than the initial threshold for 11b packets since the correlator is to allow margin for a low correlation value which can occur at the moment the correlator output is sampled (at the end of the 10 us tf (time and frequency)-estimation interval).

AGC_TH_D0_B_TF_EST

Bits	Name	Description
7:0	THLD	Reset State: 0x0050

0x3000148 AGC_TH_D0_11N

Type: read-write
Reset State: 0x005A

This registers sets the correlation threshold above which the AGC decides an 802.11n packet is being received

AGC_TH_D0_11N

Bits	Name	Description
7:0	VAL	Reset State: 0x005A

0x300014C AGC_TH_D0_11N_LOW

Type: read-write
Reset State: 0x0078

This registers sets the correlation threshold above which the AGC decides an 802.11n packet is being received

AGC_TH_D0_11N_LOW

Bits	Name	Description
7:0	VAL	Reset State: 0x0078

0x3000150 AGC_TH_D0_11AC

Type: read-write
Reset State: 0x0078

This registers sets the correlation threshold above which the AGC decides an 802.11ac packet is being received

AGC_TH_D0_11AC

Bits	Name	Description
7:0	VAL	Reset State: 0x0078

0x3000154 AGC_TH_D0_11AC_LOW

Type: read-write
Reset State: 0x0078

This registers sets the correlation threshold above which the AGC decides an 802.11ac packet is being received

AGC_TH_D0_11AC_LOW

Bits	Name	Description
7:0	VAL	Reset State: 0x0078

0x3000158 AGC_TH_MAXCORBA

Type: read-write
Reset State: 0x0000

This registers sets the cross check correlation threshold above which the AGC decides between 802.11b vs. 802.11a packet is being received

AGC_TH_MAXCORBA

Bits	Name	Description
7:0	VAL	Reset State: 0x0000

0x300015C AGC_TH_MAXCOR40

Type: read-write
Reset State: 0x00C8

This registers sets the cross check correlation threshold above which the AGC decides between 802.11n40 vs. 802.11a packet is being received

AGC_TH_MAXCOR40

Bits	Name	Description
7:0	VAL	Reset State: 0x00C8

0x3000160 AGC_TH_MAXCORA40

Type: read-write
Reset State: 0x0032

This registers sets the cross check correlation threshold above which the AGC decides between 802.11a and a 802.11n packet is being received

AGC_TH_MAXCORA40

Bits	Name	Description
7:0	VAL	Reset State: 0x0032

0x3000164 AGC_TH_MAXCOR20

Type: read-write
Reset State: 0x00C8

This registers sets the cross check correlation threshold above which the AGC decides between 802.11ac vs. 802.11a packet is being received

AGC_TH_MAXCOR20

Bits	Name	Description
10	DIS	Reset State: 0x0000
9:0	VAL	Reset State: 0x00C8

0x3000168 AGC_TH_MAXCORA80

Type: read-write
Reset State: 0x0032

This registers sets the cross check correlation threshold above which the AGC decides between 802.11a and a 802.11n packet is being received

AGC_TH_MAXCORA80

Bits	Name	Description
7:0	VAL	Reset State: 0x0032

0x300016C AGC_TH_MAXCORAB

Type: read-write
Reset State: 0x0005

For a positive 802.11b packet detection, not only should the auto-correlation value divided by the signal power exceed TH_D0_A (or TH_D0_A_LOW in high SNR), it should also exceed that of the 802.11b bandwidth packet detector multiplied by the value in this register, divided by 256. The default fraction of the double bandwidth detector output that the 802.11b detector should exceed is 0.5 (128/256).

AGC_TH_MAXCORAB

Bits	Name	Description
7:0	THRESHOLD	Reset State: 0x0005

0x3000170 AGC_C11B

Type: read-write
Reset State: 0x00E2

Averaging Parameter for correlation metric of 11b detector. Allowed values are 200-255

AGC_C11B

Bits	Name	Description
7:0	VAL	Reset State: 0x00E2

0x3000174 AGC_C11BP

Type: read-write
Reset State: 0x00FD

Averaging Parameter for power metric of 11b detector. Allowed values are 200-255

AGC_C11BP

Bits	Name	Description
7:0	VAL	Reset State: 0x00FD

0x3000178 AGC_TH_CAP_A

Type: read-write
Reset State: 0x0032

Detection threshold for capture event when reception of current 11a packet has been aborted. Value 0 is disables this check.

AGC_TH_CAP_A

Bits	Name	Description
7:0	LEVEL_JUMP	Delta signal level. Default value 50 (7dB). Reset State: 0x0032

0x300017C AGC_TH_CAP_B

Type: read-write
Reset State: 0x0032

Detection threshold for capture event when reception of current 11b packet has been aborted. Value 0 is disables this check.

AGC_TH_CAP_B

Bits	Name	Description
7:0	LEVEL_JUMP	Delta signal level. Default value 50 (7dB). Reset State: 0x0032

0x3000180 AGC_TH_CAP_RXA

Type: read-write
Reset State: 0x0032

Detection threshold for capture event when 11a packet is being received. Value 0 is disables this check.

AGC_TH_CAP_RXA

Bits	Name	Description
7:0	LEVEL_JUMP	Delta signal level. Default value 50 (7dB). Reset State: 0x0032

0x3000184 AGC_TH_CAP_RXB

Type: read-write
Reset State: 0x0032

Detection threshold for capture event when 11b packet is being received. Value 0 is disables this check.

AGC_TH_CAP_RXB

Bits	Name	Description
7:0	LEVEL_JUMP	Delta signal level. Default value 50 (7dB). Reset State: 0x0032

0x3000188 AGC_TH_PIP_PWR_JUMP

Type: read-write
Reset State: 0x0000

Threshold for power jump to detect for a packet-in-packet case

AGC_TH_PIP_PWR_JUMP

Bits	Name	Description
7:0	VAL	Reset State: 0x0000

0x300018C AGC_TH_EOP_LVL_DROP

Type: read-write
Reset State: 0x0010

Threshold for signal level drop to detect end of packet in the case of a corrupted length field.

AGC_TH_EOP_LVL_DROP

Bits	Name	Description
7:0	EOP_LVL_DROP	Delta signal level Default value 16 (12dB). Reset State: 0x0010

0x3000190 AGC_TH_CORR_DROP

Type: read-write
Reset State: 0x0000

AGC compares power with this threshold. If power is lower, in correlation state then an 802.11a trigger is ignored.

AGC_TH_CORR_DROP

Bits	Name	Description
7:0	THRESHOLD	Power drop threshold. Default value 0 (i.e., disabled). Reset State: 0x0000

0x3000194 AGC_CORR_TIME

Type: read-write
Reset State: 0x0190

This register specifies the time, in increments of 25ns, which the AGC can spend correlating if an energy jump has been detected in the AGC state.

AGC_CORR_TIME

Bits	Name	Description
11:0	TIME	Correlation Time. Default value is 400, i.e., 10 microseconds. Reset State: 0x0190

0x3000198 AGC_ALL_RX_ON_TIME

Type: read-write
Reset State: 0x0019

Time to leave all antennas on after a set_all_rx command. Units are in 0.8us steps.

AGC_ALL_RX_ON_TIME

Bits	Name	Description
5:0	DELAY	Reset State: 0x0019

0x300019C AGC_TRIGGER_DELAY

Type: read-write
Reset State: 0x0014

Detector triggers are ignored for a time specified by this register after a set_all_rx command. This enables the detectors to build up a reliable power estimate.

AGC_TRIGGER_DELAY

Bits	Name	Description
4:0	TIME	Delay in 100ns increments. Reset State: 0x0014

0x30001A0 AGC_PWR_NOTCH_ALPHA1

Type: read-write
Reset State: 0x012C

AGC_PWR_NOTCH_ALPHA1

Bits	Name	Description
8:0	ALPHA	Reset State: 0x012C

0x30001A4 AGC_PWR_NOTCH_ALPHA2

Type: read-write
Reset State: 0x01FF

AGC_PWR_NOTCH_ALPHA2

Bits	Name	Description
8:0	ALPHA	Reset State: 0x01FF

0x30001A8 AGC_PWR_NOTCH_T_ALPHA

Type: read-write
Reset State: 0x0008

AGC_PWR_NOTCH_T_ALPHA

Bits	Name	Description
9	BYPASS	0x0: ENABLE 0x1: BYPASS Reset State: 0x0000
8:0	TIME	Reset State: 0x0008

0x30001AC AGC_D_TX_SETTLE

Type: read-write
Reset State: 0x0028

Ranges from 0 to 12.775 micro seconds.

AGC_D_TX_SETTLE

Bits	Name	Description
8:0	DELAY	Propagation time in 25ns units. Reset State: 0x0028

0x30001B0 AGC_D_UNSATURATED

Type: read-write
Reset State: 0x0010

Gain settling delay for RF RX non-saturated RX FE. Settling time in increments of 25 ns (40 MHz samples) Ranges from 0 to 1.575 micro seconds.

AGC_D_UNSATURATED

Bits	Name	Description
5:0	DELAY	Settling time in 25ns units. Reset State: 0x0010

0x30001B4 AGC_D_SATURATED

Type: read-write
Reset State: 0x0010

Gain settling delay for RF RX saturated RX FE. Settling time in increments of 25 ns (40 MHz samples) Ranges from 0 to 1.575 micro seconds.

AGC_D_SATURATED

Bits	Name	Description
5:0	DELAY	Settling time in 25ns units. Reset State: 0x0010

0x30001B8 AGC_D_FIRANDCAL

Type: read-write
Reset State: 0x0010

RXFIR and CAL propagation delay. Ranges from 0 to 1.575 micro seconds.

AGC_D_FIRANDCAL

Bits	Name	Description
5:0	DELAY	Propagation time in 25ns units. Default value is 14, corresponding to 350 ns. Reset State: 0x0010

0x30001BC AGC_D_HT_STS_COARSE_MEAS

Type: read-write
Reset State: 0x0028

AGC_D_HT_STS_COARSE_MEAS

Bits	Name	Description
7:0	TIME	Settling time in 25ns units. Reset State: 0x0028

0x30001C0 AGC_D_HT_STS_FINE_MEAS

Type: read-write
Reset State: 0x0064

AGC_D_HT_STS_FINE_MEAS

Bits	Name	Description
7:0	TIME	Settling time in 25ns units. Reset State: 0x0064

0x30001C4 AGC_D_VHT_STS_COARSE_MEAS

Type: read-write
Reset State: 0x0028

AGC_D_VHT_STS_COARSE_MEAS

Bits	Name	Description
7:0	TIME	Settling time in 25ns units. Reset State: 0x0028

0x30001C8 AGC_D_VHT_STS_FINE_MEAS

Type: read-write
Reset State: 0x0066

AGC_D_VHT_STS_FINE_MEAS

Bits	Name	Description
7:0	TIME	Settling time in 25ns units. Reset State: 0x0066

0x30001CC AGC_D_VHT_DET_TIME

Type: read-write
Reset State: 0x008E

AGC_D_VHT_DET_TIME

Bits	Name	Description
7:0	TIME	Max time in 25ns units that VHT detection is allowed from the start of the VHT-STS. Reset State: 0x008E

0x30001D0 AGC_SIFS_TIME_A

Type: read-write
Reset State: 0x0028

This register specifies the time in 25 ns increments, that the receiver is insensitive after the reception of an IEEE802.11a packet. This value may be set to zero which increases false detection probability of ACK packets, but which allows receptions of packets with a non-standard interframe spacing.

AGC_SIFS_TIME_A

Bits	Name	Description
9:0	SIFS_A	SIFS time. Default value is 40, or 1 micro seconds (16 us as per 11a standard - 4us CCA hangover time). 0x0: MIN 0x1: STEP 0x3FF: MAX Reset State: 0x0028

0x30001D4 AGC_SIFS_TIME_B

Type: read-write
Reset State: 0x0028

This register specifies the time in 25 ns increments, that the receiver is insensitive after the reception of an IEEE802.11b packet. This value may be set to zero which increases false detection probability of ACK packet, but which allows receptions of packets with a non-standard interframe spacing.

AGC_SIFS_TIME_B

Bits	Name	Description
9:0	SIFS_B	SIFS time. Default value is 40, or 1 micro seconds. 0x0: MIN 0x1: STEP 0x3FF: MAX Reset State: 0x0028

0x30001D8 AGC_MAX_RX_TIME_A

Type: read-write
Reset State: 0x01AD

Max receive time of an 11a packet in 12.8 us increments. Used to prevent lockup of the AGC state machine when it is unable to determine end of packet in the case of a corrupted length field when no end of packet level drop is detected.

AGC_MAX_RX_TIME_A

Bits	Name	Description
11:0	MAX_RX_TIME	Max RX time. Default value 20+4096*8/6=5482 (6 Mbit/s packet of 4096 bytes plus OFDM preamble) and 429*12.8=5491.2) Reset State: 0x01AD

0x30001DC AGC_MAX_RX_TIME_B

Type: read-write
Reset State: 0x0A10

Max receive time of an 11b packet in 25.6 us increments. Used to prevent lockup of the AGC state machine when it is unable to determine end of packet in the case of a corrupted length field when no end of packet level drop is detected.

AGC_MAX_RX_TIME_B

Bits	Name	Description
11:0	MAX_RX_TIME	Max RX time. Default value 192+4096*8=32960 (1 Mbit/s packet of 4096 bytes plus long preamble) and 2576*12.8=32973) Reset State: 0x0A10

0x30001E0 AGC_WLAN_POS_EN

Type: read-write
Reset State: 0x0000

Enable for WLAN positioning feature

AGC_WLAN_POS_EN

Bits	Name	Description
0	ENABLE	Reset State: 0x0000

0x30001E4 AGC_WLAN_POS_OFFSET_11B

Type: read-write
Reset State: 0x0040

Offset applied to SIFS time measured for 11b packets.

AGC_WLAN_POS_OFFSET_11B

Bits	Name	Description
6:0	OFFSET	In 25ns steps. Reset State: 0x0040

0x30001E8 AGC_WLAN_POS_OFFSET_11A

Type: read-write
Reset State: 0x0040

Offset applied to SIFS time measured for 11a/n 20MHz packets.

AGC_WLAN_POS_OFFSET_11A

Bits	Name	Description
6:0	OFFSET	In 25ns steps. Reset State: 0x0040

0x30001EC AGC_WLAN_POS_OFFSET_11N

Type: read-write
Reset State: 0x0040

Offset applied to SIFS time measured for 11n 40MHz packets.

AGC_WLAN_POS_OFFSET_11N

Bits	Name	Description
6:0	OFFSET	In 25ns steps. Reset State: 0x0040

0x30001F0 AGC_WLAN_POS_OFFSET_11AC

Type: read-write
Reset State: 0x0040

Offset applied to SIFS time measured for 11ac 80MHz packets.

AGC_WLAN_POS_OFFSET_11AC

Bits	Name	Description
6:0	OFFSET	In 25ns steps. Reset State: 0x0040

0x30001F4 AGC_WLAN_POS_STATUS

Type: read-only

AGC_WLAN_POS_STATUS

Bits	Name	Description
9:0	SIFS_TIME	Measured SIFS time in 25ns steps. To clear this value, set the wlan_pos_en register to 0.

0x30001F8 AGC_RDET_RSSI_THRESHOLD

Type: read-write
Reset State: 0x007F

If the maximum of the N_LISTEN RSSI inputs as calculated by the power block in the AGC exceeds the value in the up threshold field of this register, a start of pulse is flagged to the pulse train detector. When the max RSSI sinks below the value of the down threshold field, the end of pulse is flagged. If both thresholds are set to 0, the analog pulse detector (in the Mars RF ASIC) is used instead. The start of the pulse is detected on the rising edge of this signal. The end of the pulse is detected on the falling edge.

AGC_RDET_RSSI_THRESHOLD

Bits	Name	Description
13:7	DET_THLD_DN	Pulse detection threshold. Reset State: 0x0000
6:0	DET_THLD_UP	Pulse detection threshold. Reset State: 0x007F

0x30001FC AGC_RDET_MIN_IAT_WRITE

Type: read-write
Reset State: 0x6F7C

This register defines the maximum inter-arrival time between radar pulses, measured in multiples of 128 samples. Pulse that arrive after the previous pulse within a time less than the value in this register are ignored by the radar pulse train detector. If set equal to max_iat, then this register has no effect on the operation of the radar detector. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

AGC_RDET_MIN_IAT_WRITE

Bits	Name	Description
15:0	MIN_IAT	Minimum Inter-arrival time. default is 0.499 ms (radar type 3). 0x1: STEP_SIZE Reset State: 0x6F7C

0x3000200 AGC_RDET_MAX_IAT_WRITE

Type: read-write
Reset State: 0x01BF

This register defines the maximum inter-arrival time between radar pulses, measured in multiples of 128 samples. If this time is exceeded, then the radar detector assumes the pulse train has ended and checks whether more than min_pulse_train_count1 pulses have been counted. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

AGC_RDET_MAX_IAT_WRITE

Bits	Name	Description
15:0	MAX_IAT	Maximum Inter-arrival time. Default is 3.072 (ms radar type 1). 0x1: STEP_SIZE Reset State: 0x01BF

0x3000204 AGC_RDET_PULSE_WIDTH_MARGIN_WRITE

Type: read-write
Reset State: 0x0005

When the first pulse of a train arrives, its duration is stored. Subsequent pulses' durations are compared to this first one. If a pulse of a different length is encountered, the pulse train ends. The comparison uses a margin as defined by this register. The check performed is if abs (current_pulse_duration - first_pulse_duration) <= this register then the current pulse does not break the train, and the pulse counter is increased. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

AGC_RDET_PULSE_WIDTH_MARGIN_WRITE

Bits	Name	Description
7:0	PW_MRGN	Pulse width margin. Reset State: 0x0005

0x3000208 AGC_RDET_MIN_PULSE_TRAIN_COUNT1_WRITE

Type: read-write
Reset State: 0x0004

If a radar pulse train ends because the maximum inter-arrival time has expired, the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

AGC_RDET_MIN_PULSE_TRAIN_COUNT1_WRITE

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold. Reset State: 0x0004

0x300020C AGC_RDET_MIN_PULSE_TRAIN_COUNT2_WRITE

Type: read-write
Reset State: 0x0004

If a radar pulse train ends because a pulse of different duration as the first pulse in the train is detected, the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

AGC_RDET_MIN_PULSE_TRAIN_COUNT2_WRITE

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold. Reset State: 0x0004

0x3000210 AGC_RDET_MIN_PULSE_TRAIN_COUNT3_WRITE

Type: read-write
Reset State: 0x0004

If a radar a pulse is detected the number of pulses counted is increased. If the number of pulses counted is greater than or equal to this register's contents, then the radar detection flag is raised. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

AGC_RDET_MIN_PULSE_TRAIN_COUNT3_WRITE

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold. Reset State: 0x0004

0x3000214 AGC_RDET_MIN_PULSE_TRAIN_COUNT4_WRITE

Type: read-write
Reset State: 0x0000

If a pulse arrives before the minimum inter-arrival time has expired the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. Special values are provided to simply ignore radar pulses which arrive within the minimum arrival time or to reset the pulse counter without comparing the current pulse count with this register. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

AGC_RDET_MIN_PULSE_TRAIN_COUNT4_WRITE

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold. Default is 0 0x0: NO_RESET 0xFFFF: NO_CHECK Reset State: 0x0000

0x3000218 AGC_RDET_MIN_RADAR_PULSE_WIDTH_WRITE

Type: read-write
Reset State: 0x0012

Minimum radar pulse width, specified in samples. When the end of a pulse is detected, its duration is compared to the contents of this registers. When the pulse duration is less than or equal to the this register's content, the pulse is ignored. This mechanism is to ensure that short glitches (for instance ripple on a pulse which is just on the rssi_threshold level) or a rapidly switching clip detect signal are ignored. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

AGC_RDET_MIN_RADAR_PULSE_WIDTH_WRITE

Bits	Name	Description
15:0	MIN_PW	Minimum pulse width. Reset State: 0x0012

0x300021C AGC_RDET_MAX_RADAR_PULSE_WIDTH_WRITE

Type: read-write
Reset State: 0x0016

Maximum radar pulse width, specified in samples. When the end of a pulse is detected, its duration is compared to the contents of this registers. When the pulse duration is greater than or equal to the this register's content, the pulse is ignored. This mechanism is to ensure that packet transmissions (typically of much longer duration as radar pulses) are not counted as radar pulses. Setting this register to 0 will disable the radar detector. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

AGC_RDET_MAX_RADAR_PULSE_WIDTH_WRITE

Bits	Name	Description
15:0	MAX_PW	Maximum pulse width. Reset State: 0x0016

0x3000220 AGC_RDET_MIN_IAT_READ

Type: read-only

This register defines the maximum inter-arrival time between radar pulses, measured in multiples of 128 samples. Pulse that arrive after the previous pulse within a time less than the value in this register are ignored by the radar pulse train detector. If set equal to max_iat, then this value has no effect on the operation of the radar detector. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

AGC_RDET_MIN_IAT_READ

Bits	Name	Description
15:0	MIN_IAT	Minimum Inter-arrival time. default is 0.499 ms (radar type 3). 0x1: STEP_SIZE

0x3000224 AGC_RDET_MAX_IAT_READ

Type: read-only

This register defines the maximum inter-arrival time between radar pulses, measured in multiples of 128 samples. If this time is exceeded, then the radar detector assumes the pulse train has ended and checks whether more than min_pulse_train_count1 pulses have been counted. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

AGC_RDET_MAX_IAT_READ

Bits	Name	Description
15:0	MAX_IAT	Maximum Inter-arrival time. Default is 3.072 (ms radar type 1). 0x1: STEP_SIZE

0x3000228 AGC_RDET_PULSE_WIDTH_MARGIN_READ

Type: read-only

When the first pulse of a train arrives, its duration is stored. Subsequent pulses' durations are compared to this first one. If a pulse of a different length is encountered, the pulse train ends. The comparison uses a margin as defined by this register. The check performed is if abs (current_pulse_duration - first_pulse_duration) <= this register then the current pulse does not break the train, and the pulse counter is increased. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

AGC_RDET_PULSE_WIDTH_MARGIN_READ

Bits	Name	Description
7:0	PW_MRGN	Pulse width margin.

0x300022C AGC_RDET_MIN_PULSE_TRAIN_COUNT1_READ

Type: read-only

If a radar pulse train ends because the maximum inter-arrival time has expired, the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

AGC_RDET_MIN_PULSE_TRAIN_COUNT1_READ

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold.

0x3000230 AGC_RDET_MIN_PULSE_TRAIN_COUNT2_READ

Type: read-only

If a radar pulse train ends because a pulse of different duration as the first pulse in the train is detected, the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

AGC_RDET_MIN_PULSE_TRAIN_COUNT2_READ

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold.

0x3000234 AGC_RDET_MIN_PULSE_TRAIN_COUNT3_READ

Type: read-only

If a radar a pulse is detected the number of pulses counted is increased. If the number of pulses counted is greater than or equal to this register's contents, then the radar detection flag is raised. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

AGC_RDET_MIN_PULSE_TRAIN_COUNT3_READ

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold.

0x3000238 AGC_RDET_MIN_PULSE_TRAIN_COUNT4_READ

Type: read-only

If a pulse arrives before the minimum inter-arrival time has expired the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. Special values are provided to simply ignore radar pulses which arrive within the minimum arrival time or to reset the pulse counter without comparing the current pulse count with this register. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

AGC_RDET_MIN_PULSE_TRAIN_COUNT4_READ

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold. Default is 0 0x0: NO_RESET 0xFFFF: NO_CHECK

0x300023C AGC_RDET_MIN_RADAR_PULSE_WIDTH_READ

Type: read-only

Minimum radar pulse width, specified in samples. When the end of a pulse is detected, its duration is compared to the contents of this registers. When the pulse duration is less than or equal to the this register's content, the pulse is ignored. This mechanism is to ensure that short glitches (for instance ripple on a pulse which is just on the rssi_threshold level) or a rapidly switching clip detect signal are ignored. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

AGC_RDET_MIN_RADAR_PULSE_WIDTH_READ

Bits	Name	Description
15:0	MIN_PW	Minimum pulse width.

0x3000240 AGC_RDET_MAX_RADAR_PULSE_WIDTH_READ

Type: read-only

Maximum radar pulse width, specified in samples. When the end of a pulse is detected, its duration is compared to the contents of this registers. When the pulse duration is greater than or equal to the this register's content, the pulse is ignored. This mechanism is to ensure that packet transmissions (typically of much longer duration as radar pulses) are not counted as radar pulses. Setting this register to 0 will disable the radar detector. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

AGC_RDET_MAX_RADAR_PULSE_WIDTH_READ

Bits	Name	Description
15:0	MAX_PW	Maximum pulse width.

0x3000244 AGC_RDET_RESET

Type: read-write
Reset State: 0x08FF

Reset the radar detector to its initial state by writing a 1 followed by a zero to bit 0 in this register. Writing a 1 will disable the radar detector. The radar detector is disabled by default.

AGC_RDET_RESET

Bits	Name	Description
14	DET_WRITE	Train detector APB write bit. 0x0: DIS 0x1: EN Reset State: 0x0000
13:11	RSSI_MODE	Configure RSSI combination mode. 0x0: RSSI0 0x1: MAX_RSSI 0x2: MIN_RSSI Reset State: 0x0001
10:8	DET_SEL	Select train detector to program. 0x7: SEL7 0x6: SEL6 0x5: SEL5 0x4: SEL4 0x3: SEL3 0x2: SEL2 0x1: SEL1 0x0: SEL0 Reset State: 0x0000
7:0	DET_RST	8'b0xxxxxxx -> enable7 (Enable train detector 7) 8'b1xxxxxxx -> disable7 (Disable train detector 7) 8'bx0xxxxxx -> enable6 (Enable train detector 6) 8'bx1xxxxxx -> disable6 (Disable train detector 6) 8'bxx0xxxxx -> enable5 (Enable train detector 5) 8'bxx1xxxxx -> disable5 (Disable train detector 5) 8'bxxx0xxxx -> enable4 (Enable train detector 4) 8'bxxx1xxxx -> disable4 (Disable train detector 4) 8'bxxxx0xxx -> enable3 (Enable train detector 3) 8'bxxxx1xxx -> disable3 (Disable train detector 3) 8'bxxxxx0xx -> enable2 (Enable train detector 2) 8'bxxxxx1xx -> disable2 (Disable train detector 2) 8'bxxxxxx0x -> enable1 (Enable train detector 1) 8'bxxxxxx1x -> disable1 (Disable train detector 1) 8'bxxxxxxx0 -> enable0 (Enable train detector and rest of radar detector) 8'bxxxxxxx1 -> disable0 (Disable train detector and rest of radar detector) Enable/Disable of radar detector and train detector instantiations. Reset State: 0x00FF

0x3000248 AGC_RDET_RADAR_DETECTED

Type: read-only

When this bit is set a radar pulse train has been detected. This bit must be reset by the radar detection (interrupt) services routine by writing a '1' into the dflag_rst register.

AGC_RDET_RADAR_DETECTED

Bits	Name	Description
5:3	TRIGGER_DET	Number of detector instance that triggered the radar detector.
2:1	TRIGGER_SRC	Trigger source. For debugging purposes this field display the reason why the radar detector triggered. 0x1: C1 0x2: C2 0x3: C3 0x0: C4
0	PULSE_DET	Detection bit. 0x0: IDEL 0x1: PDET

0x300024C AGC_RDET_PULSEWIDTH

Type: read-only

This register specifies the width of the first pulse in the detected pulse train. All other pulses in the train have an equal with, to within the pulse_width_margin.

AGC_RDET_PULSEWIDTH

Bits	Name	Description
15:0	PULSE_WIDTH	Pulse width.

0x3000250 AGC_RDET_NUM_DETECTED

Type: read-only

This register reports the number of pulses counted by the radar detection algorithm.

AGC_RDET_NUM_DETECTED

Bits	Name	Description
15:0	NUM_DET	Number of pulses counted.

0x3000254 AGC_RDET_MEASUREMENT_DELAY

Type: read-write
Reset State: 0x0020

This register configures the time interval (measured in rssi samples) after which the radar detector measures rssi level after it returns to the CORR state after a gain set due to a clip event. It can not

evaluate RSSI immediately since the RSSI circuit comes out of reset when the CORR state is entered. Therefore it takes time for the RSSI to ramp up (about 32 samples). The time programmed in this register should be larger than the RSSI ramp up time.

AGC_RDET_MEASUREMENT_DELAY

Bits	Name	Description
8	CORR_FLAG_BYPASS	Correlation flag function bypass. If asserted, the correlation flag function in the RDET pulse detector (used to delay transition of the main state machine from IDLE to CLIP_S1) will be bypassed. Default setting = 1'b0. Reset State: 0x0000
7:0	TIME	Measurement delay. Reset State: 0x0020

0x3000258 AGC_RDET_FLAG_RESET

Type: command
Reset State: 0x0000

This register contains 2 bits that control the operation of the radar detector.

AGC_RDET_FLAG_RESET

Bits	Name	Description
0	DFLAG_RST	Reset detector flag. While the detector flag is set further radar detects are ignored and the num_detected and pulse width registers are not updated. By writing a 1 to this register, the detector flag is reset and will be set when the next radar burst is detected. 0x0: NORMAL 0x1: RESET Reset State: 0x0000

0x300025C AGC_RSSI_THRESHOLD_CLIPPED

Type: read-write
Reset State: 0x0000

RSSI threshold for clipped pulses

AGC_RSSI_THRESHOLD_CLIPPED

Bits	Name	Description
13:7	DET_THLD_DN	Pulse detection threshold. Reset State: 0x0000

AGC_RSSI_THRESHOLD_CLIPPED (cont.)

Bits	Name	Description
6:0	DET_THLD_UP	Pulse detection threshold. Reset State: 0x0000

0x3000260 AGC_CW_PULSE_WIDTH

Type: read-write
Reset State: 0x0019

When the radar detector's pulse detector detects a radar pulse it monitors the CW detect flag. When this flag is set the pulse detector sets a local flag called cw_detected. When at the end of the radar pulse, the cw_detected flag is still not set, the in the pulse is discounted as a radar pulse (which should be narrow-band) and the pulse_cancel output is asserted. Some pulses are too short to perform a cw detection on. The cw detection time is the sum of the sample data gathering time (which is programmed in CSR cw_radar_delay) and the fft and cw detect calculation time. If the pulse duration is less than the number in this register, then the radar detector'S pulse detector assumes that the detected pulse is a radar pulse. The radar detector's train detectors may still reject is because it is not in between the minimum and maximum radar pulse width.

AGC_CW_PULSE_WIDTH

Bits	Name	Description
7:0	VAL	Duration of data gathering and calculation time for cw detection, specified in multiples of 0.8 us (16 20 Mhz sample). Reset State: 0x0019

0x3000264 AGC_CW_RADAR

Type: read-write
Reset State: 0x007D

This register configures if and with what delay the radar detector can start the CW detector.

AGC_CW_RADAR

Bits	Name	Description
9	DET_DIS	Disables control of the CW detector by the radar detector. Reset State: 0x0000
8:0	DELAY	Amount of delay in 40 MHz samples between start pulse of the radar detector and the time that the CW detector starts calculating. Reset State: 0x007D

0x3000268 AGC_ACI_DETECT_TH

Type: read-write
Reset State: 0x0148

When detecting a radar pulse, the radar detector's pulse detector calculates the difference between the total (pre FIR) RSSI and the in-band (post FIR) RSSI. If this difference exceeds the threshold programmed in this register, the aci_detect flag is asserted. If, during a radar pulse, the ratio of the total time that this flag is asserted and the pulse's duration exceeds the second threshold specified in this register, then the radar detector decides that this pulse was in the adjacent channel. The rain detector will then ignored this pulse. This mechanism help to avoid false triggers on packet traffic, interference and radar pulses in the adjacent channel. This type of false triggers would have the adverse effect that the radar detector would vacate a clean channel because a noisy neighbor.

AGC_ACI_DETECT_TH

Bits	Name	Description
12	DETECT_DIS	0x1: DISABLE 0x0: ENABLE Reset State: 0x0000
11:4	TH_RSSI_ACI	This register field specifies the RSSI delta which the pre and post FIR RSSI should differ by, to be considered adjacent channel power. Reset State: 0x0014
3:0	ACI_FRACTION	This register field specifies the fractional threshold that the pre and post FIR RSSI difference should exceed to be counted as ACI (Adjacent Channel Interference). This threshold is specified in integer multiples of 1/16-this. For example, a value of 8 means that the RSSI should differ by more than th_rss_aci for more than 50% of the duration of the detected radar pulse for it to ruled ACI. Reset State: 0x0008

0x300026C AGC_TRANSITION_COUNT_GLOBAL_EN

Type: read-write
Reset State: 0x0001

This is a global enable/disable for all transition counters. This is useful for freezing the counters at the same time instant before reading or writing to them.

AGC_TRANSITION_COUNT_GLOBAL_EN

Bits	Name	Description
0	ENABLE	Reset State: 0x0001

0x3000270 AGC_TRANSITION_COUNT0_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 0. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT0_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x3000274 AGC_TRANSITION_COUNT1_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 1. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT1_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x3000278 AGC_TRANSITION_COUNT2_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 2. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT2_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x300027C AGC_TRANSITION_COUNT3_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 3. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT3_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x3000280 AGC_TRANSITION_COUNT4_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 4. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT4_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000

AGC_TRANSITION_COUNT4_EN (cont.)

Bits	Name	Description
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x3000284 AGC_TRANSITION_COUNT5_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 5. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT5_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x3000288 AGC_TRANSITION_COUNT6_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 6. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT6_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x300028C AGC_TRANSITION_COUNT7_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 7. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT7_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x3000290 AGC_TRANSITION_COUNT8_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 8. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT8_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x3000294 AGC_TRANSITION_COUNT9_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 9. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT9_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x3000298 AGC_TRANSITION_COUNT10_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 10. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT10_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x300029C AGC_TRANSITION_COUNT11_EN

Type: read-write
Reset State: 0x0000

Control word for state transition counter 11. This counter can be triggered on any transition between any 2 AGC states.

AGC_TRANSITION_COUNT11_EN

Bits	Name	Description
10	ENABLE	Enables counter. Reset State: 0x0000

AGC_TRANSITION_COUNT11_EN (cont.)

Bits	Name	Description
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x30002A0 AGC_TRANSITION_COUNT0

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT0

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002A4 AGC_TRANSITION_COUNT1

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT1

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002A8 AGC_TRANSITION_COUNT2

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT2

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002AC AGC_TRANSITION_COUNT3

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT3

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002B0 AGC_TRANSITION_COUNT4

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT4

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002B4 AGC_TRANSITION_COUNT5

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT5

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002B8 AGC_TRANSITION_COUNT6

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT6

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002BC AGC_TRANSITION_COUNT7

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT7

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002C0 AGC_TRANSITION_COUNT8

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT8

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002C4 AGC_TRANSITION_COUNT9

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT9

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002C8 AGC_TRANSITION_COUNT10

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT10

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002CC AGC_TRANSITION_COUNT11

Type: write-only

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

AGC_TRANSITION_COUNT11

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x30002D0 AGC_NOISE_HIST_CTRL

Type: read-write
Reset State: 0x0001

Controls various modes of operation of the noise histogram module. It can be reset and stopped, it can be read out and reset, it can read out without being reset, and it can be read out, reset and stopped.

AGC_NOISE_HIST_CTRL

Bits	Name	Description
2	READ_AND_CLEAR	When this bit is set and the read_pulse bit is written to, the current noise histogram bin counter values are latched into the rssi status registers, the noise histogram counters are reset and noise histogram collection continues. Reset State: 0x0000
1	READOUT	When this bit is set and the read_pulse bit is written to, the current noise histogram bin counter values are latched into to the rssi status registers. Noise histogram collection continues. Reset State: 0x0000
0	RESET	When this bit is set the current noise histogram bin counter values are written to the rssi status registers, the noise histogram collection is halted and the counters are reset. Reset State: 0x0001

0x30002D4 AGC_NOISE_HIST_BIN0_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 0. Most significant 10 bits.

AGC_NOISE_HIST_BIN0_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x30002D8 AGC_NOISE_HIST_BIN0_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 0. Least significant 16 bits.

AGC_NOISE_HIST_BIN0_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x30002DC AGC_NOISE_HIST_BIN1_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 1. Most significant 10 bits.

AGC_NOISE_HIST_BIN1_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x30002E0 AGC_NOISE_HIST_BIN1_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 1. Least significant 16 bits.

AGC_NOISE_HIST_BIN1_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x30002E4 AGC_NOISE_HIST_BIN2_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 2. Most significant 10 bits.

AGC_NOISE_HIST_BIN2_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x30002E8 AGC_NOISE_HIST_BIN2_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 2. Least significant 16 bits.

AGC_NOISE_HIST_BIN2_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x30002EC AGC_NOISE_HIST_BIN3_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 3. Most significant 10 bits.

AGC_NOISE_HIST_BIN3_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x30002F0 AGC_NOISE_HIST_BIN3_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 3. Least significant 16 bits.

AGC_NOISE_HIST_BIN3_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x30002F4 AGC_NOISE_HIST_BIN4_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 4. Most significant 10 bits.

AGC_NOISE_HIST_BIN4_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x30002F8 AGC_NOISE_HIST_BIN4_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 4. Least significant 16 bits.

AGC_NOISE_HIST_BIN4_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x30002FC AGC_NOISE_HIST_BIN5_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 5. Most significant 10 bits.

AGC_NOISE_HIST_BIN5_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x3000300 AGC_NOISE_HIST_BIN5_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 5. Least significant 16 bits.

AGC_NOISE_HIST_BIN5_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x3000304 AGC_NOISE_HIST_BIN6_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 6. Most significant 10 bits.

AGC_NOISE_HIST_BIN6_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x3000308 AGC_NOISE_HIST_BIN6_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 6. Least significant 16 bits.

AGC_NOISE_HIST_BIN6_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x300030C AGC_NOISE_HIST_BIN7_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 7. Most significant 10 bits.

AGC_NOISE_HIST_BIN7_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x3000310 AGC_NOISE_HIST_BIN7_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 7. Least significant 16 bits.

AGC_NOISE_HIST_BIN7_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x3000314 AGC_NOISE_HIST_BIN8_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 8. Most significant 10 bits.

AGC_NOISE_HIST_BIN8_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x3000318 AGC_NOISE_HIST_BIN8_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 8. Least significant 16 bits.

AGC_NOISE_HIST_BIN8_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x300031C AGC_NOISE_HIST_BIN9_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 9. Most significant 10 bits.

AGC_NOISE_HIST_BIN9_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x3000320 AGC_NOISE_HIST_BIN9_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 9. Least significant 16 bits.

AGC_NOISE_HIST_BIN9_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x3000324 AGC_NOISE_HIST_BIN10_MSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 10. Most significant 10 bits.

AGC_NOISE_HIST_BIN10_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x3000328 AGC_NOISE_HIST_BIN10_LSW

Type: read-only

Counts RSSI samples within IPI (idle power indicator) level 10. Least significant 16 bits.

AGC_NOISE_HIST_BIN10_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x300032C AGC_NOISE_HIST_BUSY_MSW

Type: read-only

Counts microseconds during noise histogram collection during which no noise is measured because a packet is transmitted, received or NAV is busy. Most significant 10 bits.

AGC_NOISE_HIST_BUSY_MSW

Bits	Name	Description
9:0	COUNT	IPI level counter value.

0x3000330 AGC_NOISE_HIST_BUSY_LSW

Type: read-only

Counts microseconds during noise histogram collection during which no noise is measured because a packet is transmitted, received or NAV is busy. Least significant 16 bits.

AGC_NOISE_HIST_BUSY_LSW

Bits	Name	Description
15:0	COUNT	IPI level counter value.

0x3000334 AGC_WATCHDOG_MASK

Type: read-write
Reset State: 0x0001

This register is used to mask the watchdog-driven reset of the AGC state machine. When the reset is not masked, an expiry of the AGC watchdog timer will set the timeout state register, generate an interrupt and reset the AGC state machine. When the reset is masked, an expiry of the AGC watchdog timer will set the timeout state register, generate an interrupt, but will not reset the AGC state machine. This functionality is intended for debugging purposes when the AGC state machine

needs to remain in the hanging state so the various conditions that may have lead to the hangup can be studied before they are automatically reset by the watchdog timer.

AGC_WATCHDOG_MASK

Bits	Name	Description
0	MASK	0x0: UNMASKED 0x1: MASKED Reset State: 0x0001

0x3000338 AGC_TIMEOUT_STATE

Type: read-only

AGC state in which watchdog timer expired.

AGC_TIMEOUT_STATE

Bits	Name	Description
4:0	STATE	AGC State.

0x300033C AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A20

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the WAIT_DCO_A state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A20

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2 * 12.5 ns = 6.375 us. Reset State: 0x0000

0x3000340 AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A40

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the WAIT_DCO_A40 state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A40

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2 * 12.5 ns = 6.375 us. Reset State: 0x0000

0x3000344 AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A80

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the WAIT_DCO_A80 state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A80

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2 * 12.5 ns = 6.375 us. Reset State: 0x0000

0x3000348 AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_B

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the WAIT_DCO_B state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_B

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2 * 12.5 ns = 6.375 us. Reset State: 0x0000

0x300034C AGC_AGC_WATCHDOG_TIMEOUT_WAIT_A

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the WAIT_A state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_WAIT_A

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 8 (2^3) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2^3 * 25 ns = 51 us. Reset State: 0x0000

0x3000350 AGC_AGC_WATCHDOG_TIMEOUT_RXA_HDR

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the RXA_HDR state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_RXA_HDR

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 8 (2^3) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2^3 * 25 ns = 51 us. Reset State: 0x0000

0x3000354 AGC_AGC_WATCHDOG_TIMEOUT_HT_STS_COARSE

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the HT_STS_COARSE state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_HT_STS_COARSE

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2 * 12.5 ns = 6.375 us. Reset State: 0x0000

0x3000358 AGC_AGC_WATCHDOG_TIMEOUT_HT_STS_FINE

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the HT_STS_FINE state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_HT_STS_FINE

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2 * 12.5 ns = 6.375 us. Reset State: 0x0000

0x300035C AGC_AGC_WATCHDOG_TIMEOUT_VHT_STS_COARSE

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the VHT_STS_COARSE state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state

machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_VHT_STS_COARSE

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2 * 12.5 ns = 6.375 us. Reset State: 0x0000

0x3000360 AGC_AGC_WATCHDOG_TIMEOUT_VHT_STS_FINE

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the VHT_STS_FINE state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_VHT_STS_FINE

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2 * 12.5 ns = 6.375 us. Reset State: 0x0000

0x3000364 AGC_AGC_WATCHDOG_TIMEOUT_RXA_DATA

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the RXA_DATA state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_RXA_DATA

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 16384 (2^14) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2^14 * 25 ns = 104 ms. Reset State: 0x0000

0x3000368 AGC_AGC_WATCHDOG_TIMEOUT_CAP_A

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the CAP_A state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_CAP_A

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 16384 (2^14) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2^14 * 25 ns = 104 ms. Reset State: 0x0000

0x300036C AGC_AGC_WATCHDOG_TIMEOUT_TF_EST

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the TF_EST state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_TF_EST

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 4 (2^2) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2^2 * 25 ns = 25.5 us. Reset State: 0x0000

0x3000370 AGC_AGC_WATCHDOG_TIMEOUT_WAIT_B

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the WAIT_B state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_WAIT_B

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 64 (2^6) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2^6 * 25 ns = 408 us. Reset State: 0x0000

0x3000374 AGC_AGC_WATCHDOG_TIMEOUT_RXB_HDR

Type: read-write
Reset State: 0x007D

This register configures the watchdog timer for the RXB_HDR state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_RXB_HDR

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 64 (2^6) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2^6 * 25 ns = 408 us. Reset State: 0x007D

0x3000378 AGC_AGC_WATCHDOG_TIMEOUT_RXB_DATA

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the RXB_DATA state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_RXB_DATA

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 16384 (2^14) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2^14 * 25 ns = 104 ms. Reset State: 0x0000

0x300037C AGC_AGC_WATCHDOG_TIMEOUT_CAP_B

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the CAP_B state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_CAP_B

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 16384 (2^14) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2^14 * 25 ns = 104 ms. Reset State: 0x0000

0x3000380 AGC_AGC_WATCHDOG_TIMEOUT_WAIT_SIFS

Type: read-write
Reset State: 0x0000

This register configures the watchdog timer for the WAIT_SIFS state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

AGC_AGC_WATCHDOG_TIMEOUT_WAIT_SIFS

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 8 (2^3) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of 255 * 2^3 * 25 ns = 51 us. Reset State: 0x0000

0x3000384 AGC_RXFIR_CONFIG

Type: read-write
Reset State: 0x0000

Contains RxFIR configuration settings.

