Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x44301003

DDR DRAM Timing Register 0_ALT

This register contains parameters which are specified by the memory vendor in ns. The alternate/shadow register is DDR_DRAM_TIMING_0 and gets used during HW frequency switch.

This register holds the SDRAM timing parameters. The value of the settings is in clock cycles and may vary from one SDRAM vendor to another. The value that should be selected for each field is:

the number_of_clock_cycles of the vendor's specified value.

An example:

When the vendor's specification states tRCD = 44nS and the SDRAM clock rate = 166 MHz, the calculations are:

1. 1/166 MHz = 6nS.
2. 44nS/6nS = 7.33 clocks.
3. 7.33 clocks rounds up to 8 clocks.

Therefore, the value of RASmin_timer should be written as 4'b1000.

EBI1_CH1_DDR_DRAM_TIMING_0_ALT

Bits	Name	Description
31:29	TRTP	SW: RW, HW: R This is not the same as the memory timing parameter tRTP. Number of Additional clock cycles between a Read and a Precharge command to the same page with actual BL/2 as the initial base delay. This needs to be set depending on the memory device present. For LPDDR, this needs to be set to at least 2 cycles. For LPDDR2-S2, use MAX(2, "tRTP (memory timing parameter in ddr1x clock cycles) -1") For LPDDR2-S4, use MAX(2, "tRTP (memory timing parameter in clock cycles) -2") For PCDDR2, use MAX(2, "tRTP (memory timing parameter in clock cycles) -2") For PCDDR3, use MAX(2, "tRTP (memory timing parameter in clock cycles) -4") 0x0: RESERVED_1 0x1: RESERVED_2 0x2: Additional 2 clock cycles (default) 0x3: Additional 3 clock cycles 0x4: Additional 4 clock cycles 0x5: Additional 5 clock cycles 0x6: Additional 6 clock cycles 0x7: Additional 7 clock cycles
28:24	TFAW	SW: RW, HW: R Programmable rolling window during which the number of activations should not exceed the CSR field - max_num_activations_tFAW. This needs to be set based on the specific SDRAM device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: RESERVED_4 0x4: MIN_CC (4 cycles default)
23:20	TRCD	SW: RW, HW: R Number of clock cycles from activate to column command (same bank). This needs to be set based on the specific SDRAM device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
19:16	RESERVED_19_16	

EBI1_CH1_DDR_DRAM_TIMING_0_ALT (cont.)

Bits	Name	Description
15:12	TRRD	SW: RW, HW: R Number of clock cycles between Activate to Activate (different banks on same chip select). This needs to be set based on the specific SDRAM device. 0x0: RESERVED 0x1: MIN_CC (1 cycle default)
11:9	PWR_DOWN_ODT_OFF_MAX_MIN_DIFF	SW: RW, HW: R Number of clock cycles specifying the difference in the power down ODT off max/min timing parameter. For PCDDR2 & PCDDR3, this is rounded up version in ddr1x clock cycles of (tAOFPDmax - tAOFPDmin).
8:7	RESERVED_8_7	
6:5	TZQCL_MSB	SW: RW, HW: R The complete value of tZQCL timer is {tZQCL_MSB, tZQCL}. tZQCL is from DDR_DRAM_TIMING_7 CSR. Number of ddr1x clock cycles required for the long calibration sequence to execute. ZQ Calibration commands are only supported by LPDDR2 and PCDDR3 devices. For LPDDR2, this is the timing parameter - tZQCL and for PCDDR3, this is the timing parameter tZQoper.
4:0	TRAS_MIN	SW: W, HW: R Number of clocks cycles between Active and Precharge (same bank). This needs to be set based on the specific SDRAM device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

DDR Timing Parameters Register 3_ALT

This register contains parameters which are specified by the memory vendor in ns. The alternate/shadow register is DDR_DRAM_TIMING_3 and gets used during HW frequency switch.

EBI1_CH1_DDR_DRAM_TIMING_3_ALT

Bits	Name	Description
31:28	PD_EXIT_DURATION_ODT	SW: RW, HW: R This specifies the amount of time after a powerdown exit (which qualifies as asynchronous ODT for PCDDR2/3 devices) for which the column commands will be blocked to avoid large ODT on/off timing ranges. For PCDDR3 devices, this needs to be programmed to the timing parameter tXPDLL delay in ddr1x clock cycles. For PCDDR2 devices, this needs to be programmed to the timing parameter tAXPD delay in ddr1x clock cycles. For LPDDR1/2 devices, leave this field as POR value. The MSB value of this timer is PD_EXIT_DURATION_ODT_MSB.
27:24	TWTR	SW: RW, HW: R tWTR delay in clock cycles. 0x1: 1Cycle (default)
23	PD_EXIT_DURATION_ODT_MSB	SW: RW, HW: R The MSB bit for PD_EXIT_DURATION_ODT. This is required for PCDDR3 at higher frequencies.
22:19	TWR	SW: RW, HW: R Number of clocks from last data word to precharge
18:9	TXSRD	SW: RW, HW: R Number of clock cycles between self refresh exit and next valid Read command. The value is based on the specific SDRAM device present. For PCDDR3, this needs to be programmed with tXSDLL timing parameter. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
8	RESERVED_8	Reserved
7:0	TXSNR	SW: RW, HW: R Number of clock cycles between self refresh exit and next valid Non-Read command. The value is based on the specific SDRAM device present. For LPDDR1/2 devices, the value programmed in TXSNR should be the same as in TXSRD. The different parameters are required for SDRAM devices with DLL's - PCDDR2/3. For PCDDR3, this needs to be programmed with tXS timing parameter. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

DDR Timing Parameters Register 4_ALT

This register contains parameters which are specified by the memory vendor in ns. The alternate/shadow register is DDR_DRAM_TIMING_4 and gets used during HW frequency switch.

EBI1_CH1_DDR_DRAM_TIMING_4_ALT

Bits	Name	Description
31:24	TRFC	SW: RW, HW: R Number of clock cycles between auto-refresh command and the next activate command. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
23:20	TMOD	SW: RW, HW: R Specifies the timing parameter TMOD in ddr1x clock cycles for PCDDR2/3 devices.
19:16	TXPNR_ACT_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next valid non-read command. This value gets used only if the Power down state was active power down. This distinction is required for PCDDR devices where in a slow/fast exit option in the Mode Register could potentially mean different timers for read commands (which require a DLL) Vs. a non-read command. For PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. For LPDDR1/2 program this to "tXPNR" if available, else set to "tXP". For PCDDR3, set this to "tXP". 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)

EBI1_CH1_DDR_DRAM_TIMING_4_ALT (cont.)

Bits	Name	Description
15:12	TXPR_ACT_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next read command. This value gets used only if the Power down state was active power down. For PCDDR2, if Mode register for "Active Power Down Exit Time" is programmed to "fast exit", set this to memory timing parameter "tXARD", else program this to "tXARDS". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. For LPDDR1/2, program this to "tXPR" if available, else set to "tXP". For PCDDR3, set this to "tXP". 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
11:8	TXPNR_PCHG_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next non-read command. This value gets used only if the Power down state was precharge power down. For PCDDR3, if ODT is enabled and the Mode register for "DLL control for Precharge PD" is programmed to "fast exit", set this to memory timing parameter "tXPDLL", else program this to "tXP". For LPDDR1/2 & PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. The MSB bit for this is from TXPNR_PCHG_PWR_DOWN_MSB. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
7:4	TXPR_PCHG_PWR_DOWN	SW: RW, HW: R Number of clock cycles between power down exit and next read command. This value gets used only if the Power down state was precharge power down. For PCDDR3, if Mode register for "DLL control for Precharge PD" is programmed to "fast exit", set this to memory timing parameter "tXP", else program this to "tXPDLL". For LPDDR1/2 & PCDDR2, program this to "tXPNR" if available, else set to "tXP". Additionally for PCDDR2 devices, if ODT is enabled then the value in this field needs to be >= tAXPD. The MSB bit for this is from TXPR_PCHG_PWR_DOWN_MSB. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: MIN_CC (2 cycles default)
3:2	RESERVED_3_2	Reserved
1	TXPNR_PCHG_PWR_DOWN_MSB	SW: RW, HW: R The MSB bit for TXPNR_PCHG_PWR_DOWN. This is required for PCDDR3 at higher frequencies.
0	TXPR_PCHG_PWR_DOWN_MSB	SW: RW, HW: R The MSB bit for TXPR_PCHG_PWR_DOWN. This is required for PCDDR3 at higher frequencies.

DDR Timing Parameters Register 5_ALT

This register contains parameters which are specified by the memory vendor in ns. The alternate/shadow register is DDR_DRAM_TIMING_5 and gets used during HW frequency switch.

EBI1_CH1_DDR_DRAM_TIMING_5_ALT

Bits	Name	Description
31:24	SELF_RFSH_MIN_DURATION	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles the SDRAM device is required to remain in self refresh mode once a self refresh command is registered. For LPDDR1, this is specified as tRFC, for LPDDR2, this is specified as tCKESR, for PCDDR2/3, this is specified as tCKE. Based on current implementation, the design waits this CSR field plus DDR_DRAM_TIMING_5[CLK_RESTART_BEFORE_SELF_RFSH_EXIT] plus 2 ddr1x cycles at least before coming out of self refresh.
23	RESERVED_23	Reserved
22:20	CLK_STOP_AFTER_SELF_RFSH_ENTRY	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles after the Self Refresh command is registered that the external clock to the memory device needs to run before it can be turned off. For LPDDR1/2 and PCDDR2 SDRAM devices, this should be set to "1", for PCDDR3 SDRAM devices, this should be set to "tCKSRE"
19:16	CLK_RESTART_BEFORE_SELF_RFSH_EXIT	SW: RW, HW: R This specifies the minimum number of ddr1x clock cycles the memory clock is required to be stable/re-started before CKE can go high to indicate a self refresh exit. Based on the memory device alone, for LPDDR1, this is at least "1", for LPDDR2, this needs to be set to at least 2 clock cycles. For PCDDR2 SDRAM devices, this should be set to "1", for PCDDR3 SDRAM devices, this should be set to "tCKSRX". This CSR field represents the lower 4 bits. The upper 4 bits are in CLK_RESTART_BEFORE_SR_EXIT_UPPER CSR field below. If the cur_mode in the pads is enabled and the system is configured to dynamically turn off the cur_mode during self refresh, then the 8-bit timer needs to be programmed such that it provides at least 100ns of pad settling time.

EBI1_CH1_DDR_DRAM_TIMING_5_ALT (cont.)

Bits	Name	Description
15:12	TRP_AB	SW: RW, HW: R Number of clocks from all bank precharge to Activate (same bank). This needs to be set based on the specific SDRAM device. For LPDDR1, PCDDR3 & 4-bank PCDDR2 devices, set this to timing parameter tRP. For 8-bank PCDDR2 devices, set this to tRP + 1*tck (in clock cycles). For LPDDR2 devices, set this to timing parameter tRPab. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)
11:8	CLK_RESTART_BEFORE_SR_EXIT_UPPER	SW: RW, HW: R These bits are the upper 4 bits for the CLK_RESTART_BEFORE_SELF_RFSH_EXIT CSR field above. The timer is 8 bits wide. If the cur_mode in the pads is enabled and the system is configured to dynamically turn off the cur_mode during self refresh, then the 8-bit timer needs to be programmed such that it provides at least 100ns of pad settling time.
7:4	TRP_PB	SW: RW, HW: R Number of clocks from per bank precharge to Activate (same bank). This needs to be set based on the specific SDRAM device. For LPDDR1, PCDDR3 & PCDDR2 devices, set this to timing parameter tRP. For LPDDR2 devices, set this to timing parameter tRPpb. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: RESERVED_3 0x3: MIN_CC (3 cycles default)

EBI1_CH1_DDR_DRAM_TIMING_5_ALT (cont.)

Bits	Name	Description
3:0	RD_LATENCY	SW: RW, HW: R Actual Rd Latency (from Chip select assertion to the clock edge where read data is expected - This will not be exactly equal to CAS latency from memory specs) For LPDDR1, use Read latency of 3(fixed), for LPDDR2, use Read latency of memory device + RU(tdqsckmax/tck) (RU - round up) where tck is the time period of the current ddr1x clock frequency of operation. For PCDDR2/3 devices, use the read latency of the device. 0x0: RESERVED_1 0x1: RESERVED_2 0x2: 2 cycles 0x3: 3 cycles (default) 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 7 cycles 0x8: 8 cycles 0x9: 9 cycles 0xA: 10 cycles 0xB: 11 cycles 0xC: 12 cycles 0xD: 13 cycles 0xE: 14 cycles 0xF: 15 cycles

0x00D8009C EBI1_CH1_DDR_UPDATE_FREQ_CHANGE_ALT

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x10000000

DDR Update Frequency Change ALT register.

This register contains parameters which are dependent on the frequency of operation. The fields in this register are valid only if DDR_CMD_EXEC_OPT_2[UPDATE_MEM_LATENCY_ON_FREQ_SWITCH] is set.

The original CSR field for WR_LATENCY below is DDR_DRAM_TIMING_6[WR_LATENCY].

The original CSR field for ODT_START_DELAY_RD/WR below is DDR_CMD_EXEC_OPT_3[ODT_START_DELAY_RD/WR].

The original CSR field for ODT_OFF_DELAY below is DDR_CMD_EXEC_OPT_3[ODT_OFF_DELAY].

The original CSR field for tANPD below is DDR_CMD_EXEC_OPT_3[tANPD].

EBI1_CH1_DDR_UPDATE_FREQ_CHANGE_ALT

Bits	Name	Description
31:28	WR_LATENCY	SW: RW, HW: R Actual Write Latency (from Chip select assertion to the clock edge where write data is driven - This will not be exactly equal to tWL latency from memory specs). For LPDDR1, use Write latency of 1 (fixed), for LPDDR2, use Write latency of device parameter tWL + 1. For PCDDR2/3 devices, use the write latency of the device. 0x0: RESERVED 0x1: 1 cycle (default) 0x2: 2 cycles 0x3: 3 cycles 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 7 cycles 0x8: 8 cycles 0x9: 9 cycles 0xA: 10 cycles 0xB: 11 cycles 0xC: 12 cycles 0xD: 13 cycles 0xE: 14 cycles 0xF: 15 cycles
27:22	RESERVED_27_22	Reserved
21:19	ODT_START_DELAY_WR	SW: RW, HW: R This delay only applies to the Rank ODT and not the controller ODT. Specifies the delay in ddr1x clock cycles between the DDR Write command and the ODT being driven high. Typically for PCDDR2 devices for writes, this should be set to (Write latency - tAOND) and for PCDDR3 devices for writes, this must be set to "1" for optimal settings. The above indicates the maximum value allowed for the ODT signal to be turned on/driven high w.r.t the write CAS command. Note that a value of "0" indicates that the ODT signal is turned on 1 cycle before the write CAS command. A value of "1" indicates that the ODT signal is turned on in the same cycle as the write CAS command and so on. The difference between the maximum value and the value programmed is required to be added as additional incremental delays to DDR_DRAM_TIMING_2[tOST], DDR_DRAM_TIMING_2[tRTW_SAME_RANK] and DDR_DRAM_TIMING_2[tRTW_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are MAX and MAX-1.

EBI1_CH1_DDR_UPDATE_FREQ_CHANGE_ALT (cont.)

Bits	Name	Description
18:16	ODT_START_DELAY_RD	SW: RW, HW: R This delay only applies to the Rank ODT and not the controller ODT. Specifies the delay in ddr1x clock cycles between the DDR Read command and the ODT being driven high. Typically for PCDDR2 devices for reads, this should be set to (Read latency - tAOND) and for PCDDR3 devices for reads, this must be set to (Read Latency - (Write Latency - 2)) for optimal settings. The above indicates the maximum value allowed for the ODT signal to be turned on/driven high w.r.t the read CAS command. Note that a value of "0" indicates that the ODT signal is turned on 1 cycle before the read CAS command. A value of "1" indicates that the ODT signal is turned on in the same cycle as the read CAS command and so on. The difference between the maximum value and the value programmed might need to be added as additional incremental delays to DDR_SM_TIMING_0[DLY_RD_DIFF_RANK], DDR_DRAM_TIMING_2[WR_TO_RD_DLY_DIFF_RANK] to avoid cases where in there is overlap among the different ODT signals. The values verified are MAX and MAX-1.
15:13	ODT_OFF_DELAY	SW: RW, HW: R This delay specifies the ODT off memory timing parameter for rank ODT. For PCDDR2, if DDR_CMD_EXEC_OPT_0[PWR_DOWN_EN] is 1'b0 then program this to the timing parameter, tAOFD. For PCDDR2, if DDR_CMD_EXEC_OPT_0[PWR_DOWN_EN] is 1'b1 then program this to MAX(tAOFD, tANPD). For PCDDR3, this is to be programmed to "Write Latency -2", which is ODTLoff.
12:4	RESERVED_12_4	Reserved
3:1	TANPD	SW: RW, HW: R This specifies the memory timing parameter tANPD in ddr1x clock cycles. For PCDDR2 devices, program this to the timing parameter tANPD, for PCDDR3 devices, this needs to be programmed to WL - 1 (as per PCDDR3 spec).
0	RESERVED_0	Reserved

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Mode Register Write Control for HW Frequency Switch Register

This register is used/valid as part of HW based frequency switch if DDR_CMD_EXEC_OPT_2[UPDATE_MEM_LATENCY_ON_FREQ_SWITCH] is set.There is no rank select field as the mode register write command goes to all initialized ranks. If the memory latencies are required to be changed as part of frequency switching, SW would be required to program the correct Read/Write latency in the corresponding _ALT registers and also program this register to have HW perform an MRW with the updated latency values when a frequency switch request is being processed.

EBI1_CH1_DDR_MRW0_HW_FREQ_SWITCH

Bits	Name	Description

DDR DQ Calibration Read Data Register for Rank1

This register contains the DRAM mode register contents for a DQ calibration command triggered via DDR_MR_CNTL_WDATA[RD_DQCAL] to Rank1. This is used to capture the read data from the SDRAM device's mode register for a read DQ calibration command for LPDDR2 or an MPR read command for PCDDR3. The DQS data bits 0, 8, 16 and 24 are only captured on each DQS edge. Hence for a memory burst length of 4 (LPDDR2 DQ calibration), only 16:0 bits of the field below have valid data. In case of PCDDR3 MPR read command (memory burst length of 8), all 32 bits of the field below are valid.

EBI1_CH1_DDR_DQCAL_RDATA_RANK1

Bits	Name	Description
31:0	DQCAL_RDATA	SW: R, HW: W Data for DQ Calibration Read for Rank1. The data captures the lowest bit for each byte across the memory burst. For example, each cycle of memory burst is 8 bytes of data - 1 bit for each byte is captured which is 8 bits for every cycle of DQS.

DDR DQ Calibration Status Register for Rank1

EBI1_CH1_DDR_DQCAL_STATUS_RANK1

Bits	Name	Description
31	DQCAL_COMPARE_BYTE3	SW: R, HW: W Indicates whether the DQ calibration command for LPDDR2 or PCDDR3 triggered via DDR_MR_CNTL_WDATA[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW de-asserts RD_DQCAL indicating that the command completed. SW also needs to ensure that the number of DQS edges received (NUM_DQS_EDGES_RECD_BYTE3) were correct. A valid pass is only when number of DQS edges received were correct and the PASS comparison read. 0x0: FAIL 0x1: PASS
30	DQCAL_COMPARE_BYTE2	SW: R, HW: W Indicates whether the DQ calibration command for LPDDR2 or PCDDR3 triggered via DDR_MR_CNTL_WDATA[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW de-asserts RD_DQCAL indicating that the command completed. SW also needs to ensure that the number of DQS edges received (NUM_DQS_EDGES_RECD_BYTE2) were correct. A valid pass is only when number of DQS edges received were correct and the PASS comparison read. 0x0: FAIL 0x1: PASS
29	DQCAL_COMPARE_BYTE1	SW: R, HW: W Indicates whether the DQ calibration command for LPDDR2 or PCDDR3 triggered via DDR_MR_CNTL_WDATA[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW de-asserts RD_DQCAL indicating that the command completed. SW also needs to ensure that the number of DQS edges received (NUM_DQS_EDGES_RECD_BYTE1) were correct. A valid pass is only when number of DQS edges received were correct and the PASS comparison read. 0x0: FAIL 0x1: PASS
28	DQCAL_COMPARE_BYTE0	SW: R, HW: W Indicates whether the DQ calibration command for LPDDR2 or PCDDR3 triggered via DDR_MR_CNTL_WDATA[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW de-asserts RD_DQCAL indicating that the command completed. SW also needs to ensure that the number of DQS edges received (NUM_DQS_EDGES_RECD_BYTE0) were correct. A valid pass is only when number of DQS edges received were correct and the PASS comparison read. 0x0: FAIL 0x1: PASS

DDR RCW Async Reset & Control Register

This register controls the async reset for the generated RCW (Read capture window for DQS) signal for DQS qualification in the PHY. It also includes a global disable control which results in the external RCW signal being driven always to 1'b1.

EBI1_CH1_DDR_RCW_RESET_AND_CNTL

Bits	Name	Description
31:28	RESERVED_31_28	
27	RCW_ASYNC_RESET_BYTE3	SW: RW, HW: R SW control for the async reset for the flops in the RCW generation circuit for PHY data byte3. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. HW will assert reset for a few cycles and then de-assert. Sw need not write this to 1'b0. The read value will always be 1'b0. 0x0: RESET OFF (default) 0x1: RESET ON
26	RCW_ASYNC_RESET_BYTE2	SW: RW, HW: R SW control for the async reset for the flops in the RCW generation circuit for PHY data byte3. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. HW will assert reset for a few cycles and then de-assert.. Sw need not write this to 1'b0. The read value will always be 1'b0. 0x0: RESET OFF (default) 0x1: RESET ON
25	RCW_ASYNC_RESET_BYTE1	SW: RW, HW: R SW control for the async reset for the flops in the RCW generation circuit for PHY data byte3. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. HW will assert reset for a few cycles and then de-assert. Sw need not write this to 1'b0. The read value will always be 1'b0. 0x0: RESET OFF (default) 0x1: RESET ON
24	RCW_ASYNC_RESET_BYTE0	SW: RW, HW: R SW control for the async reset for the flops in the RCW generation circuit for PHY data byte3. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. HW will assert reset for a few cycles and then de-assert. Sw need not write this to 1'b0. The read value will always be 1'b0. 0x0: RESET OFF (default) 0x1: RESET ON
23:17	RESERVED_23_17	

EBI1_CH1_DDR_RCW_RESET_AND_CNTL (cont.)

Bits	Name	Description
16	RCW_ENABLE	SW: RW, HW: R When set to 1'b0, the external RCW (Read capture window) for precise DQS qualification is always driven to 1'b1 for all data bytes. When enabled (required only for PCDDR3), the design will send out an RCW pulse equal to the memory BL/2 -1 cycles to the PHY data bytes. 0x0: Disable (default) 0x1: Enable
15:1	RESERVED_15_1	
0	RD_FIFO_CNTL_DBG_EN	SW: RW, HW: R When set to 1'b1, this will match the previous design behavior wherein the read data keep/throw is written for MRR commands. If this field is set, then RCW_ENABLE must be disabled. 0x0: Disable (default) 0x1: Enable

0x00D80200 EBI1_CH1_DDR_ENHPRI_EN

Type: Read/Write
Clock: RUNALWAYSCLK
Reset State: 0x00000000

DDR Enhanced command Priority Enable Register.

This register is used to enable and configure enable enhanced prioritization of read and write commands within the DDR controller.

EBI1_CH1_DDR_ENHPRI_EN

Bits	Name	Description
31	ENHANCED_PRI_EN	SW: RW, HW: R Enables enhanced transaction prioritization mode. When enabled the priority of read and write transactions within the DDR controller can be modified to more quickly resolve blocking conditions and minimize worse case latencies. When this feature is enabled is it required that read command starvation be disabled by programming DDR_CMD_EXEC_OPT_0[RDCMD_STARVATION_TIMER] = 0. 0x0: Disable (default) 0x1: Enable
30	RD_PRI_AGING_EN	When enabled the DDR priority of read commands increases the longer they remaining unserviced. The priority adjustment is set through the DDR_ENHPRI_RDn registers. 0x0: Disable (default) 0x1: Enable

EBI1_CH1_DDR_ENHPRI_EN (cont.)

Bits	Name	Description
29	WR_PRI_AGING_EN	When enabled the DDR priority of write commands increases the longer they remaining unserviced. The priority adjustment is set through the DDR_ENHPRI_WRn registers. 0x0: Disable (default) 0x1: Enable
28	RESERVED_28	
27	ADJ_PRI_RDBLOCKING	SW: RW, HW: R When enabled the AXI priority of a read command blocking acceptance of write data is replaced with the value in the PRI_RDBLOCKING field. 0x0: Disable (default) 0x1: Enable
26	ADJ_PRI_RDMERGE	SW: RW, HW: R When enabled a read merge is considered to be blocking write data and its priority is replaced with the value in the PRI_RDBLOCKING field. 0x0: Disable (default) 0x1: Enable
25:24	PRI_RDBLOCKING	AXI priority for blocking read commands 0x0: AXI priority Level 0 (default) 0x1: AXI priority Level 1 0x2: AXI priority Level 2 0x3: AXI priority Level 3
23	ADJ_PRI_WRBLOCKING	SW: RW, HW: R When enabled the AXI priority of a write command blocking acceptance of write data or execution of a subsequent read is replaced with the value in the PRI_RDBLOCKING field. 0x0: Disable (default) 0x1: Enable
22	RESERVED_22	
21:20	PRI_WRBLOCKING	AXI priority for blocking write commands 0x0: AXI priority Level 0 (default) 0x1: AXI priority Level 1 0x2: AXI priority Level 2 0x3: AXI priority Level 3
19:16	RESERVED_19_16	

EBI1_CH1_DDR_ENHPRI_EN (cont.)

Bits	Name	Description
15:8	CONFLICT_BLOCK_HIT	SW: RW, HW: R When not disabled a page conflict of the given priority level(s) blocks any new command presented to the DDR controller from being a page hit to the same rank/bank as the conflict. Others : All combinations of priorities are legal. 0x0: Disabled 0x1: Priority 0 0x2: Priority 1 0x3: Priorities 0 and 1 0x4: Priority 2 0x8: Priority 3 0x10: Priority 4 0x20: Priority 5 0x40: Priority 6 0x80: Priority 7

13.3.1.6 Loop-back Selftest Registers

This section contains the registers that are related to loop-back selftest logic. They control the loop-back path and logic behaviors. They also provide a mechanism to read out the MISR signature registers for software to compare the results.

0x00DD0000 EBI1_CH1_LBST_CNTL

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

LBST logic control register.

EBI1_CH1_LBST_CNTL

Bits	Name	Description
31	FORCE_DRIVE_DQS	SW : RW Force DIM to drive memory dqs 0x0: stop forcing to drive DQS 0x1: start driving always
30	FORCE_DRIVE_CK	SW : RW Force DIM to drive memory clock 0x0: stop forcing to drive CK 0x1: start driving always
29	CLR_CNTR_DQ_ALL	SW : W Writing '1' to this bit will clear all the counters for DQ 0x0: no action 0x1: clear the counter
28	CLR_CNTR_CA_ALL	SW : W Writing '1' to this bit will clear all the counters for CA 0x0: no action 0x1: clear the counter
27	RESET_FIFO	SW : W Write '1' to this bit clear the DQ and CA FIFO 0x0: no action 0x1: reset FIFO
26	SHIFT_PRPG_DQ	SW : RW Control if DQ PRPG should be shifting 0x0: no shifting PRPG 0x1: start shifting PRPG
25	SHIFT_PRPG_CA	SW : RW Control if CA PRPG should be shifting 0x0: no shifting PRPG 0x1: start shifting PRPG
24	DATA_SRC_CA	SW : RW Data source for command and address: 0x0: from DDR controller 0x1: from LBST CA PRPG
23:22	DATA_SRC_DQ	SW : RW Data source for read data: 0x0: from DDR controller 0x1: from LBST DQ PRPGs 0x2: Dynamicall switching in read/write.

EBI1_CH1_LBST_CNTL (cont.)

Bits	Name	Description
21:20	FIFO_WE_DQ	SW : RW WE for CA FIFOs and DQ FIFOs 0x0: Write is disabled on all FIFOs 0x1: Write disabled on DQ FIFOs, enabled on CA FIFOs. 0x2: Write enabled all FIFOs 0x3: Dynamicall switching in read/write on DQ FIFOs. Always enabled on CA FIFOs
19	FORCE_OE_DQ	SW : RW Control DQ's OE if FORCE_MODE_DQ == 1 0x0: Force DQ IE to be 0 0x1: Force DQ IE to be 1
18	FORCE_IE_DQ	SW : RW Control DQ's IE if FORCE_MODE_DQ == 1 0x0: Force DQ IE to be 0 0x1: Force DQ IE to be 1
17	FORCE_MODE_DQ	SW : RW DQ's IE/OE is either controlled by DDR controller or by the FORCE_IE_DQ, FORCE_OE_DQ 0x0: Controlled by DDR controller 0x1: Manually controlled by LBST logic
16	FORCE_IE_CA	SW : RW Force IE to turn on on all the command/address pads 0x0: Stop forcing IE 0x1: Force to turn on
15:14	READ_BURST	SW : RW Controls numbers of data burst per matching read command: 0x0: 4 burst of data 0x1: 8 burst of data 0x2: 16 burst of data 0x3: unused
13	IGNORE_IDLE_CMD	SW : RW Controls whether IDLE command will be ignored in MISR operation 0x0: Don't ignore zero data 0x1: Ignore zero data
12	IGNORE_ZERO_DQ	SW : RW Controls whether zero data will be ignored or not in MISR operation 0x0: Don't ignore zero data 0x1: Ignore zero data

EBI1_CH1_LBST_CNTL (cont.)

Bits	Name	Description
11:10	MISR_TRIG_DQ	SW : RW Specify condition that triggers shifting of DQ MISR: 0x0: When DQ FIFO is not empty 0x1: by matching command 0x2: by external shift enable bit 0x3: CSR controlled enable. Turned on by writing to START_SHIFT_PRPG. Turned off by writing to STOP_SHIFT_PRPG.
9:8	MISR_TRIG_CA	SW : RW Specify condition that triggers shifting of CA MISR: 0x0: when CMD FIFO is not empty and command matches 0x1: unused 0x2: by external shift enable bit 0x3: CSR controlled enable. Turned on by writing to START_SHIFT_PRPG. Turned off by writing to STOP_SHIFT_PRPG.
7:6	MISR_MODE_DQ	SW : RW Operating mode for DQ MISRs 0x0: Hold 0x1: Parallel-in parallel-out FF buffer 0x2: LFSR 0x3: Shift register only
5:4	MISR_MODE_CA	SW : RW Operating mode for CA MISR 0x0: Hold 0x1: Parallel-in parallel-out FF buffer 0x2: LFSR 0x3: Shift register only
3:2	LB_MODE_DQ	SW : RW Controls loop-back path within DIMs for write data 0x0: Normal functional mode 0x1: External loop-back mode 0x2: Do not use. 0x3: Internal loop-back mode
1	LB_CK_SEL_CA	SW : RW Controls which of the 2 memory clocks is used in command/address loop back 0x0: use rank 0's clock 0x1: use rank 1's clock
0	LB_MODE_CA	SW : RW Controls loop-back path within DIMs for command/address 0x0: path is disabled 0x1: path is enabled

0x00DD0004 EBI1_CH1_LBST_MISR_CA

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

LBST MISR register for command & address. Software can either read out this register to get the signature results, or write to this register to set up the seed for PRPG.

EBI1_CH1_LBST_MISR_CA

Bits	Name	Description
31:0	MISR_VAL	SW : RW MISR value

0x00DD0008 EBI1_CH1_LBST_MISR_DQ_EVEN

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

LBST MISR register for even data burst. Software can either read out this register to get the signature results, or write to this register to set up the seed for PRPG.

EBI1_CH1_LBST_MISR_DQ_EVEN

Bits	Name	Description
31:0	MISR_VAL	SW : RW MISR value

0x00DD000C EBI1_CH1_LBST_MISR_DQ_ODD

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

LBST MISR register for odd data burst. Software can either read out this register to get the signature results, or write to this register to set up the seed for PRPG.

EBI1_CH1_LBST_MISR_DQ_ODD

Bits	Name	Description
31:0	MISR_VAL	SW : RW MISR value

0x00DD0010 EBI1_CH1_LBST_COUNT_CA_ALL

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

This register displays the CA counter value. The counter counts number of all the looped-back commands burst. In SDR command mode, a burst equals to one DRAM command shots. In DDR mode, a burst equals to two DRAM command shots. The counter freezes at 0xFFFF.

EBI1_CH1_LBST_COUNT_CA_ALL

Bits	Name	Description
31:0	COUNT	SW : RW Counter value

0x00DD0014 EBI1_CH1_LBST_COUNT_CA_CMPR

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

This register displays the CA counter value. The counter counts number of all the looped-back commands burst that match the compare value and enable conditions. In SDR command mode, a burst equals to one DRAM command shots. In DDR mode, a burst equals to two DRAM command shots. The counter freezes at 0xFFFF.

EBI1_CH1_LBST_COUNT_CA_CMPR

Bits	Name	Description
31:0	COUNT	SW : R/W Counter value

0x00DD0018 EBI1_CH1_LBST_COUNT_DQ_ALL

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

This register displays the DQ counter value. The counter counts number of all the looped-back DQ data. One DQ data cycle equals to two DQ bursts. The counter freezes at 0xFFFF.

EBI1_CH1_LBST_COUNT_DQ_ALL

Bits	Name	Description
31:0	COUNT	SW : R/W Counter value

0x00DD001C EBI1_CH1_LBST_COUNT_DQ_CMPR

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

This register displays the DQ counter value. The counter counts number of all the looped-back DQ data cycle that are non-zero if the IGNORE_ZERO_DATA in LBST_CNTL is turned on. One DQ data cycle equals to two DQ bursts. The counter freezes at 0xFFFF.

EBI1_CH1_LBST_COUNT_DQ_CMPR

Bits	Name	Description
31:0	COUNT	SW : R/W Counter value

0x00DD0030 EBI1_CH1_LBST_CMPR_VAL_CA_EVEN

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

The command/address compare value for even address burst. If the looped-back CA match the compare value after the LBST_CMPR_EN_CA_EVEN is applied, the matching condition can be used to trigger read data generation. It will also increment the CA compare counter.

EBI1_CH1_LBST_CMPR_VAL_CA_EVEN

Bits	Name	Description
31:29	RESERVED_31_29	
28:8	CMPR_CA	SW : RW Compare value for command/address. Bit definition varies depending on the DRAM technologies.
7:6	CMPR_RESET_N	SW : RW Compare value for RESET_N of both ranks.
5:4	CMPR_CS_N	SW : RW Compare value for CS_N of both ranks.

EBI1_CH1_LBST_CMPR_VAL_CA_EVEN (cont.)

Bits	Name	Description
3:2	CMPR_CKE	SW : RW Compare value for CKE of both ranks.
1:0	CMPR_ODT	SW : RW Compare value for ODT of both ranks.

0x00DD0034 EBI1_CH1_LBST_CMPR_VAL_CA_ODD

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

The command/address compare value for odd address burst. If the looped-back CA match the compare value after the LBST_CMPR_EN_CA_ODD is applied, the matching condition can be used to trigger read data generation. It will also increment the CA compare counter.

EBI1_CH1_LBST_CMPR_VAL_CA_ODD

Bits	Name	Description
31:18	RESERVED_31_18	
17:8	CMPR_CA	SW : RW Compare value for odd command/address in LPDDR2 mode.
7:0	RESERVED_7_0	

0x00DD0038 EBI1_CH1_LBST_CMPR_EN_CA_EVEN

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

The command/address compare Enable for even address burst. The Enable bits of corresponding DRAM command/address bits match the definitions in LBST_CMPR_VAL_CA_EVEN.

EBI1_CH1_LBST_CMPR_EN_CA_EVEN

Bits	Name	Description
31	CMPR_NOT	SW : RW Inverse the compare condition so a match means NOT equal to the compare value and enable conditions.
30:29	RESERVED_30_29	

EBI1_CH1_LBST_CMPR_EN_CA_EVEN (cont.)

Bits	Name	Description
28:8	CMPR_EN_CA	SW : RW Enable bit for command/address compare. 0x0: don't care. 0x1: compare enabled.
7:0	CMPR_EN_CMD	SW : RW Enable bit for command compare. 0x0: don't care. 0x1: compare enabled.

0x00DD003C EBI1_CH1_LBST_CMPR_EN_CA_ODD

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

The command/address compare Enable for odd address burst. The Enable bits of corresponding DRAM command/address bits match the definitions in LBST_CMPR_VAL_CA_ODD.

EBI1_CH1_LBST_CMPR_EN_CA_ODD

Bits	Name	Description
31:18	RESERVED_31_18	
17:8	CMPR_EN_CA	SW : RW Enable bit for command/address compare. 0x0: don't care. 0x1: compare enabled.
7:0	RESERVED_7_0	

0x00DD0040 EBI1_CH1_LBST_CNTL2

Type: Read/Write
Clock: CLK_DDR_1X
Reset State: 0x00000000

LBST logic control register 2.

EBI1_CH1_LBST_CNTL2

Bits	Name	Description
31:2	RESERVED_31_2	

EBI1_CH1_LBST_CNTL2 (cont.)

Bits	Name	Description
1	IGNORE_DM	SW : RW When the loop-back data is written into MISR, This bit controls whether the DM bits are used to mask off the data (to force it to zero) or not. 0x0: consider DM bits. Zero the data only when DM is asserted 0x1: Ignore DM bits. Always take the data bit directly
0	MODE_SYNC_DRIVE_PRPG	SW : RW Controls the flop delay along the i_drive_prpg input path. 0x0: i_drive_prpg is feed into a DDR_1x demet directly 0x1: i_drive_prpg is going through 5-stage XO flops then goes to DDR_1x demet

13.4 DIM D00 DQ Registers (0x1A700000 DIM_D00_REG_BASE)

This section describes the D00 DIM TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1A700000 DIM_D00_DIM_DQ_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D00_DIM_DQ_TOP_CFG

Bits	Name	Description
26	CDC_LDO_EN	Enablement of CDC LDO 1’b1 : Enabled 1’b0 : Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1’b1 : Enabled 1’b0 : Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1’b1 : Disabled 1’b0 : Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1’b1 : Enable the RCW 1’b0 : Disabled (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1 : from Read CDCCAL 1’b0 : from Write CDCCAL (default)
12	DEBUG_BUS_EN	1’b1 : Enables the debug bus functionality 1’b0 : Disables the debug bus and drives all ’0’s on debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_dq[5:0] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend

DIM_D00_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1A700004 DIM_D00_DIM_DQ_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_DQ_HW_INFO register configures the following:

DIM_DQ_HW_INFO

DIM_D00_DIM_DQ_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1A700008 DIM_D00_DIM_DQ_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_DQ_HW_VERSION register configures the following:

DIM_DQ_HW_VERSION

DIM_D00_DIM_DQ_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.
27:16	MINOR	Minor version indicates expanded functionary, backward compatible.
15:0	STEP	Step indicates HW change which is not intended to impact SW compatibility.

0x1A700010 DIM_D00_DIM_DQ_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D00_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x1A700014 DIM_D00_DIM_DQ_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D00_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x1A700018 DIM_D00_DIM_DQ_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D00_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1A700020 DIM_D00_DIM_DQ_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D00_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1’b1 : differential output (default) 1’b0 : single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)

DIM_D00_DIM_DQ_PAD_CFG3 (cont.)

Bits	Name	Description
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x1A700024 DIM_D00_DIM_DQ_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D00_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x1A700030 DIM_D00_DIM_DQ_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D00_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1A700034 DIM_D00_DIM_DQ_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D00_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unit step and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x1A700038 DIM_D00_DIM_DQ_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D00_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic auto-calibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic auto-calibration interval based on sleep clock.

0x1A70003C DIM_D00_DIM_DQ_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_D00_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic auto-calibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic auto-calibration interval based on reference clock.

0x1A700040 DIM_D00_DIM_DQ_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_D00_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1A700044 DIM_D00_DIM_DQ_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D00_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1A700048 DIM_D00_DIM_DQ_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D00_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1A70004C DIM_D00_DIM_DQ_RD_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D00_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1A700050 DIM_D00_DIM_DQ_RD_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D00_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1A700054 DIM_D00_DIM_DQ_RD_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D00_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1A700058 DIM_D00_DIM_DQ_RD_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_TEST_CFG register configures the following:

DIM_DQ_RD_CDC_TEST_CFG

DIM_D00_DIM_DQ_RD_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1’b1: Test outputs from the main DDA are connected to the CDC test ports 1’b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1’b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1’b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1’b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1’b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1’b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1’b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1A70005C DIM_D00_DIM_DQ_RD_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D00_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1’b1 to start the reference window. Write 1’b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1’b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1’b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1’b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1’b1 written to this bit puts delay array 0 in delay-mode

DIM_D00_DIM_DQ_RD_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1A700060 DIM_D00_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D00_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x1A700070 DIM_D00_DIM_DQ_RD_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D00_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. **NOTE** The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1A700074 DIM_D00_DIM_DQ_RD_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D00_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1A700078 DIM_D00_DIM_DQ_RD_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D00_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1A70007C DIM_D00_DIM_DQ_RD_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D00_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D00_DIM_DQ_RD_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1A700080 DIM_D00_DIM_DQ_RD_CDC_STATUS4

Type: Read
Clock: HCLK
Reset State: 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D00_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x1A7000AC DIM_D00_DIM_DQ_WR_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D00_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as subunit count 1’b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1’b1: Offset is subtracted from the subunit count 1’b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as unit step count 1’b0: Programmed offset is added/subtracted from the unit step count

DIM_D00_DIM_DQ_WR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1A7000B0 DIM_D00_DIM_DQ_WR_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D00_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1A7000B4 DIM_D00_DIM_DQ_WR_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D00_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.

DIM_D00_DIM_DQ_WR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1A7000B8 DIM_D00_DIM_DQ_WR_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_TEST_CFG register configures the following:

DIM_DQ_WR_CDC_TEST_CFG

DIM_D00_DIM_DQ_WR_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1A7000BC DIM_D00_DIM_DQ_WR_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D00_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1A7000D0 DIM_D00_DIM_DQ_WR_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D00_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1A7000D4 DIM_D00_DIM_DQ_WR_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D00_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1A7000D8 DIM_D00_DIM_DQ_WR_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D00_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1A7000DC DIM_D00_DIM_DQ_WR_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D00_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D00_DIM_DQ_WR_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1A700100 DIM_D00_DIM_DQ_DQ_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D00_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1A700104 DIM_D00_DIM_DQ_DQ_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D00_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x1A700110 DIM_D00_DIM_DQ_DQS_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D00_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1A700114 DIM_D00_DIM_DQ_DQS_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D00_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

13.5 DIM D01 DQ Registers (0x1A800000 DIM_D01_REG_BASE)

This section describes the D01 DIM DQ TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1A800000 DIM_D01_DIM_DQ_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D01_DIM_DQ_TOP_CFG

Bits	Name	Description
26	CDC_LDO_EN	Enablement of CDC LDO 1’b1 : Enabled 1’b0 : Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1’b1 : Enabled 1’b0 : Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1’b1 : Disabled 1’b0 : Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1’b1 : Enable the RCW 1’b0 : Disabled (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1 : from Read CDCCAL 1’b0 : from Write CDCCAL (default)
12	DEBUG_BUS_EN	1’b1 : Enables the debug bus functionality 1’b0 : Disables the debug bus and drives all ’0’s on debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_dq[5:0] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend

DIM_D01_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1A800004 DIM_D01_DIM_DQ_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_DQ_HW_INFO register configures the following:

DIM_DQ_HW_INFO

DIM_D01_DIM_DQ_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1A800008 DIM_D01_DIM_DQ_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_DQ_HW_VERSION register configures the following:

DIM_DQ_HW_VERSION

DIM_D01_DIM_DQ_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.

DIM_D01_DIM_DQ_HW_VERSION (cont.)

Bits	Name	Description
27:16	MINOR	Minor version indicates expanded functionary, backward compatible.
15:0	STEP	Step indicates HW change which is not intended to impact SW compatibility.

0x1A800010 DIM_D01_DIM_DQ_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D01_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x1A800014 DIM_D01_DIM_DQ_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D01_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x1A800018 DIM_D01_DIM_DQ_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D01_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1A800020 DIM_D01_DIM_DQ_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D01_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1’b1 : differential output (default) 1’b0 : single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad

DIM_D01_DIM_DQ_PAD_CFG3 (cont.)

Bits	Name	Description
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x1A800024 DIM_D01_DIM_DQ_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D01_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver

DIM_D01_DIM_DQ_PAD_CFG4 (cont.)

Bits	Name	Description
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x1A800030 DIM_D01_DIM_DQ_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D01_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1’b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1’b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1’b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1’b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1’b0: Tracking calibration uses previous Target_count value. 1’b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1’b0: unitstep and subunit caps are from calibration or SW settings 1’b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1’b1: Enables periodic auto calibration 1’b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.

DIM_D01_DIM_DQ_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1A800034 DIM_D01_DIM_DQ_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D01_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.

DIM_D01_DIM_DQ_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x1A800038 DIM_D01_DIM_DQ_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D01_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1’b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1’b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1’b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1’b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1A80003C DIM_D01_DIM_DQ_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_D01_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1A800040 DIM_D01_DIM_DQ_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_D01_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1A800044 DIM_D01_DIM_DQ_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D01_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1A800048 DIM_D01_DIM_DQ_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D01_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1A80004C DIM_D01_DIM_DQ_RD_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D01_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as subunit count 1’b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1’b1: Offset is subtracted from the subunit count 1’b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset

DIM_D01_DIM_DQ_RD_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1A800050 DIM_D01_DIM_DQ_RD_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D01_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1A800054 DIM_D01_DIM_DQ_RD_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D01_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1A800058 DIM_D01_DIM_DQ_RD_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_TEST_CFG register configures the following:

DIM_DQ_RD_CDC_TEST_CFG

DIM_D01_DIM_DQ_RD_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1A80005C DIM_D01_DIM_DQ_RD_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D01_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1A800060 DIM_D01_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D01_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x1A800070 DIM_D01_DIM_DQ_RD_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D01_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count

DIM_D01_DIM_DQ_RD_CDC_STATUS0 (cont.)

Bits	Name	Description
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1A800074 DIM_D01_DIM_DQ_RD_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D01_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1A800078 DIM_D01_DIM_DQ_RD_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D01_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1A80007C DIM_D01_DIM_DQ_RD_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D01_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1A800080 DIM_D01_DIM_DQ_RD_CDC_STATUS4

Type: Read
Clock: HCLK
Reset State: 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D01_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x1A8000AC DIM_D01_DIM_DQ_WR_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D01_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1A8000B0 DIM_D01_DIM_DQ_WR_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D01_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates

DIM_D01_DIM_DQ_WR_CDC_DELAY_CFG (cont.)

Bits	Name	Description
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1A8000B4 DIM_D01_DIM_DQ_WR_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D01_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1A8000B8 DIM_D01_DIM_DQ_WR_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_TEST_CFG register configures the following:

DIM_DQ_WR_CDC_TEST_CFG

DIM_D01_DIM_DQ_WR_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1A8000BC DIM_D01_DIM_DQ_WR_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D01_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode

DIM_D01_DIM_DQ_WR_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1A8000D0 DIM_D01_DIM_DQ_WR_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D01_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count

DIM_D01_DIM_DQ_WR_CDC_STATUS0 (cont.)

Bits	Name	Description
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1A8000D4 DIM_D01_DIM_DQ_WR_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D01_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1A8000D8 DIM_D01_DIM_DQ_WR_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D01_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1A8000DC DIM_D01_DIM_DQ_WR_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D01_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1A800100 DIM_D01_DIM_DQ_DQ_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D01_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	

DIM_D01_DIM_DQ_DQ_IOC_SLV_CFG (cont.)

Bits	Name	Description
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1A800104 DIM_D01_DIM_DQ_DQ_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D01_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x1A800110 DIM_D01_DIM_DQ_DQS_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D01_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	

DIM_D01_DIM_DQ_DQS_IOC_SLV_CFG (cont.)

Bits	Name	Description
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1A800114 DIM_D01_DIM_DQ_DQS_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D01_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

13.6 DIM D02 DQ Registers (0x1A900000 DIM_D02_REG_BASE)

This section describes the D02 DIM DQ TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1A900000 DIM_D02_DIM_DQ_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D02_DIM_DQ_TOP_CFG

Bits	Name	Description
26	CDC_LDO_EN	Enablement of CDC LDO 1’b1 : Enabled 1’b0 : Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1’b1 : Enabled 1’b0 : Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1’b1 : Disabled 1’b0 : Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1’b1 : Enable the RCW 1’b0 : Disabled (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1 : from Read CDCCAL 1’b0 : from Write CDCCAL (default)
12	DEBUG_BUS_EN	1’b1 : Enables the debug bus functionality 1’b0 : Disables the debug bus and drives all ’0’s on debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_dq[5:0] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend

DIM_D02_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1A900004 DIM_D02_DIM_DQ_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_DQ_HW_INFO register configures the following:

DIM_DQ_HW_INFO

DIM_D02_DIM_DQ_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1A900008 DIM_D02_DIM_DQ_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_DQ_HW_VERSION register configures the following:

DIM_DQ_HW_VERSION

DIM_D02_DIM_DQ_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.

DIM_D02_DIM_DQ_HW_VERSION (cont.)

Bits	Name	Description
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1A900010 DIM_D02_DIM_DQ_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D02_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x1A900014 DIM_D02_DIM_DQ_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D02_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x1A900018 DIM_D02_DIM_DQ_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D02_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1A900020 DIM_D02_DIM_DQ_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D02_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1’b1 : differential output (default) 1’b0 : single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)

DIM_D02_DIM_DQ_PAD_CFG3 (cont.)

Bits	Name	Description
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x1A900024 DIM_D02_DIM_DQ_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D02_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x1A900030 DIM_D02_DIM_DQ_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D02_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1A900034 DIM_D02_DIM_DQ_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D02_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x1A900038 DIM_D02_DIM_DQ_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D02_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1A90003C DIM_D02_DIM_DQ_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_D02_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1A900040 DIM_D02_DIM_DQ_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_D02_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1A900044 DIM_D02_DIM_DQ_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D02_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1A900048 DIM_D02_DIM_DQ_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D02_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1A90004C DIM_D02_DIM_DQ_RD_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D02_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1A900050 DIM_D02_DIM_DQ_RD_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D02_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1A900054 DIM_D02_DIM_DQ_RD_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D02_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1A900058 DIM_D02_DIM_DQ_RD_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_TEST_CFG register configures the following:

DIM_DQ_RD_CDC_TEST_CFG

DIM_D02_DIM_DQ_RD_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1’b1: Test outputs from the main DDA are connected to the CDC test ports 1’b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1’b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1’b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1’b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1’b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1’b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1’b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1A90005C DIM_D02_DIM_DQ_RD_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D02_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1’b1 to start the reference window. Write 1’b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1’b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1’b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1’b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1’b1 written to this bit puts delay array 0 in delay-mode

DIM_D02_DIM_DQ_RD_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1A900060 DIM_D02_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D02_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x1A900070 DIM_D02_DIM_DQ_RD_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D02_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1A900074 DIM_D02_DIM_DQ_RD_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D02_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1A900078 DIM_D02_DIM_DQ_RD_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D02_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1A90007C DIM_D02_DIM_DQ_RD_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D02_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D02_DIM_DQ_RD_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1A900080 DIM_D02_DIM_DQ_RD_CDC_STATUS4

Type: Read
Clock: HCLK
Reset State: 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D02_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x1A9000AC DIM_D02_DIM_DQ_WR_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D02_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as subunit count 1’b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1’b1: Offset is subtracted from the subunit count 1’b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as unit step count 1’b0: Programmed offset is added/subtracted from the unit step count

DIM_D02_DIM_DQ_WR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1A9000B0 DIM_D02_DIM_DQ_WR_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D02_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1A9000B4 DIM_D02_DIM_DQ_WR_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D02_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.

DIM_D02_DIM_DQ_WR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1A9000B8 DIM_D02_DIM_DQ_WR_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_TEST_CFG register configures the following:

DIM_DQ_WR_CDC_TEST_CFG

DIM_D02_DIM_DQ_WR_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1A9000BC DIM_D02_DIM_DQ_WR_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D02_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1A9000D0 DIM_D02_DIM_DQ_WR_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D02_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1A9000D4 DIM_D02_DIM_DQ_WR_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D02_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1A9000D8 DIM_D02_DIM_DQ_WR_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D02_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1A9000DC DIM_D02_DIM_DQ_WR_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D02_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D02_DIM_DQ_WR_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1A900100 DIM_D02_DIM_DQ_DQ_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D02_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1A900104 DIM_D02_DIM_DQ_DQ_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D02_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x1A900110 DIM_D02_DIM_DQ_DQS_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D02_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1A900114 DIM_D02_DIM_DQ_DQS_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D02_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

13.7 DIM D03 DQ Registers (0x1AA00000 DIM_D03_REG_BASE)

This section describes the D03 DIM DQ TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1AA00000 DIM_D03_DIM_DQ_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D03_DIM_DQ_TOP_CFG

Bits	Name	Description
26	CDC_LDO_EN	Enablement of CDC LDO 1’b1 : Enabled 1’b0 : Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1’b1 : Enabled 1’b0 : Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1’b1 : Disabled 1’b0 : Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1’b1 : Enable the RCW 1’b0 : Disabled (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1 : from Read CDCCAL 1’b0 : from Write CDCCAL (default)
12	DEBUG_BUS_EN	1’b1 : Enables the debug bus functionality 1’b0 : Disables the debug bus and drives all ’0’s on debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_dq[5:0] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend

DIM_D03_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1AA00004 DIM_D03_DIM_DQ_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_DQ_HW_INFO register configures the following:

DIM_DQ_HW_INFO

DIM_D03_DIM_DQ_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1AA00008 DIM_D03_DIM_DQ_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_DQ_HW_VERSION register configures the following:

DIM_DQ_HW_VERSION

DIM_D03_DIM_DQ_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.

DIM_D03_DIM_DQ_HW_VERSION (cont.)

Bits	Name	Description
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1AA00010 DIM_D03_DIM_DQ_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D03_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x1AA00014 DIM_D03_DIM_DQ_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D03_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x1AA00018 DIM_D03_DIM_DQ_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D03_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1AA00020 DIM_D03_DIM_DQ_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D03_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1’b1 : differential output (default) 1’b0 : single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)

DIM_D03_DIM_DQ_PAD_CFG3 (cont.)

Bits	Name	Description
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x1AA00024 DIM_D03_DIM_DQ_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D03_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x1AA00030 DIM_D03_DIM_DQ_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D03_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1AA00034 DIM_D03_DIM_DQ_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D03_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x1AA00038 DIM_D03_DIM_DQ_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D03_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1AA0003C DIM_D03_DIM_DQ_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_D03_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1AA00040 DIM_D03_DIM_DQ_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_D03_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1AA00044 DIM_D03_DIM_DQ_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D03_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1AA00048 DIM_D03_DIM_DQ_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D03_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1AA0004C DIM_D03_DIM_DQ_RD_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D03_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AA00050 DIM_D03_DIM_DQ_RD_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D03_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AA00054 DIM_D03_DIM_DQ_RD_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D03_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AA00058 DIM_D03_DIM_DQ_RD_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_TEST_CFG register configures the following:

DIM_DQ_RD_CDC_TEST_CFG

DIM_D03_DIM_DQ_RD_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1’b1: Test outputs from the main DDA are connected to the CDC test ports 1’b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1’b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1’b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1’b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1’b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1’b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1’b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AA0005C DIM_D03_DIM_DQ_RD_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D03_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1’b1 to start the reference window. Write 1’b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1’b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1’b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1’b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1’b1 written to this bit puts delay array 0 in delay-mode

DIM_D03_DIM_DQ_RD_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AA00060 DIM_D03_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D03_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x1AA00070 DIM_D03_DIM_DQ_RD_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D03_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AA00074 DIM_D03_DIM_DQ_RD_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D03_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AA00078 DIM_D03_DIM_DQ_RD_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D03_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AA0007C DIM_D03_DIM_DQ_RD_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D03_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D03_DIM_DQ_RD_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AA00080 DIM_D03_DIM_DQ_RD_CDC_STATUS4

Type: Read
Clock: HCLK
Reset State: 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D03_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x1AA000AC DIM_D03_DIM_DQ_WR_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D03_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as subunit count 1’b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1’b1: Offset is subtracted from the subunit count 1’b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as unit step count 1’b0: Programmed offset is added/subtracted from the unit step count

DIM_D03_DIM_DQ_WR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AA000B0 DIM_D03_DIM_DQ_WR_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D03_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AA000B4 DIM_D03_DIM_DQ_WR_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D03_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.

DIM_D03_DIM_DQ_WR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AA000B8 DIM_D03_DIM_DQ_WR_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_TEST_CFG register configures the following:

DIM_DQ_WR_CDC_TEST_CFG

DIM_D03_DIM_DQ_WR_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AA000BC DIM_D03_DIM_DQ_WR_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D03_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AA000D0 DIM_D03_DIM_DQ_WR_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D03_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AA000D4 DIM_D03_DIM_DQ_WR_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D03_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AA000D8 DIM_D03_DIM_DQ_WR_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D03_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AA000DC DIM_D03_DIM_DQ_WR_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D03_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D03_DIM_DQ_WR_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AA00100 DIM_D03_DIM_DQ_DQ_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D03_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AA00104 DIM_D03_DIM_DQ_DQ_IOC_SLV_STATUS

Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D03_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x1AA00110 DIM_D03_DIM_DQ_DQS_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D03_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AA00114 DIM_D03_DIM_DQ_DQS_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D03_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

13.8 DIM C00 CA Registers (0x1AB00000 DIM_C00_REG_BASE)

This section describes the C00 DIM CA TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1AB00000 DIM_C00_DIM_CA_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_CA_TOP_CFG register configures the following:

DIM_CA_TOP_CFG

DIM_C00_DIM_CA_TOP_CFG

Bits	Name	Description
20	IOCAL_CTLR_SEL	Select source of PCNT/NCNT/PNCNT_VALID 1’b1: external 1’b0: internal (default)
16	SDR_MODE_EN	1’b1 : Enables SDR mode on address bus 1’b0 : Enables DDR mode on address bus (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1: From IOCAL 1’b0: From CDCCAL (default)
12	DEBUG_BUS_EN	1’b1: Enables the debug bus functionality 1’b0: Disables the debug bus and drives all ’0’s on the debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_ca[7:5] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1’b0) 1’b1 : with pipe extend (default) 1’b0: without pipe extend
0	WR_CLK_SEL	Write clock select 1’b1 : With write CDC (default) 1’b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1AB00004 DIM_C00_DIM_CA_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_CA_HW_INFO register configures the following:

DIM_CA_HW_INFO

DIM_C00_DIM_CA_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1AB00008 DIM_C00_DIM_CA_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_CA_HW_VERSION register configures the following:

DIM_CA_HW_VERSION

DIM_C00_DIM_CA_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1AB00010 DIM_C00_DIM_CA_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_CA_PAD_CFG0 register configures the following:

DIM_CA_PAD_CFG0

DIM_C00_DIM_CA_PAD_CFG0

Bits	Name	Description
31	CA_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	CA_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	CA_LV_MODE	Mode pin for high/low voltage regime
28	CA_ODT_ENA	Enable bit for on-die termination
27:26	CA_ODT	Impedance control bit settings for on-die termination
25:24	CA_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	CA_NSLEW	Slew rate control bits for output path NMOS
17:16	CA_PSLEW	Slew rate control bits for output path PMOS
13:12	CA_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	CA_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	CA_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CA_ROUT	Impedance control bit settings for output driver
2:0	CA_DCC	Duty cycle correction bits for output path

0x1AB00014 DIM_C00_DIM_CA_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0220440

The DIM_CA_PAD_CFG1 register configures the following:

DIM_CA_PAD_CFG1

DIM_C00_DIM_CA_PAD_CFG1

Bits	Name	Description
31	CK_DDR_MODE1	Mode select for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	CK_DDR_MODE0	Mode select for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	CK_LV_MODE	Mode select for high/low voltage regime
28	CK_CMFB_ENA	Common mode feedback loop enable
27	CK_ODT_ENA1	Enable bit for on-die termination (when hp_mode = 1'b1)
26	CK_ODT_ENA	Enable bit for on-die termination (when hp_mode = 1'b0) Bit field name missing '0' for APQ8064 SW compatibility.
25:24	CK_ODT	Impedance control bit settings for on-die termination
21:20	CK_NSLEW	Slew rate control bits for output path NMOS
17:16	CK_PSLEW	Slew rate control bits for output path PMOS
13	CK_CUR_MODE1	Current/Voltage mode selection (when hp_mode = 1'b1) 1'b1 : Current mode 1'b0 : Voltage mode (default)
12	CK_CUR_MODE0	Current/Voltage mode selection (when hp_mode = 1'b0) 1'b1 : Current mode 1'b0 : Voltage mode (default)
10:8	CK_I_DRV	Control bit settings for bias current
7	CK_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CK_ROUT	Impedance control bit settings for output driver
2:0	CK_DCC	Duty cycle correction bits for output path

0x1AB00018 DIM_C00_DIM_CA_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_CA_PAD_CFG2 register configures the following:

DIM_CA_PAD_CFG2

DIM_C00_DIM_CA_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1AB0001C DIM_C00_DIM_CA_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x00300000

The DIM_CA_PAD_CFG3 register configures the following:

DIM_CA_PAD_CFG3

DIM_C00_DIM_CA_PAD_CFG3

Bits	Name	Description
31:30	CS_N_IE	
29:28	CS_N_OE	
25	CK_IE	
24	CK_OE	
23:22	CKE_IE	
21:20	CKE_OE	
19:10	CA_IE	
9:0	CA_OE	

0x1AB00020 DIM_C00_DIM_CA_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_PAD_CFG4 register configures the following:

DIM_CA_PAD_CFG4

DIM_C00_DIM_CA_PAD_CFG4

Bits	Name	Description
31:30	CS_N_OE_DYN_ENA	Enable dynamic control of CS_N OE 1'b1: Dynamic control enabled and CS_N_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CS_N OE gated by CA_PAD_CFG3 bits Note: This register should not be set in external loopback mode since it will change the IE contol source.
29:28	CS_N_OE_DYN	Dynamic OE control for each of the CS_N outputs, OR-ed with common controller OE.
25	RESERVED_1	
24	RESERVED_2	
23:22	CKE_OE_DYN_ENA	Enable dynamic control of CKE OE 1'b1: Dynamic control enabled and CKE_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CKE OE gated by CA_PAD_CFG3 bits
21:20	CKE_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.
19:10	CA_OE_DYN_ENA	Enable dynamic control of CA OE 1'b1: Dynamic control enabled and CA_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CA OE gated by CA_PAD_CFG3 bits
9:0	CA_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.

0x1AB00030 DIM_C00_DIM_CA_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG0 register configures the following:

DIM_CA_CDC_CTLR_CFG0

DIM_C00_DIM_CA_CDC_CTLR_CFG0

Bits	Name	Description
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1AB00034 DIM_C00_DIM_CA_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG1 register configures the following:

DIM_CA_CDC_CTLR_CFG1

DIM_C00_DIM_CA_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x1AB00038 DIM_C00_DIM_CA_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_CA_CDC_CAL_TIMER_CFG0

DIM_C00_DIM_CA_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.

DIM_C00_DIM_CA_CDC_CAL_TIMER_CFG0 (cont.)

Bits	Name	Description
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1AB0003C DIM_C00_DIM_CA_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_CA_CDC_CAL_TIMER_CFG1

DIM_C00_DIM_CA_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1AB00040 DIM_C00_DIM_CA_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_REFCOUNT_CFG register configures the following:

DIM_CA_CDC_REFCOUNT_CFG

DIM_C00_DIM_CA_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1AB00044 DIM_C00_DIM_CA_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_CA_CDC_COARSE_CAL_CFG configures the following:

DIM_CA_CDC_COARSE_CAL_CFG

DIM_C00_DIM_CA_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1AB00048 DIM_C00_DIM_CA_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_RSVD_CFG register configures the following:

DIM_CA_CDC_RSVD_CFG

DIM_C00_DIM_CA_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1AB0004C DIM_C00_DIM_CA_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_OFFSET_CFG register configures the following:

DIM_CA_CDC_OFFSET_CFG

DIM_C00_DIM_CA_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AB00050 DIM_C00_DIM_CA_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_DELAY_CFG register configures the following:

DIM_CA_CDC_DELAY_CFG

DIM_C00_DIM_CA_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates

DIM_C00_DIM_CA_CDC_DELAY_CFG (cont.)

Bits	Name	Description
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AB00054 DIM_C00_DIM_CA_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_SW_MODE_CFG register configures the following:

DIM_CA_CDC_SW_MODE_CFG

DIM_C00_DIM_CA_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AB00058 DIM_C00_DIM_CA_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures the following:

DIM_CA_CDC_TEST_CFG

DIM_C00_DIM_CA_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AB0005C DIM_C00_DIM_CA_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures the following:

DIM_CA_CDC_SW_OVRD_CFG

DIM_C00_DIM_CA_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode

DIM_C00_DIM_CA_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AB00070 DIM_C00_DIM_CA_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_CA_CDC_STATUS0 register configures the following:

DIM_CA_CDC_STATUS0

DIM_C00_DIM_CA_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count

DIM_C00_DIM_CA_CDC_STATUS0 (cont.)

Bits	Name	Description
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AB00074 DIM_C00_DIM_CA_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS1 register configures the following:

DIM_CA_CDC_STATUS1

DIM_C00_DIM_CA_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AB00078 DIM_C00_DIM_CA_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_CA_CDC_STATUS2 register configures the following:

DIM_CA_CDC_STATUS2

DIM_C00_DIM_CA_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AB0007C DIM_C00_DIM_CA_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS3 register configures the following:

DIM_CA_CDC_STATUS3

DIM_C00_DIM_CA_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AB000E0 DIM_C00_DIM_CA_IOC_CTLR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures the following:

DIM_CA_IOC_CTLR_CFG

DIM_C00_DIM_CA_IOC_CTLR_CFG

Bits	Name	Description
31	CAL_NOW	SW : RW Set this bit to 1’b1 will cause the IO calibration starts immediately. This bit has to be cleared after the calibration has been done. 0x0: no-op 0x1: start IOCal immediately
30	IO_CAL_AUTO	Periodic auto calibration mode. Writing a ’1’ to this bit will trigger periodic auto calibration with the period specified in IOC_CTLR_TIMER_CFG register. If ’0’, it disables the timer based on sleep clock. Note that this does not impact the timer based on fixed frequency clock (ffclk).
29	IO_CAL_FF_TIMER_EN	Fixed Frequency Timer mode. Writing a ’1’ to this bit will set the timer running off tcxo clock. If ’0’, it disables the timer based on fixed frequency clock.
28	IO_CAL_BANDGAP_DYN_CTRL	Enable dynamic control of the bandgap element: This low-power feature is only available on x2 core. Bit reserved for x0/x1 cores. 1’b1: Enabled - bandgap element turned on only during IO calibration or when current mode is enabled. 1’b0: Disabled (default) - bandgap element turned on/off statically based on BANDHGAP_ENA0/1 bits.
25	SW_FFCLK_ON	Writing a ’1’ to this field will turn on the fixed frequency (xo) clock on signal
24	LV_MODE	SW : RW Enable/Disable low-voltage mode (MIF2 pad only) 0x0: 1.8V 0x1: non-1.8V
20:16	MARGIN_LOAD	SW : RW If the difference between the current IOCal result is greater than the last result by the number specified here, then the IOCal controller will request value update to DDR controller. 0x0: always update
13:12	IMP_SEL	SW : RW Select bits to choose which impedance to calibrate to
10	PN_SEL_CA	SW : RW Enables loading of HW calibrated values for ca pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on ca pads when it is time to update the pads with the new value.
9	PN_SEL_DATA	SW : RW Enables loading of HW calibrated values for dq/dqs pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on data pads when it is time to update the pads with the new value.

DIM_C00_DIM_CA_IOC_CTLR_CFG (cont.)

Bits	Name	Description
8	CAL_USE_LAST	SW : RW Select the initial value to start IO calibration 0x0: start from a fixed values specified in IOC_CTLR_PNCNT_CFG (default) 0x1: start from previous IOCal PNCNT results
6:4	SAMPLE_POINT	SW : RW Specify number of samples per measure point 0x0: 1 0x1: 3 0x2: 5 0x3: 7 0x4: 9 0x5: 11 0x6: 13 0x7: 15
3	DDR_MODE1	
2	DDR_MODE0	
1	BANDGAP_ENA1	SW : RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable
0	BANDGAP_ENA0	SW : RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable

0x1AB000E4 DIM_C00_DIM_CA_IOC_CTLR_PNCNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures the following:

This register contains the initial value for the next calibration to start from. Softwave can set the hardware to either start calibration from a fixed value or from previous results. If software chooses to use fixed value by setting CAN_USE_LAST in register IOC_CTLR_CFG to be 0, then the values in this register will be used.