AGC_RXFIR_CONFIG

Bits	Name	Description
0	DEC_BY_4	Enables decimation-by-4 in the stage 1 RxFIR instead of decimation-by-3 in the normal functional mode. Reset State: 0x0000

0x3000388 AGC_VHTSIGA1_CONTENTS_1

Type: read-write
Reset State: 0x00C0

Contains programming for bit fields for VHTSIGA1"

AGC_VHTSIGA1_CONTENTS_1

Bits	Name	Description
9:5	START_BWCFG	Start of bwcfg field in VHTSIGA1 Reset State: 0x0006
4:0	START_RESERVED	Start of reserved field in VHTSIGA1 Reset State: 0x0000

0x300038C AGC_VHTSIGA1_CONTENTS_2

Type: read-write
Reset State: 0x000A

Contains programming for bit fields for VHTSIGA1"

AGC_VHTSIGA1_CONTENTS_2

Bits	Name	Description
4:0	START_MUMIMO	Start of MUMIMO field in VHTSIGA1 Reset State: 0x000A

0x3000390 AGC_VHTSIGA2_CONTENTS_1

Type: read-write
Reset State: 0x0020

Contains programming for bit fields for VHTSIGA2"

AGC_VHTSIGA2_CONTENTS_1

Bits	Name	Description
13:10	RESERVED	Reserved bits Reset State: 0x0000
9:5	START_NOTSOUNDING	Start for VHTSIGA2 notsounding bit Reset State: 0x0001
4:0	START_SMOOTHING	Start for VHTSIGA2 smoothing bit Reset State: 0x0000

0x3000394 AGC_VHTSIGA2_CONTENTS_2

Type: read-write
Reset State: 0x0062

Contains programming for bit fields for VHTSIGA2"

AGC_VHTSIGA2_CONTENTS_2

Bits	Name	Description
9:5	START_SHORTGI	Start for VHTSIGA2 shortgi bit Reset State: 0x0003
4:0	START_STBC	Start for VHTSIGA2 stbc bit Reset State: 0x0002

0x3000398 AGC_VHTSIGA2_CONTENTS_3

Type: read-write
Reset State: 0x0004

Contains programming for bit fields for VHTSIGA2"

AGC_VHTSIGA2_CONTENTS_3

Bits	Name	Description
4:0	START_RESERVED	Start of reserved field in VHTSIGA2 Reset State: 0x0004

0x300039C AGC_VHTSIGA2_CONTENTS_4

Type: read-write
Reset State: 0x024A

Contains programming for bit fields for VHTSIGA2"

AGC_VHTSIGA2_CONTENTS_4

Bits	Name	Description
9:5	START_TAIL	Start of tail field in VHTSIGA2. Width is constant 6 bits Reset State: 0x0012
4:0	START_CRC	Start of crc field in VHTSIGA2. Width is constant 8 bits Reset State: 0x000A

0x30003A0 AGC_VHTSIGB_CONTENTS_1

Type: read-write
Reset State: 0x0120

Contains programming for bit fields for VHTSIGB"

AGC_VHTSIGB_CONTENTS_1

Bits	Name	Description
9:5	START_CODING	Start for VHTSIGB shortgi bit Reset State: 0x0009
4:0	START_MCS	Start for VHTSIGB mcs bits Reset State: 0x0000

0x30003A4 AGC_VHTSIGB_CONTENTS_2

Type: read-write
Reset State: 0x024A

Contains programming for bit fields for VHTSIGB"

AGC_VHTSIGB_CONTENTS_2

Bits	Name	Description
9:5	START_TAIL	Start of tail field in VHTSIGB. Width is constant 6 bits Reset State: 0x0012
4:0	START_CRC	Start of crc field in VHTSIGB. Width is constant 8 bits Reset State: 0x000A

0x30003A8 AGC_VHTSIGA_BWENCODING

Type: read-write
Reset State: 0x01AC

Contains programming for bandwidth

AGC_VHTSIGA_BWENCODING

Bits	Name	Description
8:6	BW80	Fully specified field to indicate 20M mode, 40M mode and 80M mode. Reset State: 0x0006
5:3	BW40	Reset State: 0x0005
2:0	BW20	Reset State: 0x0004

0x30003AC AGC_VHTSIGA_GID1

Type: read-write
Reset State: 0x003F

Contains programming for group-id

AGC_VHTSIGA_GID1

Bits	Name	Description
11:6	GID2	The receiver will use this GID as the reference GID, i.e., the receiver will compare the received GID with this GID and if they do not match, will abort the packet defer for the duration of lsig. Reset State: 0x0000
5:0	GID1	The transmitter and receiver will use this GID as the reference GID, i.e., the Tx will fill this group-id in GID field to signal SU. The receiver will compare the received GID with this GID and if they do not match, will abort the packet defer for the duration of lsig. Reset State: 0x003F

0x30003B0 AGC_VHTSIGA_GID2

Type: read-write
Reset State: 0x0000

Contains programming for group-id

AGC_VHTSIGA_GID2

Bits	Name	Description
5:0	GID3	The transmitter and receiver will use this GID as the reference GID, i.e., the Tx will fill this group-id in GID field. The receiver will compare the received GID with this GID and if they do not match, will abort the packet defer for the duration of lsig. Reset State: 0x0000

0x30003B4 AGC_CCA_GI_DET_CFG_LGI

Type: read-write
Reset State: 0xA59B

AGC_CCA_GI_DET_CFG_LGI

Bits	Name	Description
15:8	TIMER_MAX_END	This register holds the upper limit on the timer (running off 40MHz clock) by when the subsequent ccadet-threshold crossing is expected. Ideally this value is 160 implying 4 microseconds. Reset State: 0x00A5
7:0	TIMER_MIN_END	This register holds the lower limit on the timer (running off 40MHz clock) by when the subsequent ccadet-threshold crossing is expected. Ideally this value is 160 implying 4 microseconds. Reset State: 0x009B

0x30003B8 AGC_CCA_GI_DET_CFG_SGI

Type: read-write
Reset State: 0x958B

AGC_CCA_GI_DET_CFG_SGI

Bits	Name	Description
15:8	TIMER_MAX_END	This register holds the upper limit on the timer (running off 40MHz clock) by when the subsequent ccadet-threshold crossing is expected. Ideally this value is 144 implying 3.6 microseconds. Reset State: 0x0095
7:0	TIMER_MIN_END	This register holds the lower limit on the timer (running off 40MHz clock) by when the subsequent ccadet-threshold crossing is expected. Ideally this value is 144 implying 3.6 microseconds. Reset State: 0x008B

16.2.12 btcf

0x3000000 BTCF_BTCF_CONFIG

Type: read-write
Reset State: 0x0EDD

Programs the offsets that will be added to the computed values

BTCF_BTCF_CONFIG

Bits	Name	Description
11:8	FFT_TOFFSET256	signed 2's complement number which is used to adjust the timing offset for the 256-point FFT start time Reset State: 0x000E
7:4	FFT_TOFFSET128	signed 2's complement number which is used to adjust the timing offset for the 128-point FFT start time Reset State: 0x000D
3:0	FFT_TOFFSET64	signed 2's complement number which is used to adjust the timing offset for the 64-point FFT start time Reset State: 0x000D

0x3000004 BTCF_BTCF_DET_RATIO

Type: read-write
Reset State: 0x0005

Detection thresholds for OFDM packets.

BTCF_BTCF_DET_RATIO

Bits	Name	Description
2:0	VALUE	The alpha value used to compute the pkt_valid flag. unsigned number. A combination of pkt_det_ratio and pkt_det_dshift determine the 11a detection threshold. Reset State: 0x0005

0x3000008 BTCF_BTCF_DET_DSHIFT

Type: read-write
Reset State: 0x0001

Detection shift values for OFDM packets.

BTCF_BTCF_DET_DSHIFT

Bits	Name	Description
2:0	VALUE	The shift value used to compute the pkt_valid flag. unsigned number Reset State: 0x0001

0x300000C BTCF_BTCFMIN

Type: read-only

Stores the last computed btcf_min value

BTCF_BTCFMIN

Bits	Name	Description
14:0	BTCF	The last latched btcf value when newmin was asserted. This is denoted as Bmin(t) in the uarch.

0x3000010 BTCF_PWRMIN

Type: read-only

Stores the last computed pow(t) value corresponding to btcf_min

BTCF_PWRMIN

Bits	Name	Description
15:0	POW	The last latched pow(t) value when newmin was asserted

0x3000014 BTCF_OFFSETMIN

Type: read-only

Stores the last computed offset counter value corresponding to btcf_min

BTCF_OFFSETMIN

Bits	Name	Description
7:0	COUNT	The last latched offset count when newmin was asserted. This provides the count value from when the first valid btcf value was computed. This value added with fft_toffset gives the delta to the TDC module

16.2.13 cal

0x3000000 CAL_CALMODE

Type: read-write

Determines the calibration mode and generates calibration enable ring these modes The Enable_Measure bit in the MSB of the register is used to enable the measurement of the value. For instance, in DC offset initial calibration mode, the CPU writes to the DC offset DAC n the RF ASIC through the SPI interface. The CPU then has to command the DC offset calibration module in the PHY to measure the DC offset (at the ADC output) after the new DAC output (in the RF ASIC) can be observed at the ADC output (typically after 0.5 us after the DAC is written to in the RF ASIC). Hence, once the CPU writes to the SPI interface, it then waits for a specific period of time (1 us) after the SPI write completes, and then asserts this bit to command the DC offset module to start the measurement. Once the measurement is done (as indicated by the CAL_STATUS) register, this bit has to be disabled so as to set up for the next measurement.

CAL_CALMODE

Bits	Name	Description
2:0	MODE	Sets the calibration mode mode value 3'b101 to 3'b111 are unused 0x0: NORMAL 0x1: INITDCCAL 0x2: RESDCCAL 0x3: IQCAL 0x4: TXLOCAL

0x3000004 CAL_MEASURE

Type: command
Reset State: 0x0000

By writing to this register, in calibration modes other than normal mode, a measure pulse is pulsed to the calibration module. Originally, this was a level signal called Enable_Measure. With the wr_Pulse register type being supported, it was decided to add this, so that software does not have to disable and then enable for the cal module to detect a pulse

CAL_MEASURE

Bits	Name	Description
0	CMD	Measure write pulse bit which enables the measurement for the specified calibration mode in the cal_mode register 0x0: NORMAL 0x1: MEASURE Reset State: 0x0000

0x3000008 CAL_CHAIN_SEL

Type: read-write

Determines which transmit/receive channel is being calibrated. If Bit 2 is 0, then the I channel of the transmit/receive chain is selected. If Bit 2 is 1, then the Q chain of the transmit/receive chain is selected. CS1 and CS0 determine which of the receive chains 0,1,2 or the transmit chains 0,1 are being calibrated as shown in table below.

CAL_CHAIN_SEL

Bits	Name	Description
2	IQSEL	Selects I/Q inputs for the inputs specified in chain 0x0: ISEL 0x1: QSEL
1:0	CHAIN	Selects receive chain output 0x0: CHAIN0 0x1: CHAIN1 0x2: CHAIN2 0x3: CHAIN3

0x300000C CAL_LENGTH_INIT

Type: read-write
Reset State: 0x03FF

The CAL_LENGTH registers are used to determine what length should the calibration module average over. If it is desirable to average over N samples, the CPU should write N-1 to this register where N is always an integer number that represents some power of 2.

CAL_LENGTH_INIT

Bits	Name	Description
11:0	LENGTH	Reset State: 0x03FF

0x3000010 CAL_LENGTH_RSA

Type: read-write
Reset State: 0x0001

The CAL_LENGTH registers are used to determine what length should the calibration module average over. If it is desirable to average over N samples, the CPU should write N-1 to this register where N is always an integer number that represents some power of 2.

CAL_LENGTH_RSA

Bits	Name	Description
11:0	LENGTH	Reset State: 0x0001

0x3000014 CAL_LENGTH_RSB

Type: read-write
Reset State: 0x00FF

The CAL_LENGTH registers are used to determine what length should the calibration module average over. If it is desirable to average over N samples, the CPU should write N-1 to this register where N is always an integer number that represents some power of 2.

CAL_LENGTH_RSB

Bits	Name	Description
11:0	LENGTH	Reset State: 0x00FF

0x3000018 CAL_DCO_THRESHOLD

Type: read-write
Reset State: 0x004C

Threshold value for the digital DC offset measured on a per-packet basis. If the measured digital DC offset is more than this threshold, the DC offset module sets the CAL_ATTENTION register to request CPU to recalibrate. Default is 150 mV (= 76 LSBs of a 10-bit ADC with a -1V to +1V swing) =0x4C

CAL_DCO_THRESHOLD

Bits	Name	Description
10:0	VALUE	Reset State: 0x004C

0x300001C CAL_DCTIMER1

Type: read-write
Reset State: 0x2C24

When the DC offset module is commanded to measure the digital DC offset either by the CPU or the AGC module (the AGC module does so on every packet), the DC offset module terminates all the RFICs inputs and waits for the time (number for 80MHz clocks) specified in the CAL_DC_TIMER1 register. This allows for the terminated input to be observed at the ADC outputs. This time is typically in the order if 0.5 us = 20 40MHz clocks = = 40 80 MHz clocks =

0x28 - 1 POR. Note that this number should always be an odd number (to be a multiple of 40 MHz clocks)

CAL_DCTIMER1

Bits	Name	Description
15:8	VALUE_RSB	Reset State: 0x002C
7:0	VALUE_RSA	Reset State: 0x0024

0x3000020 CAL_DCTIMER2

Type: read-write
Reset State: 0x2000

When the DC offset module is commanded to measure the digital DC offset either by the CPU or the AGC module (the AGC module does so on every packet), the DC offset module terminates all the RFICs inputs and waits for the time (number for 80MHz clocks) specified in the CAL_DC_TIMER1 register. This allows for the terminated input to be observed at the ADC outputs. This time is typically in the order if 0.5 us = 20 40MHz = 40 80 MHz clocks = 0x28-1. Now when the DC offset measurement is done, the DC offset module switches the RF front end back in. After switching the RF FE in, the DC offset module waits for CAL_DC_TIMER2 time before it can assert a data valid signal to the rest of the blocks. The reason there are two different timer registers for turning on and turning off the RF FE is so as to support any asymmetry in turning on/turning off the RF FE. If this saves clocks, then it allows data to be sampled earlier which may be particularly useful in per-packet calibration. Presently, the default value is 0.5us.

CAL_DCTIMER2

Bits	Name	Description
15:8	VALUE_RSB	Reset State: 0x0020
7:0	VALUE_RSA	Reset State: 0x0000

0x3000024 CAL_DCOFFSET

Type: read-only
Reset State: 0x0000

Measured DC offset, lower order bits. This register gives the measured DC offset (the output of the ADC of the selected chain) when the calibration mode is in DC Offset Initial Calibration and/or Digital DC offset calibration mode. This is a 11-bit 2's complement value. The CPU reads this value when it reads the CAL_STATUS to be done. The value read corresponds to the value in CHAIN_SEL.

CAL_DCOFFSET

Bits	Name	Description
10:0	DCOFFSET	Reset State: 0x0000

0x3000028 CAL_PWRDCOFFSET

Type: read-only
Reset State: 0x0000

Measured power of DC offset, lower order bits. This register gives the measured power of the input signal (the output of the ADC of the selected chain) when the calibration mode is in DC Offset Initial Calibration and/or Digital DC offset calibration mode. This is a 11-bit 2's complement value. The CPU reads this value when it reads the CAL_STATUS to be done. The value read corresponds to the value in CHAIN_SEL.

CAL_PWRDCOFFSET

Bits	Name	Description
15:0	POWER	Reset State: 0x0000

0x300002C CAL_CLR_DCOFFSET

Type: command
Reset State: 0x0000

Usually the last measured DC offset is held for the next packet as well until a new dco measurement is commanded by the AGC. Since, DC offset can change with time, when the AGC comes out of reset (like after beacon power save modes), software may decide to clear the DC offset register.

CAL_CLR_DCOFFSET

Bits	Name	Description
0	CMD	Clear write pulse bit which clears the latched DC offset values 0x0: NORMAL 0x1: MEASURE Reset State: 0x0000

0x3000030 CAL_CHN0_DCO_OVR

Type: read-write
Reset State: 0x0000

Used to override the measured DC offset for chain 0

CAL_CHN0_DCO_OVR

Bits	Name	Description
15:8	Q0	Reset State: 0x0000
7:0	I0	Reset State: 0x0000

0x3000034 CAL_STATUS

Type: read-only
Reset State: 0x0000

Indicates the calibration status for the current mode

CAL_STATUS

Bits	Name	Description
15:14	STATUS	Only busy, idle and done are implemented 0x0: IDLE 0x1: DONE 0x2: BUSY 0x3: ERR Reset State: 0x0000

0x3000038 CAL_OVERRIDE

Type: read-write
Reset State: 0x0000

Sets the test mode for calibration

CAL_OVERRIDE

Bits	Name	Description
0	CHN0_DC	DCO bypass bit 0x0: NORMAL 0x1: BYPASS Reset State: 0x0000

0x300003C CAL_CORR_ENABLE

Type: read-write
Reset State: 0x0002

This register provides packet-type specific enables for DCO correction

CAL_CORR_ENABLE

Bits	Name	Description
1	EN_11B	Reset State: 0x0001
0	EN_OFDM	Reset State: 0x0000

0x3000040 CAL_AIEST

Type: read-only
Reset State: 0x0000

When CAL_MODE is set to I/Q amplitude imbalance, this register gives the amplitude imbalance for that tone (CAL_IQ_TONENUM reg) for the current gain setting in AGC_GAIN_SET register. This is a 10-bit value. The CPU reads this value when it reads the CAL_STATUS to be done.The value read corresponds to the value in CHAIN_SEL.

CAL_AIEST

Bits	Name	Description
8:0	AIEST	Reset State: 0x0000

0x3000044 CAL_IQ_CORR_MODE

Type: read-write
Reset State: 0x0005

This register is used for controlling the corrector modes.

CAL_IQ_CORR_MODE

Bits	Name	Description
3:1	C0_THROUGH_TAP_SEL	Allows for selecting the specific tap location as the through tap component for the I/Q correctors. Default selection is the centre tap location. Non-listed encodings default to centre tap selection. 0x0: C0_IN_DATA_TAP 0x1: C0_IN_DATA_DLY1 0x2: C0_IN_DATA_DLY2 0x3: C0_IN_DATA_DLY3 0x4: C0_IN_DATA_DLY4 Reset State: 0x0002
0	BYPASS	When set(1), the iq corr coefficients are set to 0. When 0, iq corr coefficients are read from IQ_CORR_COEFF memory. This register was added to purely save test time and sim issues so the memories don't have to be slammed at the start of the sim Reset State: 0x0001

0x3000048 CAL_DEBUG_OUTPUT_EN_MASK

Type: read-write
Reset State: 0x0008

The bit fields in this register mask the cal_txfir_txlomode and dc_bsr_dcest output wires. This is to be used for cal debugging and system bring-up. When the *_en bits are zero the associated signals will not be asserted outside of the CAL module. The default is to have all bits in the *_en asserted for normal operation. The DC estimation enables have now been split into three categories - coarse (periodic) cal, OFDM packet residual CAL and 11b residual CAL.

CAL_DEBUG_OUTPUT_EN_MASK

Bits	Name	Description
3	TXLO_EN	Reset State: 0x0001
2	DC_EST_EN_11B	Reset State: 0x0000
1	DC_EST_EN_OFDM	Reset State: 0x0000
0	DC_EST_EN_COARSE	Reset State: 0x0000

0x300004C CAL_FORCE_TR_SWITCH

Type: read-write
Reset State: 0x0000

Using this register, the T/R switches may be set to TX mode during DCO calibration. The register provides this function to be enabled in any of the three following categories - coarse (periodic) cal, OFDM packet residual CAL and 11b residual CAL.

CAL_FORCE_TR_SWITCH

Bits	Name	Description
2	EN_11B	Reset State: 0x0000
1	EN_OFDM	Reset State: 0x0000
0	EN_COARSE	Reset State: 0x0000

0x3000050 CAL_AIEST_DISABLE

Type: read-write
Reset State: 0x0000

Using this register, the IQ amplitude imbalance estimate may be suppressed during IQ phase imbalance calculation.

CAL_AIEST_DISABLE

Bits	Name	Description
0	FLAG	Reset State: 0x0000

0x3000054 CAL_BARAM_ACCESS

Type: read-write
Reset State: 0x0000

This register controls which data stream has access to the BARAM memory. When set, the BARAM is only accessible by the host, not by internal logic.

CAL_BARAM_ACCESS

Bits	Name	Description
0	APB	Reset State: 0x0000

0x3000200+0x8*n CAL_BARAMn_0, n=[0..63]

Type: read-write
Reset State: 0x0000

Read write interface to the burst average RAM in the PIE module

CAL_BARAMn_0

Bits	Name	Description
15:0	IAVG	Reset State: 0x0000

0x3000204+0x8*n CAL_BARAMn_1, n=[0..63]

Type: read-write
Reset State: 0x0000

Read write interface to the burst average RAM in the PIE module

CAL_BARAMn_1

Bits	Name	Description
15:0	QAVG	Reset State: 0x0000

0x3000800+0x20*n CAL_IQ_CORR_COEFF_MEMn_0, n=[0..39]

Type: read-write
Reset State: 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

CAL_IQ_CORR_COEFF_MEMn_0

Bits	Name	Description
15:9	C0_I1_0	2's complement IQ imbalance correction coefficient for I-rail tap1 on chain 0 Reset State: 0x0000
8:0	C0_I0	2's complement IQ imbalance correction coefficient for I-rail tap0 on chain 0 Reset State: 0x0000

0x3000804+0x20*n CAL_IQ_CORR_COEFF_MEMn_1, n=[0..39]

Type: read-write
Reset State: 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

CAL_IQ_CORR_COEFF_MEMn_1

Bits	Name	Description
15:11	C0_I3_0	2's complement IQ imbalance correction coefficient for I-rail tap3 on chain 0 Reset State: 0x0000
10:2	C0_I2	2's complement IQ imbalance correction coefficient for I-rail tap2 on chain 0 Reset State: 0x0000
1:0	C0_I1_1	2's complement IQ imbalance correction coefficient for I-rail tap1 on chain 0 Reset State: 0x0000

0x3000808+0x20*n CAL_IQ_CORR_COEFF_MEMn_2, n=[0..39]

Type: read-write
Reset State: 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

CAL_IQ_CORR_COEFF_MEMn_2

Bits	Name	Description
15:13	C0_Q0_0	2's complement IQ imbalance correction coefficient for Q-rail tap0 on chain 0 Reset State: 0x0000
12:4	C0_I4	2's complement IQ imbalance correction coefficient for I-rail tap4 on chain 0 Reset State: 0x0000
3:0	C0_I3_1	2's complement IQ imbalance correction coefficient for I-rail tap3 on chain 0 Reset State: 0x0000

0x300080C+0x20*n CAL_IQ_CORR_COEFF_MEMn_3, n=[0..39]

Type: read-write
Reset State: 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

CAL_IQ_CORR_COEFF_MEMn_3

Bits	Name	Description
15	C0_Q2_0	2's complement IQ imbalance correction coefficient for Q-rail tap2 on chain 0 Reset State: 0x0000
14:6	C0_Q1	2's complement IQ imbalance correction coefficient for Q-rail tap1 on chain 0 Reset State: 0x0000
5:0	C0_Q0_1	2's complement IQ imbalance correction coefficient for Q-rail tap0 on chain 0 Reset State: 0x0000

0x3000810+0x20*n CAL_IQ_CORR_COEFF_MEMn_4, n=[0..39]

Type: read-write
Reset State: 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

CAL_IQ_CORR_COEFF_MEMn_4

Bits	Name	Description
15:8	C0_Q3_0	2's complement IQ imbalance correction coefficient for Q-rail tap3 on chain 0 Reset State: 0x0000
7:0	C0_Q2_1	2's complement IQ imbalance correction coefficient for Q-rail tap2 on chain 0 Reset State: 0x0000

0x3000814+0x20*n CAL_IQ_CORR_COEFF_MEMn_5, n=[0..39]

Type: read-write
Reset State: 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

CAL_IQ_CORR_COEFF_MEMn_5

Bits	Name	Description
9:1	C0_Q4	2's complement IQ imbalance correction coefficient for Q-rail tap4 on chain 0 Reset State: 0x0000

CAL_IQ_CORR_COEFF_MEMn_5 (cont.)

Bits	Name	Description
0	C0_Q3_1	2's complement IQ imbalance correction coefficient for Q-rail tap3 on chain 0 Reset State: 0x0000

16.2.14 fft

0x3000000+0x8*n FFT_FFT_RAM_0n_0, n=[0..255]

Type: read-write
Reset State: 0x0000

Ping-Pong FFT Reorder RAM shared by all receive chains.

FFT_FFT_RAM_0n_0

Bits	Name	Description
15:12	IMAG_DATA0_0	12-bit image data for Rx antenna 0 Reset State: 0x0000
11:0	REAL_DATA0	12-bit real data for Rx antenna 0 Reset State: 0x0000

0x3000004+0x8*n FFT_FFT_RAM_0n_1, n=[0..255]

Type: read-write
Reset State: 0x0000

Ping-Pong FFT Reorder RAM shared by all receive chains.

FFT_FFT_RAM_0n_1

Bits	Name	Description
7:0	IMAG_DATA0_1	12-bit image data for Rx antenna 0 Reset State: 0x0000

0x3000800+0x8*n FFT_FFT_RAM_1n_0, n=[0..255]

Type: read-write
Reset State: 0x0000

Ping-Pong FFT Reorder RAM shared by all receive chains.

FFT_FFT_RAM_1n_0

Bits	Name	Description
15:12	IMAG_DATA0_0	12-bit image data for Rx antenna 0 Reset State: 0x0000
11:0	REAL_DATA0	12-bit real data for Rx antenna 0 Reset State: 0x0000

0x3000804+0x8*n FFT_FFT_RAM_1n_1, n=[0..255]

Type: read-write
Reset State: 0x0000

Ping-Pong FFT Reorder RAM shared by all receive chains.

FFT_FFT_RAM_1n_1

Bits	Name	Description
7:0	IMAG_DATA0_1	12-bit image data for Rx antenna 0 Reset State: 0x0000

0x3001000 FFT_APB_ACCESS

Type: read-write
Reset State: 0x0000

This register controls APB access of the FFT Reorder RAM.

FFT_APB_ACCESS

Bits	Name	Description
0	APB_MODE	APB access enable bit - internal memory may be accessed only when this bit is asserted Reset State: 0x0000

0x3001004 FFT_FFT_TOGGLE

Type: read-only

This register is a 1-bit counter that is updated at the end of each FFT block.

FFT_FFT_TOGGLE

Bits	Name	Description
0	COUNT	FFT block count

16.2.15 mpi

0x3000000 MPI_WATCHDOG_MAX_COMMAND1

Type: read-write
Reset State: 0x0000

Allowed time for state machine to remain in COMMAND1 state

MPI_WATCHDOG_MAX_COMMAND1

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog. Reset State: 0x0000

0x3000004 MPI_WATCHDOG_MAX_COMMAND2

Type: read-write
Reset State: 0x0000

Allowed time for state machine to remain in COMMAND2 state

MPI_WATCHDOG_MAX_COMMAND2

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog. Reset State: 0x0000

0x3000008 MPI_WATCHDOG_MAX_WAIT

Type: read-write
Reset State: 0x0000

Allowed time for state machine to remain in WAIT state

MPI_WATCHDOG_MAX_WAIT

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog. Reset State: 0x0000

0x300000C MPI_WATCHDOG_MAX_TRANSFER

Type: read-write
Reset State: 0x0000

Allowed time for state machine to remain in TRANSFER state

MPI_WATCHDOG_MAX_TRANSFER

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog. Reset State: 0x0000

0x3000010 MPI_MAX_REQAORB

Type: read-write
Reset State: 0x0000

Holds the maximum number of txa or txb requests per packet that should be allowed during transmit. Default value of 0 disables the reporting of max_request_exceeded violation

MPI_MAX_REQAORB

Bits	Name	Description
15:0	VALUE	Reset State: 0x0000

0x3000014 MPI_COMMAND2_DELAY

Type: read-write
Reset State: 0x026C

Delay between end of first 4 bytes of COMMAND and start of rest of COMMAND. The state machine automatically adjusts for 20/40/80MHz bandwidth settings.

MPI_COMMAND2_DELAY

Bits	Name	Description
15:0	VALUE	Reset State: 0x026C

0x3000018 MPI_MPI_ENABLE

Type: read-write
Reset State: 0x0000

This register must be set to 0x1 for the MPI to respond to TXP signals. This register is used to disable the MPI during MAC loopback tests.

MPI_MPI_ENABLE

Bits	Name	Description
0	VALUE	Reset State: 0x0000

0x300001C MPI_TXP_MPI_START

Type: write-only

Counts number of TXP_MPI_START events received by TX Mac-PHY Interface module.

MPI_TXP_MPI_START

Bits	Name	Description
15:0	COUNT	TXP_MPI_START event counter.

0x3000020 MPI_MPI_TXP_REQ

Type: write-only

Counts number of MPI_TXP_REQ generated by TX MAC-PHY Interface module.

MPI_MPI_TXP_REQ

Bits	Name	Description
15:0	COUNT	MPI_TXP_REQ event counter.

0x3000024 MPI_TXA_MPI_DATA_REQ

Type: write-only

Counts number of TXA_MPI_DATA_REQ events received by TX Mac-PHY Interface module.

MPI_TXA_MPI_DATA_REQ

Bits	Name	Description
15:0	COUNT	TXA_MPI_DATA_REQ event counter.

0x3000028 MPI_TXB_MPI_DATA_REQ

Type: write-only

Counts number of TXB_MPI_DATA_REQ events received by TX Mac-PHY Interface module.

MPI_TXB_MPI_DATA_REQ

Bits	Name	Description
15:0	COUNT	TXB_MPI_DATA_REQ event counter.

0x300002C MPI_TXP_MPI_DATA_VAL

Type: write-only

Counts number of TXP_MPI_DATA_VAL pulses received.

MPI_TXP_MPI_DATA_VAL

Bits	Name	Description
15:0	COUNT	TXP_MPI_DATA_VAL event counter.

0x3000030 MPI_MPI_TXA_DATA_VAL

Type: write-only

Counts number of MPI_TXA_DATA_VAL generated by TX MAC-PHY Interface module.

MPI_MPI_TXA_DATA_VAL

Bits	Name	Description
15:0	COUNT	MPI_TXA_DATA_VAL event counter.

0x3000034 MPI_MPI_TXB_DATA_VAL

Type: write-only

Counts number of MPI_TXB_DATA_VAL generated by TX MAC-PHY Interface module.

MPI_MPI_TXB_DATA_VAL

Bits	Name	Description
15:0	COUNT	MPI_TXB_DATA_VAL event counter.

0x3000038 MPI_MPI_TXA_LASTBYTE

Type: write-only

Counts number of MPI_TXA_LASTBYTE generated by TX MAC-PHY Interface module.

MPI_MPI_TXA_LASTBYTE

Bits	Name	Description
15:0	COUNT	MPI_TXA_LASTBYTE event counter.

0x300003C MPI_MPI_TXA_CW_LASTBYTE

Type: write-only

Counts number of MPI_TXA_CW_LASTBYTE generated by TX MAC-PHY Interface module.

MPI_MPI_TXA_CW_LASTBYTE

Bits	Name	Description
15:0	COUNT	MPI_TXA_CW_LASTBYTE event counter.

0x3000040 MPI_MPI_TXA_CW_MAX_PARITY

Type: write-only

Counts number of MPI_TXA_CW_MAX_PARITY generated by TX MAC-PHY Interface module.

MPI_MPI_TXA_CW_MAX_PARITY

Bits	Name	Description
15:0	COUNT	MPI_TXA_CW_MAX_PARITY event counter.

0x3000044 MPI_MPI_STATE

Type: read-only

Stores the last 4 MPI states.

MPI_MPI_STATE

Bits	Name	Description
15:0	VALUE	Bit[15:12] = Previous MPI state (N-3) Bit[11:8] = Previous MPI state (N-2) Bit[7:4] = Previous MPI state (N-1) Bit[3:0] = Current MPI state

0x3000048 MPI_IDLE_FLAG

Type: read-only

Indicates current state of the IDLE flag.

MPI_IDLE_FLAG

Bits	Name	Description
0	VALUE	

0x300004C MPI_REQ_ALARM

Type: write-only

Counts number of REQ_ALARM abort pulses generated by TX MAC-PHY Interface module (when too many MPI requests were issued or if contiguous request pulses received).

MPI_REQ_ALARM

Bits	Name	Description
15:0	COUNT	

0x3000050 MPI_WATCHDOG_ALARM

Type: write-only

Counts number of WATCHDOG_ALARM abort pulses generated by TX MAC-PHY Interface module.

MPI_WATCHDOG_ALARM

Bits	Name	Description
15:0	COUNT	

0x3000054 MPI_COMMAND_ALARM

Type: write-only

Counts number of times that a command word was received when data was expected by the TX MAC-PHY Interface module and vice versa.

MPI_COMMAND_ALARM

Bits	Name	Description
15:0	COUNT	

0x3000058 MPI_TXP_ABORT

Type: write-only

Counts number of times that an abort was received from the TXP.

MPI_TXP_ABORT

Bits	Name	Description
15:0	COUNT	

0x300005C MPI_TXCTL_ABORT

Type: write-only

Counts number of times that an abort was received from the TXCTL.

MPI_TXCTL_ABORT

Bits	Name	Description
15:0	COUNT	

16.2.16 phydbg

0x3000000 PHYDBG_CFGMODE

Type: read-write
Reset State: 0x0000

This register configures basic modes of the capture and playback controllers in phydbg module. In all registers, fields with a suffix of 0 affect the capture controller and fields with a suffix of 1 affect the playback controller.

PHYDBG_CFGMODE

Bits	Name	Description
15	ENB_TESTBUS_OUTPUT	When high the testbus is output. This uses the phydbg mif write fifo, so no capture of data to the mif is possible while this is set. Reset State: 0x0000
13	DBGMEM_SEL1	High use debug SRAM for playback; Low use packet SRAM for playback. If dbgmem_sel0 and dbgmem_sel1 are both high then playback will use the lower half of debug SRAM. Reset State: 0x0000
12	STOP1	High to terminate playback after current packet. Reset State: 0x0000
8	CONT1	High for continuous playback; Low for single-shot playback. Reset State: 0x0000
7	TESTBUS_VITSEL0	High to select combo mux vital signals to testbus; Low to select combo mux data to testbus. Reset State: 0x0000
6	DBGMEM_SEL0	High use debug SRAM for capture; Low use packet SRAM for capture. If dbgmem_sel0 and dbgmem_sel1 are both high then capture will use the upper half of debug SRAM. Reset State: 0x0000
5	CRCCAPTURE0	High to select CRC based capture; Low normal capture mode. Reset State: 0x0000
4	STOP0	This field is used only if cont0 is high and seltrig[stop] configuration is set. High to terminate continuous capture. Reset State: 0x0000
3	SC0	High to select start trigger as the start condition for capture; Low to capture as soon as 'start' is set. Reset State: 0x0000
2	EC0	High to select end trigger as the stop condition for capture; Low to select max address or full length of RAM as the stop condition. Reset State: 0x0000
1	CONT0	High for continuous capture; Low for single-shot capture. Reset State: 0x0000

0x3000004 PHYDBG_SELTRIG

Type: read-write
Reset State: 0x0000

Selects which of the triggers will be used as triggers for start, end and stop condition.

PHYDBG_SELTRIG

Bits	Name	Description
12	AMPDU_CRC	If set, then crc trigger conditions are related to AMPDU packets otherwise, they relate to MPDU packets. Reset State: 0x0000
10:8	STOP0	Selects between various events to terminate continuous capture. AGC and CRC stop conditions are intended for use with CRC capture mode. 0x0: REG 0x1: AGC 0x2: GPIO 0x4: NOAGC 0x5: CRCPASS 0x6: CRCFAIL Reset State: 0x0000
6:4	ETRIG0	Selects between various sources of end trigger for the capture controller 0x0: TBUS 0x1: AGC 0x2: GPIO 0x4: CRCDONE 0x5: CRCPASS 0x6: CRCFAIL Reset State: 0x0000
2:0	STRIG0	Selects between various sources of start trigger for the capture controller 0x0: TBUS 0x1: AGC 0x2: GPIO 0x4: CRCDONE 0x5: CRCPASS 0x6: CRCFAIL 0x7: DISABLED Reset State: 0x0000

0x3000008 PHYDBG_RST0

Type: command
Reset State: 0x0000

Resets capture controller

PHYDBG_RST0

Bits	Name	Description
0	RST	When this register is written, a pulse of width same as clock period is generated Reset State: 0x0000

0x300000C PHYDBG_RST1

Type: command
Reset State: 0x0000

Resets playback controller

PHYDBG_RST1

Bits	Name	Description
0	RST	When this register is written, a pulse of width same as clock period is generated Reset State: 0x0000

0x3000010 PHYDBG_START0

Type: command
Reset State: 0x0000

Reference pulse for starting capture controller

PHYDBG_START0

Bits	Name	Description
0	START	When this register is written, a pulse of width same as clock period is generated that starts the capture controller state machine. Reset State: 0x0000

0x3000014 PHYDBG_START1

Type: command
Reset State: 0x0000

Reference pulse for starting the playback controller

PHYDBG_START1

Bits	Name	Description
0	START	When this register is written, a pulse of width same as clock period is generated that starts the playback controller. Reset State: 0x0000

0x3000018 PHYDBG_STATUS

Type: read-only

Status Register of the capture and playback controllers.

PHYDBG_STATUS

Bits	Name	Description
13	RDBUSY	Status of playback controller (gen_raddr) during read. High for busy.
12:8	TXSTATE	Current state of packet generator (gen_txdata) FSM 0x0: IDLE 0x1: INFD0 0x2: INFD1 0x3: WARMUP 0x4: CLKSTART0 0x5: CLKSTART1 0x6: CLKSTART2 0x7: CLKSTART3 0x8: CMD_START 0x9: CMD 0xA: CMD_WAIT 0xB: PYLDF 0xC: PYLDF_WAIT 0xD: PYLDR 0xE: PYLDR_WAIT 0xF: CRC 0x10: CRC_WAIT 0x11: FLUSH 0x12: TXDONEWAIT 0x13: TIFWAIT
4:0	WRSTATE	Current state of capture controller (gen_waddr) FSM. 0x1: IDLE 0x2: START 0x4: WRWAIT 0x8: WRACTIVE 0x10: WRPOST

0x300001C PHYDBG_DELAY0

Type: read-write
Reset State: 0x0000

Delay capture from the start trigger.

PHYDBG_DELAY0

Bits	Name	Description
15:0	DLY	Number of clocks to wait after the start condition (Ref CFGMODE[sc0]) before starting capture. Reset State: 0x0000

0x3000020 PHYDBG_TRIGPTR0

Type: read-only

Indicates the RAM address to which the phydbg data was being written to when the end trigger came

PHYDBG_TRIGPTR0

Bits	Name	Description
13:0	TRIGPTR	In capture modes involving end trigger, the memory address wraps around the full length of memory. This refers to the last address of the memory to which the data was written to, when the end trigger came. With the length of memory of L, if the value of this register is sampled as T, the previous data is stored contiguously from locations T+1 ... L-1, 0, 1 ... T.

0x3000024 PHYDBG_TMUX_STRBQUAL

Type: read-write
Reset State: 0x0000

Data qualifier for the tmux input data

PHYDBG_TMUX_STRBQUAL

Bits	Name	Description
13:11	STRBDIV0	Captures very n+1 strobed pieces of data. Reset State: 0x0000

PHYDBG_TMUX_STRBQUAL (cont.)

Bits	Name	Description
10:8	STRBSEL0	Strobe source select and generator 0x0: STRB_NORMAL 0x1: STRB_TMUX 0x2: STRB_VIT 0x3: STRB_ALL Reset State: 0x0000
6:0	STRBPOS0	Bit position of capture strobe from testmux data or vital signals Reset State: 0x0000

0x3000028 PHYDBG_CAPT_CFG

Type: read-write
Reset State: 0x0000

Selects which of the input data will be captured in the associated memories. Note that the selection for capture to memory is done for up to 128 bits of data, depending on [MEM_CFG] setting. Only 54 bits can be output on the testbus. See also register CAPT_CFG2.

PHYDBG_CAPT_CFG

Bits	Name	Description
13:8	XBARSEL	Multiplexer select for 80MHz domain signals (i.e.. ADC, RXFIR and DAC data). The available modes depend on the number of TX and RX chains in the device. 0x0: C32_ADC_CH0 0x4: C32_RXF20_CH0 0x8: C32_RXF40_CH0 0xC: C32_RXF80_CH0 0x20: C32_DAC_CH0 Reset State: 0x0000
7	RFSAT_GAIN_SEL	High to capture rxgainN[0] in place of rfsatN bits. Reset State: 0x0000
6:4	VITSEL	Multiplexer select lines for vital bus mux for memory capture or testbus or trigger selection logic. 0x0: VITSEL_RXA 0x1: VITSEL_RXB 0x2: VITSEL_RXSM 0x3: VITSEL_TX 0x4: VITSEL_AGC 0x5: VITSEL_PMI Reset State: 0x0000

PHYDBG_CAPT_CFG (cont.)

Bits	Name	Description
3:0	DATASEL	Multiplexer select lines for data mux for memory capture or testbus. 0x0: SEL_XBAR 0x1: SEL_AGC 0x2: SEL_RXA 0x3: SEL_TX 0x4: SEL_RAVIT 0x5: SEL_RBVIT 0x6: SEL_RXFSM 0x7: SEL_TXVIT 0x8: SEL_PMI 0x9: SEL_AGCVIT Reset State: 0x0000

0x300002C PHYDBG_CAPT_CFG2

Type: read-write
Reset State: 0x0000

Selects which of the input data will be captured in the associated memories. Note that the selection for capture to memory is done for up to 128 bits of data, depending on [MEM_CFG] setting. Only 54 bits can be output on the testbus. See also register CAPT_CFG.

PHYDBG_CAPT_CFG2

Bits	Name	Description
0	XBAR_PIC_DATASEL	Multiplexer select line for selecting between xbar data iq values and post IQ Corrected data. This applies for all capture modes. 0x0: LO 0x1: HI Reset State: 0x0000

0x3000030 PHYDBG_START_TRIGWD0

Type: read-write
Reset State: 0x0000

This register specifies the current state and new state of AGC main state machine, the transition between which will cause a pulse to be generated. That can be used as a trigger to capture the required data selected by SELECT register.

PHYDBG_START_TRIGWD0

Bits	Name	Description
10	ENB	High to enable trigger. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x3000034 PHYDBG_END_TRIGWD0

Type: read-write
Reset State: 0x0000

This register specifies the current state and new state of AGC main state machine, the transition between which will cause a pulse to be generated. That can be used as a trigger to capture the required data selected by SELECT register.

PHYDBG_END_TRIGWD0

Bits	Name	Description
10	ENB	High to enable trigger. Reset State: 0x0000
9:5	NEXT_STATE	State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	State from which transition originates. Reset State: 0x0000

0x3000038 PHYDBG_STOP_TRIGWD0

Type: read-write
Reset State: 0x0000

This register specifies the state of AGC main state machine that is detected to terminate crc-based capture.

PHYDBG_STOP_TRIGWD0

Bits	Name	Description
4:0	STATE	State to detect. Reset State: 0x0000

0x300003C PHYDBG_START_ADDR0

Type: read-write
Reset State: 0x0000

Specifies the start address of memory to be used for capture. The controller generates addresses from START_ADDR to MAX_ADDR. If MAX_ADDR is less than START_ADDR then capture will wrap-around at the top of memory.

PHYDBG_START_ADDR0

Bits	Name	Description
13:0	ADDR	Reset State: 0x0000

0x3000040 PHYDBG_MAX_ADDR0

Type: read-write
Reset State: 0x0000

Specifies the max address of memory to be used for capture. The controller generates addresses from 0 to MAXADDR.

PHYDBG_MAX_ADDR0

Bits	Name	Description
13:0	ADDR	Reset State: 0x0000

0x3000044 PHYDBG_START_ADDR1

Type: read-write
Reset State: 0x0000

Specifies the start address of memory to be used for playback. The controller generates addresses from START_ADDR to MAX_ADDR. If MAX_ADDR is less than START_ADDR then playback will wrap-around at the top of memory.

PHYDBG_START_ADDR1

Bits	Name	Description
13:0	ADDR	Reset State: 0x0000

0x3000048 PHYDBG_MAX_ADDR1

Type: read-write
Reset State: 0x0000

Specifies the max address of memory to be used for playback. The controller generates addresses from STARTADDR to MAXADDR.

PHYDBG_MAX_ADDR1

Bits	Name	Description
13:0	ADDR	Reset State: 0x0000

0x300004C PHYDBG_AGCRST

Type: read-write
Reset State: 0x0000

Enable register for AGC reset during playback mode

PHYDBG_AGCRST

Bits	Name	Description
0	EN	When high, will enable reset generated by playback controller Reset State: 0x0000

0x3000050 PHYDBG_TMUX_STRIG

Type: read-write
Reset State: 0x0000

Bit position of start trigger when generated from testmux data or vital signals

PHYDBG_TMUX_STRIG

Bits	Name	Description
8	INVERT0	Invert trigger bit. When 0, trigger on active high signal. When 1, trigger on active low signal. Reset State: 0x0000
7	SELFMVIT0	High to select TMUX_STRIG[pos0] and TMUX_STRIG[pos0] from muxed vital signals bus rather than muxed databus. Reset State: 0x0000

PHYDBG_TMUX_STRIG (cont.)

Bits	Name	Description
6:0	POS0	The signal in bit position indicated by this value will be used as a start trigger source for the capture controller (refer to the SELTRIG register description). Reset State: 0x0000

0x3000054 PHYDBG_TMUX_ETRIG

Type: read-write
Reset State: 0x0000

Bit position of end trigger when generated from testmux data or vital signals

PHYDBG_TMUX_ETRIG

Bits	Name	Description
8	INVERT0	Invert trigger bit. When 0, trigger on active high signal. When 1, trigger on active low signal. Reset State: 0x0000
6:0	POS0	The signal in bit position indicated by this value will be used as a end trigger source for the capture controller (refer to the SELTRIG register description). Reset State: 0x0000

0x3000058 PHYDBG_PLYBCK_CFG

Type: read-write
Reset State: 0x0000

Configures the phydbg playback modes

PHYDBG_PLYBCK_CFG

Bits	Name	Description
15:13	PLYBK_RATE	Set sample playback rate. 0x0: PLYBK_240M 0x1: PLYBK_160M 0x2: PLYBK_120M 0x3: PLYBK_80M 0x4: PLYBK_40M 0x5: PLYBK_20M Reset State: 0x0000

PHYDBG_PLYBCK_CFG (cont.)

Bits	Name	Description
12:8	TXPB_MODE	These bits control playback of TX sample data. 0x0: TXPB32_DISABLE 0x1: TXPB32_TXF80_CH0 0x5: TXPB32_DAC80_CH0 Reset State: 0x0000
7:3	RXPB_MODE	These bits control playback of RX sample data. 0x0: RXPB32_DISABLE 0xA: RXPB32_ADC80_CH0 Reset State: 0x0000
2	TXAIF_DBGSEL	When high, tx_aif will select phydbg data. Reset State: 0x0000
1	TXFIR_DBGSEL	When high, tx_fir will select phydbg data. Reset State: 0x0000
0	MPI_TXTEST	When high, the data from phydbg is used in tx-mpi in place of tfp inputs Reset State: 0x0000

0x300005C PHYDBG_PLYBCK_CFG2

Type: read-write
Reset State: 0x0000

Controls playback data from memory.

PHYDBG_PLYBCK_CFG2

Bits	Name	Description
6:5	TX_ATTENUATION	specifies the attenuation for tx playback. From 0 to 18db in 6db increments. Reset State: 0x0000
4:0	ADDR_INC	specifies the address increment value for playback from memory. Increment will be (addr_inc + 1), giving a range of 1 to 32. Reset State: 0x0000

0x3000060 PHYDBG_PRBS

Type: read-write
Reset State: 0x00FF

Initializes PRBS generator for MPI packet generator.

PHYDBG_PRBS

Bits	Name	Description
15	AUTO_RELOAD	Reload the prbs for every packet transmitted. Reset State: 0x0000
7:0	SEED_LSB	LSB of the prbs seed Reset State: 0x00FF

0x3000064 PHYDBG_PRBS_MS

Type: read-write
Reset State: 0xFFFF

Most significant word of the prbs seed

PHYDBG_PRBS_MS

Bits	Name	Description
15:0	SEED_MSW	MSW of the prbs seed Reset State: 0xFFFF

0x3000068 PHYDBG_PRBS_LOAD

Type: command
Reset State: 0x0000

Loads PRBS generator with seed specified in {PRBS_MS, PRBS[7:0]} registers

PHYDBG_PRBS_LOAD

Bits	Name	Description
0	LOAD	When this register is written, a pulse of width same as clock period is generated Reset State: 0x0000

0x300006C PHYDBG_TXPKT_CNT

Type: read-write
Reset State: 0x0001

Max number of packets that will be driven to mpi interface from memory. This field is ignored when CFGMODE[cpm1] is high.

PHYDBG_TXPKT_CNT

Bits	Name	Description
15:0	CNT	Reset State: 0x0001

0x3000070 PHYDBG_RXPKT_CNT

Type: write-only

Incremented for each packet received that matches the pattern specified in RXPKT_FLTRn and with correct CRC.

PHYDBG_RXPKT_CNT

Bits	Name	Description
15:0	CNT	Write zero to clear.

0x3000074 PHYDBG_CAPTCNT

Type: write-only

Incremented for each word written to SRAM.

PHYDBG_CAPTCNT

Bits	Name	Description
15:0	CNT	Write zero to clear.

0x3000078 PHYDBG_POSTTRIGCNT

Type: read-write
Reset State: 0x0000

Number of words of data captured after the end-trigger condition in the post-trigger capture mode (used with CRC capture mode). Must be less than size of available capture memory.

PHYDBG_POSTTRIGCNT

Bits	Name	Description
13:0	CNT	Reset State: 0x0000

0x300007C PHYDBG_WARMUP_DLY

Type: read-write
Reset State: 0x0000

Sets the duration of RF warmup as a multiple of the Phy clock period. Setting to zero will keep the warmup signal continuously asserted.

PHYDBG_WARMUP_DLY

Bits	Name	Description
15:0	DLY	Reset State: 0x0000

0x3000080 PHYDBG_RXPKT_FILTER_10

Type: read-write
Reset State: 0x0000

2 bytes of the RX packet filter pattern for CRC check. All-zeros pattern disables filtering.

PHYDBG_RXPKT_FILTER_10

Bits	Name	Description
15:0	DATA	Reset State: 0x0000

0x3000084 PHYDBG_RXPKT_FILTER_32

Type: read-write
Reset State: 0x0000

2 bytes of the RX packet filter pattern for CRC check. All-zeros pattern disables filtering.

PHYDBG_RXPKT_FILTER_32

Bits	Name	Description
15:0	DATA	Reset State: 0x0000

0x3000088 PHYDBG_PLYBKCNT

Type: write-only

Increment for each packet transmitted when mpi_txtest is high. Not used when mpi_txtest is low.

PHYDBG_PLYBKCNT

Bits	Name	Description
15:0	CNT	Write zero to clear.

0x300008C PHYDBG_AMPDU_RXPKT_CNT

Type: write-only

Incremented for each AMPDU packet received with correct CRC.

PHYDBG_AMPDU_RXPKT_CNT

Bits	Name	Description
15:0	CNT	Write zero to clear.

0x3000090 PHYDBG_AUTO_TRIG_PLAYBACK1

Type: read-write
Reset State: 0x0000

This register controls the automatic data playback trigger. The trigger can be either the AGC state machine transitioning from one state to another, or the gpio trigger

PHYDBG_AUTO_TRIG_PLAYBACK1

Bits	Name	Description
11	GPIO_ENB	High to enable gpio auto playback trigger, overrides the "enb" for agc. Reset State: 0x0000
10	ENB	High to enable agc auto playback trigger. Reset State: 0x0000
9:5	NEXT_STATE	Agc State in which transition ends. Reset State: 0x0000
4:0	CURRENT_STATE	AGC State from which transition originates. Reset State: 0x0000

0x3000094 PHYDBG_AUTO_TRIG_PLAYBACK_DELAY1

Type: read-write
Reset State: 0x0000

Indicates the number of clk160 clocks to count before triggering the start of the transmit packet after detecting the agc state transition. In volans the clk160 is running at 80MHz, so the range is 0 to 819us in 12.5ns increments.

PHYDBG_AUTO_TRIG_PLAYBACK_DELAY1

Bits	Name	Description
15:0	DELAY	Reset State: 0x0000

0x3000098 PHYDBG_AUTO_TRIG_PLAYBACK_TIMEOUT_DELAY1

Type: read-write
Reset State: 0x0000

Indicates the number of clk160 clocks to count before initiating a transmit packet. This is to deal with the possibility that the AGC will not detect the incoming packet, and as a result no more packets being transmitted. The delay is will be "delay x 4096" clocks. In volans the clk160 is running at 80MHz, so the range is 0 to 209ms in 51.2us increments.

PHYDBG_AUTO_TRIG_PLAYBACK_TIMEOUT_DELAY1

Bits	Name	Description
11:0	DELAY	Reset State: 0x0000

0x300009C PHYDBG_GPIO_OUT_TRIG

Type: read-write
Reset State: 0x0000

Select the source to be used for gpio output trigger.

PHYDBG_GPIO_OUT_TRIG

Bits	Name	Description
2:0	SELECT	Multiplexer select which source to use for the gpio output trigger. 0x0: GPIO_DISABLE 0x1: GPIO_START 0x2: GPIO_END 0x3: GPIO_STOP 0x4: GPIO_AUTO Reset State: 0x0000

0x3002000+0x8*n PHYDBG_DBGMEMn_0, n=[0..1023]

Type: read-write
Reset State: 0x0000

Read/write access to phydbg internal memory.

PHYDBG_DBGMEMn_0

Bits	Name	Description
15:0	DATA_0	Reset State: 0x0000

0x3002004+0x8*n PHYDBG_DBGMEMn_1, n=[0..1023]

Type: read-write
Reset State: 0x0000

Read/write access to phydbg internal memory.

PHYDBG_DBGMEMn_1

Bits	Name	Description
15:0	DATA_1	Reset State: 0x0000

16.2.17 phyint

0x3000000 PHYINT_STATUS

Type: read-write
Reset State: 0x0000

This register consolidates all the interrupt requests on Phy. All interrupt requests are active high. Interrupt bit fields ending in "_P" can be cleared by writing a "1" to the corresponding bit in this register. Interrupt bit fields not ending in "_P" must be cleared at source.

PHYINT_STATUS

Bits	Name	Description
14	AGC_WATCHDOG_EXP	AGC FSM watchdog timer expired Reset State: 0x0000
13	TAHDR_INVLD_RATE	Txa header processor found a bad rate field from mpi data *** This interrupt does not exist in Gen5/6 *** Reset State: 0x0000

PHYINT_STATUS (cont.)

Bits	Name	Description
12	PMI_ALARM_P	The alarm condition in PMI Reset State: 0x0000
11	RACTL_ALARM_P	The alarm condition in RACTL Reset State: 0x0000
10	RBHPC_SOFEOFATN_P	The sof/eof interrupt from the RXB Reset State: 0x0000
9	TXCTL_ALARM_P	The interrupt from overall Tx Controller indicating error condition inside Phy TX Reset State: 0x0000
8	TACTL_ALARM_P	The interrupt from TACTL indicating error condition inside Phy Txa Reset State: 0x0000
7	MPI_MAXREQATN_P	The interrupt from MAC-Phy Interface (MPI) block indicating too many requests from txa or txb controller engines The threshold is configurable in mpi.reg Reset State: 0x0000
6	MPI_WATCHDOG_P	The interrupt from MAC-Phy Interface (MPI) block indicating expiry of watchdog timer Reset State: 0x0000
5	MPI_TXPABORT_P	The interrupt from MAC-Phy Interface (MPI) block indicating Txp abort Reset State: 0x0000
4	TPC_ATN_P	The interrupt from Transmit Power Control (TPC) block signifying error in tpc loop convergence. Reset State: 0x0000
3	CAL_ATN_P	The interrupt from the Calibration (CAL) block signifying calibration failure. Reset State: 0x0000
2	AGC_RADARDET_P	Set whenever the AGC detects radar. *** This interrupt does not exist in Libra *** Reset State: 0x0000
1	AGC_CLRCHAN_P	Set whenever the channel is clear, i.e., CCA is high. Reset State: 0x0000
0	RFIF_CALIB_DONE_P	Interrupt from Iris on calibration completion. ** NOTE ** this bit is used for agc_pktdet_n interrupt in Virgo ** ** NOTE ** this bit was used for indicating vswr overload in Libra and Volans ** Reset State: 0x0000

0x3000004 PHYINT_FAST_MASK

Type: read-write
Reset State: 0x0000

This register masks the Status register before the bits are combined to generate the fast interrupt to the embedded CPU. Setting a bit to "1" enables the interrupt, "0" masks the interrupt.

PHYINT_FAST_MASK

Bits	Name	Description
14	AGC_WATCHDOG_EXP	Fast mask bit for bit[14] in STATUS register. Reset State: 0x0000
13	TAHDR_INVLD_RATE	Fast mask bit for bit[13] in STATUS register. Reset State: 0x0000
12	PMI_ALARM_P	Fast mask bit for bit[12] in STATUS register. Reset State: 0x0000
11	RACTL_ALARM_P	Fast mask bit for bit[11] in STATUS register. Reset State: 0x0000
10	RBHPC_SOFEOFATN_P	Fast mask bit for bit[10] in STATUS register. Reset State: 0x0000
9	TXCTL_ALARM_P	Fast mask bit for bit[9] in STATUS register. Reset State: 0x0000
8	TACTL_ALARM_P	Fast mask bit for bit[8] in STATUS register. Reset State: 0x0000
7	MPI_MAXREQATN_P	Fast mask bit for bit[7] in STATUS register. Reset State: 0x0000
6	MPI_WATCHDOG_P	Fast mask bit for bit[6] in STATUS register. Reset State: 0x0000
5	MPI_TXPABORT_P	Fast mask bit for bit[5] in STATUS register. Reset State: 0x0000
4	TPC_ATN_P	Fast mask bit for bit[4] in STATUS register. Reset State: 0x0000
3	CAL_ATN_P	Fast mask bit for bit[3] in STATUS register. Reset State: 0x0000
2	AGC_RADARDET_P	Fast mask bit for bit[2] in STATUS register. Reset State: 0x0000
1	AGC_CLRCHAN_P	Fast mask bit for bit[1] in STATUS register. Reset State: 0x0000
0	RFIF_CALIB_DONE_P	Fast mask bit for bit[0] in STATUS register. Reset State: 0x0000

0x3000008 PHYINT_SLOW_MASK

Type: read-write
Reset State: 0x0000

This register masks the Status register before the bits are combined to generate the slow interrupt to the embedded CPU. Setting a bit to "1" enables the interrupt, "0" masks the interrupt.

PHYINT_SLOW_MASK

Bits	Name	Description
14	AGC_WATCHDOG_EXP	Slow mask bit for bit[14] in STATUS register. Reset State: 0x0000
13	TAHDR_INVLD_RATE	Slow mask bit for bit[13] in STATUS register. Reset State: 0x0000
12	PMI_ALARM_P	Slow mask bit for bit[12] in STATUS register. Reset State: 0x0000
11	RACTL_ALARM_P	Slow mask bit for bit[11] in STATUS register. Reset State: 0x0000
10	RBHPC_SOFEOFATN_P	Slow mask bit for bit[10] in STATUS register. Reset State: 0x0000
9	TXCTL_ALARM_P	Slow mask bit for bit[9] in STATUS register. Reset State: 0x0000
8	TACTL_ALARM_P	Slow mask bit for bit[8] in STATUS register. Reset State: 0x0000
7	MPI_MAXREQATN_P	Slow mask bit for bit[7] in STATUS register. Reset State: 0x0000
6	MPI_WATCHDOG_P	Slow mask bit for bit[6] in STATUS register. Reset State: 0x0000
5	MPI_TXPABORT_P	Slow mask bit for bit[5] in STATUS register. Reset State: 0x0000
4	TPC_ATN_P	Slow mask bit for bit[4] in STATUS register. Reset State: 0x0000
3	CAL_ATN_P	Slow mask bit for bit[3] in STATUS register. Reset State: 0x0000
2	AGC_RADARDET_P	Slow mask bit for bit[2] in STATUS register. Reset State: 0x0000
1	AGC_CLRCHAN_P	Slow mask bit for bit[1] in STATUS register. Reset State: 0x0000
0	RFIF_CALIB_DONE_P	Slow mask bit for bit[0] in STATUS register. Reset State: 0x0000

0x300000C PHYINT_HOST_MASK

Type: read-write
Reset State: 0x0000

This register masks the Status register before the bits are combined to generate the PCI/USB interrupt to the Host processor. Setting a bit to "1" enables the interrupt, "0" masks the interrupt.

PHYINT_HOST_MASK

Bits	Name	Description
14	AGC_WATCHDOG_EXP	Host mask bit for bit[14] in STATUS register. Reset State: 0x0000
13	TAHDR_INVLD_RATE	Host mask bit for bit[13] in STATUS register. Reset State: 0x0000
12	PMI_ALARM_P	Host mask bit for bit[12] in STATUS register. Reset State: 0x0000
11	RACTL_ALARM_P	Host mask bit for bit[11] in STATUS register. Reset State: 0x0000
10	RBHPC_SOFEOFATN_P	Host interrupt mask bit for bit[10] in STATUS register. Reset State: 0x0000
9	TXCTL_ALARM_P	Host interrupt mask bit for bit[9] in STATUS register. Reset State: 0x0000
8	TACTL_ALARM_P	Host interrupt mask bit for bit[8] in STATUS register. Reset State: 0x0000
7	MPI_MAXREQATN_P	Host interrupt mask bit for bit[7] in STATUS register. Reset State: 0x0000
6	MPI_WATCHDOG_P	Host interrupt mask bit for bit[6] in STATUS register. Reset State: 0x0000
5	MPI_TXPABORT_P	Host interrupt mask bit for bit[5] in STATUS register. Reset State: 0x0000
4	TPC_ATN_P	Host interrupt mask bit for bit[4] in STATUS register. Reset State: 0x0000
3	CAL_ATN_P	Host interrupt mask bit for bit[3] in STATUS register. Reset State: 0x0000
2	AGC_RADARDET_P	Host interrupt mask bit for bit[2] in STATUS register. Reset State: 0x0000
1	AGC_CLRCHAN_P	Host interrupt mask bit for bit[1] in STATUS register. Reset State: 0x0000
0	RFIF_CALIB_DONE_P	Host interrupt mask bit for bit[0] in STATUS register. Reset State: 0x0000

16.2.18 pmi

0x3000000 PMI_PMI_STATE

Type: read-only

Reflects the current value of the state machine.

PMI_PMI_STATE

Bits	Name	Description
2:0	VALUE	PMI state.

0x3000004 PMI_RXA_PKTS

Type: write-only

Counts number of single packets only.

PMI_RXA_PKTS

Bits	Name	Description
15:0	COUNT	RXA single packet event counter.

0x300000C PMI_RXB_PACKETS

Type: write-only

Counts number of RXB packets.

PMI_RXB_PACKETS

Bits	Name	Description
15:0	COUNT	RXB packet start event counter.

0x3000010 PMI_RXA_DATA_VALID

Type: write-only

Counts number of RXA data valid pulses.

PMI_RXA_DATA_VALID

Bits	Name	Description
15:0	COUNT	RXA data valid pulse counter.

0x3000014 PMI_RXB_DATA_VALID

Type: write-only

Counts number of RXB data valid pulses.

PMI_RXB_DATA_VALID

Bits	Name	Description
15:0	COUNT	RXB data valid pulse counter.

0x3000018 PMI_RXP_SHUTOFF

Type: write-only

Counts number of RXP shutoff pulses.

PMI_RXP_SHUTOFF

Bits	Name	Description
15:0	COUNT	RXP shutoff pulse counter.

0x300001C PMI_PHY_STARTS

Type: write-only

Counts number of RXP start pulses issued.

PMI_PHY_STARTS

Bits	Name	Description
15:0	COUNT	RXP start pulses counter.

0x3000020 PMI_PHY_DATA_VAL

Type: write-only

Counts number of RXP data valid pulses.

PMI_PHY_DATA_VAL

Bits	Name	Description
15:0	COUNT	RXP data valid pulses counter.

0x3000024 PMI_PHY_ABORT

Type: write-only

Counts number of RXP abort pulses.

PMI_PHY_ABORT

Bits	Name	Description
15:0	COUNT	RXP abort pulses counter.

0x3000028 PMI_PHY_INT

Type: write-only

Counts number of interrupt pulses.

PMI_PHY_INT

Bits	Name	Description
15:0	COUNT	PHYINT interrupt pulses counter.

0x300002C PMI_WATCHDOG_TIMEOUT_GENERAL

Type: read-write
Reset State: 0x0000

Max duration of non-idle time for PMI state machine before abort generated. Duration defined as (x*128 + 128) clocks, where x is the value in this register.

PMI_WATCHDOG_TIMEOUT_GENERAL

Bits	Name	Description
15:0	VALUE	PMI state machine general timeout value (disabled by default). Reset State: 0x0000

0x3000030 PMI_WATCHDOG_TIMEOUT_11A

Type: read-write
Reset State: 0x0015

Max duration of time between 11a data valids before abort generated. Duration defined as (x*128 + 128) clocks, where x is the value in this register.

PMI_WATCHDOG_TIMEOUT_11A

Bits	Name	Description
15:0	VALUE	PMI state machine 11a-dval timeout value (default value 21). Reset State: 0x0015

0x3000034 PMI_WATCHDOG_TIMEOUT_11B

Type: read-write
Reset State: 0x002A

Max duration of time between 11b data valids before abort generated. Duration defined as (x*128 + 128) clocks, where x is the value in this register.

PMI_WATCHDOG_TIMEOUT_11B

Bits	Name	Description
15:0	VALUE	PMI state machine 11b-dval timeout value (default value 42). Reset State: 0x002A

0x3000038 PMI_DISABLE_FLAGS

Type: read-write
Reset State: 0x0000

Various functionality enables.

PMI_DISABLE_FLAGS

Bits	Name	Description
2	STATS_UPDATE_DISABLE_FLAG	When asserted, this switch disables updating of the stats APB registers in the PMI. Reset State: 0x0000
1	CRC_DISABLE_FLAG	When asserted, this switch disables CRC checking in the PMI. Reset State: 0x0000
0	RXP_DISABLE_FLAG	When asserted, this switch disables all output to the RXP. Reset State: 0x0000

0x300003C PMI_CRC_FSM_RESET

Type: command
Reset State: 0x0000

Accessing this register will generate a pulse that resets the CRC FSM

PMI_CRC_FSM_RESET

Bits	Name	Description
0	PULSE	Reset State: 0x0000

0x3000040 PMI_RXPKT_FILTER_LSW

Type: read-write
Reset State: 0x0000

LS 2 bytes of the RX packet filter pattern for CRC check. All-zeros pattern disables filtering.

PMI_RXPKT_FILTER_LSW

Bits	Name	Description
15:0	DATA	Reset State: 0x0000

0x3000044 PMI_RXPKT_FILTER_MSW

Type: read-write
Reset State: 0x0000

MS 2 bytes of the RX packet filter pattern for CRC check. All-zeros pattern disables filtering.

PMI_RXPKT_FILTER_MSW

Bits	Name	Description
15:0	DATA	Reset State: 0x0000

0x3000048 PMI_CRC_DONE

Type: write-only

Number of packets that completed the CRC check.

PMI_CRC_DONE

Bits	Name	Description
15:0	COUNT	

0x300004C PMI_CRC_PASS

Type: write-only

Number of packets that passed the CRC check.

PMI_CRC_PASS

Bits	Name	Description
15:0	COUNT	

0x3000050 PMI_AMPDU_BAD

Type: write-only

Number of packets that failed the AMPDU CRC check.

PMI_AMPDU_BAD

Bits	Name	Description
15:0	COUNT	

0x3000054 PMI_AMPDU_GOOD

Type: write-only

Number of packets that passed the AMPDU CRC check.

PMI_AMPDU_GOOD

Bits	Name	Description
15:0	COUNT	

0x3000058 PMI_AMPDU_DONE

Type: write-only

Number of packets that completed the AMPDU CRC check.

PMI_AMPDU_DONE

Bits	Name	Description
15:0	COUNT	

0x300005C PMI_LAST_STATS0

Type: read-only

Last statistics data transferred to RXP, bits[15:0].

PMI_LAST_STATS0

Bits	Name	Description
15:0	DATA	

0x3000060 PMI_LAST_STATS1

Type: read-only

Last statistics data transferred to RXP, bits[31:16].

PMI_LAST_STATS1

Bits	Name	Description
15:0	DATA	

0x3000064 PMI_LAST_STATS2

Type: read-only

Last statistics data transferred to RXP, bits[47:32].

PMI_LAST_STATS2

Bits	Name	Description
15:0	DATA	

0x3000068 PMI_LAST_STATS3

Type: read-only

Last statistics data transferred to RXP, bits[63:48].

PMI_LAST_STATS3

Bits	Name	Description
15:0	DATA	

16.2.19 ractl

0x3000000 RACTL_PTC_LOOP_EN

Type: read-write
Reset State: 0x003F

This registers provides the enable signals for the amplitude, frequency and channel tracking functions within the RXA PTC module. When each bit is asserted, the corresponding tracking loop is enabled.

RACTL_PTC_LOOP_EN

Bits	Name	Description
5	TIME_ADJ_EN	TDC timing adjustment enable. Reset State: 0x0001
4	PH_ADJ_EN	TDC phase adjustment enable. Reset State: 0x0001
3	CHAN_EN	Channel tracking enable. If asserted, PTC channel tracking loop will detect channel phase changes and modify the channel estimate samples received from the channel estimator module. Reset State: 0x0001
2	FREQ_EN	Frequency tracking enable. If asserted, PTC frequency tracking loop will track reference oscillator frequency drift and modify the phase of the incoming samples received from the phase imbalance corrector module. Reset State: 0x0001
1	AMP_EN_MIMO	Amplitude tracking enable for mimo symbols. If asserted, PTC amplitude tracking loop will track and modify the amplitude of the incoming samples received from the phase imbalance corrector module (mimo symbols only) Reset State: 0x0001
0	AMP_EN_SIMO	Amplitude tracking enable for simo symbols. If asserted, PTC amplitude tracking loop will track and modify the amplitude of the incoming samples received from the phase imbalance corrector module (simo symbols only) Reset State: 0x0001

0x3000004 RACTL_PTC_LOOP_GAIN

Type: read-write
Reset State: 0x002A

This registers provides the gain factors for the amplitude, frequency and channel tracking functions within the RXA PTC module.

RACTL_PTC_LOOP_GAIN

Bits	Name	Description
7:4	CHAN_GAIN	Channel tracking loop gain. 0x0: CGAIN_2 0x1: CGAIN_3 0x2: CGAIN_4 0x3: CGAIN_4TOO Reset State: 0x0002
3:2	FREQ_GAIN	Frequency tracking loop gain. 0x0: FGNO_AVG 0x1: FGAIN_2 0x2: FGAIN_3 0x3: FGAIN_4 Reset State: 0x0002
1:0	AMP_GAIN	Amplitude tracking loop gain. 0x0: AGNO_AVG 0x1: AGAIN_3 0x2: AGAIN_4 0x3: AGAIN_5 Reset State: 0x0002

0x3000008 RACTL_PTC_CHAN_FREQ

Type: read-write
Reset State: 0x087E

This value represents the ratio of sampling frequency to RF channel frequency using 10-bit quantisation

RACTL_PTC_CHAN_FREQ

Bits	Name	Description
11:0	PTC_CHAN_FREQ	Default setting = 12'd2174 Reset State: 0x087E

0x300000C RACTL_RACTL_TEST

Type: read-write
Reset State: 0x07B0

This register contains all the test mode flags for the RX-A controller

RACTL_RACTL_TEST

Bits	Name	Description
10	NDP_EN_11N	This bit enables the checking of NDP(ZLF) packets Reset State: 0x0001
9	FCM_EN_11N	This bit enables declaration of 256 QAM as supported rate in 11AC Reset State: 0x0001
8	RATE_EN_11N	This bit enables service-field-overloading for bw-capability exchange in legacy rts/cts frames. Default enabled, pmi byte5[6:4] gets data from de-scrambler input. Reset State: 0x0001
7	SSF_RESERVED_CHK_EN	This bit enables the SSF RESERVED field check mode. If not set, ESF packet reception is disabled. Ref register hexD4. NOTE - for Taurus, this bit is not used Reset State: 0x0001
6	DEBUG_MODE_EN	This bit controls if ractl should use watchdog mechanism to generate end-of-input-pkt. Reset State: 0x0000
5	RATE_CHK_EN	This bit enables the RATE field content check mode and enables assertion of the SHDR_INVALID or EHDR_INVALID flag to the AGC module if the RATE field does not contain a legal value. Reset State: 0x0001
4	SERVICE_EN	This bit enables the SERVICE field content check mode and enables assertion of the SERVICE_INVALID flag to the AGC module. Reset State: 0x0001
3	SOUNDING_BIT_CHK_EN	This bit (previously called parity_check_en) enables checking of sounding bit for unsupported htsig purpose (applies only to non-ndp packets) Reset State: 0x0000

0x3000010 RACTL_RXA_ABORT

Type: command
Reset State: 0x0000

Writing any value to this register instructs the RX-A controller to abort the current packet and return the RXA module to idle mode.

RACTL_RXA_ABORT

Bits	Name	Description
0	RXA_ABORT	Writing any value to this bit will trigger an abort of the RX-A module. Reading this register will return a 0 value. Reset State: 0x0000

0x3000014 RACTL_RACTL_TOFFSET

Type: read-write
Reset State: 0x0000

This register contains a timing offset value that is added to the timing correction value provided by the BTCF module. This addition takes place in the TDC module.

RACTL_RACTL_TOFFSET

Bits	Name	Description
7:0	RACTL_TOFFSET	Timing offset value fed to the TDC module. Default setting = 8'h0. Reset State: 0x0000

0x3000018 RACTL_RACTL_DELTAT_IN

Type: read-write
Reset State: 0x0000

This register contains a test value that overrides the timing correction value provided by the BTCF module.

RACTL_RACTL_DELTAT_IN

Bits	Name	Description
15	APB_DT_OVERRIDE	If asserted, the RACTL module passes the APB timing offset value to the TDC module instead of that received from BTCF. Reset State: 0x0000
8:0	APB_DT	Test BTCF timing correction value that overrides the internally-calculated value. Default setting = 8'h0. Reset State: 0x0000

0x300001C RACTL_RACTL_DELTAT_OUT

Type: read-only

This register allows the host to observe timing value that is fed to the TDC module

RACTL_RACTL_DELTAT_OUT

Bits	Name	Description
8:0	TDC_DT	Current timing correction value being used by TDC module provided by PTC Note the current timing adjust value is in PTC_DELTAAMP_TIMINGOFFSET_OUT register

0x3000020 RACTL_RACTL_DELTAF_IN

Type: read-write
Reset State: 0x0000

Test frequency correction value that overrides the value provided by the BTCF module.

RACTL_RACTL_DELTAF_IN

Bits	Name	Description
15	APB_DFUPDT_OVERRIDE	Use this to indicate PTC to use the initially received value rather than updating it. Reset State: 0x0000
14	APB_DFINIT_OVERRIDE	If asserted, the RACTL module passes the APB frequency error value to the TDC module instead of that received from BTCF. Reset State: 0x0000
9:0	APB_DF	Test frequency correction value that overrides the internally-calculated value. Default setting = 10'h0. Reset State: 0x0000

0x3000024 RACTL_RACTL_DELTAF_OUT

Type: read-only

Current frequency correction value being used by TDC module

RACTL_RACTL_DELTAF_OUT

Bits	Name	Description
11:0	PTC_DF	Current frequency correction value being used by TDC module

0x3000028 RACTL_PTC_DELTAAMP_TIMINGOFFSET_OUT

Type: read-only

Current frequency correction value being used by PTC module

RACTL_PTC_DELTAAMP_TIMINGOFFSET_OUT

Bits	Name	Description
9:8	PTC_DT	Current timing offset correction value being provided PTC to TDC
7:0	PTC_DA	Current amplitude correction value being used by PTC module

0x300002C RACTL_RACTL_TEST_SIG_LEN

Type: read-write
Reset State: 0xFFFF

Test SIGNAL field length value that overrides the internally-demodulated value.

RACTL_RACTL_TEST_SIG_LEN

Bits	Name	Description
15:0	RACTL_LENGTH	Test LENGTH field value that overrides the internally-demodulated value. Default setting = 16'hffff. Reset State: 0xFFFF

0x3000030 RACTL_RACTL_TEST_CFG

Type: read-write
Reset State: 0x0000

Contains test SIGNAL field rate values

RACTL_RACTL_TEST_CFG

Bits	Name	Description
5:2	RACTL_RATE	Test RATE field value that overrides the internally-demodulated value. Default setting = 4'h0. Reset State: 0x0000
1	LENGTH_OVRD_EN	This bit enables the use of APB LENGTH value rather than the LENGTH field decoded by RAHDR. Reset State: 0x0000
0	RATE_OVRD_EN	This bit enables the use of APB RATE value rather than the RATE field decoded by RAHDR. Reset State: 0x0000

0x3000034 RACTL_TESTMUX_SEL

Type: read-write
Reset State: 0x0014

Selector signals for the test busses from the RX-A module

RACTL_TESTMUX_SEL

Bits	Name	Description
15:13	RESERVED	RESERVED FOR FUTURE USE Reset State: 0x0000
12:11	RACTLTEST_HDRSELECT	0x0: Selects existing testbus in pktparams 1: Selects lsig and htsig (tail and crc on the msbs-see the 3 lsbs to determine the pkt-type 2: Selects lsig and vhtsiga tail and crc on the msbs-see the 3 lsbs to determine the pkt-type) Reset State: 0x0000
10:9	RACTLTEST_SELECT160	Selector signal for the RACTL testbus at 160 0 test0 1 160 domain signals involved in clock-domain-crossing 2, 3 - tdcintf and other 160M ractl-interface signals Reset State: 0x0000
8:7	RACTLTEST_SELECT8040	Selector signal for the RACTL vital testbus at 8040 0 vital0 1 vital1 2 - 8040 domain signals involved in clock-domain-crossing 3 - Ractl main state machine essential signals Reset State: 0x0000
6:0	TESTBUS_SELECT	Selector signal for the RX-A test bus Bit 6 will select between the vital signals at rxa_top (0) or vital signals from only ractl (1) Bit 5 will select between the signals in 80M (0) and 160M (1) domain Bit 4:0 will select the modules for which signals will be monitored in both 80M domain and 160M domains 4:0 80 / 8040 160 ---------- ---------- 0 fscale tdc,fft 1 btcf tdc1 2 tdc tdc2 3 ractl1 fft1 4 ractl2 fft2 5 ractl3 fft3 7 che 8 ptc1 9 ptc2 10 lmap 11 dint 12 vit 13 radscr 14 che-ptc 15 che-lmap 16 che-lmap 17 lmap snr 18 ractl 19 che new set in riva 20 che new set in riva 21-24 phycsxi che and lmap interface data Reset State: 0x0014

0x3000038 RACTL_RACTL_PKTCOUNT

Type: write-only

Number of packet burst start signals received by the RACTL module

RACTL_RACTL_PKTCOUNT

Bits	Name	Description
11:0	RACTL_SPKTCOUNT	Number of packet burst start signals received by the RACTL module from AGC

0x300003C RACTL_RACTL_SYMCOUNT

Type: write-only

Number of OFDM symbol start signals generated by the RACTL module

RACTL_RACTL_SYMCOUNT

Bits	Name	Description
15:0	RACTL_SYMCOUNT	Number of OFDM symbol start signals generated by the RACTL module

0x3000048 RACTL_PTC_PKTCOUNT

Type: write-only

Number of packet burst start signals received by the PTC module

RACTL_PTC_PKTCOUNT

Bits	Name	Description
11:0	PTC_SPKTCOUNT	Number of packet burst start signals received by the PTC module (all packet types)

0x300004C RACTL_PTC_SYMCOUNT

Type: write-only

Number of OFDM symbol start signals received by the PTC module

RACTL_PTC_SYMCOUNT

Bits	Name	Description
15:0	PTC_SYMCOUNT	Number of OFDM symbol start signals received by the PTC module

0x300005C RACTL_PTC_PKTCOUNT_20M

Type: write-only

Number of packet burst start signals received by the PTC module in 20MHz modes

RACTL_PTC_PKTCOUNT_20M

Bits	Name	Description
11:0	PTC_SPKTCOUNT_20M	Number of packet burst start signals received by the PTC module in 20MHz modes (all packet types) This includes the 20M 11n packets falsely detected as 40M packets

0x3000060 RACTL_PTC_PKTCOUNT_40M

Type: write-only

Number of packet burst start signals received by the PTC module in 40MHz modes

RACTL_PTC_PKTCOUNT_40M

Bits	Name	Description
11:0	PTC_SPKTCOUNT_40M	Number of packet burst start signals received by the PTC module in 40MHz and 80MHz modes (all packet types) This includes the 40M 11n packets falsely detected as 80M packets

0x3000064 RACTL_PTC_PKTCOUNT_SIMO

Type: write-only

Number of packet burst start signals received by the PTC module in simo mode

RACTL_PTC_PKTCOUNT_SIMO

Bits	Name	Description
11:0	PTC_SPKTCOUNT_SIMO	Number of packet burst start signals received by the PTC module in simo modes. This includes the 20M and 40M 11n and legacy mode packets but does not include stbc mode packets

0x3000074 RACTL_PTC_PKTCOUNT_STBC

Type: write-only

Number of packet burst start signals received by the PTC module in stbc modes

RACTL_PTC_PKTCOUNT_STBC

Bits	Name	Description
11:0	PTC_SPKTCOUNT_STBC	Number of packet burst start signals received by the PTC module in stbc modes. This includes the 20M and 40M 11n mode packets.

0x3000078 RACTL_FFT_OPSCALE

Type: read-write
Reset State: 0x0000

Amount of output attenuation to be applied by the FFT module

RACTL_FFT_OPSCALE

Bits	Name	Description
1:0	FFT_OPSCALE	Amount of output attenuation to be applied by the FFT module 0x0: GAIN_1 0x1: GAIN_1_2 0x2: GAIN_1_4 0x3: GAIN_1_8 Reset State: 0x0000

0x300007C RACTL_RACTL_STATE

Type: read-only

Current state of RACTL state machine

RACTL_RACTL_STATE

Bits	Name	Description
14:10	PREV1_STATE	Previous-but-1 state of RACTL state machine
9:5	PREV0_STATE	Previous state of RACTL state machine
4:0	CURRENT_STATE	Current state of RACTL state machine

0x3000080 RACTL_AGC_ABORT_COUNT

Type: write-only

Number of abort signals received from the AGC module

RACTL_AGC_ABORT_COUNT

Bits	Name	Description
15:0	AGC_ABORTCOUNT	Number of abort signals received from the AGC module

0x3000084 RACTL_SIGNAL_INVALID_COUNT_LSIG

Type: write-only

Number of packets received with invalid LEGACY SIGNAL field values

RACTL_SIGNAL_INVALID_COUNT_LSIG

Bits	Name	Description
15:0	INVALID_SFCOUNT	Number of packets received with invalid SIGNAL field values

0x3000088 RACTL_SERV_INVALID_COUNT

Type: write-only

Number of packets received with invalid SERVICE field values

RACTL_SERV_INVALID_COUNT

Bits	Name	Description
15:0	INVALID_SERVCOUNT	Number of packets received with invalid SERVICE field values

0x300008C RACTL_INTERRUPT_COUNT

Type: write-only

Combined number of interrupts received by RAHDR and RACTL

RACTL_INTERRUPT_COUNT

Bits	Name	Description
15:0	INTERRUPT_COUNT	Total number of interrupts. For Volans: Does not include the NDP packets that qualify for CSI transfer. Does not include the "Unsupported configuration" (Note that for Volans, 1rx 4ss configuration is allowed.)

0x3000090 RACTL_LAST_LS_SIGNAL

Type: read-only
Reset State: 0x0000

This register holds the LS 16 bits of the last decoded standard SIGNAL field value. On reset, the register is set to 0

RACTL_LAST_LS_SIGNAL

Bits	Name	Description
15:0	VALUE	LS 16 bits of the last decoded standard SIGNAL field Reset State: 0x0000

0x3000094 RACTL_LAST_MS_SIGNAL

Type: read-only
Reset State: 0x0000

This register holds the MS 16 bits of the last decoded standard SIGNAL field value. On reset, the register is set to 0

RACTL_LAST_MS_SIGNAL

Bits	Name	Description
7:0	VALUE	MS 8 bits of the last decoded standard SIGNAL field Reset State: 0x0000

0x3000098 RACTL_STATISTICS_SELECT

Type: read-write
Reset State: 0x0000

This register selects the format of the 8-byte stats field appended to the end of a received packet

RACTL_STATISTICS_SELECT

Bits	Name	Description
2:0	VALUE	Stats format selector 0x0: AGC_CONSOLIDATED1 0x1: AGC_CONSOLIDATED2 0x2: TDC_CONSOLIDATED 0x3: CAL_ONLY 0x4: KNOWN_PATTERN 0x5: FSCALE_CONSOLIDATED Reset State: 0x0000

0x300009C RACTL_AC_CHK

Type: read-write
Reset State: 0x0001

Supplies the configuration parameters to RAHDR

RACTL_AC_CHK

Bits	Name	Description
0	BW_MSB_CHECK	Asserted to indicate the vhtsiga bits [2:0] will be checked against agc bw [2:0] settings. 0 => vhtsiga bits [1:0] will be checked against agc bw [1:0] settings. Reset State: 0x0001

0x30000A0 RACTL_DAGC_TGTBO

Type: read-write
Reset State: 0x001E

Fscale Target Backoff for Digital Gain computation. The gain is set this amount of dBs below the gain that would fully saturate the receiver. The backoff is specified in 0.5 dB steps.

RACTL_DAGC_TGTBO

Bits	Name	Description
5:0	BACK_OFF	Backoff value. Default backoff is 30. Reset State: 0x001E

0x30000A4 RACTL_CMDWDFILL

Type: read-write
Reset State: 0x0003

Sets the options for software to get sig,htsig,service field in the command word

RACTL_CMDWDFILL

Bits	Name	Description
1	SERVICE_EN	Asserted to enable transmission of sig,htsig from RAHDR to PMI. Default is enable. Reset State: 0x0001
0	HDR_EN	Asserted to enable transmission of sig,htsig rom RAHDR to PMI. Default is enable. Reset State: 0x0001

0x30000A8 RACTL_LAST_HTSIGNAL0

Type: read-only
Reset State: 0x0000

This register holds the LS 16 bits of the last decoded 'unsupported' HTSIG SIGNAL field value. On reset, the register is set to 0

RACTL_LAST_HTSIGNAL0

Bits	Name	Description
15:0	VALUE	LS 16 bits of the last decoded 'unsupported' HTSIG SIGNAL field Reset State: 0x0000

0x30000AC RACTL_LAST_HTSIGNAL1

Type: read-only
Reset State: 0x0000

This register holds bits[31:16] of the last decoded 'unsupported' HTSIG SIGNAL field value. On reset, the register is set to 0

RACTL_LAST_HTSIGNAL1

Bits	Name	Description
15:0	VALUE	bits [31:16] of the last decoded 'unsupported' HTSIG SIGNAL field Reset State: 0x0000

0x30000B0 RACTL_LAST_HTSIGNAL2

Type: read-only
Reset State: 0x0000

This register holds bits [47:32] of the last decoded 'unsupported' HTSIG SIGNAL field value. On reset, the register is set to 0

RACTL_LAST_HTSIGNAL2

Bits	Name	Description
15:0	VALUE	MS 16 bits of the last decoded 'unsupported' HTSIG SIGNAL field Reset State: 0x0000

0x30000B4 RACTL_PTC_TH

Type: read-write
Reset State: 0x0008

RACTL_PTC_TH

Bits	Name	Description
3:0	QBPSK	Reset State: 0x0008

0x30000B8 RACTL_RACTL_STATUS

Type: read-write
Reset State: 0x0000

RACTL_RACTL_STATUS

Bits	Name	Description
13	PKTABORTSCOPE_CLR	Clear for bits [9:1] Reset State: 0x0000
12	PKT_PENDING_CLR	Clear for bit 0. Reset State: 0x0000
9:1	PKTABORTSCOPE	When sampled, shows the reason for ractl packet abort 0 - ssf_invalid 1 - htsig_invalid 2 - not_avalid 3 - serv_invalid 4 - state machine watchdog expired 5 - unsupported mode with given antenna configuration (NOTE that for Volans, 1rx all streams are supported for CSI transfer. However, the definition of this bit has been retained) 6 - unsupported htsig (NOTE that for Volans, NDP packets are supported for CSI transfer. However, the definition of this bit has been retained) 7 - spare 8 - spare
0	PKT_PENDING	When sampled, shows if a packet is pending for processing by RACTL

0x30000BC RACTL_STROBE_UNSUPPHTSIG

Type: command

Initiates write of the 1st occurrence of unsupported htsig

RACTL_STROBE_UNSUPPHTSIG

Bits	Name	Description
0	INITIATE	Write to this register to do only one write to registers 9C to A0 above.

0x30000C0 RACTL_NES2_MCSBOUND0

Type: read-write
Reset State: 0x1715

Programmable lower and upper bounds of mcs fields to detect Nes of 2

RACTL_NES2_MCSBOUND0

Bits	Name	Description
14:8	MCSUB0	Upper bound0. This value will be used with 11n40 flag to declare Nes of 2 Reset State: 0x0017

RACTL_NES2_MCSBOUND0 (cont.)

Bits	Name	Description
6:0	MCSLB0	Lower bound0. This value will be used with 11n40 flag to declare Nes of 2 Reset State: 0x0015

0x30000C4 RACTL_NES2_MCSBOUND1

Type: read-write
Reset State: 0x1F1C

Programmable lower and upper bounds of mcs fields to detect Nes of 2

RACTL_NES2_MCSBOUND1

Bits	Name	Description
14:8	MCSUB1	Upper bound1. This value will be used with 11n40 flag to declare Nes of 2 Reset State: 0x001F
6:0	MCSLB1	Lower bound1. This value will be used with 11n40 flag to declare Nes of 2 Reset State: 0x001C

0x30000C8 RACTL_NES2_MCSBOUND2

Type: read-write
Reset State: 0x3434

Programmable lower and upper bounds of mcs fields to detect Nes of 2

RACTL_NES2_MCSBOUND2

Bits	Name	Description
14:8	MCSUB2	Upper bound2. This value will be used with 11n40 flag to declare Nes of 2 Reset State: 0x0034
6:0	MCSLB2	Lower bound2. This value will be used with 11n40 flag to declare Nes of 2 Reset State: 0x0034

0x30000CC RACTL_NES2_MCSBOUND3

Type: read-write
Reset State: 0x4C46

Programmable lower and upper bounds of mcs fields to detect Nes of 2

RACTL_NES2_MCSBOUND3

Bits	Name	Description
14:8	MCSUB3	Upper bound3. This value will be used with 11n40 flag to declare Nes of 2 Reset State: 0x004C
6:0	MCSLB3	Lower bound3. This value will be used with 11n40 flag to declare Nes of 2 Reset State: 0x0046

0x30000D0 RACTL_LSIGLEN_LOWERBOUND

Type: read-write
Reset State: 0x0149

Programmable lower bound of length field in LSIG to detect htsig in a MM packet

RACTL_LSIGLEN_LOWERBOUND

Bits	Name	Description
9:5	LSIGLENLB_AC	The length field in the lsig is required to be equal to or more than this value to look for an vhtsiga in the next symbol Reset State: 0x000A
4:0	LSIGLENLB_N	The length field in the lsig is required to be equal to or more than this value to look for an htsig in the next symbol Reset State: 0x0009

0x30000D4 RACTL_RACTL_INTR_EN

Type: read-write
Reset State: 0x0060

The enables to report the interrupts to Phyint. Bit 0 is for enabling interrupt from rahdr and the other ones are in sequence corresponding to register RACTL_STATUS By default, only watchdog-expiry and unsupported configuration-related interrupts are enabled

RACTL_RACTL_INTR_EN

Bits	Name	Description
7	UNSUPHTSIG_INTRMASKEN	Reset State: 0x0000
6	UNSUPCFG_INTRMASKEN	Reset State: 0x0001
5	WATCHDOGEXP_INTRMASKEN	Reset State: 0x0001
4	SERVINVALID_INTRMASKEN	Reset State: 0x0000
3	NOTAVALID_INTRMASKEN	Reset State: 0x0000
2	HTSIG_INVALID_INTRMASKEN	Reset State: 0x0000
1	SSF_INVALID_INTRMASKEN	Reset State: 0x0000
0	RAHDR_INTRMASKEN	Reset State: 0x0000

0x30000D8 RACTL_RACTL_SUPP_BWMISMCOUNT

Type: read-write
Reset State: 0x0000

RACTL counter to count the number of times rxa demodulated a packet at a lower bandwidth compared to that specified by agc. Note that counter is in hardware and the slave is only a readonly.

RACTL_RACTL_SUPP_BWMISMCOUNT

Bits	Name	Description
15	RST	Resets the above counters Reset State: 0x0000
14:10	BW80FOUND20MISM	The dynamic bandwidth setting is 80Mhz but 20M packet detected
9:5	BW80FOUND40MISM	The dynamic bandwidth setting is 80Mhz but 40M packet detected
4:0	BW40FOUND20MISM	The dynamic bandwidth setting is 40Mhz but 20M packet detected

0x30000DC RACTL_PTC_TH1

Type: read-write
Reset State: 0x0006

RACTL_PTC_TH1

Bits	Name	Description
3:0	IBPSK	Reset State: 0x0006

0x30000F0 RACTL_LMAP

Type: read-write
Reset State: 0x0000

This register holds 2 bits - one (bit 1) is applicable till the header is demodulated and the other (bit 0) for the data symbols in general. The value in bit 0 of this bit register specifies whether duplicate tones need to be combined in the RXA before simo slicer function in the data portions of the symbol Note that the contents of this register is modified by ractl's mode detection logic such that HT-duplicate packets should always do MRC over duplicate tones irrespective of this setting. Stated otherwise, this register only affects legacy duplicate mode packets.

RACTL_LMAP

Bits	Name	Description
1	DUPTONE_COMB_EN_SF	Off by default. When high, duplicate tones combining will take place only for signal fields (legacy or htsig) duplicate symbols. Note that due to hardware processing latencies, the settings of this bit will affect the duplicate combining of the service-data symbol of the legacy duplicate packet. Reset State: 0x0000
0	DUPTONE_COMB_EN	Off by default. When high, duplicate tones combining will take place only for legacy duplicate symbols. Note that due to hardware processing latencies, the settings of this bit will _not_ affect the duplicate combining of the service-data symbol of the legacy duplicate packet. Reset State: 0x0000

0x30000F4 RACTL_RACTL_SPL

Type: read-write
Reset State: 0x0006

This register holds some configuration bits to handle ractl-agc signalling of txop signal (only for MM packets and when LSIG and HTSIG both pass) and ractl-rahdr signalling to steer transfer of data to pmi.

RACTL_RACTL_SPL

Bits	Name	Description
15	RESET_TXOP	Off by default. When high, the txop signal from ractl will be cleared. This clearing mechanism is devised since the txop signal is not cleared with regular clearing mechanism in ractl like agc_start and agc_abort Reset State: 0x0000
2	NDP_PMI_XFER	ON by default. When high, the command-word and statistics bytes go to pmi. When low, nothing goes. Reset State: 0x0001
1	TXOP_SIG_NDP	On by default. When low, specifies that txop signal need not be toggled at all for ndp (zlf) packets Reset State: 0x0001
0	TXOP_SIG_SUPPHTSIG	Off by default. When high, specifies that txop calculation to be done for supported htsig Note that txop calculation is always done on unsupported htsig. Reset State: 0x0000

0x30000F8 RACTL_WATCHDOG1

Type: read-write
Reset State: 0x0000

Watchdog timer max values in header detection states Watchdog timer max values in microseconds.