DIM_CA_IOC_CTLR_CFG

DIM_C00_DIM_CA_IOC_CTLR_PNCNT_CFG

Bits	Name	Description
12:8	NCNT_INIT_CSR	SW : RW Starting PCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted
4:0	PCNT_INIT_CSR	SW : RW Starting NCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted

0x1AB000E8 DIM_C00_DIM_CA_IOC_CTLR_TIMER_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_CFG register configures the following:

DIM_CA_IOC_CTLR_TIMER_CFG

DIM_C00_DIM_CA_IOC_CTLR_TIMER_CFG

Bits	Name	Description
31:16	TIMER_PERIOD	SW : RW Recalibration Period. The period is measured in timer clock cycles. Typically it's a 32kHz clock. The minimum period that can be programmed is 3. 0,1,2: Invalid values
15:0	FF_TIMER_PERIOD	SW : RW Recalibration Period for the timer running of xo clock. 0x0: Invalid

0x1AB000EC DIM_C00_DIM_CA_IOC_CTLR_TIMER_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_STATUS register configures the following:

DIM_CA_IOC_CTLR_TIMER_STATUS

DIM_C00_DIM_CA_IOC_CTLR_TIMER_STATUS

Bits	Name	Description
15:0	TIMER_STATUS	Current Auto Calibration Timer value. As this register is written in sleep clock domain and read in xo clock domain and no hardware synchronization in place, It is required by the software to read this register 4 times to get the correct value.

0x1AB000F0 DIM_C00_DIM_CA_IOC_CTLR_CHAR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_ CHAR_CFGregister configures the following:

This register is used by hardware verification software only. It provides a mechanism to allow software to bypass the internal calibration state machine and directly access the IOCAL pad inputs.

IDIM_CA_IOC_CTLR_CHAR_CFG

DIM_C00_DIM_CA_IOC_CTLR_CHAR_CFG

Bits	Name	Description
16	SM_BYP_ENA	SW : RW Characterization Bypass Path Enable 0x0: Non-bypass: State Machine Controls IOCAL pad inputs (default) 0x1: bypass: This register controls IOCal pad inputs
15	SM_BYP_N_ENA	SW : RW IO CAL Characterization n_enable: 0x0: de-asserted (default) 0x1: asserted
12:8	SM_BYP_NCNT	SW : RW IO CAL Characterization ncnt value. 0x0: count 0 (default)
7	SM_BYP_P_ENA	SW : RW IO CAL Characterization p_enable: 0x0: de-asserted (default) 0x1: asserted
4:0	SM_BYP_PCNT	SW : RW IO CAL Characterization pcnt value. 0x0: count 0 (default)

0x1AB000F4 DIM_C00_DIM_CA_IOC_CTLR_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00011010

The DIM_CA_IOC_CTLR_STATUS register configures the following:

DIM_CA_IOC_CTLR_STATUS

DIM_C00_DIM_CA_IOC_CTLR_STATUS

Bits	Name	Description
31	INIT_IOCAL_DONE	SW : R The very first IO Calibration is finished This bit is stiky. once it becomes 1'b1 until software writes it back to 0. 0x0: Init-cal never done 0x1: Init-cal finished
18	IOCAL_DONE_D	SW : R IO Calibration is finished 0x0: in progress 0x1: finished
17	IOCAL_BUSY	SW : R Status of calibration State machine 0x0: idle 0x1: busy
16	SYNC_COMP	SW : R comp value from IOCal pad
12:8	NCNT_HOLD	SW : R Current NCNT value used
4:0	PCNT_HOLD	SW : R Current PCNT value used

0x1AB00100 DIM_C00_DIM_CA_CA_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CA_IOC_SLV_CFG register configures the following:

This register specifies the overriding pcnt and ncnt values. Overriding mode is controlled by PNCNT_HW_LOAD_EN bit in this register.

DIM_CA_CA_IOC_SLV_CFG

DIM_C00_DIM_CA_CA_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW : RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW : RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW : RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW : RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1AB00104 DIM_C00_DIM_CA_CA_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CA_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_C00_DIM_CA_CA_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

0x1AB00110 DIM_C00_DIM_CA_CK_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CK_IOC_SLV_CFG register configures the following:

DIM_CA_CK_IOC_SLV_CFG

DIM_C00_DIM_CA_CK_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW : RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW : RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW : RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW : RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1AB00114 DIM_C00_DIM_CA_CK_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CK_IOC_SLV_STATUS register configures the following:

DIM_CA_CK_IOC_SLV_STATUS

DIM_C00_DIM_CA_CK_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

13.9 DIM D10 DQ Registers (0x1AC00000 DIM_D10_REG_BASE)

This section describes the D10 DIM DQ TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1AC00000 DIM_D10_DIM_DQ_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D10_DIM_DQ_TOP_CFG

Bits	Name	Description
26	CDC_LDO_EN	Enablement of CDC LDO 1’b1 : Enabled 1’b0 : Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1’b1 : Enabled 1’b0 : Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1’b1 : Disabled 1’b0 : Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1’b1 : Enable the RCW 1’b0 : Disabled (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1 : from Read CDCCAL 1’b0 : from Write CDCCAL (default)
12	DEBUG_BUS_EN	1’b1 : Enables the debug bus functionality 1’b0 : Disables the debug bus and drives all ’0’s on debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_dq[5:0] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend

DIM_D10_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1AC00004 DIM_D10_DIM_DQ_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_DQ_HW_INFO register configures the following:

DIM_DQ_HW_INFO

DIM_D10_DIM_DQ_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1AC00008 DIM_D10_DIM_DQ_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_DQ_HW_VERSION register configures the following:

DIM_DQ_HW_VERSION

DIM_D10_DIM_DQ_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.

DIM_D10_DIM_DQ_HW_VERSION (cont.)

Bits	Name	Description
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1AC00010 DIM_D10_DIM_DQ_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D10_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x1AC00014 DIM_D10_DIM_DQ_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D10_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x1AC00018 DIM_D10_DIM_DQ_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D10_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1AC00020 DIM_D10_DIM_DQ_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D10_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1’b1 : differential output (default) 1’b0 : single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)

DIM_D10_DIM_DQ_PAD_CFG3 (cont.)

Bits	Name	Description
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x1AC00024 DIM_D10_DIM_DQ_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D10_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x1AC00030 DIM_D10_DIM_DQ_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D10_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1AC00034 DIM_D10_DIM_DQ_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures DIM_DQ_CDC_CTLR_CFG1.

DIM_D10_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x1AC00038 DIM_D10_DIM_DQ_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures DIM_DQ_CDC_CAL_TIMER_CFG0.

DIM_D10_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1AC0003C DIM_D10_DIM_DQ_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures DIM_DQ_CDC_CAL_TIMER_CFG1.

DIM_D10_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1AC00040 DIM_D10_DIM_DQ_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures DIM_DQ_CDC_REFCOUNT_CFG.

DIM_D10_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1AC00044 DIM_D10_DIM_DQ_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures DIM_DQ_CDC_COARSE_CAL_CFG.

DIM_D10_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1AC00048 DIM_D10_DIM_DQ_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures DIM_DQ_CDC_RSVD_CFG.

DIM_D10_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1AC0004C DIM_D10_DIM_DQ_RD_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures DIM_DQ_RD_CDC_OFFSET_CFG.

DIM_D10_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AC00050 DIM_D10_DIM_DQ_RD_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures DIM_DQ_RD_CDC_DELAY_CFG.

DIM_D10_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AC00054 DIM_D10_DIM_DQ_RD_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures DIM_DQ_RD_CDC_SW_MODE_CFG.

DIM_D10_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1’b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AC00058 DIM_D10_DIM_DQ_RD_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_TEST_CFG register configures DIM_DQ_RD_CDC_TEST_CFG.

DIM_D10_DIM_DQ_RD_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1’b1: Test outputs from the main DDA are connected to the CDC test ports 1’b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1’b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1’b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1’b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1’b0 : CDC test ports disabled

DIM_D10_DIM_DQ_RD_CDC_TEST_CFG (cont.)

Bits	Name	Description
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AC0005C DIM_D10_DIM_DQ_RD_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures DIM_DQ_RD_CDC_SW_OVRD_CFG.

DIM_D10_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AC00060 DIM_D10_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures DIM_DQ_RD_CDC_SLAVE_DDA_CFG.

DIM_D10_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x1AC00070 DIM_D10_DIM_DQ_RD_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures DIM_DQ_RD_CDC_STATUS0.

DIM_D10_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AC00074 DIM_D10_DIM_DQ_RD_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures DIM_DQ_RD_CDC_STATUS1.

DIM_D10_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.

DIM_D10_DIM_DQ_RD_CDC_STATUS1 (cont.)

Bits	Name	Description
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AC00078 DIM_D10_DIM_DQ_RD_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures DIM_DQ_RD_CDC_STATUS2.

DIM_D10_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AC0007C DIM_D10_DIM_DQ_RD_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures DIM_DQ_RD_CDC_STATUS3.

DIM_D10_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AC00080 DIM_D10_DIM_DQ_RD_CDC_STATUS4

Type: Read
Clock: HCLK
Reset State: 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures DIM_DQ_RD_CDC_STATUS4.

DIM_D10_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x1AC000AC DIM_D10_DIM_DQ_WR_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures DIM_DQ_WR_CDC_OFFSET_CFG.

DIM_D10_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AC000B0 DIM_D10_DIM_DQ_WR_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures DIM_DQ_WR_CDC_DELAY_CFG.

DIM_D10_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AC000B4 DIM_D10_DIM_DQ_WR_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures DIM_DQ_WR_CDC_SW_MODE_CFG.

DIM_D10_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AC000B8 DIM_D10_DIM_DQ_WR_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_TEST_CFG register configures DIM_DQ_WR_CDC_TEST_CFG.

DIM_D10_DIM_DQ_WR_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AC000BC DIM_D10_DIM_DQ_WR_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures DIM_DQ_WR_CDC_SW_OVRD_CFG.

DIM_D10_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode

DIM_D10_DIM_DQ_WR_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AC000D0 DIM_D10_DIM_DQ_WR_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures DIM_DQ_WR_CDC_STATUS0.

DIM_D10_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.

DIM_D10_DIM_DQ_WR_CDC_STATUS0 (cont.)

Bits	Name	Description
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AC000D4 DIM_D10_DIM_DQ_WR_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures DIM_DQ_WR_CDC_STATUS1.

DIM_D10_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AC000D8 DIM_D10_DIM_DQ_WR_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures DIM_DQ_WR_CDC_STATUS2.

DIM_D10_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AC000DC DIM_D10_DIM_DQ_WR_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures DIM_DQ_WR_CDC_STATUS3.

DIM_D10_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AC00100 DIM_D10_DIM_DQ_DQ_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures DIM_DQ_DQ_IOC_SLV_CFG.

DIM_D10_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	

DIM_D10_DIM_DQ_DQ_IOC_SLV_CFG (cont.)

Bits	Name	Description
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AC00104 DIM_D10_DIM_DQ_DQ_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures DIM_CA_CA_IOC_SLV_STATUS.

DIM_D10_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x1AC00110 DIM_D10_DIM_DQ_DQS_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures DIM_DQ_DQS_IOC_SLV_CFG.

DIM_D10_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AC00114 DIM_D10_DIM_DQ_DQS_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures DIM_DQ_DQS_IOC_SLV_STATUS.

DIM_D10_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

13.10 DIM D11 DQ Registers (0x1AD00000 DIM_D11_REG_BASE)

This section describes the D11 DIM DQ TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1AD00000 DIM_D11_DIM_DQ_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D11_DIM_DQ_TOP_CFG

Bits	Name	Description
26	CDC_LDO_EN	Enablement of CDC LDO 1’b1 : Enabled 1’b0 : Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1’b1 : Enabled 1’b0 : Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1’b1 : Disabled 1’b0 : Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1’b1 : Enable the RCW 1’b0 : Disabled (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1 : from Read CDCCAL 1’b0 : from Write CDCCAL (default)
12	DEBUG_BUS_EN	1’b1 : Enables the debug bus functionality 1’b0 : Disables the debug bus and drives all ’0’s on debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_dq[5:0] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend

DIM_D11_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1AD00004 DIM_D11_DIM_DQ_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_DQ_HW_INFO register configures the following:

DIM_DQ_HW_INFO

DIM_D11_DIM_DQ_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1AD00008 DIM_D11_DIM_DQ_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_DQ_HW_VERSION register configures the following:

DIM_DQ_HW_VERSION

DIM_D11_DIM_DQ_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.

DIM_D11_DIM_DQ_HW_VERSION (cont.)

Bits	Name	Description
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1AD00010 DIM_D11_DIM_DQ_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D11_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x1AD00014 DIM_D11_DIM_DQ_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D11_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x1AD00018 DIM_D11_DIM_DQ_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D11_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1AD00020 DIM_D11_DIM_DQ_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D11_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1’b1 : differential output (default) 1’b0 : single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)

DIM_D11_DIM_DQ_PAD_CFG3 (cont.)

Bits	Name	Description
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x1AD00024 DIM_D11_DIM_DQ_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D11_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x1AD00030 DIM_D11_DIM_DQ_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D11_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1AD00034 DIM_D11_DIM_DQ_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D11_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x1AD00038 DIM_D11_DIM_DQ_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D11_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1AD0003C DIM_D11_DIM_DQ_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_D11_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1AD00040 DIM_D11_DIM_DQ_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_D11_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1AD00044 DIM_D11_DIM_DQ_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D11_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1AD00048 DIM_D11_DIM_DQ_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D11_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1AD0004C DIM_D11_DIM_DQ_RD_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D11_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AD00050 DIM_D11_DIM_DQ_RD_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D11_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AD00054 DIM_D11_DIM_DQ_RD_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D11_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AD00058 DIM_D11_DIM_DQ_RD_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_TEST_CFG register configures the following:

DIM_DQ_RD_CDC_TEST_CFG

DIM_D11_DIM_DQ_RD_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AD0005C DIM_D11_DIM_DQ_RD_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D11_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode

DIM_D11_DIM_DQ_RD_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AD00060 DIM_D11_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D11_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x1AD00070 DIM_D11_DIM_DQ_RD_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D11_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AD00074 DIM_D11_DIM_DQ_RD_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D11_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AD00078 DIM_D11_DIM_DQ_RD_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D11_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AD0007C DIM_D11_DIM_DQ_RD_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D11_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D11_DIM_DQ_RD_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AD00080 DIM_D11_DIM_DQ_RD_CDC_STATUS4

Type: Read
Clock: HCLK
Reset State: 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D11_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x1AD000AC DIM_D11_DIM_DQ_WR_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D11_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as subunit count 1’b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1’b1: Offset is subtracted from the subunit count 1’b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as unit step count 1’b0: Programmed offset is added/subtracted from the unit step count

DIM_D11_DIM_DQ_WR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AD000B0 DIM_D11_DIM_DQ_WR_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D11_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AD000B4 DIM_D11_DIM_DQ_WR_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D11_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.

DIM_D11_DIM_DQ_WR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AD000B8 DIM_D11_DIM_DQ_WR_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_TEST_CFG register configures the following:

DIM_DQ_WR_CDC_TEST_CFG

DIM_D11_DIM_DQ_WR_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AD000BC DIM_D11_DIM_DQ_WR_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D11_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AD000D0 DIM_D11_DIM_DQ_WR_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D11_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AD000D4 DIM_D11_DIM_DQ_WR_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D11_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AD000D8 DIM_D11_DIM_DQ_WR_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D11_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AD000DC DIM_D11_DIM_DQ_WR_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D11_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D11_DIM_DQ_WR_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AD00100 DIM_D11_DIM_DQ_DQ_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D11_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AD00104 DIM_D11_DIM_DQ_DQ_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D11_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x1AD00110 DIM_D11_DIM_DQ_DQS_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D11_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AD00114 DIM_D11_DIM_DQ_DQS_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D11_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

13.11 DIM D12 DQ Registers (0x1AE00000 DIM_D12_REG_BASE)

This section describes the D12 DIM DQ TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1AE00000 DIM_D12_DIM_DQ_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D12_DIM_DQ_TOP_CFG

Bits	Name	Description
26	CDC_LDO_EN	Enablement of CDC LDO 1’b1 : Enabled 1’b0 : Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1’b1 : Enabled 1’b0 : Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1’b1 : Disabled 1’b0 : Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1’b1 : Enable the RCW 1’b0 : Disabled (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1 : from Read CDCCAL 1’b0 : from Write CDCCAL (default)
12	DEBUG_BUS_EN	1’b1 : Enables the debug bus functionality 1’b0 : Disables the debug bus and drives all ’0’s on debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_dq[5:0] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend

DIM_D12_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1AE00004 DIM_D12_DIM_DQ_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_DQ_HW_INFO register configures the following:

DIM_DQ_HW_INFO

DIM_D12_DIM_DQ_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1AE00008 DIM_D12_DIM_DQ_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_DQ_HW_VERSION register configures the following:

DIM_DQ_HW_VERSION

DIM_D12_DIM_DQ_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.

DIM_D12_DIM_DQ_HW_VERSION (cont.)

Bits	Name	Description
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1AE00010 DIM_D12_DIM_DQ_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D12_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x1AE00014 DIM_D12_DIM_DQ_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D12_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x1AE00018 DIM_D12_DIM_DQ_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D12_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1AE00020 DIM_D12_DIM_DQ_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D12_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1’b1 : differential output (default) 1’b0 : single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)

DIM_D12_DIM_DQ_PAD_CFG3 (cont.)

Bits	Name	Description
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x1AE00024 DIM_D12_DIM_DQ_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D12_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x1AE00030 DIM_D12_DIM_DQ_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D12_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1AE00034 DIM_D12_DIM_DQ_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D12_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x1AE00038 DIM_D12_DIM_DQ_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D12_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1AE0003C DIM_D12_DIM_DQ_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_D12_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1AE00040 DIM_D12_DIM_DQ_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_D12_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1AE00044 DIM_D12_DIM_DQ_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D12_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1AE00048 DIM_D12_DIM_DQ_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D12_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1AE0004C DIM_D12_DIM_DQ_RD_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D12_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AE00050 DIM_D12_DIM_DQ_RD_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D12_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AE00054 DIM_D12_DIM_DQ_RD_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D12_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AE00058 DIM_D12_DIM_DQ_RD_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_TEST_CFG register configures the following:

DIM_DQ_RD_CDC_TEST_CFG

DIM_D12_DIM_DQ_RD_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AE0005C DIM_D12_DIM_DQ_RD_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D12_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode

DIM_D12_DIM_DQ_RD_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AE00060 DIM_D12_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D12_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x1AE00070 DIM_D12_DIM_DQ_RD_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D12_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AE00074 DIM_D12_DIM_DQ_RD_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D12_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AE00078 DIM_D12_DIM_DQ_RD_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D12_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AE0007C DIM_D12_DIM_DQ_RD_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D12_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D12_DIM_DQ_RD_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AE00080 DIM_D12_DIM_DQ_RD_CDC_STATUS4

Type: Read
Clock: HCLK
Reset State: 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D12_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x1AE000AC DIM_D12_DIM_DQ_WR_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D12_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as subunit count 1’b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1’b1: Offset is subtracted from the subunit count 1’b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1’b1: The programmed offset is directly loaded as unit step count 1’b0: Programmed offset is added/subtracted from the unit step count

DIM_D12_DIM_DQ_WR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AE000B0 DIM_D12_DIM_DQ_WR_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D12_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AE000B4 DIM_D12_DIM_DQ_WR_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D12_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.

DIM_D12_DIM_DQ_WR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AE000B8 DIM_D12_DIM_DQ_WR_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_TEST_CFG register configures the following:

DIM_DQ_WR_CDC_TEST_CFG

DIM_D12_DIM_DQ_WR_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AE000BC DIM_D12_DIM_DQ_WR_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D12_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AE000D0 DIM_D12_DIM_DQ_WR_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D12_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AE000D4 DIM_D12_DIM_DQ_WR_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D12_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AE000D8 DIM_D12_DIM_DQ_WR_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D12_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AE000DC DIM_D12_DIM_DQ_WR_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D12_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D12_DIM_DQ_WR_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AE00100 DIM_D12_DIM_DQ_DQ_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D12_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AE00104 DIM_D12_DIM_DQ_DQ_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D12_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x1AE00110 DIM_D12_DIM_DQ_DQS_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D12_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AE00114 DIM_D12_DIM_DQ_DQS_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D12_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

13.12 LPA IF Registers (0x28100000 LPA_IF_BASE)

This section contains the LPAIF registers.

13.12.1 LPA Interface registers

The LPA_IF address map is divided into 14, 4 KB regions to allow MPU protection of audio interface control, mixer, each interrupt control register set and each DMA channel. The 4 KB regions and contents are summarized in the table below:

Address Range	Contents
Addr: 0x0000 - 0x0FFF	Audio Interfaces: PCM, I2S, Digital Mic, VFR sel, spare
Addr: 0x1000 - 0x1FFF	Write DMA Loopback & Mix Control, Test mode
Addr: 0x2000 - 0x2FFF	Mixer Control Register
Addr: 0x3000 - 0x3FFF	Interrupt control and status for audio_out0_irq
Addr: 0x4000 - 0x4FFF	Interrupt control and status for audio_out1_irq
Addr: 0x5000 - 0x5FFF	Interrupt control and status for audio_out2_irq

13.12.1.1 PCM Interface

This section describes the control registers for the PCM interface.

NOTE The reset for the PCM interface comes from the clock controller in LPASS. The logic in the PCM interface is reset synchronously so a clock must be present to get a clean startup. Each time the PCM interface is started, SW should:

1. set the LPASS clock control such that the valid clock is selected and if the clock is external, it must be running
2. write to LPASS clock control to issue a reset to the PCM interface
3. Configure the PCM control register (LPAIF_PCM_CTL)
4. release the reset (PCM setting must not be changed unless reset is asserted or the PCM clock is off as there is no enable bit)

0x28100000 LPAIF_PCM_CTL

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0006_8000

Control registers for the PCM interface.

LPAIF_PCM_CTL

Bits	Name	Description
31:19	RESERVED	
18	CTRL_DATA_OE	SW: RW, HW: R When set, the PCM block will tri-state the data out signal except when the PCM block is driving the active slot. This is necessary only when multiple masters are connected to the same data line. When clear, the PCM block will drive the data signal at all times and must be the only master.
17:15	RATE	SW: RW, HW: R These bits define the number of bits clocks per PCM frame for long and short frame sync formats. This will allow the APQ to support PCM rates other than 2.048 MHz (PCM Mode) and 128 kHz (AUX PCM mode). These bits MUST ALWAYS be set regardless of whether the SYNC_SRC is set for EXTERNAL or INTERNAL. The number of slots available per frame is the number of bits per frame divided by the number of bits per slot (TPCM_WIDTH and RPCM WIDTH). The number of bits per frame is common between the transmit and receive data but the slot width and slot selection is independent. Assuming a desired frame rate of 8 kHz: 0x0: 8 (64 kHZ) 0x1: 16 (128 kHz, AUX PCM mode) 0x2: 32 (256 kHz) 0x3: 64 (512 kHZ) 0x4: 128 (1024 kHZ) 0x5: 256 (2048 kHZ , PCM mode, default value)
14	LOOPBACK	SW: RW, HW: R When set, the PCM DOUT is looped back to PCM DIN internally.
13	SYNC_SRC	SW: RW, HW: R When set, the PCM block will generate a sync signal to drive offchip and for internal use. When cleared, the PCM block will use an external sync. The type of sync generated or expected is selected by AUX_MODE. 0x0: EXTERNAL 0x1: INTERNAL

LPAIF_PCM_CTL (cont.)

Bits	Name	Description
12	AUX_MODE	SW: RW, HW: R Selects between PCM (short sync) and Aux PCM (long sync) modes. In short sync mode, the sync pulse is one clock period wide and comes before the MSB of the first slot. In long sync mode, the sync pulse has a 50% duty cycle and its rising edge is coincident with the MSB of the first slot: 0x0: PCM 0x1: AUX
11	RPCM_WIDTH	SW: RW, HW: R Selects between 8 and 16 bit samples in the incoming stream: 0x0: 8_bit 0x1: 16_bit
10	TPCM_WIDTH	SW: RW, HW: R Selects between 8 and 16 bit samples in the outgoing stream: 0x0: 8_bit 0x1: 16_bit
9:5	RPCM_SLOT	SW: RW, HW: R Specifies the incoming slot to use in the PCM stream. The number of slots available per frame is the number of bits per frame divided by the number of bits per slot (TPCM_WIDTH and RPCM WIDTH). The number of bits per frame is common between the transmit and receive data but the slot width and slot selection is independent. 00000 = (slot0, first slot) 00001 = (slot1, second slot) ... 11111 = (slot31, 32nd slot)
4:0	TPCM_SLOT	SW: RW, HW: R Specifies the outgoing slot to use in the PCM stream. The number of slots available per frame is the number of bits per frame divided by the number of bits per slot (TPCM_WIDTH and RPCM WIDTH). The number of bits per frame is common between the transmit and receive data but the slot width and slot selection is independent. 00000 = (slot0, first slot) 00001 = (slot1, second slot) ... 11111 = (slot31, 32nd slot)

13.12.1.2 I2S Interfaces

This section contains the control registers for the 5 I2S interfaces in LPA_IF. The control register is identical for each interface although some fields are unused by hardware. The table below details how each of these registers map to the I2S interfaces and which fields are applicable:

Index(a)	I2S Interface	Notes
0	Codec Speaker	SPKR_MODE must be set to SD0 MIC_EN, MIC_MODE, MIC_MONO and LOOPBACK fields are unused for this instance.
1	Codec Mic	MIC_MODE must be set to SD0, SD1 or QUAD01 SPKR_EN, SPKR_MODE, and SPKR_MONO fields are unused for this instance. Loopback mode applies.
2	MI2S (8 Channel)	All fields supported. Loopback mode applies.
3	Secondary Speaker	SPKR_MODE must be set to SD0 MIC_EN, MIC_MODE, MIC_MONO and LOOPBACK fields are unused for this instance.
4	Secondary Mic	MIC_MODE must be set to SD0 SPKR_EN, SPKR_MODE, and SPKR_MONO fields are unused for this instance. Loopback mode applies.

NOTE The resets for the I2S interfaces come from the clock controller in LPASS. The logic in the I2S interfaces is reset synchronously so a clock must be present to get a clean startup. Each time one of the I2S interfaces is started, SW should:

1. Set the LPASS clock control such that the valid clock is selected. If the clock is external, it must be running.
2. Write to LPASS clock control to issue a reset to the I2S interface.
3. Release the reset.
4. Configure the relevant LPAIF_I2S_CTLa register.
5. Set the relevant enable bit (MIC_EN or SPKR_EN) as part of the same write or after setting the other control bits.
6. Do not change settings while relevant enable bit is set.

0x28100004+0x4*a LPAIF_I2S_CTLa, a=[0..4]

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0004

LPAIF_I2S_CTLa

Bits	Name	Description
31:16	RESERVED	

LPAIF_I2S_CTLa (cont.)

Bits	Name	Description
15	LOOPBACK	SW: RW, HW: R Loopback control bit. 0x0: DISABLE 0x1: ENABLE (only applicable to a=1=codec_mic, a=2=mi2s, & a=4=sec mic. If ENABLE is set for a=1, codec speaker is looped back to both wires of codec mic. For a=2, mi2s is looped back on itself. For a=4 sec speaker is looped backed to sec mic)
14	SPKR_EN	SW: RW, HW: R Enable for the speaker direction operation (out of the APQ). I2S interface will start transmitting serial data when enabled and trying to access a read DMA channel. Set the enable after the other control bits (speaker related, bit_width, ws_src) are configured. Disable before changing the other bits. 0x0: DISABLE 0x1: ENABLE
13:10	SPKR_MODE	SW: RW, HW: R Controls which I2S lines are used (if supported by HW) and multichannel operation 0x0: NONE 0x1: SD0 (data sent to SD0 only- stereo or mono) 0x2: SD1 (data sent to SD1 only- stereo or mono) 0x3: SD2 (data sent to SD2 only- stereo or mono) 0x4: SD3 (data sent to SD3 only- stereo or mono) 0x5: QUAD01 (SD0 & SD1 = quad channel mode) 0x6: QUAD23 (SD2 & SD3 = quad channel mode) 0x7: 6CH (SD0, SD1 & SD2 = 6 channel mode) 0x8: 8CH (SD0, SD1, SD2 & SD3 = 8 channel mode)
9	SPKR_MONO	SW: RW, HW: R In mono mode, the speaker path of I2S (out of APQ) will take each mono sample from memory and transmit it during both the right and left portions of the word select. Only applicable when a single I2S line is used in SPKR_MODE. 0x0: STEREO 0x1: MONO
8	MIC_EN	SW: RW, HW: R Enable for the microphone direction operation (into the APQ). I2S interface will start capturing data when enabled and trying to access a write DMA channel. Set the enable after the other control bits (mic related, bit_width, ws_src) are configured. Disable before changing the other bits. 0x0: DISABLE 0x1: ENABLE

LPAIF_I2S_CTLa (cont.)

3	MIC_MONO	SW: RW, HW: R Controls whether only the left word is stored in memory (mono) or the left and right words are stored (stereo). In mono mode, the data in the right portion of WS is ignored. Only applicable when a single I2S line is used in MIC_MODE. 0x0: STEREO 0x1: MONO
2	WS_SRC	SW: RW, HW: R Controls the source of the word select, internally generated or taken from outside. Does not affect the clock. Master/Slave bit clock mode is controlled in LPASS clk_ctl. 0x0: INT (master mode) 0x1: EXT (slave mode)
1:0	BIT_WIDTH	SW: RW, HW: R Controls the bit width of the I2S samples 0x0: 16 0x1: 24 0x2: 32 0x3: RESERVED

13.12.1.3 Digital Mic Control

Registers to control the 4 digital mic pathis in LPA_IF.

NOTE Digital Mic cannot operate at the same time as the codec mic I2S interface. Enabling digital mic operation will mux the codec mic I2S interface out.

0x28100018 LPAIF_DMIC_CTL

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

Register which is common to all 4 digital mic data pathis.

This section contains the control registers for the 4 digital mic data pathis (left0, right0, left1 and right1). The control registers is identical for each path. The table below details how each of these registers map to the digital mic data pathis and which fields are applicable:

Index(a)	Digital Mic Path	Notes
0	left0	connected to data0_in pin of LPA_IF, sampled on the rising edge of the clock.
1	right0	connected to data0_in pin of LPA_IF, sampled on the falling edge of the clock
2	left1	connected to data1_in pin of LPA_IF, sampled on the rising edge of the clock.
3	right1	connected to data1_in pin of LPA_IF, sampled on the falling edge of the clock

Bits	Name	Description
31:5	RESERVED	
4	EN	SW: RW, HW: R Enable Digital mic operation. NOTE: Enabling digital mic operation will mux the codec mic I2S interface out. Digital mics will start capturing data when enabled and trying to access a write DMA channel. Set the enable after the other control bits (mic related, bit_width, ws_src) are configured. Disable before changing the other bits. Enable after write DMA channel is configured and enabled. 0x0: DISABLE 0x1: ENABLE
3:1	DMIC_MODE	SW: RW, HW: R Controls which digital mics are used and multichannel operation 0x0: NONE 0x1: LEFT0 (data taken data0_in on rise edge - mono) 0x2: RIGHT0 (data taken data0_in on fall edge- mono) 0x3: LEFT1 (data taken data1_in on rise edge - mono) 0x4: RIGHT1 (data taken data1_in on fall edge - mono) 0x5: STEREO0 (LEFT0 & RIGHT0 = 2 channel mode) 0x6: STEREO1 (LEFT1 & RIGHT1 = 2 channel mode) 0x7: QUAD (4 channel mode)
0	BIT_WIDTH	SW: RW, HW: R Controls the bit width of the dmic samples 0x0: 16 0x1: 20

0x2810001C+ 0x4*a LPAIF_DMIC_VOL_CTLa, a=[0..3]

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_FF00

LPAIF_DMIC_VOL_CTLa

Bits	Name	Description
31:21	RESERVED	
20	UPDATE_STATUS	SW: R, HW: W Status of gain update. If set after writing a 1 to UPDATE_GAIN, gain has not been applied yet. Do not update gain value until this value reads back as '0'. 0x0: COMPLETE 0x1: PENDING (timeout or zero crossing)
19	UPDATE_GAIN	SW: W, HW: R Controls the loading of the gain value. The new gain value will not be applied until a 1 is written to this bit. 0x0: NO 0x1: YES (issue command to accept new gain)
18	TX_HPF_BP	SW: RW, HW: R When set(1) bypass TX DC blocking in digital mic datapath. 0x0: DC_BLOCK 0x1: BYPASS_DC_BLOCK
17	DMIC_GAIN_BP	SW: RW, HW: R When set (1), bypass DMIC gain stage post CIC. 0x0: GAIN 0x1: BYPASS_GAIN
16	MUTE_EN	SW: RW, HW: R When set(1), Mutes the output of this path. 0x0: NORMAL 0x1: MUTE
15:8	TIMEOUT_VAL	SW: RW, HW: R .Timeout value for gain application. Gain is normally applied at zero crossing. If zero crossing is not detected before timer expires, gain will be applied anyway. Timeout in Seconds = (256 * TIMEOUT_VAL + 255) / SampleRate 0xFF: DEFAULT (65535 samples = 1.37 sec @ 48 kHz)
7:0	GAIN	SW: RW, HW: R Channel Gain. 8 bit signed value representing gain in dB. Supported range = 0xAC (-84 dB) to 0x23 (35 dB) Examples: multiply by 1.0 = 0x00 = 0 dB multiply by 0.5 = 0xFA = -6 dB multiply by 2.0 = 0x06 = 6 dB 0x0: DEFAULT (=0 dB)

13.12.1.4 Vocoder Frame Reference Select

Register to select the source of the vocoder frame reference as either the modem subsystem (internal) or an external pin.

0x2810002C LPAIF_EXT_VFR

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

Select internal or external vocoder frame reference

LPAIF_EXT_VFR

Bits	Name	Description
31:1	RESERVED	
0	SEL	SW: RW, HW: R When set, the vocoder frame reference will be from an external pin. When cleared, the internal vocoder frame reference from the modem will be used (default). 0x0: INTERNAL 0x1: EXTERNAL

13.12.1.5 Spare Register

Spare register for possible ECOs.

0x28100030 LPAIF_SPARE

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

Spare register

LPAIF_SPARE

Bits	Name	Description
31:0	SPARE	

13.12.1.6 Write DMA Loopback and Mixout

This register is used to block or allow each write DMA channel from using Loopback modes or MIXOUT. The bit corresponding to a DMA channel is not set and the "AUDIO_INTF" field in the

LPA_DMA_CTLa register is set to MIXOUT, LOOPBACK1 or LOOPBACK2, the HW will force the effective value back to NONE.

0x28101000 LPAIF_WRDMA_LPBK_MIX

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_000F

Enable write DMAs to use loopback or mixout modes.

LPAIF_WRDMA_LPBK_MIX

Bits	Name	Description
31:4	RESERVED	
3	CH8	SW: RW, HW: R Control weather write dma channel 8 can be used for loopback or mixout operation. 0x0: BLOCK (loopback or mixout is not allowed) 0x1: ALLOW (dma channel can be used for loopback or mixout)
2	CH7	SW: RW, HW: R Control weather write dma channel 7 can be used for loopback or mixout operation. 0x0: BLOCK (loopback or mixout is not allowed) 0x1: ALLOW (dma channel can be used for loopback or mixout)
1	CH6	SW: RW, HW: R Control weather write dma channel 6 can be used for loopback or mixout operation. 0x0: BLOCK (loopback or mixout is not allowed) 0x1: ALLOW (dma channel can be used for loopback or mixout)
0	CH5	SW: RW, HW: R Control weather write dma channel 5 can be used for loopback or mixout operation. 0x0: BLOCK (loopback or mixout is not allowed) 0x1: ALLOW (dma channel can be used for loopback or mixout)

13.12.1.7 Debug Control

This control register is used to bring out various internal nodes to the testbus for debug.

0x28101004 LPAIF_DEBUG_CTL

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

Select signals for test modem.

LPAIF_DEBUG_CTL

Bits	Name	Description
31:5	RESERVED	
4	TESTMODE	SW: RW, HW: R Enable test mode. If not set, SEL field will have no effect and testbus will be driven to 0s. 0x0: OFF (not in test mode) 0x1: ON (in test mode)
3:0	TESTSEL	SW: RW, HW: R Select which function is brought out to the test bus for visibility. 0x0: CH0 (DMA Ch 0 - RD DMA) 0x1: CH1 (DMA Ch 1 - RD DMA) 0x2: CH2 (DMA Ch 2 - RD DMA) 0x3: CH3 (DMA Ch 3 - RD DMA) 0x4: CH4 (DMA Ch 4 - RD DMA) 0x5: CH5 (DMA Ch 5 - WR DMA) 0x6: CH6 (DMA Ch 6 - WR DMA) 0x7: CH7 (DMA Ch 7 - WR DMA) 0x8: CH8 (DMA Ch 8 - WR DMA) 0x9: MIXER 0xA: CODEC_SPKR 0xB: CODEC_MIC 0xC: MI2S 0xD: SEC_SPKR 0xE: SEC_MIC 0xF: DMIC

13.12.1.8 Mixer control

The LPA_IF block contains 1 linear mixer which can be fed by 2 Read DMA engines simultaneously. This register is used to select which read DMA channels feed the mixer.

NOTE The output of the mixer will be connected to the audio interace (AUDIO_INTF field of the LPAIF_DMA_CTLa register) of the DMA channel connected to Port 0 if both ports are configured. If only Port 1 is configured, the output of the mixer will be connected to the audio interlace of the DMA channel connected to Port 1. If the audio interface of the DMA channel assigned to Port 1 does not match the audio interface of Port 0, the output of this DMA channel assigned to Port 1 will NOT be connected to the mixer. (i.e., the AUDIO_INTF must match for the 2 DMA channels selected to feed the mixer).

If adding the mixer to an existing, running audio stream:

Setup a 2nd Read DMA channel (B)

Enable Read DMA channel (B)

NOTE Poll channel B FIFO_WORDCNT field of the LPAIF_DMA_PER_CNTa register until it reaches programmed watermark

Configure LPAIF_MIXER_CTL register:

set port 0 to channel A (existing stream)

set port1 to channel B (new stream)

0x28102000 LPAIF_MIXER_CTL

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

Enable mixer / selects which DMA channels will feed the mixer.

LPAIF_MIXER_CTL

Bits	Name	Description
31:11	RESERVED	
10	OVR_DET	SW: R, HW: W Clear mixer overflow detection bit. OVR_DET bit will be set if ever the addition of 2 inputs exceeded max neg or pos value for current bit width. 0x0: OK (no overflow has occurred since reset or last OVR_CLR) 0x1: YES (overflow occurred since reset or last OVR_CLR. If SAT_EN was set, outputs were saturated.)
9	OVR_CLR	SW: W, HW: R Clear mixer overflow detection bit. Overflow detection bit (OVR_DET above) will be set if ever the addition of 2 inputs exceeds max neg or pos value for current bit width. A single write with a ’1’ in this bit will clear the OVR_DET bit. 0x0: NO (do not clear status) 0x1: YES (clear overflow/saturation status)
8	SAT_EN	SW: RW, HW: R Enables mixer to saturate outputs if addition of inputs exceeds max neg or pos value for current bit width. 0x0: DISABLE (outputs will overflow/change sign) 0x1: ENABLE (saturate to max pos or neg value)
7:6	BIT_WIDTH	SW: RW, HW: R Determines the bit width of the samples to be mixed 0x0: 8 (only for PCM i/f) 0x1: 16 0x2: 24 (8 lsbs are pass through from port 0) 0x3: 32

LPAIF_MIXER_CTL (cont.)

Bits	Name	Description
5:3	PORT1_CH	SW: RW, HW: R Determines which (if any) read DMA channel should be connected to port 1 of the mixer 0x0: NONE (disable port 1) 0x1: CHAN0 0x2: CHAN1 0x3: CHAN2 0x4: CHAN3 0x5: CHAN4
2:0	PORT0_CH	SW: RW, HW: R Determines which (if any) read DMA channel should be connected to port 0 of the mixer. 0x0: NONE (disable port 0) 0x1: CHAN0 0x2: CHAN1 0x3: CHAN2 0x4: CHAN3 0x5: CHAN4

13.12.1.9 Audio Interrupt Registers

The audio interrupt control registers support each of the interrupt sources generating interrupts on either of 3interrupt outputs audio_irq_out0, audio_irq_out1, audio_irq_out2. Each interrupt output has its own enable, status, clear, force and raw status register. These registers support the following functionality:

- poll raw status of interrupt source even if not enabled
- force an interrupt
- clearing the interrupt source clears it if forced or actual source caused it
- enable for each interrupt source and for interrupt output
- reading the interrupt status determines which enabled interrupts are asserted
- the same value can be written back to clear these interrupts

The registers below apply to the 3 interrupt outputs. Each register type occurs 3 times, once for each interrupt output based on an index "a" as shown below. a = 0 is for audio_irq_out0, a=1 is for audio_irq_out1 and a=2 is for audio_irq_out2.

0x28103000+ 0x1000*a LPAIF_IRQ_ENa, a=[0..2]

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

Interrupt enables. The definition of the fields are as follows:

ERR_CHX = When set, enables a bus error (AHB) on channel X to cause an interrupt

OVR_CHX = When set, enables an overrun on channel X to cause an interrupt. (Applicable to write DMA channels 5-8)

UNDR_CHX= When set, enables an underrun on channel X to cause an interrupt. (Applicable to read DMA channels 0-4)

PER_CHX= When set, enables channel X reaching of the period count to cause an interrupt.

0x28103008+ 0x1000*a LPAIF_IRQ_RAW_STATa, a=[0..2]

Type: Read
Clock: CC_LPAIF_HCLK

Raw status of the interrupt sources. A bit set in this status register indicates the interrupt event occurred whether it was enabled or not. This register can be used for polling operations or debug. The raw status is cleared when the a ’1’ is written to the corresponding bit in the LPAIF_IRQ_CLEARa register.

Interrupt raw status. The definition of the fields are as follows:

ERR_CHX = When set, a bus error (AHB) occurred on channel X regardless of enable.

OVR_CHX = When set, an overrun occurred on channel X regardless of enable. (Applicable to write DMA channels 5-8)

UNDR_CHX= When set, an underrun occurred on channel X regardless of enable. (Applicable to read DMA channels 0-4)

PER_CHX= When set, channel X reached the period count regardless of enable.

0x2810300C+ 0x1000*a LPAIF_IRQ_CLEARa, a=[0..2]

Type: Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

Writing a 1 to a bit in this register will clear the latched interrupt event regardless of whether it is enabled for interrupt source 0 or interrupt source 1. The clear function is independent between interrupt source 0 and interrupt source 1. The corresponding bit in LPAIF_IRQ_RAW_STATa and LPAIF_IRQ_STATa will be cleared by writing a ’1’ to a bit in this register.

Interrupt clear. The definition of the fields are as follows:

ERR_CHX = Writing a 1 will clear the bus error detection for channel X.

OVR_CHX = Writing a 1 will clear the overrun detection for channel X. (Applicable to write DMA channels 5-8)

UNDR_CHX= Writing a 1 will clear the underrun detection for channel X. (Applicable to read DMA channels 0-4)

PER_CHX= Writing a 1 will clear the period count detection for channel X.

0x28103010+ 0x1000*a LPAIF_IRQ_FORCEa, a=[0..2]

Type: Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

Writing a 1 to a bit in this register will force the corresponding condition as if it were generated by HW. If enabled for the corresponding interrupt output, the condition will cause an interrupt. All the registers (clear, raw_status, enable, status) operate as if the condition were caused by HW. Useful for ISR development and testing. The forced condition is cleared by writing a 1 to the corresponding bit in LPAIF_IRQ_CLRx. Writing a 0 to a bit in this register has no effect.

Interrupt force. The definition of the fields are as follows:

ERR_CHX = Writing a 1 will force a bus error condition for channel X.

OVR_CHX = Writing a 1 will force an underrun condition for channel X. (Applicable to write DMA channels 5-8)

UNDR_CHX= Writing a 1 will force an underrun condition for channel X. (Applicable to read DMA channels 0-4)

PER_CHX= Writing a 1 will force a period count expired condition for channel X.

13.12.1.10 Audio DMA Registers

The DMA channels can be allocated as follows:

Table 13-6 DMA Channel Allocation

Channel	Audio Direction	AHB Operation
Channel 0	Speaker	Read
Channel 1	Speaker	Read
Channel 2	Speaker	Read
Channel 3	Speaker	Read
Channel 4	Speaker	Read
Channel 5	Microphone	Write
Channel 6	Microphone	Write
Channel 7	Microphone	Write
Channel 8	Microphone	Write

Only 1 DMA channel can be connected to a speaker audio interface. If the user does program 2 Read DMA channels to the same interface, the lowest number channel will have priority. The only exception is when 2 read DMA channels feed the same interface via the mixer (LPAIF_MIXER_CTL).

Loopback mode is when samples pulled from memory by a Read DMA channel are looped back to a Write DMA Channel and written back to memory bypassing any audio HW block. Write DMA channels should be disabled before their corresponding read DMA channel in loopback mode to prevent invalid samples from being written to memory.

In loopback mode, the read channel must be programmed to a running audio interface. The audio interface will determine the rate of the transfers.

NOTE Only write DMA channels should be programmed to loopback in the AUDIO_INTF field.

DMA channels have a fixed assignment for loopback except for channel 8 which can be programmed to take read data from Channel 3 or Channel4:

Channel 0 -> Channel 5

Channel 1 -> Channel 6

Channel 2 -> Channel 7

Channel 3 -> Channel 8 or

Channel 4 -> Channel 8

The registers below apply to the 9 DMA channels. Each register type is repeated 9 times, once for each channel based on an index "a" as shown below. a = 0 is for channel 0 ... a=8 for channel 8.'

0x28106000+ 0x1000*a LPAIF_DMA_CTLa, a=[0..8]

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

Control register for DMA Channel "a"

LPAIF_DMA_CTLa

Bits	Name	Description
31:12	RESERVED	
11	BURST_EN	SW: RW, HW: R When set, DMA engine issue 4 beat AHB transactions (INCR4) instead of singles to the AHB bus. NOTE: Do NOT change BURST_EN while DMA channel is enabled. READ DMA: DMA cannot start a new burst until current FIFO depth is < 5 since FIFO is 8 deep and there must be room for all 4 beats Watermark should be programmed to >4. As soon as depth < 4 and less than the watermark, DMA will fetch 4 more words. Recommendation: If application is low latency/low speed, use shallow watermark and SINGLEs else use watermark of >4 and INCR4. WRITE DMA: DMA cannot start a burst until at least 4 samples are in the FIFO. Watermark for write DMA is the FIFO depth you do not wish to reach. If using INCR4, set watermark for 8. 0x0: SINGLE 0x1: INCR4

LPAIF_DMA_CTLa (cont.)

Bits	Name	Description
10:8	WPSCNT	SW: RW, HW: R Sets the number of 32 bit words per audio sample. This field is required to ensure data is routed to the proper audio channel. 0x0: ONE (mono, 16 bit stereo) 0x1: TWO (16 bit 4 channel, 32/24/20 bit stereo) 0x2: THREE (16 bit 6 channel) 0x3: FOUR (16 bit 8 channel, 32/24/20 bit 4 channel) 0x5: SIX (32/24/20 bit 6 channel) 0x7: EIGHT (32/24/20 bit 8 channel) 0x4: RESERVED_1 0x6: RESERVED_2
7:4	AUDIO_INTF	SW: RW, HW: R This field selects the audio interface supported by this DMA channel. Only 1 DMA channel shall be programmed to a speaker audio interface at any given time. In loopback, samples pulled from memory by Channel 0-4 are looped back to Channel 5-8 and written back to memory bypassing any audio HW block. In loopback mode, the sample rate will be dictated by the audio hw interface selected for Channel 0-4 therefore a valid, running audio interface must be selected for Channel 0-4. 0x0: NONE (DMA channel is unused) 0x1: CODEC (primary I2S interface) 0x2: PCM 0x3: SEC_I2S (secondary I2S interface) 0x4: MI2S (8 channel I2S interface) 0x5: HDMI (internal HDMI block, channels 0-4 only) 0x6: MIXOUT (mixer output, channels 5-8 only) 0x7: LOOPBACK1 (channel 0->5, 1->6,2->7,3->8 channels 5-8 only) 0x8: LOOPBACK2 (channel 4->8, valid for channel 8 only)
3:1	FIFO_WATERMRK	SW: RW, HW: R Sets a limit on the number of 32-bit words in the DMA FIFO (a watermark). The watermark for read channels (Ch 0-4) sets a limit on the number of 32 bit words the DMA will try to keep in the FIFO. The watermark for write channels (Ch 5-8) sets the FIFO depth that will generate an overrun interrupt. 0x0: 1 0x1: 2 0x2: 3 0x3: 4 0x4: 5 0x5: 6 0x6: 7 0x7: 8

LPAIF_DMA_CTLa (cont.)

Bits	Name	Description
0	ENABLE	SW: RW, HW: R Enable DMA channel. A channel which performs AHB reads (Channel 0-4) will immediately begin fetching data from the base address when enabled. A channel which performs AHB writes (Channel 5-8) will wait until a 32-bit word has been placed in the FIFO by the audio HW block and will then start storing them at the base address. Therefore, the DMA channel should be enabled before the audio HW block. 0x0: OFF 0x1: ON

0x28106004+ 0x1000*a LPAIF_DMA_BASEa, a=[0..8]

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

Base address for channel "a". Note that the base address is restricted to multiples of 16 bytes to prevent a burst access from ever crossing a 1024 byte boundary.

LPAIF_DMA_BASEa

Bits	Name	Description
31:4	BASE_ADDR	SW: RW, HW: R Base address of the circular buffer. When enabled, the DMA channel will start accesses at this address.
3:0	RESERVED	All buffers must start on a 16 byte boundary so these bits are ignored and the forced to 0 by HW.

0x28106008+ 0x1000*a LPAIF_DMA_BUFF_LENa, a=[0..8]

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0003

Buffer length for channel "a". Note that the buffer length is restricted to multiples of 16 bytes such that and integer number of INCR4 bursts will always exist in a buffer. The 2 LSBs of the length are effectively forced to 1s. e.g. Setting the LENGTH field (19:2) to 0s will result in a buffer length of 4 32 bit words.

LPAIF_DMA_BUFF_LENa

Bits	Name	Description
31:20	RESERVED_1	
19:2	LENGTH	SW: RW, HW: R Defines the size of the circular buffer in memory. Circular buffer will have BUFF_LEN+1 32-bit words. When enabled, the DMA channel will start at BASE_ADDR and roll over at BASE_ADDR+(BUFF_LEN)*4. This register directly controls the rollover value for the buffer counter (BUFF_CNT) i.e., a value of 4095 here will result in a 4096 length buffer. This field sets the 18 most significant bits of BUFF_LEN. The 2 LSBs are always 1s.
1:0	RESERVED_2	The minimum buffer length and size increment is 16 bytes so these bits are ignored and the forced to 1s by HW. These bits will read back as 1s.

0x2810600C+ 0x1000*a LPAIF_DMA_CURR_ADDRa, a=[0..8]

Type: Read
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

LPAIF_DMA_CURR_ADDRa

Bits	Name	Description
31:0	ADDR	SW: RW, HW: W Reads return next 32-bit word address to be used by the DMA channel.

0x28106010+ 0x1000*a LPAIF_DMA_PER_LENa, a=[0..8]

Type: Read/Write
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

LPAIF_DMA_PER_LENa

Bits	Name	Description
31:20	RESERVED	

LPAIF_DMA_PER_LENa (cont.)

Bits	Name	Description
19:0	LENGTH	SW: RW, HW: R Period Length. Defines the length of a periodic software interrupt in "32-bit words". Interrupt will be generated when PER_CHx is set in LPAIF_IRQ_ENx and the number of 32-bit words defined by PER_LEN has been written or read. This register directly controls the rollover value for the period counter (PER_CNT) ie a value of 4095 here will result in a 4096 32-bit words per period. PER_CNT rolls over at PER_LEN. (i.e., a value of 4095 here will result in an interrupt every 4096 32-bit words)

0x28106014+ 0x1000*a LPAIF_DMA_PER_CNTa, a=[0..8]

Type: Read
Clock: CC_LPAIF_HCLK
Reset State: 0x0000_0000

LPAIF_DMA_PER_CNTa

Bits	Name	Description
31:25	RESERVED	
24	FORMAT_ERR	SW: R, HW: W When set, the DMA engine has detected a problem with the programmed value for WPSCNT. For Read DMA channels, FORMAT_ERR indicates that the buffer length did not contain an integer number of samples. e.g. If WPSCNT is set for 8 words per sample, a format error will occur if the buffer length is set for 260 words. For Write DMA channels, FORMAT_ERR indicates that the WPSCNT field rollover did not match the cnt indicator from the audio interface (e.g. WPSCNT is set for 8 words per sample but audio interface is only using 2 words per sample). It can also indicate the buffer length did not contain a integer number of samples.

LPAIF_DMA_PER_CNTa (cont.)

Bits	Name	Description
23:20	FIFO_WORDCNT	SW: R, HW: W Returns the current number of 32bit words in the FIFO. If INCR4 bursts are not enabled via BURST_EN, the FIFO_WORDCNT ideally will return 0 for write channels and FIFO_WATERMRK for read channels. If bursts are enabled, the write DMAs will accumulate 4 write samples before attempting to push them to memory and the read DMAs will wait until the FIFO_WORDCNT is less than 5 before attempting to read more samples from memory. 0x0: 0 0x1: 1 0x2: 2 0x3: 3 0x4: 4 0x5: 5 0x6: 6 0x7: 7 0x8: 8
19:0	PER_CNT	SW: R, HW: W A counter which determines when software will receive a DMA interrupt. Interrupt will be generated when PER_CHx is set in LPAIF_IRQ_ENx and PER_CNT = PER_LEN. This counter is incremented when the DMA address is incremented but need not roll over at the same point as the address counter. PER_CNT is reset when DMA channel is disabled.

13.13 DIM D13 DQ Registers (0x1AF00000 DIM_D13_REG_BASE)

This section describes the D13 DIM DQ TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1AF00000 DIM_D13_DIM_DQ_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D13_DIM_DQ_TOP_CFG

Bits	Name	Description
26	CDC_LDO_EN	Enablement of CDC LDO 1’b1 : Enabled 1’b0 : Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1’b1 : Enabled 1’b0 : Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1’b1 : Disabled 1’b0 : Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1’b1 : Enable the RCW 1’b0 : Disabled (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1 : from Read CDCCAL 1’b0 : from Write CDCCAL (default)
12	DEBUG_BUS_EN	1’b1 : Enables the debug bus functionality 1’b0 : Disables the debug bus and drives all ’0’s on debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_dq[5:0] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend

DIM_D13_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1AF00004 DIM_D13_DIM_DQ_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_DQ_HW_INFO register configures the following:

DIM_DQ_HW_INFO

DIM_D13_DIM_DQ_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1AF00008 DIM_D13_DIM_DQ_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_DQ_HW_VERSION register configures the following:

DIM_DQ_HW_VERSION

DIM_D13_DIM_DQ_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.

DIM_D13_DIM_DQ_HW_VERSION (cont.)

Bits	Name	Description
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1AF00010 DIM_D13_DIM_DQ_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D13_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x1AF00014 DIM_D13_DIM_DQ_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D13_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x1AF00018 DIM_D13_DIM_DQ_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D13_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1AF00020 DIM_D13_DIM_DQ_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D13_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1’b1 : differential output (default) 1’b0 : single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)

DIM_D13_DIM_DQ_PAD_CFG3 (cont.)

Bits	Name	Description
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x1AF00024 DIM_D13_DIM_DQ_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D13_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x1AF00030 DIM_D13_DIM_DQ_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D13_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1AF00034 DIM_D13_DIM_DQ_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D13_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x1AF00038 DIM_D13_DIM_DQ_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D13_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1AF0003C DIM_D13_DIM_DQ_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_D13_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1AF00040 DIM_D13_DIM_DQ_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_D13_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1AF00044 DIM_D13_DIM_DQ_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D13_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1AF00048 DIM_D13_DIM_DQ_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D13_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1AF0004C DIM_D13_DIM_DQ_RD_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D13_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AF00050 DIM_D13_DIM_DQ_RD_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D13_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AF00054 DIM_D13_DIM_DQ_RD_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D13_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AF00058 DIM_D13_DIM_DQ_RD_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_TEST_CFG register configures the following:

DIM_DQ_RD_CDC_TEST_CFG

DIM_D13_DIM_DQ_RD_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AF0005C DIM_D13_DIM_DQ_RD_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D13_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode

DIM_D13_DIM_DQ_RD_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AF00060 DIM_D13_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D13_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x1AF00070 DIM_D13_DIM_DQ_RD_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D13_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AF00074 DIM_D13_DIM_DQ_RD_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D13_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AF00078 DIM_D13_DIM_DQ_RD_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D13_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AF0007C DIM_D13_DIM_DQ_RD_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D13_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D13_DIM_DQ_RD_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AF00080 DIM_D13_DIM_DQ_RD_CDC_STATUS4

Type: Read
Clock: HCLK
Reset State: 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D13_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x1AF000AC DIM_D13_DIM_DQ_WR_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D13_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count

DIM_D13_DIM_DQ_WR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AF000B0 DIM_D13_DIM_DQ_WR_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D13_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AF000B4 DIM_D13_DIM_DQ_WR_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D13_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.

DIM_D13_DIM_DQ_WR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AF000B8 DIM_D13_DIM_DQ_WR_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_TEST_CFG register configures the following:

DIM_DQ_WR_CDC_TEST_CFG

DIM_D13_DIM_DQ_WR_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AF000BC DIM_D13_DIM_DQ_WR_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D13_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AF000D0 DIM_D13_DIM_DQ_WR_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D13_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AF000D4 DIM_D13_DIM_DQ_WR_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D13_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AF000D8 DIM_D13_DIM_DQ_WR_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D13_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AF000DC DIM_D13_DIM_DQ_WR_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D13_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D13_DIM_DQ_WR_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AF00100 DIM_D13_DIM_DQ_DQ_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D13_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AF00104 DIM_D13_DIM_DQ_DQ_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D13_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x1AF00110 DIM_D13_DIM_DQ_DQS_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D13_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AF00114 DIM_D13_DIM_DQ_DQS_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D13_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

13.14 DIM C10 CA Registers (0x1B000000 DIM_C10_REG_BASE)

This section describes the C10 DIM CA TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1B000000 DIM_C10_DIM_CA_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_CA_TOP_CFG register configures the following:

DIM_CA_TOP_CFG

DIM_C10_DIM_CA_TOP_CFG

Bits	Name	Description
20	IOCAL_CTLR_SEL	Select source of PCNT/NCNT/PNCNT_VALID 1'b1: external 1'b0: internal (default)
16	SDR_MODE_EN	1'b1 : Enables SDR mode on address bus 1'b0 : Enables DDR mode on address bus (default)
13	DEBUG_BUS_SEL	Debug bus source select 1'b1: From IOCAL 1'b0: From CDCCAL (default)
12	DEBUG_BUS_EN	1'b1: Enables the debug bus functionality 1'b0: Disables the debug bus and drives all '0's on the debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_ca[7:5] 1'b1 : from cdc test outputs 1'b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1'b1) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0: without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1B000004 DIM_C10_DIM_CA_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_CA_HW_INFO register configures the following:

DIM_CA_HW_INFO

DIM_C10_DIM_CA_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1B000008 DIM_C10_DIM_CA_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_CA_HW_VERSION register configures the following:

DIM_CA_HW_VERSION

DIM_C10_DIM_CA_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1B000010 DIM_C10_DIM_CA_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_CA_PAD_CFG0 register configures the following:

DIM_CA_PAD_CFG0

DIM_C10_DIM_CA_PAD_CFG0

Bits	Name	Description
31	CA_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	CA_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	CA_LV_MODE	Mode pin for high/low voltage regime
28	CA_ODT_ENA	Enable bit for on-die termination
27:26	CA_ODT	Impedance control bit settings for on-die termination
25:24	CA_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	CA_NSLEW	Slew rate control bits for output path NMOS
17:16	CA_PSLEW	Slew rate control bits for output path PMOS
13:12	CA_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	CA_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	CA_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CA_ROUT	Impedance control bit settings for output driver
2:0	CA_DCC	Duty cycle correction bits for output path

0x1B000014 DIM_C10_DIM_CA_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0220440

The DIM_CA_PAD_CFG1 register configures the following:

DIM_CA_PAD_CFG1

DIM_C10_DIM_CA_PAD_CFG1

Bits	Name	Description
31	CK_DDR_MODE1	Mode select for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	CK_DDR_MODE0	Mode select for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	CK_LV_MODE	Mode select for high/low voltage regime
28	CK_CMFB_ENA	Common mode feedback loop enable
27	CK_ODT_ENA1	Enable bit for on-die termination (when hp_mode = 1'b1)
26	CK_ODT_ENA	Enable bit for on-die termination (when hp_mode = 1'b0) Bit field name missing '0' for APQ8064 SW compatibility.
25:24	CK_ODT	Impedance control bit settings for on-die termination
21:20	CK_NSLEW	Slew rate control bits for output path NMOS
17:16	CK_PSLEW	Slew rate control bits for output path PMOS
13	CK_CUR_MODE1	Current/Voltage mode selection (when hp_mode = 1'b1) 1'b1 : Current mode 1'b0 : Voltage mode (default)
12	CK_CUR_MODE0	Current/Voltage mode selection (when hp_mode = 1'b0) 1'b1 : Current mode 1'b0 : Voltage mode (default)
10:8	CK_I_DRV	Control bit settings for bias current
7	CK_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CK_ROUT	Impedance control bit settings for output driver
2:0	CK_DCC	Duty cycle correction bits for output path

0x1B000018 DIM_C10_DIM_CA_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_CA_PAD_CFG2 register configures the following:

DIM_CA_PAD_CFG2

DIM_C10_DIM_CA_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1B00001C DIM_C10_DIM_CA_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x00300000

The DIM_CA_PAD_CFG3 register configures the following:

DIM_CA_PAD_CFG3

DIM_C10_DIM_CA_PAD_CFG3

Bits	Name	Description
31:30	CS_N_IE	
29:28	CS_N_OE	
25	CK_IE	
24	CK_OE	
23:22	CKE_IE	
21:20	CKE_OE	
19:10	CA_IE	
9:0	CA_OE	

0x1B000020 DIM_C10_DIM_CA_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_PAD_CFG4 register configures the following:

DIM_CA_PAD_CFG4

DIM_C10_DIM_CA_PAD_CFG4

Bits	Name	Description
31:30	CS_N_OE_DYN_ENA	Enable dynamic control of CS_N OE 1'b1: Dynamic control enabled and CS_N_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CS_N OE gated by CA_PAD_CFG3 bits Note: This register should not be set in external loopback mode since it will change the IE contol source.
29:28	CS_N_OE_DYN	Dynamic OE control for each of the CS_N outputs, OR-ed with common controller OE.
25	RESERVED_1	
24	RESERVED_2	
23:22	CKE_OE_DYN_ENA	Enable dynamic control of CKE OE 1'b1: Dynamic control enabled and CKE_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CKE OE gated by CA_PAD_CFG3 bits
21:20	CKE_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.
19:10	CA_OE_DYN_ENA	Enable dynamic control of CA OE 1'b1: Dynamic control enabled and CA_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CA OE gated by CA_PAD_CFG3 bits
9:0	CA_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.

0x1B000030 DIM_C10_DIM_CA_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG0 register configures the following:

DIM_CA_CDC_CTLR_CFG0

DIM_C10_DIM_CA_CDC_CTLR_CFG0

Bits	Name	Description
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1B000034 DIM_C10_DIM_CA_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG1 register configures the following:

DIM_CA_CDC_CTLR_CFG1

DIM_C10_DIM_CA_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x1B000038 DIM_C10_DIM_CA_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_CA_CDC_CAL_TIMER_CFG0

DIM_C10_DIM_CA_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.

DIM_C10_DIM_CA_CDC_CAL_TIMER_CFG0 (cont.)

Bits	Name	Description
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1B00003C DIM_C10_DIM_CA_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_CA_CDC_CAL_TIMER_CFG1

DIM_C10_DIM_CA_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1B000040 DIM_C10_DIM_CA_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_REFCOUNT_CFG register configures the following:

DIM_CA_CDC_REFCOUNT_CFG

DIM_C10_DIM_CA_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1B000044 DIM_C10_DIM_CA_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_CA_CDC_COARSE_CAL_CFG configures the following:

DIM_CA_CDC_COARSE_CAL_CFG

DIM_C10_DIM_CA_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1B000048 DIM_C10_DIM_CA_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_RSVD_CFG register configures the following:

DIM_CA_CDC_RSVD_CFG

DIM_C10_DIM_CA_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1B00004C DIM_C10_DIM_CA_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_OFFSET_CFG register configures the following:

DIM_CA_CDC_OFFSET_CFG

DIM_C10_DIM_CA_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1B000050 DIM_C10_DIM_CA_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_DELAY_CFG register configures the following:

DIM_CA_CDC_DELAY_CFG

DIM_C10_DIM_CA_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates

DIM_C10_DIM_CA_CDC_DELAY_CFG (cont.)

Bits	Name	Description
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1B000054 DIM_C10_DIM_CA_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_SW_MODE_CFG register configures the following:

DIM_CA_CDC_SW_MODE_CFG

DIM_C10_DIM_CA_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1’b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1B000058 DIM_C10_DIM_CA_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures the following:

DIM_CA_CDC_TEST_CFG

DIM_C10_DIM_CA_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1B00005C DIM_C10_DIM_CA_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures the following:

DIM_CA_CDC_SW_OVRD_CFG

DIM_C10_DIM_CA_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode

DIM_C10_DIM_CA_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1B000070 DIM_C10_DIM_CA_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_CA_CDC_STATUS0 register configures the following:

DIM_CA_CDC_STATUS0

DIM_C10_DIM_CA_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count

DIM_C10_DIM_CA_CDC_STATUS0 (cont.)

Bits	Name	Description
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1B000074 DIM_C10_DIM_CA_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS1 register configures the following:

DIM_CA_CDC_STATUS1

DIM_C10_DIM_CA_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1B000078 DIM_C10_DIM_CA_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_CA_CDC_STATUS2 register configures the following:

DIM_CA_CDC_STATUS2

DIM_C10_DIM_CA_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1B00007C DIM_C10_DIM_CA_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS3 register configures the following:

DIM_CA_CDC_STATUS3

DIM_C10_DIM_CA_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1B0000E0 DIM_C10_DIM_CA_IOC_CTLR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures the following:

DIM_CA_IOC_CTLR_CFG

DIM_C10_DIM_CA_IOC_CTLR_CFG

Bits	Name	Description
31	CAL_NOW	SW : RW Set this bit to 1’b1 will cause the IO calibration starts immediately. This bit has to be cleared after the calibration has been done. 0x0: no-op 0x1: start IOCal immediately
30	IO_CAL_AUTO	Periodic auto calibration mode. Writing a ’1’ to this bit will trigger periodic auto calibration with the period specified in IOC_CTLR_TIMER_CFG register. If ’0’, it disables the timer based on sleep clock. Note that this does not impact the timer based on fixed frequency clock (ffclk).
29	IO_CAL_FF_TIMER_EN	Fixed Frequency Timer mode. Writing a ’1’ to this bit will set the timer running off tcxo clock. If ’0’, it disables the timer based on fixed frequency clock.
28	IO_CAL_BANDGAP_DYN_CTRL	Enable dynamic control of the bandgap element: This low-power feature is only available on x2 core. Bit reserved for x0/x1 cores. 1’b1: Enabled - bandgap element turned on only during IO calibration or when current mode is enabled. 1’b0: Disabled (default) - bandgap element turned on/off statically based on BANDHGAP_ENA0/1 bits.
25	SW_FFCLK_ON	Writing a ’1’ to this field will turn on the fixed frequency (xo) clock on signal
24	LV_MODE	SW : RW Enable/Disable low-voltage mode (MIF2 pad only) 0x0: 1.8V 0x1: non-1.8V
20:16	MARGIN_LOAD	SW : RW If the difference between the current IOCal result is greater than the last result by the number specified here, then the IOCal controller will request value update to DDR controller. 0x0: always update
13:12	IMP_SEL	SW : RW Select bits to choose which impedance to calibrate to
10	PN_SEL_CA	SW : RW Enables loading of HW calibrated values for ca pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on ca pads when it is time to update the pads with the new value.
9	PN_SEL_DATA	SW : RW Enables loading of HW calibrated values for dq/dqs pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on data pads when it is time to update the pads with the new value.

DIM_C10_DIM_CA_IOC_CTLR_CFG (cont.)