RACTL_WATCHDOG1

Bits	Name	Description
15:12	WD_HTSIG	Watchdog timer maxvalue in HTSIG state; Minimum value 5. Value of 0 disables this timer. Reset State: 0x0000
11:8	WD_SF3	Watchdog timer maxvalue in SF3 state; Minimum value 5. Value of 0 disables this timer. Reset State: 0x0000
7:4	WD_SF2	Watchdog timer maxvalue in SF2 state; Minimum value 5. Value of 0 disables this timer. Reset State: 0x0000
3:0	WD_SF1	Watchdog timer maxvalue in SF1 state; Minimum value 5. Value of 0 disables this timer. Reset State: 0x0000

0x30000FC RACTL_WATCHDOG2

Type: read-write
Reset State: 0x0000

Watchdog timer max values in extra short and long training, servdata and recovery states Watchdog timer maxvalues in microseconds.

RACTL_WATCHDOG2

Bits	Name	Description
15:12	WD_WF	Watchdog timer maxvalue in WAITFINISH state; Minimum value 11. Value of 0 disables this timer. Reset State: 0x0000
11:8	WD_SERV	Watchdog timer maxvalue in SERV state; Minimum value 5. Value of 0 disables this timer. Reset State: 0x0000
7:4	WD_EXTRALTF	Watchdog timer maxvalue in extra LTF states; Minimum value 5. Value of 0 disables this timer. Reset State: 0x0000
3:0	WD_STS	Watchdog timer maxvalue in STS state; Minimum value 7. Value of 0 disables this timer. Reset State: 0x0000

0x3000100 RACTL_WATCHDOG3

Type: read-write
Reset State: 0x0000

Watchdog timer max values in data state and eopcount state Watchdog timer maxvalues in microseconds.

RACTL_WATCHDOG3

Bits	Name	Description
15	WDEXP_ABORT_EN	Enable for generating internal ractl abort based on expiry of watchdog timers listed in the registers WATCHDOG1, WATCHDOG2 and WATCHDOG3 Reset State: 0x0000
12:0	WD_DAT	Watchdog timer maxvalue in DATA and EOPCNT state. Value of 0 disables this timer. Reset State: 0x0000

0x3000104 RACTL_PTC_PKTCOUNT_GF

Type: write-only

Number of packet burst start signals received by the PTC module in all Greenfield modes

RACTL_PTC_PKTCOUNT_GF

Bits	Name	Description
11:0	PTC_SPKTCOUNT_GF	Number of packet burst start signals received by the PTC module in all Greenfield modes.

0x3000108 RACTL_PTC_PKTCOUNT_MM

Type: write-only

Number of packet burst start signals received by the PTC module in all Mixed-mode packets

RACTL_PTC_PKTCOUNT_MM

Bits	Name	Description
11:0	PTC_SPKTCOUNT_MM	Number of packet burst start signals received by the PTC module in all Mixed-mode modes.

0x300010C RACTL_LMAP_CONTROL

Type: read-write
Reset State: 0x0005

This registers provides the channel tracking controls

RACTL_LMAP_CONTROL

Bits	Name	Description
2:1	LMAP_TRACK_GAIN	Programmable tracking loop gain. Default setting = 2'h2. 0x0: LOOPGAIN_8 0x1: LOOPGAIN_16 0x2: LOOPGAIN_32 0x3: INVALID Reset State: 0x0002
0	LMAP_TRACK_EN	Channel tracking enable. If de-asserted, the channel tracking loop will not modify channel estimate samples received from the channel estimator module. Default setting = 1'b1. Reset State: 0x0001

0x3000110 RACTL_RACTL_UNSUPP_BWMISMCOUNT

Type: read-write
Reset State: 0x0000

RACTL counter to count the number of times rxa encountered packet at a higher bandwidth compared to that specified by agc. Note that counter is in hardware and the slave is only a readonly.

RACTL_RACTL_UNSUPP_BWMISMCOUNT

Bits	Name	Description
15	RST	Resets the above counters Reset State: 0x0000
14:10	BW20FOUND80MISM	The dynamic bandwidth setting is 20Mhz but 80M packet detected
9:5	BW40FOUND80MISM	The dynamic bandwidth setting is 40Mhz but 80M packet detected
4:0	BW20FOUND40MISM	The dynamic bandwidth setting is 20Mhz but 40M packet detected

0x3000114 RACTL_RACTL_LAST_BW

Type: read-only

RACTL_RACTL_LAST_BW

Bits	Name	Description
15:8	DYN	Most recent rightmost {prev4_dyn, prev3_dyn, prev2_dyn, prev1_dyn}
7:0	STATIC	Most recent rightmost {prev4_static, prev3_static, prev2_static, prev1_static}

0x300012C RACTL_RACTL_CLK160_DYNSEL1

Type: read-write
Reset State: 0x0099

RACTL_RACTL_CLK160_DYNSEL1

Bits	Name	Description
7	ENABLE_GF	If set, selects the following clock-ratios for the data section of the clk160 processing in rxa. Default setting-dynamic selection disabled for gf packets Reset State: 0x0001

RACTL_RACTL_CLK160_DYNSEL1 (cont.)

Bits	Name	Description
5:4	GF_CLKRATIOSEL	0x0: switched-clk is 1:1 of original clock1: switched-clk is 2:3 of original clock 2 : switched-clk is 4:5 of original clock 3 : switched-clk is 8:9 of original clock Default is 1:1 Reset State: 0x0001
3	ENABLE_LEGACY	If set, selects the following clock-ratios for the data section of the clk160 processing in rxa. Default setting-dynamic selection enabled for legacy packets Reset State: 0x0001
1:0	LGCY_CLKRATIOSEL	0x0: switched-clk is 1:1 of original clock1: switched-clk is 2:3 of original clock 2 : switched-clk is 4:5 of original clock 3 : switched-clk is 8:9 of original clock Default is 2:3 Reset State: 0x0001

0x3000130 RACTL_RACTL_CLK160_DYNSEL2

Type: read-write
Reset State: 0x0A89

RACTL_RACTL_CLK160_DYNSEL2

Bits	Name	Description
15	ENABLE_MM_SGISTBC	If set, selects the following clock-ratios for the data section of the clk160 processing in rxa. Default setting-dynamic selection enabled for mm stbc short-gi packets Reset State: 0x0000
13:12	MM_SGISTBC_CLKRATIOSEL	0x0: switched-clk is 1:1 of original clock1: switched-clk is 2:3 of original clock 2 : switched-clk is 4:5 of original clock 3 : switched-clk is 8:9 of original clock Default is 8:9 Reset State: 0x0000
11	ENABLE_MM_SGI	If set, selects the following clock-ratios for the data section of the clk160 processing in rxa. Default setting-dynamic selection enabled for mm short-gi packets Reset State: 0x0001
9:8	MM_SGI_CLKRATIOSEL	0x0: switched-clk is 1:1 of original clock1: switched-clk is 2:3 of original clock 2 : switched-clk is 4:5 of original clock 3 : switched-clk is 8:9 of original clock Default is 4:5 Reset State: 0x0002
7	ENABLE_MM_LGISTBC	If set, selects the following clock-ratios for the data section of the clk160 processing in rxa. Default setting-dynamic selection enabled for mm stbc packets Reset State: 0x0001

RACTL_RACTL_CLK160_DYNSEL2 (cont.)

Bits	Name	Description
5:4	MM_LGISTBC_CLKRATIOSEL	0x0: switched-clk is 1:1 of original clock1: switched-clk is 2:3 of original clock 2 : switched-clk is 4:5 of original clock 3 : switched-clk is 8:9 of original clock Default is 4:5 Reset State: 0x0000
3	ENABLE_MM_LGI	If set, selects the following clock-ratios for the data section of the clk160 processing in rxa. Default setting-dynamic selection enabled for mm long-gi packets Reset State: 0x0001
1:0	MM_LGI_CLKRATIOSEL	0x0: switched-clk is 1:1 of original clock1: switched-clk is 2:3 of original clock 2 : switched-clk is 4:5 of original clock 3 : switched-clk is 8:9 of original clock Default is 2:3 Reset State: 0x0001

0x3000134 RACTL_RACTL_SNRSTATS

Type: read-only

RACTL_RACTL_SNRSTATS

Bits	Name	Description
15:0	STATS	Note that this is a running sum or minimum of the per symbol snr based on the register below. This is cleared with the clear bit below.

0x3000138 RACTL_RACTL_SNRSTATS_SYMCNT

Type: read-only

RACTL_RACTL_SNRSTATS_SYMCNT

Bits	Name	Description
7:0	STATS_SYMCNT	Note that this is a running symbol count that is cleared with the clear bit below.

0x300013C RACTL_RACTL_SNRSTATSCLR

Type: command
Reset State: 0x0000

RACTL_RACTL_SNRSTATSCLR

Bits	Name	Description
0	CLR	Reset State: 0x0000

0x3000140 RACTL_RACTL_SNRSTATSCFG

Type: read-write
Reset State: 0x0000

RACTL_RACTL_SNRSTATSCFG

Bits	Name	Description
1	COLLECT_ALWAYS	When high, the statistics is collected irrespective of txbusy is high or not. Reset State: 0x0000
0	LOCK	As long as the lock is asserted, the data (RACTL_SNRSTATS and RACTL_SNRSTATS_SYMCNT) do not get updated. Reset State: 0x0000

0x3000144 RACTL_LMAP_SNR_SEL

Type: read-write
Reset State: 0x0001

RACTL_LMAP_SNR_SEL

Bits	Name	Description
0	ENABLE_SNRCOMP	When asserted, selects the LMAP SNR computation function. This is used in CSI report as well as per-symbol snr metric Reset State: 0x0001

0x3000148 RACTL_CSI_CONFIG

Type: read-write
Reset State: 0x0183

RACTL_CSI_CONFIG

Bits	Name	Description
9	CSI_ABORT_CLR	When set to 1, CSI abort counter is cleared Reset State: 0x0000
8	CSI_XFER_EN	When set to 1, CSI-transfer is enabled. This influences CHE and PHYCSXI functionality for CSI transfer Reset State: 0x0001
7	CSI_WATCHDOG_EN	When set to 1, the watchdog timer in PHYCSXI is on and expires after 10 microseconds (max possible CSI xfer time) Note - has power impact. Switch this off if power-saving is desired. Reset State: 0x0001

RACTL_CSI_CONFIG (cont.)

Bits	Name	Description
6	NOTSOUNDINGPPDU_GENERATE_CSI	When set to 1, generate CSI report for nonsounding valid PPDU (MCS <8 length > 0, not_sounding is 1) See PHYCSXI documentation Reset State: 0x0000
5	INVALID_NDP2_GENERATE_CSI	When set to 1, generate CSI report for invalid NDP2 (8 <= MCS < 32, length is 0, not_sounding is 1) Reset State: 0x0000
4	INVALID_NDP1_GENERATE_CSI	When set to 1, generate CSI report for invalid NDP1 (MCS < 8, length is 0, not_sounding is 0 or 1) Reset State: 0x0000
3:2	NG	0x0: NG_56 0x1: NG_30 0x2: NG_16 0x3: NG_RESVD Reset State: 0x0000
1:0	NB	0x0: NB_4 0x1: NB_5 0x2: NB_6 0x3: NB_8 Reset State: 0x0003

0x300014C RACTL_SIGNAL_INVALID_COUNT_HTSIG

Type: write-only

Number of packets received with invalid HT SIGNAL field values

RACTL_SIGNAL_INVALID_COUNT_HTSIG

Bits	Name	Description
15:0	INVALID_SFCOUNT	Number of packets received with invalid SIGNAL field values

0x3000150 RACTL_LST_MCS

Type: read-only

The last MCS received by the controller

RACTL_LST_MCS

Bits	Name	Description
6:0	VALUE	

0x3000154 RACTL_RXFIR_SCALING_COEFF

Type: read-write
Reset State: 0x0001

RACTL_RXFIR_SCALING_COEFF

Bits	Name	Description
0	DC_NOTCH_EN	When high, selects rxfir scaling coefficients (to be used by FFT) appropriate with rxfir operation WITH dc notch. Note to use this register bit with appropriate AGC bit settings Reset State: 0x0001

0x3000158 RACTL_CSI_STATS1

Type: write-only

Number of CSI transfers initiated by RACTL in various cases

RACTL_CSI_STATS1

Bits	Name	Description
7:0	MACREQ_NONNDP_SOUNDING	Counts the number of MAC-requested CSI transfers for non-NDP sounding PPDU packets. These packets will have MCS less than 8 and may be STBC packets. [Case1 - (mcs_lt_8 & length_ge0 & not_sounding_0 & nonndp_sounding_cfg_modf)]

0x300015C RACTL_CSI_STATS2

Type: write-only

Number of CSI transfers initiated by RACTL in various cases

RACTL_CSI_STATS2

Bits	Name	Description
7:0	MACREQ_NDP_SOUNDING	Counts the number of MAC-requested CSI transfers for NDP sounding packets. These packets will have MCS between 8 and 31 and non-STBC packets. The HTSIG is 'unsupported' type [Case2 - (mcs_ge8_n_lt32 & length_0 & not_sounding_0 & stbc_0 & ndp_sounding_cfg_modf)]

0x3000160 RACTL_CSI_STATS3

Type: write-only

Number of CSI transfers initiated by RACTL in various cases

RACTL_CSI_STATS3

Bits	Name	Description
7:0	INTREQ_NDP	Counts the number of RACTL-requested CSI transfers for NDP packets. These packets will have MCS less than 8. Note that GF SISO NDP packets, CSI transfer is not supported. [Case3 - mcs_lt_8 & length_0 & ractlreg_ractlpp_invalid_ndp1_generate_csi & ((

0x3000164 RACTL_CSI_STATS4

Type: write-only

Number of CSI transfers initiated by RACTL in various cases

RACTL_CSI_STATS4

Bits	Name	Description
7:0	INTREQ_NDP_NONSOUNDING	Counts the number of RACTL-requested CSI transfers for NDP non-sounding packets. These packets will have MCS between 8 and 31. The HTSIG is 'unsupported' type [Case4 - mcs_ge8_n_lt32 & length_0 & not_sounding & ractlreg_ractlpp_invalid_ndp2_generate_csi]

0x3000168 RACTL_CSI_STATS5

Type: read-only

Number of CSI aborts initiated by RACTL in various cases

RACTL_CSI_STATS5

Bits	Name	Description
7:0	ABORTCNT	

0x300016C RACTL_RACTL_CRCCHKCFG

Type: read-write
Reset State: 0x0004

RACTL_RACTL_CRCCHKCFG

Bits	Name	Description
2:1	CRCCHK_EN_VHTSIGB	Do CRC-field check in VHTSIGB over VHTSIGB only (==2'd0) Do CRC-field check in VHTSIGB over VHTSIGA and VHTSIGB (==2'd1) Do CRC-field check in VHTSIGB over LSIG and VHTSIGA and VHTSIGB (==2'd2 or 2'd3) Reset State: 0x0002
0	CRCCHK_EN_VHTSIGA	Do CRC-field check of VHTSIGA over VHTSIGA only (==0) or check over LSIG and VHTSIGA (==1) Reset State: 0x0000

0x3000170 RACTL_RACTL_FEEDBACKCFG

Type: read-write
Reset State: 0x0000

RACTL_RACTL_FEEDBACKCFG

Bits	Name	Description
1:0	FEEDBACK_TYPE	Feedback-type to ber sent to MCFG from PHY. 0 and 1 for CSI, 2 for uncompressed vector feedback; 3 for compressed vector feedback Reset State: 0x0000

0x3000174 RACTL_RACTL_ENABLE_AC

Type: read-write
Reset State: 0x0001

RACTL_RACTL_ENABLE_AC

Bits	Name	Description
1	BEHAV_11N	When enabled, the signal-field check of 11ac will be similar to 11n, i.e., the crc failure will be treated as a packet-abort condition. Any other condition will qualify for unsupported packet and deferral will be based on lsig. If this bit is 0, irrespective of unsupported or crc-failed vhtsiga, deferral will be done based on lsig. Reset State: 0x0000
0	CFG	Enables reception of AC packets Reset State: 0x0001

0x3000178 RACTL_RACTL_PKTCOUNT_AC20

Type: write-only

Number of AC20 packets detected by RACTL

RACTL_RACTL_PKTCOUNT_AC20

Bits	Name	Description
7:0	AC20_SPKTCOUNT	

0x300017C RACTL_RACTL_PKTCOUNT_AC40

Type: write-only

Number of AC40 packets detected by RACTL

RACTL_RACTL_PKTCOUNT_AC40

Bits	Name	Description
7:0	AC40_SPKTCOUNT	

0x3000180 RACTL_RACTL_PKTCOUNT_AC80

Type: write-only

Number of AC80 packets detected by RACTL

RACTL_RACTL_PKTCOUNT_AC80

Bits	Name	Description
7:0	AC80_SPKTCOUNT	

0x3000184 RACTL_LAST_LSIG0

Type: read-only
Reset State: 0x0000

This register will be used to primarily diagnose 11n MM and 11AC packet demodulation issues.

RACTL_LAST_LSIG0

Bits	Name	Description
15:0	VALUE	Reset State: 0x0000

0x3000188 RACTL_LAST_LSIG1

Type: read-only
Reset State: 0x0000

This register will be used to primarily diagnose 11n MM and 11AC packet demodulation issues.

RACTL_LAST_LSIG1

Bits	Name	Description
7:0	VALUE	Reset State: 0x0000

0x300018C RACTL_CHE_PKTCOUNT

Type: write-only

Number of packet burst start signals received by the CHE module

RACTL_CHE_PKTCOUNT

Bits	Name	Description
7:0	CHE_SPKTCOUNT	Number of packet burst start signals received by the CHE module

0x3000190 RACTL_LMAP_OPSCALE1_SISO

Type: read-write
Reset State: 0x28EC

This registers provides the rate-qam-size dependent output scaling to LMAP simo distance outputs

RACTL_LMAP_OPSCALE1_SISO

Bits	Name	Description
14:12	SISO_MCS4_16QA3BY4	Reset State: 0x0002
11:9	SISO_MCS3_16QA1BY2	Reset State: 0x0004
8:6	SISO_MCS2_QPSK3BY4	Reset State: 0x0003
5:3	SISO_MCS1_QPSK1BY2	Reset State: 0x0005
2:0	SISO_MCS0_BPSK1BY2	Reset State: 0x0004

0x3000194 RACTL_LMAP_OPSCALE2_SISO

Type: read-write
Reset State: 0x0053

This registers provides the rate-qam-size dependent output scaling to LMAP simo distance outputs

RACTL_LMAP_OPSCALE2_SISO

Bits	Name	Description
14:12	SISO_MCS9_256QA5BY6	Reset State: 0x0000
11:9	SISO_MCS8_256QA3BY4	Reset State: 0x0000
8:6	SISO_MCS7_64QA5BY6	Reset State: 0x0001
5:3	SISO_MCS6_64QA3BY4	Reset State: 0x0002
2:0	SISO_MCS5_64QA2BY3	Reset State: 0x0003

0x3000198 RACTL_LMAP_OPSCALE1_STBC

Type: read-write
Reset State: 0x26E4

This registers provides the rate-qam-size dependent output scaling to LMAP stbc distance outputs

RACTL_LMAP_OPSCALE1_STBC

Bits	Name	Description
14:12	STBC_MCS4_16QA3BY4	Reset State: 0x0002
11:9	STBC_MCS3_16QA1BY2	Reset State: 0x0003
8:6	STBC_MCS2_QPSK3BY4	Reset State: 0x0003
5:3	STBC_MCS1_QPSK1BY2	Reset State: 0x0004
2:0	STBC_MCS0_BPSK1BY2	Reset State: 0x0004

0x300019C RACTL_LMAP_OPSCALE2_STBC

Type: read-write
Reset State: 0x0052

This registers provides the rate-qam-size dependent output scaling to LMAP stbc distance outputs

RACTL_LMAP_OPSCALE2_STBC

Bits	Name	Description
14:12	STBC_MCS9_256QA5BY6	Reset State: 0x0000
11:9	STBC_MCS8_256QA3BY4	Reset State: 0x0000
8:6	STBC_MCS7_64QA5BY6	Reset State: 0x0001
5:3	STBC_MCS6_64QA3BY4	Reset State: 0x0002
2:0	STBC_MCS5_64QA2BY3	Reset State: 0x0002

0x30001A0 RACTL_LMAP_OPSCALE3

Type: read-write
Reset State: 0x0109

This registers provides the rate-qam-size dependent output scaling to LMAP distance outputs

RACTL_LMAP_OPSCALE3

Bits	Name	Description
8:6	LGCY_BPSK3BY4	Reset State: 0x0004
5:3	STBC_MCS10_256QA7BY8	Reset State: 0x0001
2:0	SISO_MCS10_256QA7BY8	Reset State: 0x0001

0x30001A4 RACTL_FORCE_DBGPKTTYPE

Type: read-write
Reset State: 0x0000

Forces the packet-type of received packet based on forced Ibpsk or Qbpskchecks in RACTL main FSM Note that the following packet-types will be inferred from the combination of symtype checks: {sym0_Ibpskforce, sym1_Ibpskforce, sym2_Ibpskforce} implies Legacy 6 mbps {sym0_Ibpskforce, sym1_Ibpskforce, sym2_Qbpskforce} implies 11AC {sym0_Ibpskforce, sym1_Qbpskforce, Not applicable } implies 11n_MM {sym0_Qbpskforce, Not applicable , Not applicable } implies 11n_GF

RACTL_FORCE_DBGPKTTYPE

Bits	Name	Description
5	SYM2_QBPSKFORCE	Reset State: 0x0000
4	SYM2_IBPSKFORCE	Reset State: 0x0000
3	SYM1_QBPSKFORCE	Reset State: 0x0000

RACTL_FORCE_DBGPKTTYPE (cont.)

Bits	Name	Description
2	SYM1_IBPSKFORCE	Reset State: 0x0000
1	SYM0_QBPSKFORCE	Reset State: 0x0000
0	SYM0_IBPSKFORCE	Reset State: 0x0000

16.2.20 rbapb

0x3000000 RBAPB_CONTROL_RXB_DSCR

Type: read-write

Controls RXB Descrambler.

RBAPB_CONTROL_RXB_DSCR

Bits	Name	Description
1	SFD_DETECT	Disable descrambled short SFD detector. 0x0: ENABLE 0x1: DISABLE
0	DESCRAMBLER	Disable RXB Descrambler. 0x0: ENABLE 0x1: DISABLE

0x3000004 RBAPB_COUNT_SSFD

Type: write-only

Counts the number of short Start-of-Frame delimiters detected.

RBAPB_COUNT_SSFD

Bits	Name	Description
15:0	COUNT	Number of short Start-of-Frame delimiters detected

0x3000008 RBAPB_COUNT_LSFD

Type: write-only

Counts the number of logn Start-of-Frame delimiters detected.

RBAPB_COUNT_LSFD

Bits	Name	Description
15:0	COUNT	Number of long Start-of-Frame delimiters detected

0x300000C RBAPB_IGN_ILL_PLCP

Type: read-write
Reset State: 0x00FB

This register is used to enable checking of the following fields of the PLCP header: CRC16, Rate field and Service Field. These correctness check are all described in standard IEEE802.11b. The CRC16 should check, the service field should have its reserved bits set to zero and the rate field should contain one of the supported rates (in multiples of 100 kbit/s): 8'd10, 8'd20, 8'd55 or 8'd110.

RBAPB_IGN_ILL_PLCP

Bits	Name	Description
10	IGN_SIG	Used to ignore check for valid signal fields and pass packets with signal field errors Valid rate fields conents are 10, 20, 55 and 110 (decimal), denoting 1,2, 5.5 and 11 Mbit/s. 0x0: ENABLE 0x1: IGNORE
9	IGN_SVC	Used to ignore check for valid service fields and pass packets with signal field errors A valid service fields has all bits equal to zero for 1, 2 and 5.5 Mbit/s mode. The most significant bit may be non-zero in 11 Mbits/s mode. 0x0: ENABLE 0x1: IGNORE
8	IGN_CRC	Used to ignore CRC check and pass packets with PLCP CRC errors. 0x0: ENABLE 0x1: IGNORE
7:0	SVC_MASK	Service Field Mask. The field is applied using a logical 'and' to the service field before the illegal service field check is applied. By default the 'coupled clocks' bit is masked out, in order not to reject packets tranmsitted by products with uincoupled clocks or products which couple clocks only for higher bit rates. Reset State: 0x00FB

0x3000010 RBAPB_COUNT_PLCP_CRC_ERRORS

Type: write-only

Counter number of CRC errors.

RBAPB_COUNT_PLCP_CRC_ERRORS

Bits	Name	Description
15:0	COUNT	CRC error counter.

0x3000014 RBAPB_COUNT_PLCP_SIG_ERRORS

Type: write-only

Counter number of signal field errors.

RBAPB_COUNT_PLCP_SIG_ERRORS

Bits	Name	Description
15:0	COUNT	Illegal signal field counter.

0x3000018 RBAPB_COUNT_PLCP_SVC_ERRORS

Type: write-only

Counter number of service field errors.

RBAPB_COUNT_PLCP_SVC_ERRORS

Bits	Name	Description
15:0	COUNT	Illegals service field counter.

0x300001C RBAPB_COUNT_RX_BYTES

Type: write-only

Counts number of payload bytes received by the RXB receiver (output by the header processor).

RBAPB_COUNT_RX_BYTES

Bits	Name	Description
15:0	COUNT	Byte counter.

0x3000020 RBAPB_COUNT_MPI_SOF

Type: write-only

Countrs number of Start-Of_Frame signals generated by header processor and sent to MPI.

RBAPB_COUNT_MPI_SOF

Bits	Name	Description
15:0	COUNT	rbhdr_mpi_sof event counter.

0x3000024 RBAPB_COUNT_MPI_EOF

Type: write-only

Countrs number of End-Of_Frame signals generated by header processor and sent to MPI.

RBAPB_COUNT_MPI_EOF

Bits	Name	Description
15:0	COUNT	rbhdr_mpi_eof event counter.

0x3000028 RBAPB_SFD_DET_TMO

Type: read-write
Reset State: 0x007D

SFD Detetction threshold is specified in microseconds. Power-on reset value is 125 decimal. Includes demodulation and descrambling delay. This register is used to lead a timer that aborts the SFD detection process. It should be as set as low as possible to reduce the receiver dead time to a minimum.

RBAPB_SFD_DET_TMO

Bits	Name	Description
7:0	TIME	SFD detection timeout. 0x7D: POR Reset State: 0x007D

0x300002C RBAPB_SLR_SFD_DET_TMO

Type: read-write
Reset State: 0x01F4

SFD Detetction threshold is specified in microseconds. Power-on reset value is 500 decimal. Includes demodulation and descrambling delay. This register is used to set a timer that aborts the SFD detection process for SLR packets. It should be as set as low as possible to reduce the receiver dead time to a minimum.

RBAPB_SLR_SFD_DET_TMO

Bits	Name	Description
8:0	TIME	SLR SFD detection timeout. 0x1F4: POR Reset State: 0x01F4

0x3000030 RBAPB_COUNT_RXB_START

Type: write-only

Counts number of RXB_START events received by the RXB controler.

RBAPB_COUNT_RXB_START

Bits	Name	Description
15:0	COUNT	RXB_START Counter

0x3000038 RBAPB_COUNT_RXB_ABORT

Type: write-only

Counts number of RXB_ABORT events received by the RXB controler.

RBAPB_COUNT_RXB_ABORT

Bits	Name	Description
15:0	COUNT	RXB_ABORT event counter.

0x300003C RBAPB_RXB_RESET

Type: command

Resets RXB controller state machine.

RBAPB_RXB_RESET

Bits	Name	Description
0	RST	Reset RXB.

0x3000040 RBAPB_CONTROL_BARKER_TIMING_TRACKING

Type: read-write
Reset State: 0x0006

Control Barker timing tracking.

RBAPB_CONTROL_BARKER_TIMING_TRACKING

Bits	Name	Description
2	FEEDBACK	Enable Barker timing tracking. 0x0: DISABLE 0x1: ENABLE Reset State: 0x0001
1:0	THRESHOLD	Timing error threshold. Reset State: 0x0002

0x3000048 RBAPB_CMF_PLL_COEFF_A

Type: read-write
Reset State: 0x02DE

CMF PLL Loop Coefficient A

RBAPB_CMF_PLL_COEFF_A

Bits	Name	Description
9:0	COEFF_A	default value -290 Reset State: 0x02DE

0x300004C RBAPB_CMF_PLL_COEFF_B

Type: read-write
Reset State: 0x0127

CMF PLL Loop Coefficient B

RBAPB_CMF_PLL_COEFF_B

Bits	Name	Description
9:0	COEFF_B	default value 295 Reset State: 0x0127

0x3000050 RBAPB_CMF_PLL_COEFF_A_SLR_TRACK

Type: read-write
Reset State: 0x0378

CMF PLL Loop Coefficient A used for SLR packets after SFD has been detected

RBAPB_CMF_PLL_COEFF_A_SLR_TRACK

Bits	Name	Description
9:0	COEFF_A_TRACK	default value -136 Reset State: 0x0378

0x3000054 RBAPB_CMF_PLL_COEFF_B_SLR_TRACK

Type: read-write
Reset State: 0x008A

CMF PLL Loop Coefficient B used for SLR packets after SFD has been detected

RBAPB_CMF_PLL_COEFF_B_SLR_TRACK

Bits	Name	Description
9:0	COEFF_B_TRACK	default value 138 Reset State: 0x008A

0x3000058 RBAPB_ANTENNA_DIVERSITY_MODE

Type: read-write
Reset State: 0x0000

This register defines the behaviour of the antenna diversity logic.

RBAPB_ANTENNA_DIVERSITY_MODE

Bits	Name	Description
1:0	VALUE	Antenna diversity selector mode field 0x0: DISABLE 0x1: ALWAYS 0x2: SNR_SWITCH 0x3: RESV Reset State: 0x0000

0x300005C RBAPB_SNR_THRESHOLD

Type: read-write
Reset State: 0x0019

This threshold is used to decide whether the SNR of the current packet is sufficient to support diversity

RBAPB_SNR_THRESHOLD

Bits	Name	Description
5:0	VALUE	SNR threshold value Reset State: 0x0019

0x3000060 RBAPB_SNR_AVERAGER_GAIN

Type: read-write
Reset State: 0x0028

Barker and CCK demod SNR averager loop gain

RBAPB_SNR_AVERAGER_GAIN

Bits	Name	Description
5:4	RBCCK_HANDOFF	CCK demod SNR averager loop gain - default value = 2^6 Reset State: 0x0002
3:2	RBBRK_HANDOFF	Barker demod SNR averager loop gain after antenna diversity selection - default value = 2^6 Reset State: 0x0002
1:0	RBBRK_ANTSEL	Barker demod SNR averager loop gain during antenna diversity selection - default value = 2^4 Reset State: 0x0000

0x3000064 RBAPB_LMS_AVERAGER_SHIFT

Type: read-write
Reset State: 0x0014

Channel equaliser averager loop gain

RBAPB_LMS_AVERAGER_SHIFT

Bits	Name	Description
5:3	SLR	LMS averager loop gain - range 2^(0-7), default value = 2^2 Reset State: 0x0002
2:0	NON_SLR	LMS averager loop gain - range 2^(0-7), default value = 2^4 Reset State: 0x0004

0x3000068 RBAPB_COUNT_DYNSEL_ANT0

Type: write-only

Counts the number of times antenna0 is selected when dynamic antena selection is enabled.

RBAPB_COUNT_DYNSEL_ANT0

Bits	Name	Description
15:0	COUNT	antenna0 event counter.

0x300006C RBAPB_COUNT_DYNSEL_ANT1

Type: write-only

Counts the number of times antenna1 is selected when dynamic antena selection is enabled.

RBAPB_COUNT_DYNSEL_ANT1

Bits	Name	Description
15:0	COUNT	antenna1 event counter.

0x3000070 RBAPB_COUNT_DYNSEL_2ANT

Type: write-only

Counts the number of times both antennae are selected when dynamic antena selection is enabled.

RBAPB_COUNT_DYNSEL_2ANT

Bits	Name	Description
15:0	COUNT	both antennae event counter.

16.2.21 bbana

0x3000000 BBANA_ADC_CTRL

Type: read-write
Reset State: 0x0000

This set of registers are used to control ADC operations.

BBANA_ADC_CTRL

Bits	Name	Description
9	OFFSET_MEAS	Enable ADCs to do offset calibration. Reset State: 0x0000
8:7	INTLV_CTRL	Used to control ADC interleaving. Reset State: 0x0000
6	ADC_PWR_DOWN_N	Power down I & Q reference, clock and output (active low). Not currently used. 0x0: PWR_DOWN 0x1: ENABLED Reset State: 0x0000
5	OUTPUT_DISABLE_Q	Output disable control for ADC Q data rail. 0x0: NORMAL 0x1: MID Reset State: 0x0000
4	EN_Q_OVERRIDE	Enable override control for ADC Q data rail. 0x0: NO_OVERRIDE 0x1: OVERRIDE Reset State: 0x0000
3	EN_Q	Enable ADC for Q data rail. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0000
2	OUTPUT_DISABLE_I	Output disable control for ADC I data rail. 0x0: NORMAL 0x1: MID Reset State: 0x0000
1	EN_I_OVERRIDE	Enable override control for ADC I data rail. 0x0: NO_OVERRIDE 0x1: OVERRIDE Reset State: 0x0000
0	EN_I	Enable ADC for I data rail. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0000

0x3000004 BBANA_ADC_CLK_CTRL

Type: read-write
Reset State: 0x0000

This set of registers are used for controlling the ADC clock settings.

BBANA_ADC_CLK_CTRL

Bits	Name	Description
5:4	ADJ_DUTY_CYCLE_PW	Setting used to adjust the duty cycle pulse width Reset State: 0x0000
3	DUTY_CYCLE_EN	Setting used to enable/disable the duty cycle circuit 0x0: DISABLED 0x1: ENABLED Reset State: 0x0000
2	CLKEDGE_SEL	Setting used to select the edge of the clock to be used by the ADCs 0x0: POSEDGE 0x1: NEGEDGE Reset State: 0x0000
1	CLKSRC_SEL	Setting used to select the clock source to the ADCs Reset State: 0x0000
0	DISABLE_CLK	Used to enable/disable clock to ADCs. 0x0: ENABLED 0x1: DISABLED Reset State: 0x0000

0x3000008 BBANA_ADC_REF_CTRL

Type: read-write
Reset State: 0x0000

This set of registers are used for controlling the reference circuit settings.

BBANA_ADC_REF_CTRL

Bits	Name	Description
6	REF_PWRDOWN	Power down the reference. Reset State: 0x0000
5	VDD_SEL	Switch the reference to VDD. Reset State: 0x0000
4	BIAS_SEL	Selects the source of the reference bias. Reset State: 0x0000

BBANA_ADC_REF_CTRL (cont.)

Bits	Name	Description
3:2	OUT_BIAS	Used to adjust the bias current of the reference generator. Reset State: 0x0000
1:0	V_ADJUST	Register value used to adjust the ADC reference voltage. Reset State: 0x0000

0x300000C BBANA_ADC_CONV_ADJ

Type: read-write
Reset State: 0x0000

This set of registers are used for adjusting various conversion settings.

BBANA_ADC_CONV_ADJ

Bits	Name	Description
8:7	INP_FILT_POLE	Register value used to modify the input filter pole frequency. Reset State: 0x0000
6:5	CONV_DLY	Adjust the conversion delay. Reset State: 0x0000
4:3	COMM_BIAS	Adjust the common mode bias. Reset State: 0x0000
2:0	REG_ADJUST	Register value used to adjust the regulator. Reset State: 0x0000

0x3000010 BBANA_ADC_SPARE

Type: read-write
Reset State: 0x0000

This register contains the ADC spare1 and spare2 bits.

BBANA_ADC_SPARE

Bits	Name	Description
15:14	DELAY_SEL	Delay select control register. 0x0: DSEL_UNDEF_0 0x1: DSEL_UNDEF_1 0x2: DSEL_UNDEF_2 0x3: DSEL_UNDEF_3 Reset State: 0x0000

BBANA_ADC_SPARE (cont.)

Bits	Name	Description
13	RESET_MODE	Controls the current reset mode in operation. 0x0: SAMP_BF_RST 0x1: RST_BF_SAMP Reset State: 0x0000
12:9	NON_OVL_TIM_CTRL	Controls timing in non overlap circuit. 0x0: NON_OVL_TYP 0x1: SAMPB_TRK 0x2: TRK_TRST 0x4: TRST_TRK 0x8: TRK_SAMPB Reset State: 0x0000
8	TEST_SIG_CTRL	Controls test signal outputs on clock and core sel signals. 0x0: DEF_OUT_CK_CRSEL 0x1: HSTST_OUT_CK_CRSEL Reset State: 0x0000
7	TIMING_MODE	Controls the timing mode being used. 0x0: TIMG_MD_UNUSED_0 0x1: TIMG_MD_UNUSED_1 Reset State: 0x0000
6	IQ_CONV_SYNC_MODE	Controls whether I and Q conversions are synchronized. 0x0: NO_IQ_SYNC 0x1: IQ_CNV_SYNC Reset State: 0x0000
5	GLOBAL_INTLV_CTRL	Controls the interleaving function (global level). 0x0: INTRL_DIS 0x1: INTRL_EN Reset State: 0x0000
4	CAP_VALUE_CTRL_SEL	Selects the bits that control the capacitor value. 0x0: BW_FILC 0x1: CAPC_FILC Reset State: 0x0000
3	BG_PWR_MODE	Bandgap power mode register. 0x0: BG_POWER_UP 0x1: BG_SLEEP Reset State: 0x0000
2	REGULATOR_CTRL	ADC regulator control register. 0x0: REGL_ENABLED 0x1: REGL_DISABLED Reset State: 0x0000

BBANA_ADC_SPARE (cont.)

Bits	Name	Description
1	STB_CIRCUIT_CTRL	Low current stability circuit control register. 0x0: STB_ENABLED 0x1: STB_DISABLED Reset State: 0x0000
0	BG_PWR_CTRL	Bandgap power control register. 0x0: BYP_OFF 0x1: BYP_ON Reset State: 0x0000

0x3000014 BBANA_ADC_SPARE3

Type: read-write
Reset State: 0x0000

This register contains the third set of ADC spare bits.

BBANA_ADC_SPARE3

Bits	Name	Description
7:4	SPARE3_UNUSED	Register value holding unused (unmapped) ADC spare3 bits. Reset State: 0x0000
3	CONV_CTRL	Conversion control register. 0x0: CONV_UNDEF_0 0x1: CONV_UNDEF_1 Reset State: 0x0000
2:0	FILT_CTRL	ADC filter control register. 0x0: FILT_UNDEF_0 0x1: FILT_UNDEF_1 0x2: FILT_UNDEF_2 0x3: FILT_UNDEF_3 0x4: FILT_UNDEF_4 0x5: FILT_UNDEF_5 0x6: FILT_UNDEF_6 0x7: FILT_UNDEF_7 Reset State: 0x0000

0x3000018 BBANA_DAC_CTRL

Type: read-write
Reset State: 0x0022

This set of registers are used to control DAC operations.

BBANA_DAC_CTRL

Bits	Name	Description
13:10	DAC_CFG	Register for DAC configuration settings. Reset State: 0x0000
9	CLKEDGE_SEL	Setting used to select the edge of the clock to be used by the DACs 0x0: POSEDGE 0x1: NEGEDGE Reset State: 0x0000
8	INPUT_STANDBY_EN_CTRL	Note: This bit is no longer used. Control of TXAIF input signal on to DAC enable/standby signal. 0x0: ENABLE_DRIVEN 0x1: STANDBY_DRIVEN Reset State: 0x0000
7	STANDBY_Q_OVERRIDE	Standby override control for DAC Q data rail. 0x0: NO_OVERRIDE 0x1: OVERRIDE Reset State: 0x0000
6	STANDBY_Q	Standby control for DAC Q data rail. 0x0: NORMAL 0x1: MID Reset State: 0x0000
5	EN_Q_OVERRIDE	Enable override control for DAC Q data rail. 0x0: NO_OVERRIDE 0x1: OVERRIDE Reset State: 0x0001
4	EN_Q	Enable DAC for Q data rail. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0000
3	STANDBY_I_OVERRIDE	Standby override control for DAC I data rail. 0x0: NO_OVERRIDE 0x1: OVERRIDE Reset State: 0x0000
2	STANDBY_I	Standby control for DAC I data rail. 0x0: NORMAL 0x1: STANDBY Reset State: 0x0000
1	EN_I_OVERRIDE	Enable override control for DAC I data rail. 0x0: NO_OVERRIDE 0x1: OVERRIDE Reset State: 0x0001

BBANA_DAC_CTRL (cont.)

Bits	Name	Description
0	EN_I	Enable DAC for I data rail. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0000

0x300001C BBANA_DAC_BIAS

Type: read-write
Reset State: 0x0000

This set of registers are used to control the DAC bias.

BBANA_DAC_BIAS

Bits	Name	Description
5:0	TX_BIAS	Select output current value. Reset State: 0x0000

0x3000020 BBANA_DEBUG

Type: read-write
Reset State: 0x0000

This set of registers are used for test mode functions.

BBANA_DEBUG

Bits	Name	Description
6:5	ATB_ADDR	Selects atest0 or atest1 Reset State: 0x0000
4	DAC_TEST_EN	Enable the analog test muxes for driving atest0/1. Reset State: 0x0000
3:2	ATEST	Select analog signal on test pad. These signals directly control the atest signals on the ADC. Reset State: 0x0000
1:0	DTEST	Mux digital signals onto I/Q output signals. These signals directly control the dtest signals on the ADC. Reset State: 0x0000

16.2.22 RFIF

0x3000000 RFIF_RF_BUS_CONTROL

Type: read-write
Reset State: 0x0201

This set of registers are used to adjust timing parameters used, and to issue special commands, over the RF bus interface.

RFIF_RF_BUS_CONTROL

Bits	Name	Description
11:8	IRIS_ASYNC_CAP_DLY	Iris begins driving asynchronous signals to Riva at the completion of an RF command. This field is used to delay the sampling of this data after a command has completed. The default value represents a delay of approx. 25 ns ((2+1) x 120M clocks - spec requirement) when bit 3 of this register is 0. The delay changes to be in units of 60M clocks after completion of a register read command when bit 3 in this register is 1. Reset State: 0x0002
7	ENABLE_80M_IRIS_CLK_OVERRIDE	This bit is used to override the control of the 80M clock used for RF calibration mode. When disabled, the clock enable for the 80M Iris clock is automatically disabled when we observe a calibration done signal from Iris (software must still enable the clock via bit 6 below). If there are any issues with this automatic clock disabling feature, this override bit can be enabled to re-activate manual control of disabling the 80M clock via bit 6 below. 0x0: OVERRIDE_DISABLED 0x1: OVERRIDE_ENABLED Reset State: 0x0000
6	ENABLE_80M_IRIS_CLK	This bit is used to enable/disable the 80M clock used for RF calibration mode. During RF calibration mode, an 80 MHz clock must be fed out on the cmd_clk signal, and it is this bit that is used to enable/disable that clock. Bit 2 in this register is used to select this clock as the source to Iris. Bit 2 must be set first, followed by this bit. And after RF calibration, this bit must be disabled first, followed by bit 2. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0000

RFIF_RF_BUS_CONTROL (cont.)

Bits	Name	Description
5:4	SET_RF_BUS_RD_DELAY	Controls the delay value used by the RF bus interface state machine for register reads. By default (2'b00), the RF bus interface state machine inserts 3 cmd_clk cycles before it samples the read data (on the 4th cmd_clk cycle). Each value set in this register increases the delay inserted by the RF bus interface state machine before it samples the read data, by 1/2 cmd_clk cycle - i.e., 2'b01 causes the insertion of 3.5 cmd_clk cycles, and 2'b10 causes the insertion of 4 cmd_clk cycles. 0x0: DEFAULT 0x1: HALF_CYCLE 0x2: ONE_CYCLE 0x3: INVALID Reset State: 0x0000
3	SET_RF_BUS_FREQ	Controls the frequency setting of the RF bus interface cmd_clk signal. For Riva, two RF bus frequency values are supported - 60 MHz (default) and 30 MHz. When set to 1, this bit sets the RF bus frequency to be 30 MHz. When 0, the default mode of 60 MHz is selected. 0x0: V_60M_MODE 0x1: V_30M_MODE Reset State: 0x0000
2	ENABLE_RF_CALIBRATION	This bit is used to enable/disable the RF calibration mode. During RF calibration mode, an 80 MHz clock must be fed out on the cmd_clk signal, and it is this bit that is used to enable the selection of the 80 MHz clock onto cmd_clk. The entire RF calibration mode is under software control - software needs to set this bit when the 80 MHz clock is required, and disable this bit when calibration is complete. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0000
1	ENABLE_DEBUG_MODE	This bit enables/disables debug mode. When this bit is set, and enable_rf_bus (bit 0) is 0, the RFIF will direct the agc_testbus signal and tx_en signal onto cmd_data and cmd_set respectively. This mode is disabled if enable_rf_bus is set (1), or this bit is disabled. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0000
0	ENABLE_RF_BUS	This bit enables/disables access to the RF bus. When this bit is 0 (disabled), the RF bus pins are not driven by internal RFIF logic, but may be used to drive debug data over the RF bus. The ENABLE_DEBUG_MODE bit must be set for the debug mode to be in effect. To avoid any pin conflict, debug data is only driven on the RF bus pins, when both ENABLE_DEBUG_MODE is set and ENABLE_RF_BUS is disabled. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0001

0x3000004 RFIF_RF_BUS_STATUS

Type: read-only
Reset State: 0x0000

These registers capture the status of the RF bus interface state machine and controlling logic.

RFIF_RF_BUS_STATUS

Bits	Name	Description
4	CALIB_DONE	Holds the current state of the Iris calibration mode done signal. When calibration mode is selected, this signal will reset to 0. On completion of calibration, this signal will capture the done signal returned from Iris. Reset State: 0x0000
3:0	RF_BUS_SM_STATE	Current state of the RF bus interface state machine. Reset State: 0x0000

0x3000008 RFIF_ARB_CONTROL

Type: read-write
Reset State: 0x000F

This set of registers are used by the arbitration module to enable/disable data path access to the RF bus interface.

RFIF_ARB_CONTROL

Bits	Name	Description
3	ENABLE_TXGAIN_COMMANDS	Enables/disables the Tx gain commands coming from the TXFIR. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0001
2	ENABLE_RXGAIN_COMMANDS	Enables/disables the Rx gain commands coming from the AGC. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0001
1	ENABLE_PHYHW_COMMANDS	This bit enables/disables accesses by PHY H/W over the RF bus interface. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0001

RFIF_ARB_CONTROL (cont.)

Bits	Name	Description
0	ENABLE_RFAPB_COMMANDS	This bit enables/disables accesses by the RFAPB interface over the RF bus interface. 0x0: DISABLED 0x1: ENABLED Reset State: 0x0001

0x300000C RFIF_ARB_COMMAND

Type: read-write
Reset State: 0x000F

This set of registers are used by the arbitration module to issue RF commands requested by software over the RF interface bus.