Bits	Name	Description
8	CAL_USE_LAST	SW : RW Select the initial value to start IO calibration 0x0: start from a fixed values specified in IOC_CTLR_PNCNT_CFG (default) 0x1: start from previous IOCal PNCNT results
6:4	SAMPLE_POINT	SW : RW Specify number of samples per measure point 0x0: 1 0x1: 3 0x2: 5 0x3: 7 0x4: 9 0x5: 11 0x6: 13 0x7: 15
3	DDR_MODE1	
2	DDR_MODE0	
1	BANDGAP_ENA1	SW : RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable
0	BANDGAP_ENA0	SW : RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable

0x1B0000E4 DIM_C10_DIM_CA_IOC_CTLR_PNCNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures the following:

This register contains the initial value for the next calibration to start from. Softwave can set the hardware to either start calibration from a fixed value or from previous results. If software chooses to use fixed value by setting CAN_USE_LAST in register IOC_CTLR_CFG to be 0, then the values in this register will be used.

DIM_CA_IOC_CTLR_CFG

DIM_C10_DIM_CA_IOC_CTLR_PNCNT_CFG

Bits	Name	Description
12:8	NCNT_INIT_CSR	SW : RW Starting PCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted
4:0	PCNT_INIT_CSR	SW : RW Starting NCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted

0x1B0000E8 DIM_C10_DIM_CA_IOC_CTLR_TIMER_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_CFG register configures the following:

DIM_CA_IOC_CTLR_TIMER_CFG

DIM_C10_DIM_CA_IOC_CTLR_TIMER_CFG

Bits	Name	Description
31:16	TIMER_PERIOD	SW : RW Recalibration Period. The period is measured in timer clock cycles. Typically it's a 32kHz clock. The minimum period that can be programmed is 3. 0,1,2: Invalid values
15:0	FF_TIMER_PERIOD	SW : RW Recalibration Period for the timer running of xo clock. 0x0: Invalid

0x1B0000EC DIM_C10_DIM_CA_IOC_CTLR_TIMER_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_STATUS register configures the following:

DIM_CA_IOC_CTLR_TIMER_STATUS

DIM_C10_DIM_CA_IOC_CTLR_TIMER_STATUS

Bits	Name	Description
15:0	TIMER_STATUS	Current Auto Calibration Timer value. As this register is written in sleep clock domain and read in xo clock domain and no hardware synchronization in place, It is required by the software to read this register 4 times to get the correct value.

0x1B0000F0 DIM_C10_DIM_CA_IOC_CTLR_CHAR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_ CHAR_CFGregister configures the following:

This register is used by hardware verification software only. It provides a mechanism to allow software to bypass the internal calibration state machine and directly access the IOCAL pad inputs.

IDIM_CA_IOC_CTLR_CHAR_CFG

DIM_C10_DIM_CA_IOC_CTLR_CHAR_CFG

Bits	Name	Description
16	SM_BYP_ENA	SW : RW Characterization Bypass Path Enable 0x0: Non-bypass: State Machine Controls IOCAL pad inputs (default) 0x1: bypass: This register controls IOCal pad inputs
15	SM_BYP_N_ENA	SW : RW IO CAL Characterization n_enable: 0x0: de-asserted (default) 0x1: asserted
12:8	SM_BYP_NCNT	SW : RW IO CAL Characterization ncnt value. 0x0: count 0 (default)
7	SM_BYP_P_ENA	SW : RW IO CAL Characterization p_enable: 0x0: de-asserted (default) 0x1: asserted
4:0	SM_BYP_PCNT	SW : RW IO CAL Characterization pcnt value. 0x0: count 0 (default)

0x1B0000F4 DIM_C10_DIM_CA_IOC_CTLR_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00011010

The DIM_CA_IOC_CTLR_STATUS register configures the following:

DIM_CA_IOC_CTLR_STATUS

DIM_C10_DIM_CA_IOC_CTLR_STATUS

Bits	Name	Description
31	INIT_IOCAL_DONE	SW : R The very first IO Calibration is finished This bit is stiky. once it becomes 1'b1 until software writes it back to 0. 0x0: Init-cal never done 0x1: Init-cal finished
18	IOCAL_DONE_D	SW : R IO Calibration is finished 0x0: in progress 0x1: finished
17	IOCAL_BUSY	SW : R Status of calibration State machine 0x0: idle 0x1: busy
16	SYNC_COMP	SW : R comp value from IOCal pad
12:8	NCNT_HOLD	SW : R Current NCNT value used
4:0	PCNT_HOLD	SW : R Current PCNT value used

0x1B000100 DIM_C10_DIM_CA_CA_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CA_IOC_SLV_CFG register configures the following:

This register specifies the overriding pcnt and ncnt values. Overriding mode is controlled by PNCNT_HW_LOAD_EN bit in this register.

DIM_CA_CA_IOC_SLV_CFG

DIM_C10_DIM_CA_CA_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW : RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW : RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW : RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW : RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1B000104 DIM_C10_DIM_CA_CA_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CA_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_C10_DIM_CA_CA_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

0x1B000110 DIM_C10_DIM_CA_CK_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CK_IOC_SLV_CFG register configures the following:

DIM_CA_CK_IOC_SLV_CFG

DIM_C10_DIM_CA_CK_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW : RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW : RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW : RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW : RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1B000114 DIM_C10_DIM_CA_CK_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CK_IOC_SLV_STATUS register configures the following:

DIM_CA_CK_IOC_SLV_STATUS

DIM_C10_DIM_CA_CK_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

14 Multi-Media Subsystem Registers

14.1 Overview

Table 14-1 Multi_Media_Sub_System Bases

Base Name	Parent	Address

14.2 MM SS Clocks registers (0x04000000 MMSS_CC_BASE)

This section contains the Multi-Media Subsystem (MMSS) Clocks registers.

14.2.1 MMSS AHB AXI Clock registers

Clock selection, programming, and gating are under AXI9 control.

0x04000004 MMSS_AHB_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The AHB_NS controls the source selection and configuration of the clocks in the AHB domain.

MMSS_AHB_NS

Bits	Name	Description
31:22	RESERVED_1	Reserved bits
21	CLKCTL_RST0	The reset bit for the hm_arm_clk_ctl res0 0x0: Not Active 0x1: Active
20	CLKCTL_RST1	The reset bit for the hm_arm_clk_ctl res1 0x0: Not Active 0x1: Active
19:18	RESERVED_2	Do not use for APQ8064 (previously used for CLK_DIV_VAL)
17	RESERVED_3	Do not use for APQ8064 (previously used for CLK_SRC_SEL)
16:15	RESERVED_4	Reserved bits
14	CLK_OUT_SEL	This field selects the clk source of the AHB hm_arm_crc 0x0: SRC0 0x1: SRC1

MMSS_AHB_NS (cont.)

Bits	Name	Description
13:10	SRC1_DIV	Divide value for the src1_div pin of AHB hm_arm_crc. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4 0x4: Div-5 0x5: Div-6 0x6: Div-7 0x7: Div-8 0x8: Div-9 0x9: Div-10 0xA: Div-11 0xB: Div-12 0xC: Div-13 0xD: Div-14 0xE: Div-15 0xF: Div-16
9:6	SRC0_DIV	Divide value for the src0_div pin of AHB hm_arm_crc. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4 0x4: Div-5 0x5: Div-6 0x6: Div-7 0x7: Div-8 0x8: Div-9 0x9: Div-10 0xA: Div-11 0xB: Div-12 0xC: Div-13 0xD: Div-14 0xE: Div-15 0xF: Div-16
5:3	SRC1_SEL	This field selects the output of the clock source 1 MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: reserved 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

MMSS_AHB_NS (cont.)

Bits	Name	Description
2:0	SRC0_SEL	This field selects the output of the clock source 0 MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: reserved 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

0x04000008 MMSS_AHB_EN

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x00000003

The AHB_EN controls the CXC enable of the clocks in the AHB domain.

MMSS_AHB_EN

Bits	Name	Description
31	FAB_AHB_CLK_EN	This bit enables the fab_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
30	MMSS_FPB_HALT_CTRL_SEL	This is the hardware clock halt control for mmss_fpb_clk. 0x1: Hardware 0x0: Software
29	APU_AHB_HALT_CTRL_SEL	This is the hardware clock halt control for apu_ahb_clk. 0x1: Hardware 0x0: Software
28	APU_AHB_CLK_EN	This bit enables the apu_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
27	RESERVED_1	Removed for APQ8064.
26	SMMU_AHB_HALT_CTRL_SEL	This is the hardware clock halt control smmu_ahb_clk. 0x1: Hardware 0x0: Software
25	RESERVED_2	Removed for APQ8064.

MMSS_AHB_EN (cont.)

Bits	Name	Description
24	AMP_AHB_CLK_EN	This bit enables the amp_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
23	RESERVED_3	Do not use for APQ8064 (previously used for SMI0_AHB_CLK_EN)
22	DSI2_S_AHB_CLK_EN	This bit enables the dsi2_s_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
21	JPEGD_AHB_CLK_EN	This bit enables the jpegd_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
20	RESERVED_4	Do not use for APQ8064 (previously used for csi1_ahb_clk_en)
19	RESERVED	Removed for APQ8064
18	DSI_S_AHB_CLK_EN	This bit enables the dsi1_s_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
17	DSI2_M_AHB_CLK_EN	This bit enables the dsi2_m_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
16	VPE_AHB_CLK_EN	This bit enables the vpe_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
15	SMMU_AHB_CLK_EN	This bit enables the smmu_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
14	HDMI_M_AHB_CLK_EN	This bit enables the hdmi_m_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
13	VFE_AHB_CLK_EN	This bit enables the vfe_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

MMSS_AHB_EN (cont.)

Bits	Name	Description
12	ROT_AHB_CLK_EN	This bit enables the rot_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
11	VCODEC_AHB_CLK_EN	This bit enables the vcodec_ahb_clk. 0x1: Enabled 0x0: Disabled
10	MDP_AHB_CLK_EN	This bit enables the mdp_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
9	DSI_M_AHB_CLK_EN	This bit enables the dsi1_m_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
8	DSI2_M_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for dsi2_m_ahb_clk. 0x1: Hardware 0x0: Software
7	CSI_AHB_CLK_EN	This bit enables the csi_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
6	IMEM_AHB_CLK_EN	This bit enables the imem_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
5	IJPEG_AHB_CLK_EN	This bit enables the ijpeg_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
4	HDMI_S_AHB_CLK_EN	This bit enables the hdmi_s_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
3	GFX3D_AHB_CLK_EN	This bit enables the gfx3d_ahb_clk. 0x1: Enabled 0x0: Disabled
2	REVERSED	Removed for APQ8064

MMSS_AHB_EN (cont.)

Bits	Name	Description
1	MMSS_FPB_CLK_EN	This bit enables the mmss_fpb_clk during SW mode (The corresponding halt_ctrl_sel should be set to 0x0); During SW mode, do not set this bit to 0x0 otherwise mmss will hang and will need reset. By default this bit is set to 0x1. 0x1: Enabled 0x0: Disabled
0	SFPB_CLK_GATING_SW_CTRL	Default to 1, to bypass the HW clock gating of system fpb. 0x1: Software 0x0: Hardware

0x04000038 MMSS_AHB_EN2

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x000007F9

The AHB_EN controls the CXC enable of the clocks in the AHB domain.

MMSS_AHB_EN2

Bits	Name	Description
31	FAB_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for fab_ahb_clk. 0x1: Hardware 0x0: Software
30	IJPEG_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for ijpeg_ahb_clk. 0x1: Hardware 0x0: Software
29	RESERVED_1	Removed for APQ8064
28	RESERVED_2	Removed for APQ8064

26	VCODEC_AHB_HALT_CTRL_SEL	This is the hardware clock halt control for vcodec_ahb_clk. 0x1: Hardware 0x0: Software
25	ROT_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for rot_ahb_clk. 0x1: Hardware 0x0: Software

MMSS_AHB_EN2 (cont.)

Bits	Name	Description
24	VPE_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for vpe_ahb_clk. 0x1: Hardware 0x0: Software
23	VFE_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for vfe_ahb_clk. 0x1: Hardware 0x0: Software
22	HDMI_S_AHB_HALT_CTRL_SEL	This is the hardware clock halt control for hdmi_s_ahb_clk. 0x1: Hardware 0x0: Software
21	HDMI_M_AHB_HALT_CTRL_SEL	This is the hardware clock halt control for hdmi_m_ahb_clk. 0x1: Hardware 0x0: Software
20	DSI_S_AHB_HALT_CTRL_SEL	This is the hardware clock halt control for dsi1_s_ahb_clk. 0x1: Hardware 0x0: Software
19	DSI_M_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for dsi1_m_ahb_clk. 0x1: Hardware 0x0: Software
18	AMP_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for amp_ahb_clk. 0x1: Hardware 0x0: Software
17	RESERVED_3	Do not use for APQ8064 (previously used for csi1_ahb_halt_ctrl_sel)
16	CSI_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for csi_ahb_clk. 0x1: Hardware 0x0: Software
15	DSI2_S_AHB_HALT_CTRL_SEL	This is the hardware clock halt control for dsi2_s_ahb_clk. 0x1: Hardware 0x0: Software
14	RESERVED_4	Do not use for APQ8064 (previously used for SMI0_AHB_HALT_CTRL_SEL)
13	MDP_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for mdp_ahb_clk. 0x1: Hardware 0x0: Software

MMSS_AHB_EN2 (cont.)

Bits	Name	Description
12	IMEM_AHB_HALT_CTRL_SEL	This is the hardware clock halt control for imem_ahb_clk. 0x1: Hardware 0x0: Software
11	JPEGD_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for jpegd_ahb_clk. 0x1: Hardware 0x0: Software
10:7	VFE_AHB_W	A 4 bit wake counter value; When the async clock halt is disabled, the memory control signal will be turned on immediately, but the clock will remain gated for W clock cycle. Setting to '1111' equals 18 clock-cycle-delay. This is default set to 0xF.
6:3	VFE_AHB_S	A 4 bit sleep counter value; When the async clock halt is asserted, the clock will be gated immediately, but the memory control signal will only turn off after S clock cycle. Setting to '1111' equals 18 clock-cycle-delay. This is default set to 0xF.
2	VFE_AHB_FORCE_PERIPH_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_ret_n) to power collapse the memory periphery. This SW bit when set to 0x1 will force the memory periphery to be powered on and when set to 0x0 will allow the memory periphery to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x0. 0x1: memory periphery power is forced on 0x0: memory periphery is power collapsed when clock is gated
1	VFE_AHB_FORCE_PERIPH_OFF	This SW bit when set to 0x1 will force the memory periphery to be powered off and when set to 0x0 will allow the memory periphery to be power on when clock is running. During reset, this bit is defaulted to 0x0. This bit is redundant if the FORCE_PERIPH_ON is set to 0x1. 0x1: memory periphery power is forced powered off 0x0: memory periphery is power on when clock is running
0	VFE_AHB_FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated

0x04000248 MMSS_AHB_EN3

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The AHB_EN3 controls the CXC enable of the clocks in the AHB domain.

MMSS_AHB_EN3

Bits	Name	Description
31:2	RESERVED	Reserved bits
1	VCAP_AHB_CLK_EN	This bit enables the vcap_ahb_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
0	VCAP_AHB_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for vcap_ahb_clk. 0x1: Hardware 0x0: Software

0x0400000C MMSS_AHB_INV

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The AHB_INV controls the CXC invert of the clocks in the AHB domain.

MMSS_AHB_INV

Bits	Name	Description
31:29	RESERVED_1	Reserved bits
28	VCAP_AHB_CLK_INV	This bit inverts the clk. 0x1: Inverted 0x0: Not inverted
27	MMSS_FPB_AON_CLK_INV	This bit inverts the always on fpb clk. 0x1: Inverted 0x0: Not Inverted
26	APU_AHB_CLK_INV	This bit inverts the clk. 0x1: Inverted 0x0: Not inverted
25	RESERVED_2	Removed for APQ8064.
24	AMP_AHB_CLK_INV	This bit inverts the clk. 0x1: Inverted 0x0: Not inverted
23	RESERVED_3	Do not use for APQ8064 (previous used for SMI0_AHB_CLK_INV)

MMSS_AHB_INV (cont.)

Bits	Name	Description

0x04000018 MMSS_MAXI_EN

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x7F9

The MAXI_EN controls the CXC enable of the Master clocks in the AXI domain.

MMSS_MAXI_EN

Bits	Name	Description
31	RESERVED_1	Reserved bits
30	RESERVED_2	Do not use for APQ8064 (Previously used for ROOT_AXI_CLK_INV)
29	RESERVED_3	Do not use for APQ8064 (Previously used for ROOT_AXI_HALT_CTRL_SEL)
28	RESERVED_4	Do not use for APQ8064 (Previously used for ROOT_AXI_CLK_EN)
27	JPEGD_AXI_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control jpegd_axi_clk. 0x1: Hardware 0x0: Software
26	FAB_MSP_AXI_CLK_EN	This bit enables the fab_msp_axi clocks. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
25	JPEGD_AXI_CLK_EN	This bit enables the jpegd_axi_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

MMSS_MAXI_EN (cont.)

Bits	Name	Description
24	GMEM_AXI_CLK_EN	This bit enables the gmem_axi_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
23	MDP_AXI_CLK_EN	This bit enables the mdp_axi_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
22	IMEM_AXI_CLK_EN	Clock enable bit for the imem_axi_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
21	IJPEG_AXI_CLK_EN	Clock enable bit ijpeg_axi_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
20	GFX3D_AXI_CLK_EN	This bit is not used.
19	VCODEC_AXI_CLK_EN	Clock enable bit vcodec_axi_clk. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
18	VFE_AXI_CLK_EN	This bit enables the VFE AXI clocks. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
17	FAB_MSP_AXI_HALT_CTRL_SEL	This is the hardware clock halt control for fab_msp_axi_clk. 0x1: Hardware 0x0: Software
16	MDP_AXI_HALT_CTRL_SEL	This is the hardware clock halt control for mdp_axi_clk. 0x1: Hardware 0x0: Software
15	IMEM_AXI_HALT_CTRL_SEL	This is the hardware clock halt control for imem_axi_clk. 0x1: Hardware 0x0: Software
14	GMEM_AXI_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control for gmem_axi_clk. 0x1: Hardware 0x0: Software
13	VCODEC_AXI_HALT_CTRL_SEL	This is the hardware clock halt control for vcodec_axi_clk. 0x1: Hardware 0x0: Software

MMSS_MAXI_EN (cont.)

Bits	Name	Description
12	VFE_AXI_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control vfe_axi_clk. 0x1: Hardware 0x0: Software
11	IJPEG_AXI_HALT_CTRL_SEL	This is the hardware clock halt control for ijpeg_axi_clk. 0x1: Hardware 0x0: Software
10:7	MDP_AXI_W	A 4 bit wake counter value; When the async clock halt is disabled, the memory control signal will be turned on immediately, but the clock will remain gated for W clock cycle. Setting to ’1111’ equals 18 clock-cycle-delay. This is default set to 0xF.
6:3	MDP_AXI_S	A 4 bit sleep counter value; When the async clock halt is asserted, the clock will be gated immediately, but the memory control signal will only turn off after S clock cycle. Setting to ’1111’ equals18 clock-cycle-delay. This is default set to 0xF.
2	MDP_AXI_FORCE_PERIPH_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_ret_n) to power collapse the memory periphery. This SW bit when set to 0x1 will force the memory periphery to be powered on and when set to 0x0 will allow the memory periphery to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x0. 0x1: memory periphery power is forced on 0x0: memory periphery is power collapsed when clock is gated
1	MDP_AXI_FORCE_PERIPH_OFF	This SW bit when set to 0x1 will force the memory periphery to be powered off and when set to 0x0 will allow the memory periphery to be power on when clock is running. During reset, this bit is defaulted to 0x0. This bit is redundant if the FORCE_PERIPH_ON is set to 0x1. 0x1: memory periphery power is forced powered off 0x0: memory periphery is power on when clock is running
0	MDP_AXI_FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated

0x04000020 MMSS_MAXI_EN2

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x3027FCFF

The MAXI_EN controls the CXC enable of the Master clocks in the AXI domain.

MMSS_MAXI_EN2

Bits	Name	Description
31	RESERVED_1	Do not use for APQ8064 (previously used for SMI_2X_AXI_CLK_INV)
30	RESERVED_2	Do not use for APQ8064 (previously used for SMI_2X_AXI_CLK_EN)
29	AXI_ROOT_EN	This bit enables the async_clk_r_ena of axi root cell. Default is set to 0x1. 0x1: enabled 0x0: disabled
28	VCODEC_AXI_FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated
27	VPE_AXI_HALT_CTRL_SEL	This is the hardware clock halt control for vpe_axi_clk. 0x1: Hardware 0x0: Software
26	VPE_AXI_CLK_EN	This bit enables the clocks. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
25	ROT_AXI_HALT_CTRL_SEL	This is the hardware clock halt control for rot_axi_clk. 0x1: Hardware 0x0: Software
24	ROT_AXI_CLK_EN	Clock enable bit. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
23	SMI_AXI_CLK_INV	Do not use for APQ8064 (previously used for smi_axi_clk_inv)
22	SMI_AXI_CLK_EN	Do not use for APQ8064 (previously used for smi_axi_clk_en)
21	GMEM_AXI_FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated

MMSS_MAXI_EN2 (cont.)

Bits	Name	Description
20	GMEM_AXI_FORCE_PERIPH_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_ret_n) to power collapse the memory periphery. This SW bit when set to 0x1 will force the memory periphery to be powered on and when set to 0x0 will allow the memory periphery to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x0. 0x1: memory periphery power is forced on 0x0: memory periphery is power collapsed when clock is gated
19	GMEM_AXI_FORCE_PERIPH_OFF	This SW bit when set to 0x1 will force the memory periphery to be powered off and when set to 0x0 will allow the memory periphery to be power on when clock is running. During reset, this bit is defaulted to 0x0. This bit is redundant if the FORCE_PERIPH_ON is set to 0x1. 0x1: memory periphery power is forced powered off 0x0: memory periphery is power on when clock is running
18:15	GMEM_AXI_W	A 4 bit wake counter value; When the async clock halt is disabled, the memory control signal will be turned on immediately, but the clock will remain gated for W clock cycle. Setting to ’1111’ equals 18 clock-cycle-delay. This is default set to 0xF.
14:11	GMEM_AXI_S	A 4 bit sleep counter value; When the async clock halt is asserted, the clock will be gated immediately, but the memory control signal will only turn off after S clock cycle. Setting to ’1111’ equals18 clock-cycle-delay. This is default set to 0xF.
10	IMEM_AXI_FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated
9	IMEM_AXI_FORCE_PERIPH_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_ret_n) to power collapse the memory periphery. This SW bit when set to 0x1 will force the memory periphery to be powered on and when set to 0x0 will allow the memory periphery to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x0. 0x1: memory periphery power is forced on 0x0: memory periphery is power collapsed when clock is gated
8	IMEM_AXI_FORCE_PERIPH_OFF	This SW bit when set to 0x1 will force the memory periphery to be powered off and when set to 0x0 will allow the memory periphery to be power on when clock is running. During reset, this bit is defaulted to 0x0. This bit is redundant if the FORCE_PERIPH_ON is set to 0x1. 0x1: memory periphery power is forced powered off 0x0: memory periphery is power on when clock is running

MMSS_MAXI_EN2 (cont.)

Bits	Name	Description
7:4	IMEM_AXI_W	A 4 bit wake counter value; When the async clock halt is disabled, the memory control signal will be turned on immediately, but the clock will remain gated for W clock cycle. Setting to ’1111’ equals 18 clock-cycle-delay. This is default set to 0xF.
3:0	IMEM_AXI_S	A 4 bit sleep counter value; When the async clock halt is asserted, the clock will be gated immediately, but the memory control signal will only turn off after S clock cycle. Setting to ’1111’ equals18 clock-cycle-delay. This is default set to 0xF.

0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x04000044 MMSS_CSI0_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSI0_MD contains the M and D values of the M/N:D divider.

MMSS_CSI0_MD

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x04000048 MMSS_CSI0_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSI0_NS_REG controls the source selection and configuration of the clocks in the CSI domain. It also contains the N value of the DSI M/N:D divider.

MMSS_CSI0_NS

Bits	Name	Description
31:24	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
23:16	RESERVED_1	Reserved bits
15:14	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4
13:8	RESERVED_2	Reserved bits
7	MNCNTR_RST	The MN reset bit 0x0: Not Active 0x1: Active
6:3	RESERVED	Reserved bits
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: gnd 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

0x04000024 MMSS_CSI1_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSI1_CC contains the clock control bits.

MMSS_CSI1_CC

Bits	Name	Description
31:11	RESERVED	Reserved bits
10	PHY_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control for csiphy_clk 0x1: Hardware 0x0: Software
9	CLKPHY_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
8	CLKPHY_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
7:6	MND_MODE	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control for csi_clk 0x1: Hardware 0x0: Software
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x04000028 MMSS_CSI1_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSI1_MD contains the M and D values of the M/N:D divider.

MMSS_CSI1_MD

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x04000010 MMSS_CSI1_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSI1_NS_REG controls the source selection and configuration of the clocks in the CSI domain. It also contains the N value of the DSI M/N:D divider.

MMSS_CSI1_NS

Bits	Name	Description
31:24	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
23:16	RESERVED_1	Reserved bits
15:14	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4
13:8	RESERVED_2	Reserved bits
7	MNCNTR_RST	The MN reset bit 0x0: Not Active 0x1: Active
6:3	RESERVED	Reserved bits

MMSS_CSI1_NS (cont.)

Bits	Name	Description
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: gnd 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

0x0400022C MMSS_CSI2_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSI2_CC contains the clock control bits.

MMSS_CSI2_CC

Bits	Name	Description
31:11	RESERVED	Reserved bits
10	PHY_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control for csiphy_clk 0x1: Hardware 0x0: Software
9	CLKPHY_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
8	CLKPHY_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
7:6	MND_MODE	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled

MMSS_CSI2_CC (cont.)

Bits	Name	Description
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control for csi_clk 0x1: Hardware 0x0: Software
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x04000230 MMSS_CSI2_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSI2_MD contains the M and D values of the M/N:D divider.

MMSS_CSI2_MD

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x04000234 MMSS_CSI2_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSI2_NS_REG controls the source selection and configuration of the clocks in the CSI domain. It also contains the N value of the DSI M/N:D divider.

MMSS_CSI2_NS

Bits	Name	Description
31:24	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
23:16	RESERVED_1	Reserved bits
15:14	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4
13:8	RESERVED_2	Reserved bits
7	MNCNTR_RST	The MN reset bit 0x0: Not Active 0x1: Active
6:3	RESERVED	Reserved bits
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: gnd 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

0x0400004C MMSS_DSI_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The DSI_CC contains the clock control bits.

MMSS_DSI_CC

Bits	Name	Description
31	FORCE_CORE_ON	Reserved bits (not used for APQ8064)
30	FORCE_PERIPH_ON	Reserved bits (not used for APQ8064)
29	FORCE_PERIPH_OFF	Reserved bits (not used for APQ8064)
28:24	RESERVED_1	Reserved bits
23:20	W	Reserved bits (not used for APQ8064)

MMSS_DSI_CC (cont.)

Bits	Name	Description
19:16	S	Reserved bits (not used for APQ8064)
15:9	RESERVED_2	Reserved bits
8	PMXO_SEL	Removed for APQ8064. Will use PXO directly.
7:6	MND_MODE	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control for dsi_clk 0x1: Hardware 0x0: Software
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x04000050 MMSS_DSI_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The DSI_MD contains the M and D values of the M/N:D divider.

MMSS_DSI_MD

Bits	Name	Description
31:9	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x04000054 MMSS_DSI_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The DSI_NS_REG controls the source selection and configuration of the clocks in the DSI domain. It also contains the N value of the DSI M/N:D divider.

MMSS_DSI_NS

Bits	Name	Description
31:24	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
15:14	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4
13:8	RESERVED_1	Reserved bits
7	MNCNTR_RST	The MN reset bit 0x0: Not Active 0x1: Active
6:3	RESERVED_2	Reserved bits
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: dsi2_phy_pll_out_dsiclk 0x2: gnd 0x3: dsi1_phy_pll_out_dsiclk 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

0x04000058 MMSS_MISC_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The MISC_CC contains the clock control bits.

MMSS_MISC_CC

Bits	Name	Description
31	FORCE_CORE_ON	Reserved bits (not used for APQ8064)
30	FORCE_PERIPH_ON	Reserved bits (not used for APQ8064)
29	FORCE_PERIPH_OFF	Reserved bits (not used for APQ8064)
28	RESERVED_1	Reserved bits
27	CSI_PIX_CLK_INV	This bit inverts the clock at output of CXC 0x1: Inverted 0x0: Not Inverted
26	CSI_PIX_CLK_EN	This bit enables the csi_pix_clk CXC 0x1: Enabled 0x0: Disabled
25	CSI_PIX_SRC_SEL	Anti-glitch mux select for csi_pix_clk. Note Anti-glitch mux require all the clock sources to be running when switching. 0x0: csi0_clksrc 0x1: csi1_clksrc
24	RESERVED_2	Do not use for APQ8064 (previously used for SMI0_XO_HALT_CTRL_SEL)
23	RESERVED_3	Reserved bit
22	RESERVED_4	Do not use for APQ8064 (previously used for DSI_ESC_HALT_CTRL_SEL)
21	RESERVED_5	Do not use for APQ8064 (previously used for DSI_BYTE_HALT_CTRL_SEL)
20	MDP_VSYNC_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control. 0x1: Hardware 0x0: Software
19:18	HDMI_DIV	This field selects the divide value for hdmi_app_clk. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4
17:16	RESERVED_6	Reserved bits
15	RESERVED_7	Reserved bit
14	CSI_RDI_CLK_INV	This bit inverts the clock at output of CXC 0x1: Inverted 0x0: Not Inverted
13	CSI_RDI_CLK_EN	This bit enables the csi_rdi_clk CXC 0x1: Enabled 0x0: Disabled

MMSS_MISC_CC (cont.)

Bits	Name	Description
12	CSI_RDI_SRC_SEL	Anti-glitch mux select for csi_rdi_clk. Note Anti-glitch mux require all the clock sources to be running when switching. 0x0: csi0_clksrc 0x1: csi1_clksrc
11	RESERVED_8	Do not use for APQ8064 (previously used for SMI0_XO_CLK_INV)
10	RESERVED_9	Do not use for APQ8064 (previously used for SMI0_XO_CLK_EN)
9:8	RESERVED_10	Reserved bits
7	MDP_VSYNC_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
6	MDP_VSYNC_CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
5:4	RESERVED_11	Reserved bits
3	RESERVED_12	Do not use for APQ8064 (previously used for DSI_BYTE_CLK_INV)
2	RESERVED_13	Do not use for APQ8064 (previously used for DSI_BYTE_CLK_EN)
1	RESERVED_14	Do not use for APQ8064 (previously used for DSI_ESC_CLK_INV)
0	RESERVED_BIT0	Do not use for APQ8064 (previously used for DSI_ESC_CLK_EN)

0x0400005C MMSS_MISC_CC2

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x00000400

The MISC_CC contains the clock control bits.

MMSS_MISC_CC2

Bits	Name	Description
31	RESERVED_1	Reserved bit
30	RESERVED_2	Do not use for APQ8064 (previously used for DSI_BYTE_FORCE_PERIPH_ON)
29	RESERVED_3	Do not use for APQ8064 (previously used for DSI_BYTE_FORE_PERIPH_OFF)
28	HDMIPLL_MUXSEL	Removed for APQ8064. Will directly use PXO.

MMSS_MISC_CC2 (cont.)

Bits	Name	Description
27:24	RESERVED_4	Do not use for APQ8064 (previously used for BYTECLK_CDIV_VAL)
23	HDMI_APP_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock halt control. 0x1: Hardware 0x0: Software
22	RESERVED_5	Do not use for APQ8064 (previously used for BYTECLK_PMXO_SEL))
21:18	HDMIREF_CDIV_VAL	Reserved bits (Do not use for APQ8064)
17	HDMI_PMXO_SEL	hdmi_pmxo
16	RESERVED_6	Reserved bits
15	RESERVED_7	Do not use for APQ8064 (previously used for SMI0_PMXO_SEL)
14	RESERVED_8	Do not use for APQ8064 (previously used for ESC_PMXO_SEL)
13	VSYNC_PMXO_SEL	Removed for APQ8064. Will directly use PXO.
12	HDMI_APP_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
11	HDMI_APP_CLK_EN	This bit enables the CXC output. 0x1: Enabled 0x0: Disabled
10	RESERVED_9	Do not use for APQ8064 (previously used for DSI_BYTE_FORCE_CORE_ON)
9:6	RESERVED_10	Do not use for APQ8064 (previously used for DSI_BYTE_W)
5:2	RESERVED	Do not use for APQ8064 (previously used for DSI_BYTE_S)
1:0	RESERVED_BIT1_0	Do not use for APQ8064 (previously used for ESCCLK_CDIV_VAL)

0x04000238 MMSS_MISC_CC3

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The MISC_CC3 contains the clock control bits.

MMSS_MISC_CC3

Bits	Name	Description
31:14	RESERVED	Reserved bits

MMSS_MISC_CC3 (cont.)

Bits	Name	Description
13	CSI_PIX_SRC_SEL2	Second Anti-Glitch Mux select. Note Anti-glitch mux require all the clock sources to be running when switching. 0x0: Output of MISC_CC 0x1: csi2_clksrc
12	CSI_RDI_SRC_SEL2	Anti-Glitch Mux select. Note Anti-glitch mux require all the clock sources to be running when switching. 0x0: Output of MISC_CC 0x1: csi2_clksrc
11	CSI_PIX1_CLK_INV	This bit inverts the clock at output of CXC 0x1: Inverted 0x0: Not Inverted
10	CSI_PIX1_CLK_EN	This bit enables the csi_pix_clk CXC 0x1: Enabled 0x0: Disabled
9	CSI_PIX1_SRC_SEL2	Second Anti-Glitch Mux select. Note Anti-glitch mux require all the clock sources to be running when switching. Note: select 0 is not gnd, but should be: Output of MISC_CC3[CSI_PIX1_SRC_SEL] 0x0: gnd 0x1: csi2_clksrc
8	CSI_PIX1_SRC_SEL	Anti-Glitch Mux select. Note Anti-glitch mux require all the clock sources to be running when switching. 0x0: csi0_clksrc 0x1: csi1_clksrc
7	CSI_RDI2_CLK_INV	This bit inverts the clock at output of CXC 0x1: Inverted 0x0: Not Inverted
6	CSI_RDI2_CLK_EN	This bit enables the csi_rdi_clk CXC 0x1: Enabled 0x0: Disabled
5	CSI_RDI2_SRC_SEL2	Second Anti-Glitch Mux select. Note Anti-glitch mux require all the clock sources to be running when switching. Note: select 0 is not gnd, but should be: Output of MISC_CC3[CSI_RDI2_SRC_SEL] 0x0: gnd 0x1: csi2_clksrc
4	CSI_RDI2_SRC_SEL	Anti-Glitch Mux select. Note Anti-glitch mux require all the clock sources to be running when switching. 0x0: csi0_clksrc 0x1: csi1_clksrc

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x9FF00000

The GFX3D_CC contains the clock control bits.

MMSS_GFX3D_CC

Bits	Name	Description
31	FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated
30	FORCE_PERIPH_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_ret_n) to power collapse the memory periphery. This SW bit when set to 0x1 will force the memory periphery to be powered on and when set to 0x0 will allow the memory periphery to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x0. 0x1: memory periphery power is forced on 0x0: memory periphery is power collapsed when clock is gated
29	FORCE_PERIPH_OFF	This SW bit when set to 0x1 will force the memory periphery to be powered off and when set to 0x0 will allow the memory periphery to be power on when clock is running. During reset, this bit is defaulted to 0x0. This bit is redundant if the FORCE_PERIPH_ON is set to 0x1. 0x1: memory periphery power is forced powered off 0x0: memory periphery is power on when clock is running
28:24	RESERVED_1	Reserved bits
23:20	W	A 4 bit wake counter value; When the async clock halt is disabled, the memory control signal will be turned on immediately, but the clock will remain gated for W clock cycle. Setting to ’1111’ equals 18 clock-cycle-delay. This is default set to 0xF.
19:16	S	A 4 bit sleep counter value; When the async clock halt is asserted, the clock will be gated immediately, but the memory control signal will only turn off after S clock cycle. Setting to ’1111’ equals18 clock-cycle-delay. This is default set to 0xF.
15:12	RESERVED_2	Reserved bits
11	CLK_OUT_SEL	This field selects the modulo-N divide value. 0x0: SRC0 0x1: SRC1

MMSS_GFX3D_CC (cont.)

Bits	Name	Description
10:9	MND_MODE0	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
8	MND_EN0	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled
7:6	MND_MODE1	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN1	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control for gfx3d_clk 0x1: Hardware 0x0: Software
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

7:4	M_VAL	This is the M value for the clock branch's M/N:D divider.
3:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x0400008C MMSS_GFX3D_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The GFX3D_NS_REG controls the source selection and configuration of the clocks in the GFX3D domain. It also contains the N value of the GFX3D M/N:D divider.

MMSS_GFX3D_NS

Bits	Name	Description
31:24	RESERVED_1	Reserved bits
23	CLKCTL_RST0	The reset bit for the hm_dyn_clk_ctl res0 0x0: Not Active 0x1: Active
22	CLKCTL_RST1	The reset bit for the hm_dyn_clk_ctl res1 0x0: Not Active 0x1: Active

MMSS_GFX3D_NS (cont.)

Bits	Name	Description
21:18	N0_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
17:14	N1_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
13:6	RESERVED_2	Reserved bits
5:3	SRC0_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: reserved 0x4: mxo 0x5: mmccpll0_src 0x6: clk_test_se 0x7: pll_test_se
2:0	SRC1_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: reserved 0x4: mxo 0x5: mmccpll0_src 0x6: clk_test_se 0x7: pll_test_se

0x04000098 MMSS_IJPEG_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x9FF00000

The IJPEG_CC contains the clock control bits.

MMSS_IJPEG_CC

Bits	Name	Description
31	FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated

MMSS_IJPEG_CC (cont.)

Bits	Name	Description
30	FORCE_PERIPH_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_ret_n) to power collapse the memory periphery. This SW bit when set to 0x1 will force the memory periphery to be powered on and when set to 0x0 will allow the memory periphery to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x0. 0x1: memory periphery power is forced on 0x0: memory periphery is power collapsed when clock is gated
29	FORCE_PERIPH_OFF	This SW bit when set to 0x1 will force the memory periphery to be powered off and when set to 0x0 will allow the memory periphery to be power on when clock is running. During reset, this bit is defaulted to 0x0. This bit is redundant if the FORCE_PERIPH_ON is set to 0x1. 0x1: memory periphery power is forced powered off 0x0: memory periphery is power on when clock is running
28:24	RESERVED_1	Reserved bits
23:20	W	A 4 bit wake counter value; When the async clock halt is disabled, the memory control signal will be turned on immediately, but the clock will remain gated for W clock cycle. Setting to ’1111’ equals 18 clock-cycle-delay. This is default set to 0xF.
19:16	S	A 4 bit sleep counter value; When the async clock halt is asserted, the clock will be gated immediately, but the memory control signal will only turn off after S clock cycle. Setting to ’1111’ equals18 clock-cycle-delay. This is default set to 0xF.
15:8	RESERVED_2	Reserved bits
7:6	MND_MODE	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control for ijpeg_clk 0x1: Hardware 0x0: Software
3	IDLE_CTRL_SEL	This is the hardware clock idle control. 0x1: Hardware 0x0: Software

MMSS_IJPEG_CC (cont.)

Bits	Name	Description
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x0400009C MMSS_IJPEG_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The IJPEG_MD contains the M and D values of the M/N:D divider.

MMSS_IJPEG_MD

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x040000A0 MMSS_IJPEG_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The IJPEG_NS_REG controls the source selection and configuration of the clocks in the IJPEG domain. It also contains the N value of the IJPEG M/N:D divider.

MMSS_IJPEG_NS

Bits	Name	Description
31:24	RESERVED_1	Reserved bits
23:16	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.

MMSS_IJPEG_NS (cont.)

Bits	Name	Description
15:12	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4 0x4: Div-5 0x5: Div-6 0x6: Div-7 0x7: Div-8 0x8: Div-9 0x9: Div-10 0xA: Div-11 0xB: Div-12 0xC: Div-13 0xD: Div-14 0xE: Div-15 0xF: Div-16

3	LVDS_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control. 0x1: Hardware 0x0: Software
2	LVDS_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
1	LVDS_CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
0	DSI2_PCLK_CGC_EN	This bit controls the acgc for the dsi2_pclk. Default is enabled. 0x1: Enabled 0x0: Disabled

0x040000D8 MMSS_PIXEL_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

This register is not used in APQ8064. Maintained for backward compatibility.

MMSS_PIXEL_MD

Bits	Name	Description
31:0	RESERVED	Do not use for APQ8064.

0x040000B8 MMSS_DSI2_PIXEL_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The DSI2_PIXEL_MD contains the M and D values of the M/N:D divider.

MMSS_DSI2_PIXEL_MD

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x040000DC MMSS_PIXEL_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

This register is not used in APQ8064. Maintained for backward compatibility.

MMSS_PIXEL_NS

Bits	Name	Description
31:0	RESERVED	Do not use for APQ8064.

0x040000E4 MMSS_DSI2_PIXEL_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The dsi2_PIXEL_NS_REG controls the source selection and configuration of the clocks in the dsi2_PIXEL domain. It also contains the N value of the dsi2_PIXEL M/N:D divider.

MMSS_DSI2_PIXEL_NS

Bits	Name	Description
31:24	RESERVED_1	Reserved bits
23:16	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.

MMSS_DSI2_PIXEL_NS (cont.)

Bits	Name	Description
15:12	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4 0x4: Div-5 0x5: Div-6 0x6: Div-7 0x7: Div-8 0x8: Div-9 0x9: Div-10 0xA: Div-11 0xB: Div-12 0xC: Div-13 0xD: Div-14 0xE: Div-15 0xF: Div-16
11:8	PRE_DIV_IDLE	Reserved
7	MNCNTR_RST	The MN reset bit 0x0: Not Active 0x1: Active
6:3	RESERVED_2	Reserved bits
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: dsi2_phy_pll_out_dsiclk 0x2: lvdsphy_clk 0x3: dsi1_phy_pll_out_dsiclk 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

0x04000090 MMSS_DSI1_BYTE_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x80FF0000

The DSI1_BYTE_CC contains the clock control bits.

MMSS_DSI1_BYTE_CC

Bits	Name	Description
31	FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated
30	FORCE_PERIPH_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_ret_n) to power collapse the memory periphery. This SW bit when set to 0x1 will force the memory periphery to be powered on and when set to 0x0 will allow the memory periphery to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x0. 0x1: memory periphery power is forced on 0x0: memory periphery is power collapsed when clock is gated
29	FORCE_PERIPH_OFF	This SW bit when set to 0x1 will force the memory periphery to be powered off and when set to 0x0 will allow the memory periphery to be power on when clock is running. During reset, this bit is defaulted to 0x0. This bit is redundant if the FORCE_PERIPH_ON is set to 0x1. 0x1: memory periphery power is forced powered off 0x0: memory periphery is power on when clock is running
28:24	RESERVED_1	Reserved bits
23:20	W	A 4 bit wake counter value; When the async clock halt is disabled, the memory control signal will be turned on immediately, but the clock will remain gated for W clock cycle. Setting to ’1111’ equals 18 clock-cycle-delay. This is default set to 0xF.
19:16	S	A 4 bit sleep counter value; When the async clock halt is asserted, the clock will be gated immediately, but the memory control signal will only turn off after S clock cycle. Setting to ’1111’ equals18 clock-cycle-delay. This is default set to 0xF.
15:5	RESERVED_2	Reserved bits
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control. 0x1: Hardware 0x0: Software
3	RESERVED	Reserved bits
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled

MMSS_DSI1_BYTE_CC (cont.)

Bits	Name	Description
1	CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x040000B0 MMSS_DSI1_BYTE_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The DSI1_BYTE_NS_REG controls the source selection and configuration of the clocks in the dsi1 BYTE domain.

MMSS_DSI1_BYTE_NS

Bits	Name	Description
31:16	RESERVED_1	Reserved bits
15:12	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4 0x4: Div-5 0x5: Div-6 0x6: Div-7 0x7: Div-8 0x8: Div-9 0x9: Div-10 0xA: Div-11 0xB: Div-12 0xC: Div-13 0xD: Div-14 0xE: Div-15 0xF: Div-16

Clock: AHB_CLK
Reset State: 0x000004FF

The TV_CC contains the clock control bits.

MMSS_TV_CC2

Bits	Name	Description
31:18	RESERVED_1	Reserved bits
17	NPL_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
16	NPL_CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
15	RGB_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted

MMSS_TV_CC2 (cont.)

Bits	Name	Description
14	RGB_CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
13	RESERVED_2	Do not use for APQ8064. (previously used for DSUB_HALT_CTRL_SEL)
12	RESERVED_3	Do not use for APQ8064. (previously used for DSUB_CLK_INV)
11	RESERVED_4	Do not use for APQ8064. (previously used for DSUB_CLK_EN)
10	MDP_TV_CLK_FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated
9	MDP_TV_CLK_FORCE_PERIPH_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_ret_n) to power collapse the memory periphery. This SW bit when set to 0x1 will force the memory periphery to be powered on and when set to 0x0 will allow the memory periphery to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x0. 0x1: memory periphery power is forced on 0x0: memory periphery is power collapsed when clock is gated
8	MDP_TV_CLK_FORCE_PERIPH_OFF	This SW bit when set to 0x1 will force the memory periphery to be powered off and when set to 0x0 will allow the memory periphery to be power on when clock is running. During reset, this bit is defaulted to 0x0. This bit is redundant if the FORCE_PERIPH_ON is set to 0x1. 0x1: memory periphery power is forced powered off 0x0: memory periphery is power on when clock is running
7:4	MDP_TV_CLK_W	A 4 bit wake counter value; When the async clock halt is disabled, the memory control signal will be turned on immediately, but the clock will remain gated for W clock cycle. Setting to ’1111’ equals 18 clock-cycle-delay. This is default set to 0xF.
3:0	MDP_TV_CLK_S	A 4 bit sleep counter value; When the async clock halt is asserted, the clock will be gated immediately, but the memory control signal will only turn off after S clock cycle. Setting to ’1111’ equals18 clock-cycle-delay. This is default set to 0xF.

0x040000F0 MMSS_TV_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The TV_MD contains the M and D values of the M/N:D divider.

MMSS_TV_MD

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x040000F4 MMSS_TV_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The TV_NS_REG controls the source selection and configuration of the clocks in the TV domain. It also contains the N value of the TV M/N:D divider.

MMSS_TV_NS

Bits	Name	Description
31:24	RESERVED_1	Reserved bits
23:16	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
15:14	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4
13:8	RESERVED_2	Reserved bits
7	MNCNTR_RST	The MN reset bit 0x0: Not Active 0x1: Active
6	TV_CLK_DIV2_EN	MDP_TV_CLK and NPL_TV_CLK selec bit.
5:3	RESERVED	Reserved bits

MMSS_TV_NS (cont.)

Bits	Name	Description
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: lvdsphy clk 0x2: gnd_1 0x3: hdmi phy clk 0x4: mxo 0x5: gnd_2 0x6: clk_test_se 0x7: pll_test_se

0x040000F8 MMSS_VCODEC_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x80FF0000

The VCODEC_CC contains the clock control bits.

MMSS_VCODEC_CC

Bits	Name	Description
31	FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. To use inter frame clock gating of 1080P video core, RAMs shall not be set into the sleep mode to avoid CPU to execute undefined instruction at the very first cycle of re-enabled clock. Hence FORCE_CORE_ON and FORCE_PERIPH_ON bits need to be set to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated
30	FORCE_PERIPH_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_ret_n) to power collapse the memory periphery. This SW bit when set to 0x1 will force the memory periphery to be powered on and when set to 0x0 will allow the memory periphery to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x0. To use inter frame clock gating of 1080P video core, RAMs shall not be set into the sleep mode to avoid CPU to execute undefined instruction at the very first cycle of re-enabled clock. Hence FORCE_CORE_ON and FORCE_PERIPH_ON bits need to be set to 0x1. 0x1: memory periphery power is forced on 0x0: memory periphery is power collapsed when clock is gated

MMSS_VCODEC_CC (cont.)

Bits	Name	Description
29	FORCE_PERIPH_OFF	This SW bit when set to 0x1 will force the memory periphery to be powered off and when set to 0x0 will allow the memory periphery to be power on when clock is running. During reset, this bit is defaulted to 0x0. This bit is redundant if the FORCE_PERIPH_ON is set to 0x1. 0x1: memory periphery power is forced powered off 0x0: memory periphery is power on when clock is running
28:24	RESERVED_1	Reserved bits
23:20	W	A 4 bit wake counter value; When the async clock halt is disabled, the memory control signal will be turned on immediately, but the clock will remain gated for W clock cycle. Setting to ’1111’ equals 18 clock-cycle-delay. This is default set to 0xF.
19:16	S	A 4 bit sleep counter value; When the async clock halt is asserted, the clock will be gated immediately, but the memory control signal will only turn off after S clock cycle. Setting to ’1111’ equals18 clock-cycle-delay. This is default set to 0xF.
15:14	RESERVED_2	Reserved bits
13	CLK_OUT_SEL	This field selects the modulo-N divide value. 0x0: SRC0 0x1: SRC1
12:11	MND_MODE1	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
10	MND_EN1	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled
9	PIXEL_CLK_INV	This bit inverts the vcodec_pclk. 0x1: Inverted 0x0: Not inverted
8	PIXEL_CLK_EN	Reserved
7:6	MND_MODE0	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN0	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled

MMSS_VCODEC_CC (cont.)

Bits	Name	Description
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control. 0x1: Hardware 0x0: Software
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CLK_INV	This bit inverts the clock at output of CXC of vcodec_clk. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the vcodec_pclk and vcodec_clk. (The halt_ctrl_sel should be set to 0 (software mode). 0x1: Enabled 0x0: Disabled

0x040000FC MMSS_VCODEC_MD0

19:16	S	Reserved bits (not used for APQ8064)
15:9	RESERVED_2	Reserved bits
8	MNCNTR_RST	The MN reset bit 0x0: Not Active 0x1: Active
7:6	MND_MODE	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control. 0x1: Hardware 0x0: Software
3	IDLE_CTRL_SEL	Reserved bit (Do not use for APQ8064)
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x04000144 MMSS_CAMCLK0_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CAMCLK0_MD contains the M and D values of the M/N:D divider.

MMSS_CAMCLK0_MD

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x04000148 MMSS_CAMCLK0_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CAMCLK0_NS_REG controls the source selection and configuration of the clocks in the CAMCLK domain. It also contains the N value of the CAMCLK0 M/N:D divider.

MMSS_CAMCLK0_NS

Bits	Name	Description
31:24	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
23:16	RESERVED_1	Reserved bits
15:14	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4
13:3	RESERVED_2	Reserved bits

MMSS_CAMCLK0_NS (cont.)

Bits	Name	Description
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: reserved 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

0x04000154 MMSS_CAMCLK1_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CAMCLK1_CC contains the clock control bits.

MMSS_CAMCLK1_CC

Bits	Name	Description
31	FORCE_CORE_ON	Reserved bits (not used for APQ8064)
30	FORCE_PERIPH_ON	Reserved bits (not used for APQ8064)
29	FORCE_PERIPH_OFF	Reserved bits (not used for APQ8064)
28:24	RESERVED_1	Reserved bits
23:20	W	Reserved bits (not used for APQ8064)
19:16	S	Reserved bits (not used for APQ8064)
15:9	RESERVED_2	Reserved bits
8	MNCNTR_RST	The MN reset bit 0x0: Not Active 0x1: Active
7:6	MND_MODE	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled

MMSS_CAMCLK1_CC (cont.)

Bits	Name	Description
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control. 0x1: Hardware 0x0: Software
3	IDLE_CTRL_SEL	Reserved
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x04000158 MMSS_CAMCLK1_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CAMCLK1_MD contains the M and D values of the M/N:D divider.

MMSS_CAMCLK1_MD

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x0400015C MMSS_CAMCLK1_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CAMCLK1_NS_REG controls the source selection and configuration of the clocks in the CAMCLK domain. It also contains the N value of the CAMCLK1 M/N:D divider.

MMSS_CAMCLK1_NS

Bits	Name	Description
31:24	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
23:16	RESERVED_1	Reserved bits
15:14	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4
13:3	RESERVED_2	Reserved bits
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: reserved 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

0x04000220 MMSS_CAMCLK2_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CAMCLK2_CC contains the clock control bits.

MMSS_CAMCLK2_CC

Bits	Name	Description
31	FORCE_CORE_ON	Reserved bits (not used for APQ8064)
30	FORCE_PERIPH_ON	Reserved bits (not used for APQ8064)
29	FORCE_PERIPH_OFF	Reserved bits (not used for APQ8064)
28:24	RESERVED_1	Reserved bits
23:20	W	Reserved bits (not used for APQ8064)
19:16	S	Reserved bits (not used for APQ8064)
15:9	RESERVED_2	Reserved bits

MMSS_CAMCLK2_CC (cont.)

Bits	Name	Description
8	MNCNTR_RST	The MN reset bit 0x0: Not Active 0x1: Active
7:6	MND_MODE	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control. 0x1: Hardware 0x0: Software
3	IDLE_CTRL_SEL	Reserved
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x04000224 MMSS_CAMCLK2_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CAMCLK2_MD contains the M and D values of the M/N:D divider.

MMSS_CAMCLK2_MD

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x04000228 MMSS_CAMCLK2_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CAMCLK2_NS_REG controls the source selection and configuration of the clocks in the CAMCLK domain. It also contains the N value of the CAMCLK1 M/N:D divider.

MMSS_CAMCLK2_NS

Bits	Name	Description
31:24	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
23:16	RESERVED_1	Reserved bits
15:14	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4
13:3	RESERVED_2	Reserved bits

0x04000160 MMSS_CSIPHYTIMER_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSIPHYTIMER_CC contains the clock control bits.

MMSS_CSIPHYTIMER_CC

Bits	Name	Description
31:13	RESERVED	Reserved bits

MMSS_CSIPHYTIMER_CC (cont.)

Bits	Name	Description
12	CSI2CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
11	CSI2CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
10	CSI1CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
9	CSI1CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
8	MNCNTR_RST	The MN reset bit 0x0: Not Active 0x1: Active
7:6	MND_MODE	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control. 0x1: Hardware 0x0: Software
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CSI0CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CSI0CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x04000164 MMSS_CSIPHYTIMER_MD

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSIPHYTIMER_MD contains the M and D values of the M/N:D divider.

MMSS_CSIPHYTIMER_MD

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:8	M_VAL	This is the M value for the clock branch's M/N:D divider.
7:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x04000168 MMSS_CSIPHYTIMER_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The CSIPHYTIMER_NS_REG controls the source selection and configuration of the clocks in the CSIPHYTIMER domain. It also contains the N value of the CSIPHYTIMER M/N:D divider.

MMSS_CSIPHYTIMER_NS

Bits	Name	Description
31:24	N_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
23:16	RESERVED_1	Reserved bits
15:14	PRE_DIV_FUNC	This field selects the modulo-N pre-divide value during functional mode of operation. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4
13:3	RESERVED_2	Reserved bits

MMSS_CSIPHYTIMER_NS (cont.)

Bits	Name	Description
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: reserved 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

0x0400014C MMSS_GCCPERFPLL_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x1

This bit is used to control the CGC that is gating the GCC PERF PLL source. Since the APQ8064 PLL8 is placed far from the mmss cc clock generators, due to power reason this clock source can be gated by SW if needed. By default this clock CGC is 0x1 or enabled.

MMSS_GCCPERFPLL_CTL

Bits	Name	Description
31:2	RESERVED	Reserved bits
1	RESERVED_BIT1	Reserved bit
0	CGC_CLK_EN	gated GCC PERF PLL source clock enable; Default is 0x1. 0x0: disable 0x1: enable

0x04000180 MMSS_GFX2D0_GFS_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x300

GFX2D0 Power Rail control.

MMSS_GFX2D0_GFS_CTL

Bits	Name	Description
31:10	RESERVED_1	Reserved bits

MMSS_GFX2D0_GFS_CTL (cont.)

Bits	Name	Description
9	GFX2D0_GFS_RET	GDS Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode).
8	GFX2D0_GFS_EN	GDS enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care.
7:6	RESERVED_2	Reserved
5	GFX2D0_CLAMP	Clamp I/O bit for the core. 1 = clamp, 0 = unclamp
4:0	GFX2D0_GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed switch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x04000184 MMSS_GFX2D1_GFS_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x300

GFX2D1 Power Rail control.

MMSS_GFX2D1_GFS_CTL

Bits	Name	Description
31:10	RESERVED_1	Reserved bits
9	GFX2D1_GFS_RET	GDS Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode).
8	GFX2D1_GFS_EN	GDS enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care.
7:6	RESERVED_2	Reserved
5	GFX2D1_CLAMP	Clamp I/O bit for the core. 1 = clamp, 0 = unclamp
4:0	GFX2D1_GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed switch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x04000188 MMSS_GFX3D_GFS_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x300

GFX3D Power Rail control.

MMSS_GFX3D_GFS_CTL

Bits	Name	Description
31:10	RESERVED_1	Reserved bits
9	GFX3D_GFS_RET	GDS Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode).
8	GFX3D_GFS_EN	GDS enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care.
7:6	RESERVED_2	Reserved
5	GFX3D_CLAMP	Clamp I/O bit for the core. 1 = clamp, 0 = unclamp
4:0	GFX3D_GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed switch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x0400018C MMSS_ROT_GFS_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x300

ROT Power Rail control.

MMSS_ROT_GFS_CTL

Bits	Name	Description
31:10	RESERVED_1	Reserved bits
9	ROT_GFS_RET	GDS Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode).

MMSS_ROT_GFS_CTL (cont.)

Bits	Name	Description
8	ROT_GFS_EN	GDS enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care.
7:6	RESERVED_2	Reserved
5	ROT_CLAMP	Clamp I/O bit for the core. 1 = clamp, 0 = unclamp
4:0	ROT_GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed switch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x04000190 MMSS_MDP_GFS_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x300

MDP Power Rail control.

MMSS_MDP_GFS_CTL

Bits	Name	Description
31:10	RESERVED_1	Reserved bits
9	MDP_GFS_RET	GDS Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode).
8	MDP_GFS_EN	GDS enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care.
7:6	RESERVED_2	Reserved
5	MDP_CLAMP	Clamp I/O bit for the core. 1 = clamp, 0 = unclamp
4:0	MDP_GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed switch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x04000194 MMSS_VED_GFS_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x300

VED Power Rail control.

MMSS_VED_GFS_CTL

Bits	Name	Description
31:10	RESERVED_1	Reserved bits
9	VED_GFS_RET	GDS Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode).
8	VED_GFS_EN	GDS enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care.
7:6	RESERVED_2	Reserved
5	VED_CLAMP	Clamp I/O bit for the core. 1 = clamp, 0 = unclamp
4:0	VED_GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed switch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x04000198 MMSS_VFE_GFS_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x300

VFE Power Rail control.

Bits	Name	Description
31:10	RESERVED_1	Reserved bits
9	VFE_GFS_RET	GDS Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode).

MMSS_VFE_GFS_CTL (cont.)

Bits	Name	Description
8	VFE_GFS_EN	GDS enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care.
7:6	RESERVED_2	Reserved
5	VFE_CLAMP	Clamp I/O bit for the core. 1 = clamp, 0 = unclamp
4:0	VFE_GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed switch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x0400019C MMSS_VPE_GFS_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x300

VPE Power Rail control.

MMSS_VPE_GFS_CTL

Bits	Name	Description
31:10	RESERVED_1	Reserved bits
9	VPE_GFS_RET	GDS Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode).
8	VPE_GFS_EN	GDS enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care.
7:6	RESERVED_2	Reserved
5	VPE_CLAMP	Clamp I/O bit for the core. 1 = clamp, 0 = unclamp
4:0	VPE_GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed switch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x040001A0 MMSS_GEMINI_GFS_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x300

Power Rail status.

MMSS_GEMINI_GFS_CTL

Bits	Name	Description
31:10	RESERVED_1	Reserved bits
9	GEMINI_GFS_RET	GDS Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode).
8	GEMINI_GFS_EN	GDS enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care.
7:6	RESERVED_2	Reserved
5	GEMINI_CLAMP	Clamp I/O bit for the core. 1 = clamp, 0 = unclamp
4:0	GEMINI_GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed switch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x04000254 MMSS_VCAP_GFS_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x020

Power Rail status for VCAP IP. This core is power collapsed and clamped by default.

MMSS_VCAP_GFS_CTL

Bits	Name	Description
31:10	RESERVED_1	Reserved bits
9	VCAP_GFS_RET	GDS Retention bit. GFS_RET = 0 and GFS_EN = 0 will collapse the power to the core. GFS_RET = 1 and GFS_EN = 0 put core into VDD_MIN stage (aka sleep mode). This bit is set to 0x0 by default.

MMSS_VCAP_GFS_CTL (cont.)

Bits	Name	Description
8	VCAP_GFS_EN	GDS enable bit. GFS_EN = 1 for core operational mode. When GFS_EN = 1, GFS_RET is a don't care. This bit is set to 0x0 by default
7:6	RESERVED_2	Reserved
5	VCAP_CLAMP	Clamp I/O bit for the core. 1 = clamp, 0 = unclamp. This bit is set to 0x1 by default
4:0	VCAP_GFS_CNT	This is the number of AHB_CLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed switch. Should set to all 1s for safe mode operation. Decreasing the CNT value can reduce latency.

0x040001A4 MMSS_GFS_CTL_STATUS

Type: Read
Clock: AHB_CLK

Power Rail status.

MMSS_GFS_CTL_STATUS

Bits	Name	Description
31:10	RESERVED	Reserved bits
9	VCAP	Power status for VCAP GFS 0x0: OFF 0x1: ON

0x040001A8 MMSS_AXI_FRQSW_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x00000000

This register is not used in APQ8064. Maintained for backward compatibility.

MMSS_AXI_FRQSW_CTL

Bits	Name	Description
31:6	RESERVED_1	Reserved bits
5:0	RESERVED_2	Do not use for APQ8064

0x040001AC MMSS_AXI_CLK_SRC_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

This register is not used in APQ8064. Maintained for Backward compatibility.

.

MMSS_AXI_CLK_SRC_CTL

Bits	Name	Description
31:0	RESERVED	Do not use for APQ8064

0x040001B0 MMSS_AXI_FRQSW_STATUS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

This register is not used in APQ8064. Maintained for backward compatibility.

MMSS_AXI_FRQSW_STATUS

Bits	Name	Description
31:0	RESERVED	Do not use for APQ8064

0x04000178 MMSS_VCAP_CC

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x80FF0000

The VCAP_CC contains the clock control bits.

MMSS_VCAP_CC

Bits	Name	Description
31	FORCE_CORE_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_nret_n) to power collapse the memory core. This SW bit when set to 0x1 will force the memory core to be powered on and when set to 0x0 will allow the memory core to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x1. 0x1: memory core power is forced on 0x0: memory core is power collapsed when clock is gated
30	FORCE_PERIPH_ON	When the clock is gated using the fxcxc hm, it triggers a signal (slp_ret_n) to power collapse the memory periphery. This SW bit when set to 0x1 will force the memory periphery to be powered on and when set to 0x0 will allow the memory periphery to be power collapsed when clock is gated. During reset, this bit is defaulted to 0x0. 0x1: memory periphery power is forced on 0x0: memory periphery is power collapsed when clock is gated
29	FORCE_PERIPH_OFF	This SW bit when set to 0x1 will force the memory periphery to be powered off and when set to 0x0 will allow the memory periphery to be power on when clock is running. During reset, this bit is defaulted to 0x0. This bit is redundant if the FORCE_PERIPH_ON is set to 0x1. 0x1: memory periphery power is forced powered off 0x0: memory periphery is power on when clock is running
28:24	RESERVED_1	Reserved bits

MMSS_VCAP_CC (cont.)

Bits	Name	Description
23:20	W	A 4 bit sleep counter value; When the async clock halt is disabled, the memory control signal will be turned on immediately, but the clock will remain gated for W clock cycle . Setting to ’1111’ equals 18 clock-cycle-delay.
19:16	S	A 4 bit sleep counter value; When the async clock halt is asserted, the clock will be gated immediately, but the memory control signal will only turn off after S clock cycle. Setting to’1111’ equals18 clock-cycle-delay.
15	RESERVED_2	Reserved bits
14	NPL_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
13	NPL_CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled
12	NPL_HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control for vcap_npl_clk 0x1: Hardware 0x0: Software
11	CLK_OUT_SEL	This field selects the modulo-N divide value. 0x0: SRC0 0x1: SRC1
10:9	MND_MODE0	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
8	MND_EN0	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled
7:6	MND_MODE1	This field determines the operational mode of the M/N:D divider. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
5	MND_EN1	This field enables the M/N:D divider. 0x1: Enabled 0x0: Disabled

MMSS_VCAP_CC (cont.)

Bits	Name	Description
4	HALT_CTRL_SEL	Hardware mode is not supported. Do not set this bit to 0x1. This is the hardware clock idle control for vcap_clk 0x1: Hardware 0x0: Software
2	ROOT_EN	This bit enables the root of the clock tree. 0x1: Enabled 0x0: Disabled
1	CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	CLK_EN	This bit enables the CXC output. (The corresponding halt_ctrl_sel should be set to 0x0 (software mode)). 0x1: Enabled 0x0: Disabled

0x040001EC MMSS_VCAP_MD0

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The VCAP_MD contains the M and D values of the M/N:D divider.

MMSS_VCAP_MD0

Bits	Name	Description
31:8	RESERVED	Reserved bits
7:4	M_VAL	This is the M value for the clock branch's M/N:D divider.
3:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x04000218 MMSS_VCAP_MD1

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The VCAP_MD contains the M and D values of the M/N:D divider.

MMSS_VCAP_MD1

Bits	Name	Description
31:8	RESERVED	Reserved bits
7:4	M_VAL	This is the M value for the clock branch's M/N:D divider.
3:0	D_VAL	This is the NOT(2*D) value for the clock branch's M/N:D divider.

0x0400021C MMSS_VCAP_NS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The VCAP_NS_REG controls the source selection and configuration of the clocks in the VCAP domain. It also contains the N value of the MDP M/N:D divider.

MMSS_VCAP_NS

Bits	Name	Description
31:24	RESERVED_1	Reserved bits
23	CLKCTL_RST0	The reset bit for the hm_dyn_clk_ctl res0 0x0: Not Active 0x1: Active
22	CLKCTL_RST1	The reset bit for the hm_dyn_clk_ctl res1 0x0: Not Active 0x1: Active
21:18	N0_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
17:14	N1_VAL	This is the NOT(N-M) value of the clock branch's M/N:D divider when it is used as either modulo-N divider or as full M/N:D divider.
13:6	RESERVED_2	Reserved bits
5:3	SRC0_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: gnd 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

MMSS_VCAP_NS (cont.)

Bits	Name	Description
2:0	SRC1_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mmccpll1_src 0x2: gccperfpll_src 0x3: gnd 0x4: mxo 0x6: clk_test_se 0x7: pll_test_se

0x04000170 MMSS_RPM_IRQ_EN

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

This RPM_IRQ_EN is used to enable the IRQ from cores to RPM

MMSS_RPM_IRQ_EN

Bits	Name	Description
31:25	RESERVED	Reserved bits
24	GFX3D_VBIF	Level IRQ for Oxili vbif
23	VCAP_VP	Level IRQ from vcap pad
22	VCAP_VC	Level IRQ from vcap core
21	CSIPHY2	Edge IRQ from csiphy2
20	CSID2	Edge IRQ from csid2
19	VPE	Level IRQ from vpe
18	MFC	Level IRQ from vcodec
17	TVENC	Removed for APQ8064
16	ROTATOR	Level IRQ from rotator
15	MDP	Level IRQ from mdp
14	JPEGD	Level IRQ from jpegd
13	IMEM	Level IRQ from imem
12	HDMI	Level IRQ from hdmi
11	GFX3D	Level IRQ from gfx3d
10	VGC1	Removed for APQ8064
9	VGC0	Removed for APQ8064

MMSS_RPM_IRQ_EN (cont.)

Bits	Name	Description
8	DSI2	Level IRQ from dsi2
7	DSI1	Level IRQ from dsi1
6	VFE	Edge IRQ from vfe
5	JPEG	Edge IRQ from jpeg
4	ISPIF	Edge IRQ from ispif
3	CSID1	Edge IRQ from csid1
2	CSID0	Edge IRQ from csid0
1	CSIPHY1	Edge IRQ from csiphy1
0	CSIPHY0	Edge IRQ from csiphy0

0x04000174 MMSS_RPM_IRQ_STATUS

Type: Read Only
Clock: AHB_CLK
Reset State: 0x0

This RPM_IRQ_STATUS is used to read the status of the IRQ from cores to RPM

MMSS_RPM_IRQ_STATUS

Bits	Name	Description
31:25	RESERVED	Reserved bits
24	GFX3D_VBIF	Read Status of IRQ from Oxili vbif
23	VCAP_VP	Read Status of IRQ from vcap pad
22	VCAP_VC	Read Status of IRQ from vcap core
21	CSIPHY2	Read Status of IRQ from csiphy2
20	CSID2	Read Status of IRQ from csid2
19	VPE	Read Status of IRQ from vpe
18	MFC	Read Status of IRQ from vcodec
17	TVENC	Removed for APQ8064
16	ROTATOR	Read Status of IRQ from rotator
15	MDP	Read Status of IRQ from mdp
14	JPEGD	Read Status of IRQ from jpegd
13	IMEM	Read Status of IRQ from imem
12	HDMI	Read Status of IRQ from hdmi

MMSS_RPM_IRQ_STATUS (cont.)

Bits	Name	Description
11	GFX3D	Read Status of IRQ from gfx3d
10	VGC1	Removed for APQ8064
9	VGC0	Removed for APQ8064
8	DSI2	Read Status of IRQ from dsi2
7	DSI1	Read Status of IRQ from dsi1
6	VFE	Read Status of IRQ from vfe
5	JPEG	Read Status of IRQ from jpeg
4	ISPIF	Read Status of IRQ from ispif
3	CSID1	Read Status of IRQ from csid1
2	CSID0	Read Status of IRQ from csid0
1	CSIPHY1	Read Status of IRQ from csiphy1
0	CSIPHY0	Read Status of IRQ from csiphy0

0x0400017C MMSS_RPM_IRQ_CLEAR

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

This RPM_IRQ_CLEAR is used for the edge IRQ. The edge IRQ is converted to level irq, and this bit is used to de-assert the level irq.

MMSS_RPM_IRQ_CLEAR

Bits	Name	Description
31:9	RESERVED	Reserved bits
8	CSIPHY2	clear for csiphy2
7	CSID2	clear for csid2
6	VFE	clear for vfe
5	JPEG	clear for peg
4	ISPIF	clear for ispif
3	CSID1	clear for csid1
2	CSID0	clear for csid0
1	CSIPHY1	clear for csiphy1
0	CSIPHY0	clear for csiphy0

0x040001B4 MMSS_DBG_CFG_REG_HS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The DBG_CFG_REG is used for high speed clock debugging.

MMSS_DBG_CFG_REG_HS

Bits	Name	Description
31:7	RESERVED	Reserved bits

MMSS_DBG_CFG_REG_HS (cont.)

Bits	Name	Description
6:1	CLK_SEL	These bits are used to select the clk to be debugged. 0x0: cc_csi0_clk 0x1: cc_csi1_clk 0x2: cc_dsi1_clk 0x3: cc_dsi2_clk 0x4: cc_csi_vfe_clk 0x5: cc_ijpeg_clk 0x6: cc_vfe_clk 0x7: Reserved_07 0x8: Reserved_08 0x9: cc_gfx3d_clk 0xA: cc_jpegd_clk 0xB: cc_vcodec_clk 0xC: cc_axi_s0_clk 0xD: cc_axi_s1_clk 0xE: cc_axi_s2_clk 0xF: cc_fab_core_clk 0x10: cc_fab_msp_axi_clk 0x11: cc_gmem_axi_clk 0x12: cc_ijpeg_axi_clk 0x13: cc_imem_axi_clk 0x14: cc_jpegd_axi_clk 0x15: cc_mdp_axi_clk 0x16: cc_rot_axi_clk 0x17: cc_vcodec_axi_clk 0x18: cc_vfe_axi_clk 0x19: cc_vpe_axi_clk 0x1A: cc_mdp_clk 0x1B: cc_rot_clk 0x1C: cc_vpe_clk 0x1D: cc_hdmi_ref_clk 0x1E: cc_hdmi_tv_clk 0x1F: cc_mdp_tv_clk 0x20: cc_axi_s0_fclk 0x21: cc_axi_s1_fclk 0x22: cc_axi_s2_fclk 0x23: cc_axi_s3_fclk 0x24: cc_csiphy0_clk 0x25: cc_csiphy1_clk 0x26: cc_csi_pix_clk 0x27: cc_csi_rdi_clk 0x28: cc_lut_mdp_clk 0x29: cc_vcodec_A_axi_clk 0x2A: cc_vcodec_B_axi_clk 0x2B: cc_csiphy1_timer_clk 0x2C: cc_csiphy0_timer_clk

MMSS_DBG_CFG_REG_HS (cont.)

Bits	Name	Description
6:1	CLK_SEL (CONTINUED)	0x2D: cc_csi2_clk 0x2E: cc_csiphy2_clk 0x2F: cc_csiphy2_timer_clk 0x30: cc_csi_pix1_clk 0x31: cc_csi_rdi1_clk 0x32: cc_csi_rdi2_clk 0x33: cc_vcap_clk 0x34: cc_vcap_npl_clk 0x36: cc_vcap_axi_clk 0x37: cc_rgc_tv_clk 0x38: cc_npl_tv_clk 0x39: cc_gfx3d_axi_clk
0	DBG_CLK_EN	This bit enables the dbg_clk. 0x1: Enabled 0x0: Disabled

0x040001B8 MMSS_DBG_CFG_REG_LS

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The DBG_CFG_REG is used for low speed clock debugging.

MMSS_DBG_CFG_REG_LS

Bits	Name	Description
31:7	RESERVED	Reserved bits

MMSS_DBG_CFG_REG_LS (cont.)

Bits	Name	Description
6:1	CLK_SEL	These bits are used to select the clk to be debugged. 0x0: cc_dsi1_byte_clk 0x1: cc_dsi2_byte_clk 0x2: cc_camclk1_po 0x3: cc_mdp_dsi1_pclk 0x4: cc_dsi2_pclk 0x5: cc_vcodec_pclk 0x6: cc_amp_ahb_clk 0x7: cc_csi_ahb_clk 0x8: cc_dsi2_s_ahb_clk 0x9: cc_dsi1_m_ahb_clk 0xA: cc_dsi1_s_ahb_clk 0xB: cc_fab_ahb_clk 0xC: Reserved_0C 0xD: Reserved_0D 0xE: cc_gfx3d_ahb_clk 0xF: cc_hdmi_m_ahb_clk 0x10: cc_hdmi_s_ahb_clk 0x11: cc_ijpeg_ahb_clk 0x12: cc_imem_ahb_clk 0x13: cc_jpegd_ahb_clk 0x14: cc_mdp_ahb_clk 0x15: cc_mmss_fpb_clk 0x16: cc_rot_ahb_clk 0x17: cc_dsi1_esc_clk 0x18: cc_smmu_ahb_clk 0x19: Reversed_19 0x1A: cc_vcodec_ahb_clk 0x1B: cc_vfe_ahb_clk 0x1C: cc_vpe_ahb_clk 0x1D: cc_camclk0_po 0x1E: cc_dsi_ref_clk 0x1F: cc_hdmi_app_clk 0x20: cc_mdp_vsync_clk 0x21: Reserved_21 0x22: Reserved_22 0x23: cc_dsi2_esc_clk 0x24: cc_apu_ahb_clk 0x25: cc_mmss_fpb_always_on_clk 0x26: cc_dsi2_m_ahb_clk 0x27: cc_camclk2_po 0x28: cc_vcap_ahb_clk 0x29: cc_dsi2_mdp_pclk 0x2A: cc_lvdsphy_pixel_clk

Bits	Name	Description
0	DBG_CLK_EN	This bit enables the dbg_clk. 0x1: Enabled 0x0: Disabled

0x040001C0 MMSS_SPDM_CYC_CNT

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

MMSS_SPDM_CYC_CNT

Bits	Name	Description
31:14	RESERVED_1	Reserved bits
13	MDP_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
12	MDP_CLK_EN	This bit enables the CXC output. 0x1: Enabled 0x0: Disabled
11	DSI_PCLK_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
10	DSI_PCLK_CLK_EN	This bit enables the CXC output. 0x1: Enabled 0x0: Disabled
9	RESERVED_2	Removed feature for APQ8064.
8	RESERVED	Removed feature for APQ8064.
7	GFX3D_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
6	GFX3D_CLK_EN	This bit enables the CXC output. 0x1: Enabled 0x0: Disabled
5	FAB_AHB_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
4	FAB_AHB_CLK_EN	This bit enables the CXC output. 0x1: Enabled 0x0: Disabled

MMSS_SPDM_CYC_CNT (cont.)

Bits	Name	Description
3	FAB_CORE_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
2	FAB_CORE_CLK_EN	This bit enables the CXC output. 0x1: Enabled 0x0: Disabled
1	VCODEC_CLK_INV	This bit inverts the clock at output of CXC. 0x1: Inverted 0x0: Not inverted
0	VCODEC_CLK_EN	This bit enables the CXC output. 0x1: Enabled 0x0: Disabled

0x040001C4 MMSS_DBG_BUS_CFG_REG

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

MMSS_DBG_BUS_CFG_REG

Bits	Name	Description
31:4	RESERVED	Reserved bits
3:0	BUS_SEL	Debug bus select 0x0: disabled 0x1: vec_a 0x2: vec_b 0x3: vec_c 0x4: vec_d 0x5: vec_e 0x6: vec_f 0x7: vec_g 0x8: vec_h 0x9: vec_i 0xA: vec_def 0xB: vec_j 0xC: vec_k

0x040001C8 MMSS_DBG_BUS_VEC_A

Type: Read Only
Clock: AHB_CLK
Reset State: 0x0

MMSS_DBG_BUS_VEC_A

Bits	Name	Description
31	RESERVED_1	Reserved bit
30	MDP0_AXI_CLKON	Read back register for mdp0_axi_clkon
29	MDP1_AXI_CLKON	Read back register for mdp1_axi_clkon
28	VPE_CLK_OFF	Read back register for vpe_clk_off
27	VPE_CLKON	Read back register for vpe_clkon
26	VPE_CLK_SLP_NRET_N	Read back register for vpe_clk_slp_nret_n
25	VPE_CLK_SLP_RET_N	Read back register for vpe_clk_slp_ret_n
24	IJPEG_CLK_OFF	Read back register for ijpeg_clk_off
23	IJPEG_DISABLE	Read back register for ijpeg_disable
22	IJPEG_CLKON	Read back register for ijpeg_clkon
21	IJPEG_CLK_SLP_NRET_N	Read back register for ijpeg_clk_slp_nret_n
20	IJPEG_CLK_SLP_RET_N	Read back register for ijpeg_clk_slp_ret_n
19	JPEGD_CLK_OFF	Read back register for jpegd_clk_off
18	JPEGD_DISABLE	Read back register for jpegd_disable
17	JPEGD_CLKON	Read back register for jpegd_clkon
16	JPEGD_CLK_SLP_NRET_N	Read back register for jpegd_clk_slp_nret_n
15	JPEGD_CLK_SLP_RET_N	Read back register for jpegd_clk_slp_ret_n
14	RESERVED_2	Removed for APQ8064.

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

This register space is used for fpb always on clock enabling only. Do not use for any other purpose. The fpb always on clock should always be defaulted to enable; if disabled, it may not recover, thus this bit is used only for static power testing purpose.

MMSS_FPB_EN

Bits	Name	Description
0	FPB_ALWAYS_ON_CLK_EN	Caution: This register will disable the fpb_always_on clock and not recoverable. Do not set it to 0x1, unless for power or leakage testing purpose. 0x0: Enable 0x1: Disable

15:8	HPIMEM	Custom RAM
7:0	RF8441	Custom regfile

0x040001BC MMSS_MMSS_CUSTOMMEM_ARRSTBYN

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x1

MMSS_MMSS_CUSTOMMEM_ARRSTBYN

Bits	Name	Description
0	IMEM	Array standby bit for MMSS IMEM custom memory. This is an active low signal; Default is 0x1

0x04000204 MMSS_SW_RESET_ALL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The SW_RESET_ALL register is used to reset most clock branches.

MMSS_SW_RESET_ALL

Bits	Name	Description
0	SW_RESET_ALL	Setting (1) this bit has the same function as setting all bits in the SW_RESET: 0x0: Not Active 0x1: Active

0x04000208 MMSS_SW_RESET_AXI

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0003FFFF

The SW_RESET_AXI register controls the individual resets to all blocks.

MMSS_SW_RESET_AXI

Bits	Name	Description
31:18	RESERVED	Reserved bits
17	GFX3D_AXI	The reset bit 0x0: Not Active 0x1: Active
16	VCAP_AXI	The reset bit 0x0: Not Active 0x1: Active
15	VPE_AXI	The reset bit 0x0: Not Active 0x1: Active
14	IJPEG_AXI	The reset bit 0x0: Not Active 0x1: Active
13	MDP_AXI	The reset bit 0x0: Not Active 0x1: Active
9	VFE_AXI	The reset bit 0x0: Not Active 0x1: Active
8	SP_AXI	The reset bit 0x0: Not Active 0x1: Active
7	VCODEC_AXI	The reset bit 0x0: Not Active 0x1: Active
6	ROT_AXI	The reset bit 0x0: Not Active 0x1: Active
5	VCODEC_AXI_A	The reset bit 0x0: Not Active 0x1: Active
4	VCODEC_AXI_B	The reset bit 0x0: Not Active 0x1: Active
3	FAB_S3_AXI	The reset bit 0x0: Not Active 0x1: Active

MMSS_SW_RESET_AXI (cont.)

Bits	Name	Description
2	FAB_S2_AXI	The reset bit 0x0: Not Active 0x1: Active
1	FAB_S1_AXI	The reset bit 0x0: Not Active 0x1: Active
0	FAB_S0_AXI	The reset bit 0x0: Not Active 0x1: Active

0x0400020C MMSS_SW_RESET_AHB

Type: Write/Read
Clock: AHB_CLK
Reset State: 0xFFFFFFFF

The SW_RESET_AHB register controls the individual resets to all blocks.

MMSS_SW_RESET_AHB

Bits	Name	Description
31	SMMU_GFX3D_AHB	The reset bit 0x0: Not Active 0x1: Active
30	SMMU_VPE_AHB	The reset bit 0x0: Not Active 0x1: Active
29	SMMU_VFE_AHB	The reset bit 0x0: Not Active 0x1: Active
28	SMMU_ROT_AHB	The reset bit 0x0: Not Active 0x1: Active
27	SMMU_VCODEC_B_AHB	The reset bit 0x0: Not Active 0x1: Active
26	SMMU_VCODEC_A_AHB	The reset bit 0x0: Not Active 0x1: Active

MMSS_SW_RESET_AHB (cont.)

Bits	Name	Description
25	SMMU_MDP1_AHB	The reset bit 0x0: Not Active 0x1: Active
24	SMMU_MDP0_AHB	The reset bit 0x0: Not Active 0x1: Active
23	SMMU_JPEGD_AHB	The reset bit 0x0: Not Active 0x1: Active
22	SMMU_IJPEG_AHB	The reset bit 0x0: Not Active 0x1: Active
21	RESERVED_1	Removed for APQ8064
20	REVERSED	Removed for APQ8064
19	RESERVED_2	Do not use for APQ8064. (previously used for SMI0_AHB)
18	APU_AHB	The reset bit 0x0: Not Active 0x1: Active
17	CSI_AHB	The reset bit 0x0: Not Active 0x1: Active
16	RESERVED_3	Do not use for APQ8064 (previously used for CSI1_AHB)
15	RESERVED_4	Removed for APQ8064.
14	VPE_AHB	The reset bit 0x0: Not Active 0x1: Active
13	FABRIC_AHB	The reset bit 0x0: Not Active 0x1: Active
12	RESERVED_5	Removed for APQ8064
11	RESERVED_6	Removed for APQ8064
10	GFX3D_AHB	The reset bit 0x0: Not Active 0x1: Active
9	HDMI_AHB	The reset bit 0x0: Not Active 0x1: Active

MMSS_SW_RESET_AHB (cont.)

Bits	Name	Description
8	IMEM_AHB	The reset bit 0x0: Not Active 0x1: Active
7	IJPEG_AHB	The reset bit 0x0: Not Active 0x1: Active
6	DSI_M_AHB	The reset bit 0x0: Not Active 0x1: Active
5	DSI_S_AHB	The reset bit 0x0: Not Active 0x1: Active
4	JPEGD_AHB	The reset bit 0x0: Not Active 0x1: Active
3	MDP_AHB	The reset bit 0x0: Not Active 0x1: Active
2	ROT_AHB	The reset bit 0x0: Not Active 0x1: Active
1	VCODEC_AHB	The reset bit 0x0: Not Active 0x1: Active
0	VFE_AHB	The reset bit 0x0: Not Active 0x1: Active

0x04000200 MMSS_SW_RESET_AHB2

Type: Write/Read
Clock: AHB_CLK
Reset State: 0xF

The SW_RESET_AHB register controls the individual resets to all blocks.

MMSS_SW_RESET_AHB2

Bits	Name	Description
3	SMMU_VCAP_AHB	The reset bit 0x0: Not Active 0x1: Active
2	VCAP_AHB	The reset bit 0x0: Not Active 0x1: Active
1	DSI2_M_AHB	The reset bit 0x0: Not Active 0x1: Active
0	DSI2_S_AHB	The reset bit 0x0: Not Active 0x1: Active

0x04000210 MMSS_SW_RESET_CORE

Type: Write/Read
Clock: AHB_CLK
Reset State: 0xFFFFFFFF

The SW_RESET_CORE register controls the individual resets to all blocks.

MMSS_SW_RESET_CORE

Bits	Name	Description
31	CSIPHY2_CLK	The reset bit 0x0: Not Active 0x1: Active
30	CSI_PIX1_CLK	The reset bit 0x0: Not Active 0x1: Active
29	CSIPHY0_CLK	The reset bit 0x0: Not Active 0x1: Active
28	CSIPHY1_CLK	The reset bit 0x0: Not Active 0x1: Active
27	CSI_RDI_CLK	The reset bit 0x0: Not Active 0x1: Active

MMSS_SW_RESET_CORE (cont.)

Bits	Name	Description
26	CSI_PIX_CLK	The reset bit 0x0: Not Active 0x1: Active
25	DSI2_CORE	The reset bit 0x0: Not Active 0x1: Active
24	VFE_CSI_CORE	The reset bit 0x0: Not Active 0x1: Active
23	RESERVED_1	Do not use for APQ8064 (previously used for vfe_csi1_core)
22	RESERVED_2	Do not use for APQ8064 (previously used for SMI0_CORE)
21	MDP_CORE	The reset bit 0x0: Not Active 0x1: Active
20	AMP_CORE	The reset bit 0x0: Not Active 0x1: Active
19	JPEGD_CORE	The reset bit 0x0: Not Active 0x1: Active
18	CSI1_CORE	The reset bit 0x0: Not Active 0x1: Active
17	VPE_CORE	The reset bit 0x0: Not Active 0x1: Active
16	FABRIC_CORE	The reset bit 0x0: Not Active 0x1: Active
15	VFE_CORE	The reset bit 0x0: Not Active 0x1: Active
14	RESERVED_3	Removed for APQ8064
13	RESERVED_4	Removed for APQ8064
12	GFX3D_CORE	The reset bit 0x0: Not Active 0x1: Active

MMSS_SW_RESET_CORE (cont.)

Bits	Name	Description
11	HDMI_CORE	The reset bit 0x0: Not Active 0x1: Active
10	IMEM_CORE	The reset bit 0x0: Not Active 0x1: Active
9	IJPEG_CORE	The reset bit 0x0: Not Active 0x1: Active
8	CSI0_CORE	The reset bit 0x0: Not Active 0x1: Active
7	DSI_CORE	The reset bit 0x0: Not Active 0x1: Active
6	VCODEC_CORE	The reset bit 0x0: Not Active 0x1: Active
5	RESERVED	Do not use for APQ8064 (previously used for MDP_PCLK)
4	MDP_TV_CORE	The reset bit 0x0: Not Active 0x1: Active
3	MDP_VSYNC_CORE	The reset bit 0x0: Not Active 0x1: Active
2	ROT_CORE	The reset bit 0x0: Not Active 0x1: Active
1	TV_HDMI_CORE	The reset bit 0x0: Not Active 0x1: Active
0	RESERVED_0	Removed for APQ8064

0x04000214 MMSS_SW_RESET_CORE2

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x1F

The SW_RESET_CORE register controls the individual resets to all blocks.

MMSS_SW_RESET_CORE2

Bits	Name	Description
31:4	RESERVED	Reserved Bits
4	VCAP_NPL_CORE	The reset bit 0x0: Not Active 0x1: Active
3	VCAP_CORE	The reset bit 0x0: Not Active 0x1: Active
2	CSI2_CORE	The reset bit 0x0: Not Active 0x1: Active
1	CSI_RDI1_CLK	The reset bit 0x0: Not Active 0x1: Active
0	CSI_RDI2_CLK	The reset bit 0x0: Not Active 0x1: Active

0x04000300 MMSS_PLL0_MODE

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The PLL_MODE configures and controls the PLL. All register bits are clear (0) on RESOUT.

MMSS_PLL0_MODE

Bits	Name	Description
31:5	RESERVED	Reserved bits
4	PLL_REF_XO_SEL	Specify the reference XO to be used 0x0: PXO (24.576Mhz) 0x1: MXO (27Mhz)
3	PLLTEST	Set(1) this bit to enter the PLL test mode. Clear (0) this bit for the normal mode.
2	RESET_N	Low asserted reset for the digital logic in the PLL. This includes the MND dividers and integer divider.
1	BYPASSNL	Clear (0) to bypass the PLL (PLLOUT is then identical to the input reference). Set (1) to use the PLL. Default is clear (0) at RESOUT (different from previous APQs)

MMSS_PLL0_MODE (cont.)

Bits	Name	Description
0	OUTCTRL	Set (1) to activate the PLL's output (the analog circuitry is active but the output is not). Set (1) will enable the following PLL's output: nPLLOUT_LV_MAIN (if MAIN output enabled PLL0_CONFIG[23]) nPLLOUT_LV_BIST (If BIST output enabled PLL0_TEST_CTL[13]) nPLLOUT_LV_AUX (If AUX output enabled PLL0_TEST_CTL[12]) Clear (0) to disable the PLL's output and save power. Clears (0) at RESOUT.

0x04000304 MMSS_PLL0_L_VAL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The SR_PLL implements the following frequency equation:

PLLOUT_LV_MAIN=CK_IN*(1/PRE_DIV)*(L+M/N)*(1/POST_DIV)

CK_IN is the input reference frequency (XO)

PRE_DIV can be either 1 or 2

POST_DIV can be either 1,2,4, or 8

The value of the PLL_L_VAL is the given value of L for the SR_PLL frequency equation.

MMSS_PLL0_L_VAL

Bits	Name	Description
31:10	RESERVED	Reserved bits
9:0	PLL_L	This register contains the 6-bit L value in the PLL's fractional division ratio.

0x04000308 MMSS_PLL0_M_VAL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The value of the PLL_M_VAL is the given value of M for the SR_PLL frequency equation.

MMSS_PLL0_M_VAL

Bits	Name	Description
31:19	RESERVED	UNUSED
18:0	PLL_M	This register contains the 19-bit M value of the PLL's numerator value in the fractional division ratio.

0x0400030C MMSS_PLL0_N_VAL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The value of the PLL_N_VAL is the given value of N for the SR_PLL frequency equation.

MMSS_PLL0_N_VAL

Bits	Name	Description
31:19	RESERVED	UNUSED
18:0	PLL_N	This register contains the 19-bit N value of the PLL's denominator value in the fractional division ratio.

0x04000310 MMSS_PLL0_CONFIG

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The field descriptions show the mapping from 45nm NT wrapper PLL0_CONFIG register to SRPLL input, PLL_CONFIG_CTL. Some bits of PLL_CONFIG_CTL come from PLL0_TEST_CTL.

The PLL0_CONFIG register is used for the PLL0 (SR PLL) for:

- Enable the main output
- Setup integer or fractional mode
- Setup the Post divider ratio
- Setup the Pre divider ratio
- Select the appropriate VCO, depending on the generated frequency

MMSS_PLL0_CONFIG

Bits	Name	Description
31:28	RESERVED_BITS31_28	PLL0_CONFIG(31:30) maps to PLL_CONFIG_CTL(27:26) PLL0_CONFIG(29) maps to PLL_CONFIG_CTL(23) PLL0_CONFIG(28) maps to PLL_CONFIG_CTL(15)
27	EARLY_OUT_ENA	PLL0_CONFIG(27) : PLL_CONFIG_CTL(3) PLLOUT_LV_EARLY enable 0x0: Disable 0x1: Enable
26	CLK33_OUT_SEL	Not Used
25	CLK33_OUT_ENA	Not Used
24	OUT_SEL	Not Used
23	MAIN_OUT_ENA	PLL0_CONFIG(23) : PLL_CONFIG_CTL(0) PLLOUT_LV_MAIN enable 0x0: Disable 0x1: Enable

18	INTERNAL_BIT18	Not Used
17:16	VCO	PLL0_CONFIG(17) : PLL_CONFIG_CTL(9) VCO Selection PLL0_CONFIG(16) : Not Used 0x0: Select 100 - 500 MHz VCO 0x1: Select 400 - 1400 MHz VCO
15	INTERNAL_BIT15	Not Used
14:0	INTERNAL_BITS14_0	Not Used

0x04000314 MMSS_PLL0_TEST_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The PLL0_TEST_CTL register is used to enable the TEST, BIST and AUX outputs of PLL0 (SRPLL). The field descriptions show the mapping from 45nm NT wrapper PLL0_TEST_CTL register to SR PLL inputs, PLL_TEST_CTL and PLL_CONFIG_CTL.

MMSS_PLL0_TEST_CTL

Bits	Name	Description
31:19	RESERVED_BITS31_19	PLL0_TEST_CTL(31:30) maps to PLL_CONFIG_CTL(25:24) PLL0_TEST_CTL(29:28) maps to PLL_CONFIG_CTL(21:20) PLL0_TEST_CTL(27:26) maps to PLL_CONFIG_CTL(19:18) PLL0_TEST_CTL(25:24) maps to PLL_CONFIG_CTL(17:16) PLL0_TEST_CTL(23:22) maps to PLL_CONFIG_CTL(13:12) PLL0_TEST_CTL(21) maps to PLL_CONFIG_CTL(11) PLL0_TEST_CTL(20) maps to PLL_TEST_CTL(9) PLL0_TEST_CTL(19) : Not Used

0x04000318 MMSS_PLL0_STATUS

Type: Read Only
Clock: AHB_CLK
Reset State: 0x0

For backward compatibility, NT-PLL fields are maintained.

MMSS_PLL0_STATUS

Bits	Name	Description
15:0	PLL_STATUS	This register contains signals from the PLL's STATUS port. It is used to observe various 'status' values within the PLL.

0x0400031C MMSS_PLL1_MODE

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The PLL_MODE configures and controls the PLL. All register bits are clear (0) on RESOUT.

MMSS_PLL1_MODE

Bits	Name	Description
31:5	RESERVED	Reserved bits
4	PLL_REF_XO_SEL	Specify the reference XO to be used 0x0: PXO (24.576Mhz) 0x1: MXO (27Mhz)
3	PLLTEST	Set (1) this bit to enter the PLL test mode. Clear (0) this bit for the normal mode.
2	RESET_N	Low asserted reset for the digital logic in the PLL. This includes the MND dividers and integer divider.
1	BYPASSNL	Clear (0) to bypass the PLL (PLLOUT is then identical to the input reference). Set (1) to use the PLL. Default is clear (0) at RESOUT (different from previous APQs)

MMSS_PLL1_MODE (cont.)

Bits	Name	Description
0	OUTCTRL	Set (1) to activate the PLL's output (the analog circuitry is active but the output is not). Set (1) will enable the following PLL's output: n PLLOUT_LV_MAIN (if MAIN output enabled PLL0_CONFIG[23]) n PLLOUT_LV_BIST (If BIST output enabled PLL0_TEST_CTL[13]) n PLLOUT_LV_AUX (If AUX output enabled PLL0_TEST_CTL[12]) Clear (0) to disable the PLL's output and save power. Clears (0) at RESOUT.

0x04000320 MMSS_PLL1_L_VAL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The SR_PLL implements the following frequency equation:

PLLOUT_LV_MAIN=CK_IN*(1/PRE_DIV)*(L+M/N)*(1/POST_DIV)

Where:

- CK_IN is the input reference frequency (XO)
- PRE_DIV can be either 1 or 2
- POST_DIV can be either 1,2,4, or 8

The value of the PLL_L_VAL is the given value of L for the SR_PLL frequency equation.

MMSS_PLL1_L_VAL

Bits	Name	Description
31:10	RESERVED	Reserved bits
9:0	PLL_L	This register contains the 6-bit L value in the PLL's fractional division ratio.

0x04000324 MMSS_PLL1_M_VAL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The value of the PLL_M_VAL is the given value of M for the SR_PLL frequency equation.

MMSS_PLL1_M_VAL

Bits	Name	Description
31:19	RESERVED	Reserved bits
18:0	PLL_M	This register contains the 19-bit M value of the PLL's numerator value in the fractional division ratio.

0x04000328 MMSS_PLL1_N_VAL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The value of the PLL_N_VAL is the given value of N for the SR_PLL frequency equation.

MMSS_PLL1_N_VAL

Bits	Name	Description
18:0	PLL_N	This register contains the 19-bit N value of the PLL's denominator value in the fractional division ratio.

0x0400032C MMSS_PLL1_CONFIG

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The field descriptions show the mapping from 45nm NT wrapper PLL1_CONFIG register to SRPLL input, PLL_CONFIG_CTL. Some bits of PLL_CONFIG_CTL come from PLL1_TEST_CTL.

The PLL1_CONFIG register is used for the PLL1 (SR PLL) to:

- Enable the main output
- Set up integer or fractional mode
- Set up the Post divider ratio
- Set up the Pre divider ratio
- Select the appropriate VCO depending on the generated frequency

MMSS_PLL1_CONFIG

Bits	Name	Description
31:28	RESERVED_BITS31_28	PLL1_CONFIG(31:30) maps to PLL_CONFIG_CTL(27:26) PLL1_CONFIG(29) maps to PLL_CONFIG_CTL(23) PLL1_CONFIG(28) maps to PLL_CONFIG_CTL(15)

0x04000334 MMSS_PLL1_STATUS

Type: Read Only
Clock: AHB_CLK
Reset State: 0x0

For backward compatibility, NT-PLL fields are maintained.

MMSS_PLL1_STATUS

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:0	PLL_STATUS	This register contains signals from the PLL's STATUS port. It is used to observe various 'status' values within the PLL.

0x04000338 MMSS_PLL3_MODE

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The PLL_MODE configures and controls the PLL. All register bits are clear (0) on RESOUT.

MMSS_PLL3_MODE

Bits	Name	Description
31:5	RESERVED	Reserved bits
4	PLL_REF_XO_SEL	Specify the reference XO to be used 0x0: PXO (24.576Mhz) 0x1: MXO (27Mhz)
3	PLLTEST	0x1 Set(1) this bit to enter the PLL test mode. 0x0 Clear (0) this bit for the normal mode.
2	RESET_N	Low asserted reset for the digital logic in the PLL. This includes the MND dividers and integer divider.
1	BYPASSNL	0x0 Clear (0) to bypass the PLL (PLLOUT is then identical to the input reference). 0x1 Set (1) to use the PLL. Default is clear (0) at RESOUT (different from previous APQs)

MMSS_PLL3_MODE (cont.)

Bits	Name	Description
0	OUTCTRL	0x1 Set (1) to activate the PLL's output (the analog circuitry is active but the output is not). 0x1 Set (1) will enable the following PLL's output: - PLLOUT_LV_MAIN (if MAIN output enabled PLL0_CONFIG[23]) - PLLOUT_LV_BIST (If BIST output enabled PLL0_TEST_CTL[13]) - PLLOUT_LV_AUX (If AUX output enabled PLL0_TEST_CTL[12]) 0x0 Clear (0) to disable the PLL's output and save power. Clears (0) at RESOUT.

0x0400033C MMSS_PLL3_L_VAL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The SR_PLL implements the following frequency equation:

PLLOUT_LV_MAIN=CK_IN*(1/PRE_DIV)*(L+M/N)*(1/POST_DIV)

Where:

- CK_IN is the input reference frequency (XO)
- PRE_DIV can be either 1 or 2
- POST_DIV can be either 1,2,4, or 8

The value of the PLL_L_VAL is the given value of L for the SR_PLL frequency equation.

MMSS_PLL3_L_VAL

Bits	Name	Description
31:10	RESERVED	Reserved bits
9:0	PLL_L	This register contains the 6-bit L value in the PLL's fractional division ratio.

0x04000340 MMSS_PLL3_M_VAL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The value of the PLL_M_VAL is the given value of M for the SR_PLL frequency equation.

MMSS_PLL3_M_VAL

Bits	Name	Description
31:19	RESERVED	Reserved bits
18:0	PLL_M	This register contains the 19-bit M value of the PLL's numerator value in the fractional division ratio.

0x04000344 MMSS_PLL3_N_VAL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The value of the PLL_N_VAL is the given value of N for the SR_PLL frequency equation.

MMSS_PLL3_N_VAL

Bits	Name	Description
18:0	PLL_N	This register contains the 19-bit N value of the PLL's denominator value in the fractional division ratio.

0x04000348 MMSS_PLL3_CONFIG

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The field descriptions show the mapping from 45nm NT wrapper PLL3_CONFIG register to SRPLL input, PLL_CONFIG_CTL. Some bits of PLL_CONFIG_CTL come from PLL3_TEST_CTL.

The PLL_CONFIG register is used for the PLL (SR PLL) to:

- Enable the main output
- Set up integer or fractional mode
- Set up the Post divider ratio
- Se tup the Pre divider ratio
- Select the appropriate VCO, depending on the generated frequency

MMSS_PLL3_CONFIG

Bits	Name	Description
31:28	RESERVED_BITS31_28	PLL3_CONFIG(31:30) maps to PLL_CONFIG_CTL(27:26) PLL3_CONFIG(29) maps to PLL_CONFIG_CTL(23) PLL3_CONFIG(28) maps to PLL_CONFIG_CTL(15)
27	EARLY_OUT_ENA	PLL3_CONFIG(27) : PLL_CONFIG_CTL(3) PLLOUT_LV_EARLY enable 0x0: Disable 0x1: Enable
26	CLK33_OUT_SEL	Not Used
25	CLK33_OUT_ENA	Not Used
24	OUT_SEL	Not Used
23	MAIN_OUT_ENA	PLL3_CONFIG(23) : PLL_CONFIG_CTL(0) PLLOUT_LV_MAIN enable 0x0: Disable 0x1: Enable
22	MN_ACCUM_ENA	PLL3_CONFIG(22) : PLL_CONFIG_CTL(14) PLL fractional mode control 0x0: Disable 0x1: Enable
21:20	PLLOUT_DIVIDE	PLL3_CONFIG(21:20) : PLL_CONFIG_CTL(8:7) PLL Post-divider control 0x0: Divide by 1 (use this setting when sending reference clock to output) 0x1: Divide by 2 0x2: Divide by 4 0x3: Invalid
19	PRE_DIVIDE	PLL3_CONFIG(19) : PLL_CONFIG_CTL(6) PLL pre-divider control 0x0: Divide by 1 0x1: Divide by 2
18	INTERNAL_BIT18	Not Used
17:16	VCO	PLL3_CONFIG(17) : PLL_CONFIG_CTL(9) VCO Selection PLL3_CONFIG(16) : Not Used 0x0: Select 100 - 500 MHz VCO 0x1: Select 400 - 1400 MHz VCO
15	INTERNAL_BIT15	Not Used
14:0	INTERNAL_BITS14_0	Not Used

0x0400034C MMSS_PLL3_TEST_CTL

Type: Write/Read
Clock: AHB_CLK
Reset State: 0x0

The PLL3_TEST_CTL register is used to enable the TEST, BIST and AUX outputs of PLL3 (SRPLL). The field descriptions show the mapping from 45nm NT wrapper PLL3_TEST_CTL register to SR PLL inputs, PLL_TEST_CTL and PLL_CONFIG_CTL.

MMSS_PLL3_TEST_CTL

Bits	Name	Description
31:19	RESERVED_BITS31_19	PLL3_TEST_CTL(31:30) maps to PLL_CONFIG_CTL(25:24) PLL3_TEST_CTL(29:28) maps to PLL_CONFIG_CTL(21:20) PLL3_TEST_CTL(27:26) maps to PLL_CONFIG_CTL(19:18) PLL3_TEST_CTL(25:24) maps to PLL_CONFIG_CTL(17:16) PLL3_TEST_CTL(23:22) maps to PLL_CONFIG_CTL(13:12) PLL3_TEST_CTL(21) maps to PLL_CONFIG_CTL(11) PLL3_TEST_CTL(20) maps to PLL_TEST_CTL(9) PLL3_TEST_CTL(19) : Not Used
18:17	INTERNAL_BITS18_17	PLL3_TEST_CTL(18:17) : Not Used
16	INTERNAL_BIT16	PLL3_TEST_CTL(16) : PLL_CONFIG_CTL(5) Output clock polarity 0x0: Do not invert output 0x1: Invert output
15	INTERNAL_BIT15	PLL3_TEST_CTL(15) : PLL_CONFIG_CTL(4) PLLOUT_LV_TEST enable 0x0: Disable 0x1: Enable
14	RESERVED_BIT14	PLL3_TEST_CTL(14) : Not used. See PLL3_L_VAL(14) that maps to PLL_TEST_CTL(14)
13	PLLOUT_BIST_ENABLE	PLL3_TEST_CTL(13) : PLL_CONFIG_CTL(2) PLLOUT_LV_BIST enable 0x0: Disable 0x1: Enable (must be enabled to use noise generator)

MMSS_PLL3_TEST_CTL (cont.)

Bits	Name	Description
12	PLLOUT_AUX_ENABLE	PLL3_TEST_CTL(12) : PLL_CONFIG_CTL(1) PLLOUT_LV_AUX enable 0x0: Disable 0x1: Enable

MMSS_PLL3_TEST_CTL (cont.)

Bits	Name	Description
11:0	INTERNAL_BITS11_0	PLL3_TEST_CTL(11) : Not Used PLL3_TEST_CTL(10) : PLL_TEST_CTL(8) Charge pump external bias control PLL3_TEST_CTL(9:8) : PLL_CONFIG_CTL(29:28) PFD force bits PLL3_TEST_CTL(9) = Force PFD up PLL3_TEST_CTL(8) = Force PFD down PLL3_TEST_CTL(7) : PLL_TEST_CTL(7) DTEST signal select PLL3_TEST_CTL(6) : PLL_TEST_CTL(6) ATEST amplifier bypass control PLL3_TEST_CTL(5:4) : PLL_TEST_CTL(5:4) ATEST1 signal select Force PLL filter voltage externally (set PLL_TEST_CTL(6) to 1) PLL3_TEST_CTL(3:2) : PLL_TEST_CTL(3:2) ATEST0 signal select PLL3_TEST_CTL(1) : PLL_TEST_CTL(1) ATEST1 Control PLL3_TEST_CTL(0) : PLL_TEST_CTL(0) ATEST0 Control 0x0: Disable 0x1: Enable 0x0: Normal operation_1 0x1: Force PFD UP -> 1 0x0: Normal operation_2 0x1: Force PFD DN -> 1 0x0: Select clock detect signal 0x1: Select feedback divider output signal 0x0: Do not bypass ATEST buffer amplifier 0x1: Bypass ATEST buffer amplifier 0x0: Observe Nwell reference (set PLL_TEST_CTL6 to 0) 0x1: Observe regulator output (set PLL_TEST_CTL6 to 0) 0x2: Observe PLL filter voltage (set PLL_TEST_CTL6 to 0) 0x3: Supply noise measurement mode 0x0: Provide external bias current to charge pump (set PLL_TEST_CTL8 to 1)

MMSS_PLL3_TEST_CTL (cont.)

Bits	Name	Description
11:0	INTERNAL_BITS11_0 (continued)	PLL3_TEST_CTL(11) : Not Used PLL3_TEST_CTL(10) : PLL_TEST_CTL(8) Charge pump external bias control PLL3_TEST_CTL(9:8) : PLL_CONFIG_CTL(29:28) PFD force bits PLL3_TEST_CTL(9) = Force PFD up PLL3_TEST_CTL(8) = Force PFD down PLL3_TEST_CTL(7) : PLL_TEST_CTL(7) DTEST signal select PLL3_TEST_CTL(6) : PLL_TEST_CTL(6) ATEST amplifier bypass control PLL3_TEST_CTL(5:4) : PLL_TEST_CTL(5:4) ATEST1 signal select Force PLL filter voltage externally (set PLL_TEST_CTL(6) to 1) PLL3_TEST_CTL(3:2) : PLL_TEST_CTL(3:2) ATEST0 signal select PLL3_TEST_CTL(1) : PLL_TEST_CTL(1) ATEST1 Control PLL3_TEST_CTL(0) : PLL_TEST_CTL(0) ATEST0 Control 0x0: Disable 0x1: Enable 0x0: Normal operation_1 0x1: Force PFD UP -> 1 0x0: Normal operation_2 0x1: Force PFD DN -> 1 0x0: Select clock detect signal 0x1: Select feedback divider output signal 0x0: Do not bypass ATEST buffer amplifier 0x1: Bypass ATEST buffer amplifier 0x0: Observe Nwell reference (set PLL_TEST_CTL6 to 0) 0x1: Observe regulator output (set PLL_TEST_CTL6 to 0) 0x2: Observe PLL filter voltage (set PLL_TEST_CTL6 to 0) 0x3: Supply noise measurement mode 0x0: Provide external bias current to charge pump (set PLL_TEST_CTL8 to 1)

0x04000350 MMSS_PLL3_STATUS

Type: Read Only
Clock: AHB_CLK
Reset State: 0x0

For backward compatibility, NT-PLL fields are maintained.

MMSS_PLL3_STATUS

Bits	Name	Description
31:16	RESERVED	Reserved bits
15:0	PLL_STATUS	This register contains signals from the PLL's STATUS port. It is used to observe various status values within the PLL.

14.3 MFC Registers (0x04400000 MFC_BASE)

14.3.1 MFC Software Reset Registers

0x04400000 A_MFC_SW_RESET

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x000003fe

Soft reset for each module in MFC

0: Reset

1: Release

RISC to Host Interrupt Register

A_MFC_SW_RESET

Bits	Name	Description
9	RSTN_RG_MPEG2	Soft reset for RG_MPEG2
8	RSTN_RG_MPEG4	Soft reset for RG_MPEG4
7	RSTN_RG_VC1	Soft reset for RG_VC1
6	RSTN_RG_H264	Soft reset for RG_H264
5	RSTN_RG_COMMON	Soft reset for RG_COMMON and RG_DECCOM
4	RSTN_DMX	Soft reset for DMX 0
3	RSTN_VI	Soft reset for VI
2	RSTN_MFCCORE	Soft reset for MFC core
1	RSTN_MC	Soft reset for MC
0	RSTN_RISC	Soft reset for RISC core

0x04400008 A_MFC_RISC_HOST_INT

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

This interrupt is asserted when RISC CPU writes a set of requests into a MFC_RISC_HOST_INT register and put "1" into Interrupt bit (bit0). Then host CPU checks the MFC_RISC_HOST_INT register and properly processes ISR (interrupt service routine) and clears the Interrupt bit (bit0).

Host2Risc command register

A_MFC_RISC_HOST_INT

Bits	Name	Description
0	INTERRUPT	0: Interrupt Clear 1: This register may become `1' by RISC in MFC.

0x04400030 A_MFC_HOST2RISC_COMMAND

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Host can send command to Risc using HOST2RISC Command register when open instance or close instance.

RISC2HOST Arg Registers

A_MFC_HOST2RISC_COMMAND

Bits	Name	Description
31:0	HOST2RISC_COMMAND	Host to Risc Command register. 0: Empty 1: Open Instance 2: Close Instance 3: System Init

0x04400034 A_MFC_HOST2RISC_ARG1

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

The first argument of the host command.

A_MFC_HOST2RISC_ARG1

Bits	Name	Description
31:0	HOST2RISC_ARG1	- When HOST2RISC_COMMAND is "open instance", HOST2RISC_ARG is Codec Type. <Codec Type> 0 H.264 Decoding 1 VC1 Advanced Profile Decoding 2 MPEG4 / DivX / XVid Decoding 3 MPEG1/MPEG2 Decoding 4 H.263 Decoding 5 VC1 Simple/Main Profile Decoding 6 DivX 3.11 Decoding 7

0x04400038 A_MFC_HOST2RISC_ARG2

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

The second argument of the host command.

A_MFC_HOST2RISC_ARG2

Bits	Name	Description
31:0	HOST2RISC_ARG2	Reserved register

0x0440003C A_MFC_HOST2RISC_ARG3

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

The third argument of the host command.

A_MFC_HOST2RISC_ARG3

Bits	Name	Description
31:0	HOST2RISC_ARG3	Reserved register

0x04400040 A_MFC_HOST2RISC_ARG4

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

The fourth argument of the host command.

RISC2HOST Command Registers

A_MFC_HOST2RISC_ARG4

Bits	Name	Description
31:0	HOST2RISC_ARG4	Reserved register

0x04400044 A_MFC_RISC2HOST_COMMAND

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Risc can respond to host using RISC2HOST command register when open instance or close instance.

RISC2HOST Arg Registers

A_MFC_RISC2HOST_COMMAND

Bits	Name	Description
31:0	RISC2HOST_COMMAND	0: Empty 1: OPEN_CH_RET 2 : CLOSE_CH_RET 3 : ERROR_RET 4 : SEQ_DONE_RET 5 : FRAME_DONE_RET 6

0x04400048 A_MFC_RISC2HOST_ARG1

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

This register is used with RISC2HOST command register.

A_MFC_RISC2HOST_ARG1

Bits	Name	Description
31:0	INSTANCE_ID	Instance ID

0x0440004C A_MFC_RISC2HOST_ARG2

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

The second argument of the host command.

A_MFC_RISC2HOST_ARG2

Bits	Name	Description
31:0	MFC_RISC2HOST_ARG2	Reserved register

0x04400050 A_MFC_RISC2HOST_ARG3

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

The third argument of the host command.

A_MFC_RISC2HOST_ARG3

Bits	Name	Description
31:0	MFC_RISC2HOST_ARG3	Reserved register

0x04400054 A_MFC_RISC2HOST_ARG4

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

The fourth argument of the host command.

Firmware Version Information Registers

A_MFC_RISC2HOST_ARG4

Bits	Name	Description
31:0	MFC_RISC2HOST_ARG4	Reserved register

0x04400058 A_MFC_FIRMWARE_VERSION

Type: Read
Clock: AHB_CLOCK
Reset State: 0x00000000

This register shows a version of Firmware.

Firmware Status Register

A_MFC_FIRMWARE_VERSION

Bits	Name	Description
23:16	YEAR	Year: 00
15:8	MONTH	Month: 1
7:0	DAY	Day: 1

0x04400080 A_MFC_FIRMWARE_STATUS

Type: Read
Clock: AHB_CLOCK
Reset State: 0x00000000

Firmware status for a stream.

Number of Master Port Register

A_MFC_FIRMWARE_STATUS

Bits	Name	Description
0	FIRMWARE_STATUS	0: Not Ready 1: Ready

0x04400B14 A_MFC_NUM_MASTER

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Number of used masters

Channel A DRAM Base Address Register

A_MFC_NUM_MASTER

Bits	Name	Description
0	MFC_NUM_MASTER	Number of used master 0: One master 1: Two masters

0x04400508 A_MFC_MC_DRAMBASE_ADDR_A

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xD3000000

DRAM base address which indicates the base address of total memory map of MFC IP.

Channel B DRAM Base Address Register

A_MFC_MC_DRAMBASE_ADDR_A

Bits	Name	Description
31:17	MC_DRAMBASE_ADDR	DRAM base address (in 128 kBytes boundary) This must be aligned by 128KByte. MFC's access range is from DRAMBASE_ADDR_A to DRAMBASE_ADDR_A + 256MByte through Port_A

0x0440050C A_MFC_MC_DRAMBASE_ADDR_B

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x23000000

DRAM base address which indicates the base address of total memory map of MFC IP.

MC (Memory Controller) Status Register

A_MFC_MC_DRAMBASE_ADDR_B

Bits	Name	Description
31:17	MC_DRAMBASE_ADDR	DRAM base address (in 128 kBytes boundary) This must be aligned by 128KByte. MFC's access range is from DRAMBASE_ADDR_A to DRAMBASE_ADDR_B + 256MByte through Port_B

0x04400510 A_MFC_MC_STATUS

Type: Read
Clock: AHB_CLOCK
Reset State: 0x0000000X

Bus Arbiter's status. This register can be used to check whether Bus is busy or not before resetting MFC IP.

RISC Instruction Base Selection Register

A_MFC_MC_STATUS

Bits	Name	Description
1	MC_BUSY_B	Busy at Channel B 1: busy 0: idle
0	MC_BUSY_A	Busy at Channel A 1: busy 0: idle

0x04400514 A_MFC_MC_RS_IBASE

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_MC_RS_IBASE

Bits	Name	Description
0	MC_RS_IBASE	0: Channel A 1: Channel B

0x04400604 A_MFC_COMMON_BASE_ADDR_1

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_1

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400608 A_MFC_COMMON_BASE_ADDR_2

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_2

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440060C A_MFC_COMMON_BASE_ADDR_3

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_3

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400610 A_MFC_COMMON_BASE_ADDR_4

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_4

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400614 A_MFC_COMMON_BASE_ADDR_5

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_5

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400618 A_MFC_COMMON_BASE_ADDR_6

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_6

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440061C A_MFC_COMMON_BASE_ADDR_7

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_7

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400620 A_MFC_COMMON_BASE_ADDR_8

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_8

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400624 A_MFC_COMMON_BASE_ADDR_9

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_9

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400628 A_MFC_COMMON_BASE_ADDR_10

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_10

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440062C A_MFC_COMMON_BASE_ADDR_11

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_11

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400630 A_MFC_COMMON_BASE_ADDR_12

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_12

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400634 A_MFC_COMMON_BASE_ADDR_13

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_13

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400638 A_MFC_COMMON_BASE_ADDR_14

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_14

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440063C A_MFC_COMMON_BASE_ADDR_15

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_15

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400640 A_MFC_COMMON_BASE_ADDR_16

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_16

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400644 A_MFC_COMMON_BASE_ADDR_17

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_17

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400648 A_MFC_COMMON_BASE_ADDR_18

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_18

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440064C A_MFC_COMMON_BASE_ADDR_19

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_19

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400650 A_MFC_COMMON_BASE_ADDR_20

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_20

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400654 A_MFC_COMMON_BASE_ADDR_21

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_21

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400658 A_MFC_COMMON_BASE_ADDR_22

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_22

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440065C A_MFC_COMMON_BASE_ADDR_23

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_23

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400660 A_MFC_COMMON_BASE_ADDR_24

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_24

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400664 A_MFC_COMMON_BASE_ADDR_25

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_25

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400668 A_MFC_COMMON_BASE_ADDR_26

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_26

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440066C A_MFC_COMMON_BASE_ADDR_27

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_27

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400670 A_MFC_COMMON_BASE_ADDR_28

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_28

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400674 A_MFC_COMMON_BASE_ADDR_29

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_29

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400678 A_MFC_COMMON_BASE_ADDR_30

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_30

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440067C A_MFC_COMMON_BASE_ADDR_31

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_31

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400680 A_MFC_COMMON_BASE_ADDR_32

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_32

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400684 A_MFC_COMMON_BASE_ADDR_33

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_33

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400688 A_MFC_COMMON_BASE_ADDR_34

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_34

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440068C A_MFC_COMMON_BASE_ADDR_35

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_35

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400690 A_MFC_COMMON_BASE_ADDR_36

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_36

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400694 A_MFC_COMMON_BASE_ADDR_37

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_37

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400698 A_MFC_COMMON_BASE_ADDR_38

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_38

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440069C A_MFC_COMMON_BASE_ADDR_39

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_39

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006A0 A_MFC_COMMON_BASE_ADDR_40

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_40

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006A4 A_MFC_COMMON_BASE_ADDR_41

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_41

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006A8 A_MFC_COMMON_BASE_ADDR_42

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_42

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006AC A_MFC_COMMON_BASE_ADDR_43

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_43

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006B0 A_MFC_COMMON_BASE_ADDR_44

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_44

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006B4 A_MFC_COMMON_BASE_ADDR_45

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_45

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006B8 A_MFC_COMMON_BASE_ADDR_46

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_46

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006BC A_MFC_COMMON_BASE_ADDR_47

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_47

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006C0 A_MFC_COMMON_BASE_ADDR_48

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_48

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006C4 A_MFC_COMMON_BASE_ADDR_49

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_49

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006C8 A_MFC_COMMON_BASE_ADDR_50

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_50

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006CC A_MFC_COMMON_BASE_ADDR_51

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_51

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006D0 A_MFC_COMMON_BASE_ADDR_52

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_52

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006D4 A_MFC_COMMON_BASE_ADDR_53

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_53

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006D8 A_MFC_COMMON_BASE_ADDR_54

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_54

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006DC A_MFC_COMMON_BASE_ADDR_55

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_55

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006E0 A_MFC_COMMON_BASE_ADDR_56

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_56

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006E4 A_MFC_COMMON_BASE_ADDR_57

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_57

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006E8 A_MFC_COMMON_BASE_ADDR_58

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_58

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006EC A_MFC_COMMON_BASE_ADDR_59

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_59

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006F0 A_MFC_COMMON_BASE_ADDR_60

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_60

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006F4 A_MFC_COMMON_BASE_ADDR_61

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_61

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006F8 A_MFC_COMMON_BASE_ADDR_62

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_62

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044006FC A_MFC_COMMON_BASE_ADDR_63

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

For Port_B : Common Base Registers 64 - 127

A_MFC_COMMON_BASE_ADDR_63

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400700 A_MFC_COMMON_BASE_ADDR_64

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_64

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400704 A_MFC_COMMON_BASE_ADDR_65

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_65

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400708 A_MFC_COMMON_BASE_ADDR_66

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_66

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440070C A_MFC_COMMON_BASE_ADDR_67

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_67

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400710 A_MFC_COMMON_BASE_ADDR_68

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_68

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400714 A_MFC_COMMON_BASE_ADDR_69

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_69

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400718 A_MFC_COMMON_BASE_ADDR_70

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_70

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440071C A_MFC_COMMON_BASE_ADDR_71

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_71

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400720 A_MFC_COMMON_BASE_ADDR_72

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_72

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400724 A_MFC_COMMON_BASE_ADDR_73

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_73

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400728 A_MFC_COMMON_BASE_ADDR_74

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_74

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440072C A_MFC_COMMON_BASE_ADDR_75

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_75

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400730 A_MFC_COMMON_BASE_ADDR_76

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_76

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400734 A_MFC_COMMON_BASE_ADDR_77

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_77

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400738 A_MFC_COMMON_BASE_ADDR_78

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_78

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440073C A_MFC_COMMON_BASE_ADDR_79

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_79

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400740 A_MFC_COMMON_BASE_ADDR_80

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_80

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400744 A_MFC_COMMON_BASE_ADDR_81

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_81

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400748 A_MFC_COMMON_BASE_ADDR_82

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_82

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x0440074C A_MFC_COMMON_BASE_ADDR_83

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_83

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400750 A_MFC_COMMON_BASE_ADDR_84

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_84

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400754 A_MFC_COMMON_BASE_ADDR_85

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_85

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400758 A_MFC_COMMON_BASE_ADDR_86

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

A_MFC_COMMON_BASE_ADDR_86

A_MFC_COMMON_BASE_ADDR_126

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x044007FC A_MFC_COMMON_BASE_ADDR_127

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0xXXXXXXXX

Picture Width in Pixel Register

A_MFC_COMMON_BASE_ADDR_127

Bits	Name	Description
16:0	BASE_ADDR	Codec common memory region start address

0x04400818 A_MFC_HSIZE_PX

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Frame width at encoder.

Picture Height in Pixel Register

A_MFC_HSIZE_PX

Bits	Name	Description
12:0	FRAME_WIDTH	Coded width of frame

0x0440081C A_MFC_MC_VSIZE_PX

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Indicate height size of Picture. In interlaced-field coding mode, FRAME_HEIGHT is coded height of field. In progressive or interlaced-frame coding mode, FRAME_HEIGHT is coded height of frame at encoder.

Profile Register

A_MFC_MC_VSIZE_PX

Bits	Name	Description
12:0	FRAME_HEIGHT	Coded height of frame (field or frame)

0x04400830 A_MFC_PROFILE

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Profile and Version Control at encoder only.

Picture Structure Register

A_MFC_PROFILE

Bits	Name	Description
15:8	LEVEL	Level control register Ex) 3.1 = 8'd31

A_MFC_PROFILE (cont.)

Bits	Name	Description
5:0	PROFILE	<MPEG4> [5:4] standard selection control 0: MPEG-4 1: DivX 2: H.263, MP4 short header 3: Reserved When [5:4] == 2'd0 (MPEG-4) [0] MPEG4_PROFILE 0: Simple Profile 1: Advanced Simple Profile <H.264> [4] 8x8 enable flag (don't-care for encoding) [3:2] Chroma IDC (1 for encoding) [1: 0] profile 0: Main profile 1: High profile 2 : Baseline profile Other bits must set to be 0.

0x0440083C A_MFC_PICTURE_STRUCT

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Picture Field/Frame flag register. This register is used at encoder only.

Loop Filter Control Register

A_MFC_PICTURE_STRUCT

Bits	Name	Description
0	FIELD	<H.264, VC-1, MPEG-2> 0: Frame picture 1: Field picture <MPEG-4> 0: Frame picture only

0x04400848 A_MFC_LF_CONTROL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

This register is used at encoder only.

H.264 Loop Filter Alpha Offset Register

A_MFC_LF_CONTROL

Bits	Name	Description
1:0	LF_CONTROL	<H.264> [1:0] Loop Filter Disable Indicator from bitstream <MPEG-4> [1] Reserved [0] DF enable 1: Enable 0: Disable

0x0440084C A_MFC_LF_ALPHA_OFF

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Loop Filter Alpha Offset. This register is used at encoder only.

H.264 Loop Filter Beta Offset Register

A_MFC_LF_ALPHA_OFF

Bits	Name	Description
4:0	LF_ALPHAS_OFF	Loop filter alpha offset from bitstream

0x04400850 A_MFC_LF_BETA_OFF

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Loop Filter Beta Offset. This register is used at encoder only.

Pixel Cache Control Register

A_MFC_LF_BETA_OFF

Bits	Name	Description
4:0	LF_BETA_OFF	Loop filter beta offset from bitstream

0x04400A00 A_MFC_PIXEL_CACHE_CTRL0

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Pixel cache control register 0.

Auxiliary Host Command Base Register for Channel 0

A_MFC_PIXEL_CACHE_CTRL0

Bits	Name	Description
0	PIXEL_CACHE_EN	Pixel cache on/off 1: cache on 0: cache off This value can be changed at every frame decoding.

0x04400B18 A_MFC_CH0_HOST_WR_ADR

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

points to a space of shared memory consisting of multiple commands which host can write for channel 0.

Auxiliary RISC Response Base Register for Channel 0

A_MFC_CH0_HOST_WR_ADR

Bits	Name	Description
31:0	MFC_CH0_HOST_WR_ADR	Host set address register for writing command at channel 0. The address points to a space of shared memory consisting of multiple commands which host can write. The detailed structure of the shared memory is to be defined.

0x04400B1C A_MFC_CH0_HOST_RD_ADR

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Points to a space of shared memory consisting of multiple responses which host can read for channel 0.

Auxiliary Host Command Base Register for Channel 1

A_MFC_CH0_HOST_RD_ADR

Bits	Name	Description
31:0	MFC_CH0_HOST_RD_ADR	Host set address register for reading response at channel 0. The address points to a space of shared memory consisting of multiple responses which host can read. The detailed structure of the shared memory is to be defined.

0x04400B20 A_MFC_CH1_HOST_WR_ADR

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Points to a space of shared memory consisting of multiple commands which host can write for channel 1.

Auxiliary RISC Response Base Register for Channel 1

A_MFC_CH1_HOST_WR_ADR

Bits	Name	Description
31:0	MFC_CH1_HOST_WR_ADR	Host set address register for writing command at channel 1. The address points to a space of shared memory consisting of multiple commands which host can write. The detailed structure of the shared memory is to be defined.

0x04400B24 A_MFC_CH1_HOST_RD_ADR

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Points to a space of shared memory consisting of multiple responses which host can read for channel 1.

QP Plane Address Register

A_MFC_CH1_HOST_RD_ADR

Bits	Name	Description
31:0	MFC_CH1_HOST_RD_ADR	Host set address register for reading response at channel 1. The address points to a space of shared memory consisting of multiple responses which host can read. The detailed structure of the shared memory is to be defined.

0x04400C30 A_MFC_QP_OFFSEET

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Offset from DPB start at decoder. 1 unit = 64 bit

QP Save Feature Enable Register

A_MFC_QP_OFFSEET

Bits	Name	Description
31:0	MFC_QP_OFFSET	When MFC_QP_OUT_EN is `1', Luma DPB have to include area for QP's information. In this case, QP's information will be written from DPB + MFC_QP_OFFSET.

0x04400C34 A_MFC_QP_OUT_EN

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

QP save enable at decoder

If "MFC_QP_OUT_EN" is 1, Quantization value of each MB will be written in DPB area. Its address is calculated followings:

x_pos = [0...(img_hsize_mb-1)];

y_pos = frame ’ [0...(img_vsize_mb-1)] :

top ’ [0, 2, 4 ...(img_vsize_mb*2-2)] :

[1, 3, 5 ...(img_vsize_mb*2-1)] ;

< I_XSIZE >

if (img_hsize_mb < 64) I_XSIZE = 64

else if ((img_hsize_mb & 0x3f)!=0) I_XSIZE = ((img_hsize_mb>>6)<<6) + 64

```
    else I_XSIZE = img_hsize_mb
< I_XSIZE >
    if (frame) begin
    if(img_vsize_mb < 32) I_YSIZE = 32
    else if((img_vsize_mb & 0x1f)!=0) I_YSIZE = ((img_vsize_mb>>5)<<5) + 32 + 32
    else I_YSIZE = img_vsize_mb + 32
    end
    else begin
    if(img_vsize_mb < 16) I_YSIZE = 32
    else if((img_vsize_mb & 0x1f)!=0) I_YSIZE = ((img_vsize_mb>>4)<<5) + 32 + 32
    else I_YSIZE = (img_vsize_mb<<1) + 32
    end
pixel_x_m1 = I_XSIZE -1 ;
pixel_y_m1 = I_YSIZE -1 ;
roundup_x = ((pixel_x_m1)/16/8 + 1) ;
roundup_y = ((pixel_x_m1)/16/4 + 1) ;
x_addr = x_pos/4;
linear_addr0 = (((y_pos & 0x1f) <<4) |(x_addr & 0xf ) ) << 2 ;
linear_addr1 = (((y_pos >> 6) & 0xff) * roundup_x + ((x_addr >> 5) & 0x7f)) ;
    if( ((x_addr >> 5) & 0x1) == ((y_pos >> 5) & 0x1))
    bank_addr = ((x_addr >> 4) & 0x1);
    else
    bank_addr = 0x2 | ((x_addr >> 4) & 0x1);
physical_addr = DRAM_BASE + DPB_OFFSET + QP_OFFSET +
    (linear_addr1 <<13) | (bank_addr << 11)| linear_addr0 ;
qp_save_range = (pixel_y_minus[5]==0) ' pixel_y_minus[14:6] * roundup_x +
pixel_x_minus[14:8] +1:
    roundup_x * roundup_y;
```

Channel and Stream Interface Registers

There are two channel sets to communicate between host and MFC V5. Each channel 0 / 1 has two kind of registers. One is for response from MFC V5 like as MFC_SI_RTN_CHID and 15 numbers of MFC_COMMON_SI_RG. The other is for command from Host like as MFC_SI_CH_INST_ID and 15 numbers of MFC_COMMON_CH_RG.

Return CH0 Instance ID Register

A_MFC_QP_OUT_EN

Bits	Name	Description
0	MFC_QP_OUT_EN	0: QP out disable 1: QP out enable

0x04402000 A_MFC_SI_RTN_CHID

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Common SI Register 1-15

A_MFC_SI_RTN_CHID

Bits	Name	Description
31:0	RTN_CHID	Return Channel Instance ID which is used to identify which Channel's operation is done

0x04402008 A_MFC_COMMON_SI_RG_2

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_2

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_2	Return MFC's status after processing.

0x0440200C A_MFC_COMMON_SI_RG_3

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_3

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_3	Return MFC's status after processing.

0x04402010 A_MFC_COMMON_SI_RG_4

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_4

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_4	Return MFC's status after processing.

0x04402014 A_MFC_COMMON_SI_RG_5

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_5

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_5	Return MFC's status after processing.

0x04402018 A_MFC_COMMON_SI_RG_6

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_6

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_6	Return MFC's status after processing.

0x0440201C A_MFC_COMMON_SI_RG_7

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_7

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_7	Return MFC's status after processing.

0x04402020 A_MFC_COMMON_SI_RG_8

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_8

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_8	Return MFC's status after processing.

0x04402024 A_MFC_COMMON_SI_RG_9

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_9

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_9	Return MFC's status after processing.

0x04402028 A_MFC_COMMON_SI_RG_10

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_10

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_10	Return MFC's status after processing.

0x0440202C A_MFC_COMMON_SI_RG_11

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_11

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_11	Return MFC's status after processing.

0x04402030 A_MFC_COMMON_SI_RG_12

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_12

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_12	Return MFC's status after processing.

0x04402034 A_MFC_COMMON_SI_RG_13

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_13

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_13	Return MFC's status after processing.

0x04402038 A_MFC_COMMON_SI_RG_14

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_SI_RG_14

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_14	Return MFC's status after processing.

0x0440203C A_MFC_COMMON_SI_RG_15

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

NOTE The registers from 0x2040 to 0x207C have the same functionality as those from 0x2080 to 0x20BC. The registers from 0x2040 to 0x207C are used for channel 0 and those from 0x2080 to 0x20BC are for channel 1. They are used by both encoder and decoder with different meanings.

CH0 Instance ID Register

A_MFC_COMMON_SI_RG_15

Bits	Name	Description
31:0	MFC_COMMON_SI_RG_15	Return MFC's status after processing.

0x04402040 A_MFC_SI_CH0_INST_ID

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Common CH0 Register 1-15

A_MFC_SI_CH0_INST_ID

Bits	Name	Description
17:16	CH_DEC_TYPE	CH0 decoding control [1:0] 1: Sequence Header Decoding 2 : Frame Decoding/Encoding 3 : Last Frame Decoding/Encoding
15:0	CH_INST_ID	Instance ID for Codec

0x04402044 A_MFC_COMMON_CH0_RG_1

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_1

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_1	Set the value of MFC processing

0x04402048 A_MFC_COMMON_CH0_RG_2

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_2

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_2	Set the value of MFC processing

0x0440204C A_MFC_COMMON_CH0_RG_3

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_3

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_3	Set the value of MFC processing

0x04402050 A_MFC_COMMON_CH0_RG_4

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_4

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_4	Set the value of MFC processing

0x04402054 A_MFC_COMMON_CH0_RG_5

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_5

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_5	Set the value of MFC processing

0x04402058 A_MFC_COMMON_CH0_RG_6

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_6

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_6	Set the value of MFC processing

0x0440205C A_MFC_COMMON_CH0_RG_7

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_7

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_7	Set the value of MFC processing

0x04402060 A_MFC_COMMON_CH0_RG_8

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_8

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_8	Set the value of MFC processing

0x04402064 A_MFC_COMMON_CH0_RG_9

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_9

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_9	Set the value of MFC processing

0x04402068 A_MFC_COMMON_CH0_RG_10

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_10

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_10	Set the value of MFC processing

0x0440206C A_MFC_COMMON_CH0_RG_11

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_11

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_11	Set the value of MFC processing

0x04402070 A_MFC_COMMON_CH0_RG_12

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_12

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_12	Set the value of MFC processing

0x04402074 A_MFC_COMMON_CH0_RG_13

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_13

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_13	Set the value of MFC processing

0x04402078 A_MFC_COMMON_CH0_RG_14

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH0_RG_14

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_15	Set the value of MFC processing

0x0440207C A_MFC_COMMON_CH0_RG_15

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

CH1 Instance ID Register

A_MFC_COMMON_CH0_RG_15

Bits	Name	Description
31:0	MFC_COMMON_CH0_RG_15	Set the value of MFC processing

0x04402080 A_MFC_SI_CH1_INST_ID

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Common SI Register 1 - 15 CH 1

A_MFC_SI_CH1_INST_ID

Bits	Name	Description
17:16	CH_DEC_TYPE	CH1 decoding control [1:0] 1: Sequence Header Decoding 2 : Frame Decoding/Encoding 3 : Last Frame Decoding/Encoding
15:0	CH_INST_ID	Instance ID for Codec

0x04402088 A_MFC_COMMON_CH1_RG_2

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_2

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_2	Return MFC's status after processing.

0x0440208C A_MFC_COMMON_CH1_RG_3

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_3

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_3	Return MFC's status after processing.

0x04402090 A_MFC_COMMON_CH1_RG_4

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_4

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_4	Return MFC's status after processing.

0x04402094 A_MFC_COMMON_CH1_RG_5

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_5

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_5	Return MFC's status after processing.