RFIF_ARB_COMMAND

Bits	Name	Description
6:4	RF_CMD_DATA_WRD1	This field holds the first data word of the software requested RF command. Currently the only commands with data supported are the RF clock enable command, and the RF reset command, of which both require only a single data word. The encoding definitions provided are for the clock enable command only. The RF reset command data word should be set to all zero. 0x0: DISABLE_19P2 0x1: ENABLE_19P2 0x2: DISABLE_38P4 0x3: ENABLE_38P4 0x4: RESERVED_WRD4 0x5: RESERVED_WRD5 0x6: DISABLE_48 0x7: ENABLE_48 Reset State: 0x0000
3:1	RF_CMD	This field holds the RF_CMD to be issued. Default command is set to RF_RESET command. 0x0: CLOCK_ENABLE_CMD 0x1: MODE_CMD 0x2: RESERVED_CMD2 0x3: RESERVED_CMD3 0x4: RESERVED_CMD4 0x5: RESERVED_CMD5 0x6: RESERVED_CMD6 0x7: RESET_CMD Reset State: 0x0007

RFIF_ARB_COMMAND (cont.)

Bits	Name	Description
0	ISSUE_RF_CMD	This bit is used to initiate an RF command over the RF bus interface. Writing a 1 to this bit requests the arbiter to issue the command loaded in the RF_CMD field. Note that only RF commands with 1 data word are currently supported by this means. When issuing a command (by writing a 1 to this bit), the value in this bit will clear to zero to indicate that the current command is in progress. When the command has completed, the value of this bit will return to 1. Reading this bit returns the status described in the encoding section. 0x0: CMD_IN_PROGRESS 0x1: IDLE Reset State: 0x0001

0x3000010 RFIF_ARB_STATUS

Type: read-only
Reset State: 0x0000

These registers hold the current status of the arbitration module, and are used for debug and status checking.

RFIF_ARB_STATUS

Bits	Name	Description
15:12	RXGAIN_ABORTED_CMDS	Holds the number of RXGAIN commands aborted (by request). Reset State: 0x0000
11:8	RFAPB_DROPPED_CMDS	Holds the number of commands dropped because RFAPB accesses are disabled. Reset State: 0x0000
7:4	BLOCKED_CMDS	Holds the total number of RF commands blocked because the RF Bus has not been enabled. Reset State: 0x0000
3:0	ARB_SM_STATE	Captures the current state of the Arbitration state machine module. Used for debugging purposes. Reset State: 0x0000

0x3000014 RFIF_BT_CTRL_CFG

Type: read-write
Reset State: 0x0003

This register configures the behavior of the BT input signals with regards to the PHY.

RFIF_BT_CTRL_CFG

Bits	Name	Description
2	BT_RX_SHARING_EN	Enables simultaneous RX sharing of antenna with the BT device. Reset State: 0x0000
1	BT_MEDIUM_SHUTDOWN	Controls whether or not the bt_medium input is used to shutdown the PHY. 1 means it will, 0 means it won't. Reset State: 0x0001
0	BT_TX_SHUTDOWN	Controls whether or not the bt_tx input is used to shutdown the PHY. 1 means it will, 0 means it won't. Reset State: 0x0001

0x3000018 RFIF_TX_EN_CFG

Type: read-write
Reset State: 0x0000

This register controls the behaviour of the TX_EN signal.

RFIF_TX_EN_CFG

Bits	Name	Description
1	TX_OVERRIDE_VAL	If the Tx enable override is enabled, then this is the overriding value for the Tx. Reset State: 0x0000
0	OVERRIDE_EN	Setting this bit to 1 enables the override of the Tx enable. Reset State: 0x0000

0x300001C RFIF_RESET_CTRL

Type: read-write
Reset State: 0x0000

Reset control register.

RFIF_RESET_CTRL

Bits	Name	Description
4	STATS_RESET	Setting this to 1 resets all of the current debug statistics counters. Reset State: 0x0000
3	PHYHW_SM_RESET	Setting this to 1 resets all of the PHY H/W interface state machines. Reset State: 0x0000

RFIF_RESET_CTRL (cont.)

Bits	Name	Description
2	RF_BUS_IF_SM_RESET	Setting this to 1 resets the RF bus interface state machine. This should only be used if hang has somehow occurred in this state machine. Reset State: 0x0000
1	ARB_SM_RESET	Setting this to 1 resets the arbitration state machine. This should only be used if hang has somehow occurred in this state machine. Reset State: 0x0000
0	RFAPB_SM_RESET	Setting this to 1 resets the RFAPB state machine. This should only be used if hang has somehow occurred in this state machine. Reset State: 0x0000

0x3000020 RFIF_PHY_HW_STATUS

Type: read-only
Reset State: 0x0000

These registers hold the current status of the PHY HW module, and are used for debug and status checking.

RFIF_PHY_HW_STATUS

Bits	Name	Description
15:10	PHYHW_DROPPED_CMDS	Holds the number of commands dropped because PHY H/W and/or TX & RX gain commands are disabled. Reset State: 0x0000
9:8	MODE_SM_STATE	Captures the current state of the MODE state machine module. Used for debugging purposes. Reset State: 0x0000
7:5	REG_RDWR_SM_STATE	Captures the current state of the Register read/write state machine module. Used for debugging purposes. Reset State: 0x0000
4:3	TXGAIN_SM_STATE	Captures the current state of the TXGAIN state machine module. Used for debugging purposes. Reset State: 0x0000
2:0	RXGAIN_SM_STATE	Captures the current state of the RXGAIN state machine module. Used for debugging purposes. Reset State: 0x0000

0x3000024 RFIF_RFAPB_STATUS

Type: read-only
Reset State: 0x0000

Captures current status of the RFAPB module.

RFIF_RFAPB_STATUS

Bits	Name	Description
2:0	RFAPB_SM_STATE	Captures the current state of the RFAPB state machine module. Used for debugging purposes. Reset State: 0x0000

0x3000028 RFIF_ERROR_CONDS

Type: read-write
Reset State: 0x0000

Captures error conditions if they occur.

RFIF_ERROR_CONDS

Bits	Name	Description
0	WR_FIFO_RD_EMPTY_ERR	This condition indicates that the write data fifo (data to be written to IRIS) became empty. This should never occur. A write of 1 will clear this condition. Reset State: 0x0000

0x300002C RFIF_HKADC_RD_ADDR

Type: read-write
Reset State: 0x0535

Specifies the Iris read address for HKADC operations.

RFIF_HKADC_RD_ADDR

Bits	Name	Description
10:0	RD_ADDR	This field contains the read address for HKADC operations. Reset State: 0x0535

0x3000030 RFIF_HKADC_WR_ADDR

Type: read-write
Reset State: 0x0532

Specifies the Iris write address for HKADC operations.

RFIF_HKADC_WR_ADDR

Bits	Name	Description
10:0	WR_ADDR	This field contains the write address for HKADC operations. Reset State: 0x0532

0x3000034 RFIF_HKADC_CONV_TIMER

Type: read-write
Reset State: 0x007F

Specifies the time in units of 12.5ns (80MHz) that the RFIF will wait for the HKADC conversion to occur, before issuing a read to read the data from Iris.

RFIF_HKADC_CONV_TIMER

Bits	Name	Description
6:0	WAIT_CNT	Total time to wait for the HKADC conversion to complete (in units of 12.5ns). Reset State: 0x007F

0x3000400+0x10*n RFIF_RX_GAINn_0, n=[0..47]

Type: read-write
Reset State: 0x0000

Read write interface to the RX Gain look up Table

RFIF_RX_GAINn_0

Bits	Name	Description
15:0	RXGAIN_VALUE_0	Reset State: 0x0000

0x3000404+0x10*n RFIF_RX_GAINn_1, n=[0..47]

Type: read-write
Reset State: 0x0000

Read write interface to the RX Gain look up Table

RFIF_RX_GAINn_1

Bits	Name	Description
15:0	RXGAIN_VALUE_1	Reset State: 0x0000

0x3000408+0x10*n RFIF_RX_GAINn_2, n=[0..47]

Type: read-write
Reset State: 0x0000

Read write interface to the RX Gain look up Table

RFIF_RX_GAINn_2

Bits	Name	Description
6:0	RXGAIN_VALUE_2	Reset State: 0x0000

0x3000800+0x20*n RFIF_TX_GAINn_0, n=[0..31]

Type: read-write
Reset State: 0x0000

Read write interface to the TX Gain look up Table

RFIF_TX_GAINn_0

Bits	Name	Description
15:0	TXGAIN_VALUE_0	Reset State: 0x0000

0x3000804+0x20*n RFIF_TX_GAINn_1, n=[0..31]

Type: read-write
Reset State: 0x0000

Read write interface to the TX Gain look up Table

RFIF_TX_GAINn_1

Bits	Name	Description
15:0	TXGAIN_VALUE_1	Reset State: 0x0000

0x3000808+0x20*n RFIF_TX_GAINn_2, n=[0..31]

Type: read-write
Reset State: 0x0000

Read write interface to the TX Gain look up Table

RFIF_TX_GAINn_2

Bits	Name	Description
15:0	TXGAIN_VALUE_2	Reset State: 0x0000

0x300080C+0x20*n RFIF_TX_GAINn_3, n=[0..31]

Type: read-write
Reset State: 0x0000

Read write interface to the TX Gain look up Table

RFIF_TX_GAINn_3

Bits	Name	Description
15:0	TXGAIN_VALUE_3	Reset State: 0x0000

0x3000810+0x20*n RFIF_TX_GAINn_4, n=[0..31]

Type: read-write
Reset State: 0x0000

Read write interface to the TX Gain look up Table

RFIF_TX_GAINn_4

Bits	Name	Description
15:0	TXGAIN_VALUE_4	Reset State: 0x0000

0x3000814+0x20*n RFIF_TX_GAINn_5, n=[0..31]

Type: read-write
Reset State: 0x0000

Read write interface to the TX Gain look up Table

RFIF_TX_GAINn_5

Bits	Name	Description
10:0	TXGAIN_VALUE_5	Reset State: 0x0000

16.2.23 rxaclkctrl

0x3000000 RXACLKCTRL_ROOT_CLK_EN

Type: read-write
Reset State: 0x0000

RXACLKCTRL_ROOT_CLK_EN

Bits	Name	Description
2	CLK80_40D	Reset State: 0x0000
1	CLK160	Reset State: 0x0000
0	CLK80	Reset State: 0x0000

0x3000004 RXACLKCTRL_APB_BLOCK_CLK_EN

Type: read-write
Reset State: 0xFFFF

RXACLKCTRL_APB_BLOCK_CLK_EN

Bits	Name	Description
15	PHYCSXI	Reset State: 0x0001
14	FSCALE	Reset State: 0x0001
13	RXA	Reset State: 0x0001
12	RAHDR	Reset State: 0x0001
11	RADSCR	Reset State: 0x0001
10	VIT	Reset State: 0x0001
9	DINT	Reset State: 0x0001

RXACLKCTRL_APB_BLOCK_CLK_EN (cont.)

Bits	Name	Description
8	LMAP	Reset State: 0x0001
7	PTC	Reset State: 0x0001
6	RACTL_APB	Reset State: 0x0001
5	CHE	Reset State: 0x0001
4	INF	Reset State: 0x0001
3	FFT	Reset State: 0x0001
2	TDC	Reset State: 0x0001
1	BTCF	Reset State: 0x0001
0	RACTL	Reset State: 0x0001

0x3000008 RXACLKCTRL_APB_BLOCK_DYN_CLKG_DISABLE

Type: read-write
Reset State: 0x0040

RXACLKCTRL_APB_BLOCK_DYN_CLKG_DISABLE

Bits	Name	Description
15	PHYCSXI	Reset State: 0x0000
14	FSCALE	Reset State: 0x0000
13	RXA	Reset State: 0x0000
12	RAHDR	Reset State: 0x0000
11	RADSCR	Reset State: 0x0000
10	VIT	Reset State: 0x0000
9	DINT	Reset State: 0x0000
8	LMAP	Reset State: 0x0000
7	PTC	Reset State: 0x0000
6	RACTL_APB	Reset State: 0x0001
5	CHE	Reset State: 0x0000
4	INF	Reset State: 0x0000
3	FFT	Reset State: 0x0000
2	TDC	Reset State: 0x0000
1	BTCF	Reset State: 0x0000
0	RACTL	Reset State: 0x0000

0x300000C RXACLKCTRL_DYN_ANTSW_CLK_CTRL_DISABLE

Type: read-write
Reset State: 0x0000

RXACLKCTRL_DYN_ANTSW_CLK_CTRL_DISABLE

Bits	Name	Description
0	ANTSW_CTRL	Reset State: 0x0000

0x3000010 RXACLKCTRL_MAIN1_FAST_CLK_CTRL

Type: read-write
Reset State: 0x0152

Control for the auxiliary fast clock coming to Phy from external clock control logic.

RXACLKCTRL_MAIN1_FAST_CLK_CTRL

Bits	Name	Description
12	DBG_FORCE_FAST_ALWAYS	This is a debug-only mode configuration. Should always be left at 0 for normal purposes. When high, forces the fast_clk to be the source of clock for ALL 11AC packet types. Reset State: 0x0000
11	COMPLIANT_BEHAV	This bit when set to 1 enforces phy-mac interface signalling (related to 256qam processing) to comply with other modes (11a, 11n and 11ac) at the cost of increased latency in 20M and 40M modes depending on tx_bw setting. The following applies to how the clkdivratio for 20M packets is decided in compliant_behav case: *** The design forces this value to 1 when tx_bw_config is 1 or more. *** The value is forced to 0 when tx_bw_config is 0. The following applies to how the clkdivratio for 40M packets is decided- *** The design forces the value to 1 if tx_bw_config is 1. Otherwise a value of 1 or 2 can be used. When this bit is set to 0, all 256QAM STBC 20M packets will get 160MHz fastclk; all 256QAM STBC 40M packets will get either 160 or 320 MHz clock depending on extnclkdivmode40 above. Reset State: 0x0000
10:5	CLKCHGDLY	Specifies the delay (in number of 80MHz clocks) between assertion of fast_clk_en in ractl (in main2 domain) to when the processing of MCS 8 and 9 STBC data-symbols is going to start. This delay is required so as to allow multi-cycle operation of the enable. This delay should include CDC delays inside PHY as well as clock-generation delay. Tune this to the minimum required delay. Reset State: 0x000A

RXACLKCTRL_MAIN1_FAST_CLK_CTRL (cont.)

Bits	Name	Description
4:3	EXTNCLKDIVMODE40	This divmode determines the frequency of the clock being used by functional logic to demodulate 40MHz MCS8 and 9 STBC pkts. A value of 2 implies the clk used has same freq as that of the input fast clk. A value of 1 implies the clk used has one-half freq as that of the input fast clk. A value of 0 implies the clk used has one-quarter freq as that of the input fast clk. Compare this with the clock-division mechanism based on channel bandwidth configuration. Note that setting the value to < 2 will increase the latency of 40M packets to > 11 microseconds. Reset State: 0x0002
2:1	EXTNCLKDIVMODE20	This divmode determines the frequency of the clock being used by functional logic to demodulate 20MHz MCS8 and 9 STBC pkts. A value of 2 implies the clk used has same freq as that of the input fast clk. A value of 1 implies the clk used has one-half freq as that of the input fast clk. A value of 0 implies the clk used has one-quarter freq as that of the input fast clk. Compare this with the clock-division mechanism based on channel bandwidth configuration. Note that setting the value to 0 will increase the latency of 20M packets to > 12 microseconds so a value of 0 should never be used. A value of 2 is usable at the expense of power consumption penalty. *** NOT actually used *** Reset State: 0x0001
0	FORCE_CLK_DISABLE	When high, forcefully disables the clock to save power. When low, the functional logic decides the duration of the enable. Note that functional logic will ensure this clock is enabled only when STBC data symbols in 11AC MCS8 and MCS9 packets mode are being demodulated by RX. Reset State: 0x0000

16.2.24 rxclkctrl

0x3000000 RXCLKCTRL_ROOT_CLK_EN

Type: read-write
Reset State: 0x0000

RXCLKCTRL_ROOT_CLK_EN

Bits	Name	Description
9	CLK3BY4_S	Reset State: 0x0000
8	CLK1BY4_S	Reset State: 0x0000
7	CLK160_D	Reset State: 0x0000
6	CLK80_S	Reset State: 0x0000
5	CLK40	Reset State: 0x0000
4	CLK80_40D	Reset State: 0x0000

RXCLKCTRL_ROOT_CLK_EN (cont.)

Bits	Name	Description
3	CLK80_40S	Reset State: 0x0000
2	CLK160	Reset State: 0x0000
1	CLK_MIF_PHYDBG_INTF	Reset State: 0x0000
0	CLK80	0x0: DISABLE 0x0: ENABLE Reset State: 0x0000

0x3000004 RXCLKCTRL_APB_BLOCK_CLK_EN

Type: read-write
Reset State: 0x1531

RXCLKCTRL_APB_BLOCK_CLK_EN

Bits	Name	Description
13	RXFIR_DWNS	Reset State: 0x0000
12	AGC_APB	Reset State: 0x0001
11	AGC	Reset State: 0x0000
10	XBAR	Reset State: 0x0001
9	RFIF	Reset State: 0x0000
8	PHYDBG_APB	Reset State: 0x0001
7	PHYDBG	Reset State: 0x0000
6	CAL_EST	Reset State: 0x0000
5	CAL	Reset State: 0x0001
4	RXFIR	Reset State: 0x0001
3	PMI	Reset State: 0x0000
2	PHYINT	Reset State: 0x0000
1	TMUX	Reset State: 0x0000
0	RXB	0x0: DISABLE 0x1: ENABLE Reset State: 0x0001

0x3000008 RXCLKCTRL_APB_BLOCK_DYN_CLKG_DISABLE

Type: read-write
Reset State: 0x0010

RXCLKCTRL_APB_BLOCK_DYN_CLKG_DISABLE

Bits	Name	Description
8	PMIRDET	Reset State: 0x0000
6	PMICCA	Reset State: 0x0000
5	XBAR	Reset State: 0x0000
4	CAL_APB	Reset State: 0x0001
3	CAL	Reset State: 0x0000
2	RXFIR	Reset State: 0x0000
1	PMI	Reset State: 0x0000
0	RXB	0x0: ENABLE 0x1: DISABLE Reset State: 0x0000

0x300000C RXCLKCTRL_APB_BLOCK_DYN_CLKG_DISABLE_AGC

Type: read-write
Reset State: 0x0008

Since AGC has a bunch of sub blocks they need to have their own dynamic clock gate disable

RXCLKCTRL_APB_BLOCK_DYN_CLKG_DISABLE_AGC

Bits	Name	Description
8	CCADET	Reset State: 0x0000
7	DET11AC80	Reset State: 0x0000
6	DET11N40	Reset State: 0x0000
5	DET11A	Reset State: 0x0000
4	DET11B	Reset State: 0x0000
3	APB	Reset State: 0x0001
2	RDET	Reset State: 0x0000
1	PWR	Reset State: 0x0000
0	MAIN	Reset State: 0x0000

0x3000010 RXCLKCTRL_APB_SYNC_RESET

Type: command
Reset State: 0x0000

RXCLKCTRL_APB_SYNC_RESET

Bits	Name	Description
0	VALUE	Reset State: 0x0000

0x3000014 RXCLKCTRL_CLK_PHY_MAIN2_3BY4_DIV_BYPASS

Type: read-write
Reset State: 0x0000

RXCLKCTRL_CLK_PHY_MAIN2_3BY4_DIV_BYPASS

Bits	Name	Description
0	BYP	Reset State: 0x0000

0x3000018 RXCLKCTRL_BW_CONFIG

Type: read-only

RXCLKCTRL_BW_CONFIG

Bits	Name	Description
3:2	TX_VAL	
1:0	RX_VAL	

0x3000020 RXCLKCTRL_PHY_VERSION

Type: read-only
Reset State: 0xAA80

Contains information about the PHY variant type and revision number.

RXCLKCTRL_PHY_VERSION

Bits	Name	Description
15:6	REG_ID	This is an ID number that uniquely identifies this register as a PHY version register. Reset State: 0x02AA
5:3	REVISION	Revision number.
2:0	VARIANT	0x0: RIVA

16.2.25 tactl

0x3000000 TACTL_CFG

Type: read-write
Reset State: 0x0006

Tx-A Block Configuration and Setup Register

TACTL_CFG

Bits	Name	Description
3:2	B_11AC_CRC_MODE	When set instructs the TAHDR module to generate an 11n CRC and insert it into the HT-SIG2 symbol. 0x0: NO_CRC 0x1: OPT1 0x2: OPT2 0x3: OPT3 Reset State: 0x0001
1	B_11N_CRC_ENABLE	When set instructs the TAHDR module to generate an 11n CRC and insert it into the HT-SIG2 symbol. Reset State: 0x0001
0	TACTL_ABORT	When set instructs the tactl module to abort and return to idle state Reset State: 0x0000

0x3000004 TACTL_SCR_CONFIG

Type: read-write
Reset State: 0x007F

Configures the Tx-a scrambler with a programmable seed

TACTL_SCR_CONFIG

Bits	Name	Description
9	TASCR_BYPASS	When set puts the Scrambler in bypass mode Reset State: 0x0000
8	TASCR_LOAD	When set, the scrambler seed is immediately loaded with the programmed value. Thereafter, the seed is reset to the programmed value at the start of every 11a/n packet. Reset State: 0x0000
6:0	TASCR_SEED	Programmable seed for the scrambler Reset State: 0x007F

0x3000008 TACTL_TATMUX_CONFIG

Type: read-write
Reset State: 0x0000

The mux in txa_tmux will be selected using the select lines from this register

TACTL_TATMUX_CONFIG

Bits	Name	Description
5:0	MUX_SEL	Defaults to the 0th group Reset State: 0x0000

0x300000C TACTL_SCALE_20

Type: read-write
Reset State: 0x0080

This register contains an 8-bit amplitude scaling factor to be applied to all short preamble symbols of 20MHz packets.

TACTL_SCALE_20

Bits	Name	Description
7:0	VALUES	Reset State: 0x0080

0x3000010 TACTL_SCALE_40

Type: read-write
Reset State: 0x0080

This register contains an 8-bit amplitude scaling factor to be applied to all short preamble symbols of 40MHz packets.

TACTL_SCALE_40

Bits	Name	Description
7:0	VALUES	Reset State: 0x0080

0x3000014 TACTL_SCALE_80

Type: read-write
Reset State: 0x0080

This register contains an 8-bit amplitude scaling factor to be applied to all short preamble symbols of 80MHz packets.

TACTL_SCALE_80

Bits	Name	Description
7:0	VALUES	Reset State: 0x0080

0x3000018 TACTL_DOT11AC_SERVICE_OVERRIDE

Type: read-write
Reset State: 0x0000

Flag to insert APB-programmable value into SERVICE field for 11ac packets

TACTL_DOT11AC_SERVICE_OVERRIDE

Bits	Name	Description
0	FLAG	Reset State: 0x0000

0x300001C TACTL_DOT11AC_APB_SERVICE

Type: read-write
Reset State: 0x0000

Contains the 16-bit SERVICE field value

TACTL_DOT11AC_APB_SERVICE

Bits	Name	Description
15:0	VALUE	Reset State: 0x0000

0x3000020 TACTL_CTRL_STATE

Type: read-only

Indicates the last 4 states of the TXA controller

TACTL_CTRL_STATE

Bits	Name	Description
15:0	VALUE	Bits[15:12] = Prev (N-3) state Bits[11:8] = Prev (N-2) state Bits[7:4] = Prev (N-1) state Bits[3:0] = Current state

0x3000024 TACTL_PKT_REQ_COUNT

Type: read-only

TACTL_PKT_REQ_COUNT

Bits	Name	Description
15:0	VALUE	Counts number of requests made to MPI for current packet

0x3000028 TACTL_TAHDR_SYM_COUNT

Type: read-only

TACTL_TAHDR_SYM_COUNT

Bits	Name	Description
15:0	VALUE	Counts number of TXA_HDR symbol starts for current packet

0x300002C TACTL_TAQAM_SYM_COUNT

Type: read-only

TACTL_TAQAM_SYM_COUNT

Bits	Name	Description
15:0	VALUE	Counts number of TXA_QAM symbol starts for current packet

0x3000030 TACTL_LAST_SYM_PARAMS

Type: read-only

TACTL_LAST_SYM_PARAMS

Bits	Name	Description
15:10	RATE	Rate field for last TAHDR symbol processed
9:8	BW	Bandwidth of last packet processed
7:3	SYM_TYPE	Symbol type of last symbol processed in QAM module
2:0	PKT_TYPE	Packet type for last packet processed

0x3000034 TACTL_QAM_NSYMS

Type: write-only

TACTL_QAM_NSYMS

Bits	Name	Description
15:0	SYMCNT	Counts the total number of OFDM Symbols through the TX-A QAM Mapper

0x3000038 TACTL_NPKTS

Type: write-only

TACTL_NPKTS

Bits	Name	Description
15:0	PKTCNT	Counts the number of packet starts received from TXCTL

0x300003C TACTL_SCR_LFSR

Type: read-only
Reset State: 0x0000

State of LFSR in txa_scr

TACTL_SCR_LFSR

Bits	Name	Description
6:0	TASCR_LFSR	Current state of LFSR Reset State: 0x0000

0x3000040 TACTL_ALARMS

Type: read-only
Reset State: 0x0000

Monitor of all contributors to TXA abort

TACTL_ALARMS

Bits	Name	Description
5:0	VALUE	Bit[0] = Abort received from TXCTL Bit[1] = TXA Header error Bit[2] = Invalid data rate error Bit[3] = TXA Interleaver error Bit[4] = TXCTL packet start received when state machine busy Bit[5] = Incorrect bandwidth field in command word Reset State: 0x0000

0x3000044 TACTL_RESET_ALARMS

Type: command
Reset State: 0x0000

Resets the alarm flags

TACTL_RESET_ALARMS

Bits	Name	Description
0	RESET_ALARMS	When this register is written to with any value, a active high pulse is generated which will reset all alarm flags in the TACTL alarms register. Reset State: 0x0000

16.2.26 taqam

0x3000000 TAQAM_SCALE_BPSK

Type: read-write
Reset State: 0x007F

Amplitude scale factor for BPSK modulation

TAQAM_SCALE_BPSK

Bits	Name	Description
8:0	REG	Reset State: 0x007F

0x3000008 TAQAM_SCALE_QPSK

Type: read-write
Reset State: 0x005A

Amplitude scale factor for QPSK modulation

TAQAM_SCALE_QPSK

Bits	Name	Description
8:0	REG	Reset State: 0x005A

0x300000C TAQAM_SCALE_QAM16

Type: read-write
Reset State: 0x0050

Amplitude scale factor for 16QAM modulation

TAQAM_SCALE_QAM16

Bits	Name	Description
8:0	REG	Reset State: 0x0050

0x3000010 TAQAM_SCALE_QAM64

Type: read-write
Reset State: 0x004E

Amplitude scale factor for 64QAM modulation

TAQAM_SCALE_QAM64

Bits	Name	Description
8:0	REG	Reset State: 0x004E

0x3000014 TAQAM_SCALE_QAM256

Type: read-write
Reset State: 0x004E

Amplitude scale factor for 256QAM modulation

TAQAM_SCALE_QAM256

Bits	Name	Description
8:0	REG	Reset State: 0x004E

0x3000018 TAQAM_SCALE_LEGACY20

Type: read-write
Reset State: 0x0089

Amplitude scale factor for legacy packets and 11n/ac legacy symbols

TAQAM_SCALE_LEGACY20

Bits	Name	Description
8:0	REG	Reset State: 0x0089

0x300001C TAQAM_SCALE_LEGACY40

Type: read-write
Reset State: 0x0060

Amplitude scale factor for legacy 40MHz duplicate packets and 11n/ac 40MHz legacy symbols

TAQAM_SCALE_LEGACY40

Bits	Name	Description
8:0	REG	Reset State: 0x0060

0x3000020 TAQAM_SCALE_LEGACY80

Type: read-write
Reset State: 0x0085

Amplitude scale factor for legacy 80MHz duplicate packets and 11n/ac 80MHz legacy symbols

TAQAM_SCALE_LEGACY80

Bits	Name	Description
8:0	REG	Reset State: 0x0085

0x3000024 TAQAM_SCALE_HT20

Type: read-write
Reset State: 0x0085

Amplitude scale factor for (V)HT-LTF, HT-SIG in GF mode, VHT-SIG-B and Data 11n/ac 20MHz symbols

TAQAM_SCALE_HT20

Bits	Name	Description
8:0	REG	Reset State: 0x0085

0x3000028 TAQAM_SCALE_HT40

Type: read-write
Reset State: 0x005B

Amplitude scale factor for (V)HT-LTF, HT-SIG in GF mode, VHT-SIG-B and Data 11n/ac 40MHz symbols

TAQAM_SCALE_HT40

Bits	Name	Description
8:0	REG	Reset State: 0x005B

0x300002C TAQAM_SCALE_HT80

Type: read-write
Reset State: 0x007B

Amplitude scale factor for VHT-LTF, VHT-SIG-B and Data 11ac 80MHz symbols

TAQAM_SCALE_HT80

Bits	Name	Description
8:0	REG	Reset State: 0x007B

0x3000030 TAQAM_AC

Type: read-write
Reset State: 0x03E7

Programmable features to mitigate risk of spec change

TAQAM_AC

Bits	Name	Description
9	SB_ROT_EN	Reset State: 0x0001
8	CYC_ROT_EN	Reset State: 0x0001
7:0	PILOT80	Reset State: 0x00E7

16.2.27 tbapb

0x3000000 TBAPB_CRC16_CTRL

Type: read-write
Reset State: 0x0000

Controls CRC16 generator operation that calculates IEEE802.11b PLCP header CRC. For debugging purposes.

TBAPB_CRC16_CTRL

Bits	Name	Description
0	DIS	When set disables CRC16 calculation. Should be 0 (enabled) for normal operation. 0x0: ENABLE 0x1: DISABLE Reset State: 0x0000

0x3000004 TBAPB_SCRAMBLE_CTRL

Type: read-write
Reset State: 0x0000

Controls data scrambler operation that scrambled IEEE802.11b frame. For debugging purposes.

TBAPB_SCRAMBLE_CTRL

Bits	Name	Description
0	DIS	When set disables data scrambling by bypassing scrambler. Should be 0 (enabled) for normal operation. 0x0: ENABLE 0x1: DISABLE Reset State: 0x0000

0x3000008 TBAPB_TXB_DEBUG

Type: write-only
Reset State: 0x0000

Debug counter, counts bytes entered into the CRC16 generator module.

TBAPB_TXB_DEBUG

Bits	Name	Description
15:0	COUNT	Byte counters reset on read. Reset State: 0x0000

0x300000C TBAPB_LINEAR_DELAY_ANT1

Type: read-write
Reset State: 0x0002

Stores the select for the delay diversity value to be applied to txb chain2 samples in barker and cck modulated data

TBAPB_LINEAR_DELAY_ANT1

Bits	Name	Description
7:6	CCK11DIVDLY	0 implies no delay to chain2 cck11 modulated data 1 implies 1 delay (1 20MHz sample) to chain2 cck11 modulated data 2 implies 2 delays 3 implies 3 delays Reset State: 0x0000
5:3	CCK5DIVDLY	0 implies no delay to chain2 cck5 modulated data 1 implies 1 delay (1 20MHz sample) to chain2 cck5 modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays Reset State: 0x0000
2:0	BRKDIVDLY	0 implies no delay to chain2 barker modulated data 1 implies 1 delay (1 20MHz sample) to chain2 barker modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays Reset State: 0x0002

0x3000010 TBAPB_LINEAR_DELAY_ANT2

Type: read-write
Reset State: 0x0004

Stores the select for the delay diversity value to be applied to txb chain3 samples in barker and cck modulated data

TBAPB_LINEAR_DELAY_ANT2

Bits	Name	Description
7:6	CCK11DIVDLY	0 implies no delay to chain3 cck11 modulated data 1 implies 1 delay (1 20MHz sample) to chain3 cck11 modulated data 2 implies 2 delays 3 implies 3 delays Reset State: 0x0000
5:3	CCK5DIVDLY	0 implies no delay to chain3 cck5 modulated data 1 implies 1 delay (1 20MHz sample) to chain3 cck5 modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays Reset State: 0x0000
2:0	BRKDIVDLY	0 implies no delay to chain3 barker modulated data 1 implies 1 delay (1 20MHz sample) to chain3 barker modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays Reset State: 0x0004

0x3000014 TBAPB_LINEAR_DELAY_ANT3

Type: read-write
Reset State: 0x0006

Stores the select for the delay diversity value to be applied to txb chain4 samples in barker and cck modulated data

TBAPB_LINEAR_DELAY_ANT3

Bits	Name	Description
7:6	CCK11DIVDLY	0 implies no delay to chain4 cck11 modulated data 1 implies 1 delay (1 20MHz sample) to chain4 cck11 modulated data 2 implies 2 delays 3 implies 3 delays Reset State: 0x0000
5:3	CCK5DIVDLY	0 implies no delay to chain4 cck5 modulated data 1 implies 1 delay (1 20MHz sample) to chain4 cck5 modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays Reset State: 0x0000
2:0	BRKDIVDLY	0 implies no delay to chain4 barker modulated data 1 implies 1 delay (1 20MHz sample) to chain4 barker modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays Reset State: 0x0006

16.2.28 tdc

0x3000000 TDC_TDCSYM_IN

Type: write-only

Number of multiples of 80 baseband samples received by the TDC module (from the AGC module)

TDC_TDCSYM_IN

Bits	Name	Description
15:0	TDCSYM_IN	Number of multiples of 80 baseband samples received by the TDC module (from the AGC module)

0x3000004 TDC_TDCSYM_OUT

Type: write-only

Number of symbol start pulses received by the TDC module (from the RACTL module)

TDC_TDCSYM_OUT

Bits	Name	Description
15:0	TDCSYM_OUT	Number of symbol start pulses received by the TDC module (from the RACTL module)

0x3000008 TDC_TDCPKT_IN

Type: write-only

Number of packet start signals received by the TDC module

TDC_TDCPKT_IN

Bits	Name	Description
15:0	TDCPKT_IN	Number of packet start signals received by the TDC module

0x300000C TDC_CWDET_COUNT

Type: write-only

Number of times that the CW detector was triggered

TDC_CWDET_COUNT

Bits	Name	Description
15:0	CW_COUNT	Number of times that the CW detector was triggered

0x3000010 TDC_CWDET_STATUS

Type: read-only

Indicates whether CW has been detected by CWDET module, and if so at what location.

TDC_CWDET_STATUS

Bits	Name	Description
6	CWDET_EN	Indicates that CW notch is currently enabled.
5:0	CWDET_LOC	Location of last CW notch detected.

0x3000014 TDC_CWDET_OVERRIDE

Type: read-write
Reset State: 0x0000

Location of APB-programmable fixed CW notch

TDC_CWDET_OVERRIDE

Bits	Name	Description
6	APB_MODE	APB control of CW notch_location signal If this bit is set, the CW detector will override the calculated value of this signal with the APB-programmed value in the CWDET_NOTCH_LOC register. Default value = 1'b0; Reset State: 0x0000
5:0	NOTCH_LOC	Location of APB-programmable fixed CW notch Default value = 6'h0 Reset State: 0x0000

0x3000018 TDC_CWDET_TRIGGER

Type: command
Reset State: 0x0000

This register manually triggers the update of the CW notch enable and location in the AGC

TDC_CWDET_TRIGGER

Bits	Name	Description
0	TRIGGER	Writing any value to this register will pulse the cw_detected signal to the AGC if the APB_MODE bit has been set in the CWDET_NOTCH_LOC register Reset State: 0x0000

0x300001C TDC_APB_GAIN_THRESH_LLP64_1RX

Type: read-write
Reset State: 0x0016

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving non-11n or 20MHz 11n packets.

TDC_APB_GAIN_THRESH_LLP64_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd23 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd23, will result in a backoff value of 12dB. To set a different backoff, set to: round(16+2*log2(175)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0016

0x3000020 TDC_APB_GAIN_THRESH_LLP64_2RX

Type: read-write
Reset State: 0x0016

This register contains the desired value of the TDC power calculator for 2 active chains for an ideal target backoff when receiving non-11n or 20MHz 11n packets.

TDC_APB_GAIN_THRESH_LLP64_2RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd23 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd23, will result in a backoff value of 12dB. To set a different backoff, set to: round(16+2*log2(175)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0016

0x3000024 TDC_APB_GAIN_THRESH_LLP128_1RX

Type: read-write
Reset State: 0x0014

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving 40MHz 11n packets.

TDC_APB_GAIN_THRESH_LLP128_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: round(14+2*log2(175)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0014

0x3000028 TDC_APB_GAIN_THRESH_LLP128_2RX

Type: read-write
Reset State: 0x0014

This register contains the desired value of the TDC power calculator for 2 active chains for an ideal target backoff when receiving 40MHz 11n packets.

TDC_APB_GAIN_THRESH_LLP128_2RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: round(14+2*log2(175)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0014

0x300002C TDC_APB_GAIN_THRESH_HTLTF64_1RX

Type: read-write
Reset State: 0x0016

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving 20MHz 11n mixed-mode packets with 1 active chain.

TDC_APB_GAIN_THRESH_HTLTF64_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd23 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd23, will result in a backoff value of 12dB. To set a different backoff, set to: round(18+2*log2(79)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0016

0x3000030 TDC_APB_GAIN_THRESH_HTLTF64_2RX

Type: read-write
Reset State: 0x0016

This register contains the desired value of the TDC power calculator for 2 active chains for an ideal target backoff when receiving 20MHz 11n mixed-mode packets with 2 active chains.

TDC_APB_GAIN_THRESH_HTLTF64_2RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd23 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd23, will result in a backoff value of 12dB. To set a different backoff, set to: round(18+2*log2(79)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0016

0x3000034 TDC_APB_GAIN_THRESH_HTLTF128_1RX

Type: read-write
Reset State: 0x0014

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving 40MHz 11n mixed-mode packets with 1 active chain.

TDC_APB_GAIN_THRESH_HTLTF128_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: round(16+2*log2(79)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0014

0x3000038 TDC_APB_GAIN_THRESH_HTLTF128_2RX

Type: read-write
Reset State: 0x0014

This register contains the desired value of the TDC power calculator for 2 active chains for an ideal target backoff when receiving 40MHz 11n mixed-mode packets with 2 active chains.

TDC_APB_GAIN_THRESH_HTLTF128_2RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: round(16+2*log2(79)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0014

0x300003C TDC_APB_GAIN_THRESH_LLP256_1RX

Type: read-write
Reset State: 0x0016

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving 40MHz 11n packets.

TDC_APB_GAIN_THRESH_LLP256_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: round(14+2*log2(175)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0016

0x3000040 TDC_APB_GAIN_THRESH_LLP256_2RX

Type: read-write
Reset State: 0x0014

This register contains the desired value of the TDC power calculator for 2 active chains for an ideal target backoff when receiving 40MHz 11n packets.

TDC_APB_GAIN_THRESH_LLP256_2RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: round(14+2*log2(175)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0014

0x3000044 TDC_APB_GAIN_THRESH_VHTLTF256_1RX

Type: read-write
Reset State: 0x0016

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving 40MHz 11n mixed-mode packets with 1 active chain.

TDC_APB_GAIN_THRESH_VHTLTF256_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: round(16+2*log2(79)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0016

0x3000048 TDC_APB_GAIN_THRESH_VHTLTF256_2RX

Type: read-write
Reset State: 0x0014

This register contains the desired value of the TDC power calculator for 2 active chains for an ideal target backoff when receiving 80MHz 11n mixed-mode packets with 2 active chains.

TDC_APB_GAIN_THRESH_VHTLTF256_2RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: round(16+2*log2(79)-T*log2(10)/5), where T is the target backoff in dB Reset State: 0x0014

0x300004C TDC_RAM_OVERFLOW

Type: read-only

Bit[0] of this register indicates the value of the TDC RAM overflow flag

TDC_RAM_OVERFLOW

Bits	Name	Description
0	RAM_OVERFLOW	Bit[0] of this register indicates the value of the TDC RAM overflow flag

16.2.29 tpc

0x3000000 TPC_TXPWR_OVERRIDE0

Type: read-write
Reset State: 0x0033

Register allows to override the automatic power control algorithm on transmit chains.

TPC_TXPWR_OVERRIDE0

Bits	Name	Description
10:6	RF_POWER	Override power control loop and write directly to the RF chip Reset State: 0x0000
5:0	FINE_POWER	Override power control loop and write directly to the gain multipliers Reset State: 0x0033

0x3000004 TPC_TXPWR_ENABLE

Type: read-write
Reset State: 0x0003

controls the power gain mode.

TPC_TXPWR_ENABLE

Bits	Name	Description
2	FIXED_RF_GAIN	fixed_rf_gain and en (clpc_en) are used to set the tpc mode. When fixed_rf_gain is set, a single rf gain value is used for the tx power control. CLPC Modes 1 and 2 require fixed_rf_gain be set. In Mode 1, rf gain will be static, in Mode 2, the gain value will be adjusted based on feadback from the PDADC. Reset State: 0x0000

TPC_TXPWR_ENABLE (cont.)

Bits	Name	Description
1	OVERRIDE	When set the rf and digital gain values from the TXPWR_OVERRIDE register are used for all transmit power values. Reset State: 0x0001
0	EN	en (clpc_en) and fixed_rf_gain are used to set the tpc mode. When en is set, the gain LUTs will be updated based on the feedback from the PDADC. CLPC Modes 2 and 3 require en be set. Reset State: 0x0001

0x3000008 TPC_ADC_CTRL_GET_ADC

Type: command

ADC control port. Starts conversion.

TPC_ADC_CTRL_GET_ADC

Bits	Name	Description
0	GET_ADC	Write to this register to get ADC readout (start the conversion). This register was used in Titan to perform temperature measurement. Not used in Taurus.

0x300000C TPC_ADC_STATUS

Type: read-only

ADC status port, shows when ADC is ready (conversion finished).

TPC_ADC_STATUS

Bits	Name	Description
2	FAILED	0x0: SUCCESS 0x1: FAILURE
1	BUSY_P	When 0, either failure happened or result of power measurement is available in SENSED_PWR register. 0x0: IDLE 0x1: BUSY
0	BUSY_T	Busy with a APB-initiated conversion. To be polled until 0. When 0, either failure happened or result of conversion is available in ADC_DATA register. 0x0: IDLE 0x1: BUSY

0x3000010 TPC_MAN_TXPWR

Type: command

Manual TX gain command strobe.

TPC_MAN_TXPWR

Bits	Name	Description
0	STRB	Write to this register to manually send out a TX gain command when in override mode.

0x3000014 TPC_MAX_RF_GAIN

Type: read-write
Reset State: 0x001F

Contains the maximum RF gain to which the power control loop operates. This is different for the 2.4 vs. 5GHz bands.

TPC_MAX_RF_GAIN

Bits	Name	Description
4:0	VALUE	Default 15, i.e., 20dBm (2.4GHz value) Should be set to 9 (16dBm) for 5GHz. Reset State: 0x001F

0x3000018 TPC_MIN_RF_GAIN

Type: read-write
Reset State: 0x0000

Contains the minimum RF gain to which the power control loop operates. This is different for the 2.4 vs. 5GHz bands.

TPC_MIN_RF_GAIN

Bits	Name	Description
4:0	VALUE	Default 15, i.e., 20dBm (2.4GHz value) Should be set to 9 (16dBm) for 5GHz. Reset State: 0x0000

0x300001C TPC_MAX_DIGITAL_GAIN

Type: read-write
Reset State: 0x000F

Max value of tx digital gain range.

TPC_MAX_DIGITAL_GAIN

Bits	Name	Description
3:0	VALUE	Default value = 15 Reset State: 0x000F

0x3000020 TPC_MID_DIGITAL_GAIN

Type: read-write
Reset State: 0x0008

Mid value of tx digital gain range. Must be set to 1 or more!

TPC_MID_DIGITAL_GAIN

Bits	Name	Description
3:0	VALUE	Default value = 8 Reset State: 0x0008

0x3000024 TPC_MIN_DIGITAL_GAIN

Type: read-write
Reset State: 0x0000

Min value of tx digital gain range.

TPC_MIN_DIGITAL_GAIN

Bits	Name	Description
3:0	VALUE	Default value = 0 Reset State: 0x0000

0x300002C TPC_RC_DELAY

Type: read-write
Reset State: 0x04B0

Contains the delay between the start of TX and the start of power measurement.

TPC_RC_DELAY

Bits	Name	Description
12:0	DELAY	Default 1200, i.e., 15uS @ 80MHz clock. Value automatically adjusted for static bandwidth so that duration for given APB value is constant for all bandwidths. Reset State: 0x04B0

0x3000030 TPC_SENSED_PWR0

Type: read-only

Contains data from the Pwr ADCs which sensed the cygnus power during transmit operation

TPC_SENSED_PWR0

Bits	Name	Description
10:0	VALUE	PWRADC0 readback during transmit.

0x3000034 TPC_ADCTIMEOUT

Type: read-write
Reset State: 0x0900

Contains Pwr ADC response timeout value

TPC_ADCTIMEOUT

Bits	Name	Description
15:0	VALUE	Specifies the number of operating clocks that power-adc state machine can be in non-idle state and beyond that point, the power-adc response failure will be declared and state machine will be brought to idle. Value automatically adjusted for static bandwidth so that duration for given APB value is constant for all bandwidths. Reset State: 0x0900

0x3000038 TPC_APBACCESS

Type: read-write
Reset State: 0x0000

Selects APB access control

TPC_APBACCESS

Bits	Name	Description
0	SELECT	Set this bit to high to enable APB access of TPC memory Reset State: 0x0000

0x300003C TPC_PTADC_FSM_RST

Type: command

This register does the resetting of the state machine which interacts with power-adc analog interface

TPC_PTADC_FSM_RST

Bits	Name	Description
0	RST	Write to this register to reset

0x3000044 TPC_PDADC_RANGE

Type: read-write
Reset State: 0x0001

This register defines which portion of the 11-bit input PDADC sample is fed to the 8-bit LUT

TPC_PDADC_RANGE

Bits	Name	Description
1:0	SELECT	2'h0 : selects bits [10:3] of input PDADC sample 2'h1 : selects bits [9:2] of input PDADC sample 2'h2 : selects bits [8:1] of input PDADC sample 2'h3 : selects bits [7:0] of input PDADC sample Reset State: 0x0001

0x3000048 TPC_PDADC_OFFSET

Type: read-write
Reset State: 0x0000

Offset value to be subtracted from raw PDADC value

TPC_PDADC_OFFSET

Bits	Name	Description
10:0	VALUE	Reset State: 0x0000

0x300004C TPC_GAIN_OFFSET1

Type: read-write
Reset State: 0x0000

Open Loop gain values for converting digital to an absolute digital gain value for the TXFIR fine gain block.

TPC_GAIN_OFFSET1

Bits	Name	Description
11:6	OL_11B	Reset State: 0x0000
5:0	OL_OFDM	Reset State: 0x0000

0x3000050 TPC_GAIN_OFFSET2

Type: read-write
Reset State: 0x030C

Closed Loop gain values for converting digital to an absolute digital gain value for the TXFIR fine gain block.