0x04402098 A_MFC_COMMON_CH1_RG_6

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_6

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_6	Return MFC's status after processing.

0x0440209C A_MFC_COMMON_CH1_RG_7

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_7

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_7	Return MFC's status after processing.

0x044020A0 A_MFC_COMMON_CH1_RG_8

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_8

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_8	Return MFC's status after processing.

0x044020A4 A_MFC_COMMON_CH1_RG_9

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_9

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_9	Return MFC's status after processing.

0x044020A8 A_MFC_COMMON_CH1_RG_10

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_10

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_10	Return MFC's status after processing.

0x044020AC A_MFC_COMMON_CH1_RG_11

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_11

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_11	Return MFC's status after processing.

0x044020B0 A_MFC_COMMON_CH1_RG_12

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_12

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_12	Return MFC's status after processing.

0x044020B4 A_MFC_COMMON_CH1_RG_13

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_13

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_13	Return MFC's status after processing.

0x044020B8 A_MFC_COMMON_CH1_RG_14

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

A_MFC_COMMON_CH1_RG_14

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_14	Return MFC's status after processing.

0x044020BC A_MFC_COMMON_CH1_RG_15

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

NOTE The registers from 0x2040 to 0x207C have the same functionality as those from 0x20C0 to 0x20FC. The registers from 0x2040 to 0x207C are used for channel 0 and those from 0x20C0 to 0x20FC are for channel 1.

Encoded Data Formatter Unit Registers

Upper Stream Buffer Full Register

A_MFC_COMMON_CH1_RG_15

Bits	Name	Description
31:0	MFC_COMMON_CH1_RG_15	Return MFC's status after processing.

0x0440C004 A_STR_BF_U_FULL_0

Type: Read
Clock: AHB_CLOCK
Reset State: 0x00000000

Upper Stream Buffer Empty Register

A_STR_BF_U_FULL_0

Bits	Name	Description
0	BUFFER_U_FULL_L	Stream buffer status register - EDFU indicates upper buffer full status to external host. (1 = full)

0x0440C008 A_STR_BF_U_EMPTY_0

Type: Write
Clock: AHB_CLOCK
Reset State: 0x00000000

(Auto clear register)

Lower Stream Buffer Full Register.

A_STR_BF_U_EMPTY_0

Bits	Name	Description
0	BUFFER_U_EMPTY	Upper stream buffer clear register. The host should clear the buffer after it read data in the buffer.

0x0440C00C A_STR_BF_L_FULL_0

Type: Read
Clock: AHB_CLOCK
Reset State: 0x00000000

Lower Stream Buffer Empty Register

A_STR_BF_L_FULL_0

Bits	Name	Description
0	BUFFER_L_FULL_L	Stream buffer status register - EDFU indicates lower buffer full status to external host. (1 = full)

0x0440C010 A_STR_BF_L_EMPTY_0

Type: Write
Clock: AHB_CLOCK
Reset State: 0x00000000

(Auto clear register)

EDFU Status Register

A_STR_BF_L_EMPTY_0

Bits	Name	Description
0	BUFFER_L_EMPTY	Lower stream buffer clear register. The host should clear the buffer after it read data in the buffer.

0x0440C018 A_STR_BF_STATUS

Type: Read
Clock: AHB_CLOCK
Reset State: 0x00000000

(Auto clear register)

EDFU Stream Control Register

A_STR_BF_STATUS

Bits	Name	Description
8	ACTIVE_BUFFER	1: lower buffer 0: upper buffer

A_STR_BF_STATUS (cont.)

Bits	Name	Description
4	ENC_INT4	Encoding is done (including flashing out the bit-stream FIFO)
3	ENC_INT3	Both upper and lower buffers are full. The upper buffer must be read first.
2	ENC_INT2	Lower buffer is full.
1	ENC_INT1	Both upper and lower buffers are full. The lower buffer must be read first.
0	ENC_INT0	Upper buffer is full.

0x0440C054 A_EDFU_SF_EPB_ON_CTL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

EDFU control register

A_EDFU_SF_EPB_ON_CTL

Bits	Name	Description
1	STEAM_ENDIAN	0: Little-endian 1 : Big-endian
0	EPB_ON_CTRL	Insert EPB byte count value per frame. Valid at H.264 only 0: Automatically EPB insertion off 1 : Automatically EPB insertion on

0x0440C058 A_EDFU_SF_BUF_CTRL

Type: Write
Clock: AHB_CLOCK
Reset State: 0x00000000

(Auto clear register)

Stream Buffer Mode Control Register at Encoding

A_EDFU_SF_BUF_CTRL

Bits	Name	Description
2	EDFU_MC_INIT	1: Init EDFU_MC module
1	BUF_RESET	1: Buffer reset command 0: Normal operation

A_EDFU_SF_BUF_CTRL (cont.)

Bits	Name	Description
0	BUF_FLUSH	1: Buffer flush command 0: Normal operation

0x0440C05C A_STR_BF_MODE_CTRL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

EDFU fifo level control register

Picture Type Control Register

A_STR_BF_MODE_CTRL

Bits	Name	Description
0	STR_BF_MODE_CTRL	1: Stream buffer frame mode 0: Stream buffer double buffer mode.

0x0440C504 A_ENC_PIC_TYPE_CTRL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

. Used for H.264 encoder.

B-Picture Recon Picture Writing Control Register

A_ENC_PIC_TYPE_CTRL

Bits	Name	Description
18	ENC_PIC_TYPE_USE	1: Use ENC_PIC_TYPE_CTRL [17:0] register value for picture type setting 0: Use 0x083C (MFC_PICTURE_TYPE register)
17:16	B_FRM_CTRL	The number of B-code. 2'h0 : The number of B-code is zero. 2'h1 : The number of B-code is one. 2'h2 : The number of B-code is two. 2'h3 : Reserved.

A_ENC_PIC_TYPE_CTRL (cont.)

Bits	Name	Description
15:0	I_FRM_CTRL	16'h0 : all sequence is P frame 16'h1 : all sequence is I frame 16'h2 : I - P - I - P 16'h3 : I - P - P - I

0x0440C508 A_ENC_B_RECON_WRITE_ON

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

B-frame reconstructed data write control register (Default : 0. This is for just debugging. If you want this register to be `1', add this area in memory map.)

Multi-slice control register

A_ENC_B_RECON_WRITE_ON

Bits	Name	Description
0	B_RECON_ON	0: Disable recon data write at B-frame 1: Enable recon data write at B-frame

0x0440C50C A_ENC_MSLICE_CTR

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Macroblock Number of Multi-slice Setting Register

A_ENC_MSLICE_CTR

Bits	Name	Description
2:1	MSLICE_MODE	0: Multi slicing is done by MB count 1: Multi slicing is done by byte count
0	MSLICE_ENA	0: One slice per frame 1: Enable of resync marker or multi slice.

0x0440C510 A_ENC_MSLICE_MB

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

One slice size setting register when multi-slice is enabled. Fixed macroblock number of multi-slice setting register.

Byte Number of Multi-slice Setting Register

A_ENC_MSLICE_MB

Bits	Name	Description
15:0	MSLICE_MB	The number of macroblock in one slice when MSLICE_MODE = 0 and MSLICE_ENA = 1.

0x0440C514 A_ENC_MSLICE_BYTE

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

One slice size setting register when multi-slice is enabled. Byte count number of multi-slice setting register.

Circular Intra refresh macroblock setting register

A_ENC_MSLICE_BYTE

Bits	Name	Description
31:0	MSLICE_BYTE	The number of byte count in one slice when MSLICE_MODE = 1 and MSLICE_ENA = 1.

0x0440C518 A_ENC_CIR_CTRL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Intra refresh macroblock setting register

Memory Structure of Current Frame Settuing Register

A_ENC_CIR_CTRL

Bits	Name	Description
15:0	CIR_NUM	Number of intra-refresh macroblock.

0x0440C51C A_ENC_MAP_FOR_CUR

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Memory structure setting register of current frame.

Padding Value Control Register

A_ENC_MAP_FOR_CUR

Bits	Name	Description
1:0	ENC_MAP_FOR_CUR	Memory structure of macroblock 0: Linear mode. 3 : 64x32 tiled mode

0x0440C520 A_ENC_PADDING_CTRL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Padding Control Register.

Encoder Interrupt Status Register

A_ENC_PADDING_CTRL

Bits	Name	Description
31	PAD_CTRL_ON	0: Use boundary pixel for current image padding in case that its image size is not multiple by 16. 1: Use this register's value for current image padding
23:16	CR_PAD_VAL	Value for original CR image's padding when PAD_CTRL_ON is 1.
15:8	CB_PAD_VAL	Value for original CB image's padding when PAD_CTRL_ON is 1.
7:0	LUMA_PAD_VAL	Value for original LUMA image's padding when PAD_CTRL_ON is 1.

0x0440C524 A_ENC_INT_STATUS

Type: Read
Clock: AHB_CLOCK
Reset State: 0x00000000

Interrupt status register at encoder

Encoder Interrupt Mask Register

A_ENC_INT_STATUS

Bits	Name	Description
4	ENT_INT4	Stream data writes done to external memory
3	ENT_INT3	End of lower buffer writing and waiting for empty status of upper buffer.
2	ENT_INT2	End of lower buffer writing and continue to upper buffer area.
1	ENT_INT1	End of upper buffer writing and waiting for empty status of lower buffer.
0	ENT_INT0	End of upper buffer writing and continue to lower buffer area.

0x0440C528 A_ENC_INT_MASK

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Interrupt Bit Mask Register - When bit value is 1, interrupt will be generated.

Encoder Intra Mode Bias Register

A_ENC_INT_MASK

Bits	Name	Description
4	ENT_INT4	1: enable ENC_INT4 0: disable ENC_INT4
3	ENT_INT3	1: enable ENC_INT3 0: disable ENC_INT3
2	ENT_INT2	1: enable ENC_INT2 0: disable ENC_INT2
1	ENT_INT1	1: enable ENC_INT1 0: disable ENC_INT1
0	ENT_INT0	1: enable ENC_INT0 0: disable ENC_INT0

0x0440C588 A_ENC_COMMON_INTRA_BIAS

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Intra mode bias register for the macro block mode decision.

Encoder Bi-Directional Mode Bias Register

A_ENC_COMMON_INTRA_BIAS

Bits	Name	Description
15:0	ENC_COMMON_INTRA_BIAS	This register is used in favor of the intra mode in the weigjhted macro block mode decision.

0x0440C58C A_ENC_COMMON_BI_DIRECT_BIAS

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Bi-directional mode bias register for the macro block mode decision.

Encoder Reference Frame Number Register

A_ENC_COMMON_BI_DIRECT_BIAS

Bits	Name	Description
15:0	ENC_COMMON_BI_DIRECT_BIAS	This register is used against the bi-directional mode in the weighted macro block mode decision.

0x0440C530 A_ENC_REF_NUM_SEL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Number of reference frame for encoding control register. Maximum 2 reference frame is supported.

Rate Control Configuration Register

A_ENC_REF_NUM_SEL

Bits	Name	Description
0	REF_NUM_SEL	0: 1 reference frame 1: 2 reference frame

0x0440C5A0 A_ENC_RC_CONFIG

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Configuration of Rate Control block.

RC Frame Rate Register

A_ENC_RC_CONFIG

Bits	Name	Description
9	FR_RC_EN	Frame level rate control enable 0: Disable Frame level rate control by F/W 1: Enable Frame level rate control by F/W
8	MB_RC_EN	Macroblock level rate control enable 0: Disable MB level rate control by H/W 1: Enable MB level rate control by H/W
5:0	FRAME_QP	Frame QP (quantization parameter) is used for the QP of the first macroblock in a frame. This value is in the range of 0 to 51. The QP of the next macroblocks can be changed as the following table according to the value of FR_RC_EN and MB_RC_EN. Case BIT[9:8] 2'b00 : Constant QP is applied to all macroblocks. 2'b01 : The QP of the next macroblocks can vary with macroblock adaptive scaling. 2'b10 : The QP of the next macroblocks can be changed by the difference between the numbers of target bit and generated bit during the encoding a picture. But macroblock adaptive scaling is not applied. 2'b11 : The QP of the next macroblocks can be changed by the difference between the numbers of target bit and generated bit during the encoding a picture. It also can vary with macroblock adaptive scaling.

0x0440C5A4 A_RC_FRAME_RATE

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Frame rate for the frame level RC.

RC Bit Rate Register

A_RC_FRAME_RATE

Bits	Name	Description
7:0	FRAME_RATE	Frames per second. `0' is forbidden. Valid only when Frame level RC is enabled.

0x0440C5A8 A_RC_BIT_RATE

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Frame rate for the frame level RC.

RC Quantizer Parameter Boundary Register

A_RC_BIT_RATE

Bits	Name	Description
7:0	BIT_RATE	Bits per second. `0' is forbidden. Valid only when Frame level RC is enabled.

0x0440C5AC A_RC_QBOUND

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Maximum and minimum value of the quantization parameter.

Reaction Coefficient Register

A_RC_QBOUND

Bits	Name	Description
13:8	MAX_QP	Maximum quantization parameter.

A_RC_QBOUND (cont.)

Bits	Name	Description
7:0	MIN_QP	Minimum quantization parameter.

0x0440C5B0 A_RC_RPARA

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Rate control reaction coefficient.

Macroblock Level Rate Control Register

A_RC_RPARA

Bits	Name	Description
15:0	REACT_PARA	Rate control reaction coefficient. `0' is forbidden. Notes: - Valid only when the Frame level RC is enabled. - For tight CBR, this field must be small. (ex. 2

0x0440C5B4 A_RC_MB_CTRL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Control the macroblock adaptive scaling features.

NOTE Valid only when the Macroblock level RC is enabled.

Internal Reference Quantization Scale Register

A_RC_MB_CTRL

Bits	Name	Description
3	DARK_DISABLE	Disable Dark Region Adaptive feature. 0: Enable Dark Region Adaptive feature. QP of dark MB may not be smaller than frame QP although it is smooth, static or it has small activity. 1: Disable Dark Region Adaptive feature.

A_RC_MB_CTRL (cont.)

Bits	Name	Description
2	SMOOTH_DISABLE	Disable Smooth Region Adaptive feature. 0: Enable Smooth Region Adaptive feature. QP of smooth MB may be smaller than frame QP. 1: Disable Smooth Region Adaptive feature.
1	STATIC_DISABLE	Disable Static Region Adaptive feature. 0: Enable Static Region Adaptive feature. QP of static MB may be smaller than frame QP. 1: Disable Static Region Adaptive feature.
0	ACT_DISABLE	Disable MB Activity Adaptive feature. 0: Enable MB Activity Adaptive feature. QP of MB that has small activity may be smaller than frame QP and QP of MB that has large activity may be larger than frame QP 1: Disable MB Activity Adaptive feature.

0x0440C5B8 A_RC_QOUT

Type: Read
Clock: AHB_CLOCK
Reset State: 0x00000000

Final frame quantization parameter.

NOTE QP_OUT can be referenced for the frame quantization parameter (FRAME_QP) of the next frame.

H.264 Encode Register

A_RC_QOUT

Bits	Name	Description
5:0	QP_OUT	Final frame quantization parameter (FRAME_QP) referenced for encoding the last macroblock of the current picture

0x0440D004 A_H264_ENC_ENTRP_MODE

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

H.264 Entropy Register - Entropy coding mode.

H.264 Loop Filter Alpha Offset Register

A_H264_ENC_ENTRP_MODE

Bits	Name	Description
0	H264_ENC_ENTRP_MODE	0: CAVLC. 1: CABAC.

0x0440D008 A_H264_ENC_LF_ALPHA_OFFSET

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Loop filter alpha offset.

H.264 Loop Filter Beta Offset Register

A_H264_ENC_LF_ALPHA_OFFSET

Bits	Name	Description
4:0	H264_ENC_LF_ALPHA_OFFSET	Loop filter alpha offset.

0x0440D00C A_H264_ENC_LF_BETA_OFFSET

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Loop filter alpha offset.

H.264 Number of Reference Register

A_H264_ENC_LF_BETA_OFFSET

Bits	Name	Description
4:0	H264_ENC_LF_BETA_OFFSET	Loop filter beta offset.

0x0440D010 A_H264_ENC_NUM_OF_REF

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

The maximum number of reference pictures.

H.264 Active Number of Reference Register

A_H264_ENC_NUM_OF_REF

Bits	Name	Description
4:0	H264_ENC_NUM_OF_REF	The maximum number of reference pictures.

0x0440D014 A_H264_ENC_ACTIVE_NUM_OF_REF

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

The number of reference pictures.

H.264 Inter Weighted Parameter Register

A_H264_ENC_ACTIVE_NUM_OF_REF

Bits	Name	Description
9:5	REF_IDX_L0_MINUS1	number_ref_idx_l0_active_minus1.
4:0	REF_IDX_L1_MINUS1	number_ref_idx_l1_active_minus1.

0x0440D01C A_H264_ENC_MDINTER_WEIGHT

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

For calculation of cost value, inter weighted parameter for mode decision.

H.264 Intra Weighted Parameter Register

A_H264_ENC_MDINTER_WEIGHT

Bits	Name	Description
4:0	H264_ENC_MDINTER_WEIGHT	If interSAD < MDInterWeightPPS, select the inter mode.

0x0440D020 A_H264_ENC_MDINTRA_WEIGHT

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

For calculation of cost value, intera weighted parameter for mode decision.

H.264 Motion Vector Enable in INTRA Register

A_H264_ENC_MDINTRA_WEIGHT

Bits	Name	Description
4:0	H264_ENC_MDINTRA_WEIGHT	If interSAD < intraSAD + MDIntraWeightPPS, select the inter mode

0x0440D024 A_H264_ENC_INTRAMV_EN

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Motion vector enable in INTRA slice for rate control.

H.264 Direct Mode Register

A_H264_ENC_INTRAMV_EN

Bits	Name	Description
0	H264_ENC_INTRAMV_EN	0: Off 1: On

0x0440D028 A_H264_ENC_DIREC8X8_INF_FLAG

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Specifies the method used in the derivation process for luma motion vector for B_Skip, B_Direct_16x16 and B_Direct_8x8.

H.264 LIST0 Field Information Register

A_H264_ENC_DIREC8X8_INF_FLAG

Bits	Name	Description
0	H264_ENC_DIRECT8X8_INF_FLAG	Specifies the method used in the derivation process for luma motion vector for B_Skip, B_Direct_16x16 and B_Direct_8x8.

0x0440D02C A_H264_ENC_LIST0_TOP_FIELD

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Information of top/bottom field of selected reference picture.

H.264 LIST1 Field Information Register

A_H264_ENC_LIST0_TOP_FIELD

Bits	Name	Description
0	ENC_LIST0_TOP_FIELD	Information of list0 top/bottom field of selected reference picture. 1: Field 0: Frame

0x0440D030 A_H264_ENC_LIST1_TOP_FIELD

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Information of top/bottom field of selected reference picture.

H.264 8X8 Transform Enable Flag Register

A_H264_ENC_LIST1_TOP_FIELD

Bits	Name	Description
0	ENC_LIST1_TOP_FIELD	Information of list1 top/bottom field of selected reference picture. 1: Field 0: Frame

0x0440D034 A_H264_ENC_TRANS_8X8_FLAG

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

n 8x8 transform enable flag in PPS at high profile.

Encode MV Info On Register

A_H264_ENC_TRANS_8X8_FLAG

Bits	Name	Description
0	ENC_TRANS_8X8_FLAG	0: Disable 1: Enable

0x0440D140 A_MBINFO_ON

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

- Dump MB Info to address location specified by MBINFO_ADDR register (0x0720).

MPEG-4 Quarter Pixel Interpolation Register

A_MBINFO_ON

Bits	Name	Description
0	ENC_MBINFO_ON	0: Disable 1: Enable

0x0440E008 A_MPEG4_ENC_QUART_PXL

Type: Read/Write
Clock: AHB_CLOCK
Reset State: 0x00000000

Quarter pel interpolation control register

A_MPEG4_ENC_QUART_PXL

Bits	Name	Description
0	MPEG4_QUART_PXL	0: Quarter pixel search disable. 1: Quarter pixel search enable.

14.4 MFCV1080P Registers (0x04400000 MFC_BASE)

0x04480000 A_MFCV1080P_MGEN_VERSION

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x0000001D

A_MFCV1080P_MGEN_VERSION

Bits	Name	Description
7:0	VERSION	HW version of mgen2axi core being used. (R29)

0x04480004 A_MFCV1080P_MGEN_AXI_AOOORD

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

A_MFCV1080P_MGEN_AXI_AOOORD

Bits	Name	Description
0	AXI_AOOORD	"Out of order" enable for reads, 1 bit per client. If zero, the AXI bus and slaves must ensure that all reads from that client are completed in the order they are requested from the client. 0x0: RESET_VAL

0x04480008 A_MFCV1080P_MGEN_AXI_AOOOWR

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

A_MFCV1080P_MGEN_AXI_AOOOWR

Bits	Name	Description
0	AXI_AOOOWR	"Out of order" enable for writes from client 4w+0. If zero, the AXI bus and slaves must ensure that all writes from this client are completed in the order they are requested from the client. 0x0: RESET_VAL

0x0448000C A_MFCV1080P_MGEN_AXI_ATYPE

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000006

A_MFCV1080P_MGEN_AXI_ATYPE

Bits	Name	Description
3:0	AXI_TYPE	The value to drive on ATYPE signal, 4 bits per client. Probably one of these: 0110 - Normal, Cacheable, Writeback, Write-allocate, Non-shared. 0111 - same as above except Shared 0110 - RESET_VAL

0x04480010 A_MFCV1080P_MGEN_AXI_AREQPRIORITY

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

A_MFCV1080P_MGEN_AXI_AREQPRIORITY

Bits	Name	Description
1:0	AXI_AREQPRIORITY	Request priority, 2 bits per client. This value is driven onto AXI bus only, not used internally when for client arbitration. 0x0: RESET_VAL

0x04480014 A_MFCV1080P_MGEN_AXI_CTL

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

A_MFCV1080P_MGEN_AXI_CTL

Bits	Name	Description
31	AXI_INTR_CLR	When set (1), MFCV1080P_MGEN_AXI_STATUS. AXI_ERR_INTR & AXI_WDTIMEOUT_INTR is cleared. It has to be explicitly cleared to capture the next AXI ERR/WDTIMEOUT interrupt. 0x0: RESET VAL
20:17	AXI_WDTIMEOUT_LOG2	Write data timeout value in log2 format.The actual timeout value is power of 2 of this specified log2 value.

A_MFCV1080P_MGEN_AXI_CTL (cont.)

Bits	Name	Description
16	AXI_HALT_ON_WDTIMEOUT	When set (1), write data timeout behaves like "halt on error". Wdtimeout_halt will go high and remain high until AXI reset and wdtimeout_stb (glitch-free strobe) will be high in the first cycle.
12	AXI_HALT_ON_WR_ERR	When set (1), a write error response from AXI (on bresp) acts like a HALT_REQ and also disables all ARB-XIN interfaces - instead, fake write data to AXI (zero write enables) and discard read data from AXI. SW should wait for HALT_ACK and then reset the core.
8	AXI_HALT_ON_RD_ERR	When set (1), an read error response from AXI (on rresp) acts like a HALT_REQ and also disables all ARB-XIN interfaces - instead, fake write data to AXI (zero write enables) and discard read data from AXI. SW should wait for HALT_ACK and then reset the core.
4	AXI_RESET	When set (1), the AXI master port is held in reset. The clock that it uses may be turned off. 0x0: RESET_VAL
0	AXI_HALT_REQ	When set (1), this core will not issue any additional AXI requests. This bit should not be reset to 0 until HALT_ACK is 1. 0x0: RESET_VAL

0x04480018 A_MFCV1080P_MGEN_AXI_STATUS

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000030

AXI_A & AXI_B statuses are located at [4n] & [4n+1] respectively.

A_MFCV1080P_MGEN_AXI_STATUS

Bits	Name	Description
13:12	AXI_WDTIMEOUT_INTR	Indicates AXI_WDTIMEOUT interrupt has occurred. It stays on until MFCV1080P_MGEN_AXI_CTL.AXI_INTR_CLR is set (1).
9:8	AXI_ERR_INTR	Indicates AXI_ERR interrupt has occurred. It stays on until MFCV1080P_MGEN_AXI_CTL.AXI_INTR_CLR is set (1).
5:4	AXI_IDLE	Indicates that the AXI master port is idle (no pending requests on AXI).
1:0	AXI_HALT_ACK	Indicates that the halt request was completed (no more pending requests). This will remain high until this arbiter is reset.

0x0448001C A_MFCV1080P_MGEN_AXI_ERROR_INFO_AXI_A

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

A_MFCV1080P_MGEN_AXI_ERROR_INFO_AXI_A

Bits	Name	Description
16	AXI_WDTIMEOUT	Indicates that an AXI write data timeout has occurred since the last AXI reset, and it was treated the same as a write error response with AXI_HALT_ON_WR_ERR=1. SW should wait for HALT_ACK and then reset the core.
11	AXI_ERR	Indicates an AXI error occurred since the last AXI reset. The AXI_ERR interrupt status may be more useful than this bit.
10	AXI_ERR_TYPE	The type of the last error that occurred. 0x0: axi_rresp 0x1: axi_bresp (has priority over rresp if happen same time)
9:8	AXI_RESP	The value of axi_rresp or axi_bresp when the last error occurred.
7:4	AXI_MID	The value on axi_rmid or axi_bmid when the last error occurred.
3:0	AXI_TID	The value on axi_rtid or axi_btid when the last error occurred.

0x04480020 A_MFCV1080P_MGEN_AXI_ERROR_INFO_AXI_B

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

A_MFCV1080P_MGEN_AXI_ERROR_INFO_AXI_B

Bits	Name	Description
16	AXI_WDTIMEOUT	Indicates that an AXI write data timeout has occurred since the last AXI reset, and it was treated the same as a write error response with AXI_HALT_ON_WR_ERR=1. SW should wait for HALT_ACK and then reset the core.
11	AXI_ERR	Indicates an AXI error occurred since the last AXI reset. The AXI_ERR interrupt status may be more useful than this bit.
10	AXI_ERR_TYPE	The type of the last error that occurred. 0x0: axi_rresp 0x1: axi_bresp (has priority over rresp if happen same time)
9:8	AXI_RESP	The value of axi_rresp or axi_bresp when the last error occurred.
7:4	AXI_MID	The value on axi_rmid or axi_bmid when the last error occurred.
3:0	AXI_TID	The value on axi_rtid or axi_btid when the last error occurred.

0x04480024 A_MFCV1080P_MGEN_AXI_TEST_CTL

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

A_MFCV1080P_MGEN_AXI_TEST_CTL

Bits	Name	Description
24	AXI_RD_LAT_REP_EN	1 bit per arb. when enabled, each beat of read data is replaced with the read access latency (of AXI cycles from request til read data returned) 0x0: RESET_VAL
20	AXI_LSFR_EN	1 bit per arb, when enabled the AXI response is "faked" (all reads complete in order) and read data is generated using LFSR. During test, some arbs may use real data, while others use random data. THIS FEATURE IS NOT IMPLEMENTED, WILL BE DROPPED. 0x0: RESET_VAL
16	AXI_MISR_RES	1 bit per arb, need to write 1 and then write 0
12	AXI_MISR_EN	1 bit per arb 0x0: RESET_VAL
8	AXI_MISR_WD	1 bit per arb, to select misr input 0x0: read data (coming back from AXI) 0x1: write data (going to AXI)
7	AXI_CTR_EN	Enable all profiling counters 0x0: RESET_VAL
6	AXI_CTR_RES	Reset all profiling counters (they are also reset by AXI_RESET)
5:4	AXI_TEST_ARB_SEL_1_0	Select which arbiter to drive AXI_TEST_OUT.
3:0	AXI_TEST_OUT_SEL_3_0	Select which test data is read via AXI_TEST_OUT. 0x0: num read bursts (32 bits) 0x1: total read BW (32 bits - up to 68GB) 0x2: max outstanding reads (8 bits) 0x3: avg wait for read accept (10 bits over 128 reads) 0x4: min read latency (16 bits) 0x5: max read latency (16 bits) 0x6: avg read latency (16 bits over 1K read beats) 0x8: num write bursts (32 bits) 0x9: total write BW (32 bits - up to 68GB) 0xA: max outstanding writes (8 bits) 0xB: avg wait for write accept (10 bits over 128 writes) 0xC: MISR signature word 0 0xD: MISR signature word 1 0xE: MISR signature word 2 0xF: MISR signature word 3

0x04480028 A_MFCV1080P_MGEN_AXI_TEST_OUT_AXI_A

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

A_MFCV1080P_MGEN_AXI_TEST_OUT_AXI_A

Bits	Name	Description
31:0	AXI_TEST_OUT	The output selected by AXI_TEST_CTL reg. There are 4 registers to allow 128 bit data.

0x0448002C A_MFCV1080P_MGEN_AXI_TEST_OUT_AXI_B

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

A_MFCV1080P_MGEN_AXI_TEST_OUT_AXI_B

Bits	Name	Description
31:0	AXI_TEST_OUT	The output selected by AXI_TEST_CTL reg. There are 4 registers to allow 128 bit data.

0x04480030 A_MFCV1080P_TESTMODE_CTL

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00010000

A_MFCV1080P_TESTMODE_CTL

Bits	Name	Description
31	ENABLE	Enable test mdoe 0x0: disable 0x1: enable
30	CONST_VAL	Output constant instead of selected test bus Based on Select[1:0] When "00", test bus output = 0xBB55_1080 When "01", test bus output = 0x5555_5555 When "10", test bus output = 0xAAAA_AAAA When "11", test bus output = MFCV1080p_TESTMODE_CTL 0x0: Normal test bus output 0x1: Enable constant value

A_MFCV1080P_TESTMODE_CTL (cont.)

Bits	Name	Description
19:12	MFCV_1080P_VERSION	POR value indicates mfcv_1080p core version being used. However, this 8 bit field can be reprogrammed to any value as general purpose register afterward.
11:8	MGEN2MAXI_DATA_SEL	MGEN2MAXI Data select [3:0]
7	MGEN2MAXI_XIN_SEL	MGEN2MAXI Xin select (when MGEN2MAXI_ARB = 0) 0x0: Xin0 port "01" 0x1: Xin1 port "10"
6	MGEN2MAXI_ARB_SEL	MGEN2MAXI Arb select 0x0: Select Xin port 0x1: Select Arb port
5:4	MGEN2MAXI_TESTBUS_SEL	MGEN2MAXI test bus select 0x0: test bus 1 (core clock) 0x1: test bus 2 (axi clock) 0x2: axi_test_out_1 0x3: axi_test_out_2
3	AHB2AHB_TESTBUS_SEL	AHB2AHB test bus select 0x0: Slave bus "01" 0x1: Master bus "10"
2	MGEN2MAXI_AXI_SEL	Select mgen2maxi test bus from AXI_A or AXI_B port 0x0: AXI_A 0x1: AXI_B
1:0	SELECT	Select test bus from different modules 0x0: AHB2AHB 0x1: MGEN2MAXI 0x2: ENHANCE BLK - AHB2AHB 0x3: EHNANCE BLK - PIXEL CACHE

0x04480034 A_MFCV1080P_MGEN_XBAR_IN_RD_WR_LIM

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00001010

A_MFCV1080P_MGEN_XBAR_IN_RD_WR_LIM

Bits	Name	Description
15:8	XBAR_IN_RD_LIM	The maximum number of pending reads from each client. Must be less than or equal to the HW parameter that limits the same. Default is 16 and range is [0,32].

A_MFCV1080P_MGEN_XBAR_IN_RD_WR_LIM (cont.)

Bits	Name	Description
7:0	XBAR_IN_WR_LIM	The maximum number of pending writes from each client. Must be less than or equal to the HW parameter that limits the same. Default is 16 and range is [0,32].

0x04480038 A_MFCV1080P_MGEN_XBAR_OUT_RD_WR_LIM

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00001010

A_MFCV1080P_MGEN_XBAR_OUT_RD_WR_LIM

Bits	Name	Description
15:8	XBAR_OUT_RD_LIM	The maximum number of pending reads from each client. Must be less than or equal to the HW parameter that limits the same. Default is 16 and range is [0,32].
7:0	XBAR_OUT_WR_LIM	The maximum number of pending writes from each client. Must be less than or equal to the HW parameter that limits the same. Default is 16 and range is [0,32].

0x0448003C A_MFCV1080P_MGEN_XBAR_OUT_MAX_BURST

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000303

A_MFCV1080P_MGEN_XBAR_OUT_MAX_BURST

Bits	Name	Description
15:8	XBAR_OUT_MAX_RD_BURST	The maximum number of read beats minus 1 allowed on the AXI bus (arbiter outputs). Must be less the HW parameter that limits the same. Default is 3 and range is [0,8].
7:0	XBAR_OUT_MAX_WR_BURST	The maximum number of write beats minus 1 allowed on the AXI bus (arbiter outputs). Must be less the HW parameter that limits the same. Default is 3 and range is [0,8].

14.5 MFCV1080P Registers (0x04400000 MFC_BASE)

0x044C0000 A_MFCV1080P_ENH_DMI_CFG

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register is used to configure direct access to the local memory. To use this register, the core must not be in use to ensure stability of the contents of the memory.

Ram list:

CACHE_TAG (count: 8): 48x64

CACHE_FIFO_0 (count: 1): 64x64

CACHE_FIFO_1 (count: 1) : 64x33

CACHE_DATA (count: 2): 768x64

A_MFCV1080P_ENH_DMI_CFG

Bits	Name	Description
8	AUTO_INC_EN	Set (1) to auto-increment MFCV1080P_ENH_DMI_ADDR by 1 anytime MFCV1080P_ENH_DMI_DATA_LO is written or read.
3:0	DMI_RAM_SEL	This bit field is used to specify the video local memory for direct memory access. 0x0: NO_MEMORY 0x1: CACHE_TAG0 0x2: CACHE_TAG1 0x3: CACHE_TAG2 0x4: CACHE_TAG3 0x5: CACHE_TAG4 0x6: CACHE_TAG5 0x7: CACHE_TAG6 0x8: CACHE_TAG7 0x9: CACHE_FIFO_0 0xA: CACHE_FIFO_1 0xB: CACHE_DATA0 0xC: CACHE_DATA1

0x044C0004 A_MFCV1080P_ENH_DMI_ADDR

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register is used to specify the address of the memory to read/write through MFCV1080P_ENH_DMI_DATA_HI/MFCV1080P_ENH_DMI_DATA_LO.

A_MFCV1080P_ENH_DMI_ADDR

Bits	Name	Description
10:0	DMI_ADDR	This bit field specifies the local memory address of the core.

0x044C0008 A_MFCV1080P_ENH_DMI_DATA_HI

Type: Read/Write
Clock: VIDEO_CLOCK
Read Wait States:MFCV1080P_ENH_DMI_DATA_LO followed by MFCV1080P_ENH_DMI_DATA_HI
Reset State: 0x00000000

This register represents the upper 32 bits of the DMI data. The following order needs to be followed for accessing the data registers:

Write: MFCV1080P_ENH_DMI_DATA_HI followed by MFCV1080P_ENH_DMI_DATA_LO

A_MFCV1080P_ENH_DMI_DATA_HI

Bits	Name	Description
31:0	DMI_DATA_HI	This register represents the upper 32 bits of the DMI data. When this register is written, the value of this register is registered and prepared to be written into the upper 32-bits of the memory selected by DMI_RAM_SEL field in the MFCV1080P_ENH_DMI_CFG register. The actual write to the memory is triggered by a write to MFCV1080P_ENH_DMI_DATA_LO. When this register is read, it returns the upper 32 bits of the memory data accessed by the previous MFCV1080P_ENH_DMI_DATA_LO.

0x044C000C A_MFCV1080P_ENH_DMI_DATA_LO

Type: Read/Write
Clock: VIDEO_CLOCK
Read Wait States:MFCV1080P_ENH_DMI_DATA_LO followed by MFCV1080P_ENH_DMI_DATA_HI
Reset State: 0x00000000

This register represents the lower 32 bits of the DMI data. The following order needs to be followed for accessing the data registers:

Write: MFCV1080P_ENH_DMI_DATA_HI followed by MFCV1080P_ENH_DMI_DATA_LO

A_MFCV1080P_ENH_DMI_DATA_LO

Bits	Name	Description
31:0	DMI_DATA_LO	This register represents the lower 32 bits of the DMI data. When this register is written, the value of this register is written into the lower 32 bits of the memory selected by MFCV1080P_ENH_DMI_CFG[3:0]. If the memory is wider than 32 bits, the upper 32 bits can be prepared by writing to MFCV1080P_ENH_DMI_DATA_HI. When this register is read, it returns the lower 32 bits of the memory data.

0x044C0010 A_MFCV1080P_ENH_TEST_BUS_CFG

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register configures the test bus selection in the enhancement block.

A_MFCV1080P_ENH_TEST_BUS_CFG

Bits	Name	Description
4:0	PIX_CACHE_TB_SEL	(00000) Selects the constant 0xDA1CAC4E (00001) Selects the request handler testbus (00010) Selects the preprocessor testbus (00011) Selects the index tag generator testbus (00100) Selects the tags lookup testbus0 (00101) Selects the tags lookup testbus1 (00110) Selects the tags lookup testbus2 (00111) Selects the tags lookup testbus3 (01000) Selects the tag ram 0 control logic testbus (01001) Selects the tag ram 1 control logic testbus (01010) Selects the tag ram 2 control logic testbus (01011) Selects the tag ram 3 control logic testbus (01100) Selects the tag ram 4 control logic testbus (01101) Selects the tag ram 5 control logic testbus (01110) Selects the tag ram 6 control logic testbus (01111) Selects the tag ram 7 control logic testbus (10000) Selects the request generator testbus (10001) Selects the command fifo testbus (10010) Selects the data handler testbus0 (10011) Selects the data handler testbus1 (10100) Selects the data handler testbus2 (10101) Selects the statistics tracker testbus (10110) Selects the configuration register (MFCV1080P_ENH_PIX_CACHE_MISR_CFG) on the testbus

0x044C0014 A_MFCV1080P_ENH_SW_RESET

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register can be used to reset the pixel cache block and/or the CRIF registers in the enhance block. The Resets must be asserted for at least 1 cycle before it can be de-asserted.

A_MFCV1080P_ENH_SW_RESET

Bits	Name	Description
1	PIX_CACHE_SW_RESET	Set (1) to assert reset to the Pixel Cache block
0	CRIF_RESET	Set (1) to assert reset to the Enhance block CRIF registers

0x044C0018 A_MFCV1080P_ENH_PIX_CACHE_CFG

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000018

This register is used for pixel cache control that may get programmed every Frame.

A_MFCV1080P_ENH_PIX_CACHE_CFG

Bits	Name	Description
12	CACHE_HALT	(0) Clear cache halt (1) Set cache halt
9:8	PAGE_SIZE	Ensure that prefetches do not cross PAGE_SIZE boundary (00) 1K page (01) 2K page (10) 4K page (11) Reserved
5	STATISTICS_OFF	(0) Enable statistics capture (1) Disable statistics capture
4	CACHE_PORT_SELECT	(0) Use cache on port A (1) Use cache on port B
3	PREFETCH_EN	(0) Disable prefetch (1) Enable prefetch
2	SS_TILE_FORMAT	(0) External memory content is arranged in SS 4x2MB tile mode (1) External memory content is arranged in SS linear mode NOTE: This bit is disabled and set to 0 because 1080p core only supports tile mode in decoding.
1	CACHE_EN	(0) Cache is disabled, SS core interacts directly with AXI (1) Cache is enabled, SS core interacts with cache, and cache interacts with AXI
0	CACHE_TAG_CLEAR	This bit clears the tags for the cache. If the tags are cleared, everything inside the pixel cache is considered invalid. The bit must be de-asserted (0) after being set (1). If this bit is left as set (1), the tags will always be cleared and cache will consider all requests to be misses.

0x044C001C A_MFCV1080P_ENH_PIX_CACHE_FRAME_SIZE

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

Trigger: Cache Tag Clear

This is a double-buffered register, and it specifies the dimensions of a reconstructed frame. The maximum width and height that is supported is 1920x1088.

A_MFCV1080P_ENH_PIX_CACHE_FRAME_SIZE

Bits	Name	Description
26:16	FRAME_HEIGHT	Height in pixels of the reference frame.
10:0	FRAME_WIDTH	Width in pixels of the reference frame.

0x044C0020 A_MFCV1080P_ENH_PIX_CACHE_FRAME_RANGE

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

Trigger: Cache Tag Clear

This is a double-buffered register, and it specifies the amount of memory occupied by a reconstructed frame.

A_MFCV1080P_ENH_PIX_CACHE_FRAME_RANGE

Bits	Name	Description
17:0	LINEAR_LUMA	SS linear mode: number of dwords in 1 luma frame
15:8	TILE_LUMA	SS 4x2MB tile mode: number of 8K pages in 1 luma frame
7:0	TILE_CHROMA	SS 4x2MB tile mode: number of 8K pages in 1 chroma frame

0x044C0024+4*n A_MFCV1080P_ENH_PIX_CACHE_LUMA_BASE_ADDRn, n=[0..18]

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0xFFFFFFF8

Trigger: Cache Tag Clear

These are double-buffered registers, and they supply the base luma addresses of the DPB regions. When not used, it should be programmed to 0xFFFFFFF8.

A_MFCV1080P_ENH_PIX_CACHE_LUMA_BASE_ADDRn

Bits	Name	Description
31:3	ADDR	Luma regions's base starting address

0x044C0070+ 4*n A_MFCV1080P_ENH_PIX_CACHE_CHROMA_BASE_ADDRn, n=[0..18]

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0xFFFFFFF8

Trigger: Cache Tag Clear

These are double-buffered registers, and they supply the base chroma addresses of the DPB regions. When not used, it should be programmed to 0xFFFFFFF8.

A_MFCV1080P_ENH_PIX_CACHE_CHROMA_BASE_ADDRn

Bits	Name	Description
31:3	ADDR	Chroma regions's base starting address

0x044C00BC A_MFCV1080P_ENH_PIX_CACHE_STATUS

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000001

This register provide the status of the pixel cache.

A_MFCV1080P_ENH_PIX_CACHE_STATUS

Bits	Name	Description
0	IDLE	Asserts when the pixel cache is idle

0x044C00C0 A_MFCV1080P_ENH_PIX_CACHE_ACCESS_MISS_STAT

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register counts the number of misses for the data cache. The counter is reset to 0 using the cache tag clear signal.

A_MFCV1080P_ENH_PIX_CACHE_ACCESS_MISS_STAT

Bits	Name	Description
31:0	MISS_COUNT	Number of cache misses after the cache was last cleared

0x044C00C4 A_MFCV1080P_ENH_PIX_CACHE_ACCESS_HIT_STAT

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register counts the number of hits for the data cache. The counter is reset to 0 using the cache tag clear signal.

A_MFCV1080P_ENH_PIX_CACHE_ACCESS_HIT_STAT

Bits	Name	Description
31:0	HIT_COUNT	Number of cache hits after the cache was last cleared

0x044C00C8 A_MFCV1080P_ENH_PIX_CACHE_AXI_REQ_STAT

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register counts the number of AXI requests generated from the cache. The counter is reset to 0 using the cache tag clear signal.

A_MFCV1080P_ENH_PIX_CACHE_AXI_REQ_STAT

Bits	Name	Description
31:0	AXI_REQUEST_COUNT	Number of AXI requests generated

0x044C00CC A_MFCV1080P_ENH_PIX_CACHE_CORE_REQ_STAT

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register counts the number of Core requests going into the cache. The counter is reset to 0 using the cache tag clear signal.

A_MFCV1080P_ENH_PIX_CACHE_CORE_REQ_STAT

Bits	Name	Description
31:0	CORE_REQUEST_COUNT	Number of Core requests detected

0x044C00D0 A_MFCV1080P_ENH_PIX_CACHE_AXI_BUS_STAT

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register counts the number of data beats (dwords) received from the AXI. The counter is reset to 0 using the cache tag clear signal.

A_MFCV1080P_ENH_PIX_CACHE_AXI_BUS_STAT

Bits	Name	Description
31:0	AXI_BEAT_COUNT	Number of data beats received from the AXI

0x044C00D4 A_MFCV1080P_ENH_PIX_CACHE_CORE_BUS_STAT

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register counts the number of data beats (dwords) sent to the core. The counter is reset to 0 using the cache tag clear signal.

A_MFCV1080P_ENH_PIX_CACHE_CORE_BUS_STAT

Bits	Name	Description
31:0	CORE_BEAT_COUNT	Number of data beats sent to the SS core

0x044C00D8 A_MFCV1080P_ENH_PIX_CACHE_MISR_CFG

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register controls the test MISR.

A_MFCV1080P_ENH_PIX_CACHE_MISR_CFG

Bits	Name	Description
31:8	COUNTER	Maximum number of requests/data to feed into MISR. A value of 0 indicates no maximum
7:4	ID	Only transactions using this ID will be feed into the MISR
3	IGNORE_ID	(0) Use ID field to filter the requests/data going into the MISR (1) Ignore the ID field and feed all requests/data into MISR

A_MFCV1080P_ENH_PIX_CACHE_MISR_CFG (cont.)

Bits	Name	Description
2:1	INPUT_SEL	(00) Apply MISR to requests going into pixel cache (01) Apply MISR to requests generated by pixel cache (10) Apply MISR to data going into pixel cache from AXI (11) Apply MISR to data coming out of pixel cache to the core
0	MISR_EN	(0) MISR is disabled (1) MISR is enabled

0x044C00DC +4*n A_MFCV1080P_ENH_PIX_CACHE_MISR_SIGNATUREn, n=[0..1]

Type: Read
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register indicates the current test MISR signature. Different signatures are given depending on the MISR configuration, and they should be verified against the c-model.

MISR on requests:

MISR_SIGNATURE0: signature of request addresses

MISR_SIGNATURE1: signature of request burst sizes

MISR on data:

MISR_SIGNATURE0: signature of data's lower 32-bits

MISR_SIGNATURE1: signature of data's upper 32-bits

A_MFCV1080P_ENH_PIX_CACHE_MISR_SIGNATUREn

Bits	Name	Description
31:0	SIGNATURE	MISR signature

0x044C00E4 A_MFCV1080P_ENH_PIX_CACHE_SPARE_REG

Type: Read/Write
Clock: VIDEO_CLOCK
Reset State: 0x00000000

This register is a spare register. It is for future use

A_MFCV1080P_ENH_PIX_CACHE_SPARE_REG

Bits	Name	Description
31:0	SPARE_REG_VALUE	Future use

14.6 Gemini JPEG Registers (0x04600000 GEMINI_BASE)

This section provides information for the Gemini JPEG core registers.

14.6.1 AHB registers

The following registers are programmable through the Peripheral Bus AHB interface. The AHB register interface uses a request-ack protocol to hold the bus until the read data is valid so wait states are not applicable.

14.6.1.1 Gemini top registers

0x04600000 A_JPEG_HW_VERSION

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 1200

This register can be read to allow SW to identify the HW version of the GEMINI core.

A_JPEG_HW_VERSION

Bits	Name	Description
19:16	CORE_VERSION	This value identifies the generation of the Gemini core.
15:8	MAJOR_VERSION	This value represents the major version of the Gemini core.
7:0	MINOR_VERSION	This value represents the minor version of the Gemini core.

0x04600004 A_JPEG_RESET_CMD

Type: Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register is used to reset the hardware to a known state. A composite interrupt is generated when all the resets are completed. A second reset command should not be issued until the reset acknowledge is received from the first command

Note that this register is a command register - writes to this register produced strobe commands to the HW.

A_JPEG_RESET_CMD

Bits	Name	Description
31	RESET_BYPASS	When set 1, the reset controller is bypassed and SW must manually assert / de-assert reset to each clock domain using the *_DOMAIN_RESET fields. The individual functional module reset is inactive. No reset done interrupt is generated. When clear 0, the reset controller for the individual functional module is active, and the *_DOMAIN_RESET fields are not meaningful. A reset done interrupt is generated.
30	BUS_DOMAIN_RESET	This bit is used to manually assert/de-assert reset to the BUS clock domain registers.
29	JPEG_DOMAIN_RESET	This bit is used to manually assert/de-assert reset to the JPEG clock domain registers
18	CLKONIDLE_RESET	Writing a '1' causes a reset to be issued to the clkon_clkidle control block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
15	CORE_RESET	Writing a '1' causes a reset to be issued to the core. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
14	BUS_STATS_RESET	Writing a '1' causes a reset to be issued to the bus stats block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
13	BUS_MISR_RESET	Writing a '1' causes a reset to be issued to the bus MISR. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
12	TESTGEN_RESET	Writing a '1' causes a reset to be issued to the test generator block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
11	REGISTER_RESET	Writing a '1' causes a reset to be issued to the register block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
10	VFE_INTERFACE_RESET	Writing a '1' causes a reset to be issued to the VFE interface block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
9	BRIDGE_RESET	Writing a '1' causes a reset to be issued to the bus bridge block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
8	WRITE_ENGINE_RESET	Writing a '1' causes a reset to be issued to the write engine block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.

A_JPEG_RESET_CMD (cont.)

Bits	Name	Description
7	FETCH_ENGINE_RESET	Writing a '1' causes a reset to be issued to the fetch engine block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
6	STATS_RESET	Writing a '1' causes a reset to be issued to the stats block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
5	HUFFMAN_RESET	Writing a '1' causes a reset to be issued to the Huffman block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
4	ZIGZAG_RESET	Writing a '1' causes a reset to be issued to the zigzag block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
3	RLE_RESET	Writing a '1' causes a reset to be issued to the RLE block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
2	FSC_RESET	Writing a '1' causes a reset to be issued to the File Size Control Block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.
1	QUANTIZER_RESET	Writing a '1' causes a reset to be issued to the quantizer block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.This bit resets the quantization/inverse quantization module hardware.
0	DCT_RESET	Writing a '1' causes a reset to be issued to the DCT block. Writing '0' has no effect. When the reset is complete an interrupt is generated back to the GEMINI interrupt controller.This bit resets the DCT/IDCT module hardware.

0x04600008 A_JPEG_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register controls the data path configuration for the GEMINI JPEG pipeline.

Rotation is not supported for real-time JPEG.

A_JPEG_CFG

Bits	Name	Description
29	ASSERT_JPEGCLKIDLE	These bits are used in conjunction with Bit 18. When jpegclkidle is under SW control, these bits indicate the value which the HW drives on jpegclkidle. 0x0: JPEGCLKIDLE driven to 0 0x1: JPEGCLKIDLE driven to 1
28	DEASSERT_AXICLKON	These bits are used in conjunction with Bit 18. When axiclkon is under SW control, these bits indicate the value which the HW drives on axiclkon. 0x0: AXICLKON driven to 1 0x1: AXICLKON driven to 0
26:25	MODE	These bits indicate the operation the HW is to perform. 0x0: Real-time JPEG Encode 0x1: Offline JPEG Encode 0x2: Real-time Frame Rotation 0x3: Invalid
24:23	JPEG_FORMAT	These bits indicate the input image format. 0x0: Invalid 0x1: H1V2 0x2: H2V1 0x3: H2V2
22	WE_INPUT_SEL	These bits select the input for the GEMINI Write Engine. 0x0: JPEG Pipeline 0x1: Fetch Engine
21	JPEG_INPUT_SEL	These bits select the input for the GEMINI JPEG pipeline. 0x0: Fetch Engine 0x1: HW Test Generator
20	FE_INPUT_SEL	These bits select the input bus width for the GEMINI Fetch Engine. 0x0: 64 bit bus 0x1: 32 bit bus
18	CLKONIDLE_ENABLE	This bit enables/disables the clkon_clkidle HW control block. When HW control is disabled, SW has control of the values driven for the CLKONIDLE signals from the core. 0x0: CLKONIDLE HW control disabled. 0x1: CLKONIDLE HW control enabled.
17	TESTBUS_ENABLE	This bit enables the Gemini core testbus output.
16	HBFC_ENABLE	This bit enables HW control of the HBFC vote signal.
14	BUS_STATS_ENABLE	This bit enables/disables the BUS Stats block. 0x0: BUS Stats disabled. 0x1: BUS Stats enabled.

A_JPEG_CFG (cont.)

Bits	Name	Description
13	BUS_MISR_ENABLE	This bit enables/disables the BUS MISR block. 0x0: BUS MISR disabled. 0x1: BUS MISR enabled.
12	TESTGEN_ENABLE	This bit enables/disables the TESTGEN block. 0x0: TESTGEN disabled. 0x1: TESTGEN enabled.
10	VFE_INTERFACE_ENABLE	This bit enables/disables the VFE interface block. 0x0: VFE interface disabled. 0x1: VFE interface enabled.
9	IMEM_MODE_DISABLE	This bit enables/disables the IMEM address generation block that is used in the case of single IMEM instead of pingpong IMEM mode. 0x0: IMEM FIFO Based address generation. 0x1: IMEM Ping Pong address generation.
8	WE_ENABLE	This bit enables/disables the write engine block. 0x0: Write Engine disabled. 0x1: Write Engine enabled.
7	FE_ENABLE	This bit enables/disables the fetch engine block. 0x0: Fetch Engine disabled. 0x1: Fetch Engine enabled.
6	STATS_ENABLE	This bit enables/disables the STATS module in the GEMINI JPEG pipeline. 0x0: STATS disabled. 0x1: STATS enabled.
5	HUFFMAN_ENABLE	This bit enables/disables the HUFFMAN module in the GEMINI JPEG pipeline. 0x0: Huffman disabled. 0x1: Huffman enabled.
4	ZIGZAG_ENABLE	This bit enables/disables the ZIGZAG module in the GEMINI JPEG pipeline. 0x0: ZIGZAG disabled. 0x1: ZIGZAG enabled.
3	RLE_ENABLE	This bit enables/disables the Run Length Encoding module in the GEMINI JPEG pipeline. 0x0: RLE disabled. 0x1: RLE enabled.
2	FSC_ENABLE	This bit enables/disables the File Size Control block. 0x0: FSC disabled. 0x1: FSC enabled.

A_JPEG_CFG (cont.)

Bits	Name	Description
1	QUANTIZER_ENABLE	This bit enables/disables the QUANTIZER module in the GEMINI JPEG pipeline. 0x0: QUANTIZER disabled. 0x1: QUANTIZER enabled.
0	DCT_ENABLE	This bit enables/disables the DCT module in the GEMINI JPEG pipeline. 0x0: DCT disabled. 0x1: DCT enabled.

0x0460000C A_JPEG_REALTIME_CMD

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register allows the ARM to initiate and halt reads for real-time JPEG processing.

SW will write the REALTIME_COMMAND prior to enabling the source of the data to be encoded.

This register allows for stopping the VFE-Gemini interface via an immediate stop or a clean stop on a frame boundary. An immediate stop requires issuing a VFE_INTERFACE_RESET via the JPEG_RESET_CMD before enabling the VFE Interface again.

Note that this register is a command register - writes to this register produced strobe commands to the HW.

A_JPEG_REALTIME_CMD

Bits	Name	Description
1:0	REALTIME_COMMAND	The following commands are used to enable/disable fetches for real-time JPEG processing. 0x0: Disable fetch at the end of the current frame boundary. 0x1: Enable fetch at the start of the next frame boundary. 0x3: Disable fetch immediately.

0x04600010 A_JPEG_REALTIME_STATUS

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0001

This register can be read to determine the state of the VFE interface.

A_JPEG_REALTIME_STATUS

Bits	Name	Description
0	REALTIME_STATUS	This bit indicates the current status of the VFE interface. ' When set (1), the VFE interface is idle. ' When clear (0), the VFE interface is monitoring VFE signals.

14.6.1.2 Gemini interrupt registers

0x04600014 A_JPEG_IRQ_MASK

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0400

This register allows SW to control which set of events will trigger an ARM IRQ.

A_JPEG_IRQ_MASK

Bits	Name	Description
31:0	MASK	This mask is used to enable/disable an interrupt source for the GEMINI interrupt to the ARM. ' When a bit is set (1) , the interrupt source is enabled. ' When the bit is not set (0), the interrupt source is disabled. JPEG_irq_src(0) <= frame_done_irq JPEG_irq_src(1) <= fe_rd_done_irq JPEG_irq_src(2) <= fe_realtime_overflow_irq JPEG_irq_src(3) <= fe_vfe_overflow_irq JPEG_irq_src(4) <= we_y_pingpong_irq JPEG_irq_src(5) <= we_cbcr_pingpong_irq JPEG_irq_src(6) <= we_y_buffer_overflow_irq JPEG_irq_src(7) <= we_cbcr_buffer_overflow_irq JPEG_irq_src(8) <= we_ch0_data_fifo_overflow_irq JPEG_irq_src(9) <= we_ch1_data_fifo_overflow_irq JPEG_irq_src(10) <= reset_ack_irq; JPEG_irq_src(11) <= bus_error_irq; JPEG_irq_src(12) <= violation_irq;

0x04600018 A_JPEG_IRQ_CLEAR

Type: Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_IRQ_CLEAR

Bits	Name	Description
31:0	CLEAR	This register is used to clear an interrupt source. ' Setting (1) a bit clears the interrupt status in JPEG_IRQ_STATUS. ' Clearing (0) a bit has no effect. JPEG_irq_src(0) <= frame_done_irq JPEG_irq_src(1) <= fe_rd_done_irq JPEG_irq_src(2) <= fe_realtime_overflow_irq JPEG_irq_src(3) <= fe_vfe_overflow_irq JPEG_irq_src(4) <= we_y_pingpong_irq JPEG_irq_src(5) <= we_cbcr_pingpong_irq JPEG_irq_src(6) <= we_y_buffer_overflow_irq JPEG_irq_src(7) <= we_cbcr_buffer_overflow_irq JPEG_irq_src(8) <= we_ch0_data_fifo_overflow_irq JPEG_irq_src(9) <= we_ch1_data_fifo_overflow_irq JPEG_irq_src(10) <= reset_ack_irq; JPEG_irq_src(11) <= bus_error_irq; JPEG_irq_src(12) <= violation_irq;

0x0460001C A_JPEG_IRQ_STATUS

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_IRQ_STATUS

Bits	Name	Description
31:0	STATUS	This register shows the raw status of the interrupts that were triggered. JPEG_irq_src(0) <= frame_done_irq JPEG_irq_src(1) <= fe_rd_done_irq JPEG_irq_src(2) <= fe_realtime_overflow_irq JPEG_irq_src(3) <= fe_vfe_overflow_irq JPEG_irq_src(4) <= we_y_pingpong_irq JPEG_irq_src(5) <= we_cbcr_pingpong_irq JPEG_irq_src(6) <= we_y_buffer_overflow_irq JPEG_irq_src(7) <= we_cbcr_buffer_overflow_irq JPEG_irq_src(8) <= we_ch0_data_fifo_overflow_irq JPEG_irq_src(9) <= we_ch1_data_fifo_overflow_irq JPEG_irq_src(10) <= reset_ack_irq; JPEG_irq_src(11) <= bus_error_irq; JPEG_irq_src(12) <= violation_irq;

14.6.1.3 Gemini bus registers

0x04600020 A_JPEG_BUS_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

Not used Halcyon.

A_JPEG_BUS_CFG

Bits	Name	Description
0	OOOWR_ENABLE	This bit indicates to the bus slave that data from the HW core write master out to memory does not need to be processed in a strict order. For AHB based systems, this bit has no effect. 0x0: HW core write master requires the bus slave to process write data requests in the order output by HW core. 0x1: HW core write master does not require the bus slave to process write data requests in the order output by HW core.

0x04600024 A_JPEG_BUS_CMD

Type: Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register is used to halt the bridge.

Note that this register is a command register - writes to this register produced strobe commands to the HW

A_JPEG_BUS_CMD

Bits	Name	Description
0	HALT_REQ	Write a '1' to this bit to halt the bus bridge. The HALT_ACK status bit will be set to '1' after the bridge has stopped transferring data.

0x04600028 A_JPEG_BUS_STATUS

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0002

A_JPEG_BUS_STATUS

Bits	Name	Description
5:4	SLAVE_ID_ERROR	These bits indicate the slave ID of the accessed slaves that is returning an AXI error interrupt. When this error occurs, software will have to clear the AXI error interrupt, apply the AXI halt request, and then reset the AXI bridge upon the receipt of halt acknowledgement to recover from the error condition.
1	BUS_IDLE	This field reports the current state of the bus/bridge. ' When set (1), bus/bridge is IDLE ' When clear (0), bus/bridge is ACTIVE.
0	HALT_ACK	This field reports the bus/bridge acknowledgement following a halt request to the bus/bridge. ' When set (1), halt request acknowledged.

0x0460002C A_JPEG_BUS_MISR_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

The Gemini core implements a 64-bit bus MISR to allow checking of data to and from the core at the core/chip boundary. In the case where the input to the MISR is not 32-bits (APPS bus data or address lines), the HW sets the 32 MSB input values to the MISR to "0" to compute the signature.

A_JPEG_BUS_MISR_CFG

Bits	Name	Description
18:17	MISR_SIG_SEL	This bit determines which bits of the MISR signature to read. 0x0: Read 32 LSBs of the MISR signature. 0x1: Read 32 MSBs of the MISR signature. 0x2: Undefined._1 0x3: Undefined._2
16	MISR_READ_SEL	This bit determines which MISR signature to read. 0x0: Read MISR0 signature. 0x1: Read MISR1 signature.
11:10	MISR1_SRC	When the core is used in an AXI based system, the LSBs of AID of the master for which the MISR is to be computed on is programmed here. When the core is used in an AHB based system, this field takes on the following meaning: 0x0: FE Transaction 0x1: WE Transaction 0x2: Undefined._1 0x3: Undefined._2 0x0: Sample APPS-IMEM bus port. 0x1: Sample APPS bus port. 0x2: Undefined._3 0x3: Undefined._4
9:8	MISR1_INPUT_SEL	Bus MISR Sampling Transaction Mode 0x0: Sample Bus Write Data 0x1: Sample Bus Read Data 0x2: Sample Bus Write Address 0x3: Sample Bus Read Address
3:2	MISR0_SRC	When the core is used in an AXI based system, the LSBs of AID of the master for which the MISR is to be computed on is programmed here. When the core is used in an AHB based system, this field takes on the following meaning: 0x0: FE Transaction 0x1: WE Transaction 0x2: Undefined._1 0x3: Undefined._2 0x0: Sample APPS-IMEM bus port. 0x1: Sample APPS bus port. 0x2: Undefined._3 0x3: Undefined._4

A_JPEG_BUS_MISR_CFG (cont.)

Bits	Name	Description
1:0	MISR0_INPUT_SEL	Bus MISR Sampling Transaction Mode 0x0: Sample Bus Write Data 0x1: Sample Bus Read Data 0x2: Sample Bus Write Address 0x3: Sample Bus Read Address

0x04600030 A_JPEG_BUS_MISR_READ_VALUE

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register returns the lower 32-bits of the bus MISR signature.

A_JPEG_BUS_MISR_READ_VALUE

Bits	Name	Description
31:0	BUS_MISR_VALUE	This register is used to read 32-bits of the bus MISR signature. The 32-bits that are read are determined by the settings in the JPEG_BUS_MISR_CFG register.

14.6.1.4 Status registers

0x04600034 A_JPEG_STATUS_ENCODE_OUTPUT_SIZE

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

Reading this register after receiving the frame_done_irq will return the total number of bytes used to encode the input image. The read value includes the addition of the EOI and restart markers. This register is updated at the end of each frame.

A_JPEG_STATUS_ENCODE_OUTPUT_SIZE

Bits	Name	Description
27:0	OUTPUT_SIZE_BYTES	Total number of bytes used to encode the input frame.

14.6.1.5 Fetch engine registers

The Fetch Engine reads MCUs from memory to feed the JPEG pipeline. It supports reads of 8-bit YCbCr data in H2V2, H2V1, and H1V2 formats.

0x04600038 A_JPEG_FE_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_FE_CFG

Bits	Name	Description
19:18	FE_AREQP_STARVE	This field sets the Master Request Priority (AREQPRIORITY) value to be driven to the FABRIC when the HW determines it is starved for read bandwidth. Not used for Halcyon. 0x0: Normal 0x1: High 0x2: Higher 0x3: Highest
17:16	FE_AREQP_DEFAULT	This field sets the Master Request Priority (AREQPRIORITY) value to be driven to the FABRIC when the HW determines it is not starved for read bandwidth. Not used for Halcyon. 0x0: Normal 0x1: High 0x2: Higher 0x3: Highest
6	CBCR_ORDER	This bit indicates to the HW how CbCr pixels are packed in memory. 0x0: Cb pixel is in the least significant bit of the word. 0x1: Cr pixel is in the least significant bit of the word.
5:4	FE_BURST_LENGTH	This field sets the length of the burst. 0x0: Invalid_1 0x1: burst length 4 0x2: burst length 8 0x3: Invalid_2

A_JPEG_FE_CFG (cont.)

Bits	Name	Description
2:0	BYTE_ORDERING	These bits control the byte swapping in a 64-bit input word for JPEG processing. 0x0: Input Word: [63:0]. 0x1: Input Word: [55:48] & [63:56] & [39:32] & [47:40] & [23:16] & [31:24] & [7:0] & [15:8]. 0x2: Input Word: [47:40] & [39:32] & [63:56] & [55:48] & [15:8] & [7:0] & [31:24] & [23:16]. 0x3: Input Word: [39:32] & [47:40] & [55:48] & [63:56] & [7:0] & [15:8] & [23:16] & [31:24]. 0x4: Input Word: [31:0] &[63:32]. 0x5: Input Word: [23:16] & [31:24] & [7:0] & [15:8] & [55:48] & [63:56] & [39:32] & [47:40]. 0x6: Input Word: [15:8] & [7:0] & [31:24] & [23:16] & [47:40] & [39:32] & [63:56] & [55:48]. 0x7: Input Word: [0:63].

0x0460003C A_JPEG_FE_FRAME_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register is programmed with the input image size to be encoded, in units of MCUs.

This register allows support for up to 512 MCUs for the horizontal frame dimension.

This register allows support for up to 512 MCUs to be programmed for the vertical frame dimension.

A_JPEG_FE_FRAME_CFG

Bits	Name	Description
25:16	FRAME_HEIGHT_MCUS	This field is programmed with number of MCUs in the vertical direction that are in the image to be encoded, minus one. Hence, a frame with a height of N MCUs would be programmed with the value N-1.
9:0	FRAME_WIDTH_MCUS	This field is programmed with number of MCUs in the horizontal direction that are in the image to be encoded, minus one. Hence, a frame with a width of N MCUs would be programmed with the value N-1.

0x04600040 A_JPEG_FE_OUTPUT_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register is used to program the order of the two set sequence of luma/chroma blocks to be output to the JPEG processing pipeline as well as configure the FE to output fetched data in tile format or line format. The JPEG processing pipeline accepts two pixels per cycle, where each pixel is from a different 8x8 block of the same type of block (either both luma or both chroma).

The table below shows the values that could be used to program this register for typical input image formats.

Image Format	PERIOD / BLOCK_PATTERN
H2V1	N = 2 / XX01
H2V2	N = 3 / X011
H1V2	N = 2 / XX01

Block Cycle	Y Pair / CbCr Pair
0	Bit 0
1	Bit 1
2	Bit 2
3	Bit 3
4	Bit 4
5	Bit 5
6	Bit 6
7	Bit 7

A_JPEG_FE_OUTPUT_CFG

Bits	Name	Description
16	TILE_LINE_FORMAT	This field configures how the data should be read from the FE internal RAMs. For JPEG encode, this field must be set to 0. ’ When set (1), read is line based. ’ When clear (0), read is tile based.
10:8	PERIOD	This value represents the number of 8x8 block cycles the hardware repeats the programmed block pattern sequence. A period of N should be programmed as N-1.

A_JPEG_FE_OUTPUT_CFG (cont.)

Bits	Name	Description
7:0	BLOCK_PATTERN	This field gives the 8x8 block sequence that is fed to the JPEG processing pipeline. ' When set (1), a pair of luma blocks are output to the JPEG processing on the associated block cycle bit. ' When clear (0), a pair of chroma blocks are output to the JPEG processing on the associated block cycle bit.

0x04600044 A_JPEG_FE_FRAME_ROTATION_CFG

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

JPEG frame rotation on the input image is specified by this register.

A_JPEG_FE_FRAME_ROTATION_CFG

Bits	Name	Description
1:0	FE_FRAME_ROTATION	This field specifies how order at which the fetch engine will read data from memory. 0x0: 0 Degree Rotation 0x1: 90 Degree Rotation 0x2: 180 Degree Rotation 0x3: 270 Degree Rotation

0x04600048 A_JPEG_FE_Y_FRAME_ROTATION_START

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

MCU fetch order within a frame is specified by this register. The rotation within a frame is specified by the following equation in terms of the order that MCUs are fetched. This register is intended to be used for off-line JPEG processing and should be programmed to 0 when HW is configured for real-time JPEG encode.