TPC_GAIN_OFFSET2

Bits	Name	Description
11:6	CL_11B	Reset State: 0x000C
5:0	CL_OFDM	Reset State: 0x000C

0x3000800+0x4*n TPC_POWERDET0_RAMn, n=[0..255]

Type: read-write

Calibration data for the power detector

TPC_POWERDET0_RAMn

Bits	Name	Description
5:0	POWER	

0x3000C00+0x4*n TPC_RF_GAIN_LUT0n, n=[0..31]

Type: read-write

RF Course gain LUT

TPC_RF_GAIN_LUT0n

Bits	Name	Description
4:0	RF_GAIN	

0x3000C80+0 x4*n TPC_DIGITAL_GAIN_LUT0n, n=[0..31]

Type: read-write

Digital fine gain LUT

TPC_DIGITAL_GAIN_LUT0n

Bits	Name	Description
3:0	DIG_GAIN	

16.2.30 txclkctrl

0x3000000 TXCLKCTRL_ROOT_CLK_EN

Type: read-write
Reset State: 0x0000

TXCLKCTRL_ROOT_CLK_EN

Bits	Name	Description
3	CLK60	Reset State: 0x0000
2	CLK80_3BY4	Reset State: 0x0000
1	CLK160	Reset State: 0x0000
0	CLK80	Reset State: 0x0000

0x3000004 TXCLKCTRL_APB_BLOCK_CLK_EN

Type: read-write
Reset State: 0x01FF

TXCLKCTRL_APB_BLOCK_CLK_EN

Bits	Name	Description
9	TATMUX	Reset State: 0x0000
8	TPC	Reset State: 0x0001
7	TXFIR_APB	Reset State: 0x0001

TXCLKCTRL_APB_BLOCK_CLK_EN (cont.)

Bits	Name	Description
6	TXFIR	Reset State: 0x0001
5	TXB	Reset State: 0x0001
4	TXA_APB	Reset State: 0x0001
3	TXA	Reset State: 0x0001
2	TXCTL_APB	Reset State: 0x0001
1	TXCTL	Reset State: 0x0001
0	MPI	Reset State: 0x0001

0x3000008 TXCLKCTRL_APB_BLOCK_DYN_CLKG_DISABLE

Type: read-write
Reset State: 0x0094

TXCLKCTRL_APB_BLOCK_DYN_CLKG_DISABLE

Bits	Name	Description
8	TPC	Reset State: 0x0000
7	TXFIR_APB	Reset State: 0x0001
6	TXFIR	Reset State: 0x0000
5	TXB	Reset State: 0x0000
4	TXA_APB	Reset State: 0x0001
3	TXA	Reset State: 0x0000
2	TXCTL_APB	Reset State: 0x0001
1	TXCTL	Reset State: 0x0000
0	MPI	Reset State: 0x0000

16.2.31 txctl

0x3000000 TXCTL_FIR_MODE

Type: read-write
Reset State: 0x00C4

This register is used to switch in a test waveform feed to the TX FIR instead of the normal packet data stream and to manually enable the DACs and RF chains during the test mode.!!

NOTE The user must also appropriately program the DAC_SHUTDOWN register to ensure that the DAC standby and shutdown registers are configured correctly

TXCTL_FIR_MODE

Bits	Name	Description
9:8	TEST_BW_MODE	This field sets the bandwidth parameter when the TX is in WFM (test) mode. Default 2'h0 0x0: V_20MHZ 0x1: V_40MHZ 0x2: V_80MHZ Reset State: 0x0000
7	DIS_11MBPS	When set disables secondary antennae (i.e., all antennae except ant0) for 11 Mbps mode. Should be 1 (antennae disabled) for normal operation. 0x0: ENABLE 0x1: DISABLE Reset State: 0x0001
6	DIS_5MBPS	When set disables secondary antennae (i.e., all antennae except ant0) for 5.5 Mbps mode. Should be 1 (antennae disabled) for normal operation. 0x0: ENABLE 0x1: DISABLE Reset State: 0x0001
2	ANT_EN	4'bxxx0 -> none (No DAC/RF chains enabled) 4'bxxx1 -> zero (DAC/RF chain 0 enabled) This field defines which TX CHAINS (DAC and RF) are enabled in the waveform (test) mode of operation and also for packets that request the default TX enable configuration. Default 1'b1, i.e., Chain 0 enabled. Reset State: 0x0001
1	TEST_FILTER_SELECT	This bit selects the filter coefficients in the TX FIR when in test mode. Default 0 0x0: OFDM 0x1: V_11B Reset State: 0x0000
0	SELECT_FIRMODE	This bit selects the input to the TX FIR, 0=Normal, 1=WFM generator. Default 0 0x0: NORMAL 0x1: GENERATOR Reset State: 0x0000

0x3000004 TXCTL_RAMP_UP_11A

Type: read-write
Reset State: 0x004C

Specifies ramp up time for OFDM packets. Delay between RF enable and time that IQ waveform is presented on IQ outputs.

TXCTL_RAMP_UP_11A

Bits	Name	Description
9:0	TIMER	Specifies the time that the TX takes to ramp up before the base band data can be shifted into it. Measured in increments of 6.25 ns for Spica (12.5 ns for Libra) from 0 to 6.4 us (12.8us for Libra). Default 40, ie 0.25us in Gen5, 0.5uS in Libra 0x0: MIN 0x1: STEP 0x3FF: MAX Reset State: 0x004C

0x3000008 TXCTL_RAMP_UP_11B

Type: read-write
Reset State: 0x0024

Specifies ramp up time for 802.11b packets. Delay between RF enable and time that IQ waveform is presented on IQ outputs.

TXCTL_RAMP_UP_11B

Bits	Name	Description
9:0	TIMER	Specifies the time that the TX takes to ramp up before the base band data can be shifted into it. Measured in increments of 6.25 ns for Spica (12.5 ns for Libra) from 0 to 6.4 us (12.8us for Libra). Default 40, ie 0.25us in Gen5, 0.5uS in Libra 0x0: MIN 0x1: STEP 0x3FF: MAX Reset State: 0x0024

0x300000C TXCTL_RAMP_DOWN

Type: read-write
Reset State: 0x0050

Specifies ramp down time. Delay between end of IQ waveform and de-assertion of the RF enable to accommodate the delay through the DACs.

TXCTL_RAMP_DOWN

Bits	Name	Description
9:0	TIMER	Specifies the time that the TX takes to ramp up before the base band data can be shifted into it. Measured in increments of 6.25 ns for Spica (12.5 ns for Libra) from 0 to 6.4 us (12.8us for Libra). Default 80, ie 0.5us in Gen5, 1uS in Libra 0x0: MIN 0x1: STEP 0x3FF: MAX Reset State: 0x0050

0x3000010 TXCTL_TESTMUX_SELECT

Type: read-write
Reset State: 0x0000

Select the input of the test mux

TXCTL_TESTMUX_SELECT

Bits	Name	Description
8	TXFIRIN	0x1: CH0 Reset State: 0x0000
7:4	VIT	0x0: TXSM 0x1: TXCTL 0x2: TPCTXF 0x3: MPITXFA 0x4: MPITXFB 0x5: MPID 0x6: MPIV 0x7: TPC Reset State: 0x0000
2:0	DAT	0x0: DACIN 0x1: TXA 0x2: TXFIR 0x3: TPC 0x4: TXCTRL 0x5: TXCTL_MPI 0x6: MPI_TXCTL Reset State: 0x0000

0x3000014 TXCTL_DAC_CONTROL

Type: read-write
Reset State: 0x0001

This register controls DAC and RF enable signals such as standby and TX enables. Also, can control the DAC STANDBY and RF TX enable signals

TXCTL_DAC_CONTROL

Bits	Name	Description
9	TXEN_OVERRIDE_EN	0x0: NORMAL 0x1: OVERRIDE Reset State: 0x0000
8	DAC_OVERRIDE_EN	0x0: NORMAL 0x1: OVERRIDE Reset State: 0x0000
4	TXEN0_OVERRIDE_VAL	0x0: TXEN_OFF 0x1: TXEN_ON Reset State: 0x0000
0	CH0STDBY_OVERRIDE_VAL	0x0: DAC_ON 0x1: DAC_OFF Reset State: 0x0001

0x3000018 TXCTL_DAC_STDBY

Type: read-write
Reset State: 0x0181

This register controls the timing of DAC STANDBY signals

TXCTL_DAC_STDBY

Bits	Name	Description
8:0	TIMING	Each bit corresponds to one of the possible state of the TXCTL state machine. The states are as follows: Bit 0 = TXCTL_IDLE Bit 1 = TXCTL_RFWARM Bit 2 = TXCTL_START Bit 3 = reserved (unused) Bit 4 = TXCTL_RAMPUP Bit 5 = TXCTL_TX Bit 6 = TXCTL_SHUTOFF Bit 7 = TXCTL_TPC Bit 8 = TXCTL_OVERRIDE Reset State: 0x0181

0x300001C TXCTL_PLCP_OVERRIDE

Type: read-write
Reset State: 0x0000

This register contains an override mask and override values for HT-SIG fields.

TXCTL_PLCP_OVERRIDE

Bits	Name	Description
8:7	NESS	Override value for Ness field Reset State: 0x0000
6	RSVR	Override value for Reserved field Reset State: 0x0000
5	SOUND	Override value for Not-sounding field Reset State: 0x0000
4	SMOOTH	Override value for Smoothing field Reset State: 0x0000
3:0	MASK	Override mask for {Ness, Reserved, Not_sounding, Smoothing} fields Reset State: 0x0000

0x3000020 TXCTL_FSHIFT

Type: read-write
Reset State: 0x0017

When enabled, this register defines the value of the frequency shift applied to quarter and half-bandwidth packets. For instance, a 20MHz packet in an 80MHz channel is considered as a quarter-bandwidth packet and its frequency shift would be defined by the bw14 field. Similarly, the frequency shift for a 20MHz packet in a 40MHz channel or 40MHz packet in an 80MHz channel would be defined by the bw12 field

TXCTL_FSHIFT

Bits	Name	Description
4:2	BW14	0x0: ZERO 0x1: P10 0x2: P20 0x3: P30 0x4: RESERVED 0x5: M30 0x6: M20 0x7: M10 Reset State: 0x0005

TXCTL_FSHIFT (cont.)

Bits	Name	Description
1:0	BW12	0x0: ZERO 0x1: P20 0x2: RESERVED 0x3: M20 Reset State: 0x0003

0x3000024 TXCTL_ROTATION

Type: read-write
Reset State: 0xAAA5

Defines the phase rotation for each 20MHz subband

TXCTL_ROTATION

Bits	Name	Description
15:14	SB3_80V	Rotation value for subband 3 in VHT portion of 80MHz packets Reset State: 0x0002
13:12	SB3_80L	Rotation value for subband 3 in legacy portion of 80MHz packets Reset State: 0x0002
11:10	SB2_80V	Rotation value for subband 2 in VHT portion of 80MHz packets Reset State: 0x0002
9:8	SB2_80L	Rotation value for subband 2 in legacy portion of 80MHz packets Reset State: 0x0002
7:6	SB1_80V	Rotation value for subband 1 in VHT portion of 80MHz packets Reset State: 0x0002
5:4	SB1_80L	Rotation value for subband 1 in legacy portion of 80MHz packets Reset State: 0x0002
3:2	SB1_40V	Rotation value for subband 1 in VHT portion of 40MHz packets Reset State: 0x0001
1:0	SB1_40L	Rotation value for subband 1 in legacy portion of 40MHz packets 0x0: V_0 0x1: V_90 0x2: V_180 0x3: V_270 Reset State: 0x0001

0x3000028 TXCTL_SOFTRESET

Type: command
Reset State: 0x0000

Resets the PHY transmitter

TXCTL_SOFTRESET

Bits	Name	Description
0	RESET	When this register is written to with any value, a active high pulse is generated which will reset the whole of Phy Tx. Reset State: 0x0000

0x300002C TXCTL_WATCHDOG_START

Type: read-write
Reset State: 0x0000

Allowed time for state machine to remain in START state

TXCTL_WATCHDOG_START

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog. Reset State: 0x0000

0x3000030 TXCTL_WATCHDOG_RFWARM

Type: read-write
Reset State: 0x0009

Allowed time for state machine to remain in RFWARM state

TXCTL_WATCHDOG_RFWARM

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog. Reset State: 0x0009

0x3000034 TXCTL_WATCHDOG_RAMPUP

Type: read-write
Reset State: 0x0000

Allowed time for state machine to remain in RAMPUP state

TXCTL_WATCHDOG_RAMPUP

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog. Reset State: 0x0000

0x3000038 TXCTL_WATCHDOG_TX

Type: read-write
Reset State: 0x0000

Allowed time for state machine to remain in TX state

TXCTL_WATCHDOG_TX

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog. Reset State: 0x0000

0x300003C TXCTL_WATCHDOG_SHUTOFF

Type: read-write
Reset State: 0x0000

Allowed time for state machine to remain in SHUTOFF state

TXCTL_WATCHDOG_SHUTOFF

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog. Reset State: 0x0000

0x3000040 TXCTL_WATCHDOG_TPC

Type: read-write
Reset State: 0x0000

Allowed time for state machine to remain in TPC state

TXCTL_WATCHDOG_TPC

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog. Reset State: 0x0000

0x3000044 TXCTL_MAX_TXBUSY

Type: read-write
Reset State: 0x0000

Holds the max active duration of the txctl_mpi_txbusy signal (measured in 160MHz clock cycles) Default value of 0 disables the timeout event

TXCTL_MAX_TXBUSY

Bits	Name	Description
15:0	VALUE	Reset State: 0x0000

0x3000048 TXCTL_MAX_TXENB

Type: read-write
Reset State: 0x0000

Holds the max active duration of the RF TX enables (measured in 160MHz clock cycles) Default value of 0 disables the timeout event

TXCTL_MAX_TXENB

Bits	Name	Description
15:0	VALUE	Reset State: 0x0000

0x300004C TXCTL_TXBUSY_ALARM

Type: write-only

Counts number of TXBUSY timeout events

TXCTL_TXBUSY_ALARM

Bits	Name	Description
15:0	COUNT	

0x3000050 TXCTL_TXEN_ALARM

Type: write-only

Counts number of TXEN timeout events

TXCTL_TXEN_ALARM

Bits	Name	Description
15:0	COUNT	

0x3000054 TXCTL_TXCTL_STATE

Type: read-only

Stores last four states of the TXCTL state machine.

TXCTL_TXCTL_STATE

Bits	Name	Description
15:0	VALUE	Bits[15:12] = Previous (N-3) state Bits[11:8] = Previous (N-2) state Bits[7:4] = Previous (N-1) state Bits[3:0] = Current state

0x3000058 TXCTL_LAST_PKT_PARAMS1

Type: read-only

Stores the packet type, RATE field, Nss, BW mode and subband params for the last command word received.

TXCTL_LAST_PKT_PARAMS1

Bits	Name	Description
12:6	RATE	MCS Rate parameter
5:4	BANDWIDTH	Bandwidth mode parameter 00 = 20MHz packet 01 = 40MHz packet 10 = 80MHz packet 11 = Reserved
3	DUPLICATE	Subband duplicate parameter

TXCTL_LAST_PKT_PARAMS1 (cont.)

Bits	Name	Description
2:0	PKT_TYPE	Packet type parameter

0x300005C TXCTL_LAST_PKT_PACKET_LENGTH

Type: read-only

Stores the PACKET length parameter for the last command word received.

TXCTL_LAST_PKT_PACKET_LENGTH

Bits	Name	Description
15:0	VALUE	PACKET length parameter

0x3000060 TXCTL_LAST_PKT_LSIG_LENGTH

Type: read-only

Stores the LSIG length parameter for the last command word received.

TXCTL_LAST_PKT_LSIG_LENGTH

Bits	Name	Description
11:0	VALUE	LSIG length parameter

0x3000064 TXCTL_LAST_TX_POWER

Type: read-only

Stores the TX power parameter for the last command word received.

TXCTL_LAST_TX_POWER

Bits	Name	Description
4:0	VALUE	Packet TX power parameter

0x3000068 TXCTL_WATCHDOG_ALARM

Type: write-only

Counts number of WATCHDOG_ALARM abort pulses generated by the TXCTL module.

TXCTL_WATCHDOG_ALARM

Bits	Name	Description
15:0	COUNT	

0x300006C TXCTL_PKT_INVALID_ALARM

Type: write-only

Counts number of PKT_INVALID_ALARM abort pulses generated by the TXCTL module.

TXCTL_PKT_INVALID_ALARM

Bits	Name	Description
15:0	COUNT	

0x3000070 TXCTL_TXA_ABORT_ALARM

Type: write-only

Counts number of abort pulses generated by the TXA module.

TXCTL_TXA_ABORT_ALARM

Bits	Name	Description
15:0	COUNT	

0x3000074 TXCTL_LEGACY_PKTS

Type: write-only

Counts number of IEEE 802.11a packets transmitted.

TXCTL_LEGACY_PKTS

Bits	Name	Description
15:0	COUNT	Legacy packet counter.

0x3000078 TXCTL_GF_SIMO_20_PKTS

Type: write-only

Counts number of GF SIMO 20MHz packets transmitted.

TXCTL_GF_SIMO_20_PKTS

Bits	Name	Description
15:0	COUNT	GF SIMO 20MHz packet counter.

0x300007C TXCTL_GF_SIMO_40_PKTS

Type: write-only

Counts number of GF SIMO 40MHz packets transmitted.

TXCTL_GF_SIMO_40_PKTS

Bits	Name	Description
15:0	COUNT	GF SIMO 40MHz packet counter.

0x3000080 TXCTL_MM_SIMO_20_PKTS

Type: write-only

Counts number of mixed-mode SIMO 20MHz packets transmitted.

TXCTL_MM_SIMO_20_PKTS

Bits	Name	Description
15:0	COUNT	mixed-mode SIMO 20MHz packet counter.

0x3000084 TXCTL_MM_SIMO_40_PKTS

Type: write-only

Counts number of mixed-mode SIMO 40MHz packets transmitted.

TXCTL_MM_SIMO_40_PKTS

Bits	Name	Description
15:0	COUNT	mixed-mode SIMO 40MHz packet counter.

0x3000088 TXCTL_AC_SIMO_20_PKTS

Type: write-only

Counts number of 11ac SIMO 20MHz packets transmitted.

TXCTL_AC_SIMO_20_PKTS

Bits	Name	Description
15:0	COUNT	11ac SIMO 20MHz packet counter.

0x300008C TXCTL_AC_SIMO_40_PKTS

Type: write-only

Counts number of 11ac SIMO 40MHz packets transmitted.

TXCTL_AC_SIMO_40_PKTS

Bits	Name	Description
15:0	COUNT	11ac SIMO 40MHz packet counter.

0x3000090 TXCTL_AC_SIMO_80_PKTS

Type: write-only

Counts number of 11ac SIMO 80MHz packets transmitted.

TXCTL_AC_SIMO_80_PKTS

Bits	Name	Description
15:0	COUNT	11ac SIMO 80MHz packet counter.

0x3000094 TXCTL_TXB_SHORT_PKTS

Type: write-only

Counts number of TXB packets with short preamble transmitted.

TXCTL_TXB_SHORT_PKTS

Bits	Name	Description
15:0	COUNT	TXB short packet counter.

0x3000098 TXCTL_TXB_LONG_PKTS

Type: write-only

Counts number of TXB packets with long preamble transmitted.

TXCTL_TXB_LONG_PKTS

Bits	Name	Description
15:0	COUNT	TXB long packet counter.

0x300009C TXCTL_TXFIR_DONE

Type: write-only

Counts the number of packets completed at output of TXFIR.

TXCTL_TXFIR_DONE

Bits	Name	Description
15:0	COUNT	TXFIR done event counter

0x30000A0 TXCTL_MISSING_WARMUP

Type: write-only

Counts the number of packets that are initiated by TXP start pulse rather than the assertion of the TXP RF warmup flag.

TXCTL_MISSING_WARMUP

Bits	Name	Description
15:0	COUNT	Missing RF warmup flag event counter

0x30000A4 TXCTL_ALARMS

Type: read-only
Reset State: 0x0000

Monitor of all contributors to TXA abort

TXCTL_ALARMS

Bits	Name	Description
6:0	VALUE	Bit[0] = TXCTL watchdog timed out Bit[1] = Incorrect bandwidth field in command word Bit[2] = Invalid 11b packet parameters error Bit[3] = TX enable not asserted during active transmission Bit[4] = RF_WARMUP signal not asserted for sufficient length of time Bit[5] = Abort received from TACTL Bit[6] = Abort received from MPI Reset State: 0x0000

0x30000A8 TXCTL_RESET_ALARMS

Type: command
Reset State: 0x0000

Resets the alarm flags

TXCTL_RESET_ALARMS

Bits	Name	Description
0	RESET_ALARMS	When this register is written to with any value, a active high pulse is generated which will reset all alarm flags in the TACTL alarms register. Reset State: 0x0000

16.2.32 txfir

0x3000000 TXFIR_CFG

Type: read-write
Reset State: 0x003E

Sets the various modes for the Tx-FIR

TXFIR_CFG

Bits	Name	Description
5	PEAK_BYPASS_OVERRIDE_EN	When this field is set, dynamic bypass of the smart clipping logic will be disabled (low power) and the peak_bypass field will be used to either statically bypass or not bypass this logic Reset State: 0x0001
4	PEAK_BYPASS	When this field is set, the smart clipping logic is bypassed (as long as the peak_bypass_override_en field is also set) Reset State: 0x0001
3	DPD_BYPASS	When this field is set, the digital pre-distorter logic is bypassed Reset State: 0x0001
2	LOLEAKAGE_BYPASS	When this field is set, the LO leakage correction logic is bypassed Reset State: 0x0001
1	IQIMB_BYPASS	When this field is set, the IQ imbalance correction logic is bypassed Reset State: 0x0001
0	CHAIN0FIRBYPASS	When set bypasses the upsampling and filtering for chain 0 The output of the actual filter is 12-bits and hence drops the LSB of the inputs to present 9-bits at the output Reset State: 0x0000

0x3000004 TXFIR_LOLEAKAGE_SHIFT

Type: read-write
Reset State: 0x0000

This register defines the number of left shifts applied to the LO leakage value derived from the gain-based look-up table in the TXFIR

TXFIR_LOLEAKAGE_SHIFT

Bits	Name	Description
1:0	CH0	Reset State: 0x0000

0x300000C TXFIR_COEFF_QUARTER_0

Type: read-write
Reset State: 0x0099

2's complement 10-bit OFDM quarter-band FIR coefficient 0

TXFIR_COEFF_QUARTER_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0099

0x3000010 TXFIR_COEFF_QUARTER_1

Type: read-write
Reset State: 0x006D

2's complement 10-bit OFDM quarter-band FIR coefficient 1

TXFIR_COEFF_QUARTER_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x006D

0x3000014 TXFIR_COEFF_QUARTER_2

Type: read-write
Reset State: 0x0099

2's complement 10-bit OFDM quarter-band FIR coefficient 2

TXFIR_COEFF_QUARTER_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0099

0x3000018 TXFIR_COEFF_QUARTER_3

Type: read-write
Reset State: 0x03A9

2's complement 10-bit OFDM quarter-band FIR coefficient 3

TXFIR_COEFF_QUARTER_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03A9

0x300001C TXFIR_COEFF_QUARTER_4

Type: read-write
Reset State: 0x0035

2's complement 10-bit OFDM quarter-band FIR coefficient 4

TXFIR_COEFF_QUARTER_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0035

0x3000020 TXFIR_COEFF_QUARTER_5

Type: read-write
Reset State: 0x002C

2's complement 10-bit OFDM quarter-band FIR coefficient 5

TXFIR_COEFF_QUARTER_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x002C

0x3000024 TXFIR_COEFF_QUARTER_6

Type: read-write
Reset State: 0x007D

2's complement 10-bit OFDM quarter-band FIR coefficient 6

TXFIR_COEFF_QUARTER_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x007D

0x3000028 TXFIR_COEFF_QUARTER_7

Type: read-write
Reset State: 0x0050

2's complement 10-bit OFDM quarter-band FIR coefficient 7

TXFIR_COEFF_QUARTER_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0050

0x300002C TXFIR_COEFF_QUARTER_8

Type: read-write
Reset State: 0x0047

2's complement 10-bit OFDM quarter-band FIR coefficient 8

TXFIR_COEFF_QUARTER_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0047

0x3000030 TXFIR_COEFF_QUARTER_9

Type: read-write
Reset State: 0x006F

2's complement 10-bit OFDM quarter-band FIR coefficient 9

TXFIR_COEFF_QUARTER_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x006F

0x3000034 TXFIR_COEFF_QUARTER_10

Type: read-write
Reset State: 0x0051

2's complement 10-bit OFDM quarter-band FIR coefficient 10

TXFIR_COEFF_QUARTER_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0051

0x3000038 TXFIR_COEFF_QUARTER_11

Type: read-write
Reset State: 0x004C

2's complement 10-bit OFDM quarter-band FIR coefficient 11

TXFIR_COEFF_QUARTER_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x004C

0x300003C TXFIR_COEFF_QUARTER_12

Type: read-write
Reset State: 0x0057

2's complement 10-bit OFDM quarter-band FIR coefficient 12

TXFIR_COEFF_QUARTER_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0057

0x3000040 TXFIR_COEFF_QUARTER_13

Type: read-write
Reset State: 0x004A

2's complement 10-bit OFDM quarter-band FIR coefficient 13

TXFIR_COEFF_QUARTER_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x004A

0x3000044 TXFIR_COEFF_QUARTER_14

Type: read-write
Reset State: 0x0047

2's complement 10-bit OFDM quarter-band FIR coefficient 14

TXFIR_COEFF_QUARTER_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0047

0x3000048 TXFIR_COEFF_QUARTER_15

Type: read-write
Reset State: 0x0041

2's complement 10-bit OFDM quarter-band FIR coefficient 15

TXFIR_COEFF_QUARTER_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0041

0x300004C TXFIR_COEFF_QUARTER_16

Type: read-write
Reset State: 0x003E

2's complement 10-bit OFDM quarter-band FIR coefficient 16

TXFIR_COEFF_QUARTER_16

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x003E

0x3000050 TXFIR_COEFF_QUARTER_17

Type: read-write
Reset State: 0x003C

2's complement 10-bit OFDM quarter-band FIR coefficient 17

TXFIR_COEFF_QUARTER_17

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x003C

0x3000054 TXFIR_COEFF_QUARTER_18

Type: read-write
Reset State: 0x002D

2's complement 10-bit OFDM quarter-band FIR coefficient 18

TXFIR_COEFF_QUARTER_18

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x002D

0x3000058 TXFIR_COEFF_QUARTER_19

Type: read-write
Reset State: 0x002D

2's complement 10-bit OFDM quarter-band FIR coefficient 19

TXFIR_COEFF_QUARTER_19

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x002D

0x300005C TXFIR_COEFF_QUARTER_20

Type: read-write
Reset State: 0x0027

2's complement 10-bit OFDM quarter-band FIR coefficient 20

TXFIR_COEFF_QUARTER_20

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0027

0x3000060 TXFIR_COEFF_QUARTER_21

Type: read-write
Reset State: 0x0017

2's complement 10-bit OFDM quarter-band FIR coefficient 21

TXFIR_COEFF_QUARTER_21

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0017

0x3000064 TXFIR_COEFF_QUARTER_22

Type: read-write
Reset State: 0x0014

2's complement 10-bit OFDM quarter-band FIR coefficient 22

TXFIR_COEFF_QUARTER_22

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0014

0x3000068 TXFIR_COEFF_QUARTER_23

Type: read-write
Reset State: 0x000C

2's complement 10-bit OFDM quarter-band FIR coefficient 23

TXFIR_COEFF_QUARTER_23

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x000C

0x300006C TXFIR_COEFF_QUARTER_24

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 24

TXFIR_COEFF_QUARTER_24

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000070 TXFIR_COEFF_QUARTER_25

Type: read-write
Reset State: 0x03FC

2's complement 10-bit OFDM quarter-band FIR coefficient 25

TXFIR_COEFF_QUARTER_25

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03FC

0x3000074 TXFIR_COEFF_QUARTER_26

Type: read-write
Reset State: 0x03F9

2's complement 10-bit OFDM quarter-band FIR coefficient 26

TXFIR_COEFF_QUARTER_26

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03F9

0x3000078 TXFIR_COEFF_QUARTER_27

Type: read-write
Reset State: 0x03F8

2's complement 10-bit OFDM quarter-band FIR coefficient 27

TXFIR_COEFF_QUARTER_27

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03F8

0x300007C TXFIR_COEFF_QUARTER_28

Type: read-write
Reset State: 0x03F7

2's complement 10-bit OFDM quarter-band FIR coefficient 28

TXFIR_COEFF_QUARTER_28

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03F7

0x3000080 TXFIR_COEFF_QUARTER_29

Type: read-write
Reset State: 0x03F8

2's complement 10-bit OFDM quarter-band FIR coefficient 29

TXFIR_COEFF_QUARTER_29

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03F8

0x3000084 TXFIR_COEFF_QUARTER_30

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 30

TXFIR_COEFF_QUARTER_30

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000088 TXFIR_COEFF_QUARTER_31

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 31

TXFIR_COEFF_QUARTER_31

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300008C TXFIR_COEFF_QUARTER_32

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 32

TXFIR_COEFF_QUARTER_32

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000090 TXFIR_COEFF_QUARTER_33

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 33

TXFIR_COEFF_QUARTER_33

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000094 TXFIR_COEFF_QUARTER_34

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 34

TXFIR_COEFF_QUARTER_34

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000098 TXFIR_COEFF_QUARTER_35

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 35

TXFIR_COEFF_QUARTER_35

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300009C TXFIR_COEFF_QUARTER_36

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 36

TXFIR_COEFF_QUARTER_36

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30000A0 TXFIR_COEFF_QUARTER_37

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 37

TXFIR_COEFF_QUARTER_37

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30000A4 TXFIR_COEFF_QUARTER_38

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 38

TXFIR_COEFF_QUARTER_38

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30000A8 TXFIR_COEFF_QUARTER_39

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 39

TXFIR_COEFF_QUARTER_39

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30000AC TXFIR_COEFF_QUARTER_40

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 40

TXFIR_COEFF_QUARTER_40

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30000B0 TXFIR_COEFF_QUARTER_41

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 41

TXFIR_COEFF_QUARTER_41

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30000B4 TXFIR_COEFF_HALF_0

Type: read-write
Reset State: 0x003D

2's complement 10-bit OFDM half-band FIR coefficient 0

TXFIR_COEFF_HALF_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x003D

0x30000B8 TXFIR_COEFF_HALF_1

Type: read-write
Reset State: 0x0052

2's complement 10-bit OFDM half-band FIR coefficient 1

TXFIR_COEFF_HALF_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0052

0x30000BC TXFIR_COEFF_HALF_2

Type: read-write
Reset State: 0x009B

2's complement 10-bit OFDM half-band FIR coefficient 2

TXFIR_COEFF_HALF_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x009B

0x30000C0 TXFIR_COEFF_HALF_3

Type: read-write
Reset State: 0x005A

2's complement 10-bit OFDM half-band FIR coefficient 3

TXFIR_COEFF_HALF_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x005A

0x30000C4 TXFIR_COEFF_HALF_4

Type: read-write
Reset State: 0x0095

2's complement 10-bit OFDM half-band FIR coefficient 4

TXFIR_COEFF_HALF_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0095

0x30000C8 TXFIR_COEFF_HALF_5

Type: read-write
Reset State: 0x006B

2's complement 10-bit OFDM half-band FIR coefficient 5

TXFIR_COEFF_HALF_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x006B

0x30000CC TXFIR_COEFF_HALF_6

Type: read-write
Reset State: 0x00BF

2's complement 10-bit OFDM half-band FIR coefficient 6

TXFIR_COEFF_HALF_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x00BF

0x30000D0 TXFIR_COEFF_HALF_7

Type: read-write
Reset State: 0x0094

2's complement 10-bit OFDM half-band FIR coefficient 7

TXFIR_COEFF_HALF_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0094

0x30000D4 TXFIR_COEFF_HALF_8

Type: read-write
Reset State: 0x009B

2's complement 10-bit OFDM half-band FIR coefficient 8

TXFIR_COEFF_HALF_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x009B

0x30000D8 TXFIR_COEFF_HALF_9

Type: read-write
Reset State: 0x0085

2's complement 10-bit OFDM half-band FIR coefficient 9

TXFIR_COEFF_HALF_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0085

0x30000DC TXFIR_COEFF_HALF_10

Type: read-write
Reset State: 0x007A

2's complement 10-bit OFDM half-band FIR coefficient 10

TXFIR_COEFF_HALF_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x007A

0x30000E0 TXFIR_COEFF_HALF_11

Type: read-write
Reset State: 0x0071

2's complement 10-bit OFDM half-band FIR coefficient 11

TXFIR_COEFF_HALF_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0071

0x30000E4 TXFIR_COEFF_HALF_12

Type: read-write
Reset State: 0x0038

2's complement 10-bit OFDM half-band FIR coefficient 12

TXFIR_COEFF_HALF_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0038

0x30000E8 TXFIR_COEFF_HALF_13

Type: read-write
Reset State: 0x0027

2's complement 10-bit OFDM half-band FIR coefficient 13

TXFIR_COEFF_HALF_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0027

0x30000EC TXFIR_COEFF_HALF_14

Type: read-write
Reset State: 0x0025

2's complement 10-bit OFDM half-band FIR coefficient 14

TXFIR_COEFF_HALF_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0025

0x30000F0 TXFIR_COEFF_HALF_15

Type: read-write
Reset State: 0x001F

2's complement 10-bit OFDM half-band FIR coefficient 15

TXFIR_COEFF_HALF_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x001F

0x30000F4 TXFIR_COEFF_HALF_16

Type: read-write
Reset State: 0x000B

2's complement 10-bit OFDM half-band FIR coefficient 16

TXFIR_COEFF_HALF_16

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x000B

0x30000F8 TXFIR_COEFF_HALF_17

Type: read-write
Reset State: 0x03C9

2's complement 10-bit OFDM half-band FIR coefficient 17

TXFIR_COEFF_HALF_17

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03C9

0x30000FC TXFIR_COEFF_HALF_18

Type: read-write
Reset State: 0x03D0

2's complement 10-bit OFDM half-band FIR coefficient 18

TXFIR_COEFF_HALF_18

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03D0

0x3000100 TXFIR_COEFF_HALF_19

Type: read-write
Reset State: 0x03D8

2's complement 10-bit OFDM half-band FIR coefficient 19

TXFIR_COEFF_HALF_19

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03D8

0x3000104 TXFIR_COEFF_HALF_20

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 20

TXFIR_COEFF_HALF_20

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000108 TXFIR_COEFF_HALF_21

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 21

TXFIR_COEFF_HALF_21

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300010C TXFIR_COEFF_HALF_22

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 22

TXFIR_COEFF_HALF_22

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000110 TXFIR_COEFF_HALF_23

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 23

TXFIR_COEFF_HALF_23

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000114 TXFIR_COEFF_HALF_24

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 24

TXFIR_COEFF_HALF_24

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000118 TXFIR_COEFF_HALF_25

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 25

TXFIR_COEFF_HALF_25

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300011C TXFIR_COEFF_HALF_26

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 26

TXFIR_COEFF_HALF_26

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000120 TXFIR_COEFF_HALF_27

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 27

TXFIR_COEFF_HALF_27

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000124 TXFIR_COEFF_HALF_28

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 28

TXFIR_COEFF_HALF_28

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000128 TXFIR_COEFF_HALF_29

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 29

TXFIR_COEFF_HALF_29

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300012C TXFIR_COEFF_HALF_30

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 30

TXFIR_COEFF_HALF_30

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000130 TXFIR_COEFF_HALF_31

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 31

TXFIR_COEFF_HALF_31

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000134 TXFIR_COEFF_HALF_32

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 32

TXFIR_COEFF_HALF_32

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000138 TXFIR_COEFF_HALF_33

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 33

TXFIR_COEFF_HALF_33

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300013C TXFIR_COEFF_HALF_34

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 34

TXFIR_COEFF_HALF_34

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000140 TXFIR_COEFF_HALF_35

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 35

TXFIR_COEFF_HALF_35

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000144 TXFIR_COEFF_HALF_36

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 36

TXFIR_COEFF_HALF_36

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000148 TXFIR_COEFF_HALF_37

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 37

TXFIR_COEFF_HALF_37

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300014C TXFIR_COEFF_HALF_38

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 38

TXFIR_COEFF_HALF_38

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000150 TXFIR_COEFF_HALF_39

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 39

TXFIR_COEFF_HALF_39

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000154 TXFIR_COEFF_HALF_40

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 40

TXFIR_COEFF_HALF_40

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000158 TXFIR_COEFF_HALF_41

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 41

TXFIR_COEFF_HALF_41

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300015C TXFIR_COEFF_FULL_0

Type: read-write
Reset State: 0x0030

2's complement 10-bit OFDM full-band FIR coefficient 0

TXFIR_COEFF_FULL_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0030

0x3000160 TXFIR_COEFF_FULL_1

Type: read-write
Reset State: 0x0072

2's complement 10-bit OFDM full-band FIR coefficient 1

TXFIR_COEFF_FULL_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0072

0x3000164 TXFIR_COEFF_FULL_2

Type: read-write
Reset State: 0x00E2

2's complement 10-bit OFDM full-band FIR coefficient 2

TXFIR_COEFF_FULL_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x00E2

0x3000168 TXFIR_COEFF_FULL_3

Type: read-write
Reset State: 0x0104

2's complement 10-bit OFDM full-band FIR coefficient 3

TXFIR_COEFF_FULL_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0104

0x300016C TXFIR_COEFF_FULL_4

Type: read-write
Reset State: 0x0126

2's complement 10-bit OFDM full-band FIR coefficient 4

TXFIR_COEFF_FULL_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0126

0x3000170 TXFIR_COEFF_FULL_5

Type: read-write
Reset State: 0x00EB

2's complement 10-bit OFDM full-band FIR coefficient 5

TXFIR_COEFF_FULL_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x00EB

0x3000174 TXFIR_COEFF_FULL_6

Type: read-write
Reset State: 0x00F4

2's complement 10-bit OFDM full-band FIR coefficient 6

TXFIR_COEFF_FULL_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x00F4

0x3000178 TXFIR_COEFF_FULL_7

Type: read-write
Reset State: 0x00A8

2's complement 10-bit OFDM full-band FIR coefficient 7

TXFIR_COEFF_FULL_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x00A8

0x300017C TXFIR_COEFF_FULL_8

Type: read-write
Reset State: 0x0086

2's complement 10-bit OFDM full-band FIR coefficient 8

TXFIR_COEFF_FULL_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0086

0x3000180 TXFIR_COEFF_FULL_9

Type: read-write
Reset State: 0x0004

2's complement 10-bit OFDM full-band FIR coefficient 9

TXFIR_COEFF_FULL_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0004

0x3000184 TXFIR_COEFF_FULL_10

Type: read-write
Reset State: 0x03D3

2's complement 10-bit OFDM full-band FIR coefficient 10

TXFIR_COEFF_FULL_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03D3

0x3000188 TXFIR_COEFF_FULL_11

Type: read-write
Reset State: 0x039A

2's complement 10-bit OFDM full-band FIR coefficient 11

TXFIR_COEFF_FULL_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x039A

0x300018C TXFIR_COEFF_FULL_12

Type: read-write
Reset State: 0x03B8

2's complement 10-bit OFDM full-band FIR coefficient 12

TXFIR_COEFF_FULL_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03B8

0x3000190 TXFIR_COEFF_FULL_13

Type: read-write
Reset State: 0x03C0

2's complement 10-bit OFDM full-band FIR coefficient 13

TXFIR_COEFF_FULL_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03C0

0x3000194 TXFIR_COEFF_FULL_14

Type: read-write
Reset State: 0x03E6

2's complement 10-bit OFDM full-band FIR coefficient 14

TXFIR_COEFF_FULL_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03E6

0x3000198 TXFIR_COEFF_FULL_15

Type: read-write
Reset State: 0x0002

2's complement 10-bit OFDM full-band FIR coefficient 15

TXFIR_COEFF_FULL_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0002

0x300019C TXFIR_COEFF_FULL_16

Type: read-write
Reset State: 0x0020

2's complement 10-bit OFDM full-band FIR coefficient 16

TXFIR_COEFF_FULL_16

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0020

0x30001A0 TXFIR_COEFF_FULL_17

Type: read-write
Reset State: 0x002B

2's complement 10-bit OFDM full-band FIR coefficient 17

TXFIR_COEFF_FULL_17

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x002B

0x30001A4 TXFIR_COEFF_FULL_18

Type: read-write
Reset State: 0x001C

2's complement 10-bit OFDM full-band FIR coefficient 18

TXFIR_COEFF_FULL_18

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x001C

0x30001A8 TXFIR_COEFF_FULL_19

Type: read-write
Reset State: 0x000B

2's complement 10-bit OFDM full-band FIR coefficient 19

TXFIR_COEFF_FULL_19

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x000B

0x30001AC TXFIR_COEFF_FULL_20

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 20

TXFIR_COEFF_FULL_20

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001B0 TXFIR_COEFF_FULL_21

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 21

TXFIR_COEFF_FULL_21

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001B4 TXFIR_COEFF_FULL_22

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 22

TXFIR_COEFF_FULL_22

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001B8 TXFIR_COEFF_FULL_23

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 23

TXFIR_COEFF_FULL_23

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001BC TXFIR_COEFF_FULL_24

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 24

TXFIR_COEFF_FULL_24

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001C0 TXFIR_COEFF_FULL_25

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 25

TXFIR_COEFF_FULL_25

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001C4 TXFIR_COEFF_FULL_26

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 26

TXFIR_COEFF_FULL_26

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001C8 TXFIR_COEFF_FULL_27

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 27

TXFIR_COEFF_FULL_27

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001CC TXFIR_COEFF_FULL_28

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 28

TXFIR_COEFF_FULL_28

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001D0 TXFIR_COEFF_FULL_29

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 29

TXFIR_COEFF_FULL_29

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001D4 TXFIR_COEFF_FULL_30

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 30

TXFIR_COEFF_FULL_30

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001D8 TXFIR_COEFF_FULL_31

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 31

TXFIR_COEFF_FULL_31

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001DC TXFIR_COEFF_FULL_32

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 32

TXFIR_COEFF_FULL_32

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001E0 TXFIR_COEFF_FULL_33

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 33

TXFIR_COEFF_FULL_33

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001E4 TXFIR_COEFF_FULL_34

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 34

TXFIR_COEFF_FULL_34

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001E8 TXFIR_COEFF_FULL_35

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 35

TXFIR_COEFF_FULL_35

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001EC TXFIR_COEFF_FULL_36

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 36

TXFIR_COEFF_FULL_36

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001F0 TXFIR_COEFF_FULL_37

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 37

TXFIR_COEFF_FULL_37

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001F4 TXFIR_COEFF_FULL_38

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 38

TXFIR_COEFF_FULL_38

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001F8 TXFIR_COEFF_FULL_39

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 39

TXFIR_COEFF_FULL_39

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30001FC TXFIR_COEFF_FULL_40

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 40

TXFIR_COEFF_FULL_40

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000200 TXFIR_COEFF_FULL_41

Type: read-write
Reset State: 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 41

TXFIR_COEFF_FULL_41

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000204 TXFIR_COEFF_TXB_20_0

Type: read-write
Reset State: 0x0014

2's complement 10-bit Tx-B FIR20 coefficient 0

TXFIR_COEFF_TXB_20_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0014

0x3000208 TXFIR_COEFF_TXB_20_1

Type: read-write
Reset State: 0x003D

2's complement 10-bit Tx-B FIR20 coefficient 1

TXFIR_COEFF_TXB_20_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x003D

0x300020C TXFIR_COEFF_TXB_20_2

Type: read-write
Reset State: 0x007A

2's complement 10-bit Tx-B FIR20 coefficient 2

TXFIR_COEFF_TXB_20_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x007A

0x3000210 TXFIR_COEFF_TXB_20_3

Type: read-write
Reset State: 0x00C2

2's complement 10-bit Tx-B FIR20 coefficient 3

TXFIR_COEFF_TXB_20_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x00C2

0x3000214 TXFIR_COEFF_TXB_20_4

Type: read-write
Reset State: 0x00FD

2's complement 10-bit Tx-B FIR20 coefficient 4

TXFIR_COEFF_TXB_20_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x00FD

0x3000218 TXFIR_COEFF_TXB_20_5

Type: read-write
Reset State: 0x0114

2's complement 10-bit Tx-B FIR20 coefficient 5

TXFIR_COEFF_TXB_20_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0114

0x300021C TXFIR_COEFF_TXB_20_6

Type: read-write
Reset State: 0x00FD

2's complement 10-bit Tx-B FIR20 coefficient 6

TXFIR_COEFF_TXB_20_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x00FD

0x3000220 TXFIR_COEFF_TXB_20_7

Type: read-write
Reset State: 0x00BF

2's complement 10-bit Tx-B FIR20 coefficient 7

TXFIR_COEFF_TXB_20_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x00BF

0x3000224 TXFIR_COEFF_TXB_20_8

Type: read-write
Reset State: 0x0072

2's complement 10-bit Tx-B FIR20 coefficient 8

TXFIR_COEFF_TXB_20_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0072

0x3000228 TXFIR_COEFF_TXB_20_9

Type: read-write
Reset State: 0x0030

2's complement 10-bit Tx-B FIR20 coefficient 9

TXFIR_COEFF_TXB_20_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0030

0x300022C TXFIR_COEFF_TXB_20_10

Type: read-write
Reset State: 0x000A

2's complement 10-bit Tx-B FIR20 coefficient 10

TXFIR_COEFF_TXB_20_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x000A

0x3000230 TXFIR_COEFF_TXB_20_11

Type: read-write
Reset State: 0x03FA

2's complement 10-bit Tx-B FIR20 coefficient 11

TXFIR_COEFF_TXB_20_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03FA

0x3000234 TXFIR_COEFF_TXB_20_12

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR20 coefficient 12

TXFIR_COEFF_TXB_20_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000238 TXFIR_COEFF_TXB_20_13

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR20 coefficient 13

TXFIR_COEFF_TXB_20_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300023C TXFIR_COEFF_TXB_20_14

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR20 coefficient 14

TXFIR_COEFF_TXB_20_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000240 TXFIR_COEFF_TXB_20_15

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR20 coefficient 15

TXFIR_COEFF_TXB_20_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000244 TXFIR_COEFF_TXB_40_0

Type: read-write
Reset State: 0x0008

2's complement 10-bit Tx-B FIR40 coefficient 0

TXFIR_COEFF_TXB_40_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0008

0x3000248 TXFIR_COEFF_TXB_40_1

Type: read-write
Reset State: 0x000E

2's complement 10-bit Tx-B FIR40 coefficient 1

TXFIR_COEFF_TXB_40_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x000E

0x300024C TXFIR_COEFF_TXB_40_2

Type: read-write
Reset State: 0x0018

2's complement 10-bit Tx-B FIR40 coefficient 2

TXFIR_COEFF_TXB_40_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0018

0x3000250 TXFIR_COEFF_TXB_40_3

Type: read-write
Reset State: 0x0025

2's complement 10-bit Tx-B FIR40 coefficient 3

TXFIR_COEFF_TXB_40_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0025

0x3000254 TXFIR_COEFF_TXB_40_4

Type: read-write
Reset State: 0x0035

2's complement 10-bit Tx-B FIR40 coefficient 4

TXFIR_COEFF_TXB_40_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0035

0x3000258 TXFIR_COEFF_TXB_40_5

Type: read-write
Reset State: 0x0046

2's complement 10-bit Tx-B FIR40 coefficient 5

TXFIR_COEFF_TXB_40_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0046

0x300025C TXFIR_COEFF_TXB_40_6

Type: read-write
Reset State: 0x0058

2's complement 10-bit Tx-B FIR40 coefficient 6

TXFIR_COEFF_TXB_40_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0058

0x3000260 TXFIR_COEFF_TXB_40_7

Type: read-write
Reset State: 0x0069

2's complement 10-bit Tx-B FIR40 coefficient 7

TXFIR_COEFF_TXB_40_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0069

0x3000264 TXFIR_COEFF_TXB_40_8

Type: read-write
Reset State: 0x0078

2's complement 10-bit Tx-B FIR40 coefficient 8

TXFIR_COEFF_TXB_40_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0078

0x3000268 TXFIR_COEFF_TXB_40_9

Type: read-write
Reset State: 0x0083

2's complement 10-bit Tx-B FIR40 coefficient 9

TXFIR_COEFF_TXB_40_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0083

0x300026C TXFIR_COEFF_TXB_40_10

Type: read-write
Reset State: 0x0089

2's complement 10-bit Tx-B FIR40 coefficient 10

TXFIR_COEFF_TXB_40_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0089

0x3000270 TXFIR_COEFF_TXB_40_11

Type: read-write
Reset State: 0x0089

2's complement 10-bit Tx-B FIR40 coefficient 11

TXFIR_COEFF_TXB_40_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0089

0x3000274 TXFIR_COEFF_TXB_40_12

Type: read-write
Reset State: 0x0083

2's complement 10-bit Tx-B FIR40 coefficient 12

TXFIR_COEFF_TXB_40_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0083

0x3000278 TXFIR_COEFF_TXB_40_13

Type: read-write
Reset State: 0x0078

2's complement 10-bit Tx-B FIR40 coefficient 13

TXFIR_COEFF_TXB_40_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0078

0x300027C TXFIR_COEFF_TXB_40_14

Type: read-write
Reset State: 0x0069

2's complement 10-bit Tx-B FIR40 coefficient 14

TXFIR_COEFF_TXB_40_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0069

0x3000280 TXFIR_COEFF_TXB_40_15

Type: read-write
Reset State: 0x0056

2's complement 10-bit Tx-B FIR40 coefficient 15

TXFIR_COEFF_TXB_40_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0056

0x3000284 TXFIR_COEFF_TXB_40_16

Type: read-write
Reset State: 0x0043

2's complement 10-bit Tx-B FIR40 coefficient 16

TXFIR_COEFF_TXB_40_16

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0043

0x3000288 TXFIR_COEFF_TXB_40_17

Type: read-write
Reset State: 0x0030

2's complement 10-bit Tx-B FIR40 coefficient 17

TXFIR_COEFF_TXB_40_17

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0030

0x300028C TXFIR_COEFF_TXB_40_18

Type: read-write
Reset State: 0x001F

2's complement 10-bit Tx-B FIR40 coefficient 18

TXFIR_COEFF_TXB_40_18

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x001F

0x3000290 TXFIR_COEFF_TXB_40_19

Type: read-write
Reset State: 0x0012

2's complement 10-bit Tx-B FIR40 coefficient 19

TXFIR_COEFF_TXB_40_19

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0012

0x3000294 TXFIR_COEFF_TXB_40_20

Type: read-write
Reset State: 0x0008

2's complement 10-bit Tx-B FIR40 coefficient 20

TXFIR_COEFF_TXB_40_20

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0008

0x3000298 TXFIR_COEFF_TXB_40_21

Type: read-write
Reset State: 0x0002

2's complement 10-bit Tx-B FIR40 coefficient 21

TXFIR_COEFF_TXB_40_21

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0002

0x300029C TXFIR_COEFF_TXB_40_22

Type: read-write
Reset State: 0x03FF

2's complement 10-bit Tx-B FIR40 coefficient 22

TXFIR_COEFF_TXB_40_22

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03FF

0x30002A0 TXFIR_COEFF_TXB_40_23

Type: read-write
Reset State: 0x03FB

2's complement 10-bit Tx-B FIR40 coefficient 23

TXFIR_COEFF_TXB_40_23

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03FB

0x30002A4 TXFIR_COEFF_TXB_40_24

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 24

TXFIR_COEFF_TXB_40_24

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30002A8 TXFIR_COEFF_TXB_40_25

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 25

TXFIR_COEFF_TXB_40_25

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30002AC TXFIR_COEFF_TXB_40_26

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 26

TXFIR_COEFF_TXB_40_26

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30002B0 TXFIR_COEFF_TXB_40_27

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 27

TXFIR_COEFF_TXB_40_27

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30002B4 TXFIR_COEFF_TXB_40_28

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 28

TXFIR_COEFF_TXB_40_28

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30002B8 TXFIR_COEFF_TXB_40_29

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 29

TXFIR_COEFF_TXB_40_29

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30002BC TXFIR_COEFF_TXB_40_30

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 30

TXFIR_COEFF_TXB_40_30

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30002C0 TXFIR_COEFF_TXB_40_31

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 31

TXFIR_COEFF_TXB_40_31

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30002C4 TXFIR_COEFF_TXB_80_0

Type: read-write
Reset State: 0x0005

2's complement 10-bit Tx-B FIR80 coefficient 0

TXFIR_COEFF_TXB_80_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0005

0x30002C8 TXFIR_COEFF_TXB_80_1

Type: read-write
Reset State: 0x0005

2's complement 10-bit Tx-B FIR80 coefficient 1

TXFIR_COEFF_TXB_80_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0005

0x30002CC TXFIR_COEFF_TXB_80_2

Type: read-write
Reset State: 0x0006

2's complement 10-bit Tx-B FIR80 coefficient 2

TXFIR_COEFF_TXB_80_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0006

0x30002D0 TXFIR_COEFF_TXB_80_3

Type: read-write
Reset State: 0x0009

2's complement 10-bit Tx-B FIR80 coefficient 3

TXFIR_COEFF_TXB_80_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0009

0x30002D4 TXFIR_COEFF_TXB_80_4

Type: read-write
Reset State: 0x000B

2's complement 10-bit Tx-B FIR80 coefficient 4

TXFIR_COEFF_TXB_80_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x000B

0x30002D8 TXFIR_COEFF_TXB_80_5

Type: read-write
Reset State: 0x000E

2's complement 10-bit Tx-B FIR80 coefficient 5

TXFIR_COEFF_TXB_80_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x000E

0x30002DC TXFIR_COEFF_TXB_80_6

Type: read-write
Reset State: 0x0012

2's complement 10-bit Tx-B FIR80 coefficient 6

TXFIR_COEFF_TXB_80_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0012

0x30002E0 TXFIR_COEFF_TXB_80_7

Type: read-write
Reset State: 0x0016

2's complement 10-bit Tx-B FIR80 coefficient 7

TXFIR_COEFF_TXB_80_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0016

0x30002E4 TXFIR_COEFF_TXB_80_8

Type: read-write
Reset State: 0x0019

2's complement 10-bit Tx-B FIR80 coefficient 8

TXFIR_COEFF_TXB_80_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0019

0x30002E8 TXFIR_COEFF_TXB_80_9

Type: read-write
Reset State: 0x001E

2's complement 10-bit Tx-B FIR80 coefficient 9

TXFIR_COEFF_TXB_80_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x001E

0x30002EC TXFIR_COEFF_TXB_80_10

Type: read-write
Reset State: 0x0022

2's complement 10-bit Tx-B FIR80 coefficient 10

TXFIR_COEFF_TXB_80_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0022

0x30002F0 TXFIR_COEFF_TXB_80_11

Type: read-write
Reset State: 0x0027

2's complement 10-bit Tx-B FIR80 coefficient 11

TXFIR_COEFF_TXB_80_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0027

0x30002F4 TXFIR_COEFF_TXB_80_12

Type: read-write
Reset State: 0x002B

2's complement 10-bit Tx-B FIR80 coefficient 12

TXFIR_COEFF_TXB_80_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x002B

0x30002F8 TXFIR_COEFF_TXB_80_13

Type: read-write
Reset State: 0x002F

2's complement 10-bit Tx-B FIR80 coefficient 13

TXFIR_COEFF_TXB_80_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x002F

0x30002FC TXFIR_COEFF_TXB_80_14

Type: read-write
Reset State: 0x0034

2's complement 10-bit Tx-B FIR80 coefficient 14

TXFIR_COEFF_TXB_80_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0034

0x3000300 TXFIR_COEFF_TXB_80_15

Type: read-write
Reset State: 0x0038

2's complement 10-bit Tx-B FIR80 coefficient 15

TXFIR_COEFF_TXB_80_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0038

0x3000304 TXFIR_COEFF_TXB_80_16

Type: read-write
Reset State: 0x003B

2's complement 10-bit Tx-B FIR80 coefficient 16

TXFIR_COEFF_TXB_80_16

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x003B

0x3000308 TXFIR_COEFF_TXB_80_17

Type: read-write
Reset State: 0x003E

2's complement 10-bit Tx-B FIR80 coefficient 17

TXFIR_COEFF_TXB_80_17

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x003E

0x300030C TXFIR_COEFF_TXB_80_18

Type: read-write
Reset State: 0x0041

2's complement 10-bit Tx-B FIR80 coefficient 18

TXFIR_COEFF_TXB_80_18

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0041

0x3000310 TXFIR_COEFF_TXB_80_19

Type: read-write
Reset State: 0x0043

2's complement 10-bit Tx-B FIR80 coefficient 19

TXFIR_COEFF_TXB_80_19

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0043

0x3000314 TXFIR_COEFF_TXB_80_20

Type: read-write
Reset State: 0x0044

2's complement 10-bit Tx-B FIR80 coefficient 20

TXFIR_COEFF_TXB_80_20

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0044

0x3000318 TXFIR_COEFF_TXB_80_21

Type: read-write
Reset State: 0x0045

2's complement 10-bit Tx-B FIR80 coefficient 21

TXFIR_COEFF_TXB_80_21

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0045

0x300031C TXFIR_COEFF_TXB_80_22

Type: read-write
Reset State: 0x0045

2's complement 10-bit Tx-B FIR80 coefficient 22

TXFIR_COEFF_TXB_80_22

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0045

0x3000320 TXFIR_COEFF_TXB_80_23

Type: read-write
Reset State: 0x0044

2's complement 10-bit Tx-B FIR80 coefficient 23

TXFIR_COEFF_TXB_80_23

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0044

0x3000324 TXFIR_COEFF_TXB_80_24

Type: read-write
Reset State: 0x0042

2's complement 10-bit Tx-B FIR80 coefficient 24

TXFIR_COEFF_TXB_80_24

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0042

0x3000328 TXFIR_COEFF_TXB_80_25

Type: read-write
Reset State: 0x0040

2's complement 10-bit Tx-B FIR80 coefficient 25

TXFIR_COEFF_TXB_80_25

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0040

0x300032C TXFIR_COEFF_TXB_80_26

Type: read-write
Reset State: 0x003D

2's complement 10-bit Tx-B FIR80 coefficient 26

TXFIR_COEFF_TXB_80_26

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x003D

0x3000330 TXFIR_COEFF_TXB_80_27

Type: read-write
Reset State: 0x0039

2's complement 10-bit Tx-B FIR80 coefficient 27

TXFIR_COEFF_TXB_80_27

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0039

0x3000334 TXFIR_COEFF_TXB_80_28

Type: read-write
Reset State: 0x0035

2's complement 10-bit Tx-B FIR80 coefficient 28

TXFIR_COEFF_TXB_80_28

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0035

0x3000338 TXFIR_COEFF_TXB_80_29

Type: read-write
Reset State: 0x0031

2's complement 10-bit Tx-B FIR80 coefficient 29

TXFIR_COEFF_TXB_80_29

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0031

0x300033C TXFIR_COEFF_TXB_80_30

Type: read-write
Reset State: 0x002C

2's complement 10-bit Tx-B FIR80 coefficient 30

TXFIR_COEFF_TXB_80_30

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x002C

0x3000340 TXFIR_COEFF_TXB_80_31

Type: read-write
Reset State: 0x0027

2's complement 10-bit Tx-B FIR80 coefficient 31

TXFIR_COEFF_TXB_80_31

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0027

0x3000344 TXFIR_COEFF_TXB_80_32

Type: read-write
Reset State: 0x0023

2's complement 10-bit Tx-B FIR80 coefficient 32

TXFIR_COEFF_TXB_80_32

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0023

0x3000348 TXFIR_COEFF_TXB_80_33

Type: read-write
Reset State: 0x001E

2's complement 10-bit Tx-B FIR80 coefficient 33

TXFIR_COEFF_TXB_80_33

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x001E

0x300034C TXFIR_COEFF_TXB_80_34

Type: read-write
Reset State: 0x0019

2's complement 10-bit Tx-B FIR80 coefficient 34

TXFIR_COEFF_TXB_80_34

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0019

0x3000350 TXFIR_COEFF_TXB_80_35

Type: read-write
Reset State: 0x0015

2's complement 10-bit Tx-B FIR80 coefficient 35

TXFIR_COEFF_TXB_80_35

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0015

0x3000354 TXFIR_COEFF_TXB_80_36

Type: read-write
Reset State: 0x0011

2's complement 10-bit Tx-B FIR80 coefficient 36

TXFIR_COEFF_TXB_80_36

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0011

0x3000358 TXFIR_COEFF_TXB_80_37

Type: read-write
Reset State: 0x000D

2's complement 10-bit Tx-B FIR80 coefficient 37

TXFIR_COEFF_TXB_80_37

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x000D

0x300035C TXFIR_COEFF_TXB_80_38

Type: read-write
Reset State: 0x000A

2's complement 10-bit Tx-B FIR80 coefficient 38

TXFIR_COEFF_TXB_80_38

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x000A

0x3000360 TXFIR_COEFF_TXB_80_39

Type: read-write
Reset State: 0x0007

2's complement 10-bit Tx-B FIR80 coefficient 39

TXFIR_COEFF_TXB_80_39

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0007

0x3000364 TXFIR_COEFF_TXB_80_40

Type: read-write
Reset State: 0x0005

2's complement 10-bit Tx-B FIR80 coefficient 40

TXFIR_COEFF_TXB_80_40

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0005

0x3000368 TXFIR_COEFF_TXB_80_41

Type: read-write
Reset State: 0x0003

2's complement 10-bit Tx-B FIR80 coefficient 41

TXFIR_COEFF_TXB_80_41

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0003

0x300036C TXFIR_COEFF_TXB_80_42

Type: read-write
Reset State: 0x0001

2's complement 10-bit Tx-B FIR80 coefficient 42

TXFIR_COEFF_TXB_80_42

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0001

0x3000370 TXFIR_COEFF_TXB_80_43

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 43

TXFIR_COEFF_TXB_80_43

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000374 TXFIR_COEFF_TXB_80_44

Type: read-write
Reset State: 0x03FF

2's complement 10-bit Tx-B FIR80 coefficient 44

TXFIR_COEFF_TXB_80_44

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03FF

0x3000378 TXFIR_COEFF_TXB_80_45

Type: read-write
Reset State: 0x03FF

2's complement 10-bit Tx-B FIR80 coefficient 45

TXFIR_COEFF_TXB_80_45

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03FF

0x300037C TXFIR_COEFF_TXB_80_46

Type: read-write
Reset State: 0x03FF

2's complement 10-bit Tx-B FIR80 coefficient 46

TXFIR_COEFF_TXB_80_46

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03FF

0x3000380 TXFIR_COEFF_TXB_80_47

Type: read-write
Reset State: 0x03FC

2's complement 10-bit Tx-B FIR80 coefficient 47

TXFIR_COEFF_TXB_80_47

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x03FC

0x3000384 TXFIR_COEFF_TXB_80_48

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 48

TXFIR_COEFF_TXB_80_48

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000388 TXFIR_COEFF_TXB_80_49

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 49

TXFIR_COEFF_TXB_80_49

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300038C TXFIR_COEFF_TXB_80_50

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 50

TXFIR_COEFF_TXB_80_50

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000390 TXFIR_COEFF_TXB_80_51

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 51

TXFIR_COEFF_TXB_80_51

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000394 TXFIR_COEFF_TXB_80_52

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 52

TXFIR_COEFF_TXB_80_52

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x3000398 TXFIR_COEFF_TXB_80_53

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 53

TXFIR_COEFF_TXB_80_53

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x300039C TXFIR_COEFF_TXB_80_54

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 54

TXFIR_COEFF_TXB_80_54

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003A0 TXFIR_COEFF_TXB_80_55

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 55

TXFIR_COEFF_TXB_80_55

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003A4 TXFIR_COEFF_TXB_80_56

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 56

TXFIR_COEFF_TXB_80_56

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003A8 TXFIR_COEFF_TXB_80_57

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 57

TXFIR_COEFF_TXB_80_57

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003AC TXFIR_COEFF_TXB_80_58

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 58

TXFIR_COEFF_TXB_80_58

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003B0 TXFIR_COEFF_TXB_80_59

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 59

TXFIR_COEFF_TXB_80_59

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003B4 TXFIR_COEFF_TXB_80_60

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 60

TXFIR_COEFF_TXB_80_60

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003B8 TXFIR_COEFF_TXB_80_61

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 61

TXFIR_COEFF_TXB_80_61

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003BC TXFIR_COEFF_TXB_80_62

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 62

TXFIR_COEFF_TXB_80_62

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003C0 TXFIR_COEFF_TXB_80_63

Type: read-write
Reset State: 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 63

TXFIR_COEFF_TXB_80_63

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003C4 TXFIR_COEFF_PEAKW_0

Type: read-write
Reset State: 0x01FE

2's complement 9-bit peak windowing FIR coefficient 0

TXFIR_COEFF_PEAKW_0

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x01FE

0x30003C8 TXFIR_COEFF_PEAKW_1

Type: read-write
Reset State: 0x01FF

2's complement 9-bit peak windowing FIR coefficient 1

TXFIR_COEFF_PEAKW_1

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x01FF

0x30003CC TXFIR_COEFF_PEAKW_2

Type: read-write
Reset State: 0x0000

2's complement 9-bit peak windowing FIR coefficient 2

TXFIR_COEFF_PEAKW_2

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0000

0x30003D0 TXFIR_COEFF_PEAKW_3

Type: read-write
Reset State: 0x0003

2's complement 9-bit peak windowing FIR coefficient 3

TXFIR_COEFF_PEAKW_3

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0003

0x30003D4 TXFIR_COEFF_PEAKW_4

Type: read-write
Reset State: 0x0006

2's complement 9-bit peak windowing FIR coefficient 4

TXFIR_COEFF_PEAKW_4

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0006

0x30003D8 TXFIR_COEFF_PEAKW_5

Type: read-write
Reset State: 0x000B

2's complement 9-bit peak windowing FIR coefficient 5

TXFIR_COEFF_PEAKW_5

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x000B

0x30003DC TXFIR_COEFF_PEAKW_6

Type: read-write
Reset State: 0x0010

2's complement 9-bit peak windowing FIR coefficient 6

TXFIR_COEFF_PEAKW_6

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0010

0x30003E0 TXFIR_COEFF_PEAKW_7

Type: read-write
Reset State: 0x0016

2's complement 9-bit peak windowing FIR coefficient 7

TXFIR_COEFF_PEAKW_7

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x0016

0x30003E4 TXFIR_COEFF_PEAKW_8

Type: read-write
Reset State: 0x001A

2's complement 9-bit peak windowing FIR coefficient 8

TXFIR_COEFF_PEAKW_8

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x001A

0x30003E8 TXFIR_COEFF_PEAKW_9

Type: read-write
Reset State: 0x001D

2's complement 9-bit peak windowing FIR coefficient 9

TXFIR_COEFF_PEAKW_9

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x001D

0x30003EC TXFIR_COEFF_PEAKW_10

Type: read-write
Reset State: 0x001E

2's complement 9-bit peak windowing FIR coefficient 10

TXFIR_COEFF_PEAKW_10

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient Reset State: 0x001E

0x30003F0 TXFIR_PEAKW_CLIP_THRESHOLD_0

Type: read-write
Reset State: 0x0016

8-bit peak windowing clip threshold for power index 0

TXFIR_PEAKW_CLIP_THRESHOLD_0

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 0 Reset State: 0x0016

0x30003F4 TXFIR_PEAKW_CLIP_THRESHOLD_1

Type: read-write
Reset State: 0x0014

8-bit peak windowing clip threshold for power index 1

TXFIR_PEAKW_CLIP_THRESHOLD_1

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 1 Reset State: 0x0014

0x30003F8 TXFIR_PEAKW_CLIP_THRESHOLD_2

Type: read-write
Reset State: 0x0011

8-bit peak windowing clip threshold for power index 2

TXFIR_PEAKW_CLIP_THRESHOLD_2

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 2 Reset State: 0x0011

0x30003FC TXFIR_PEAKW_CLIP_THRESHOLD_3

Type: read-write
Reset State: 0x0010

8-bit peak windowing clip threshold for power index 3

TXFIR_PEAKW_CLIP_THRESHOLD_3

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 3 Reset State: 0x0010

0x3000400 TXFIR_PEAKW_CLIP_THRESHOLD_4

Type: read-write
Reset State: 0x000E

8-bit peak windowing clip threshold for power index 4

TXFIR_PEAKW_CLIP_THRESHOLD_4

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 4 Reset State: 0x000E

0x3000404 TXFIR_PEAKW_CLIP_THRESHOLD_5

Type: read-write
Reset State: 0x000C

8-bit peak windowing clip threshold for power index 5

TXFIR_PEAKW_CLIP_THRESHOLD_5

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 5 Reset State: 0x000C

0x3000408 TXFIR_PEAKW_CLIP_THRESHOLD_6

Type: read-write
Reset State: 0x000B

8-bit peak windowing clip threshold for power index 6

TXFIR_PEAKW_CLIP_THRESHOLD_6

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 6 Reset State: 0x000B

0x300040C TXFIR_PEAKW_CLIP_THRESHOLD_7

Type: read-write
Reset State: 0x000A

8-bit peak windowing clip threshold for power index 7

TXFIR_PEAKW_CLIP_THRESHOLD_7

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 7 Reset State: 0x000A

0x3000410 TXFIR_PEAKW_CLIP_THRESHOLD_8

Type: read-write
Reset State: 0x0008

8-bit peak windowing clip threshold for power index 8

TXFIR_PEAKW_CLIP_THRESHOLD_8

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 8 Reset State: 0x0008

0x3000414 TXFIR_PEAKW_CLIP_THRESHOLD_9

Type: read-write
Reset State: 0x0008

8-bit peak windowing clip threshold for power index 9

TXFIR_PEAKW_CLIP_THRESHOLD_9

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 9 Reset State: 0x0008

0x3000418 TXFIR_PEAKW_CLIP_THRESHOLD_10

Type: read-write
Reset State: 0x0007

8-bit peak windowing clip threshold for power index 10

TXFIR_PEAKW_CLIP_THRESHOLD_10

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 10 Reset State: 0x0007

0x300041C TXFIR_PEAKW_CLIP_THRESHOLD_11

Type: read-write
Reset State: 0x0006

8-bit peak windowing clip threshold for power index 11

TXFIR_PEAKW_CLIP_THRESHOLD_11

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 11 Reset State: 0x0006

0x3000420 TXFIR_PEAKW_CLIP_THRESHOLD_12

Type: read-write
Reset State: 0x0005

8-bit peak windowing clip threshold for power index 12

TXFIR_PEAKW_CLIP_THRESHOLD_12

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 12 Reset State: 0x0005

0x3000424 TXFIR_PEAKW_CLIP_THRESHOLD_13

Type: read-write
Reset State: 0x0005

8-bit peak windowing clip threshold for power index 13

TXFIR_PEAKW_CLIP_THRESHOLD_13

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 13 Reset State: 0x0005

0x3000428 TXFIR_PEAKW_CLIP_THRESHOLD_14

Type: read-write
Reset State: 0x0004

8-bit peak windowing clip threshold for power index 14

TXFIR_PEAKW_CLIP_THRESHOLD_14

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 14 Reset State: 0x0004

0x300042C TXFIR_PEAKW_CLIP_THRESHOLD_15

Type: read-write
Reset State: 0x0004

8-bit peak windowing clip threshold for power index 15

TXFIR_PEAKW_CLIP_THRESHOLD_15

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 15 Reset State: 0x0004

0x3000430 TXFIR_PEAKW_CLIP_THRESHOLD_16

Type: read-write
Reset State: 0x0003

8-bit peak windowing clip threshold for power index 16

TXFIR_PEAKW_CLIP_THRESHOLD_16

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 16 Reset State: 0x0003

0x3000434 TXFIR_PEAKW_CLIP_THRESHOLD_17

Type: read-write
Reset State: 0x0003

8-bit peak windowing clip threshold for power index 17

TXFIR_PEAKW_CLIP_THRESHOLD_17

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 17 Reset State: 0x0003

0x3000438 TXFIR_PEAKW_CLIP_THRESHOLD_18

Type: read-write
Reset State: 0x0002

8-bit peak windowing clip threshold for power index 18

TXFIR_PEAKW_CLIP_THRESHOLD_18

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 18 Reset State: 0x0002

0x300043C TXFIR_PEAKW_CLIP_THRESHOLD_19

Type: read-write
Reset State: 0x0002

8-bit peak windowing clip threshold for power index 19

TXFIR_PEAKW_CLIP_THRESHOLD_19

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 19 Reset State: 0x0002

0x3000440 TXFIR_PEAKW_CLIP_THRESHOLD_20

Type: read-write
Reset State: 0x0002

8-bit peak windowing clip threshold for power index 20

TXFIR_PEAKW_CLIP_THRESHOLD_20

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 20 Reset State: 0x0002

0x3000444 TXFIR_PEAKW_CLIP_THRESHOLD_21

Type: read-write
Reset State: 0x0002

8-bit peak windowing clip threshold for power index 21

TXFIR_PEAKW_CLIP_THRESHOLD_21

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 21 Reset State: 0x0002

0x3000448 TXFIR_PEAKW_CLIP_THRESHOLD_22

Type: read-write
Reset State: 0x0001

8-bit peak windowing clip threshold for power index 22

TXFIR_PEAKW_CLIP_THRESHOLD_22

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 22 Reset State: 0x0001

0x300044C TXFIR_PEAKW_CLIP_THRESHOLD_23

Type: read-write
Reset State: 0x0001

8-bit peak windowing clip threshold for power index 23

TXFIR_PEAKW_CLIP_THRESHOLD_23

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 23 Reset State: 0x0001

0x3000450 TXFIR_PEAKW_CLIP_THRESHOLD_24

Type: read-write
Reset State: 0x0001

8-bit peak windowing clip threshold for power index 24

TXFIR_PEAKW_CLIP_THRESHOLD_24

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 24 Reset State: 0x0001

0x3000454 TXFIR_PEAKW_CLIP_THRESHOLD_25

Type: read-write
Reset State: 0x0001

8-bit peak windowing clip threshold for power index 25

TXFIR_PEAKW_CLIP_THRESHOLD_25

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 25 Reset State: 0x0001

0x3000458 TXFIR_PEAKW_CLIP_THRESHOLD_26

Type: read-write
Reset State: 0x0001

8-bit peak windowing clip threshold for power index 26

TXFIR_PEAKW_CLIP_THRESHOLD_26

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 26 Reset State: 0x0001

0x300045C TXFIR_PEAKW_CLIP_THRESHOLD_27

Type: read-write
Reset State: 0x0001

8-bit peak windowing clip threshold for power index 27

TXFIR_PEAKW_CLIP_THRESHOLD_27

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 27 Reset State: 0x0001

0x3000460 TXFIR_PEAKW_CLIP_THRESHOLD_28

Type: read-write
Reset State: 0x0000

8-bit peak windowing clip threshold for power index 28

TXFIR_PEAKW_CLIP_THRESHOLD_28

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 28 Reset State: 0x0000

0x3000464 TXFIR_PEAKW_CLIP_THRESHOLD_29

Type: read-write
Reset State: 0x0000

8-bit peak windowing clip threshold for power index 29

TXFIR_PEAKW_CLIP_THRESHOLD_29

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 29 Reset State: 0x0000

0x3000468 TXFIR_PEAKW_CLIP_THRESHOLD_30

Type: read-write
Reset State: 0x0000

8-bit peak windowing clip threshold for power index 30

TXFIR_PEAKW_CLIP_THRESHOLD_30

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 30 Reset State: 0x0000

0x300046C TXFIR_PEAKW_CLIP_THRESHOLD_31

Type: read-write
Reset State: 0x0000

8-bit peak windowing clip threshold for power index 31

TXFIR_PEAKW_CLIP_THRESHOLD_31

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 31 Reset State: 0x0000

0x3000470 TXFIR_Q_INVERT

Type: read-write
Reset State: 0x0000

Register to enable sign inversion of the Q component of each chain

TXFIR_Q_INVERT

Bits	Name	Description
0:0	ENABLE	Per-chain enable for Q-component sign inversion of each chain Reset State: 0x0000

0x3000474 TXFIR_INTERP_X2

Type: read-write
Reset State: 0x0000

Register to enable interpolation by 2 instead of 1.5. This is used for P2P emulation

TXFIR_INTERP_X2

Bits	Name	Description
0:0	ENABLE	Interpolation-by-2 enable Reset State: 0x0000

0x3000478 TXFIR_IQCORR_CENTRE_TAP

Type: read-write
Reset State: 0x0002

This register defines the centre tap value in the IQ corrector complex filter

TXFIR_IQCORR_CENTRE_TAP

Bits	Name	Description
2:0	VALUE	IQ corrector centre tap location Reset State: 0x0002

0x300047C TXFIR_GAIN_OFFSET_OFDM

Type: read-write
Reset State: 0x0000

This register stores the gain offset (dB) applied to the demanded power for OFDM packets. The adjusted value is used to adjust the scaling profile applied in the DPD module.

TXFIR_GAIN_OFFSET_OFDM

Bits	Name	Description
5:0	VALUE	Reset State: 0x0000

0x3000480 TXFIR_GAIN_OFFSET_11B

Type: read-write
Reset State: 0x0000

This register stores the gain offset (dB) applied to the demanded power for 11b packets. The adjusted value is used to adjust the scaling profile applied in the DPD module.

TXFIR_GAIN_OFFSET_11B

Bits	Name	Description
5:0	VALUE	Reset State: 0x0000

0x3000800+0x20*n TXFIR_TXCAL_MEM0n_0, n=[0..23]

Type: read-write
Reset State: 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

TXFIR_TXCAL_MEM0n_0

Bits	Name	Description
15:9	IQPHASEIMB_COEFF_Q0_0	2's complement IQ phase imbalance correction value, coefficient q0 for chain 0 Reset State: 0x0000
8:0	IQPHASEIMB_COEFF_I0	2's complement IQ phase imbalance correction value, coefficient i0 for chain 0 Reset State: 0x0000

0x3000804+0x20*n TXFIR_TXCAL_MEM0n_1, n=[0..23]

Type: read-write
Reset State: 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

TXFIR_TXCAL_MEM0n_1

Bits	Name	Description
15:11	IQPHASEIMB_COEFF_Q1_0	2's complement IQ phase imbalance correction value, coefficient q1 for chain 0 Reset State: 0x0000
10:2	IQPHASEIMB_COEFF_I1	2's complement IQ phase imbalance correction value, coefficient i1 for chain 0 Reset State: 0x0000
1:0	IQPHASEIMB_COEFF_Q0_1	2's complement IQ phase imbalance correction value, coefficient q0 for chain 0 Reset State: 0x0000

0x3000808+0x20*n TXFIR_TXCAL_MEM0n_2, n=[0..23]

Type: read-write
Reset State: 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

TXFIR_TXCAL_MEM0n_2

Bits	Name	Description
15:13	IQPHASEIMB_COEFF_Q2_0	2's complement IQ phase imbalance correction value, coefficient q2 for chain 0 Reset State: 0x0000
12:4	IQPHASEIMB_COEFF_I2	2's complement IQ phase imbalance correction value, coefficient i2 for chain 0 Reset State: 0x0000
3:0	IQPHASEIMB_COEFF_Q1_1	2's complement IQ phase imbalance correction value, coefficient q1 for chain 0 Reset State: 0x0000

0x300080C+0x20*n TXFIR_TXCAL_MEM0n_3, n=[0..23]

Type: read-write
Reset State: 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

TXFIR_TXCAL_MEM0n_3

Bits	Name	Description
15	IQPHASEIMB_COEFF_Q3_0	2's complement IQ phase imbalance correction value, coefficient q3 for chain 0 Reset State: 0x0000
14:6	IQPHASEIMB_COEFF_I3	2's complement IQ phase imbalance correction value, coefficient i3 for chain 0 Reset State: 0x0000
5:0	IQPHASEIMB_COEFF_Q2_1	2's complement IQ phase imbalance correction value, coefficient q2 for chain 0 Reset State: 0x0000

0x3000810+0x20*n TXFIR_TXCAL_MEM0n_4, n=[0..23]

Type: read-write
Reset State: 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

TXFIR_TXCAL_MEM0n_4

Bits	Name	Description
15:8	IQPHASEIMB_COEFF_I4_0	2's complement IQ phase imbalance correction value, coefficient i4 for chain 0 Reset State: 0x0000
7:0	IQPHASEIMB_COEFF_Q3_1	2's complement IQ phase imbalance correction value, coefficient q3 for chain 0 Reset State: 0x0000

0x3000814+0x20*n TXFIR_TXCAL_MEM0n_5, n=[0..23]

Type: read-write
Reset State: 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

TXFIR_TXCAL_MEM0n_5

Bits	Name	Description
15:10	IQ_AMPIMB_COEFF_0	2's complement IQ amplitude imbalance correction factor. Reset State: 0x0000

TXFIR_TXCAL_MEM0n_5 (cont.)

Bits	Name	Description
9:1	IQPHASEIMB_COEFF_Q4	2's complement IQ phase imbalance correction value, coefficient q4 for chain 0 Reset State: 0x0000
0	IQPHASEIMB_COEFF_I4_1	2's complement IQ phase imbalance correction value, coefficient i4 for chain 0 Reset State: 0x0000

0x3000818+0x20*n TXFIR_TXCAL_MEM0n_6, n=[0..23]

Type: read-write
Reset State: 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

TXFIR_TXCAL_MEM0n_6

Bits	Name	Description
14:9	TXLOLEAKAGE_Q	2's complement Transmit chain local oscillator leakage for chain 0, Q rail Reset State: 0x0000
8:3	TXLOLEAKAGE_I	2's complement Transmit chain local oscillator leakage for chain 0, I rail Reset State: 0x0000
2:0	IQ_AMPIMB_COEFF_1	2's complement IQ amplitude imbalance correction factor. Reset State: 0x0000

0x3001000+0x10*n TXFIR_DPD_MEM0n_0, n=[0..127]

Type: read-write
Reset State: 0x0000

Contains TX pre-distorter parameter values for each RF gain setting

TXFIR_DPD_MEM0n_0

Bits	Name	Description
15:12	DPD_AOFFSET_0	DPD amplitude gain offset for each section on chain 0 Reset State: 0x0000
11:0	DPD_THRESHOLD	DPD amplitude threshold for each section on chain 0 Reset State: 0x0000

0x3001004+0x10*n TXFIR_DPD_MEM0n_1, n=[0..127]

Type: read-write
Reset State: 0x0000

Contains TX pre-distorter parameter values for each RF gain setting

TXFIR_DPD_MEM0n_1

Bits	Name	Description
15:8	DPD_AGAIN_0	DPD amplitude gain change for each section on chain 0 Reset State: 0x0000
7:0	DPD_AOFFSET_1	DPD amplitude gain offset for each section on chain 0 Reset State: 0x0000

0x3001008+0x10*n TXFIR_DPD_MEM0n_2, n=[0..127]

Type: read-write
Reset State: 0x0000

Contains TX pre-distorter parameter values for each RF gain setting

TXFIR_DPD_MEM0n_2

Bits	Name	Description
15:4	DPD_POFFSET	DPD phase gain offset for each section on chain 0 Reset State: 0x0000
3:0	DPD_AGAIN_1	DPD amplitude gain change for each section on chain 0 Reset State: 0x0000

0x300100C+0x10*n TXFIR_DPD_MEM0n_3, n=[0..127]

Type: read-write
Reset State: 0x0000

Contains TX pre-distorter parameter values for each RF gain setting

TXFIR_DPD_MEM0n_3

Bits	Name	Description
11:0	DPD_PGAIN	DPD phase gain change for each section on chain 0 Reset State: 0x0000

16.2.33 pmu

0x3000000 PMU_INT_OUT_RPM

Type: read-write
Reset State: 0x00000000

Interrupt output to RPM.

PMU_INT_OUT_RPM

Bits	Name	Description
3	RIVA_RPM_GP_LOW_IRQ	riva_rpm_gp_low_irq Reset State: 0x00000000
2	RIVA_RPM_GP_MED_IRQ	riva_rpm_gp_med_irq Reset State: 0x00000000
1	RIVA_RPM_GP_HI_IRQ	riva_rpm_gp_hi_irq Reset State: 0x00000000

0x3000004 PMU_INT_STS

Type: read-only
Reset State: 0x00000000

wake up interrupt status

PMU_INT_STS

Bits	Name	Description
7	BT_SLP_TIME_IRQ	BT sleep timer wake up interrupt Reset State: 0x00000000
6	WLAN_SLP_TIMER_IRQ	WLAN sleep timer wake up interrupt Reset State: 0x00000000
5	CCU_CCPU_WAKEUP_IRQ	WLAN to cCPU wake up interrupt. e.g., Beacon reception/time out interrupt. Reset State: 0x00000000
4	ACPU_RIVA_WAKEUP_IRQ	ACPU to Riva wake up interrupt Reset State: 0x00000000
3	RPM_RIVA_GP_LOW_IRQ	RPM to Riva wake up interrupt Reset State: 0x00000000
2	RPM_RIVA_GP_MED_IRQ	RPM to Riva wake up interrupt Reset State: 0x00000000

PMU_INT_STS (cont.)

Bits	Name	Description
1	RPM_RIVA_GP_HI_IRQ	RPM to Riva wake up interrupt Reset State: 0x00000000
0	RPM_RIVA_WAKEUP_IRQ	RPM to Riva wake up interrupt Reset State: 0x00000000

0x3000008 PMU_INT_EN

Type: read-write
Reset State: 0x00000000

interrupts enable bit.

PMU_INT_EN

Bits	Name	Description
7	BT_SLP_TIMER_IRQ_EN	enable bt_slp_timer_irq to wakeup Riva. Reset State: 0x00000000
6	WLAN_SLP_TIMER_IRQ_EN	enable wlan_slp_timer_irq to wakeup Riva. Reset State: 0x00000000
5	CCU_CCPU_WAKEUP_IRQ_EN	enable ccu_ccpu_wakeup_irq to wakeup clock gated cCPU. Reset State: 0x00000000
4	ACPU_RIVA_WAKEUP_IRQ_EN	enable acpu_riva_wakeup_irq to wakeup Riva. Reset State: 0x00000000
3	RPM_RIVA_GP_LOW_IRQ_EN	enable rpm_riva_gp_low_irq to wakeup Riva. Reset State: 0x00000000
2	RPM_RIVA_GP_MED_IRQ_EN	enable rpm_riva_gp_med_irq to wakeup Riva. Reset State: 0x00000000
1	RPM_RIVA_GP_HI_IRQ_EN	enable rpm_riva_gp_hi_irq to wakeup Riva. Reset State: 0x00000000
0	RPM_RIVA_WAKEUP_IRQ_EN	enable rpm_riva_wakeup_irq to wakeup Riva. Reset State: 0x00000000

0x300000C PMU_INT_STS_RAW

Type: read-only
Reset State: 0x00000000

wake up interrupt status before gating with enable

PMU_INT_STS_RAW

Bits	Name	Description
7	BT_SLP_TIME_IRQ_RAW	status of bt_slp_timer_irq before gating with bt_slp_timer_irq_en. Reset State: 0x00000000
6	WLAN_SLP_TIMER_IRQ_RAW	status of wlan_slp_timer_irq before gating with wlan_slp_timer_irq_en. Reset State: 0x00000000
5	CCU_CCPU_WAKEUP_IRQ_RAW	status of ccu_ccpu_wakeup_irq before gating with ccu_ccpu_wakeup_irq_en. Reset State: 0x00000000
4	ACPU_RIVA_WAKEUP_IRQ_RAW	status of acpu_riva_wakeup_irq before gating with acpu_riva_wakeup_irq_en. Reset State: 0x00000000
3	RPM_RIVA_GP_LOW_IRQ_RAW	status of rpm_riva_gp_low_irq before gating with rpm_riva_gp_low_irq_en. Reset State: 0x00000000
2	RPM_RIVA_GP_MED_IRQ_RAW	status of rpm_riva_gp_med_irq before gating with rpm_riva_gp_med_irq_en. Reset State: 0x00000000
1	RPM_RIVA_GP_HI_IRQ_RAW	status of rpm_riva_gp_hi_irq before gating with rpm_riva_gp_hi_irq_en. Reset State: 0x00000000
0	RPM_RIVA_WAKEUP_IRQ_RAW	status of rpm_riva_wakeup_irq before gating with rpm_riva_wakeup_irq_en. Reset State: 0x00000000

0x3000010 PMU_GFS_CNTL_COMMON

Type: read-write
Reset State: 0x00000002

GFS_CNTL input for Riva_Common_SS

PMU_GFS_CNTL_COMMON

Bits	Name	Description
9:5	GFS_CTL_COMMON	Reserved bits. Reset State: 0x00000000
4:0	GFS_CTL_TMR_COMMON	Timer for staggered switch on. Reset State: 0x00000002

0x3000014 PMU_GFS_CNTL_WLAN

Type: read-write
Reset State: 0x00000102

GFS_CNTL input for WLAN_SS

PMU_GFS_CNTL_WLAN

Bits	Name	Description
13	GLOBAL_CLK_GATE_DISABLE_WLAN	global clock gate disable to WLAN modules Reset State: 0x00000000
12	RESET_N_WLAN	reset, Reset State: 0x00000000
11	CLK_EN_WLAN	clock enable. Reset State: 0x00000000
10	GFS_CTL_CLAMP_IO_WLAN	clamp io. Reset State: 0x00000000
9	GFS_CTL_RET_WLAN	gfs retention bits. Reset State: 0x00000000
8	GFS_CTL_EN_WLAN	gfs enable bits. Default is 1 as headswitch shold be enabled from power on reset. Reset State: 0x00000001
7:5	GFS_CTL_WLAN	Reserved bits. Reset State: 0x00000000
4:0	GFS_CTL_TMR_WLAN	Timer for staggered switch on. Reset State: 0x00000002

0x3000018 PMU_PWR_CNTL_ADCDAC

Type: read-write
Reset State: 0x00000000

power control to ADC/DAC block

PMU_PWR_CNTL_ADCDAC

Bits	Name	Description
1	IDDQ_N_ADC	Freeze IO from ADC. Reset State: 0x00000000
0	SHUTDOWN_N_ADC	shutdown ADC regulator. Reset State: 0x00000000

0x300001C PMU_GFS_STS_COMMON

Type: read-only
Reset State: 0x00000003

GFS_CNTL status for Riva_Common_SS.

PMU_GFS_STS_COMMON

Bits	Name	Description
2	GFS_STS_CLAMP_IO_COMMON	clamp_io output from GFS_CNTL for Riva_Common_SS. Reset State: 0x00000000
1	GFS_STS_EN_FEW_COMMON	en_few output from GFS_CNTL for Riva_Common_SS. Reset State: 0x00000001
0	GFS_STS_EN_REST_COMMON	en_rest output from GFS_CNTL for Riva_Common_SS. Reset State: 0x00000001

0x3000020 PMU_GFS_STS_WLAN

Type: read-only
Reset State: 0x00000003

GFS_CNTL status for WLAN_SS.

PMU_GFS_STS_WLAN

Bits	Name	Description
2	GFS_STS_CLAMP_IO_WLAN	clamp_io output from GFS_CNTL for WLAN_SS. Reset State: 0x00000000
1	GFS_STS_EN_FEW_WLAN	en_few output from GFS_CNTL for WLAN_SS. Reset State: 0x00000001
0	GFS_STS_EN_REST_WLAN	en_rest output from GFS_CNTL for WLAN_SS. Reset State: 0x00000001

0x3000024 PMU_PWR_STS_ADCDAC

Type: read-only
Reset State: 0x00000000

Power status from ADC/DAC.

PMU_PWR_STS_ADCDAC

Bits	Name	Description
31:0	PWR_STS_ADCDAC_RSVD	Reserved. Reset State: 0x00000000

0x3000028 PMU_CFG

Type: read-write
Reset State: 0x00010000

Configuration.

PMU_CFG

Bits	Name	Description
19	ADCDAC_ASYNC_CLK_HALT	Asynchronous clock halt to CXC Reset State: 0x00000000
18	PHYDBG_CLKMUX_SEL	0x0: select PHY 320/120/60 1: select cpu clock For scan mode and MBIST mode it is always set to 0 so that roo1_320_160_60 clock is selected Reset State: 0x00000000
17	PHYDBG_ASYNC_CLK_HALT	Asynchronous clock halt to CXC Reset State: 0x00000000
16	LVMBIST_HARDCODE_EN	LV Mbist hardcode enable Reset State: 0x00000001
15:14	BW_CONFIG_RX	RX BW configuration Reset State: 0x00000000
13:12	BW_CONFIG_TX	TX BW configuration Reset State: 0x00000000
11	AHB_SAW_HPROTNS	SAW2 AHB protection control Reset State: 0x00000000
10	SPM_SYS_SLEEP_STATE	status of spm_sys_sleep_state output from SAW2 Reset State: 0x00000000
9	SPM_CPU_DBG_STAY_AWAKE	status of spm_cpu_dbg_stay_awake output from SAW2 Reset State: 0x00000000
8	SYS_SPM_DBG_NOPWRDWN	sys_spm_dbg_nopwrdwn input to SAW2 Reset State: 0x00000000
6	IRIS_XO_CFG_STS	IRIS XO configuration status.1: in progress0: done or idle Reset State: 0x00000000

PMU_CFG (cont.)