This register should be programmed as follows to perform 0, 90, 180, and 270 degree frame rotation, where FRAME_WIDTH_MCUS and FRAME_HEIGHT_MCUS are the values programmed in the FE_FRAME_CFG registers and Hx = 2 for H2VX input image format, Hx = 1 for H1VX input image format, Vx = 2 for HXV2 input image format, and Vx=1 for HXV1 input image format:

Rotation	FE_START_OFFSET Y Values
0	0
90	FRAME_WIDTH_MCUS * Hx * 8
180	FRAME_WIDTH_MCUS * Hx * 8 + (FRAME_HEIGHT_MCUS * Vx * 8) * (FRAME_WIDTH_MCUS+1) * Hx * 8
270	(FRAME_HEIGHT_MCUS * Vx * 8) * (FRAME_WIDTH_MCUS+1) * Hx * 8

A_JPEG_FE_Y_FRAME_ROTATION_START

Bits	Name	Description
25:0	FE_START_OFFSET	This field specifies the first MCU address location to fetch for the Y component.

0x0460004C A_JPEG_FE_CBCR_FRAME_ROTATION_START

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

MCU rotation within a frame is specified by this register. The rotation within a frame is specified by the following equation in terms of the order that MCUs are fetched. This register is intended to be used for off-line JPEG processing.

This register should be programmed as follows to perform 0, 90, 180, and 270 degree frame rotation, where FRAME_WIDTH_MCUS and FRAME_HEIGHT_MCUS are the values programmed in the FE_FRAME_CFG registers and Hx = 2 and Vx = 1:

Rotation	FE_START_OFFSET CbCr Value
0	0
90	FRAME_WIDTH_MCUS * Hx * 8
180	FRAME_WIDTH_MCUS * Hx * 8 + (FRAME_HEIGHT_MCUS * Vx * 8) * (FRAME_WIDTH_MCUS+1) * Hx * 8
270	(FRAME_HEIGHT_MCUS * Vx * 8) * (FRAME_WIDTH_MCUS+1) * Hx * 8

A_JPEG_FE_CBCR_FRAME_ROTATION_START

Bits	Name	Description
25:0	FE_START_OFFSET	This field specifies the first MCU address location to fetch for the Y component.

0x04600050 A_JPEG_FE_Y_FRAME_JUMP_OFFSET

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

MCU rotation within a frame is specified by this register. The rotation within a frame is specified by the following equation in terms of the order that MCUs are fetched. This register is intended to be used for off-line JPEG processing and should be programmed to 0 when the HW is configured for real-time JPEG.

For 0 or 180 degree rotation, the Y_ROW_JUMP_OFFSET is to be programmed as

8 * Hx * ((FRAME_WIDTH_MCUS+1) * (8*Vx-1) + 1)

For 90 or 270 degree rotation, the Y_ROW_JUMP_OFFSET is to be programmed as

8 * Hx * (FRAME_HEIGHT_MCUS * 8 * Vx * (FRAME_WIDTH_MCUS+1) + 1)

FRAME_HEIGHT_MCUS and FRAME_WIDTH_MCUS are the values programmed in the FE_FRAME_CFG register.

A_JPEG_FE_Y_FRAME_JUMP_OFFSET

Bits	Name	Description
26:0	Y_ROW_JUMP_OFFSET	This field gives the row jump offset for the FE to calculate the address to jump to after reading the luma component of an MCU row.

0x04600054 A_JPEG_FE_CBCR_FRAME_JUMP_OFFSET

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

MCU rotation within a frame is specified by this register. The rotation within a frame is specified by the following equation in terms of the order that MCUs are fetched. This register is intended to be used for off-line JPEG processing and should be programmed to 0 when the HW is configured for real-time JPEG.

For 0 or 180 degree rotation, the CBCR_FRAME_JUMP_OFFSET is to be programmed as

8 * Hx * ((FRAME_WIDTH_MCUS+1) * (8*Vx-1) + 1)

For 90 or 270 degree rotation, the CBCR_FRAME_JUMP_OFFSET is to be programmed as

8 * Hx * (FRAME_HEIGHT_MCUS * 8 * Vx * (FRAME_WIDTH_MCUS+1) + 1)

FRAME_HEIGHT_MCUS and FRAME_WIDTH_MCUS are the values programmed in the FE_FRAME_CFG register. Hx = 2, and Vx = 1 for CBCR_FRAME_JUMP_OFFSET register programming.

A_JPEG_FE_CBCR_FRAME_JUMP_OFFSET

Bits	Name	Description
26:0	CBCR_ROW_JUMP_OFFSET	This field gives the row jump offset for the FE to calculate the address to jump to after reading the chroma component of an MCU row.

0x04600058 A_JPEG_FE_BLOCK_ROTATION_CFG

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

Pixel rotation within an 8x8 block is specified by this register. Three SW parameters define what order the pixel data within a block is pushed to the JPEG pipeline.

The following table lists the programmed values to perform 0, 90, 180, and 270 degree rotation.

Register Field				
	0^o	90^o	180^o	270^o
PIXEL_START_OFFSET	0	7	63	56
PIXEL_H_INCREMENT	+1	+8	-1	-8
PIXEL_V_INCREMENT	+8	-1	-8	+1

A_JPEG_FE_BLOCK_ROTATION_CFG

Bits	Name	Description
25:24	BLOCK_ROTATION	This field specifies the order for which the fetch engine will order the data to the DCT. In general, this field should be programmed to match the JPEG encode orientation. 0x0: 0 Degree Rotation 0x1: 90 Degree Rotation 0x2: 180 Degree Rotation 0x3: 270 Degree Rotation
21:16	PIXEL_START_OFFSET	MCU_FIRST_PIXEL_OFFSET can take values from 0 to 63.
12:8	PIXEL_H_INCREMENT	This field should be programmed to a value between -8 and 8. The value programmed is a two's complement value. -1 would be programmed as 11111, -2 is programmed as 11110,...6 is programmed as 00110, 7 is programmed as 00111.
4:0	PIXEL_V_INCREMENT	This field should be programmed to a value between -8 and 8. The value programmed is a two's complement value. -1 would be programmed as 11111, -2 is programmed as 11110,...6 is programmed as 00110, 7 is programmed as 00111.

0x0460005C A_JPEG_FE_BURST_MASK

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register sets the burst mask on fetches from memory.

A_JPEG_FE_BURST_MASK

Bits	Name	Description
15:8	CBCR_BURST_MASK	Burst mask setting for CbCr fetches.
7:0	Y_BURST_MASK	Burst mask setting for Y fetches.

0x04600060 A_JPEG_FE_Y_WRITE_MASK_0

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register sets the Y write mask on FE burst cycles 0 and 1.

A_JPEG_FE_Y_WRITE_MASK_0

Bits	Name	Description
31:16	Y_WRITE_MASK_1	Write mask setting for Y.
15:0	Y_WRITE_MASK_0	Write mask setting for Y.

0x04600064 A_JPEG_FE_Y_WRITE_MASK_1

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register sets the Y write mask on FE burst cycles 2 and 3.

A_JPEG_FE_Y_WRITE_MASK_1

Bits	Name	Description
31:16	Y_WRITE_MASK_3	Write mask setting for Y.
15:0	Y_WRITE_MASK_2	Write mask setting for Y.

0x04600068 A_JPEG_FE_Y_WRITE_MASK_2

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register sets the Y write mask on FE burst cycles 4 and 5.

A_JPEG_FE_Y_WRITE_MASK_2

Bits	Name	Description
31:16	Y_WRITE_MASK_5	Write mask setting for Y.
15:0	Y_WRITE_MASK_4	Write mask setting for Y.

0x0460006C A_JPEG_FE_Y_WRITE_MASK_3

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register sets the Y write mask on FE burst cycles 6 and 7.

A_JPEG_FE_Y_WRITE_MASK_3

Bits	Name	Description
31:16	Y_WRITE_MASK_7	Write mask setting for Y.
15:0	Y_WRITE_MASK_6	Write mask setting for Y.

0x04600070 A_JPEG_FE_CBCR_WRITE_MASK_0

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register sets the CbCr write mask on FE burst cycles 0 and 1.

A_JPEG_FE_CBCR_WRITE_MASK_0

Bits	Name	Description
31:16	CBCR_WRITE_MASK_1	Write mask setting for CBCR.
15:0	CBCR_WRITE_MASK_0	Write mask setting for CBCR.

0x04600074 A_JPEG_FE_CBCR_WRITE_MASK_1

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register sets the CbCr write mask on FE burst cycles 2 and 3.

A_JPEG_FE_CBCR_WRITE_MASK_1

Bits	Name	Description
31:16	CBCR_WRITE_MASK_3	Write mask setting for CBCR.
15:0	CBCR_WRITE_MASK_2	Write mask setting for CBCR.

0x04600078 A_JPEG_FE_CBCR_WRITE_MASK_2

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register sets the CbCr write mask on FE burst cycles 4 and 5.

A_JPEG_FE_CBCR_WRITE_MASK_2

Bits	Name	Description
31:16	CBCR_WRITE_MASK_5	Write mask setting for CBCR.
15:0	CBCR_WRITE_MASK_4	Write mask setting for CBCR.

0x0460007C A_JPEG_FE_CBCR_WRITE_MASK_3

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register sets the CbCr write mask on FE burst cycles 6 and 7.

A_JPEG_FE_CBCR_WRITE_MASK_3

Bits	Name	Description
31:16	CBCR_WRITE_MASK_7	Write mask setting for CBCR.
15:0	CBCR_WRITE_MASK_6	Write mask setting for CBCR.

0x04600080 A_JPEG_FE_BUFFER_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register is set with the number of MCU rows in each read buffer. For real-time JPEG encode, these registers would be set to either 2 or 1 for MCU_ROWS_Y, and 1 for MCU_ROWS_CBCR.

A_JPEG_FE_BUFFER_CFG

Bits	Name	Description
28:16	CBCR_MCU_ROWS	This field is programmed with the number of MCU Rows minus 1 held in each CbCr Buffer. A value of N rows is programmed as N-1.
12:0	Y_MCU_ROWS	This field is programmed with number of MCU Rows minus 1 held in each Y Buffer. A value of N rows is programmed as N-1.

0x04600084 A_JPEG_FE_Y_PING_ADDR

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

GEMINI must fetch data from IMEM or external memory. The read ping-pong buffers are defined by a starting address and a buffer size. At startup, data is read from the memory location based on the address defined by PING_START_ADDR.

Once the last address defined by JPEG_FE_BUFFER_CFG is reached, the ping-pong buffers automatically switch so that subsequent data is read from to the address defined by the PONG_START_ADDR.

The buffer switch process repeat until the entire frame, as defined in JPEG_FE_CFG has been read.

NOTE When a buffer is switched over, an interrupt is generated. This mechanism allows the definition of the last used buffer to be updated so that it is not overwritten the next time that it is used.

A_JPEG_FE_Y_PING_ADDR

Bits	Name	Description
31:0	FE_Y_PING_START_ADDR	Ping buffer start address. Must be a multiple of 8.

0x04600088 A_JPEG_FE_Y_PONG_ADDR

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_FE_Y_PONG_ADDR

Bits	Name	Description
31:0	FE_Y_PONG_START_ADDR	Pong buffer start address. Must be a multiple of 8.

0x0460008C A_JPEG_FE_CBCR_PING_ADDR

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_FE_CBCR_PING_ADDR

Bits	Name	Description
31:0	FE_CBCR_PING_START_ADDR	Ping buffer start address. Must be a multiple of 8.

0x04600090 A_JPEG_FE_CBCR_PONG_ADDR

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_FE_CBCR_PONG_ADDR

Bits	Name	Description
31:0	FE_CBCR_PONG_START_ADDR	Pong buffer start address. Must be a multiple of 8.

0x04600094 A_JPEG_FE_CMD

Type: Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register allows SW the capability to reset the memory pointers to where data is read from. It also initiates HW fetches for off-line JPEG encode.

Note that this register is a command register - writes to this register produced strobe commands to the HW

A_JPEG_FE_CMD

Bits	Name	Description
1	FE_READ_GO_CMD	Writing to this bit initiates fetches for off-line JPEG processing. ' When set (1), triggers a request to fetch data for off-line JPEG encoding. ' Clearing the bit (0), has no effect.
0	FE_BUFFER_RELOAD_CMD	This field is used to reload and reset the read channel address to start from the PING address buffer. The value in this field is strictly a strobe (pulse) based value, and there is no registering of this value. ' When set (1), triggers a request to reset buffer pointers. ' Clearing the bit (0), has no effect.

14.6.1.6 Write Engine registers

0x04600098 A_JPEG_WE_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

.

A_JPEG_WE_CFG

Bits	Name	Description
19:18	WE_AREQP_STARVE	This field sets the Master Request Priority (AREQPRIORITY) value to be driven to the FABRIC when the HW determines it is starved for write bandwidth. Not used for Halcyon. 0x0: Normal 0x1: High 0x2: Higher 0x3: Highest

A_JPEG_WE_CFG (cont.)

Bits	Name	Description
17:16	WE_AREQP_DEFAULT	This field sets the Master Request Priority (AREQPRIORITY) value to be driven to the FABRIC when the HW determines it is not starved for write bandwidth. Not used for Halcyon. 0x0: Normal 0x1: High 0x2: Higher 0x3: Highest
11	WE_OUTPUT_DISABLE	This field is used to disable the WE output to the bridge. ’ When set (1), WE output to bridge is disabled. ’ When clear(0), WE output to bridge is enabled.
10	WE_BS_DISABLE	This field is used to disable the byte stuff function. This field should always be programmed to "0" when the HW is configured for JPEG encoding. For frame rotation this bit must be programmed to "1". ’ When set (1), WE byte stuff/marker insert is disabled. ’ When clear(0), WE byte stuff/marker insert is enabled.
9:8	WE_BP_INPUT_SEL	This field sets the input to the WE 64-bit bitpacker. This field should be programmed to "00" when the HW is configured for JPEG encoding or Frame Rotation. Currently this is used for debug purposes only. 0x0: WE byte stuff/marker insert output 0x1: Ch0 huffman output 0x2: Ch1 huffman output 0x3: Not defined
5:4	WE_BURST_LENGTH	This field sets the length of the burst. This value must be set to "00" for inline frame rotation. 0x0: burst length 2 (Not supported for 32-bit bus systems) 0x1: burst length 4 0x2: burst length 8 0x3: burst length 16
2:0	BYTE_ORDERING	These bits control the byte swapping in one word of the compressed output. 0x0: Output Word: [63:0]. 0x1: Output Word: [55:48] & [63:56] & [39:32] & [47:40] & [23:16] & [31:24] & [7:0] & [15:8]. 0x2: Output Word: [47:40] & [39:32] & [63:56] & [55:48] & [15:8] & [7:0] & [31:24] & [23:16]. 0x3: Output Word: [39:32] & [47:40] & [55:48] & [63:56] & [7:0] & [15:8] & [23:16] & [31:24]. 0x4: Output Word: [31:0] &[63:32]. 0x5: Output Word: [23:16] & [31:24] & [7:0] & [15:8] & [55:48] & [63:56] & [39:32] & [47:40]. 0x6: Output Word: [15:8] & [7:0] & [31:24] & [23:16] & [47:40] & [39:32] & [63:56] & [55:48]. 0x7: Output Word: [0:63].

0x0460009C A_JPEG_WE_FRAME_ROTATION_CFG

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

JPEG frame rotation on the input image is specified by this register.

A_JPEG_WE_FRAME_ROTATION_CFG

Bits	Name	Description
1:0	WE_FRAME_ROTATION	This field specifies how order at which the write engine will write data to memory. 0x0: 0 Degree Rotation 0x1: 90 Degree Rotation 0x2: 180 Degree Rotation 0x3: 270 Degree Rotation

0x046000A0 A_JPEG_WE_Y_FRAME_ROTATION_START0

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

This register should be programmed as follows to perform 0, 90, 180, and 270 degree frame rotation, where FRAME_WIDTH_MCUS and FRAME_HEIGHT_MCUS are the values programmed in the FE_FRAME_CFG registers and Hx = 2 for H2VX input image format, Hx = 1 for H1VX input image format, Vx = 2 for HXV2 input image format, and Vx=1 for HXV1 input image format:

Rotation	H2V1	H2V2
0	0	0
90	FRAME_HEIGHT_MCUS *(FRAME_WIDTH_MCUS-8)	FRAME_HEIGHT_MCUS *(FRAME_WIDTH_MCUS-8)
180	FRAME_WIDTH_MCUS -16	FRAME_WIDTH_MCUS *8
270	FRAME_HEIGHT_MCUS -16	FRAME_HEIGHT_MCUS-16

A_JPEG_WE_Y_FRAME_ROTATION_START0

Bits	Name	Description
23:3	WE_Y_START_OFFSET0	This field specifies the first MCU address location to write to for the Y component.

0x046000A4 A_JPEG_WE_Y_FRAME_ROTATION_START1

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

This register should be programmed as follows to perform 0, 90, 180, and 270 degree frame rotation, where FRAME_WIDTH_MCUS and FRAME_HEIGHT_MCUS are the values programmed in the FE_FRAME_CFG registers and Hx = 2 for H2VX input image format, Hx = 1 for H1VX input image format, Vx = 2 for HXV2 input image format, and Vx=1 for HXV1 input image format:

Rotation	H2V1	H2V2
0	0	0
90	FRAME_HEIGHT_MCUS *(FRAME_WIDTH_MCUS-8)	FRAME_HEIGHT_MCUS *(FRAME_WIDTH_MCUS-8)
180	FRAME_WIDTH_MCUS -16	FRAME_WIDTH_MCUS *8
270	FRAME_HEIGHT_MCUS -16	FRAME_HEIGHT_MCUS-16

A_JPEG_WE_Y_FRAME_ROTATION_START1

Bits	Name	Description
23:3	WE_Y_START_OFFSET1	This field specifies the first MCU address location to write to for the Y component.

0x046000A8 A_JPEG_WE_CBCR_FRAME_ROTATION_START0

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

Viewfinder frame rotation is specified by this register.

This register should be programmed as follows to perform 0, 90, 180, and 270 degree frame rotation, where FRAME_WIDTH_MCUS and FRAME_HEIGHT_MCUS are the values programmed in the FE_FRAME_CFG registers and Hx = 2 and Vx = 1:

Rotation	WE_START_OFFSET CbCr Value
0	0
90	FRAME_WIDTH_MCUS * Hx * 8
180	FRAME_WIDTH_MCUS * Hx * 8 + (FRAME_HEIGHT_MCUS * Vx * 8) * (FRAME_WIDTH_MCUS+1) * Hx * 8
270	(FRAME_HEIGHT_MCUS * Vx * 8) * (FRAME_WIDTH_MCUS+1) * Hx * 8

A_JPEG_WE_CBCR_FRAME_ROTATION_START0

Bits	Name	Description
23:3	WE_CBCR_START_OFFSET0	This field specifies the first MCU address location to write the Ycomponent.

0x046000AC A_JPEG_WE_CBCR_FRAME_ROTATION_START1

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

Viewfinder frame rotation is specified by this register.

This register should be programmed as follows to perform 0, 90, 180, and 270 degree frame rotation, where FRAME_WIDTH_MCUS and FRAME_HEIGHT_MCUS are the values programmed in the FE_FRAME_CFG registers and Hx = 2 and Vx = 1:

Rotation	WE_START_OFFSET CbCr Value
0	0
90	FRAME_WIDTH_MCUS * Hx * 8
180	FRAME_WIDTH_MCUS * Hx * 8 + (FRAME_HEIGHT_MCUS * Vx * 8) * (FRAME_WIDTH_MCUS+1) * Hx * 8
270	(FRAME_HEIGHT_MCUS * Vx * 8) * (FRAME_WIDTH_MCUS+1) * Hx * 8

A_JPEG_WE_CBCR_FRAME_ROTATION_START1

Bits	Name	Description
23:3	WE_CBCR_START_OFFSET1	This field specifies the first MCU address location to write the Ycomponent.

0x046000B0 A_JPEG_WE_Y_FRAME_JUMP_OFFSET0

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

Viewfinder frame rotation is specified by this register.

Table to be added here.

A_JPEG_WE_Y_FRAME_JUMP_OFFSET0

Bits	Name	Description
23:3	WE_Y_JUMP_OFFSET0	This field gives the row jump offset for the WE to calculate the address to jump to after reading the luma component of an MCU row.

0x046000B4 A_JPEG_WE_Y_FRAME_JUMP_OFFSET1

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

Viewfinder frame rotation is specified by this register.

Table to be added here.

A_JPEG_WE_Y_FRAME_JUMP_OFFSET1

Bits	Name	Description
23:3	WE_Y_JUMP_OFFSET1	This field gives the row jump offset for the WE to calculate the address to jump to after reading the luma component of an MCU row.

0x046000B8 A_JPEG_WE_CBCR_FRAME_JUMP_OFFSET0

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

Viewfinder frame rotation is specified by this register

Table to be added here.

A_JPEG_WE_CBCR_FRAME_JUMP_OFFSET0

Bits	Name	Description
23:3	WE_CBCR_JUMP_OFFSET0	This field gives the row jump offset for the WE to calculate the address to jump to after reading the chroma component of an MCU row.

0x046000BC A_JPEG_WE_CBCR_FRAME_JUMP_OFFSET1

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

Viewfinder frame rotation is specified by this register

Table to be added here.

A_JPEG_WE_CBCR_FRAME_JUMP_OFFSET1

Bits	Name	Description
23:3	WE_CBCR_JUMP_OFFSET1	This field gives the row jump offset for the WE to calculate the address to jump to after reading the chroma component of an MCU row.

0x046000C0 A_JPEG_WE_Y_THRESHOLD

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

This threshold is used to determine when to stall and de-assert stall on reads during JPEG encoding or viewfinder frame rotation. If the buffer level within the WE exceeds the threshold, the HW will stall data from the FE on an MCU boundary.

Recommended HW settings for this register when the HW is configured for JEPG encoding are given below:

WE_THRESHOLD Field	Real-time Setting	Offline Setting
WE_ASSERT_STALL_TH	0x1FF	0x190
WE_DEASSERT_STALL_TH	0x1FF	0x16A

A_JPEG_WE_Y_THRESHOLD

Bits	Name	Description
24:16	WE_DEASSERT_STALL_TH	Threshold is specified in 16 byte increments. HW will de-assert stall upon detection of buffer level falling below this threshold.
8:0	WE_ASSERT_STALL_TH	Threshold is specified in 16 byte increments. HW will assert stall upon detection of buffer level exceeding this threshold.

0x046000C4 A_JPEG_WE_CBCR_THRESHOLD

Type: Read/Write
Clock: REG_CLK
Reset State: 0x0000 0000

This threshold is used to determine when to stall and de-assert stall on chroma reads during viewfinder rotation. If the buffer level within the WE exceeds the threshold, the HW will stall data from the FE on an MCU boundary.

Recommended HW settings for this register are given below:

WE_THRESHOLD Field	Real-time Setting	Offline Setting
WE_ASSERT_STALL_TH	0x1FF	0x190
WE_DEASSERT_STALL_TH	0x1FF	0x16A

A_JPEG_WE_CBCR_THRESHOLD

Bits	Name	Description
24:16	WE_DEASSERT_STALL_TH	Threshold is specified in 16 byte increments. HW will de-assert stall upon detection of buffer level falling below this threshold.
8:0	WE_ASSERT_STALL_TH	Threshold is specified in 16 byte increments. HW will assert stall upon detection of buffer level exceeding this threshold.

0x046000C8 A_JPEG_WE_Y_PING_BUFFER_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

Buffer write pointers are switched between the ping and pong buffers when the buffers are full as determined by the BUFFER_LENGTH field. Write pointers will not be updated on frame boundaries. For JPEG encoding, only the WE_Y_PING_ADDR and WE_CBCR_PONG_ADDR buffers are used to determine where the resulting bit stream generated by the HW is written.

During JPEG encode, there may be potentially more than one encoded frame per buffer. See Section 2.2 for how SW can determine the location of frames within a single/multiple buffers based on hardware reporting. The Y Ping and CbCr Ping buffers are the same size, and the Y Pong and Y CbCr buffers are the same size. The Ping and Pong Buffer sizes do not have to be the same size.The value programmed in this register must be a multiple of 4*WE_BURST_LENGTH bytes. For example, when the WE_BURST_LENGTH is set to select a burst of 4, the buffer length must be a multiple of 4*4=16.

A_JPEG_WE_Y_PING_BUFFER_CFG

Bits	Name	Description
22:0	WE_BUFFER_LENGTH	This field sets the length of the ping buffer in bytes.

0x046000CC A_JPEG_WE_Y_PONG_BUFFER_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

The value programmed in this register must be a multiple of 16 bytes.

A_JPEG_WE_Y_PONG_BUFFER_CFG

Bits	Name	Description
22:0	WE_BUFFER_LENGTH	This field sets the length of the pong buffer in bytes.

0x046000D0 A_JPEG_WE_CBCR_PING_BUFFER_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

The value programmed in this register must be a multiple of 16 bytes.

A_JPEG_WE_CBCR_PING_BUFFER_CFG

Bits	Name	Description
22:0	WE_BUFFER_LENGTH	This field sets the length of the ping buffer in bytes.

0x046000D4 A_JPEG_WE_CBCR_PONG_BUFFER_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

The value programmed in this register must be a multiple of 16 bytes.

A_JPEG_WE_CBCR_PONG_BUFFER_CFG

Bits	Name	Description
22:0	WE_BUFFER_LENGTH	This field sets the length of the pong buffer in bytes.

0x046000D8 A_JPEG_WE_Y_PING_ADDR

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_WE_Y_PING_ADDR

Bits	Name	Description
31:3	WE_Y_PING_START_ADDR	Bus address at the start of the ping buffer. Must be a multiple of 8. This register is double buffered.

0x046000DC A_JPEG_WE_Y_PONG_ADDR

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_WE_Y_PONG_ADDR

Bits	Name	Description
31:3	WE_Y_PONG_START_ADDR	Bus address at the start of the ping buffer. Must be a multiple of 8. This register is double buffered

0x046000E0 A_JPEG_WE_CBCR_PING_ADDR

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_WE_CBCR_PING_ADDR

Bits	Name	Description
31:3	WE_CBCR_PING_START_ADDR	Bus address at the start of the ping buffer. Must be a multiple of 8.

0x046000E4 A_JPEG_WE_CBCR_PONG_ADDR

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_WE_CBCR_PONG_ADDR

Bits	Name	Description
31:3	WE_CBCR_PONG_START_ADDR	Bus address at the start of the ping buffer. Must be a multiple of 8.

0x046000E8 A_JPEG_WE_Y_UB_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

Gemini implements a unified buffer. The dimension of the unified buffer is 512x128 bits or 8KB. Each intended active write channel must have its latency buffer pre-allocated by software prior to being active. The allocation of latency buffer is done by programming JPEG_WE_*_UB_CFG registers. Each write channel must not overwrite the other write channel's buffer location. When JPEG mode is used, this register should be configured with WE_Y_UB_OFFSET set to 0 and WE_Y_UB_DEPTH set to the maximum possible value.

A_JPEG_WE_Y_UB_CFG

Bits	Name	Description
24:16	WE_Y_UB_DEPTH	This field sets the unified buffer offset from address zero of unified buffer. The value is programmed starting from 0. Program a value of n means n. Minimum is 0 double word offset (or the first address location of unified buffer) and maximum is 511 double word offset (or the last address location of unified buffer).
8:0	WE_Y_UB_OFFSET	This field sets the unified buffer depth in terms of double words (128 bits). The value is programmed starting from 0. Program a value of N means (N + 1). Minimum is 1 double word and maximum is 512 double words.

0x046000EC A_JPEG_WE_CBCR_UB_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

When JPEG mode is used, the register values in this register are ignored by the HW.

A_JPEG_WE_CBCR_UB_CFG

Bits	Name	Description
24:16	WE_CBCR_UB_DEPTH	This field sets the unified buffer offset from address zero of unified buffer. The value is programmed starting from 0. Program a value of n means n. Minimum is 0 double word offset (or the first address location of unified buffer) and maximum is 511 double word offset (or the last address location of unified buffer).
8:0	WE_CBCR_UB_OFFSET	This field sets the unified buffer depth in terms of double words (128 bits). The value is programmed starting from 0. Program a value of N means (N + 1). Minimum is 1 double word and maximum is 512 double words.

0x046000F0 A_JPEG_WE_CMD

Type: Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register allows SW the capability to reset the memory pointers to where data is written to.

Note that this register is a command register - writes to this register produced strobe commands to the HW

A_JPEG_WE_CMD

Bits	Name	Description
0	WE_BUFFER_RELOAD_CMD	This field is used to reload and reset the write channel address to start from the PING address buffer. The value in this field is strictly a strobe (pulse) based value, and there is no registering of this value.

14.6.1.7 JPEG Encode registers

0x046000F4 A_JPEG_ENCODE_CFG

Type: Write/Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register configures the JPEG encode path. The Huffman encode look up table is controlled by this register. This register also controls the restart marker interval. Allowable restart marker intervals are from 0 to 65535.

A_JPEG_ENCODE_CFG

Bits	Name	Description
16	HUFFMAN_SEL	This field determines whether HW uses a default Huffman table or a customized Huffman table. If a custom Huffman table is to be used, SW must load the Huffman table via the DMI registers. If the default Huffman table is to be used, there is no need for software to load the Huffman table. ' When set (1), HW selects a customized Huffman table for JPEG processing. ' When clear (0), HW selects the default Huffman table for JPEG processing.
15:0	RST_MARKER_PERIOD	Number of MCUs between Restart (RST) marker insertion. When programmed to 0000, restart marker insertion is disabled. A value of N MCUs between restart markers is programmed as N.

14.6.1.8 Statistics registers

This section describes the registers which can be used for JPEG statistics collection. For reference, in a typical 8MP image, there are approximately 127,896 8x8 blocks. Hence, there are 127,896 Y DC coefficients, 127,896 CbCr DC coefficients, 8,057,448 Y AC coefficients, and 8,057,448 CbCr AC coefficients.

0x046000F8 A_JPEG_ENCODE_STATS_DC_BITS_Y

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

Reading this register after receiving the frame_done_irq will return the total number of bits used to encode the luma DC coefficients.

A_JPEG_ENCODE_STATS_DC_BITS_Y

Bits	Name	Description
28:0	ENC_DC_BITS_Y	Number of bits expanded on coding the DC coefficients.

0x046000FC A_JPEG_ENCODE_STATS_DC_BITS_CBCR

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

Reading this register after receiving the frame_done_irq will return the total number of bits used to encode the chroma DC coefficients.

A_JPEG_ENCODE_STATS_DC_BITS_CBCR

Bits	Name	Description
28:0	ENC_DC_BITS_CBCR	Number of bits expanded on coding the chroma DC coefficients.

0x04600100 A_JPEG_ENCODE_STATS_AC_BITS_Y

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

Reading this register after receiving the frame_done_irq will return the total number of bits used to encode the luma AC coefficients. With a 512 x 512 H2V2 MCU image, there are approximately 210 * 210 * 6 * 26 * 23 = 6 * 229 bits.

A_JPEG_ENCODE_STATS_AC_BITS_Y

Bits	Name	Description
29:0	ENC_AC_BITS_Y	Number of bits expanded on coding the AC luma coefficients.

0x04600104 A_JPEG_ENCODE_STATS_AC_BITS_CBCR

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

Reading this register after receiving the frame_done_irq will return the total number of bits used to encode the chroma AC coefficients.

A_JPEG_ENCODE_STATS_AC_BITS_CBCR

Bits	Name	Description
29:0	ENC_AC_BITS_CBCR	Number of bits expanded on coding the AC chroma coefficients.

0x04600108 A_JPEG_ENCODE_STATS_NONZERO_AC_Y

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

Reading this register after receiving the frame_done_irq will return the total number of nonzero luma AC coefficients. A maximum of 67,108,864 non-zero coefficients can be reported by this register.

A_JPEG_ENCODE_STATS_NONZERO_AC_Y

Bits	Name	Description
25:0	ENC_NONZERO_AC_Y	Number of non-zero AC coefficients for luma.

0x0460010C A_JPEG_ENCODE_STATS_NONZERO_AC_CBCR

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

Reading this register after receiving the frame_done_irq will return the total number of nonzero chroma AC coefficients. A maximum of 67,108,864 non-zero coefficients can be reported by this register.

A_JPEG_ENCODE_STATS_NONZERO_AC_CBCR

Bits	Name	Description
25:0	ENC_NONZERO_AC_CBCR	Number of non-zero AC coefficients for chroma.

14.6.1.9 File Size Control registers

This section describes the registers that are used for file size control. These registers need to be programmed only when File Size Control functionality is enabled. With File Size Control, the image is divided into 16 horizontal or 16 vertical regions. SW must specify the bit budget for each of these regions, as well as the number of MCU rows per region.

0x04600110 A_JPEG_ENCODE_FSC_REGION_SIZE

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register establishes the region size in number of MCU rows.

A_JPEG_ENCODE_FSC_REGION_SIZE

Bits	Name	Description
8	HV_REGION	This field determines whether the vertical sequencing. ' When set (1), regions are vertical with respect to the original input image orientation. ' When clear (0), regions are horizontal with respect to the original input image orientation.
4:0	REGION_SIZE	This value is programmed to the number of MCU rows. If there are N MCU rows per region, this register should be programmed as N-1. This implies that there is a minimum setting on 1 MCU row per region.

0x04600114 A_JPEG_ENCODE_FSC_BUDGET_0

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register establishes the bit budget for regions 0 through 3. If a field within the budget register is programmed with the value N, the bit budget is 16*N for the region.

A_JPEG_ENCODE_FSC_BUDGET_0

Bits	Name	Description
31:24	BUDGET_REGION3	These bits specify the bit budget for region 3.
23:16	BUDGET_REGION2	These bits specify the bit budget for region 2.
15:8	BUDGET_REGION1	These bits specify the bit budget for region 1.
7:0	BUDGET_REGION0	These bits specify the bit budget for region 0.

0x04600118 A_JPEG_ENCODE_FSC_BUDGET_1

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register establishes the bit budget for regions 4 through 7.

A_JPEG_ENCODE_FSC_BUDGET_1

Bits	Name	Description
31:24	BUDGET_REGION7	These bits specify the bit budget for region 7.
23:16	BUDGET_REGION6	These bits specify the bit budget for region 6.
15:8	BUDGET_REGION5	These bits specify the bit budget for region 5.
7:0	BUDGET_REGION4	These bits specify the bit budget for region 4.

0x0460011C A_JPEG_ENCODE_FSC_BUDGET_2

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register establishes the bit budget for regions 8 through 11.

A_JPEG_ENCODE_FSC_BUDGET_2

Bits	Name	Description
31:24	BUDGET_REGION11	These bits specify the bit budget for region 11.
23:16	BUDGET_REGION10	These bits specify the bit budget for region 10.
15:8	BUDGET_REGION9	These bits specify the bit budget for region 9.
7:0	BUDGET_REGION8	These bits specify the bit budget for region 8.

0x04600120 A_JPEG_ENCODE_FSC_BUDGET_3

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register establishes the bit budget for regions 12 through 15.

A_JPEG_ENCODE_FSC_BUDGET_3

Bits	Name	Description
31:24	BUDGET_REGION15	These bits specify the bit budget for region 15.
23:16	BUDGET_REGION14	These bits specify the bit budget for region 14.
15:8	BUDGET_REGION13	These bits specify the bit budget for region 13.
7:0	BUDGET_REGION12	These bits specify the bit budget for region 12.

14.6.1.10 DMI registers

SW loads the quantization and Huffman LUTs. These tables are loaded via the DMI registers.

0x04600124 A_JPEG_DMI_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

HW implementation requires the used of two identical Huffman LUTS. Writing to either of the Huffman LUTs results in writing both LUTS simultaneously. HW reads from each Huffman LUT independently.

A_JPEG_DMI_CFG

Bits	Name	Description
2	AUTO_INC_EN	Setting (1) this bit auto-increments JPEG_DMI_ADDR by 1 anytime JPEG_DMI_DATA_LO is written to or read from.
1:0	DMI_RAM_SEL	This bit field is used to select the GEMINI local memory for direct memory access. 0x0: No memory selected 0x1: Quantization LUT RAM 0x2: Huffman LUT0 RAM 0x3: Huffman LUT1 RAM

0x04600128 A_JPEG_DMI_ADDR

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_DMI_ADDR

Bits	Name	Description
9:0	DMI_ADDR	This bit field specifies the address for the RAM selected by DMI_RAM_SEL.

0x0460012C A_JPEG_DMI_DATA_LO

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_DMI_DATA_LO

Bits	Name	Description
31:0	DMI_DATA_LO	This register represents the lower 32 bits of the DMI data. When this register is written, the value of this register is written into the lower 32 bits of the memory selected by JPEG_DMI_CFG. If the memory is wider than 32 bits, the upper 32 bits can be prepared by writing to JPEG_DMI_DATA_HI. When this register is read, it returns the lower 32 bits of the memory data.

14.6.1.11 Test generator registers

0x04600130 A_JPEG_TESTGEN_CFG

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A hardware test generator resides at the input to the JPEG pipeline. In test mode, the output of the test generator is used to drive the JPEG pipeline as opposed to the Fetch Engine. This register configures the HW testgen block.

A_JPEG_TESTGEN_CFG

Bits	Name	Description
28:20	TESTGEN_BLOCKS	Number of 8x8 pixel blocks to generate and feed to JPEG pipeline. This value should always be programmed to an even value.
18	TESTGEN_DC_MODE	This field selects whether the DC input value to the testgen block is generated randomly every 8x8 block or whether it is fed directly from the software regs. 0x0: HW controlled 0x1: SW register controlled
17	TESTGEN_AC_MODE	This field selects whether the AC input value to the testgen block is generated randomly every 8x8 block or whether it is fed directly from the software regs. 0x0: HW controlled 0x1: SW register controlled

A_JPEG_TESTGEN_CFG (cont.)

Bits	Name	Description
15:8	TESTGEN_DC	This field is the 8-bit signed DC value which the testgen will use to compute each pixel value when testgen_dc_mode =1.
6:0	TESTGEN_AC_MAG	This field is the 7-bit AC magnitude which the testgen will use to compute each pixel value when testgen_ac_mode =1.

0x04600134 A_JPEG_TESTGEN_SEED

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A hardware test generator resides at the input to the JPEG pipeline. In test mode, the output of the test generator is used to drive the JPEG pipeline as opposed to the Fetch Engine. This register sets the seed of the PN generator.

A_JPEG_TESTGEN_SEED

Bits	Name	Description
15:0	TESTGEN_SEED	The field is programmed with the seed value for the TESTGEN PN pixel generator.

0x04600138 A_JPEG_TESTGEN_CMD

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_TESTGEN_CMD

Bits	Name	Description
0	TESTGEN_START_CMD	This field initiates the test generator machine. The value in this field is strictly a strobe (pulse) based value, and there is no registering of this value. 0x0: Clearing this bit has no effect 0x1: Trigger a request to start the HW test generator

14.6.1.12 JPEG Performance Monitor and Debug Registers

0x0460013C A_JPEG_MONITOR_STATUS_0

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0007 ffff

This register returns the minimum number of JPEG clock cycles between MCU strobes from the VFE Interface. To clear this value, SW must reset the VFE interface.

The worst case buffer is 16 lines deep, and the longest line time is given with a 2MP sensor. At 15 fps, each line would be 66ms/1200 = 55us in duration. An MCU strobe would be expected every 16*55us = .88 ms. The JPEG clock is specified to run at max frequency of 170 MHz, or a clock period of 5.8ns. Hence, there are .88ms/5.8ns = 151,724 JPEG clock cycles expected between MCU strobes. This register supports up a count up to 524,288 clock cycles.

A_JPEG_MONITOR_STATUS_0

Bits	Name	Description
18:0	STB_TO_STB_CNT	Minimum number of JPEG clock cycles between MCU strobes.

0x04600140 A_JPEG_MONITOR_STATUS_1

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register returns the maximum WE FIFO usage during encoding as well as additional status bits. The FIFO level value fields are updated at the end of the frame. The underflow and overflow bits are set should any of the events occur. The event status bits are not expected during normal operation.

A_JPEG_MONITOR_STATUS_1

Bits	Name	Description
19	EOI_OVERFLOW	When '1', this bit indicates that the EOI strobe coming out of the bus_wr_intf may be corrupted. This is caused when 2 EOI tokens are present in the Unified Buffer at any given time.
18	EOF_OVERFLOW	When '1', this bit indicates that a PING PONG buffer switch may have been corrupted. This is caused when two ping-pong buffer switch tokens are present in the unified buffer at any given time.
17	CH1_FIFO_UNDERFLOW	When '1', this status bit indicates an underflow condition occurred on the ch1 WE FIFO.

A_JPEG_MONITOR_STATUS_1 (cont.)

Bits	Name	Description
16	CH0_FIFO_UNDERFLOW	When '1', this status bit indicates an underflow condition occurred on the ch0 WE FIFO.
13:8	CH1_FIFO_LEVEL	Max number of words held in ch1 WE FIFO.
5:0	CH0_FIFO_LEVEL	Max number of words held in ch0 WE FIFO.

0x04600144 A_JPEG_MONITOR_STATUS_2

Type: Read
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register reports the number of read transactions to IMEM and the maximum total number of bus cycles required for the reported number of read transactions. The value reported is over one IMEM buffer period. This register should be read only when the bus is inactive.

A_JPEG_MONITOR_STATUS_2

Bits	Name	Description
31:14	TRANS_BUS_CYCLES	Bus transaction cycles over one IMEM buffer period
13:0	TRANS_CNT	Bus transaction count over one IMEM buffer period

14.6.1.13 Test bus registers

0x04600148 A_JPEG_TESTBUS_SEL

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

This register controls the selection of the GEMINI test bus output. The top level of the chip must also be configured to MUX out the proper test bus to the chip pads.

A_JPEG_TESTBUS_SEL

Bits	Name	Description
9:8	DOMAIN_SEL	These bits set the selection for the output on the TESTBUS for visibility and debugging. 0x0: "01124110" 0x3: "FEEDBEEF" 0x1: JPEG_CLK Test Bus 0x2: BUS_CLK Test Bus
4:0	BUS_SEL	These bits select which bus on a clock domain is output on the TESTBUS. For JPEG CLK testbus, the selections are: For BUS CLK testbus, the selections are: 5'b00011: 5'b00100: 5'b00101: 5'b00110: 5'b00111: 5'b01000: 5'b01001: 5'b01010: 5'b01011: 5'b01100: 0x0: VFE Interface Block Test Bus 0x1: Fetch Engine Block Test Bus 0 0x2: Fetch Engine Block Test Bus 1 0x3: Fetch Engine Block Test Bus 2 0x4: DCT Block Test Bus 0x5: Quantizer Block Test Bus 0x6: FSC Block Test Bus 0x7: ZigZag Block Test Bus 0x8: Run Length Encoder Block Test Bus 0x9: Huffman Block Test Bus 0xA: Statistics Block Test Bus 0xB: Write Engine Block Test Bus 0 0xC: Write Engine Block Test Bus 1 0xD: Write Engine Block Test Bus 2 0xE: Write Engine Block Test Bus 3 0xF: IRQ Block 0x10: IMEM FIFO Addressing Channel 0 Test Bus 0x11: IMEM FIFO Addressing Channel 1 Test Bus 0x0: Bridge Testbus 1 0x1: Bridge Testbus 2 0x2: Bus MISR Test Bus

0x0460014C A_JPEG_SPARE

Type: Read/Write
Clock: REG_CLK
Read Wait States:0
Reset State: 0x0000 0000

A_JPEG_SPARE

Bits	Name	Description
31:0	SPARE	Spare register

14.7 MIPI DSI1 Registers (0x04700000 MIPI_DSI_1_BASE)

0x04700000 MIPI_DSI_1_DSI1_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Control Register provides general control to the protocol, lane management and PHY layers.

MIPI_DSI_1_DSI1_CTRL

Bits	Name	Description
31	RESERVED_1	
30	NEW_INTERLEAVE_MODE_EN	unused (Enable new interleave mode with H/W arbitration between long commands and BLLP periods.) 0x0: disable 0x1: enable
29:28	PACKET_BYTE_MSB_LSB_FLIP	Swap the bit ordering of each byte of a packet 0x0: no swap (bit 0 is lsb, bit 7 is msb) 0x1: swap each byte of payload (bit 0 is msb, bit 7 is lsb) 0x2: swap each byte of packet (bit 0 is msb, bit 7 is lsb) 0x3: reserved
27	RESERVED_2	
26	DEBUG_MODE_EN	Enable debug mode for supporting non-compliant panels 0x0: disable 0x1: enable
25	RESERVED_3	
24	CRC_CHK_EN	Enable CRC verification of the received packets 0x0: Disable 0x1: Enable
23:21	RESERVED_4	
20	ECC_CHK_EN	Enable ECC verification of the received packets 0x0: Disable 0x1: Enable
19:9	RESERVED_5	
8	CLKLN_EN	Enable clock lane of the PHY 0x0: Disable DSI PHY Clock Lane 0x1: Enable DSI PHY Clock Lane
7	DLN3_EN	Enable data lane 3 of the PHY 0x0: Disable DSI PHY Data Lane 3 0x1: Enable DSI PHY Data Lane 3

MIPI_DSI_1_DSI1_CTRL (cont.)

Bits	Name	Description
6	DLN2_EN	Enable data lane 2 of the PHY 0x0: Disable DSI PHY Data Lane 2 0x1: Enable DSI PHY Data Lane 2
5	DLN1_EN	Enable data lane 1 of the PHY 0x0: Disable DSI PHY Data Lane 1 0x1: Enable DSI PHY Data Lane 1
4	DLN0_EN	Enable data lane 0 of the PHY 0x0: Disable DSI PHY Data Lane 0 0x1: Enable DSI PHY Data Lane 0
3	RESERVED_6	
2	CMD_MODE_EN	Enable the Command Mode Engine. 0x0: Disable DSI Command Mode Engine 0x1: Enable DSI Command Mode Engine
1	VIDEO_MODE_EN	Enable the Video Mode Engine. 0x0: Disable DSI Video Mode Engine 0x1: Enable DSI Video Mode Engine
0	DSI_EN	Enable the DSI controller. 0x0: Disable DSI Controller 0x1: Enable DSI controller

0x04700004 MIPI_DSI_1_DSI1_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Status Register provides status of the DSI controller

MIPI_DSI_1_DSI1_STATUS

Bits	Name	Description
31	INTERLEAVE_OP_CONTENTION_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
31	INTERLEAVE_OP_CONTENTION	READ ONLY. The controller generates command mode packets and video mode packets at the same time (i.e.: the command mode packets are longer than one BLLP period)
30:7	RESERVED	
6	PHY_RESET_BUSY	READ ONLY. DSI interface is busy sending the panel reset through the link
5	GENERIC_TRIGGER_BUSY	READ ONLY. DSI interface is busy sending the generic trigger through the link

MIPI_DSI_1_DSI1_STATUS (cont.)

Bits	Name	Description
4	BTA_BUSY	READ ONLY. DSI interface is busy waiting for read response, acknowledge or tearing effect signal from the peripheral
3	VIDEO_MODE_ENGINE_BUSY	READ ONLY. Video Mode Engine is busy sending data from display engine
2	CMD_MODE_MDP_BUSY	READ ONLY. Command Mode Engine is busy sending data from display engine
1	CMD_MODE_DMA_BUSY	READ ONLY. Command Mode Engine is busy sending data from memory or reading data from the display panel
0	CMD_MODE_ENGINE_BUSY	READ ONLY. Command Mode Engine Busy

0x04700008 MIPI_DSI_1_DSI1_FIFO_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x11111000

Status of FIFOs in the DSI controller

MIPI_DSI_1_DSI1_FIFO_STATUS

Bits	Name	Description
31	RESERVED_1	
30	DLN3_HS_FIFO_OVERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
30	DLN3_HS_FIFO_OVERFLOW	READ ONLY. The FIFO of Lane 3 overflows
29	DLN3_HS_FIFO_FULL	READ ONLY. The FIFO of Lane 3 is full
28	DLN3_HS_FIFO_EMPTY	READ ONLY. The FIFO of Lane 3 is empty
27	RESERVED_2	
26	DLN2_HS_FIFO_OVERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
26	DLN2_HS_FIFO_OVERFLOW	READ ONLY. The FIFO for HS data on Lane 2 overflows
25	DLN2_HS_FIFO_FULL	READ ONLY. The FIFO for HS data on Lane 2 is full
24	DLN2_HS_FIFO_EMPTY	READ ONLY. The FIFO for HS data on Lane 2 is empty
23	RESERVED_3	
22	DLN1_HS_FIFO_OVERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear this bit

MIPI_DSI_1_DSI1_FIFO_STATUS (cont.)

Bits	Name	Description
22	DLN1_HS_FIFO_OVERFLOW	READ ONLY. The FIFO of Lane 1 overflows
21	DLN1_HS_FIFO_FULL	READ ONLY. The FIFO of Lane 1 is full
20	DLN1_HS_FIFO_EMPTY	READ ONLY. The FIFO of Lane 1 is empty
19	RESERVED_4	
18	DLN0_HS_FIFO_OVERFLOW	READ ONLY. The FIFO for HS data on Lane 0 overflows
18	DLN0_HS_FIFO_OVERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
17	DLN0_HS_FIFO_FULL	READ ONLY. The FIFO for HS data on Lane 0 is full
16	DLN0_HS_FIFO_EMPTY	READ ONLY. The FIFO for HS data on Lane 0 is empty
15	RESERVED_5	
14	DLN0_LP_FIFO_OVERFLOW_CLR	WRITE ONLY. unused
14	DLN0_LP_FIFO_OVERFLOW	READ ONLY. unused
13	DLN0_LP_FIFO_FULL	READ ONLY. The FIFO for LP data on Lane 0 is full
12	DLN0_LP_FIFO_EMPTY	READ ONLY. The FIFO for LP data on Lane 0 is empty
11	RESERVED_6	
10	CMD_DMA_FIFO_UNDERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
10	CMD_DMA_FIFO_UNDERFLOW	READ ONLY. The Command mode engine dmafifo underflows
9	CMD_DMA_FIFO_WR_WATERMARK_REACH_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
9	CMD_DMA_FIFO_WR_WATERMARK_REACH	READ ONLY. The Command mode engine dmafifo write watermark is reached
8	CMD_DMA_FIFO_RD_WATERMARK_REACH_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
8	CMD_DMA_FIFO_RD_WATERMARK_REACH	READ ONLY. The Command mode engine dmafifo read watermark is reached
7	CMD_MDP_FIFO_UNDERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear the underflow bit
7	CMD_MDP_FIFO_UNDERFLOW	READ ONLY. Command mode engine MDP fifo underflows
6:4	RESERVED_7	
3	VIDEO_MDP_FIFO_UNDERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear the underflow bit

MIPI_DSI_1_DSI1_FIFO_STATUS (cont.)

Bits	Name	Description
3	VIDEO_MDP_FIFO_UNDERFLOW	READ ONLY. Video fifo underflows
2:1	RESERVED_8	
0	VIDEO_MDP_FIFO_OVERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear the overflow bit
0	VIDEO_MDP_FIFO_OVERFLOW	READ ONLY. Video mode engine fifo overflows

0x0470000C MIPI_DSI_1_DSI1_VIDEO_MODE_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00008000

DSI Video Mode Engine Control Register

MIPI_DSI_1_DSI1_VIDEO_MODE_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	PULSE_MODE_OPT	Select pulse mode option 0x0: no HSA and HE following VS/VE packet 0x1: send HSA and HE following VS/VE packet
27:25	RESERVED_2	
24	HFP_PWR_MODE	Select power mode during the HFP period 0x0: send blanking packets in High Speed mode 0x1: low power stop mode (LP-11)
23:21	RESERVED_3	
20	HBP_PWR_MODE	Select power mode during the HBP period 0x0: send blanking packets in High Speed mode 0x1: low power stop mode (LP-11)
19:17	RESERVED_4	
16	HSA_PWR_MODE	Select power mode during the HSA period 0x0: send blanking packets in High Speed mode 0x1: low power stop mode (LP-11)
15	EOF_BLLP_PWR_MODE	Select power mode for the BLLP of the last line of a frame 0x0: send blanking packets during BLLP in high speed mode and block Command Mode packets 0x1: low power stop mode (LP-11 or let Command Mode Engine send packets in HS or LP mode)

MIPI_DSI_1_DSI1_VIDEO_MODE_CTRL (cont.)

Bits	Name	Description
14:13	RESERVED_5	
12	BLLP_PWR_MODE	DSI Power Mode for packets sent during BLLP period 0x0: send blanking packets during BLLP in high speed mode and block Command Mode packets 0x1: low power stop mode (LP-11 or let Command Mode Engine send packets in HS or LP mode)
11:10	RESERVED_6	
9:8	TRAFFIC_MODE	DSI video mode traffic sequence 0x0: non-burst mode with sync pulses 0x1: non-burst mode with sync start events 0x2: burst mode 0x3: reserved
7:6	RESERVED_7	
5:4	DST_FORMAT	Pixel format. If there is interleaved Command Mode pixel packets (generated from MDP), the pixel depth of the Command Mode pixel packet should be greater or equal to the pixel depth of the Video mode pixel packet. 0x0: RGB565 0x1: RGB666_1 (packed) 0x2: RGB666_2 (loosely packed) 0x3: RGB888
3:2	RESERVED_8	
1:0	VC	Virtual channel identifier

0x04700010 MIPI_DSI_1_DSI1_VIDEO_MODE_SYNC_DATATYPE

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x31211101

DSI Video Mode Sync Datatype Register

MIPI_DSI_1_DSI1_VIDEO_MODE_SYNC_DATATYPE

Bits	Name	Description
31:30	RESERVED_1	
29:24	HE	Specify the data type of a hsync end packet
23:22	RESERVED_2	
21:16	HS	Specify the data type of a hsync start packet
15:14	RESERVED_3	

MIPI_DSI_1_DSI1_VIDEO_MODE_SYNC_DATATYPE (cont.)

Bits	Name	Description
13:8	VE	Specify the data type of a vsync end packet
7:6	RESERVED_4	
5:0	VS	Specify the data type of a vsync start packet

0x04700014 MIPI_DSI_1_DSI1_VIDEO_MODE_PIXEL_DATATYPE

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x3E2E1E0E

DSI Video Mode Pixel Datatype Register

MIPI_DSI_1_DSI1_VIDEO_MODE_PIXEL_DATATYPE

Bits	Name	Description
31:30	RESERVED_1	
29:24	RGB888	Specify the datatype of an RGB888 pixel stream packet
23:22	RESERVED_2	
21:16	RGB666	Specify the datatype of a loosely-packed RGB666 pixel stream packet
15:14	RESERVED_3	
13:8	RGB666_PACKED	Specify the datatype of a packed RGB666 pixel stream packet
7:6	RESERVED_4	
5:0	RGB565	Specify the datatype of an RGB565 pixel stream packet

0x04700018 MIPI_DSI_1_DSI1_VIDEO_MODE_BLANKING_DATATYPE

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00001900

DSI Video Mode Blanking Packet Datatype Register

MIPI_DSI_1_DSI1_VIDEO_MODE_BLANKING_DATATYPE

Bits	Name	Description
31:14	RESERVED	
13:8	BLANK_PKT_DATATYPE	Specify the datatype of a blanking packet

MIPI_DSI_1_DSI1_VIDEO_MODE_BLANKING_DATATYPE (cont.)

Bits	Name	Description
7:0	BLANK_PKT_DATA	This byte will be repeated in the payload portion of the blanking packet

0x0470001C MIPI_DSI_1_DSI1_VIDEO_MODE_DATA_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Video Mode Data Control Register

MIPI_DSI_1_DSI1_VIDEO_MODE_DATA_CTRL

Bits	Name	Description
31:15	RESERVED_1	
14:12	RGB_SWAP	Swaps the R, G, and B channels of the dst pixels. This field should be used when different R,G, and B orderings are required. For example, if RGB_SWAP = 1 , RGB565 will become RBG556. 0x0: RGB 0x1: RBG 0x2: BGR 0x3: BRG 0x4: GRB 0x5: GBR 0x6: reserved_1 0x7: reserved_2
11:9	RESERVED_2	
8	B_SEL	Bit Swaps the B Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
7:5	RESERVED_3	
4	G_SEL	Bit Swaps the G Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
3:1	RESERVED_4	

MIPI_DSI_1_DSI1_VIDEO_MODE_DATA_CTRL (cont.)

Bits	Name	Description
0	R_SEL	Bit Swaps the R Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap

0x04700020 MIPI_DSI_1_DSI1_VIDEO_MODE_ACTIVE_H

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Active Horizontal Display Region register.

The Active_H_Disp register defines the horizontal characteristics of the active window. (NOTE: video mode parameters are 0-based.)

MIPI_DSI_1_DSI1_VIDEO_MODE_ACTIVE_H

Bits	Name	Description
31:28	RESERVED_1	
27:16	ACTIVE_H_END	ACTIVE_H_END field tells the video mode engine where the horizontal viewing area ends (minus one) in pixel clock cycle relative to the horizontal sync signal.
15:12	RESERVED_2	
11:0	ACTIVE_H_START	ACTIVE_H_START field tells the video mode engine where the horizontal viewing area starts (minus one) in pixel clock cycle relative to the horizontal sync signal.

0x04700024 MIPI_DSI_1_DSI1_VIDEO_MODE_ACTIVE_V

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CRTC Active Vertical Display Region register.

The Active_V_Disp register defines the vertical characteristics of the active window. (NOTE: video mode parameters are 0-based.)

MIPI_DSI_1_DSI1_VIDEO_MODE_ACTIVE_V

Bits	Name	Description
31:28	RESERVED_1	
27:16	ACTIVE_V_END	ACTIVE_V_END field tells the video mode engine where the horizontal viewing area ends (minus one) in lines relative to the vertical sync signal
15:12	RESERVED_2	
11:0	ACTIVE_V_START	ACTIVE_V_START field tells the video mode engine where the vertical viewing area starts (minus one) in lines relative to the vertical sync signal

0x04700028 MIPI_DSI_1_DSI1_VIDEO_MODE_TOTAL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Total Scan Area register.

TOTAL register defines the size of the total possible scanning area (NOTE: video mode parameters are 0-based.)

MIPI_DSI_1_DSI1_VIDEO_MODE_TOTAL

Bits	Name	Description
31:28	RESERVED_1	
27:16	VIDEO_V_TOTAL	Number of lines in one frame minus one. This value is equivalent to the period of the vertical sync
15:12	RESERVED_2	
11:0	VIDEO_H_TOTAL	Number of pixels in one scan line (horizontal line) of the LCD controller minus one. This value is equivalent to the period of the horizontal sync signal (in pixel clock cycles).

0x0470002C MIPI_DSI_1_DSI1_VIDEO_MODE_HSYNC

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HSync Control register which controls the horizontal screen position at which a horizontal sync packet is sent by the DSI controller to the panel. (NOTE: video mode parameters are 0-based.)

MIPI_DSI_1_DSI1_VIDEO_MODE_HSYNC

Bits	Name	Description
31:28	RESERVED_1	
27:16	HS_END	The position (minus one) where the horizontal sync ends in one line.
15:12	RESERVED_2	
11:0	HS_START	The position (minus one) where the horizontal sync starts in one line.

0x04700030 MIPI_DSI_1_DSI1_VIDEO_MODE_VSYNC

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

VSync Control register which controls the horizontal screen position at which a vertical sync packet is sent by the DSI controller to the panel. (NOTE: video mode parameters are 0-based.)

MIPI_DSI_1_DSI1_VIDEO_MODE_VSYNC

Bits	Name	Description
31:28	RESERVED_1	
27:16	VS_END	The position (minus one) where the vertical sync ends in one line.
15:12	RESERVED_2	
11:0	VS_START	The position (minus one) where the vertical sync starts in one line.

0x04700034 MIPI_DSI_1_DSI1_VIDEO_MODE_VSYNC_VPOS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

VSync Control register which controls the vertical screen position at which a vertical sync packet is sent by the DSI controller to the panel. (NOTE: video mode parameters are 0-based.)

MIPI_DSI_1_DSI1_VIDEO_MODE_VSYNC_VPOS

Bits	Name	Description
31:28	RESERVED_1	
27:16	VS_VPOS_END	The line (minus one) where the vertical sync ends in one frame.

MIPI_DSI_1_DSI1_VIDEO_MODE_VSYNC_VPOS (cont.)

Bits	Name	Description
15:12	RESERVED_2	
11:0	VS_VPOS_START	The line (minus one) where the vertical sync starts in one frame.

0x04700038 MIPI_DSI_1_DSI1_COMMAND_MODE_DMA_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Mode Control Register for DMA data control

MIPI_DSI_1_DSI1_COMMAND_MODE_DMA_CTRL

Bits	Name	Description
31	BROADCAST_EN	Enable the DSI core to send packets from DMA at the same time with the other core (this bit has to be set for the other DSI core as well). If broadcast is enable, the core needs to wait until both cores have fetched entire command buffer before start sending dma packets. When this bit is set, the command buffer size (DSI_DMA_CMD_LENGTH) must be less than 0x200 bytes. 0x0: disable 0x1: enable
30	BROADCAST_MASTER	Indicate whether this core is the master or slave 0x0: this core is the slave 0x1: this core is the master
29	RESERVED_1	
28	EMBEDDED_MODE	Select packet_type, BTA settings and packet header information 0x0: from the register 0x1: from the frame buffer
27	RESERVED_2	
26	POWER_MODE	Select power mode for data transmission of both embedded and non-embedded commands 0x0: high speed mode 0x1: low power mode
25	RESERVED	
24	PACKET_TYPE	Select packet type for non-embedded commands 0x0: short packet 0x1: long packet
23:22	VC	Virtual channel identifier for pixel data or non-embedded commands
21:16	DT	Data type for pixel data or non-embedded commands

MIPI_DSI_1_DSI1_COMMAND_MODE_DMA_CTRL (cont.)

Bits	Name	Description
15:0	WC	Exact number of bytes in one packet for pixel data or non-embedded commands

0x0470003C MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x06100006

DSI Command Mode Control Register for MDP data control

MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_CTRL

Bits	Name	Description
31	LINE_SPLIT	Break a line into small packets 0x0: no split 0x1: split
30:28	RGB_SWAP1	Swaps the R, G, and B channels of the dst pixels for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise rgb swap for stream1 is defined by RGB_SWAP). This field should be used when different R,G, and B orderings are required. For example, if RGB_SWAP = 1 , RGB565 will become RBG556. 0x0: RGB 0x1: RBG 0x2: BGR 0x3: BRG 0x4: GRB 0x5: GBR 0x6: reserved_1 0x7: reserved_2
27:24	DST_FORMAT1	Pixel format for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise pixel format for stream1 is defined by DST_FORMAT) - 0 = RGB111 - 1 = reserved - 2 = reserved - 3 = RGB332 (data_src_width must be in multiple of 2 pixels) - 4 = RGB444 (data_src_width must be in multiple of 2 pixels) - 5 = reserved - 6 = RGB565 - 7 = RGB666 - 8 = RGB888 others = reserved

MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_CTRL (cont.)

Bits	Name	Description
23:20	INTERLEAVE_MAX	Maximum number of Command Mode RGB packets to send within one horizontal blanking period of the Video Mode frame (sw must ensure that they can fit in one BLLP period)
19	RESERVED_1	
18:16	RGB_SWAP	Swaps the R, G, and B channels of the dst pixels. This field should be used when different R,G, and B orderings are required. For example, if RGB_SWAP = 1 , RGB565 will become RBG556. 0x0: RGB 0x1: RBG 0x2: BGR 0x3: BRG 0x4: GRB 0x5: GBR 0x6: reserved_1 0x7: reserved_2
15	STREAM1_DST_FORMAT_SEL	Pixel format selection for stream 1. If MDP sends two streams to DSI and these streams have different output formats, then the pixel clock must be set according to the smallest pixel depth between the two. Otherwise, underflow may occur. Ex.: If stream0 is in RGB888 and stream1 is in RGB565, then pixel clock must be greater than dsiclk/2. 0x0: DST_FORMAT (same as stream0) 0x1: DST_FORMAT1
14	RESERVED_2	
13	B_SEL1	Bit Swaps the B Channel of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise bit swap for stream1 is defined by B_SEL). This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
12	B_SEL	Bit Swaps the B Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
11:10	RESERVED	

MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_CTRL (cont.)

Bits	Name	Description
9	G_SEL1	Bit Swaps the G Channel of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise bit swap for stream1 is defined by G_SEL). This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
8	G_SEL	Bit Swaps the G Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
7	BYTE_MSB_LSB_FLIP1	Swap the bit ordering of each byte of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise the byte endian is defined by BYTE_MSB_LSB_FLIP). 0x0: bit 0 is lsb, bit 7 is msb 0x1: bit 0 is msb, bit 0 is lsb
6	BYTE_MSB_LSB_FLIP	Swap the bit ordering of each byte of the dst pixel (this is done after the RGB swap and R/G/B_SEL). 0x0: bit 0 is lsb, bit 7 is msb 0x1: bit 0 is msb, bit 0 is lsb
5	R_SEL1	Bit Swap the R Channel of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise bit swap for stream1 is defined by R_SEL). This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
4	R_SEL	Bit Swap the R Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000, then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap

MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_CTRL (cont.)

Bits	Name	Description
3:0	DST_FORMAT	Destination pixel format. For video mode operation interleave with MDP pixel packets, this is required: command mode pixel depth >= video mode pixel depth (check video mode pixel format in DSI_VIDEO_MODE_PIXEL_DATATYPE) - 0 = RGB111 - 1 = reserved - 2 = reserved - 3 = RGB332 (data_src_width must be in multiple of 2 pixels) - 4 = RGB444 (data_src_width must be in multiple of 2 pixels) - 5 = reserved - 6 = RGB565 - 7 = RGB666 - 8 = RGB888 others = reserved

0x04700040 MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_DCS_CMD_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00003C2C

This register controls DCS command insertion to MDP data

MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_DCS_CMD_CTRL

Bits	Name	Description
31:18	RESERVED	
17	INSERT_DCS_COMMAND2	Indicate whether a DCS command has to be inserted as the first byte of the payload of the pixel data packet of the stream NOT selected by COMMAND_MODE_DMA_STREAM_SEL 0x0: no command is inserted 0x1: value in the DCS_COMMAND field will be inserted
16	INSERT_DCS_COMMAND	Indicate whether a DCS command has to be inserted as the first byte of payload of the pixel data packet 0x0: no command is inserted 0x1: value in the DCS_COMMAND field will be inserted
15:8	WR_MEM_CONTINUE	DCS command for write_memory_continue
7:0	WR_MEM_START	DCS command for write_memory_start

0x04700044 MIPI_DSI_1_DSI1_DMA_CMD_OFFSET

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Offset Register

MIPI_DSI_1_DSI1_DMA_CMD_OFFSET

Bits	Name	Description
31:0	CMD_OFFSET	Memory offset (in bytes) for DSI command, qword aligned, i.e.: bit 2:0 are tied to 0. This value has to be multiple of 8. NOTE: Bits 0:2 of this field are preset in the factory to 0. You cannot change the setting of bits 0:2.

0x04700048 MIPI_DSI_1_DSI1_DMA_CMD_LENGTH

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Length Register

MIPI_DSI_1_DSI1_DMA_CMD_LENGTH

Bits	Name	Description
31:24	RESERVED	
23:0	CMD_LENGTH	Number of commands (in bytes). This value has to be multiple of 4.

0x0470004C MIPI_DSI_1_DSI1_DMA_FIFO_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI DMA FIFO Control Register

MIPI_DSI_1_DSI1_DMA_FIFO_CTRL

Bits	Name	Description
31:6	RESERVED_1	

MIPI_DSI_1_DSI1_DMA_FIFO_CTRL (cont.)

Bits	Name	Description
5:4	READ_WATERMARK	Allow fifo reads for a packet when the number of unread entries is above this watermark or larger than the packet size (read_watermark has to be smaller than or equal to write_watermark) 0x0: FIFO is 1/2 full 0x1: FIFO is 3/4 full 0x2: FIFO is 7/8 full 0x3: FIFO is 15/16 full
3:2	RESERVED_2	
1:0	WRITE_WATERMARK	Fills FIFO under the following conditions 0x0: FIFO is 1/2 empty 0x1: FIFO is 1/4 empty 0x2: FIFO is 1/8 empty 0x3: FIFO is 1/16 empty

0x04700050 MIPI_DSI_1_DSI1_DMA_NULL_PACKET_DATA

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000900

DSI DMA Null Packet Data Register

MIPI_DSI_1_DSI1_DMA_NULL_PACKET_DATA

Bits	Name	Description
31:14	RESERVED	
13:8	NULL_DATATYPE	Datatype of null packet
7:0	NULL_DATA	This byte will be repeated in the payload portion of the embedded null packet

0x04700054 MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_STREAM0_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI MDP stream 0 control register

MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_STREAM0_CTRL

Bits	Name	Description
31:16	MDP0_WC	Exact number of Word (byte) count for one packet
15:10	RESERVED_1	
9:8	MDP0_VC	Virtual channel
7:6	RESERVED_2	
5:0	MDP0_DT	Packet data type

0x04700058 MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_STREAM0_TOTAL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI MDP stream 0 frame dimension (NOTE: unlike video mode parameters which are 0-based, these parameters in command mode are 1-based, i.e.: the actual number of pixels are set.)

MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_STREAM0_TOTAL

Bits	Name	Description
31:28	RESERVED_1	
27:16	MDP0_V_TOTAL	Number of lines in 1 frame
15:12	RESERVED_2	
11:0	MDP0_H_TOTAL	Number of pixels in 1 line

0x0470005C MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_STREAM1_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI MDP stream 1 control register

MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_STREAM1_CTRL

Bits	Name	Description
31:16	MDP1_WC	Exact number of word (byte) count for one packet
15:10	RESERVED_1	
9:8	MDP1_VC	Virtual channel

MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_STREAM1_CTRL (cont.)

Bits	Name	Description
7:6	RESERVED_2	
5:0	MDP1_DT	Packet data type

0x04700060 MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_STREAM1_TOTAL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI MDP stream 1frame dimension (NOTE: unlike video mode parameters which are 0-based, these parameters in command mode are 1-based, i.e.: the actual number of pixels are set.)

MIPI_DSI_1_DSI1_COMMAND_MODE_MDP_STREAM1_TOTAL

Bits	Name	Description
31:28	RESERVED_1	
27:16	MDP1_V_TOTAL	Exact number of lines in 1 frame
15:12	RESERVED_2	
11:0	MDP1_H_TOTAL	Exact number of pixels in 1 line

0x04700064 MIPI_DSI_1_DSI1_ACK_ERR_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Error Report Register stores errors and acknowledge from the DSI display module.

This register stores errors from the error report packet and error in the ECC and CRC of the returned packet

MIPI_DSI_1_DSI1_ACK_ERR_STATUS

Bits	Name	Description
31:29	RESERVED_1	
28	ACK_CLR	WRITE ONLY. clear ACK by writing a ’1’ and then a ’0’ to this bit
28	ACK	READ ONLY. Transmission acknowledged by the DSI display module
27:25	RESERVED_2	

MIPI_DSI_1_DSI1_ACK_ERR_STATUS (cont.)

Bits	Name	Description
24	ERROR	READ ONLY. There is an error report returned from the DSI display module (or-ed error bits 0 - 15)
24	ERROR_CLR	WRITE ONLY. clear ERROR by writing a ’1’ and then a ’0’ to this bit
23	RDBK_INCOMPLETE_PACKET_ERR	READ ONLY. Received incomplete read packet
23	RDBK_INCOMPLETE_PACKET_ERR_CLR	WRITE ONLY. clear RDBK_INCOMPLETE_PACKET_ERR by writing a ’1’ and then a ’0’ to this bit
22:21	RESERVED_3	
20	RDBK_DATA_CRC_ERR_CLR	WRITE ONLY. clear RDBK_DATA_CRC_ERR by writing a ’1’ and then a ’0’ to this bit
20	RDBK_DATA_CRC_ERR	READ ONLY. Incorrect CRC detected in read packet
19:18	RESERVED_4	
17	RDBK_DATA_MULTI_ECC_ERR_CLR	WRITE ONLY. clear RDBK_DATA_MULTI_ECC_ERR by writing a ’1’ and then a ’0’ to this bit
17	RDBK_DATA_MULTI_ECC_ERR	READ ONLY. Multi-bit ECC detected in read packet and not corrected
16	RDBK_DATA_ECC_ERR_CLR	WRITE ONLY. clear RDBK_DATA_ECC_ERR by writing a ’1’ and then a ’0’ to this bit
16	RDBK_DATA_ECC_ERR	READ ONLY. Single bit ECC error detected in read packet and corrected by DSI controller
15	PANEL_SPECIFIC_ERR	READ ONLY. This bit correspond to bit 15 (DSI protocol violation) of the error report. Please refer to the meaning by this description rather than by the name of the register field
15	PANEL_SPECIFIC_ERR_CLR	WRITE ONLY. Clear PANEL_SPECIFIC_ERR by writing a ’1’ and then a ’0’ to this bit
14	RESERVED	
13	PROTOCOL_VIOLATION_CLR	WRITE ONLY. Clear Protocol violation by writing a ’1’ and then a ’0’ to this bit
13	PROTOCOL_VIOLATION	READ ONLY. This bit corresponds to bit 13 (invalid transmission length) of the error report. Please refer to the meaning by this description rather than by the name of the register field.
12	VC_ERR_CLR	WRITE ONLY. clear VC_ERR by writing a ’1’ and then a ’0’ to this bit
12	VC_ERR	READ ONLY. Invalid virtual channel ID detected by the DSI display module
11	DT_ERR_CLR	WRITE ONLY. Clear DT_ERR by writing a ’1’ and then a ’0’ to this bit
11	DT_ERR	READ ONLY. DSI data type not recognized by the DSI display module

MIPI_DSI_1_DSI1_ACK_ERR_STATUS (cont.)

Bits	Name	Description
10	CRC_ERR	READ ONLY. Checksum error for long packet detected by the DSI display module
10	CRC_ERR_CLR	WRITE ONLY. Clear CRC_ERR by writing a ’1’ and then a ’0’ to this bit
9	MULTI_ECC_ERR_CLR	WRITE ONLY. Clear MULTI_ECC_ERR by writing a ’1’ and then a ’0’ to this bit
9	MULTI_ECC_ERR	READ ONLY. Multi-bit ECC detected and not corrected by the DSI display module
8	ECC_ERR_CLR	WRITE ONLY. Clear ECC_ERR by writing a ’1’ and then a ’0’ to this bit
8	ECC_ERR	READ ONLY. Single bit ECC detected and corrected by the DSI display module
7	CONTENTION	READ ONLY. Contention Detected by Peripheral
7	CONTENTION_CLR	WRITE ONLY. Clear CONTENTION by writing a ’1’ and then a ’0’ to this bit
6	FALSE_CTRL_ERR_CLR	WRITE ONLY. Clear FALSE_CTRL_ERR by writing a ’1’ and then a ’0’ to this bit
6	FALSE_CTRL_ERR	READ ONLY. False Control Error detected by the DSI display module
5	TIMEOUT_CLR	WRITE ONLY. Clear TIMEOUT by writing a ’1’ and then a ’0’ to this bit
5	TIMEOUT	READ ONLY. Timeout error (Low Power forward transmission, bus turn around, High Speed reverse transmission) detected by the DSI display module
4	LP_ERR	READ ONLY. Low-power transmit sync error detected by the DSI display module
4	LP_ERR_CLR	WRITE ONLY. Clear LP_ERR by writing a ’1’ and then a ’0’ to this bit
3	ESC_ERR_CLR	WRITE ONLY. Clear ESC_ERR by writing a ’1’ and then a ’0’ to this bit
3	ESC_ERR	READ ONLY. Escape Mode Entry Command Error detected by the DSI display module
2	EOT_ERR_CLR	WRITE ONLY. Clear EOT_ERR by writing a ’1’ and then a ’0’ to this bit
2	EOT_ERR	READ ONLY. EoT Sync Error detected by the DSI display module
1	SOT_SYNC_ERR	READ ONLY. SoT Sync Error detected by the DSI display module
1	SOT_SYNC_ERR_CLR	WRITE ONLY. Clear SOT_SYNC_ERR by writing a ’1’ and then a ’0’ to this bit
0	SOT_ERR_CLR	WRITE ONLY. Clear SOT_ERR by writing a ’1’ and then a ’0’ to this bit

MIPI_DSI_1_DSI1_ACK_ERR_STATUS (cont.)

Bits	Name	Description
0	SOT_ERR	READ ONLY. SoT Error detected by the DSI display module

0x04700068 MIPI_DSI_1_DSI1_RDBK_DATA0

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Read Data 0 Register

MIPI_DSI_1_DSI1_RDBK_DATA0

Bits	Name	Description
31:0	RD_DATA0	READ ONLY. Data returned from the DSI display module

0x0470006C MIPI_DSI_1_DSI1_RDBK_DATA1

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Read Data 1 Register

MIPI_DSI_1_DSI1_RDBK_DATA1

Bits	Name	Description
31:0	RD_DATA1	READ ONLY. Data returned from the DSI display module

0x04700070 MIPI_DSI_1_DSI1_RDBK_DATA2

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Read Data 2 Register

MIPI_DSI_1_DSI1_RDBK_DATA2

Bits	Name	Description
31:0	RD_DATA2	READ ONLY. Data returned from the DSI display module

0x04700074 MIPI_DSI_1_DSI1_RDBK_DATA3

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Read Data 3 Register

MIPI_DSI_1_DSI1_RDBK_DATA3

Bits	Name	Description
31:0	RD_DATA3	READ ONLY. Data returned from the DSI display module

0x04700078 MIPI_DSI_1_DSI1_RDBK_DATATYPE0

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x22211211

DSI Read Response Datatype Register 0

MIPI_DSI_1_DSI1_RDBK_DATATYPE0

Bits	Name	Description
31:30	RESERVED_1	
29:24	DCS_SHORT_RD_2_BYTE	Specify the datatype of a DCS short read response with 2 byte returned
23:22	RESERVED_2	
21:16	DCS_SHORT_RD_1_BYTE	Specify the datatype of a DCS short read response with 1 byte returned
15:14	RESERVED_3	
13:8	GENERIC_SHORT_RD_2_BYTE	Specify the datatype of a generic short read response with 2 byte returned
7:6	RESERVED_4	
5:0	GENERIC_SHORT_RD_1_BYTE	Specify the datatype of a generic short read response with 1 byte returned

0x0470007C MIPI_DSI_1_DSI1_RDBK_DATATYPE1

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x001C1A02

DSI Read Response Datatype Register 1

MIPI_DSI_1_DSI1_RDBK_DATATYPE1

Bits	Name	Description
31:22	RESERVED_1	
21:16	DCS_LONG_RD	Specify the datatype of a DCS long read response
15:14	RESERVED_2	
13:8	GENERIC_LONG_RD	Specify the datatype of a generic long read response
7:6	RESERVED	
5:0	ERROR_REPORT	Specify the datatype of an acknowledge with error report

0x04700080 MIPI_DSI_1_DSI1_TRIG_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Trigger Control Register

When DSI is enabled and CRTC1 or 2 is used for other non-DSI panels, the display engine path trigger must be set to manual internal, otherwise the CRTC will be stalled

MIPI_DSI_1_DSI1_TRIG_CTRL

Bits	Name	Description
31	TE_SEL	Select TE path 0x0: Tearing effect_1 (external trigger returns from data link) 0x1: Tearing effect_2 (external trigger returns from a dedicated pin)
30:29	RESERVED_1	
28	COMMAND_MODE_DMA_MDP_ORDER	This bit field indicates whether DMA or MDP path will win the arbitration if both requests the link at the same time 0x0: DMA has higher priority than display processor 0x1: Display processor has higher priority than DMA
27:25	RESERVED_2	
24	COMMAND_MODE_MDP_REQ_ORDER	If PHY TE is required for one of the MDP stream while the other stream is ready to transmit, this field determines which will win the arbitration 0x0: Command Mode MDP PHY TE request has higher priority than Command Mode MDP data transmission request 0x1: Command Mode MDP Data transmission request has higher priority than Command Mode MDP PHY TE request
23:9	RESERVED_3	

MIPI_DSI_1_DSI1_TRIG_CTRL (cont.)

Bits	Name	Description
8	COMMAND_MODE_DMA_STREAM_SEL	If COMMAND_MODE_DMA_TRIGGER_SEL = SOF/EOF or both COMMAND_MODE_DMA_TRIGGER_SEL and COMMAND_MODE_MDP_TRIGGER_SEL = TE or sw+TE, the Command Mode DMA path is triggered at frame boundary of the MDP stream selected by this bit 0x0: stream 0 0x1: stream 1
7	RESERVED_4	
6:4	COMMAND_MODE_MDP_TRIGGER_SEL	TRIGGER_SEL field is used to select which trigger is used for Command Mode display processor path. (The stream to be triggered is selected by COMMAND_MODE_DMA_STREAM_SEL) 0x0: none 0x1: reserved_1 0x2: TE 0x3: reserved_2 0x4: sw trigger 0x5: reserved_3 0x6: sw trigger and TE 0x7: reserved_4
3	RESERVED	
2:0	COMMAND_MODE_DMA_TRIGGER_SEL	DMA_TRIGGER_SEL field is used to select which trigger is used for Command Mode DMA path. 0x0: none 0x1: Start/end of frame (determined by COMMAND_MODE_DMA_MDP_ORDER) 0x2: TE 0x3: reserved_1 0x4: sw trigger 0x5: sw trigger and start/end of frame (COMMAND_MODE_DMA_MDP_ORDER) 0x6: sw trigger and TE 0x7: reserved_2

0x04700084 MIPI_DSI_1_DSI1_EXT_MUX

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI External Pin Mux Register - select IO pin for tearing effect and panel reset

MIPI_DSI_1_DSI1_EXT_MUX

Bits	Name	Description
31:20	EXT_TE_HSYNC_TOTAL	Defines the total number of hsync per frame
19:8	EXT_TE_HSYNC_TRIG_CNT	Defines the number of hsync needed to trigger the engine if TE_MODE is set to 1
7	EXT_TE_POL	Polarity of external tearing effect signal 0x0: TE occurs at the rising edge 0x1: TE occurs at the falling edge
6	RESERVED	
5:4	EXT_TE_MODE	Select TE mode 0x0: vsync_1 (edge detection) 0x1: vsync_2 (pulse width detection) 0x2: vsync and hsync combin_1 (edge detection) 0x3: vsync and hsync combin_2 (pulse width detection)
3:0	EXT_TE_MUX	Input port for external tearing effect (external trigger). Valid range: 0 to 1

0x04700088 MIPI_DSI_1_DSI1_EXT_TE_PULSE_DETECT_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI External Tearing Effect Pulse Width Detection Control Register

MIPI_DSI_1_DSI1_EXT_TE_PULSE_DETECT_CTRL

Bits	Name	Description
31:16	TE_VSYNC_MIN_WIDTH	Defines the minimum width (in escclk) of the vsync pulse in the TE signal
15:0	TE_HSYNC_MAX_WIDTH	Defines the maximum width (in escclk) of the hsync pulse in the TE signal

0x0470008C MIPI_DSI_1_DSI1_CMD_MODE_DMA_SW_TRIGGER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Mode DMA Software Trigger Register

MIPI_DSI_1_DSI1_CMD_MODE_DMA_SW_TRIGGER

Bits	Name	Description
31:1	RESERVED	
0	SW_TRIGGER	Software can start a DMA trigger for the Command Mode engine by writing a 1 to this bit

0x04700090 MIPI_DSI_1_DSI1_CMD_MODE_MDP_SW_TRIGGER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Mode Display Processor Path Software Trigger Register

MIPI_DSI_1_DSI1_CMD_MODE_MDP_SW_TRIGGER

Bits	Name	Description
31:1	RESERVED	
0	SW_TRIGGER	Software can start an MPD trigger for the Command Mode engine by writing a 1 to this bit

0x04700094 MIPI_DSI_1_DSI1_CMD_MODE_BTA_SW_TRIGGER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Mode Bus-Turn-Around Software Trigger Register

MIPI_DSI_1_DSI1_CMD_MODE_BTA_SW_TRIGGER

Bits	Name	Description
31:1	RESERVED	
0	SW_TRIGGER	Software can start a BTA trigger for the Command Mode engine by writing a 1 to this bit

0x04700098 MIPI_DSI_1_DSI1_RESET_SW_TRIGGER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Reset Software Trigger Register

MIPI_DSI_1_DSI1_RESET_SW_TRIGGER

Bits	Name	Description
31:1	RESERVED	
0	SW_TRIGGER	Software can trigger reset through the data link by writing a 1 to this bit

0x0470009C MIPI_DSI_1_DSI1_MISR_CMD_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI miser control for command mode operation - misr is collected for packets output from packetizer

MIPI_DSI_1_DSI1_MISR_CMD_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	EN	enable Command Mode misr accumulation (all the misr's are reset to 0 when it is disable)
27:25	RESERVED_2	
24	WIDTH_SEL	misr width of packets generated fronm dma, mdp stream 0 and mdp stream1 data 0x0: generate misr in 8 bits 0x1: generate misr in 16 bits
23:16	MDP_STREAM1_MISR	READ ONLY. 8-bit misr for packets generated from MDP stream 1
15:8	MDP_STREAM0_MISR	READ ONLY. 8-bit misr for packets generated from MDP stream 0
7:0	DMA_MISR	READ ONLY. 8-bit misr for packets generated from memory

0x047000A0 MIPI_DSI_1_DSI1_MISR_VIDEO_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI miser control for video mode operation - misr is collected for packets output from packetizer

MIPI_DSI_1_DSI1_MISR_VIDEO_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	STOP_EN	Select misr accumulation restart or stop after N frame (specified in MAX_FRAME_COUNT) 0x0: auto reset every N frame 0x1: stop after N frames
27:25	RESERVED_2	
24	WIDTH_SEL	misr width of packets generated fronm dma, mdp stream 0 and mdp stream1 data 0x0: generate misr in 8 bits 0x1: generate misr in 16 bits
23:17	RESERVED	
16	EN	Enable Video Mode misr accumulation (the misr is reset to 0 when it is disable)
15:8	MAX_FRAME_COUNT	Internal misr is reset when the number of frames generated by the video mode engine reaches this number and the MISR field in this register is updated before the reset.
7:0	MISR	READ ONLY. misr for video mode packets

0x047000A4 MIPI_DSI_1_DSI1_LANE_STATUS

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Lane Status Register

MIPI_DSI_1_DSI1_LANE_STATUS

Bits	Name	Description
31:17	RESERVED_1	
16	DLN0_DIRECTION	READ ONLY. Indicate transmission direction of Data Lane 0 0x0: forward 0x1: reverse
15:13	RESERVED_2	
12	CLKLN_ULPS_ACTIVE_NOT	READ ONLY. Indicate whether Clock Lane is in Ultra-Low power state 0x0: ulps active 0x1: ulps not active

MIPI_DSI_1_DSI1_LANE_STATUS (cont.)

Bits	Name	Description
11	DLN3_ULPS_ACTIVE_NOT	READ ONLY. Indicate whether Data Lane 3 is in Ultra-Low power state 0x0: ulps active 0x1: ulps not active
10	DLN2_ULPS_ACTIVE_NOT	READ ONLY. Indicate whether Data Lane 2 is in Ultra-Low power state 0x0: ulps active 0x1: ulps not active
9	DLN1_ULPS_ACTIVE_NOT	READ ONLY. Indicate whether Data Lane 1 is in Ultra-Low power state 0x0: ulps active 0x1: ulps not active
8	DLN0_ULPS_ACTIVE_NOT	READ ONLY. Indicate whether Data Lane 0 is in Ultra-Low power state 0x0: ulps active 0x1: ulps not active
7:5	RESERVED	
4	CLKLN_STOPSTATE	READ ONLY. Indicate whether Clock Lane is in Stop state 0x0: active state 0x1: stop state
3	DLN3_STOPSTATE	READ ONLY. Indicate whether Data Lane 3 is in Stop state 0x0: active state 0x1: stop state
2	DLN2_STOPSTATE	READ ONLY. Indicate whether Data Lane 2 is in Stop state 0x0: active state 0x1: stop state
1	DLN1_STOPSTATE	READ ONLY. Indicate whether Data Lane 1 is in Stop state 0x0: active state 0x1: stop state
0	DLN0_STOPSTATE	READ ONLY. Indicate whether Data Lane 0 is in Stop state 0x0: active state 0x1: stop state

0x047000A8 MIPI_DSI_1_DSI1_LANE_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Lane Control Register

MIPI_DSI_1_DSI1_LANE_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	CLKLN_HS_FORCE_REQUEST	Force Clock Lane to enter HS mode always

1	DLN1_ULPS_REQUEST	Request Data Lane 1 to enter Ultra-Low power state
0	DLN0_ULPS_REQUEST	Request Data Lane 0 to enter Ultra-Low power state

0x047000AC MIPI_DSI_1_DSI1_LANE_SWAP_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Lane Swapping Control Register

MIPI_DSI_1_DSI1_LANE_SWAP_CTRL

Bits	Name	Description
31:3	RESERVED	
2:0	DLN_SWAP_SEL	PHY lane mapping for data lane 0, 1, 2, 3 output from the DSI controller - 000 = 0, 1, 2, 3 - 001 = 3, 0, 1, 2 - 010 = 2, 3, 0, 1 - 011 = 1, 2, 3, 0 - 100 = 0, 3, 2, 1 - 101 = 1, 0, 3, 2 - 110 = 2, 1, 0, 3 - 111 = 3, 2, 1, 0

0x047000B0 MIPI_DSI_1_DSI1_DLN0_PHY_ERR

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00088888

DSI PHY Error Register - reports errors returned from the PHY. If the mask bit for a specific error is set to 1, turn request will be de-asserted if the corresponding error occurs and controller will wait for the link to return to forward stopstate.

NOTE Turn request abort/interrupt will be generated if the mask field(s) in DSI_DLN0_PHY_ERR is set to 1. (Interrupt will be generated if the mask field(s) in DSI_INT_CTRL is set to 1; error status will be generated if the mask field(s) in DSI_ERR_INT_MASK0 is set to 0).

MIPI_DSI_1_DSI1_DLN0_PHY_ERR

Bits	Name	Description
31:20	RESERVED_1	
19	DLN0_ERR_CONTENTION_LP1_MASK	Option for controller to ignore this error 0x0: no action 0x1: abort turn request if error occurs
18:17	RESERVED_2	
16	DLN0_ERR_CONTENTION_LP1	READ ONLY. Contention detected while lane 0 is driven high
16	DLN0_ERR_CONTENTION_LP1_CLR	WRITE ONLY. Clear DLN0_ERR_CONTENTION_LP1 by writing a ’1’ to this field

MIPI_DSI_1_DSI1_DLN0_PHY_ERR (cont.)

Bits	Name	Description
15	DLN0_ERR_CONTENTION_LP0_MASK	Option for controller to ignore this error 0x0: no action 0x1: abort turn request if error occurs
14:13	RESERVED_3	
12	DLN0_ERR_CONTENTION_LP0_CLR	WRITE ONLY. Clear DLN0_ERR_CONTENTION_LP0 by writing a ’1’ to this field
12	DLN0_ERR_CONTENTION_LP0	READ ONLY. Contention detected while lane 0 is driven low
11	DLN0_ERR_CONTROL_MASK	Option for controller to ignore this error 0x0: no action 0x1: abort turn request if error occurs
10:9	RESERVED_4	
8	DLN0_ERR_CONTROL_CLR	WRITE ONLY. Clear DLN0_ERR_CONTROL by writing a ’1’ to this field
8	DLN0_ERR_CONTROL	READ ONLY. An incorrect line state sequence is detected
7	DLN0_ERR_SYNC_ESC_MASK	Option for controller to ignore this error 0x0: no action 0x1: abort turn request if error occurs
6:5	RESERVED_5	
4	DLN0_ERR_SYNC_ESC_CLR	WRITE ONLY. Clear DLN0_ERR_SYNC_ESC by writing a ’1’ to this field
4	DLN0_ERR_SYNC_ESC	READ ONLY. Number of bits received during a low power data transmission is not a multiple of eight when the transmission ends
3	DLN0_ERR_ESC_MASK	Option for controller to ignore this error 0x0: no action 0x1: abort turn request if error occurs
2:1	RESERVED_6	
0	DLN0_ERR_ESC_CLR	WRITE ONLY. Clear DLN0_ERR_ESC by writing a ’1’ to this field
0	DLN0_ERR_ESC	READ ONLY. Unrecognized escape entry command received

0x047000B4 MIPI_DSI_1_DSI1_LP_TIMER_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0xFFFFFFFF

DSI Timeout Control Register for Low Power Mode Transmission

MIPI_DSI_1_DSI1_LP_TIMER_CTRL

Bits	Name	Description
31:16	BTA_TO	Bus turn-around timeout (in escclk)
15:0	LP_RX_TO	Low power transmission reverse timeout (in Escclk)

0x047000B8 MIPI_DSI_1_DSI1_HS_TIMER_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x0000FFFF

DSI Timeout Control Register for High Speed Mode Transmission

MIPI_DSI_1_DSI1_HS_TIMER_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	HS_TX_TO_STOP_EN	Stop High Speed Transmission immediately at timeout
27:20	RESERVED_2	
19:16	TIMER_RESOLUTION	Control all 3 timeout counter increment steps by power of 2 of this field. Ex.: 0 = increment every escclk; - 1 = increment every 2 escclk; - 3 = increment every 8 escclk;
15:0	HS_TX_TO	High speed transmission timeout (in escclk)

0x047000BC MIPI_DSI_1_DSI1_TIMEOUT_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Timeout Status Register

MIPI_DSI_1_DSI1_TIMEOUT_STATUS

Bits	Name	Description
31:9	RESERVED_1	
8	BTA_TIMEOUT_CLR	WRITE ONLY. Writing a 1 will clear this bit
8	BTA_TIMEOUT	READ ONLY. Indicates Bus Turnaround timeout

MIPI_DSI_1_DSI1_TIMEOUT_STATUS (cont.)

Bits	Name	Description
7:5	RESERVED_2	
4	LP_RX_TIMEOUT_CLR	WRITE ONLY. Writing a 1 will clear this bit
4	LP_RX_TIMEOUT	READ ONLY. Indicates Low Power reverse transmission timeout
3:1	RESERVED	
0	HS_TX_TIMEOUT_CLR	WRITE ONLY. Writing a 1 will clear this bit
0	HS_TX_TIMEOUT	READ ONLY. Indicates High Speed forward transmission timeout

0x047000C0 MIPI_DSI_1_DSI1_CLKOUT_TIMING_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI PHY Clock Lane Timing Control Register

MIPI_DSI_1_DSI1_CLKOUT_TIMING_CTRL

Bits	Name	Description
31:14	RESERVED_1	
13:8	T_CLK_POST	Number of byteclk cycles (minus one) that the transmitter shall continue sending HS clock after the last associated Data Lane has transitioned to Low Power mode
7:6	RESERVED_2	
5:0	T_CLK_PRE	Number of byteclk cycles (minus one) that the high speed clock shall be driven prior to any associated Data Lane beginning the transition from Low Power to High Speed mode

0x047000C4 MIPI_DSI_1_DSI1_EOT_PACKET

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x010F0F08

DSI EOT Packet Register - packet to append at the end of a High Speed Data Burst

MIPI_DSI_1_DSI1_EOT_PACKET

Bits	Name	Description
31:24	ECC	ECC of the EOT packet

MIPI_DSI_1_DSI1_EOT_PACKET (cont.)

Bits	Name	Description
23:8	WC	Word count of the EOT packet
7:0	DI	Data identifier (virtual channel and datatype) of the EOT packet

0x047000C8 MIPI_DSI_1_DSI1_EOT_PACKET_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI EOT Packet Control Register

MIPI_DSI_1_DSI1_EOT_PACKET_CTRL

Bits	Name	Description
31:5	RESERVED_1	
4	RX_EOT_IGNORE	Specify whether the controller should ignore the EOT packet if it is received from reverse transmission 0x0: do not ignore 0x1: ignore
3:1	RESERVED_2	
0	TX_EOT_APPEND	Specify whether the EOT packet has to be appended at the end of each forward High Speed data burst 0x0: do not append 0x1: append

0x047000CC MIPI_DSI_1_DSI1_GENERIC_ESC_TX_TRIGGER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Generic Escape Mode Trigger Register

MIPI_DSI_1_DSI1_GENERIC_ESC_TX_TRIGGER

Bits	Name	Description
31:1	RESERVED	
0	SW_TRIGGER	Software can trigger a generic escape mode command through DISP_DSIPHY_DLN0_TX_TRIGGER_ESC[3] by writing a 1 to this bit

0x047000D0 MIPI_DSI_1_DSI1_CAM_BIST_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Display MIPI BIST Control. To start the BIST, all cam bist configuration should be done first, then CAM_BIST_EN should be set to 1 and lastly set DSI_CAM_BIST_START to 1. To stop or modify the cam bist configuration, program the DSI_CAM-BIST_* registers in reverse sequence (i.e.: start by writing DSI_CAM_BIST_START to 0).

MIPI_DSI_1_DSI1_CAM_BIST_CTRL

Bits	Name	Description
31:5	RESERVED_1	
4	CRC_EN	Enable CRC calculation for the CSI packets 0x0: disable 0x1: enable
3:2	RESERVED_2	
1	CAM_BIST_EN	- 1 Enables MIPI CSI BIST
0	CAM_BIST_RESET	- 1 Resets MIPI CSI BIST

0x047000D4 MIPI_DSI_1_DSI1_CAM_BIST_FRAME_SIZE

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

MIPI_DSI_1_DSI1_CAM_BIST_STATUS

Bits	Name	Description
31:5	RESERVED_1	
4	CAM_BIST_DONE	READ ONLY. MIPI BIST done for 1 frame
4	CAM_BIST_DONE_CLR	WRITE ONLY. Writing a 1 will clear the done bit
3:1	RESERVED_2	
0	CAM_BIST_STATUS_BUSY	READ ONLY. MIPI BIST status bit

0x04700108 MIPI_DSI_1_DSI1_ERR_INT_MASK0

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x13FF3BFF

DSI Error Interrupt Enable Register - enable any event to drive the error status (DSI_INT_CTRL.DSI_ERROR_STAT). If the DSI_INT_CTRL.DSI_ERROR_MASK is set to 1, interrupt will be generated.

NOTE Interrupt will be generated if the mask field(s) in DSI_INT_CTRL is set to 1; error status will be generated if the mask field(s) in DSI_ERR_INT_MASK0 is set to 0.

MIPI_DSI_1_DSI1_ERR_INT_MASK0

Bits	Name	Description
31:29	RESERVED_1	
28	DPHY_DSIPLL_UNLOCK_MASK	Mask dsipll unlock (to avoid sending out unnecessary interrupts, set this bit to 1 before dsipll locks) 0x0: allow generation of error status 0x1: no error status generated
27:26	RESERVED_2	

MIPI_DSI_1_DSI1_ERR_INT_MASK0 (cont.)

Bits	Name	Description
25	DLN0_ERR_CONTENTION_LP1_MASK	Mask contention while data lane 0 is driven high interrupt (DSI_DLN0_PHY_ERR reg, bit 16) 0x0: allow generation of error status (this should be set when dsipll is ready or when dsipll bypass is set to 1) 0x1: no error status generated
24	DLN0_ERR_CONTENTION_LP0_MASK	Mask contention while data lane 0 is driven low interrupt (DSI_DLN0_PHY_ERR reg, bit 12) 0x0: allow generation of error status 0x1: no error status generated
23	DLN0_ERR_CONTROL_MASK	Mask incorrect LP RX state sequence interrupt (DSI_DLN0_PHY_ERR reg, bit 8) 0x0: allow generation of error status 0x1: no error status generated
22	DLN0_ERR_SYNC_ESC_MASK	Mask LP RX data that is not byte-aligned interrupt (DSI_DLN0_PHY_ERR reg, bit 4) 0x0: allow generation of error status 0x1: no error status generated
21	DLN0_ERR_ESC_MASK	Mask incorrect LP RX escape entry interrupt (DSI_DLN0_PHY_ERR reg, bit 0) 0x0: allow generation of error status 0x1: no error status generated
20	DLN0_LP_FIFO_OVERFLOW_MASK	unused (Mask Lane Layer Low Power FIFO for data lane 0 interrupt (DSI_FIFO_STATUS reg, bit 14)) 0x0: allow generation of error status 0x1: no error status generated
19	DLN3_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 3 interrupt (DSI_STATUS reg, bit 30) 0x0: allow generation of error status 0x1: no error status generated
18	DLN2_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 2 interrupt (DSI_STATUS reg, bit 26) 0x0: allow generation of error status 0x1: no error status generated
17	DLN1_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 1 interrupt (DSI_FIFO_STATUS reg, bit 22) 0x0: allow generation of error status 0x1: no error status generated
16	DLN0_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 0 interrupt (DSI_FIFO_STATUS reg, bit 18) 0x0: allow generation of error status 0x1: no error status generated
15:14	RESERVED_3	

MIPI_DSI_1_DSI1_ERR_INT_MASK0 (cont.)

Bits	Name	Description
13	VID_MDP_FIFO_UNDERFLOW_MASK	Mask Video Mode Engine FIFO underflow interrupt (DSI_FIFO_STATUS reg, bit 3) 0x0: allow generation of error status 0x1: no error status generated
12	VID_MDP_FIFO_OVERFLOW_MASK	Mask Video Mode Engine FIFO overflow interrupt (DSI_FIFO_STATUS reg, bit 0) 0x0: allow generation of error status 0x1: no error status generated
11	CMD_MDP_FIFO_UNDERFLOW_MASK	Mask Display Engine FIFO underflow interrupt (DSI_FIFO_STATUS reg, bit 7) 0x0: allow generation of error status 0x1: no error status generated
10	RESERVED_4	
9	CMD_DMA_FIFO_UNDERFLOW_MASK	Mask Command mode dma FIFO underflow interrupt (DSI_FIFO_STATUS reg, bit 10) 0x0: allow generation of error status 0x1: no error status generated
8	INTERLEAVE_OP_CONTENTION_MASK	Mask interleave operation contention interrupt (DSI_STATUS reg, bit 31) 0x0: allow generation of error status 0x1: no error status generated
7	BTA_TO_MASK	Mask bus turnaround timeout interrupt (DSI_TIMEOUT_STATUS reg, bit 8) 0x0: allow generation of error status 0x1: no error status generated
6	HS_TX_TO_MASK	Mask High Speed forward transmission timeout interrupt (DSI_TIMEOUT_STATUS reg, bit 0) 0x0: allow generation of error status 0x1: no error status generated
5	LP_RX_TO_MASK	Mask Low Power reverse transmission timeout interrupt (DSI_TIMEOUT_STATUS reg, bit 4) 0x0: allow generation of error status 0x1: no error status generated
4	ERROR_PACKET_MASK	Mask error packet returned from peripheral interrupt (DSI_ACK_ERR_STATUS reg, bit 24) 0x0: allow generation of error status 0x1: no error status generated
3	RDBK_INCOMPLETE_PACKET_ERR_MASK	Mask incomplete read packet error interrupt (DSI_ACK_ERR_STATUS reg, bit 23) 0x0: allow generation of error status 0x1: no error status generated

MIPI_DSI_1_DSI1_ERR_INT_MASK0 (cont.)

Bits	Name	Description
2	RDBK_DATA_CRC_ERR_MASK	Mask crc error in the read packet interrupt (DSI_ACK_ERR_STATUS reg, bit 20) 0x0: allow generation of error status 0x1: no error status generated
1	RDBK_DATA_MULTI_ECC_ERR_MASK	Mask multi bit ecc error in the read packet interrupt (DSI_ACK_ERR_STATUS reg, bit 17) 0x0: allow generation of error status 0x1: no error status generated
0	RDBK_DATA_ECC_ERR_MASK	Mask single bit ecc error in the read packet interrupt (DSI_ACK_ERR_STATUS reg, bit 16) 0x0: allow generation of error status 0x1: no error status generated

0x0470010C MIPI_DSI_1_DSI1_INT_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x02200202

DSI Interrupt Control Register.

NOTE Interrupt will be generated if the mask field(s) in DSI_INT_CTRL is set to 1; error status will be generated if the mask field(s) in DSI_ERR_INT_MASK0 is set to 0.

MIPI_DSI_1_DSI1_INT_CTRL

Bits	Name	Description
31:26	RESERVED_1	
25	DSI_ERROR_MASK	DSI Error Mask. If set to 1, interrupt generation is enabled. 0x0: no interrupt generated 0x1: allow generation of interrupt
24	DSI_ERROR_AK	WRITE ONLY. DSI Error Acknowledge. If set to 1, status and interrupt is cleared.
24	DSI_ERROR_STAT	READ ONLY. DSI Error status. Set when the DSI Error has happened.
23:22	RESERVED_2	
21	DSI_BTA_DONE_MASK	DSI BTA Done Mask. If set to 1, interrupt generation is enabled. 0x0: no interrupt generated 0x1: allow generation of interrupt

MIPI_DSI_1_DSI1_INT_CTRL (cont.)

Bits	Name	Description
20	DSI_BTA_DONE_STAT	READ ONLY. DSI BTA Done Status (sw triggered BTA, embedded BTA or BTA generated for TE). Set when a bus turnaround has completed.
20	DSI_BTA_DONE_AK	WRITE ONLY. DSI BTA Done Acknowledge. If set to 1, status and interrupt is cleared.
19:18	RESERVED_3	
17	DSI_VIDEO_MODE_DONE_MASK	DSI Video Mode Engine path Done Mask. If set to 1, interrupt generation is enabled. 0x0: no interrupt generated 0x1: allow generation of interrupt
16	DSI_VIDEO_MODE_DONE_AK	WRITE ONLY. DSI Video Mode Engine path Done Acknowledge. If set to 1, status and interrupt is cleared.
16	DSI_VIDEO_MODE_DONE_STAT	READ ONLY. DSI Video Mode Engine status. Set when the DSI Video Mode Engine has finished transferring data to the panel.
15:10	RESERVED_4	
9	DSI_CMD_MODE_MDP_DONE_MASK	DSI Command Mode Engine MDP path Done Mask. If set to 1, interrupt generation is enabled. 0x0: no interrupt generated 0x1: allow generation of interrupt
8	DSI_CMD_MODE_MDP_DONE_STAT	READ ONLY. DSI Command Mode Engine MDP path status. Set when the DSI Command Mode Engine has finished transferring deng data to the panel.
8	DSI_CMD_MODE_MDP_DONE_AK	WRITE ONLY. DSI Command Mode Engine MDP path Done Acknowledge. If set to 1, status and interrupt is cleared.
7:2	RESERVED	
1	DSI_CMD_MODE_DMA_DONE_MASK	DSI Command Mode Engine DMA path Done Mask. If set to 1, interrupt generation is enabled. 0x0: no interrupt generated 0x1: allow generation of interrupt
0	DSI_CMD_MODE_DMA_DONE_AK	WRITE ONLY. DSI Command Mode Engine DMA path Done Acknowledge. If set to 1, status and interrupt is cleared.
0	DSI_CMD_MODE_DMA_DONE_STAT	READ ONLY. DSI Command Mode Engine DMA status. Set when the DSI Command Mode Engine has finished transferring dma data to the panel.

0x04700110 MIPI_DSI_1_DSI1_IOBIST_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI IOBIST Control Register

MIPI_DSI_1_DSI1_IOBIST_CTRL

Bits	Name	Description

31:0	DSI_IOBIST_CTRL	This register has 2 modes of operation: command and timing mode. All configuration fields should be written first, then enable (bit 0) should be set to 1 next and start (bit 5) is set to 1 last.
		
		COMMAND MODE
		bit 0 = DSI IOBIST ENABLE. Active high;
		bit 5 = IOBIST start. Active high;
		bit 6 = Select power mode for data transfer.
		- 0 = high speed (HS), 1 = low power (LP)
		bit 7 = Data pattern mode.
		- 0 = Use data pattern word, 1 = PRBS pattern.
		bit 10:8 = multiple of finite random run (N): if bit 12 is finite, the finite run is 256 x (N+1) runs for HS PRBS and user data, or 16 x (N+1) for LP PRBS
		bit 12 = Infinite run
		- 0 for infinite; 1 for 256 x (N+1) runs of HS PRBS, 16 x (N+1) runs of LP PRBS, 256 x (N+1) runs of HS user data, or 8 runs of LP user data.
		bit 14:13 = DSIBIST_DSIPHY_LANE_SWAP, select which lane is used as lane0 for LPDT:
		- 0 = DLN0
		- 1 = DLN1
		- 2 = DLN2
		- 3 = DLN3
		bit 15 = Select instruction type
		- 0 = command mode, 1 = DSI timing control mode.
		bit 23:16 = data pattern byte (used when bit 7 is set to 0)
		other bits = reserved
		
		TIMING MODE
		bit 0 = DSI IOBIST ENABLE. Active high;
		bit 5 = IOBIST start. Active high;
		bit 15 = Select instruction type
		- 0 = command mode, 1 = DSI timing control mode.
		(If you write one DSI timing data with the select instruction type == 1, you have to change the select instruction type from 1 to 0 for timing data latch control.)
		bit 23:16 = DSI timing data;
		bit 28:24 = DSI timing register selection:
		- 0x10 = DSI_T_CLK_PRE (data width[5:0])
		- 0x11 = DSI_T_CLK_POST (data width[5:0])

0x04700114 MIPI_DSI_1_DSI1_SOFT_RESET

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI soft reset Register

MIPI_DSI_1_DSI1_SOFT_RESET

Bits	Name	Description
31:1	RESERVED	
0	DSI_SOFT_RESET	Resets all internal logic in dsiclk, pclk, byteclk, escclk, ahbm_hclk domain. All enable bits in DSI_CTRL should be already set to 0 when exiting soft reset (DSI_SOFT_RESET changing from 1 to 0). The dynamic clocks should be forced on when DSI_SOFT_RESET is set to 1. (This reset does not apply to DSI registers which are in ahbs_hclk domain.)

0x04700118 MIPI_DSI_1_DSI1_CLK_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Clock Control Register. The dynamic clocks should be forced on when DSI_SOFT_RESET is set to 1 or when DSI_EN is changed from 1 to 0.

MIPI_DSI_1_DSI1_CLK_CTRL

Bits	Name	Description
31:18	RESERVED_1	
17:16	DSI_DSICLK_HYSTERISIS1_CTRL	DSI DSICLK Hysterisis Control
15:14	DSI_AHBM_HCLK_HYSTERISIS1_CTRL	DSI AHBM_HCLK Hysterisis Control
13:12	DSI_AHBS_HCLK_HYSTERISIS1_CTRL	unused
11	DSI_FORCE_ON_DYN_BYTECLK	DSI Dynamic BYTECLK Clock Branch Force On. Set to one to always force on this clock branch.
10	DSI_FORCE_ON_DYN_DSICLK	DSI Dynamic DSICLK Clock Branch Force On. Set to one to always force on this clock branch.
9	DSI_FORCE_ON_DYN_AHBM_HCLK	DSI Dynamic AHBM_HCLK (MCLK) Clock Branch Force On. Set to one to always force on this clock branch.

MIPI_DSI_1_DSI1_CLK_CTRL (cont.)

Bits	Name	Description
8	DSI_FORCE_ON_DYN_AHBS_HCLK	DSI Dynamic AHBS_HCLK (REGCLK)Clock Branch Force On. Set to one to always force on this clock branch.
7:6	RESERVED_2	
5	DSI_ESCCLK_ON	Turns on/off ESCCLK for the DSI. If set to 1, clock is ON.
4	DSI_BYTECLK_ON	Turns on/off BYTECLK for the DSI. If set to 1, clock is ON.
3	DSI_DSICLK_ON	Turns on/off DSICLK for the DSI. If set to 1, clock is ON.
2	DSI_PCLK_ON	Turns on/off PCLK for the DSI. If set to 1, clock is ON.
1	DSI_AHBM_SCLK_ON	Turns on/off AHBM_HCLK for the DSI. If set to 1, clock is ON.
0	DSI_AHBS_HCLK_ON	Turns on/off AHBS_HCLK for the DSI. If set to 1, clock is ON.

0x0470011C MIPI_DSI_1_DSI1_CLK_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Clock Status Register

MIPI_DSI_1_DSI1_CLK_STATUS

Bits	Name	Description
31:17	RESERVED_1	
16	DSIPLL_UNLOCKED_CLR	WRITE ONLY. Write only. Clear dsipll_unlocked status by writing to this register field
16	DSIPLL_UNLOCKED	READ ONLY. Read only. Dsi pll unlock status 0x0: dsipll not unlocked 0x1: dsipll unlocked
15:10	RESERVED_2	
9	DSI_AON_PCLK_ACTIVE	READ ONLY. DSI Always ON PCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
8	DSI_AON_ESCCLK_ACTIVE	READ ONLY. DSI Always ON ESCCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
7	DSI_DYN_BYTECLK_ACTIVE	READ ONLY. DSI Dynamic BYTECLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
6	DSI_AON_BYTECLK_ACTIVE	READ ONLY. DSI Always ON BYTECLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.

MIPI_DSI_1_DSI1_CLK_STATUS (cont.)

Bits	Name	Description
5	DSI_DYN_DSICLK_ACTIVE	READ ONLY. DSI Dynamic DSICLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
4	DSI_AON_DSICLK_ACTIVE	READ ONLY. DSI Always ON DSICLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
3	DSI_DYN_AHBS_HCLK_ACTIVE	READ ONLY. DSI Dynamic AHBS_HCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
2	DSI_AON_AHBS_HCLK_ACTIVE	READ ONLY. DSI Always ON AHBS_HCLK Active Status. Read-only field that shows the status of this clock branch.If set to one, clock is on. If set to zero, clock is off.
1	DSI_DYN_AHBM_HCLK_ACTIVE	READ ONLY. DSI Dynamic AHBM_HCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
0	DSI_AON_AHBM_HCLK_ACTIVE	READ ONLY. DSI Always ON AHBM_HCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.

3:1	RESERVED	

MIPI_DSI_1_DSI1_TEST_PATTERN_GEN_CTRL (cont.)

Bits	Name	Description
0	EN	DSI test pattern enable. This is the global enable of the pattern generator. Once this bit is set to 1, it is ready to generate data for video mode, command mode pixel or dma data. Video mode data is started by DSI*_TEST_PATTERN_GEN_VIDEO_ENABLE; Command mode pixel data can be started by DSI*_TEST_PATTERN_GEN_CMD_STREAM[01]_TRIGGER or triggered by the trigger source set in COMMAND_MODE_MDP_TRIGGER_SEL; Command mode dma data is generated when a memory read request is received (the application layer will generate memory read request when it is triggered by the trigger source set in COMMAND_MODE_DMA_TRIGGER_SEL). Note: for Command dma data, only use the pattern generator in DMA non-embedded mode only (DSI*_COMMAND_MODE_DMA_CTRL.embedded_mode set to 0) because the pattern generator only generates a test pattern for payload.

0x0470015C MIPI_DSI_1_DSI1_TEST_PATTERN_GEN_VIDEO_POLY

Type: Read/Write
Clock: AHB_SLAVE_HCLK

Bits	Name	Description
31:5	RESERVED_BITS31_5	
4	DSIPHY_BIST_LNCK_HS_REQUEST	DSIPHY_BIST_LNCK_HS_REQUEST set to 1 and any of DSIPHY_BIST_SEL[3:0] being set, starts Clock lane TX request for Clock lane HS data transition sequence. Prior to setting this bit, any of DSIPHY_BIST_SEL[3:0] must be set for at least 3 ESCCLK cycles Normal operational mode setting is 0. Power up value is 0

MIPI_DSI_1_DSI1_DSIPHY_BIST_CTRL4 (cont.)

Bits	Name	Description
3:0	DSIPHY_BIST_SEL	DSIPHY_BIST_SEL<i> set to one indicates the data lane is enabled for PHY BIST. Any one of the data lane bist_sel is on will automatically enable the clock lane. Default is set to zero, data lane will be enabled by controller. Note: for 45nm, data lane enable must go through DSI controller software control register. DSIPHY_BIST_SEL only indicates the HS TX byte data either from BIST pattern generator or from controller. For 28nm, DSIPH_BIST_SEL[3:0] os OR-ed with lane enable control driven by controller to eliminate the dependence to controller for PHY BIST. Normal operational mode setting is 0000. Power up value is 0000

3	RESERVED_6	
2	CMD_MODE_EN	Enable the Command Mode Engine. 0x0: Disable DSI Command Mode Engine 0x1: Enable DSI Command Mode Engine
1	VIDEO_MODE_EN	Enable the Video Mode Engine. 0x0: Disable DSI Video Mode Engine 0x1: Enable DSI Video Mode Engine
0	DSI_EN	Enable the DSI controller. 0x0: Disable DSI Controller 0x1: Enable DSI controller

0x05800004 MIPI_DSI_2_DSI2_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Status Register provides status of the DSI controller

MIPI_DSI_2_DSI2_STATUS

Bits	Name	Description
31	INTERLEAVE_OP_CONTENTION_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
31	INTERLEAVE_OP_CONTENTION	READ ONLY. The controller generates command mode packets and video mode packets at the same time (i.e.: the command mode packets are longer than one BLLP period)
30:7	RESERVED	

MIPI_DSI_2_DSI2_STATUS (cont.)

Bits	Name	Description
6	PHY_RESET_BUSY	READ ONLY. DSI interface is busy sending the panel reset through the link
5	GENERIC_TRIGGER_BUSY	READ ONLY. DSI interface is busy sending the generic trigger through the link
4	BTA_BUSY	READ ONLY. DSI interface is busy waiting for read response, acknowledge or tearing effect signal from the peripheral
3	VIDEO_MODE_ENGINE_BUSY	READ ONLY. Video Mode Engine is busy sending data from display engine
2	CMD_MODE_MDP_BUSY	READ ONLY. Command Mode Engine is busy sending data from display engine
1	CMD_MODE_DMA_BUSY	READ ONLY. Command Mode Engine is busy sending data from memory or reading data from the display panel
0	CMD_MODE_ENGINE_BUSY	READ ONLY. Command Mode Engine Busy

0x05800008 MIPI_DSI_2_DSI2_FIFO_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x11111000

Status of FIFOs in the DSI controller

MIPI_DSI_2_DSI2_FIFO_STATUS

Bits	Name	Description
31	RESERVED_1	
30	DLN3_HS_FIFO_OVERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
30	DLN3_HS_FIFO_OVERFLOW	READ ONLY. The FIFO of Lane 3 overflows
29	DLN3_HS_FIFO_FULL	READ ONLY. The FIFO of Lane 3 is full
28	DLN3_HS_FIFO_EMPTY	READ ONLY. The FIFO of Lane 3 is empty
27	RESERVED_2	
26	DLN2_HS_FIFO_OVERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
26	DLN2_HS_FIFO_OVERFLOW	READ ONLY. The FIFO for HS data on Lane 2 overflows
25	DLN2_HS_FIFO_FULL	READ ONLY. The FIFO for HS data on Lane 2 is full

MIPI_DSI_2_DSI2_FIFO_STATUS (cont.)

Bits	Name	Description
24	DLN2_HS_FIFO_EMPTY	READ ONLY. The FIFO for HS data on Lane 2 is empty
23	RESERVED_3	
22	DLN1_HS_FIFO_OVERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
22	DLN1_HS_FIFO_OVERFLOW	READ ONLY. The FIFO of Lane 1 overflows
21	DLN1_HS_FIFO_FULL	READ ONLY. The FIFO of Lane 1 is full
20	DLN1_HS_FIFO_EMPTY	READ ONLY. The FIFO of Lane 1 is empty
19	RESERVED_4	
18	DLN0_HS_FIFO_OVERFLOW	READ ONLY. The FIFO for HS data on Lane 0 overflows
18	DLN0_HS_FIFO_OVERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
17	DLN0_HS_FIFO_FULL	READ ONLY. The FIFO for HS data on Lane 0 is full
16	DLN0_HS_FIFO_EMPTY	READ ONLY. The FIFO for HS data on Lane 0 is empty
15	RESERVED_5	
14	DLN0_LP_FIFO_OVERFLOW_CLR	WRITE ONLY. unused
14	DLN0_LP_FIFO_OVERFLOW	READ ONLY. unused
13	DLN0_LP_FIFO_FULL	READ ONLY. The FIFO for LP data on Lane 0 is full
12	DLN0_LP_FIFO_EMPTY	READ ONLY. The FIFO for LP data on Lane 0 is empty
11	RESERVED_6	
10	CMD_DMA_FIFO_UNDERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
10	CMD_DMA_FIFO_UNDERFLOW	READ ONLY. The Command mode engine dmafifo underflows
9	CMD_DMA_FIFO_WR_WATERMARK_REACH_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
9	CMD_DMA_FIFO_WR_WATERMARK_REACH	READ ONLY. The Command mode engine dmafifo write watermark is reached
8	CMD_DMA_FIFO_RD_WATERMARK_REACH_CLR	WRITE ONLY. writing a 1 to this field will clear this bit
8	CMD_DMA_FIFO_RD_WATERMARK_REACH	READ ONLY. The Command mode engine dmafifo read watermark is reached
7	CMD_MDP_FIFO_UNDERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear the underflow bit

MIPI_DSI_2_DSI2_FIFO_STATUS (cont.)

Bits	Name	Description
7	CMD_MDP_FIFO_UNDERFLOW	READ ONLY. Command mode engine MDP fifo underflows
6:4	RESERVED_7	
3	VIDEO_MDP_FIFO_UNDERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear the underflow bit
3	VIDEO_MDP_FIFO_UNDERFLOW	READ ONLY. Video fifo underflows
2:1	RESERVED_8	
0	VIDEO_MDP_FIFO_OVERFLOW_CLR	WRITE ONLY. writing a 1 to this field will clear the overflow bit
0	VIDEO_MDP_FIFO_OVERFLOW	READ ONLY. Video mode engine fifo overflows

0x0580000C MIPI_DSI_2_DSI2_VIDEO_MODE_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00008000

DSI Video Mode Engine Control Register

MIPI_DSI_2_DSI2_VIDEO_MODE_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	PULSE_MODE_OPT	Select pulse mode option 0x0: no HSA and HE following VS/VE packet 0x1: send HSA and HE following VS/VE packet
27:25	RESERVED_2	
24	HFP_PWR_MODE	Select power mode during the HFP period 0x0: send blanking packets in High Speed mode 0x1: low power stop mode (LP-11)
23:21	RESERVED_3	
20	HBP_PWR_MODE	Select power mode during the HBP period 0x0: send blanking packets in High Speed mode 0x1: low power stop mode (LP-11)
19:17	RESERVED_4	

MIPI_DSI_2_DSI2_VIDEO_MODE_CTRL (cont.)

Bits	Name	Description
16	HSA_PWR_MODE	Select power mode during the HSA period 0x0: send blanking packets in High Speed mode 0x1: low power stop mode (LP-11)
15	EOF_BLLP_PWR_MODE	Select power mode for the BLLP of the last line of a frame 0x0: send blanking packets during BLLP in high speed mode and block Command Mode packets 0x1: low power stop mode (LP-11 or let Command Mode Engine send packets in HS or LP mode)
14:13	RESERVED_5	
12	BLLP_PWR_MODE	DSI Power Mode for packets sent during BLLP period 0x0: send blanking packets during BLLP in high speed mode and block Command Mode packets 0x1: low power stop mode (LP-11 or let Command Mode Engine send packets in HS or LP mode)
11:10	RESERVED_6	
9:8	TRAFFIC_MODE	DSI video mode traffic sequence 0x0: non-burst mode with sync pulses 0x1: non-burst mode with sync start events 0x2: burst mode 0x3: reserved
7:6	RESERVED_7	
5:4	DST_FORMAT	Pixel format. If there is interleaved Command Mode pixel packets (generated from MDP), the pixel depth of the Command Mode pixel packet should be greater or equal to the pixel depth of the Video mode pixel packet. 0x0: RGB565 0x1: RGB666_1 (packed) 0x2: RGB666_2 (loosely packed) 0x3: RGB888
3:2	RESERVED_8	
1:0	VC	Virtual channel identifier

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x31211101

DSI Video Mode Sync Datatype Register

MIPI_DSI_2_DSI2_VIDEO_MODE_SYNC_DATATYPE

Bits	Name	Description
31:30	RESERVED_1	
29:24	HE	Specify the datatype of a hsync end packet
23:22	RESERVED_2	
21:16	HS	Specify the datatype of a hsync start packet
15:14	RESERVED_3	
13:8	VE	Specify the datatype of a vsync end packet
7:6	RESERVED_4	
5:0	VS	Specify the datatype of a vsync start packet

0x05800014 MIPI_DSI_2_DSI2_VIDEO_MODE_PIXEL_DATATYPE

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x3E2E1E0E

DSI Video Mode Pixel Datatype Register

MIPI_DSI_2_DSI2_VIDEO_MODE_PIXEL_DATATYPE

Bits	Name	Description
31:30	RESERVED_1	
29:24	RGB888	Specify the datatype of an RGB888 pixel stream packet
23:22	RESERVED_2	
21:16	RGB666	Specify the datatype of a loosely-packed RGB666 pixel stream packet
15:14	RESERVED_3	
13:8	RGB666_PACKED	Specify the datatype of a packed RGB666 pixel stream packet
7:6	RESERVED_4	
5:0	RGB565	Specify the datatype of an RGB565 pixel stream packet

0x05800018 MIPI_DSI_2_DSI2_VIDEO_MODE_BLANKING_DATATYPE

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00001900

DSI Video Mode Blanking Packet Datatype Register

MIPI_DSI_2_DSI2_VIDEO_MODE_BLANKING_DATATYPE

Bits	Name	Description
31:14	RESERVED	
13:8	BLANK_PKT_DATATYPE	Specify the datatype of a blanking packet
7:0	BLANK_PKT_DATA	This byte will be repeated in the payload portion of the blanking packet

0x0580001C MIPI_DSI_2_DSI2_VIDEO_MODE_DATA_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Video Mode Data Control Register

MIPI_DSI_2_DSI2_VIDEO_MODE_DATA_CTRL

Bits	Name	Description
31:15	RESERVED_1	
14:12	RGB_SWAP	Swaps the R, G, and B channels of the dst pixels. This field should be used when different R,G, and B orderings are required. For example, if RGB_SWAP = 1 , RGB565 will become RBG556. 0x0: RGB 0x1: RBG 0x2: BGR 0x3: BRG 0x4: GRB 0x5: GBR 0x6: reserved_1 0x7: reserved_2
11:9	RESERVED_2	
8	B_SEL	Bit Swaps the B Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
7:5	RESERVED_3	

MIPI_DSI_2_DSI2_VIDEO_MODE_DATA_CTRL (cont.)

Bits	Name	Description
4	G_SEL	Bit Swaps the G Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
3:1	RESERVED_4	
0	R_SEL	Bit Swaps the R Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap

0x05800020 MIPI_DSI_2_DSI2_VIDEO_MODE_ACTIVE_H

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Active Horizontal Display Region register.

The Active_H_Disp register defines the horizontal characteristics of the active window. (NOTE: video mode parameters are 0-based.)

MIPI_DSI_2_DSI2_VIDEO_MODE_ACTIVE_H

Bits	Name	Description
31:28	RESERVED_1	
27:16	ACTIVE_H_END	ACTIVE_H_END field tells the video mode engine where the horizontal viewing area ends (minus one) in pixel clock cycle relative to the horizontal sync signal.
15:12	RESERVED_2	
11:0	ACTIVE_H_START	ACTIVE_H_START field tells the video mode engine where the horizontal viewing area starts (minus one) in pixel clock cycle relative to the horizontal sync signal.

0x05800024 MIPI_DSI_2_DSI2_VIDEO_MODE_ACTIVE_V

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CRTC Active Vertical Display Region register.

The Active_V_Disp register defines the vertical characteristics of the active window. (NOTE: video mode parameters are 0-based.)

MIPI_DSI_2_DSI2_VIDEO_MODE_ACTIVE_V

Bits	Name	Description
31:28	RESERVED_1	
27:16	ACTIVE_V_END	ACTIVE_V_END field tells the video mode engine where the horizontal viewing area ends (minus one) in lines relative to the vertical sync signal
15:12	RESERVED_2	
11:0	ACTIVE_V_START	ACTIVE_V_START field tells the video mode engine where the vertical viewing area starts (minus one) in lines relative to the vertical sync signal

0x05800028 MIPI_DSI_2_DSI2_VIDEO_MODE_TOTAL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Total Scan Area register.

TOTAL register defines the size of the total possible scanning area (NOTE: video mode parameters are 0-based.)

MIPI_DSI_2_DSI2_VIDEO_MODE_TOTAL

Bits	Name	Description
31:28	RESERVED_1	
27:16	VIDEO_V_TOTAL	Number of lines in one frame minus one. This value is equivalent to the period of the vertical sync
15:12	RESERVED_2	
11:0	VIDEO_H_TOTAL	Number of pixels in one scan line (horizontal line) of the LCD controller minus one. This value is equivalent to the period of the horizontal sync signal (in pixel clock cycles).

0x0580002C MIPI_DSI_2_DSI2_VIDEO_MODE_HSYNC

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HSync Control register which controls the horizontal screen position at which a horizontal sync packet is sent by the DSI controller to the panel. (NOTE: video mode parameters are 0-based.)

MIPI_DSI_2_DSI2_VIDEO_MODE_HSYNC

Bits	Name	Description
31:28	RESERVED_1	
27:16	HS_END	The position (minus one) where the horizontal sync ends in one line.
15:12	RESERVED_2	
11:0	HS_START	The position (minus one) where the horizontal sync starts in one line.

0x05800030 MIPI_DSI_2_DSI2_VIDEO_MODE_VSYNC

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

VSync Control register which controls the horizontal screen position at which a vertical sync packet is sent by the DSI controller to the panel. (NOTE: video mode parameters are 0-based.)

MIPI_DSI_2_DSI2_VIDEO_MODE_VSYNC

Bits	Name	Description
31:28	RESERVED_1	
27:16	VS_END	The position (minus one) where the vertical sync ends in one line.
15:12	RESERVED_2	
11:0	VS_START	The position (minus one) where the vertical sync starts in one line.

0x05800034 MIPI_DSI_2_DSI2_VIDEO_MODE_VSYNC_VPOS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

VSync Control register which controls the vertical screen position at which a vertical sync packet is sent by the DSI controller to the panel. (NOTE: video mode parameters are 0-based.)

MIPI_DSI_2_DSI2_VIDEO_MODE_VSYNC_VPOS

Bits	Name	Description
31:28	RESERVED_1	

MIPI_DSI_2_DSI2_VIDEO_MODE_VSYNC_VPOS (cont.)

Bits	Name	Description
27:16	VS_VPOS_END	The line (minus one) where the vertical sync ends in one frame.
15:12	RESERVED_2	
11:0	VS_VPOS_START	The line (minus one) where the vertical sync starts in one frame.

0x05800038 MIPI_DSI_2_DSI2_COMMAND_MODE_DMA_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Mode Control Register for DMA data control

MIPI_DSI_2_DSI2_COMMAND_MODE_DMA_CTRL

Bits	Name	Description
31	BROADCAST_EN	Enable the DSI core to send packets from DMA at the same time with the other core (this bit has to be set for the other DSI core as well). If broadcast is enable, the core needs to wait until both cores have fetched entire command buffer before start sending dma packets. When this bit is set, the command buffer size (DSI_DMA_CMD_LENGTH) must be less than 0x200 bytes. 0x0: disable 0x1: enable
30	BROADCAST_MASTER	Indicate whether this core is the master or slave 0x0: this core is the slave 0x1: this core is the master
29	RESERVED_1	
28	EMBEDDED_MODE	Select packet_type, BTA settings and packet header information 0x0: from the register 0x1: from the frame buffer
27	RESERVED_2	
26	POWER_MODE	Select power mode for data transmission of both embedded and non-embedded commands 0x0: high speed mode 0x1: low power mode
25	RESERVED	
24	PACKET_TYPE	Select packet type for non-embedded commands 0x0: short packet 0x1: long packet
23:22	VC	Virtual channel identifier for pixel data or non-embedded commands

MIPI_DSI_2_DSI2_COMMAND_MODE_DMA_CTRL (cont.)

Bits	Name	Description
21:16	DT	Data type for pixel data or non-embedded commands
15:0	WC	Exact number of bytes in one packet for pixel data or non-embedded commands

0x0580003C MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x06100006

DSI Command Mode Control Register for MDP data control

MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_CTRL

Bits	Name	Description
31	LINE_SPLIT	Break a line into small packets 0x0: no split 0x1: split
30:28	RGB_SWAP1	Swaps the R, G, and B channels of the dst pixels for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise rgb swap for stream1 is defined by RGB_SWAP). This field should be used when different R,G, and B orderings are required. For example, if RGB_SWAP = 1 , RGB565 will become RBG556. 0x0: RGB 0x1: RBG 0x2: BGR 0x3: BRG 0x4: GRB 0x5: GBR 0x6: reserved_1 0x7: reserved_2
27:24	DST_FORMAT1	Pixel format for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise pixel format for stream1 is defined by DST_FORMAT) - 0 = RGB111 - 1 = reserved - 2 = reserved - 3 = RGB332 (data_src_width must be in multiple of 2 pixels) - 4 = RGB444 (data_src_width must be in multiple of 2 pixels) - 5 = reserved - 6 = RGB565 - 7 = RGB666 - 8 = RGB888 others = reserved

MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_CTRL (cont.)

Bits	Name	Description
23:20	INTERLEAVE_MAX	Maximum number of Command Mode RGB packets to send within one horizontal blanking period of the Video Mode frame (sw must ensure that they can fit in one BLLP period)
19	RESERVED_1	
18:16	RGB_SWAP	Swaps the R, G, and B channels of the dst pixels. This field should be used when different R,G, and B orderings are required. For example, if RGB_SWAP = 1, RGB565 will become RBG556. 0x0: RGB 0x1: RBG 0x2: BGR 0x3: BRG 0x4: GRB 0x5: GBR 0x6: reserved_1 0x7: reserved_2
15	STREAM1_DST_FORMAT_SEL	Pixel format selection for stream 1. If MDP sends two streams to DSI and these streams have different output formats, then the pixel clock must be set according to the smallest pixel depth between the two. Otherwise, underflow may occur. Ex.: If stream0 is in RGB888 and stream1 is in RGB565, then pixel clock must be greater than dsiclk/2. 0x0: DST_FORMAT (same as stream0) 0x1: DST_FORMAT1
14	RESERVED_2	
13	B_SEL1	Bit Swaps the B Channel of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise bit swap for stream1 is defined by B_SEL). This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
12	B_SEL	Bit Swaps the B Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
11:10	RESERVED	

MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_CTRL (cont.)

Bits	Name	Description
9	G_SEL1	Bit Swaps the G Channel of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise bit swap for stream1 is defined by G_SEL). This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
8	G_SEL	Bit Swaps the G Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
7	BYTE_MSB_LSB_FLIP1	Swap the bit ordering of each byte of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise the byte endian is defined by BYTE_MSB_LSB_FLIP). 0x0: bit 0 is lsb, bit 7 is msb 0x1: bit 0 is msb, bit 0 is lsb
6	BYTE_MSB_LSB_FLIP	Swap the bit ordering of each byte of the dst pixel (this is done after the RGB swap and R/G/B_SEL). 0x0: bit 0 is lsb, bit 7 is msb 0x1: bit 0 is msb, bit 0 is lsb
5	R_SEL1	Bit Swaps the R Channel of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise bit swap for stream1 is defined by R_SEL). This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap
4	R_SEL	Bit Swaps the R Channel of the dst pixel. This field is used to reverse the ordering of the bits that is output for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output. 0x0: no swap 0x1: swap

MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_CTRL (cont.)

Bits	Name	Description
3:0	DST_FORMAT	Destination pixel format. For video mode operation interleave with MDP pixel packets, this is required: command mode pixel depth >= video mode pixel depth (check video mode pixel format in DSI_VIDEO_MODE_PIXEL_DATATYPE) - 0 = RGB111 - 1 = reserved - 2 = reserved - 3 = RGB332 (data_src_width must be in multiple of 2 pixels) - 4 = RGB444 (data_src_width must be in multiple of 2 pixels) - 5 = reserved - 6 = RGB565 - 7 = RGB666 - 8 = RGB888 others = reserved

0x05800040 MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_DCS_CMD_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00003C2C

This register controls DCS command insertion to MDP data

MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_DCS_CMD_CTRL

Bits	Name	Description
31:18	RESERVED	
17	INSERT_DCS_COMMAND2	Indicate whether a DCS command has to be inserted as the first byte of the payload of the pixel data packet of the stream NOT selected by COMMAND_MODE_DMA_STREAM_SEL 0x0: no command is inserted 0x1: value in the DCS_COMMAND field will be inserted
16	INSERT_DCS_COMMAND	Indicate whether a DCS command has to be inserted as the first byte of payload of the pixel data packet 0x0: no command is inserted 0x1: value in the DCS_COMMAND field will be inserted
15:8	WR_MEM_CONTINUE	DCS command for write_memory_continue
7:0	WR_MEM_START	DCS command for write_memory_start

0x05800044 MIPI_DSI_2_DSI2_DMA_CMD_OFFSET

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Offset Register

MIPI_DSI_2_DSI2_DMA_CMD_OFFSET

Bits	Name	Description
31:0	CMD_OFFSET	Memory offset (in bytes) for DSI command, qword aligned, i.e.: bit 2:0 are tied to 0. This value has to be multiple of 8. NOTE: Bits 0:2 of this field are preset in the factory to 0. You cannot change the setting of bits 0:2.

0x05800048 MIPI_DSI_2_DSI2_DMA_CMD_LENGTH

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Length Register

MIPI_DSI_2_DSI2_DMA_CMD_LENGTH

Bits	Name	Description
31:24	RESERVED	
23:0	CMD_LENGTH	Number of commands (in bytes). This value has to be multiple of 4.

0x0580004C MIPI_DSI_2_DSI2_DMA_FIFO_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI DMA FIFO Control Register

MIPI_DSI_2_DSI2_DMA_FIFO_CTRL

Bits	Name	Description
31:6	RESERVED_1	

MIPI_DSI_2_DSI2_DMA_FIFO_CTRL (cont.)