Bits	Name	Description
5	GC_BUS_MUX_SEL	0x1: GC bus is controlled by riva_top0: GC bus is controlled by WLAN PHY Reset State: 0x00000000
4	IRIS_XO_EN	0x1: enable XO during configuration0: disable XO during configuration Reset State: 0x00000000
3	IRIS_XO_CFG	start IRIS XO configuration Reset State: 0x00000000
2:1	IRIS_XO_MODE	IRIS XO mode. 2'b11 : 48MHz XO 2'b01 : 38.4MHz TCXO 2'b00 : 19.2MHz TCXO Reset State: 0x00000000
0	WARM_BOOT	warm/cold boot indication. Reset State: 0x00000000

0x300002C PMU_OVRD_EN

Type: read-write
Reset State: 0x00000003

enable override of controls

PMU_OVRD_EN

Bits	Name	Description
5	PMU_TCXO_CLKGATE_DISABLE_OVRD_EN	override tcxo_clkgate_disable for PMU Reset State: 0x00000000
4	PMU_DISABLE_CLK_GATING_OVRD_EN	override disable_clk_gating for PMU Reset State: 0x00000000
3	COMMON_CLK_EN_OVRD_EN	override clock enable to common SS except cCPU Reset State: 0x00000000
2	COMMON_RESET_N_OVRD_EN	override reset_n to common SS except cCPU Reset State: 0x00000000
1	CCPU_CLK_EN_OVRD_EN	override clock enable to cCPU Reset State: 0x00000001
0	CCPU_RESET_N_OVRD_EN	override reset_n to cCPU Reset State: 0x00000001

0x3000030 PMU_OVRD_VAL

Type: read-write
Reset State: 0x00000000

override value of controls

PMU_OVRD_VAL

Bits	Name	Description
5	PMU_TCXO_CLKGATE_DISABLE_OVRD_VAL	override value of tcxo_clkgate_disable for PMU Reset State: 0x00000000
4	PMU_DISABLE_CLK_GATING_OVRD_VAL	override value of disable_clk_gating for PMU Reset State: 0x00000000
3	COMMON_CLK_EN_OVRD_VAL	override value of clock enable to common SS except cCPU Reset State: 0x00000000
2	COMMON_RESET_N_OVRD_VAL	override value of reset_n to common SS except cCPU Reset State: 0x00000000
1	CCPU_CLK_EN_OVRD_VAL	override value of clock enable to cCPU Reset State: 0x00000000
0	CCPU_RESET_N_OVRD_VAL	override value of reset_n to cCPU Reset State: 0x00000000

0x3000034 PMU_SLP_TMR_CTL

Type: read-write
Reset State: 0x00000000

control for sleep timer

PMU_SLP_TMR_CTL

Bits	Name	Description
7	CLK_INT_CLR	Clear slp_clk_int. Reset State: 0x00000000
6	TMR_EN_INT_CLR	Clear tmr_en_int. Reset State: 0x00000000
5	CLK_INT_EN	Enable interrupt at the next rising edge of sleep clock. Due to synchronization, it may not be the very next risign edge, but could be 1
4	TMR_EN_INT_EN	Enable interrupt when sleep timer is enabled. Interrupt will be asserted at the rising edge of sleep clock when sleep timer starts to increase or decrease. Reset State: 0x00000000

PMU_SLP_TMR_CTL (cont.)

Bits	Name	Description
3	TMR_ADD	add slp_tmr_val_wr[31:0] to the current sleep timer value. Reset State: 0x00000000
2	TMR_LD	load sleep timer with slp_tmr_val_wr[31:0]. Reset State: 0x00000000
1	TMR_DEC	0x1: Decrement sleep timer when tmr_en is set.0: increment sleep timer when tmr_en is set. Reset State: 0x00000000
0	TMR_EN	Enable sleep timer increment or decrement. Reset State: 0x00000000

0x3000038 PMU_SLP_TMR_STS

Type: read-only
Reset State: 0x00000000

Status of sleep timer.

PMU_SLP_TMR_STS

Bits	Name	Description
2	CLK_INT	Status of slp_clk_int. Reset State: 0x00000000
1	TMR_EN_INT	Status of tmr_en_int. Reset State: 0x00000000
0	TOGGLE	This bit toggles at the every rising edge of sleep clock. Reset State: 0x00000000

0x300003C PMU_SLP_TMR_VAL_WR

Type: read-write
Reset State: 0x00000000

sleep timer value to be written

PMU_SLP_TMR_VAL_WR

Bits	Name	Description
31:0	SLP_TMR_WR	sleep timer value to be written. Reset State: 0x00000000

0x3000040 PMU_SLP_TMR_VAL

Type: read-only
Reset State: 0x00000000

current sleep timer value

PMU_SLP_TMR_VAL

Bits	Name	Description
31:0	SLP_TMR	current sleep timer value Reset State: 0x00000000

0x3000044 PMU_WLAN_SLP_TMR_CTL

Type: read-write
Reset State: 0x00000000

WLAN control of sleep timer

PMU_WLAN_SLP_TMR_CTL

Bits	Name	Description
2	WLAN_SLP_TMR_INT_CLR	clear sleep timer interrupt for WLAN. Reset State: 0x00000000
1	WLAN_SLP_TMR_INT_EN	enable sleep timer interrupt for WLAN. Reset State: 0x00000000
0	WLAN_SLP_TMR_EN	enable sleep timer for WLAN. Reset State: 0x00000000

0x3000048 PMU_WLAN_SLP_TMR_STS

Type: read-only
Reset State: 0x00000000

sleep timer status for WLAN

PMU_WLAN_SLP_TMR_STS

Bits	Name	Description
1	WLAN_SLP_TMR_INT	status of WLAN sleep timer interrupt Reset State: 0x00000000
0	WLAN_SLP_TMR_INT_RAW	raw status of WLAN sleep timer interrupt Reset State: 0x00000000

0x300004C PMU_WLAN_SLP_TMR_EXP

Type: read-write
Reset State: 0x00000000

sleep timer expiration value for WLAN

PMU_WLAN_SLP_TMR_EXP

Bits	Name	Description
31:0	WLAN_SLP_TMR_EXP	sleep timer expiration value for WLAN. Reset State: 0x00000000

0x3000050 PMU_BT_SLP_TMR_CTL

Type: read-write
Reset State: 0x00000000

BT control of sleep timer

PMU_BT_SLP_TMR_CTL

Bits	Name	Description
2	BT_SLP_TMR_INT_CLR	clear sleep timer interrupt for BT. Reset State: 0x00000000
1	BT_SLP_TMR_INT_EN	enable sleep timer interrupt for BT. Reset State: 0x00000000
0	BT_SLP_TMR_EN	enable sleep timer for BT. Reset State: 0x00000000

0x3000054 PMU_BT_SLP_TMR_STS

Type: read-only
Reset State: 0x00000000

sleep timer status for BT

PMU_BT_SLP_TMR_STS

Bits	Name	Description
1	BT_SLP_TMR_INT	status of BT sleep timer interrupt Reset State: 0x00000000
0	BT_SLP_TMR_INT_RAW	raw status of BT sleep timer interrupt Reset State: 0x00000000

0x3000058 PMU_BT_SLP_TMR_EXP

Type: read-write
Reset State: 0x00000000

sleep timer expiration value for BT

PMU_BT_SLP_TMR_EXP

Bits	Name	Description
31:0	BT_SLP_TMR_EXP	sleep timer expiration value for BT. Reset State: 0x00000000

0x300005C PMU_FSCXC_CS_AHB_COMMON

Type: read-write
Reset State: 0x0000C051

Control and status of FSCXC hard macro for AHB clock memories in Common_SS (cMEM)

PMU_FSCXC_CS_AHB_COMMON

Bits	Name	Description
15	MEM_CORE_ON	mem_core_on output of FSCXC. It is same as slp_nret_n. Reset State: 0x00000001
14	MEM_PERIPH_ON	mem_periph_on output of FSCXC. It is same as slp_ret_n. Reset State: 0x00000001
13	ROOT_CLOCK_OFF	Indication of clock output from FSCXC is gated. Reset State: 0x00000000
12	SYNC_CLK_HALT	Synchronous clock halt to FSCXC. Reset State: 0x00000000
11	UP_FORCE_PERIPH_OFF	Force slp_ret_n to 0. Reset State: 0x00000000
10	UP_FORCE_PERIPH_ON	Force slp_ret_n to 1. Reset State: 0x00000000
9	UP_FORCE_CORE_ON	Force slp_nret_n to 1. For entering retention sleep mode, this bit should be set to 1 before starting SAW2 power down. Reset State: 0x00000000
8	CLK_INV	Invert clock to memory Reset State: 0x00000000
7:4	W	w input to hm_fscxc. The number of memory clocks after slp_(n)ret_n is de-asserted until clock is enabled. w should meet min 20 ns, so ceil(20ns/(1/240MHz)) =5 is used as default. Reset State: 0x00000005

PMU_FSCXC_CS_AHB_COMMON (cont.)

Bits	Name	Description
3:0	S	s input to hm_fscxc. The number of memory clocks before slp_(n)ret_n is asserted from clock is disabled. Max frquency of ahb clock is 240MHz, and there is slower derived clock. s should meet at least 1 memory clock, so 1 is used as default. Reset State: 0x00000001

0x3000060 PMU_FSCXC_CS_CCPU

Type: read-write
Reset State: 0x00002051

Control and status of FSCXC hard macro for cCPU clock memories (cMEM, cCPU cache)

PMU_FSCXC_CS_CCPU

Bits	Name	Description
15	MEM_CORE_ON	mem_core_on output of FSCXC. It is same as slp_nret_n. Reset State: 0x00000000
14	MEM_PERIPH_ON	mem_periph_on output of FSCXC. It is same as slp_ret_n. Reset State: 0x00000000
13	ROOT_CLOCK_OFF	Indication of clock output from FSCXC is gated. Reset State: 0x00000001
12	SYNC_CLK_HALT	Synchronous clock halt to FSCXC. Reset State: 0x00000000
11	UP_FORCE_PERIPH_OFF	Force slp_ret_n to 0. Reset State: 0x00000000
10	UP_FORCE_PERIPH_ON	Force slp_ret_n to 1. Reset State: 0x00000000
9	UP_FORCE_CORE_ON	Force slp_nret_n to 1. For entering retention sleep mode, this bit should be set to 1 before starting SAW2 power down. Reset State: 0x00000000
8	CLK_INV	Invert clock to memory Reset State: 0x00000000
7:4	W	w input to hm_fscxc. The number of memory clocks after slp_(n)ret_n is de-asserted until clock is enabled. w should meet min 20 ns, so ceil(20ns/(1/240MHz)) =5 is used as default. Reset State: 0x00000005
3:0	S	s input to hm_fscxc. The number of memory clocks before slp_(n)ret_n is asserted from clock is disabled. Max frquency of ccpu clock is 240MHz, and there is slower derived clock. s should meet at least 1 memory clock, so 1 is used as default. Reset State: 0x00000001

0x3000064 PMU_FSCXC_CS_AHB_WLAN

Type: read-write
Reset State: 0x00002051

Control and status of FSCXC hard macro for AHB clock memories in WLAN (cMEM)

Bits	Name	Description
4	CCPU_STANDBYWFI	The status standby wfi signal from arm9. Reset State: 0x00000000
2	CCPU_REMAP_EN	Set to '1' to enable the boot address region to be re-mapped to a different 64K region in the memory map specified in ccpu_remap_addr reg. Reset State: 0x00000000
1	CCPU_INSERT_WAIT_FOR_INTERRUPT_CMD_EN	When set, cCPU logic returns a "wait for interrupt" command at boot address. Reset State: 0x00000000
0	CCPU_HIGH_INTERRUPT_VECTOR_EN	0x1: When set, cCPU fetches instructions from 0xFFFF_0000 0: When clear, cCPU fetches instructions from 0x0 Reset State: 0x00000000

0x30000A0 PMU_CCPU_BOOT_REMAP_ADDR

Type: read-write
Reset State: 0x00000000

The base address for memory re-map the 64K boot address region.

PMU_CCPU_BOOT_REMAP_ADDR

Bits	Name	Description
15:0	CCPU_BOOT_REMAP_ADDR	Base address of the 64K boot window onto the DAHB. Reset State: 0x00000000

0x30000A4 PMU_COMMON_CSR

Type: read-write
Reset State: 0x00003332

This register controls clock and soft reset of common SS and Riva top

PMU_COMMON_CSR

Bits	Name	Description
14	M2VMT_SOFT_RESET	soft reset to M2vMT module Reset State: 0x00000000
13	M2VMT_ROOT_CLK_ENABLE	root clock enable to M2vMT module Reset State: 0x00000001

PMU_COMMON_CSR (cont.)

Bits	Name	Description
12	M2VMT_CLKGATE_DISABLE	clock gate disable to M2vMT module Reset State: 0x00000001
10	ECAHB_SOFT_RESET	soft reset to ECAHB module Reset State: 0x00000000
9	ECAHB_ROOT_CLK_ENABLE	root clock enable to ECAHB module Reset State: 0x00000001
8	ECAHB_CLKGATE_DISABLE	clock gate disable to ECAHB module Reset State: 0x00000001
6	APU_SOFT_RESET	soft reset to APU module Reset State: 0x00000000
5	APU_ROOT_CLK_ENABLE	root clock enable to APU module Reset State: 0x00000001
4	APU_CLKGATE_DISABLE	clock gate disable to APU module Reset State: 0x00000001
2	CRCM_CCU_SOFT_RESET	soft reset to CCU module Reset State: 0x00000000
1	CRCM_CCU_ROOT_CLK_ENABLE	root clock enable to CCU module Reset State: 0x00000001
0	CCU_CLKGATE_DISABLE	clock gate disable to CCU module Reset State: 0x00000000

0x30000A8 PMU_TESTBUS_CTL

Type: read-write
Reset State: 0x00000000

testbus control register

PMU_TESTBUS_CTL

Bits	Name	Description
7:4	AHB_TESTBUS_SEL	testbus selection mux for ahb clock Reset State: 0x00000000
3:0	TCXO_TESTBUS_SEL	testbus selection mux for tcxo clock [3] is treated as enable Reset State: 0x00000000

0x30000AC PMU_TESTBUS_STS

Type: read-only
Reset State: 0x00000000

testbus status register

PMU_TESTBUS_STS

Bits	Name	Description
31:0	TESTBUS_STS	testbus status Reset State: 0x00000000

0x30000B0 PMU_SPARE_IN

Type: read-only
Reset State: 0x00000000

spare in register

PMU_SPARE_IN

Bits	Name	Description
31:0	SPARE_IN	spare input. This captures the riva_test_bus. Since the test bus is async, it may not reflect the actual state of the test bus Reset State: 0x00000000

0x30000B4 PMU_SPARE_OUT

Type: read-write
Reset State: 0x00000000

spare out register

PMU_SPARE_OUT

Bits	Name	Description
31	TESTBUS_FLOP_ENABLE	Enable for test_bus_flopped_stage Reset State: 0x00000000
30:22	SPARE_OUT_30_22	spare out Reset State: 0x00000000

PMU_SPARE_OUT (cont.)

Bits	Name	Description
21	RPM_RIVA_IRQ_CLR	Writing '1' will clear rpm to riva interrupts (rpm_riva_wakeup_irq, rpm_riva_gp_low_irq, rpm_riva_gp_medium_irq, rpm_riva_gp_high_irq) sticky bits. software should toggle this bit to clear the interrupts before going to powerdown. Reset State: 0x00000000
20	SYS_SPM_WAKE_CLR	Writing '1' will clear sys_spm_wakeup sticky bit to SAW2. software should toggle this bit to clear the sticky bit before going to powerdown. Reset State: 0x00000000
19	SPARE_OUT_19	spare out Reset State: 0x00000000
18:0	TESTMODE_SEL	[18] testbus30_31_on_etm_sel [17] testbus_on_etm_sel [16] sw_sel_ccpu_stretch_rst_odd [15:14] common_ss_testbus_sel [13] ext_powersave_en [12] test_wmac_ahb_mode [11:8] sw_ls_clk_debug_sel [7:4] sw_hs_clk_debug_sel [3:0] test_mode Reset State: 0x00000000

0x30000B8 PMU_A2XB_CFG

Type: read-write
Reset State: 0x00000000

A2XB config register

PMU_A2XB_CFG

Bits	Name	Description
0	A2XB_CFG_EN	Set to enable A2XB bridge Reset State: 0x00000000

0x30000BC PMU_ACPU_WAKEUP_INT_EN

Type: read-write
Reset State: 0x00000000

The interrupt enables for generating acpu wakeup interrupt; acpu_riva_wakeup_irq

PMU_ACPU_WAKEUP_INT_EN

Bits	Name	Description
12	CPSS_RIVA_INT_ENABLE	When set, cpss_riva_int will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000

PMU_ACPU_WAKEUP_INT_EN (cont.)

Bits	Name	Description
11	PMIC_RIVA_INT_ENABLE	When set, pmic_riva_int will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
10	TLMM_RIVA_INT_ENABLE	When set, i_tlmm_riva_int will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
9	LPASS_RIVA_INT_ENABLE	When set, lpass_riva_int will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
8	MSS_RIVA_INT_ENABLE	When set, mss_riva_int will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
7	APPS_RIVA_WLAN_CTRL_ENABLE	When set, i_apps_riva_wlan_ctrl will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
6	APPS_RIVA_HCI_ENABLE	When set, i_apps_riva_hci will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
5	APPS_RIVA_FM_CTRL_ENABLE	When set, i_apps_riva_fm_ctrl will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
4	APPS_RIVA_LOG_CTRL_ENABLE	When set, i_apps_riva_log_ctrl will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
3	APPS_RIVA_WLAN_SMSM_IRQ_ENABLE	When set, i_apps_riva_wlan_smsm_irq will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
2	APSS_RIVA_RESET_REQ_ENABLE	When set, i_apss_riva_reset_req will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
1	APPS_RIVA_SPARE_INTR_ENABLE	When set, i_apps_riva_spare_intr will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000
0	APPS_RIVA_LTECOEX_INTR_ENABLE	When set, i_apps_riva_ltecoex_intr will set acpu_riva_wakeup_irq interrupt. Reset State: 0x00000000

0x30000C0 PMU_ACPU_WAKEUP_INT_STS

Type: read-only
Reset State: 0x00000000

The (enable masked) status of all inputs generating acpu_riva_wakeup_irq interrupt; This is sticky status until cleared; Read-Only

PMU_ACPU_WAKEUP_INT_STS

Bits	Name	Description
12	CPSS_RIVA_INT_STATUS	When set, it indicates that the cpss_riva_int caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
11	PMIC_RIVA_INT_STATUS	When set, it indicates that the pmic_riva_int caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
10	TLMM_RIVA_INT_STATUS	When set, it indicates that the tlmm_riva_int caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
9	LPASS_RIVA_INT_STATUS	When set, it indicates that the lpass_riva_int caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
8	MSS_RIVA_INT_STATUS	When set, it indicates that the mss_riva_int caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
7	APPS_RIVA_WLAN_CTRL_STATUS	When set, it indicates that the i_apps_riva_wlan_ctrl caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
6	APPS_RIVA_HCI_STATUS	When set, it indicates that the i_apps_riva_hci caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
5	APPS_RIVA_FM_CTRL_STATUS	When set, it indicates that the i_apps_riva_fm_ctrl caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
4	APPS_RIVA_LOG_CTRL_STATUS	When set, it indicates that the i_apps_riva_log_ctrl caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
3	APPS_RIVA_WLAN_SMSM_IRQ_STATUS	When set, it indicates that the i_apps_riva_wlan_smsm_irq caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
2	APSS_RIVA_RESET_REQ_STATUS	When set, it indicates that the i_apss_riva_reset_req caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
1	APPS_RIVA_SPARE_INTR_STATUS	When set, it indicates that the i_apps_riva_spare_intr caused the acpu_riva_wakeup_irq. Reset State: 0x00000000
0	APPS_RIVA_LTECOEX_INTR_STATUS	When set, it indicates that the i_apps_riva_ltecoex_intr caused the acpu_riva_wakeup_irq. Reset State: 0x00000000

0x30000C4 PMU_ACPU_WAKEUP_INT_CLR

Type: write-only
Reset State: 0x00000000

This register clears the bits in status register acpu_wakeup_int_sts; Write-Only

PMU_ACPU_WAKEUP_INT_CLR

Bits	Name	Description
12	CPSS_RIVA_INT_CLR	When set, it clears the cpss_riva_int status; Self-clearing bit. Reset State: 0x00000000
11	PMIC_RIVA_INT_CLR	When set, it clears the pmic_riva_int status; Self-clearing bit. Reset State: 0x00000000
10	TLMM_RIVA_INT_CLR	When set, it clears the tlmm_riva_int status; Self-clearing bit. Reset State: 0x00000000
9	LPASS_RIVA_INT_CLR	When set, it clears the lpass_riva_int status; Self-clearing bit. Reset State: 0x00000000
8	MSS_RIVA_INT_CLR	When set, it clears the mss_riva_int status; Self-clearing bit. Reset State: 0x00000000
7	APPS_RIVA_WLAN_CTRL_CLR	When set, it clears the i_apps_riva_wlan_ctrl status; Self-clearing bit. Reset State: 0x00000000
6	APPS_RIVA_HCI_CLR	When set, it clears the i_apps_riva_hci status; Self-clearing bit. Reset State: 0x00000000
5	APPS_RIVA_FM_CTRL_CLR	When set, it clears the i_apps_riva_fm_ctrl status; Self-clearing bit. Reset State: 0x00000000
4	APPS_RIVA_LOG_CTRL_CLR	When set, it clears the i_apps_riva_log_ctrl status; Self-clearing bit. Reset State: 0x00000000
3	APPS_RIVA_WLAN_SMSM_IRQ_CLR	When set, it clears the i_apps_riva_wlan_smsm_irq status; Self-clearing bit. Reset State: 0x00000000
2	APSS_RIVA_RESET_REQ_CLR	When set, it clears the i_apss_riva_reset_req status; Self-clearing bit. Reset State: 0x00000000
1	APPS_RIVA_SPARE_INTR_CLR	When set, it clears the i_apps_riva_spare_intr status; Self-clearing bit. Reset State: 0x00000000
0	APPS_RIVA_LTECOEX_INTR_CLR	When set, it clears the i_apps_riva_ltecoex_intr status; Self-clearing bit. Reset State: 0x00000000

0x30000C8 PMU_ROOT_CLK_OUT_SEL

Type: read-write
Reset State: 0x00000000

Root clock sel control

PMU_ROOT_CLK_OUT_SEL

Bits	Name	Description
5	ROOT6_CLK_OUT_SEL	clock root6 out_sel. This bit selects which internal divider provides the source to the Riva root6 clock tree 0: src0 branch is selected 1: src1 branch is selected Reset State: 0x00000000
4	ROOT5_CLK_OUT_SEL	clock root5 out_sel. This bit selects which internal divider provides the source to the Riva root5 clock tree 0: src0 branch is selected 1: src1 branch is selected Reset State: 0x00000000
3	ROOT4_CLK_OUT_SEL	clock root4 out_sel. This bit selects which internal divider provides the source to the Riva root4 clock tree 0: src0 branch is selected 1: src1 branch is selected Reset State: 0x00000000
2	ROOT3_CLK_OUT_SEL	clock root3 out_sel. This bit selects which internal divider provides the source to the Riva root3 clock tree 0: src0 branch is selected 1: src1 branch is selected Reset State: 0x00000000
1	ROOT2_CLK_OUT_SEL	clock root2 out_sel. This bit selects which internal divider provides the source to the Riva root2 clock tree 0: src0 branch is selected 1: src1 branch is selected Reset State: 0x00000000
0	ROOT1_CLK_OUT_SEL	clock root1 out_sel. This bit selects which internal divider provides the source to the Riva root1 clock tree 0: src0 branch is selected 1: src1 branch is selected Reset State: 0x00000000

0x30000CC PMU_WLAN_POWER_MEASURE_MASK

Type: read-write
Reset State: 0x00000000

wlan_power_measure_mask control: Used to generate a masked vector

PMU_WLAN_POWER_MEASURE_MASK

Bits	Name	Description
4:0	WLAN_POWER_MEASURE_MASK	bit mask for wlan_power_tbusl Reset State: 0x00000000

0x30000D0 PMU_WLAN_POWER_MEASURE_MATCH

Type: read-write
Reset State: 0x00000000

wlan_power_measure_match control: Used to compare the masked vector with a programmable vector and derive a trigger

PMU_WLAN_POWER_MEASURE_MATCH

Bits	Name	Description
4:0	WLAN_POWER_MEASURE_MATCH	bit match for wlan_power_tbusl Reset State: 0x00000000

16.2.34 riva_saw2

0x3000000 RIVA_SAW2_SAW2_SECURE

Type: read-write
Reset State: 0x00000000

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus security status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to '0' the state of the SAW2_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to '1' the SAW2_SECURE register security treatment bit of that register must be '1' for access to be granted. If the security treatment bit of the register is set to '0' the non-secure (ahb_saw_hprotns = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled. When reading the SAW2_SECURE register, non-secure agents will always read '0' Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

RIVA_SAW2_SAW2_SECURE

Bits	Name	Description
2	SAW_CTL	0x1: NSEC 0: SEC Controls security treatment for the AVS. registers: SAW2_AVS_CTL, SAW2_VLVL Reset State: 0x00000000

RIVA_SAW2_SAW2_SECURE (cont.)

Bits	Name	Description
1	PWR_CTL	0x1: NSEC 0: SEC Controls security treatment for SPM registers: SAW2_SPM_CTL,SAW2_SPM_PMIC_CTL, SAW2_SPM_PMIC_DLY,SAW2_SPM_SLP_SEQ_ENTRY_n Reset State: 0x00000000
0	VLT_CTL	0x1: NSEC 0: SEC Controls security treatment for SAW2 registers: SAW2_TMR_CFG,SAW2_STS Reset State: 0x00000000

0x3000004 RIVA_SAW2_SAW2_ID

Type: read-only
Reset State: 0x40910000

This read only register reports the revision and parameter information for the SAW2 core.

RIVA_SAW2_SAW2_ID

Bits	Name	Description
30:25	NUM_SPM_ENTRY	SAW2 parameter: Indicates number of SAW2_SPM_SLP_SEQ_ENTRY register implemented. Value can range from 1 - 32 Reset State: 0x00000020
24:20	NUM_PWR_CTL	SAW2 parameter: Indicates number of power control implemented. Value can range from 2 - 16 Reset State: 0x00000009
18	PMIC_ARB_INTF	SAW2 parameter: Indicates PMIC Arbiter Interface function is implemented Reset State: 0x00000000
17	AVS_PRESENT	SAW2 parameter: Indicates AVS. function is implemented Reset State: 0x00000000
16	SPM_PRESENT	SAW2 parameter: Indicates SPM function is implemented Reset State: 0x00000001
7:4	MAJOR	Major variant Reset State: 0x00000000
3:0	MINOR	Minor variant Reset State: 0x00000000

0x3000008 RIVA_SAW2_SAW2_CFG

Type: read-write
Reset State: 0x00000000

The SAW2_CFG register is used to configure the common control between AVS. and SPM.system.

RIVA_SAW2_SAW2_CFG

Bits	Name	Description
12	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON. Reset State: 0x00000000
11:8	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port. Reset State: 0x00000000
5	PMIC_MODE	PMIC Handshake 0: 8K_PMIC (only DONE signal) 1: 7K_PMIC (both ACK and DONE signals) Reset State: 0x00000000
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period. 00000: Timer Tick every sys_ref_clk ..... 11111: Timer Tick every 128 sys_ref_clk. For sys_ref_clk = 20 MHz (53ns) The timer tick range 53 ns to 1.6us. Reset State: 0x00000000

0x300000C RIVA_SAW2_SAW2_STS_0

Type: read-only
Reset State: 0x00000000

This read only register provides software with SAW2 status.

RIVA_SAW2_SAW2_STS_0

Bits	Name	Description
31:27	SPM_STATE	Actual initial value is 'x'. State of the SPM FSM. Reset State: 0x00000000
24:16	CURR_PWR_CTL	Power Control Outputs. Reset State: 0x00000000
15	SHTDWN_REQ	This bit reflects the shutdown request from the SPM (spm_rpm_shutdown_req) to RPM. Reset State: 0x00000000
14	SHTDWN_ACK	This bit reflects the shutdown acknowledgement from the RPM (rpm_spm_shutdown_ack) to SPM. Reset State: 0x00000000
13	BRNGUP_REQ	This bit reflects the bringup request from the SPM (spm_rpm_bringup_req) to RPM. Reset State: 0x00000000

RIVA_SAW2_SAW2_STS_0 (cont.)

Bits	Name	Description
11:10	PMIC_STATE	State of the PMIC FSM: 00: IDLE (waiting for PMIC transaction from AVS. or SPM) 01: ACK (waiting for ACK from PMIC Arb) 10: DONE (waiting for DONE form PMIC Arb before transitions back to IDLE) 11: DELAY (waiting for delay count termination before transitions back to IDLE) This bit reflects the bringup acknowledgement from the RPM (rpm_spm_bringup_ack) to SPM. Reset State: 0x00000000
9:8	RPM_STATE	State of the RPM FSM: 00: RUN (waiting for SPM request) 01: STDNACK (waiting for shutdown ACK from RPM) 10: WAKEUP (waiting for wakeup interrupt) 11: BGUPACK (waiting for bringup ACK from RPM) Reset State: 0x00000000
7	AVS_STATE	State of the AVS. FSM: 0: IDLE (waiting to be enabled or for next UP/DOWN indication) 1: REQ (waiting for PMIC FSM to transition to IDLE) Reset State: 0x00000000
6:0	SPM_CMD_ADDR	Last SPM command executed. Reset State: 0x00000000

0x3000010 RIVA_SAW2_SAW2_STS_1

Type: read-only
Reset State: 0x00000000

This read only register provides software with SAW2 status.

RIVA_SAW2_SAW2_STS_1

Bits	Name	Description
30	SW_WR_PEND	Actual initial value is 'x'. This bit reflects the VLVL state of the request from the SAW2_VCTL write is pending. Reset State: 0x00000000
29	CPU_UP	Actual initial value is 'x'. This bit reflects the VLVL state of the request from the CPU (avs_saw_up) to raise the VLVL. Reset State: 0x00000000
28	CPU_DN	Actual initial value is 'x'. This bit reflects the VLVL state of the request from the CPU (avs_saw_down) to lower the VLVL. Reset State: 0x00000000

RIVA_SAW2_SAW2_STS_1 (cont.)

Bits	Name	Description
27	MAX_INT	Actual initial value is 'x'. IRQ status bit, AVS. controller detected that raising the VLVL by AVS_CTL[VLVL_STEP] would result in a value greater than AVS_CTL[MAX_VLVL]. If AVS_CTL[IRQ_MAX_EN] is set, an interrupt is issued. NOTE that software can set MAX_VLVL lower than current VLVL creating a condition where VLVL is higher than MAX_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MAX. Reset State: 0x00000000
26	MIN_INT	Actual initial value is 'x'. IRQ status bit, AVS. controller detected that lowering the VLVL by SAW2_AVS_CTL[VLVL_STEP] would result in a value less than SAW2_AVS_CTL[MIN_VLVL]. If SAW2_AVS_CTL[IRQ_MIN_EN] is set, an interrupt is issued. NOTE that software can set MIN_VLVL higher than current VLVL creating a condition where VLVL is lower than MIN_VLVL. The AVS. controller can not correct VLVL. However, this condition will set IRQ_MIN. Reset State: 0x00000000
25:16	CURR_DLY	VLVL value of the counter used to calculate the time until the next AVS. controller request for a new VLVL. Reset State: 0x00000000
7:0	CURR_PMIC_DATA	Actual initial value is 'x'. Last PMIC DATA sent to the PMIC Arbiter (and the PMIC). Reset State: 0x00000000

0x3000014 RIVA_SAW2_SAW2_VCTL

Type: read-write
Reset State: 0x00000000

Though this register is read/writable, it also causes a command pulse to the PMIC FSM. Writing this register results in a transaction to the PMIC with SAW2_VCTL being sent to the PMIC. SAW2 support both 8901 and 8058 regulator.

RIVA_SAW2_SAW2_VCTL

Bits	Name	Description
7:0	PMIC_DATA	Actual initial value is 'x'. PMIC DATA sent to the PMIC Arbiter Reset State: 0x00000000

0x3000018 RIVA_SAW2_SAW2_AVS_CTL

Type: read-write
Reset State: 0x00000000

The SAW2_AVS_CTL register is used to control the Adaptive Voltage Scaling (AVS) system. Not used for Riva.

RIVA_SAW2_SAW2_AVS_CTL

Bits	Name	Description
30	VLVL_WIDTH	Defines the VLVL field of PMIC data. SAW2 at minimum supports 8901 and 8058 regulator. See PMIC document for details. 0: 5 bits VLVL (8058 regulator) 1: 6 bits VLVL (8901 regulator) Reset State: 0x00000000
29:28	VLVL_STEP	Controls the step size of each request to PMIC Arbiter. software may use values from 0 to 3. Note that the value 0 will result in no change - that is if the CPU requests UP or DOWN, the CURR_PVLVL will be sent to the PMIC Arbiter. This may be useful for debug. If an increment or decrement operation would cause the current VLVL to transition above or below the MAX_VLVL or MIN_VLVL, the current VLVL will not be changed. An interrupt will be signaled if IRQ_MAX/MIN_EN is 1 Reset State: 0x00000000
27	EN	AVS. Enable. 0: Disable AVS. 1: Enable AVS. NOTE: setting to 0 does not disable any pending interrupts. NOTE: AVS. FSM and SPM FSM are mutually exclusive. Only one FSM is active at a time. software does not have to disable AVS. before going to sleep. Reset State: 0x00000000
26	SW_DONE_INT_EN	Set to 1 to turn on AVS. interrupt for when a software initiated voltage change has completed. Set to 0 to mask it (turn it off). ASSERTION: This interrupt is asserted only after a software write to SAW2_AVS_VLVL. Specifically, after the AVS. FSM traverses through all its states and transitions back to IDLE, the interrupt line is pulsed. The interrupt controller should be set to edge capture to receive this interrupt. CLEARING: None. This interrupt is a pulse, software does not need to clear it (aside from requirements of the interrupt controller). Reset State: 0x00000000
25	MAX_INT_EN	Set to 1 to turn on AVS. interrupt for MAX_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be greater than MAX_VLVL. CLEARING: software may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit. Reset State: 0x00000000
24	MIN_INT_EN	Set to 1 to turn on AVS. interrupt for MIN_VLVL. Set to 0 to disable interrupt. ASSERTION: When on, the AVS. Controller interrupts the processor when a new VLVL would be smaller than MIN_VLVL. CLEARING: software may cause this interrupt to de-assert by a. changing the MAX_VLVL or b. changing AVS_VLVL, or c. disabling the interrupt with this bit Reset State: 0x00000000

RIVA_SAW2_SAW2_AVS_CTL (cont.)

Bits	Name	Description
22:17	MAX_VLVL	Control maximum value of AVS. controller's VLVL. When current VLVL reaches this value it may not grow any larger. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level higher, an interrupt is issued. This value may be updated at anytime. Setting to a value lower than MIN_VLVL is not supported, and unpredictable results may occur. Reset State: 0x00000000
15:10	MIN_VLVL	Control the minimum value of AVS. controller's VLVL. When the current VLVL reaches this level it may not shrink any smaller. If IRQ_EN is set to 1 and the AVS. controller needs to raise the level lower, an interrupt is issued. This value may be updated at anytime. Setting to a value higher than MAX_VLVL is not supported, and unpredictable results may occur. Reset State: 0x00000000
9:0	AVS_DELAY	Control the time between AVS. controller's requests to change the VLVL Reset State: 0x00000000

0x300001C RIVA_SAW2_SAW2_AVS_HYSTERESIS

Type: read-write
Reset State: 0x00000000

The SAW2_AVS_HYSTERESIS register is used to delay the AVS. UP/DN signal to AVS. FSM. This is used to prevent the false PMIC step due to PDN noise.

RIVA_SAW2_SAW2_AVS_HYSTERESIS

Bits	Name	Description
23:16	DN_COUNT	HYSTERESIS DN COUNT. Delays of PMIC DN step operation. Reset State: 0x00000000
7:0	UP_COUNT	HYSTERESIS UP COUNT. Delays of PMIC UP step operation. Reset State: 0x00000000

0x3000020 RIVA_SAW2_SAW2_SPM_CTL

Type: read-write
Reset State: 0x00000000

The SAW2_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

RIVA_SAW2_SAW2_SPM_CTL

Bits	Name	Description
10:4	SPM_START_ADR	Start address for the SPM sequence. Reset State: 0x00000000
3	ISAR	Inhibit Start Address Reset 0: End of program reset the SPM_START_ADR to zero. 1: Inhibit End of program to reset SPM_START_ADR Reset State: 0x00000000
2:1	WAKEUP_CONFIG	Wakeup Configuration 00: sys_spm_wakeup 01: sys_spm_wakeup or !cpu_spm_wait_req 10: sys_spm_wakeup or rising edge of sys_saw_dbg_stay_awake 11: sys_spm_wakeup or !cpu_spm_wait_req or rising edge of sys_saw_dbg_stay_awake Reset State: 0x00000000
0	SPM_EN	SPM En. Reset State: 0x00000000

0x3000024 RIVA_SAW2_SAW2_SPM_PMIC_DLY

Type: read-write
Reset State: 0x00000000

This register provide the PMIC delay values after SPM FSM PMIC transaction. SPM wait for the programmed delay before executing the next SPM command.

RIVA_SAW2_SAW2_SPM_PMIC_DLY

Bits	Name	Description
26:24	DATA_1_VLVL1_DLY	Actual initial value is 'x'. PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms Reset State: 0x00000000
18:16	DATA_1_VLVL0_DLY	Actual initial value is 'x'. PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_1[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms Reset State: 0x00000000
10:8	DATA_0_VLVL1_DLY	Actual initial value is 'x'. PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL1] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms Reset State: 0x00000000

RIVA_SAW2_SAW2_SPM_PMIC_DLY (cont.)

Bits	Name	Description
2:0	DATA_0_VLVL0_DLY	Actual initial value is 'x'. PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_0[VLVL0] and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms Reset State: 0x00000000

0x3000028 RIVA_SAW2_SAW2_SPM_PMIC_DATA_0

Type: read-write
Reset State: 0x00000000

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

RIVA_SAW2_SAW2_SPM_PMIC_DATA_0

Bits	Name	Description
31:16	VLVL1	Actual initial value is 'x'. Actual configurable bit width is $PMIC_DATA_WIDTH+15:16. PMIC DATA sent to the PMIC Arbiter Reset State: 0x00000000
15:0	VLVL0	Actual initial value is 'x'. Actual configurable bit width is $PMIC_DATA_WIDTH-1:0. PMIC DATA sent to the PMIC Arbiter Reset State: 0x00000000

0x300002C RIVA_SAW2_SAW2_SPM_PMIC_DATA_1

Type: read-write
Reset State: 0x00000000

This register provide the PMIC data values for SPM FSM PMIC transaction. Refer to PMIC documentation for the detail definition.

RIVA_SAW2_SAW2_SPM_PMIC_DATA_1

Bits	Name	Description
31:16	VLVL1	Actual initial value is 'x'. Actual configurable bit width is $PMIC_DATA_WIDTH+15:16. PMIC DATA sent to the PMIC Arbiter Reset State: 0x00000000
15:0	VLVL0	Actual initial value is 'x'. Actual configurable bit width is $PMIC_DATA_WIDTH-1:0. PMIC DATA sent to the PMIC Arbiter Reset State: 0x00000000

0x3000030 RIVA_SAW2_SAW2_RST

Type: read-write
Reset State: 0x00000000

The SAW2_RST register is used to reset the SAW logic. This register clear itself. It does not reset any SAW2 CSRs. It reset AVS. and SPM FSM and control registers. This is use to clear any hang condition.

RIVA_SAW2_SAW2_RST

Bits	Name	Description
0	RST	Reset AVS. and SPM FSM and control registers. Reset State: 0x00000000

0x3000080+0x4*n RIVA_SAW2_SAW2_SPM_SLP_SEQ_ENTRY_n, n=[0..31]

Type: read-write
Reset State: 0x00000000

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter. n = [0..31] $clog_pwr_ctl+3:4 3:2 1 0 Command ---------- ---------- ---------- Toggle PWR_CTL bit n Dly(0,1,2,4...64) * Tick 0 Toggle Output Power control bit n X PMIC Sel 0 1 PMIC operation X 00 1 1 Sleep without RPM handshake X 01 1 1 Sleep with RPM handshake X 11 1 1 End of program

RIVA_SAW2_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description
31:24	CMD3	Actual initial value is 'x'. SPM PWR CMD3 Reset State: 0x00000000
23:16	CMD2	Actual initial value is 'x'. SPM PWR CMD2 Reset State: 0x00000000
15:8	CMD1	Actual initial value is 'x'. SPM PWR CMD1 Reset State: 0x00000000
7:0	CMD0	Actual initial value is 'x'. SPM PWR CMD0 Reset State: 0x00000000

16.2.35 adu

0x3000000 ADU_CONTROL

Type: read-write
Reset State: 0x0BFF0002

Contains configuration information for the adu

ADU_CONTROL

Bits	Name	Description
31:24	NEXT_WQ	This field indicates the WQ that the ADU will push the frames to after they have been processed. This field is only used when 'push_wq_selection_mode' is set to '1'. Reset State: 0x0000000B
23:16	WOW_WQ	This field indicates the WQ that the ADU will push the frames during WOW mode. This field is only used when 'push_wq_selection_mode' is set to '1'. Reset State: 0x000000FF
15	REG_REINIT_ERR_STATE_CFG	When set, ADU reg reinit FSM will go back to idle instead of staying in error state. Reset State: 0x00000000
13	REG_REINIT_GOTO_IDLE	When set, ADU reg reinit FSM (BPS, MIMO) will go to idle. Reset State: 0x00000000
8	CLEAR_TIMEOUT_CNT	Writing a '1' will reset the timeout counter and clear timeout error interrupt. Always read 0. Reset State: 0x00000000
7	DISABLE_LENGTH_CHECK	When set, the ADU will not check the subframe length error Reset State: 0x00000000
6	PUSH_WQ_SELECTION_WOW_MODE	This field controls where the ADU finds the index for the WQ to which the processed frames need to be pushed to in WOW mode. This bit should be set (a 0->1 transition) prior to WOW mode to select the WOW_WQ. Upon the assertion of dpu_wakeuphost, ADU will push to the normal WQ. 0: ADU will push the frame to the WQ that is selected by the push_wq_selection_mode 1: ADU will push the frame to the WQ that is indicate in the 'WOW_ WQ' field in this register Reset State: 0x00000000
5	ADU_ERROR_EXIT	Writing a '1' will clear the interrupts and ADU will go back to IDLE from ERROR_STATE. Always read 0 Reset State: 0x00000000
4	ADU_BYPASS_OPTION_ENABLE	When set, ADU will immediately forward the frame and NOT check if the frame is AMSDU Reset State: 0x00000000

ADU_CONTROL (cont.)

Bits	Name	Description
3	CLEAR_COUNTERS	When set, the ADU packet counters are cleared To re-enable theL counters, this bit needs to be cleared again Reset State: 0x00000000
2	DISABLE_HT_FIELD_DETECTION	When set, the ADU will NOT check for the presence of the HT control field Reset State: 0x00000000
1	PUSH_WQ_SELECTION_MODE	This field controls where the ADU finds the index for the WQ to which the processed frames need to be pushed to. 0: ADU will push the frame to the WQ that is indicated in the 'ADU/DPU routing flag' in the BD descriptor. 1: ADU will push the frame to the WQ that is indicate in the 'Next WQ' field in this register Reset State: 0x00000001
0	ADU_ENABLE	When set, the ADU is enabled. When the adu gets disabled in the middle of a transfer, it will finish the ongoing transfer. Reset State: 0x00000000

0x3000004 ADU_INTERRUPT_STATUS

Type: read-only
Reset State: 0x00000000

Contains status information on what interrupt has been generated Note that the interrupt is only passed on to the mCPU when the error interrupt has been enabled in the 'ADU interrupt enable' register.

ADU_INTERRUPT_STATUS

Bits	Name	Description
15:14	RESERVED	The two bits are reserved. Reset State: 0x00000000
13	ADU_POLL_CMD_ERROR	When set, adu poll cmd reached retry timeout error occurred Reset State: 0x00000000
12	UMA_WRONG_WQ_ERROR	When set, adu uma tx push to its own WQ error occurred Reset State: 0x00000000
11	TIMEOUT_ERROR	When set, timeout error occurred Reset State: 0x00000000
10	WRONG_WQ_ERROR	When set, adu push to its own WQ error occurred Reset State: 0x00000000
9	INCORRECT_LINK_ERROR	When set, an incorrect BD/PDU link error occurred Reset State: 0x00000000

ADU_INTERRUPT_STATUS (cont.)

Bits	Name	Description
8	BAD_BD_TYPE_ERROR	When set, a bad bd type error occurred Reset State: 0x00000000
7	GAM_WRITE_ERROR	When set, a gam write error occurred Reset State: 0x00000000
6	SW_REG_REINIT_DONE	When set, the software triggered reg reinit is done Reset State: 0x00000000
5	DELIMITER_LENGTH_NOT_AVAIL_ERROR	When set, the adu was not able to extract the delimiter length from the frame Reset State: 0x00000000
4	GAM_READ_ERROR	When set, the gam reported a read error Reset State: 0x00000000
3	GBI_PUSH_ERROR	When set, the gbi reported an error while a push operation was ongoing Reset State: 0x00000000
2	MPDU_HEADER_NOT_IN_BD_ERROR	When set, the mpdu header was not located fully within the BD Reset State: 0x00000000
1	GBI_POP_ZERO_ERROR	When set, the gbi returned a NULL BD pointer when the BMU was indicating DA in its WQ. Reset State: 0x00000000
0	GBI_POP_ERROR	When set, the gbi reported an error while a pop operation was ongoing Reset State: 0x00000000

0x3000008 ADU_INTERRUPT_ENABLE

Type: read-write
Reset State: 0x00000000

Contains the enable bits for which interrupt has to be generated

ADU_INTERRUPT_ENABLE

Bits	Name	Description
15:14	ADU_RESERVED	The two bits are reserved Reset State: 0x00000000
13	ADU_POLL_CMD_ERROR_ENABLE	When set, adu poll cmd reach retry timeout error will generate error interrupt Reset State: 0x00000000
12	UMA_WRONG_WQ_ERROR_ENABLE	When set, adu uma tx push its own WQ error will generate error interrupt Reset State: 0x00000000

ADU_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
11	TIMEOUT_ERROR_ENABLE	When set, timeout error will generate error interrupt Reset State: 0x00000000
10	WRONG_WQ_ERROR_ENABLE	When set, adu push its own WQ error will generate error interrupt Reset State: 0x00000000
9	INCORRECT_LINK_ERROR_ENABLE	When set, an incorrect BD/PDU link error will generate error interrupt Reset State: 0x00000000
8	BAD_BD_TYPE_ERROR_ENABLE	When set, a bad bd type error will generate error interrupt Reset State: 0x00000000
7	GAM_WRITE_ERROR_ENABLE	When set, a gam write error will generate an adu error interrupt Reset State: 0x00000000
6	SW_REG_REINIT_DONE_ENABLE	When set, when the software triggered reg reinit is done the interrupt will be generated Reset State: 0x00000000
5	DELIMITER_LENGTH_NOT_AVAIL_ERROR_ENABLE	When set, and the adu was not able to extract the delimiter length from the frame an adu error interrupt will be generated Reset State: 0x00000000
4	GAM_READ_ERROR_ENABLE	When set, and the gam reported a read error an adu error interrupt will be generated Reset State: 0x00000000
3	GBI_PUSH_ERROR_ENABLE	When set, and the gbi reported an error while a push operation was ongoing, an adu error interrupt will be generated Reset State: 0x00000000
2	MPDU_HEADER_NOT_IN_BD_ERROR_ENABLE	When set, and the mpdu header was not located fully within the BD an adu error interrupt will be generated Reset State: 0x00000000
1	GBI_POP_ZERO_ERROR_ENABLE	When set, and the gbi returned a NULL BD pointer when the BMU was indicating DA in its WQ, an adu error interrupt will be generated Reset State: 0x00000000
0	GBI_POP_ERROR_ENABLE	When set, and the gbi reported an error while a pop operation was ongoing, an adu error interrupt will be generated Reset State: 0x00000000

0x300000C ADU_ADU_TEST_CTRL

Type: read-write
Reset State: 0x00000004