Bits	Name	Description
5:4	READ_WATERMARK	Allow fifo reads for a packet when the number of unread entries is above this watermark or larger than the packet size (read_watermark has to be smaller than or equal to write_watermark) 0x0: FIFO is 1/2 full 0x1: FIFO is 3/4 full 0x2: FIFO is 7/8 full 0x3: FIFO is 15/16 full
3:2	RESERVED_2	
1:0	WRITE_WATERMARK	Fills FIFO under the following conditions 0x0: FIFO is 1/2 empty 0x1: FIFO is 1/4 empty 0x2: FIFO is 1/8 empty 0x3: FIFO is 1/16 empty

0x05800050 MIPI_DSI_2_DSI2_DMA_NULL_PACKET_DATA

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000900

DSI DMA Null Packet Data Register

MIPI_DSI_2_DSI2_DMA_NULL_PACKET_DATA

Bits	Name	Description
31:14	RESERVED	
13:8	NULL_DATATYPE	Datatype of null packet
7:0	NULL_DATA	This byte will be repeated in the payload portion of the embedded null packet

0x05800054 MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_STREAM0_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI MDP stream 0 control register

MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_STREAM0_CTRL

Bits	Name	Description
31:16	MDP0_WC	Exact number of Word (byte) count for one packet
15:10	RESERVED_1	
9:8	MDP0_VC	Virtual channel
7:6	RESERVED_2	
5:0	MDP0_DT	Packet data type

0x05800058 MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_STREAM0_TOTAL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI MDP stream 0 frame dimension (NOTE: unlike video mode parameters which are 0-based, these parameters in command mode are 1-based, i.e.: the actual number of pixels are set.)

MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_STREAM0_TOTAL

Bits	Name	Description
31:28	RESERVED_1	
27:16	MDP0_V_TOTAL	Number of lines in 1 frame
15:12	RESERVED_2	
11:0	MDP0_H_TOTAL	Number of pixels in 1 line

0x0580005C MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_STREAM1_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI MDP stream 1 control register

MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_STREAM1_CTRL

Bits	Name	Description
31:16	MDP1_WC	Exact number of word (byte) count for one packet
15:10	RESERVED_1	
9:8	MDP1_VC	Virtual channel

MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_STREAM1_CTRL (cont.)

Bits	Name	Description
7:6	RESERVED_2	
5:0	MDP1_DT	Packet data type

0x05800060 MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_STREAM1_TOTAL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI MDP stream 1frame dimension (NOTE: unlike video mode parameters which are 0-based, these parameters in command mode are 1-based, i.e.: the actual number of pixels are set.)

MIPI_DSI_2_DSI2_COMMAND_MODE_MDP_STREAM1_TOTAL

Bits	Name	Description
31:28	RESERVED_1	
27:16	MDP1_V_TOTAL	Exact number of lines in 1 frame
15:12	RESERVED_2	
11:0	MDP1_H_TOTAL	Exact number of pixels in 1 line

0x05800064 MIPI_DSI_2_DSI2_ACK_ERR_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Error Report Register stores errors and acknowledge from the DSI display module.

This register stores errors from the error report packet and error in the ECC and CRC of the returned packet

MIPI_DSI_2_DSI2_ACK_ERR_STATUS

Bits	Name	Description
31:29	RESERVED_1	
28	ACK_CLR	WRITE ONLY. clear ACK by writing a ’1’ and then a ’0’ to this bit
28	ACK	READ ONLY. Transmission acknowledged by the DSI display module
27:25	RESERVED_2	

MIPI_DSI_2_DSI2_ACK_ERR_STATUS (cont.)

Bits	Name	Description
24	ERROR	READ ONLY. There is an error report returned from the DSI display module (or-ed error bits 0 - 15)
24	ERROR_CLR	WRITE ONLY. clear ERROR by writing a ’1’ and then a ’0’ to this bit
23	RDBK_INCOMPLETE_PACKET_ERR	READ ONLY. Received incomplete read packet
23	RDBK_INCOMPLETE_PACKET_ERR_CLR	WRITE ONLY. clear RDBK_INCOMPLETE_PACKET_ERR by writing a ’1’ and then a ’0’ to this bit
22:21	RESERVED_3	
20	RDBK_DATA_CRC_ERR_CLR	WRITE ONLY. clear RDBK_DATA_CRC_ERR by writing a ’1’ and then a ’0’ to this bit
20	RDBK_DATA_CRC_ERR	READ ONLY. Incorrect CRC detected in read packet
19:18	RESERVED_4	
17	RDBK_DATA_MULTI_ECC_ERR_CLR	WRITE ONLY. clear RDBK_DATA_MULTI_ECC_ERR by writing a ’1’ and then a ’0’ to this bit
17	RDBK_DATA_MULTI_ECC_ERR	READ ONLY. Multi-bit ECC detected in read packet and not corrected
16	RDBK_DATA_ECC_ERR_CLR	WRITE ONLY. clear RDBK_DATA_ECC_ERR by writing a ’1’ and then a ’0’ to this bit
16	RDBK_DATA_ECC_ERR	READ ONLY. Single bit ECC error detected in read packet and corrected by DSI controller
15	PANEL_SPECIFIC_ERR	READ ONLY. This bit correspond to bit 15 (DSI protocol violation) of the error report. Please refer to the meaning by this description rather than by the name of the register field
15	PANEL_SPECIFIC_ERR_CLR	WRITE ONLY. Clear PANEL_SPECIFIC_ERR by writing a ’1’ and then a ’0’ to this bit
14	RESERVED	
13	PROTOCOL_VIOLATION_CLR	WRITE ONLY. Clear Protocol violation by writing a ’1’ and then a ’0’ to this bit
13	PROTOCOL_VIOLATION	READ ONLY. This bit correspond to bit 13 (invalid transmission length) of the error report. Please refer to the meaning by this description rather than by the name of the register field.
12	VC_ERR_CLR	WRITE ONLY. clear VC_ERR by writing a ’1’ and then a ’0’ to this bit
12	VC_ERR	READ ONLY. Invalid virtual channel ID detected by the DSI display module
11	DT_ERR_CLR	WRITE ONLY. clear DT_ERR by writing a ’1’ and then a ’0’ to this bit
11	DT_ERR	READ ONLY. DSI data type not recognized by the DSI display module

MIPI_DSI_2_DSI2_ACK_ERR_STATUS (cont.)

Bits	Name	Description
10	CRC_ERR	READ ONLY. Checksum error for long packet detected by the DSI display module
10	CRC_ERR_CLR	WRITE ONLY. clear CRC_ERR by writing a ’1’ and then a ’0’ to this bit
9	MULTI_ECC_ERR_CLR	WRITE ONLY. clear MULTI_ECC_ERR by writing a ’1’ and then a ’0’ to this bit
9	MULTI_ECC_ERR	READ ONLY. Multi-bit ECC detected and not corrected by the DSI display module
8	ECC_ERR_CLR	WRITE ONLY. clear ECC_ERR by writing a ’1’ and then a ’0’ to this bit
8	ECC_ERR	READ ONLY. Single bit ECC detected and corrected by the DSI display module
7	CONTENTION	READ ONLY. Contention Detected by Peripheral
7	CONTENTION_CLR	WRITE ONLY. clear CONTENTION by writing a ’1’ and then a ’0’ to this bit
6	FALSE_CTRL_ERR_CLR	WRITE ONLY. clear FALSE_CTRL_ERR by writing a ’1’ and then a ’0’ to this bit
6	FALSE_CTRL_ERR	READ ONLY. False Control Error detected by the DSI display module
5	TIMEOUT_CLR	WRITE ONLY. clear TIMEOUT by writing a ’1’ and then a ’0’ to this bit
5	TIMEOUT	READ ONLY. timeout error (Low Power forward transmission, bus turn around, High Speed reverse transmission) detected by the DSI display module
4	LP_ERR	READ ONLY. Low-power transmit sync error detected by the DSI display module
4	LP_ERR_CLR	WRITE ONLY. clear LP_ERR by writing a ’1’ and then a ’0’ to this bit
3	ESC_ERR_CLR	WRITE ONLY. clear ESC_ERR by writing a ’1’ and then a ’0’ to this bit
3	ESC_ERR	READ ONLY. Escape Mode Entry Command Error detected by the DSI display module
2	EOT_ERR_CLR	WRITE ONLY. clear EOT_ERR by writing a ’1’ and then a ’0’ to this bit
2	EOT_ERR	READ ONLY. EoT Sync Error detected by the DSI display module
1	SOT_SYNC_ERR	READ ONLY. SoT Sync Error detected by the DSI display module
1	SOT_SYNC_ERR_CLR	WRITE ONLY. clear SOT_SYNC_ERR by writing a ’1’ and then a ’0’ to this bit
0	SOT_ERR_CLR	WRITE ONLY. clear SOT_ERR by writing a ’1’ and then a ’0’ to this bit

MIPI_DSI_2_DSI2_ACK_ERR_STATUS (cont.)

Bits	Name	Description
0	SOT_ERR	READ ONLY. SoT Error detected by the DSI display module

0x05800068 MIPI_DSI_2_DSI2_RDBK_DATA0

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Read Data 0 Register

MIPI_DSI_2_DSI2_RDBK_DATA0

Bits	Name	Description
31:0	RD_DATA0	READ ONLY. Data returned from the DSI display module

0x0580006C MIPI_DSI_2_DSI2_RDBK_DATA1

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Read Data 1 Register

MIPI_DSI_2_DSI2_RDBK_DATA1

Bits	Name	Description
31:0	RD_DATA1	READ ONLY. Data returned from the DSI display module

0x05800070 MIPI_DSI_2_DSI2_RDBK_DATA2

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Read Data 2 Register

MIPI_DSI_2_DSI2_RDBK_DATA2

Bits	Name	Description
31:0	RD_DATA2	READ ONLY. Data returned from the DSI display module

0x05800074 MIPI_DSI_2_DSI2_RDBK_DATA3

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Read Data 3 Register

MIPI_DSI_2_DSI2_RDBK_DATA3

Bits	Name	Description
31:0	RD_DATA3	READ ONLY. Data returned from the DSI display module

0x05800078 MIPI_DSI_2_DSI2_RDBK_DATATYPE0

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x22211211

DSI Read Response Datatype Register 0

MIPI_DSI_2_DSI2_RDBK_DATATYPE0

Bits	Name	Description
31:30	RESERVED_1	
29:24	DCS_SHORT_RD_2_BYTE	Specify the datatype of a DCS short read response with 2 byte returned
23:22	RESERVED_2	
21:16	DCS_SHORT_RD_1_BYTE	Specify the datatype of a DCS short read response with 1 byte returned
15:14	RESERVED_3	
13:8	GENERIC_SHORT_RD_2_BYTE	Specify the datatype of a generic short read response with 2 byte returned
7:6	RESERVED_4	
5:0	GENERIC_SHORT_RD_1_BYTE	Specify the datatype of a generic short read response with 1 byte returned

0x0580007C MIPI_DSI_2_DSI2_RDBK_DATATYPE1

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x001C1A02

DSI Read Response Datatype Register 1

MIPI_DSI_2_DSI2_RDBK_DATATYPE1

Bits	Name	Description
31:22	RESERVED_1	
21:16	DCS_LONG_RD	Specify the datatype of a DCS long read response
15:14	RESERVED_2	
13:8	GENERIC_LONG_RD	Specify the datatype of a generic long read response
7:6	RESERVED	
5:0	ERROR_REPORT	Specify the datatype of an acknowledge with error report

0x05800080 MIPI_DSI_2_DSI2_TRIG_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Trigger Control Register

When DSI is enabled and CRTC1 or 2 is used for other non-DSI panels, the display engine path trigger must be set to manual internal, otherwise the CRTC will be stalled

MIPI_DSI_2_DSI2_TRIG_CTRL

Bits	Name	Description
31	TE_SEL	Select TE path 0x0: Tearing effect_1 (external trigger returns from data link) 0x1: Tearing effect_2 (external trigger returns from a dedicated pin)
30:29	RESERVED_1	
28	COMMAND_MODE_DMA_MDP_ORDER	This bit field indicates whether DMA or MDP path will win the arbitration if both requests the link at the same time 0x0: DMA has higher priority than display processor 0x1: Display processor has higher priority than DMA
27:25	RESERVED_2	
24	COMMAND_MODE_MDP_REQ_ORDER	If PHY TE is required for one of the MDP stream while the other stream is ready to transmit, this field determines which will win the arbitration 0x0: Command Mode MDP PHY TE request has higher priority than Command Mode MDP data transmission request 0x1: Command Mode MDP Data transmission request has higher priority than Command Mode MDP PHY TE request
23:9	RESERVED_3	

MIPI_DSI_2_DSI2_TRIG_CTRL (cont.)

Bits	Name	Description
8	COMMAND_MODE_DMA_STREAM_SEL	If COMMAND_MODE_DMA_TRIGGER_SEL = SOF/EOF or both COMMAND_MODE_DMA_TRIGGER_SEL and COMMAND_MODE_MDP_TRIGGER_SEL = TE or sw+TE, the Command Mode DMA path is triggered at frame boundary of the MDP stream selected by this bit 0x0: stream 0 0x1: stream 1
7	RESERVED_4	
6:4	COMMAND_MODE_MDP_TRIGGER_SEL	TRIGGER_SEL field is used to select which trigger is used for Command Mode display processor path. (The stream to be triggered is selected by COMMAND_MODE_DMA_STREAM_SEL) 0x0: none 0x1: reserved_1 0x2: TE 0x3: reserved_2 0x4: sw trigger 0x5: reserved_3 0x6: sw trigger and TE 0x7: reserved_4
3	RESERVED	
2:0	COMMAND_MODE_DMA_TRIGGER_SEL	DMA_TRIGGER_SEL field is used to select which trigger is used for Command Mode DMA path. 0x0: none 0x1: Start/end of frame (determined by COMMAND_MODE_DMA_MDP_ORDER) 0x2: TE 0x3: reserved_1 0x4: sw trigger 0x5: sw trigger and start/end of frame (COMMAND_MODE_DMA_MDP_ORDER) 0x6: sw trigger and TE 0x7: reserved_2

0x05800084 MIPI_DSI_2_DSI2_EXT_MUX

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI External Pin Mux Register - select IO pin for tearing effect and panel reset

MIPI_DSI_2_DSI2_EXT_MUX

Bits	Name	Description
31:20	EXT_TE_HSYNC_TOTAL	Defines the total number of hsync per frame
19:8	EXT_TE_HSYNC_TRIG_CNT	Defines the number of hsync needed to trigger the engine if TE_MODE is set to 1
7	EXT_TE_POL	Polarity of external tearing effect signal 0x0: TE occurs at the rising edge 0x1: TE occurs at the falling edge
6	RESERVED	
5:4	EXT_TE_MODE	Select TE mode 0x0: vsync_1 (edge detection) 0x1: vsync_2 (pulse width detection) 0x2: vsync and hsync combin_1 (edge detection) 0x3: vsync and hsync combin_2 (pulse width detection)
3:0	EXT_TE_MUX	Input port for external tearing effect (external trigger). Valid range: 0 to 1

0x05800088 MIPI_DSI_2_DSI2_EXT_TE_PULSE_DETECT_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI External Tearing Effect Pulse Width Detection Control Register

MIPI_DSI_2_DSI2_EXT_TE_PULSE_DETECT_CTRL

Bits	Name	Description
31:16	TE_VSYNC_MIN_WIDTH	Defines the minimum width (in escclk) of the vsync pulse in the TE signal
15:0	TE_HSYNC_MAX_WIDTH	Defines the maximum width (in escclk) of the hsync pulse in the TE signal

0x0580008C MIPI_DSI_2_DSI2_CMD_MODE_DMA_SW_TRIGGER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Mode DMA Software Trigger Register

MIPI_DSI_2_DSI2_CMD_MODE_DMA_SW_TRIGGER

Bits	Name	Description
31:1	RESERVED	
0	SW_TRIGGER	Software can start a DMA trigger for the Command Mode engine by writing a 1 to this bit

0x05800090 MIPI_DSI_2_DSI2_CMD_MODE_MDP_SW_TRIGGER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Mode Display Processor Path Software Trigger Register

MIPI_DSI_2_DSI2_CMD_MODE_MDP_SW_TRIGGER

Bits	Name	Description
31:1	RESERVED	
0	SW_TRIGGER	Software can start an MPD trigger for the Command Mode engine by writing a 1 to this bit

0x05800094 MIPI_DSI_2_DSI2_CMD_MODE_BTA_SW_TRIGGER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Command Mode Bus-Turn-Around Software Trigger Register

MIPI_DSI_2_DSI2_CMD_MODE_BTA_SW_TRIGGER

Bits	Name	Description
31:1	RESERVED	
0	SW_TRIGGER	Software can start a BTA trigger for the Command Mode engine by writing a 1 to this bit

0x05800098 MIPI_DSI_2_DSI2_RESET_SW_TRIGGER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Reset Software Trigger Register

MIPI_DSI_2_DSI2_RESET_SW_TRIGGER

Bits	Name	Description
31:1	RESERVED	
0	SW_TRIGGER	Software can trigger reset through the data link by writing a 1 to this bit

0x0580009C MIPI_DSI_2_DSI2_MISR_CMD_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI miser control for command mode operation - misr is collected for packets output from packetizer

MIPI_DSI_2_DSI2_MISR_CMD_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	EN	enable Command Mode misr accumulation (all the misr's are reset to 0 when it is disable)
27:25	RESERVED_2	
24	WIDTH_SEL	misr width of packets generated fronm dma, mdp stream 0 and mdp stream1 data 0x0: generate misr in 8 bits 0x1: generate misr in 16 bits
23:16	MDP_STREAM1_MISR	READ ONLY. 8-bit misr for packets generated from MDP stream 1
15:8	MDP_STREAM0_MISR	READ ONLY. 8-bit misr for packets generated from MDP stream 0
7:0	DMA_MISR	READ ONLY. 8-bit misr for packets generated from memory

0x058000A0 MIPI_DSI_2_DSI2_MISR_VIDEO_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI miser control for video mode operation - misr is collected for packets output from packetizer

MIPI_DSI_2_DSI2_MISR_VIDEO_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	STOP_EN	select misr accumulation restart or stop after N frame (specified in MAX_FRAME_COUNT) 0x0: auto reset every N frame 0x1: stop after N frames
27:25	RESERVED_2	
24	WIDTH_SEL	misr width of packets generated fronm dma, mdp stream 0 and mdp stream1 data 0x0: generate misr in 8 bits 0x1: generate misr in 16 bits
23:17	RESERVED	
16	EN	enable Video Mode misr accumulation (the misr is reset to 0 when it is disable)
15:8	MAX_FRAME_COUNT	internal misr is reset when the number of frames generated by the video mode engine reaches this number and the MISR field in this register is updated before the reset
7:0	MISR	READ ONLY. misr for video mode packets

0x058000A4 MIPI_DSI_2_DSI2_LANE_STATUS

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Lane Status Register

MIPI_DSI_2_DSI2_LANE_STATUS

Bits	Name	Description
31:17	RESERVED_1	
16	DLN0_DIRECTION	READ ONLY. Indicate transmission direction of Data Lane 0 0x0: forward 0x1: reverse
15:13	RESERVED_2	
12	CLKLN_ULPS_ACTIVE_NOT	READ ONLY. Indicate whether Clock Lane is in Ultra-Low power state 0x0: ulps active 0x1: ulps not active

MIPI_DSI_2_DSI2_LANE_STATUS (cont.)

Bits	Name	Description
11	DLN3_ULPS_ACTIVE_NOT	READ ONLY. Indicate whether Data Lane 3 is in Ultra-Low power state 0x0: ulps active 0x1: ulps not active
10	DLN2_ULPS_ACTIVE_NOT	READ ONLY. Indicate whether Data Lane 2 is in Ultra-Low power state 0x0: ulps active 0x1: ulps not active
9	DLN1_ULPS_ACTIVE_NOT	READ ONLY. Indicate whether Data Lane 1 is in Ultra-Low power state 0x0: ulps active 0x1: ulps not active
8	DLN0_ULPS_ACTIVE_NOT	READ ONLY. Indicate whether Data Lane 0 is in Ultra-Low power state 0x0: ulps active 0x1: ulps not active
7:5	RESERVED	
4	CLKLN_STOPSTATE	READ ONLY. Indicate whether Clock Lane is in Stop state 0x0: active state 0x1: stop state
3	DLN3_STOPSTATE	READ ONLY. Indicate whether Data Lane 3 is in Stop state 0x0: active state 0x1: stop state
2	DLN2_STOPSTATE	READ ONLY. Indicate whether Data Lane 2 is in Stop state 0x0: active state 0x1: stop state
1	DLN1_STOPSTATE	READ ONLY. Indicate whether Data Lane 1 is in Stop state 0x0: active state 0x1: stop state
0	DLN0_STOPSTATE	READ ONLY. Indicate whether Data Lane 0 is in Stop state 0x0: active state 0x1: stop state

0x058000A8 MIPI_DSI_2_DSI2_LANE_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Lane Control Register

MIPI_DSI_2_DSI2_LANE_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	CLKLN_HS_FORCE_REQUEST	Force Clock Lane to enter HS mode always
27:21	RESERVED_2	
20	CLKLN_FORCE_TX_STOP	Force Clock Lane to go into transmit mode and the lane module state machine is forced into the Stop state
19	DLN3_FORCE_TX_STOP	Force Data Lane 3 to go into transmit mode and the lane module state machine is forced into the Stop state
18	DLN2_FORCE_TX_STOP	Force Data Lane 2 to go into transmit mode and the lane module state machine is forced into the Stop state
17	DLN1_FORCE_TX_STOP	Force Data Lane 1 to go into transmit mode and the lane module state machine is forced into the Stop state
16	DLN0_FORCE_TX_STOP	Force Data Lane 0 to go into transmit mode and the lane module state machine is forced into the Stop state
15:13	RESERVED_3	
12	CLKLN_ULPS_EXIT	Request Clock Lane to exit Ultra-Low power state
11	DLN3_ULPS_EXIT	Request Data Lane 3 to exit Ultra-Low power state
10	DLN2_ULPS_EXIT	Request Data Lane 2 to exit Ultra-Low power state
9	DLN1_ULPS_EXIT	Request Data Lane 1 to exit Ultra-Low power state
8	DLN0_ULPS_EXIT	Request Data Lane 0 to exit Ultra-Low power state
7:5	RESERVED_4	
4	CLKLN_ULPS_REQUEST	Request Clock Lane to enter Ultra-Low power state
3	DLN3_ULPS_REQUEST	Request Data Lane 3 to enter Ultra-Low power state
2	DLN2_ULPS_REQUEST	Request Data Lane 2 to enter Ultra-Low power state
1	DLN1_ULPS_REQUEST	Request Data Lane 1 to enter Ultra-Low power state
0	DLN0_ULPS_REQUEST	Request Data Lane 0 to enter Ultra-Low power state

0x058000AC MIPI_DSI_2_DSI2_LANE_SWAP_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Lane Swapping Control Register

MIPI_DSI_2_DSI2_LANE_SWAP_CTRL

Bits	Name	Description
31:3	RESERVED	
2:0	DLN_SWAP_SEL	PHY lane mapping for data lane 0, 1, 2, 3 output from the DSI controller - 000 = 0, 1, 2, 3 - 001 = 3, 0, 1, 2 - 010 = 2, 3, 0, 1 - 011 = 1, 2, 3, 0 - 100 = 0, 3, 2, 1 - 101 = 1, 0, 3, 2 - 110 = 2, 1, 0, 3 - 111 = 3, 2, 1, 0

0x058000B0 MIPI_DSI_2_DSI2_DLN0_PHY_ERR

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00088888

DSI PHY Error Register - reports errors returned from the PHY. If the mask bit for a specific error is set to 1, turn request will be de-asserted if the corresponding error occurs and controller will wait for the link to return to forward stopstate.

NOTE Turn request abort/interrupt will be generated if the mask field(s) in DSI_DLN0_PHY_ERR is set to 1. (Interrupt will be generated if the mask field(s) in DSI_INT_CTRL is set to 1; error status will be generated if the mask field(s) in DSI_ERR_INT_MASK0 is set to 0).

MIPI_DSI_2_DSI2_DLN0_PHY_ERR

Bits	Name	Description
31:20	RESERVED_1	
19	DLN0_ERR_CONTENTION_LP1_MASK	Option for controller to ignore this error 0x0: no action 0x1: abort turn request if error occurs
18:17	RESERVED_2	
16	DLN0_ERR_CONTENTION_LP1	READ ONLY. Contention detected while lane 0 is driven high
16	DLN0_ERR_CONTENTION_LP1_CLR	WRITE ONLY. Clear DLN0_ERR_CONTENTION_LP1 by writing a ’1’ to this field

MIPI_DSI_2_DSI2_DLN0_PHY_ERR (cont.)

Bits	Name	Description
15	DLN0_ERR_CONTENTION_LP0_MASK	Option for controller to ignore this error 0x0: no action 0x1: abort turn request if error occurs
14:13	RESERVED_3	
12	DLN0_ERR_CONTENTION_LP0_CLR	WRITE ONLY. Clear DLN0_ERR_CONTENTION_LP0 by writing a ’1’ to this field
12	DLN0_ERR_CONTENTION_LP0	READ ONLY. Contention detected while lane 0 is driven low
11	DLN0_ERR_CONTROL_MASK	Option for controller to ignore this error 0x0: no action 0x1: abort turn request if error occurs
10:9	RESERVED_4	
8	DLN0_ERR_CONTROL_CLR	WRITE ONLY. Clear DLN0_ERR_CONTROL by writing a ’1’ to this field
8	DLN0_ERR_CONTROL	READ ONLY. An incorrect line state sequence is detected
7	DLN0_ERR_SYNC_ESC_MASK	Option for controller to ignore this error 0x0: no action 0x1: abort turn request if error occurs
6:5	RESERVED_5	
4	DLN0_ERR_SYNC_ESC_CLR	WRITE ONLY. Clear DLN0_ERR_SYNC_ESC by writing a ’1’ to this field
4	DLN0_ERR_SYNC_ESC	READ ONLY. Number of bits received during a low power data transmission is not a multiple of eight when the transmission ends
3	DLN0_ERR_ESC_MASK	Option for controller to ignore this error 0x0: no action 0x1: abort turn request if error occurs
2:1	RESERVED_6	
0	DLN0_ERR_ESC_CLR	WRITE ONLY. Clear DLN0_ERR_ESC by writing a ’1’ to this field
0	DLN0_ERR_ESC	READ ONLY. Unrecognized escape entry command received

0x058000B4 MIPI_DSI_2_DSI2_LP_TIMER_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0xFFFFFFFF

DSI Timeout Control Register for Low Power Mode Transmission

MIPI_DSI_2_DSI2_LP_TIMER_CTRL

Bits	Name	Description
31:16	BTA_TO	Bus turn-around timeout (in escclk)
15:0	LP_RX_TO	Low power transmission reverse timeout (in Escclk)

0x058000B8 MIPI_DSI_2_DSI2_HS_TIMER_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x0000FFFF

DSI Timeout Control Register for High Speed Mode Transmission

MIPI_DSI_2_DSI2_HS_TIMER_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	HS_TX_TO_STOP_EN	Stop High Speed Transmission immediately at timeout
27:20	RESERVED_2	
19:16	TIMER_RESOLUTION	Control all 3 timeout counter increment steps by power of 2 of this field. Ex.: 0 = increment every escclk; - 1 = increment every 2 escclk; - 3 = increment every 8 escclk;
15:0	HS_TX_TO	High speed transmission timeout (in escclk)

0x058000BC MIPI_DSI_2_DSI2_TIMEOUT_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Timeout Status Register

MIPI_DSI_2_DSI2_TIMEOUT_STATUS

Bits	Name	Description
31:9	RESERVED_1	
8	BTA_TIMEOUT_CLR	WRITE ONLY. writing a 1 will clear this bit
8	BTA_TIMEOUT	READ ONLY. Indicates Bus Turnaround timeout

MIPI_DSI_2_DSI2_TIMEOUT_STATUS (cont.)

Bits	Name	Description
7:5	RESERVED_2	
4	LP_RX_TIMEOUT_CLR	WRITE ONLY. writing a 1 will clear this bit
4	LP_RX_TIMEOUT	READ ONLY. Indicates Low Power reverse transmission timeout
3:1	RESERVED	
0	HS_TX_TIMEOUT_CLR	WRITE ONLY. writing a 1 will clear this bit
0	HS_TX_TIMEOUT	READ ONLY. Indicates High Speed forward transmission timeout

0x058000C0 MIPI_DSI_2_DSI2_CLKOUT_TIMING_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI PHY Clock Lane Timing Control Register

MIPI_DSI_2_DSI2_CLKOUT_TIMING_CTRL

Bits	Name	Description
31:14	RESERVED_1	
13:8	T_CLK_POST	Number of byteclk cycles (minus one) that the transmitter shall continue sending HS clock after the last associated Data Lane has transitioned to Low Power mode
7:6	RESERVED_2	
5:0	T_CLK_PRE	Number of byteclk cycles (minus one) that the high speed clock shall be driven prior to any associated Data Lane beginning the transition from Low Power to High Speed mode

0x058000C4 MIPI_DSI_2_DSI2_EOT_PACKET

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x010F0F08

DSI EOT Packet Register - packet to append at the end of a High Speed Data Burst

MIPI_DSI_2_DSI2_EOT_PACKET

Bits	Name	Description
31:24	ECC	ECC of the EOT packet

MIPI_DSI_2_DSI2_EOT_PACKET (cont.)

Bits	Name	Description
23:8	WC	Word count of the EOT packet
7:0	DI	Data identifier (virtual channel and datatype) of the EOT packet

0x058000C8 MIPI_DSI_2_DSI2_EOT_PACKET_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI EOT Packet Control Register

MIPI_DSI_2_DSI2_EOT_PACKET_CTRL

Bits	Name	Description
31:5	RESERVED_1	
4	RX_EOT_IGNORE	Specify whether the controller should ignore the EOT packet if it is received from reverse transmission 0x0: do not ignore 0x1: ignore
3:1	RESERVED_2	
0	TX_EOT_APPEND	Specify whether the EOT packet has to be appended at the end of each forward High Speed data burst 0x0: do not append 0x1: append

0x058000CC MIPI_DSI_2_DSI2_GENERIC_ESC_TX_TRIGGER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Generic Escape Mode Trigger Register

MIPI_DSI_2_DSI2_GENERIC_ESC_TX_TRIGGER

Bits	Name	Description
31:1	RESERVED	
0	SW_TRIGGER	Software can trigger a generic escape mode command through DISP_DSIPHY_DLN0_TX_TRIGGER_ESC[3] by writing a 1 to this bit

0x058000D0 MIPI_DSI_2_DSI2_CAM_BIST_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Display MIPI BIST Control. To start the BIST, all cam bist configuration should be done first, then CAM_BIST_EN should be set to 1 and lastly set DSI_CAM_BIST_START to 1. To stop or modify the cam bist configuration, program the DSI_CAM-BIST_* registers in reverse sequence (i.e.: start by writing DSI_CAM_BIST_START to 0).

MIPI_DSI_2_DSI2_CAM_BIST_CTRL

Bits	Name	Description
31:5	RESERVED_1	
4	CRC_EN	Enable CRC calculation for the CSI packets 0x0: disable 0x1: enable
3:2	RESERVED_2	
1	CAM_BIST_EN	- 1 Enables MIPI CSI BIST
0	CAM_BIST_RESET	- 1 Resets MIPI CSI BIST

0x058000D4 MIPI_DSI_2_DSI2_CAM_BIST_FRAME_SIZE

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Display Mipi BIST Video Frame Vertical and Horizontal size

MIPI_DSI_2_DSI2_CAM_BIST_FRAME_SIZE

Bits	Name	Description
31:16	CAM_V_SIZE	Vertical Size
15:0	CAM_H_SIZE	Horizontal Size

0x058000D8 MIPI_DSI_2_DSI2_CAM_BIST_BLOCK_SIZE

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

0x058000DC MIPI_DSI_2_DSI2_CAM_BIST_FRAME_CONFIG

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Display Mipi BIST Video Frame format

MIPI_DSI_2_DSI2_CAM_BIST_FRAME_CONFIG

Bits	Name	Description
31:25	RESERVED	
24	CAM_BIST_VIDEO_FRMT	- 0= YUV 4:2:2 8 bits 1= RAW 8 bits
23:16	CAM_FRAME_REPEAT	Reserved (Number of frame sequence NOT to be repeated)
15:0	CAM_BLANKING_CYCLES	Video scan Vertical and Horizontal Blanking cycle

0x058000E0 MIPI_DSI_2_DSI2_CAM_BIST_LSFR_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Display MIPI BIST generator random numbers generator control

MIPI_DSI_2_DSI2_CAM_BIST_LSFR_CTRL

Bits	Name	Description
31:27	RESERVED	
26	CAM_V_LSFR_EN	(Unused) V component shift register enable
25	CAM_U_LSFR_EN	(Unused) U component shift register enable
24	CAM_Y_LSFR_EN	(Unused) Y component shift register enable
23:16	CAM_V_LSFR_POLYNOMIAL	V component polynomial

MIPI_DSI_2_DSI2_CAM_BIST_LSFR_CTRL (cont.)

Bits	Name	Description
15:8	CAM_U_LSFR_POLYNOMIAL	U component polynomial
7:0	CAM_Y_LSFR_POLYNOMIAL	Y component polynomial

0x058000E4 MIPI_DSI_2_DSI2_CAM_BIST_LSFR_INIT

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Display MIPI BIST generator random numbers initial values

MIPI_DSI_2_DSI2_CAM_BIST_LSFR_INIT

Bits	Name	Description
31:24	RESERVED	
23:16	CAM_V_INIT_LSFR_VAL	V component shift register initial value
15:8	CAM_U_INIT_LSFR_VAL	U component shift register initial value
7:0	CAM_Y_INIT_LSFR_VAL	Y component shift register initial value

0x058000E8 MIPI_DSI_2_DSI2_CAM_BIST_START

Type: Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Display MIPI BIST Start Stop control

MIPI_DSI_2_DSI2_CAM_BIST_START

Bits	Name	Description
31:1	RESERVED	
0	CAM_BIST_START	WRITE ONLY. Start and stop BIST. This field should be changed when CAM_BIST_EN = 1. When this field is set to 1, the BIST runs continuously. When this field is set to 0, the BIST will turn off at the end of the current frame. 0x0: Stop 0x1: Start

0x058000EC MIPI_DSI_2_DSI2_CAM_BIST_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Display MIPI BIST BUSY

MIPI_DSI_2_DSI2_CAM_BIST_STATUS

Bits	Name	Description
31:5	RESERVED_1	
4	CAM_BIST_DONE	READ ONLY. MIPI BIST done for 1 frame
4	CAM_BIST_DONE_CLR	WRITE ONLY. Writing a 1 will clear the done bit
3:1	RESERVED_2	
0	CAM_BIST_STATUS_BUSY	READ ONLY. MIPI BIST status bit

0x05800108 MIPI_DSI_2_DSI2_ERR_INT_MASK0

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x13FF3BFF

DSI Error Interrupt Enable Register - enable any event to drive the error status (DSI_INT_CTRL.DSI_ERROR_STAT). If the DSI_INT_CTRL.DSI_ERROR_MASK is set to 1, interrupt will be generated.

NOTE Interrupt will be generated if the mask field(s) in DSI_INT_CTRL is set to 1; error status will be generated if the mask field(s) in DSI_ERR_INT_MASK0 is set to 0.

MIPI_DSI_2_DSI2_ERR_INT_MASK0

Bits	Name	Description
31:29	RESERVED_1	
28	DPHY_DSIPLL_UNLOCK_MASK	Mask dsipll unlock (to avoid sending out unnecessary interrupts, set this bit to 1 before dsipll locks) 0x0: allow generation of error status 0x1: no error status generated
27:26	RESERVED_2	

MIPI_DSI_2_DSI2_ERR_INT_MASK0 (cont.)

Bits	Name	Description
25	DLN0_ERR_CONTENTION_LP1_MASK	Mask contention while data lane 0 is driven high interrupt (DSI_DLN0_PHY_ERR reg, bit 16) 0x0: allow generation of error status (this should be set when dsipll is ready or when dsipll bypass is set to 1) 0x1: no error status generated
24	DLN0_ERR_CONTENTION_LP0_MASK	Mask contention while data lane 0 is driven low interrupt (DSI_DLN0_PHY_ERR reg, bit 12) 0x0: allow generation of error status 0x1: no error status generated
23	DLN0_ERR_CONTROL_MASK	Mask incorrect LP RX state sequence interrupt (DSI_DLN0_PHY_ERR reg, bit 8) 0x0: allow generation of error status 0x1: no error status generated
22	DLN0_ERR_SYNC_ESC_MASK	Mask LP RX data that is not byte-aligned interrupt (DSI_DLN0_PHY_ERR reg, bit 4) 0x0: allow generation of error status 0x1: no error status generated
21	DLN0_ERR_ESC_MASK	Mask incorrect LP RX escape entry interrupt (DSI_DLN0_PHY_ERR reg, bit 0) 0x0: allow generation of error status 0x1: no error status generated
20	DLN0_LP_FIFO_OVERFLOW_MASK	unused (Mask Lane Layer Low Power FIFO for data lane 0 interrupt (DSI_FIFO_STATUS reg, bit 14)) 0x0: allow generation of error status 0x1: no error status generated
19	DLN3_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 3 interrupt (DSI_STATUS reg, bit 30) 0x0: allow generation of error status 0x1: no error status generated
18	DLN2_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 2 interrupt (DSI_STATUS reg, bit 26) 0x0: allow generation of error status 0x1: no error status generated
17	DLN1_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 1 interrupt (DSI_FIFO_STATUS reg, bit 22) 0x0: allow generation of error status 0x1: no error status generated
16	DLN0_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 0 interrupt (DSI_FIFO_STATUS reg, bit 18) 0x0: allow generation of error status 0x1: no error status generated
15:14	RESERVED_3	

MIPI_DSI_2_DSI2_ERR_INT_MASK0 (cont.)

Bits	Name	Description
13	VID_MDP_FIFO_UNDERFLOW_MASK	Mask Video Mode Engine FIFO underflow interrupt (DSI_FIFO_STATUS reg, bit 3) 0x0: allow generation of error status 0x1: no error status generated
12	VID_MDP_FIFO_OVERFLOW_MASK	Mask Video Mode Engine FIFO overflow interrupt (DSI_FIFO_STATUS reg, bit 0) 0x0: allow generation of error status 0x1: no error status generated
11	CMD_MDP_FIFO_UNDERFLOW_MASK	Mask Display Engine FIFO underflow interrupt (DSI_FIFO_STATUS reg, bit 7) 0x0: allow generation of error status 0x1: no error status generated
10	RESERVED_4	
9	CMD_DMA_FIFO_UNDERFLOW_MASK	Mask Command mode dma FIFO underflow interrupt (DSI_FIFO_STATUS reg, bit 10) 0x0: allow generation of error status 0x1: no error status generated
8	INTERLEAVE_OP_CONTENTION_MASK	Mask interleave operation contention interrupt (DSI_STATUS reg, bit 31) 0x0: allow generation of error status 0x1: no error status generated
7	BTA_TO_MASK	Mask bus turnaround timeout interrupt (DSI_TIMEOUT_STATUS reg, bit 8) 0x0: allow generation of error status 0x1: no error status generated
6	HS_TX_TO_MASK	Mask High Speed forward transmission timeout interrupt (DSI_TIMEOUT_STATUS reg, bit 0) 0x0: allow generation of error status 0x1: no error status generated
5	LP_RX_TO_MASK	Mask Low Power reverse transmission timeout interrupt (DSI_TIMEOUT_STATUS reg, bit 4) 0x0: allow generation of error status 0x1: no error status generated
4	ERROR_PACKET_MASK	Mask error packet returned from peripheral interrupt (DSI_ACK_ERR_STATUS reg, bit 24) 0x0: allow generation of error status 0x1: no error status generated
3	RDBK_INCOMPLETE_PACKET_ERR_MASK	Mask incomplete read packet error interrupt (DSI_ACK_ERR_STATUS reg, bit 23) 0x0: allow generation of error status 0x1: no error status generated

MIPI_DSI_2_DSI2_ERR_INT_MASK0 (cont.)

Bits	Name	Description
2	RDBK_DATA_CRC_ERR_MASK	Mask crc error in the read packet interrupt (DSI_ACK_ERR_STATUS reg, bit 20) 0x0: allow generation of error status 0x1: no error status generated
1	RDBK_DATA_MULTI_ECC_ERR_MASK	Mask multi bit ecc error in the read packet interrupt (DSI_ACK_ERR_STATUS reg, bit 17) 0x0: allow generation of error status 0x1: no error status generated
0	RDBK_DATA_ECC_ERR_MASK	Mask single bit ecc error in the read packet interrupt (DSI_ACK_ERR_STATUS reg, bit 16) 0x0: allow generation of error status 0x1: no error status generated

0x0580010C MIPI_DSI_2_DSI2_INT_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x02200202

DSI Interrupt Control Register.

NOTE Interrupt will be generated if the mask field(s) in DSI_INT_CTRL is set to 1; error status will be generated if the mask field(s) in DSI_ERR_INT_MASK0 is set to 0.

MIPI_DSI_2_DSI2_INT_CTRL

Bits	Name	Description
31:26	RESERVED_1	
25	DSI_ERROR_MASK	DSI Error Mask. If set to 1, interrupt generation is enabled. 0x0: no interrupt generated 0x1: allow generation of interrupt
24	DSI_ERROR_AK	WRITE ONLY. DSI Error Acknowledge. If set to 1, status and interrupt is cleared.
24	DSI_ERROR_STAT	READ ONLY. DSI Error status. Set when the DSI Error has happened.
23:22	RESERVED_2	
21	DSI_BTA_DONE_MASK	DSI BTA Done Mask. If set to 1, interrupt generation is enabled. 0x0: no interrupt generated 0x1: allow generation of interrupt

MIPI_DSI_2_DSI2_INT_CTRL (cont.)

Bits	Name	Description
20	DSI_BTA_DONE_STAT	READ ONLY. DSI BTA Done Status (sw triggered BTA, embedded BTA or BTA generated for TE). Set when a bus turnaround has completed.
20	DSI_BTA_DONE_AK	WRITE ONLY. DSI BTA Done Acknowledge. If set to 1, status and interrupt is cleared.
19:18	RESERVED_3	
17	DSI_VIDEO_MODE_DONE_MASK	DSI Video Mode Engine path Done Mask. If set to 1, interrupt generation is enabled. 0x0: no interrupt generated 0x1: allow generation of interrupt
16	DSI_VIDEO_MODE_DONE_AK	WRITE ONLY. DSI Video Mode Engine path Done Acknowledge. If set to 1, status and interrupt is cleared.
16	DSI_VIDEO_MODE_DONE_STAT	READ ONLY. DSI Video Mode Engine status. Set when the DSI Video Mode Engine has finished transferring data to the panel.
15:10	RESERVED_4	
9	DSI_CMD_MODE_MDP_DONE_MASK	DSI Command Mode Engine MDP path Done Mask. If set to 1, interrupt generation is enabled. 0x0: no interrupt generated 0x1: allow generation of interrupt
8	DSI_CMD_MODE_MDP_DONE_STAT	READ ONLY. DSI Command Mode Engine MDP path status. Set when the DSI Command Mode Engine has finished transferring deng data to the panel.
8	DSI_CMD_MODE_MDP_DONE_AK	WRITE ONLY. DSI Command Mode Engine MDP path Done Acknowledge. If set to 1, status and interrupt is cleared.
7:2	RESERVED	
1	DSI_CMD_MODE_DMA_DONE_MASK	DSI Command Mode Engine DMA path Done Mask. If set to 1, interrupt generation is enabled. 0x0: no interrupt generated 0x1: allow generation of interrupt
0	DSI_CMD_MODE_DMA_DONE_AK	WRITE ONLY. DSI Command Mode Engine DMA path Done Acknowledge. If set to 1, status and interrupt is cleared.
0	DSI_CMD_MODE_DMA_DONE_STAT	READ ONLY. DSI Command Mode Engine DMA status. Set when the DSI Command Mode Engine has finished transferring dma data to the panel.

0x05800110 MIPI_DSI_2_DSI2_IOBIST_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI IOBIST Control Register

MIPI_DSI_2_DSI2_IOBIST_CTRL

Bits	Name	Description

31:0	DSI_IOBIST_CTRL	This register has 2 modes of operation: command and timing mode. All configuration fields should be written first, then enable (bit 0) should be set to 1 next and start (bit 5) is set to 1 last.
		
		COMMAND MODE
		bit 0 = DSI IOBIST ENABLE. Active high;
		bit 5 = IOBIST start. Active high;
		bit 6 = Select power mode for data transfer.
		- 0 = high speed (HS), 1 = low power (LP)
		bit 7 = Data pattern mode.
		- 0 = Use data pattern word, 1 = PRBS pattern.
		bit 10:8 = multiple of finite random run (N): if bit 12 is finite, the finite run is 256 x (N+1) runs for HS PRBS and user data, or 16 x (N+1) for LP PRBS
		bit 12 = Infinite run
		- 0 for infinite; 1 for 256 x (N+1) runs of HS PRBS, 16 x (N+1) runs of LP PRBS, 256 x (N+1) runs of HS user data, or 8 runs of LP user data.
		bit 14:13 = DSIBIST_DSIPHY_LANE_SWAP, select which lane is used as lane0 for LPDT:
		- 0 = DLN0
		- 1 = DLN1
		- 2 = DLN2
		- 3 = DLN3
		bit 15 = Select instruction type
		- 0 = command mode, 1 = DSI timing control mode.
		bit 23:16 = data pattern byte (used when bit 7 is set to 0)
		other bits = reserved
		
		TIMING MODE
		bit 0 = DSI IOBIST ENABLE. Active high;
		bit 5 = IOBIST start. Active high;
		bit 15 = Select instruction type
		- 0 = command mode, 1 = DSI timing control mode.
		(If you write one DSI timing data with the select instruction type == 1, you have to change the select instruction type from 1 to 0 for timing data latch control.)
		bit 23:16 = DSI timing data;
		bit 28:24 = DSI timing register selection:
		- 0x10 = DSI_T_CLK_PRE (data width[5:0])
		- 0x11 = DSI_T_CLK_POST (data width[5:0])

0x05800114 MIPI_DSI_2_DSI2_SOFT_RESET

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI soft reset Register

MIPI_DSI_2_DSI2_SOFT_RESET

Bits	Name	Description
31:1	RESERVED	
0	DSI_SOFT_RESET	Resets all internal logic in dsiclk, pclk, byteclk, escclk, ahbm_hclk domain. All enable bits in DSI_CTRL shoud be already set to 0 when exiting soft reset (DSI_SOFT_RESET changing from 1 to 0). The dynamic clocks should be forced on when DSI_SOFT_RESET is set to 1. (This reset does not apply to DSI registers which are in ahbs_hclk domain.)

0x05800118 MIPI_DSI_2_DSI2_CLK_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Clock Control Register. The dynamic clocks should be forced on when DSI_SOFT_RESET is set to 1 or when DSI_EN is changed from 1 to 0

MIPI_DSI_2_DSI2_CLK_CTRL

Bits	Name	Description
31:18	RESERVED_1	
17:16	DSI_DSICLK_HYSTERISIS1_CTRL	DSI DSICLK Hysterisis Control
15:14	DSI_AHBM_HCLK_HYSTERISIS1_CTRL	DSI AHBM_HCLK Hysterisis Control
13:12	DSI_AHBS_HCLK_HYSTERISIS1_CTRL	unused
11	DSI_FORCE_ON_DYN_BYTECLK	DSI Dynamic BYTECLK Clock Branch Force On. Set to one to always force on this clock branch.
10	DSI_FORCE_ON_DYN_DSICLK	DSI Dynamic DSICLK Clock Branch Force On. Set to one to always force on this clock branch.
9	DSI_FORCE_ON_DYN_AHBM_HCLK	DSI Dynamic AHBM_HCLK (MCLK) Clock Branch Force On. Set to one to always force on this clock branch.

MIPI_DSI_2_DSI2_CLK_CTRL (cont.)

Bits	Name	Description
8	DSI_FORCE_ON_DYN_AHBS_HCLK	DSI Dynamic AHBS_HCLK (REGCLK)Clock Branch Force On. Set to one to always force on this clock branch.
7:6	RESERVED_2	
5	DSI_ESCCLK_ON	Turns on/off ESCCLK for the DSI. If set to 1, clock is ON.
4	DSI_BYTECLK_ON	Turns on/off BYTECLK for the DSI. If set to 1, clock is ON.
3	DSI_DSICLK_ON	Turns on/off DSICLK for the DSI. If set to 1, clock is ON.
2	DSI_PCLK_ON	Turns on/off PCLK for the DSI. If set to 1, clock is ON.
1	DSI_AHBM_SCLK_ON	Turns on/off AHBM_HCLK for the DSI. If set to 1, clock is ON.
0	DSI_AHBS_HCLK_ON	Turns on/off AHBS_HCLK for the DSI. If set to 1, clock is ON.

0x0580011C MIPI_DSI_2_DSI2_CLK_STATUS

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DSI Clock Status Register

MIPI_DSI_2_DSI2_CLK_STATUS

Bits	Name	Description
31:17	RESERVED_1	
16	DSIPLL_UNLOCKED_CLR	WRITE ONLY. Write only. Clear dsipll_unlocked status by writing to this register field
16	DSIPLL_UNLOCKED	READ ONLY. Read only. Dsi pll unlock status 0x0: dsipll not unlocked 0x1: dsipll unlocked
15:10	RESERVED_2	
9	DSI_AON_PCLK_ACTIVE	READ ONLY. DSI Always ON PCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
8	DSI_AON_ESCCLK_ACTIVE	READ ONLY. DSI Always ON ESCCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
7	DSI_DYN_BYTECLK_ACTIVE	READ ONLY. DSI Dynamic BYTECLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
6	DSI_AON_BYTECLK_ACTIVE	READ ONLY. DSI Always ON BYTECLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.

MIPI_DSI_2_DSI2_CLK_STATUS (cont.)

Bits	Name	Description
5	DSI_DYN_DSICLK_ACTIVE	READ ONLY. DSI Dynamic DSICLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
4	DSI_AON_DSICLK_ACTIVE	READ ONLY. DSI Always ON DSICLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
3	DSI_DYN_AHBS_HCLK_ACTIVE	READ ONLY. DSI Dynamic AHBS_HCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
2	DSI_AON_AHBS_HCLK_ACTIVE	READ ONLY. DSI Always ON AHBS_HCLK Active Status. Read-only field that shows the status of this clock branch.If set to one, clock is on. If set to zero, clock is off.
1	DSI_DYN_AHBM_HCLK_ACTIVE	READ ONLY. DSI Dynamic AHBM_HCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
0	DSI_AON_AHBM_HCLK_ACTIVE	READ ONLY. DSI Always ON AHBM_HCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.

3:1	RESERVED	

MIPI_DSI_2_DSI2_TEST_PATTERN_GEN_CTRL (cont.)

Bits	Name	Description
0	EN	DSI test pattern enable. This is the global enable of the pattern generator. Once this bit is set to 1, it is ready to generate data for video mode, command mode pixel or dma data. Video mode data is started by DSI*_TEST_PATTERN_GEN_VIDEO_ENABLE; Command mode pixel data can be started by DSI*_TEST_PATTERN_GEN_CMD_STREAM[01]_TRIGGER or triggered by the trigger source set in COMMAND_MODE_MDP_TRIGGER_SEL; Command mode dma data is generated when a memory read request is received (the application layer will generate memory read request when it is triggered by the trigger source set in COMMAND_MODE_DMA_TRIGGER_SEL). Note: for Command dma data, only use the pattern generator in DMA non-embedded mode only (DSI*_COMMAND_MODE_DMA_CTRL.embedded_mode set to 0) because the pattern generator only generates a test pattern for payload.

0x0580015C MIPI_DSI_2_DSI2_TEST_PATTERN_GEN_VIDEO_POLY

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Bits	Name	Description
4	DSIPHY_BIST_LNCK_HS_REQUEST	DSIPHY_BIST_LNCK_HS_REQUEST set to 1 and any of DSIPHY_BIST_SEL[3:0] being set, starts Clock lane TX request for Clock lane HS data transition sequence. Prior to setting this bit, any of DSIPHY_BIST_SEL[3:0] must be set for at least 3 ESCCLK cycles Normal operational mode setting is 0. Power up value is 0
3:0	DSIPHY_BIST_SEL	DSIPHY_BIST_SEL<i> set to one indicates the data lane is enabled for PHY BIST. Any one of the data lane bist_sel is on will automatically enable the clock lane. Default is set to zero, data lane will be enabled by controller. Note: for 45nm, data lane enable must go through DSI controller software control register. DSIPHY_BIST_SEL only indicates the HS TX byte data either from BIST pattern generator or from controller. For 28nm, DSIPH_BIST_SEL[3:0] os OR-ed with lane enable control driven by controller to eliminate the dependence to controller for PHY BIST. Normal operational mode setting is 0000. Power up value is 0000

14.9 HDMI TX Registers (0x04A00000 HDMI_TX_BASE)

This section contains the HDMI TX registers.

0x04A00000 HDMI_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000002

HDMI block control

HDMI_CTRL

Bits	Name	Description
31:21	RESERVED_1	
20	RB_SWITCH_EN	Switch Red and Blue encoding position on TMDS output
19:3	RESERVED_2	
2	ENC_REQUIRED	- 1=Encryption required on TMDS output - 0=Encryption NOT required on TMDS output Bit has NO effect once HDCP is enabled since cipher will encrypt data
1	HDMI_DVI_SEL	- 0=DVI, 1=HDMI
0	ENABLE	- 0= Disable HDMI block, 1= Enable HDMI block 0x0: Disable 0x1: Enable

0x04A00018 HDMI_PKT_BLK_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000011

HDMI Packet Block Control

HDMI_PKT_BLK_CTRL

Bits	Name	Description
31:30	RESERVED_1	
29:16	H_CNT_OVERRIDE_VAL	H_CNT value to use if H_CNT_OVERRIDE_EN=1
15:10	RESERVED_2	

HDMI_PKT_BLK_CTRL (cont.)

Bits	Name	Description
9	ERROR_MASK	Set to 1 to enable hdmi error interrupt
8	ERROR_ACK	WRITE ONLY. Write 1 to clear error status.
7	RESERVED_3	
6	H_CNT_OVERRIDE_EN	Set to '1' to override hardware-computed H_COUNT value with value in register 0x0: Disable 0x1: Enable
5	RESERVED_4	
4	PKT_GEN_VERSION	Select which version of packet generation to use 0x0: Older Version, fill only the Vblank with data island (Debug only) 0x1: Fill blank with data islands
3:1	RESERVED	
0	KEEPOUT_MODE	Select which KEEPOUT mode after VSYNC when PKT_GEN_VERSION field is set to 1 0x0: No new packets (except GC is sent between rising edge of VSYNC and 650 pixels after rising edge of VSYNC.) 0x1: No packet is sent between 509 to 650 pixels after rising edge of VSYNC

0x04A0001C HDMI_STATUS

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HDMI Status Fields

HDMI_STATUS

Bits	Name	Description
31:28	RESERVED_1	
27	ERROR_INT	READ ONLY. HDMI error status flag is a masked OR of audio packet error, vbi packet error and audio fifo overflow.
26:21	RESERVED_2	
20	VBI_PKT_ERROR	READ ONLY. Indicates that VBI packet transmission was interrupted. Possible causes include audio packet transmission start, in which case the number of VBI packets on a line must be reduced, or overlapping VBI packets with active video, in which case the VBI line number selection must be adjusted to put the data on a vertical blank line.

HDMI_STATUS (cont.)

Bits	Name	Description
19:17	RESERVED_3	
16	AUDIO_PKT_ERROR	READ ONLY. Indicates that audio packet transmission was interrupted. Possible causes include video or VBI transmission start, in which case AUDIO_PACKETS_PER_LINE must be reduced or the pixel rate increased.
15:1	RESERVED_4	
0	ACTIVE_AVMUTE	READ ONLY. Active copy HDMI_GC.AVMUTE field. Active copy is updated on a framestart.

0x04A00020 HDMI_AUDIO_PKT_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000010

HDMI Audio Packet Control

HDMI_AUDIO_PKT_CTRL

Bits	Name	Description
31	RESERVED_1	
26	CS_60958_UPDATE	Write 1 to atomically update double-buffered 60958 Channel Status registers on next 60958 frame start
25:21	RESERVED_2	
20:16	AUDIO_PKTS_PER_LINE	Set the number of audio packets to transmit per line. Must be set to allow more than the number of samples received per line of video to be transmitted, and less than or equal to the maximum number of packets that can be transmitted per line (see HDMI functional description for equations to calculate max and min values). (Only used with HDMI_CTRL.PKT_GEN_VERSION=0; 'dont_care' otherwise)
15	RESERVED_3	
14	AUDIO_TEST_MODE	- 0 selects random number data; 1 selects ramp generator data 0x0: Disable 0x1: Enable
13	RESERVED_4	
12	AUDIO_TEST_EN	Set to 1 to send test data instead of audio samples from Audio block. The TMDS random number generator has to be enabled to generate the random samples. 0x0: Disable 0x1: Enable

HDMI_AUDIO_PKT_CTRL (cont.)

Bits	Name	Description
11:9	RESERVED_5	
8	RESERVED_6	
5:4	AUDIO_DELAY_EN	Select min audio delay after end of video line. 0x0: No delay beyond minimum required 0x1: 58 clocks 0x2: 56 clocks 0x3: Reserved
3:1	RESERVED	
0	AUDIO_SAMPLE_SEND	Set to 1 to enable transmission of Audio packets. Packet transmission begins on the next frame. 0x0: Disable Audio Packet Transmission 0x1: Enable Audio Packet Transmission

0x04A00024 HDMI_ACR_PKT_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00010000

HDMI Audio Clock Regen Packet Control

HDMI_ACR_PKT_CTRL

Bits	Name	Description
31	AUDIO_PRIORITY	ACR and audio sample packet priority 0x0: ACR packet has higher priority than AUDIO sample packet 0x1: AUDIO sample packet has higher priority than ACR packet
30:19	RESERVED_1	
18:16	N_MULTIPLE	ACR N multiple to use when SELECT filed not=0 0x0: reserved_1 0x1: x1 0x2: x2 0x3: reserved_2 0x4: x4 0x5: reserved_3 0x6: reserved_4 0x7: reserved_5
15:13	RESERVED_2	

HDMI_ACR_PKT_CTRL (cont.)

Bits	Name	Description
12	AUTO_SEND	Set to 1 to enable hardware transmission of ACR packets when new CTS value is available. Also causes CTS value to be zeroed out when an ACR packet is transmitted and no new CTS value is available. 0x0: Disable 0x1: Enable
11:9	RESERVED_3	
8	SOURCE	Select source for N and CTS values for audio clock regeneration. 0x0: Use hardware-generated CTS value 0x1: Use CTS value selected (based on audio sample rate from set written by software)
7:6	RESERVED_4	
5:4	SELECT	Select which N/CTS combination to use for ACR packet transmission. 0x0: Hardware Selected 0x1: ACR_32 0x2: ACR_44 0x3: ACR_48
3:2	RESERVED	
1	CONT	Determine whether to send Audio Clock Regeneration packet(s) once or every frame. 0x0: Disable Audio Clock Regeneration Packet Transmission 0x1: Enable Audio Clock Regeneration Packet Transmission
0	SEND	Set to 1 to enable transmission of Audio Clock Regeneration packets. Packet transmission begins when audio is enabled. 0x0: Disable Audio Clock Regeneration Packet Transmission 0x1: Enable Audio Clock Regeneration Packet Transmission

0x04A00028 HDMI_VBI_PKT_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00002000

HDMI Null, General Control and ISRC Packet Control

HDMI_VBI_PKT_CTRL

Bits	Name	Description
31:30	RESERVED_1	
29:24	ACP_LINE	Select line number to send ACP packet on.

HDMI_VBI_PKT_CTRL (cont.)

Bits	Name	Description
23:22	RESERVED_2	
21:16	ISRC_LINE	Select line number to send ISRC packets on.
15:14	RESERVED_3	
13	ACP_SOURCE	Select source for ACP packet 0x0: Audio block (Memory) 0x1: HDMI registers (written by software)
12	ACP_SEND	Set to 1 to enable transmission of Audio Content Protection packets. The ACP packet is sent in every frame when it is enabled. 0x0: Disable Audio Content Protection Packet Transmission 0x1: Enable Audio Content Protection Packet Transmission
11:10	RESERVED_4	
9	ISRC_CONT	Determine whether to send ISRC packet(s) once or every frame. 0x0: Send ISRC Packet on next frame only 0x1: Send ISRC Packet on every frame
8	ISRC_SEND	Set to 1 to enable transmission of ISRC packet(s). Packet transmission begins on the next frame. 0x0: Disable ISRC Packet Transmission 0x1: Enable ISRC Packet Transmission
7:6	RESERVED_5	
5	GC_CONT	Determine whether to send General Control packet(s) once or every frame. 0x0: Send General Control Packet on next frame only 0x1: Send General Control Packet on every frame
4	GC_SEND	Set to 1 to enable transmission of General Control packet(s). Packet transmission begins on the next frame. 0x0: Disable General Control Packet Transmission 0x1: Enable General Control Packet Transmission
3:1	RESERVED_6	
0	NULL_SEND	Set to 1 to enable transmission of Null packets to ensure maximum time between packet transmission' requirement is met. Null packets are inserted on line 2 if no other packet types are enabled for that line. (Only used with HDMI_CTRL.PKT_GEN_VERSION=0; don't_care otherwise) 0x0: Disable Null Packet Transmission 0x1: Enable Null Packet Transmission

0x04A0002C HDMI_INFOFRAME_CTRL0

Clock: AHB_SLAVE_HCLK
Reset State: 0x00000040

HDMI InfoFrame Packet Control

HDMI_INFOFRAME_CTRL0

Bits	Name	Description
31:14	RESERVED_1	
13	VENSPEC_INFO_CONT	Determine whether to send Vendor specific InfoFrame packet(s) once or every frame. 0x0: Send Vendor Specific InfoFrame Packet on next frame only 0x1: Send Vendor Specific InfoFrame Packet on every frame
12	VENSPEC_INFO_SEND	Set to 1 to enable transmission of Vendor specific InfoFrame packets. Packet transmission begins on the next frame. 0x0: Disable Vendor Specific InfoFrame Packet Transmission 0x1: Enable Vendor Specific InfoFrame Packet Transmission
11	RESERVED_2	
10	RESERVED_3	
9	RESERVED_4	
8	RESERVED_5	
7	AUDIO_INFO_UPDATE	Write 1 to automatically update double-buffered AUDIO_INFO registers on next frame / field start
6	AUDIO_INFO_SOURCE	Select source for Audio information fields which can be controlled by hardware. 0x0: Audio block 0x1: HDMI registers (written by software)
5	AUDIO_INFO_CONT	Determine whether to send Audio InfoFrame packet(s) once or every frame. 0x0: Send Audio InfoFrame Packet on next frame only 0x1: Send Audio InfoFrame Packet on every frame
4	AUDIO_INFO_SEND	Set to 1 to enable transmission of Audio InfoFrame packets. Packet transmission begins on the next frame. 0x0: Disable Audio InfoFrame Packet Transmission 0x1: Enable Audio InfoFrame Packet Transmission
3:2	RESERVED_6	
1	AVI_INFO_CONT	Determine whether to send AVI InfoFrame packet(s) once or every frame. 0x0: Send AVI InfoFrame Packet on next frame only 0x1: Send AVI InfoFrame Packet on every frame

HDMI_INFOFRAME_CTRL0 (cont.)

Bits	Name	Description
0	AVI_INFO_SEND	Set to 1 to enable transmission of AVI InfoFrame packets. Packet transmission begins on the next frame. 0x0: Disable AVI InfoFrame Packet Transmission 0x1: Enable AVI InfoFrame Packet Transmission

0x04A001D0 HDMI_AUDIO_CFG

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000040

This register is used to configure the HDMI audio engine. This register enables the audio engine, configures the number of audio channels and the audio fifo watermarks.

HDMI_AUDIO_CFG

Bits	Name	Description
31:12	RESERVED_1	

HDMI_AUDIO_CFG (cont.)

Bits	Name	Description
11	SAMP_PRE_EN	- 0 = Sample present for 4 and 6 channel will be all 1 and sample flat for unused channels will be 1. 1= Sample present for unused channels will be 0. Sample flat for unused channels will be 0.
10	HBR_EN	- 0 = Disable High Bit Rate audio packet Header. 1 = Enable High Bit Rate audio packet Header.
9	PAYLOAD_PACK_EN	Enable audio data payload packing by HDMI core. 0= Software packs the audio data payload as per IEC60958 format. 1= HDMI core does the packing of payload bits to hdmi audio data. The bits inserted are V= valid, U=User, C= Channel Select, P = parity. When enabled this will also insert the B bit mentioned in HDMI audio packet header. For more information on V,U,C,P bits please refer to IEC60958 spec. Programming V, U, C bits will be through HDMI_60958_0, HDMI_60958_1 and HDMI_60958_2 registers.
8	SMPL_DEFER_MODE	Enable the deferring of transmission of audio samples in active region when ACR packet also needs to be transmitted on the same line. This mode is used when transmitting 176.4Khz or 192 Khz audio on VGA, 480P and 576P video resolutions. 0= Disable, 1 = enable.
7:4	FIFO_WATERMARK	Watermark for HDMI fifo - 0x0 =request when empty - 0x1= when 1 empty slot - 0x2=when 2 empty slots - 0x3= when 3 slots empty - 0x4= when 4 empty slots - 0x5= when 5 empty slots - 0x6= when 6 empty slots - 0x7= when 7 empty slots - 0x8= when fifo is fully empty.
3:2	CHANNEL_NUM	Number of Audio Channels 0x0= 8 channel - 0x1= 4 channel - 0x2 = 6 channel
1	RESERVED_2	
0	ENABLE	Enable the audio engine - 0 = Disabled - 1= Enabled.

0x04A00204 HDMI_DEBUG

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Debug register

HDMI_DEBUG

Bits	Name	Description
31:0	DEBUG	HDMI debug register, DEBUG[4] when enabled, will make Sample present for LAYOUT 1 programmable. SAMPLE_PRESENT will be the value programmed in DEBUG[3:0]. DEBUG[31:5] are reserved.

0x04A00208 HDMI_USEC_REFTIMER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x0000004A

Microsecond reference timer

HDMI_USEC_REFTIMER

Bits	Name	Description
31:17	RESERVED	
16	REFTIMER_ENABLE	Enable the reference timer 0x0: Disable 0x1: Enable
15:0	REFTIMER	Value to set the register in order to generate a strobe every microsecond. This register counts on HDCP application clock

0x04A0020C HDMI_DDC_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Control Register for DDC operations

HDMI_DDC_CTRL

Bits	Name	Description
31	RESERVED_1	
21:20	TRANSACTION_CNT	Number of transactions to be done in current transfer. 0x0: transaction0 only 0x1: transaction0, transaction1 0x2: transaction0, transaction1, transaction2 0x3: transaction0, transaction1, transaction2, transaction3

HDMI_DDC_CTRL (cont.)

Bits	Name	Description
19:7	RESERVED_2	
6	RESERVED_3	
4	RESERVED_4	
3	SW_STATUS_RESET	Write 1 to reset HDMI_DDC_SW_STATUS flags, will reset SW_DONE, ABORTED, TIMEOUT, SW_INTERRUPTED, BUFFER_OVERFLOW, STOPPED_ON_NACK, NACK0, NACK1, NACK2, NACK3
2	SEND_RESET	Set to 1 to send reset sequence (9 clocks with no data) at start of transfer. This sequence is sent after GO is written to 1, before the first transaction only.
1	SOFT_RESET	Write 1 to reset DDC controller
0	GO	WRITE ONLY. Write 1 to start DDC transfer.

0x04A00210 HDMI_DDC_ARBITRATION

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000001

Configure arbitration between hardware and software use of the HDMI_DDC engine

HDMI_DDC_ARBITRATION

Bits	Name	Description
31:13	RESERVED_1	
12	ABORT_SW_XFER	WRITE ONLY. Write 1 to abort current SW transfer (send stop if transfer has started)
11:9	RESERVED_2	
8	ABORT_HW_XFER	WRITE ONLY. Write 1 to abort current HW transfer (send stop if transfer has started)
7:6	RESERVED_3	
5	NO_RESTART_SW_GO	Set to 1 to disable restart of software DDC transaction that was interrupted by hardware. Typically this bit should be 0, unless there is a problem with the DDC restart mechanism. When this bit is set to 0, the SW_DONE bit will not be set if hardware interrupts the software transfer.
4	NO_QUEUED_SW_GO	Set to 1 to disable queuing of software DDC GO. If this bit is set, then if software writes GO while DDC is in use by hardware, the GO request will be ignored and the SW_INTERRUPTED bit set.
3:2	RESERVED_4	

HDMI_DDC_ARBITRATION (cont.)

Bits	Name	Description
1:0	SW_PRIORITY	Sets priority for software DDC requests. This setting applies only when HDCP is using DDC bus and software also wants to use the same DDC bus 0x0: Normal - If NO_QUEUED_SW_GO = 0, software DDC transaction will be queued after HW DDC. If NO_QUEUED_SW_GO = 1, software DDC transaction is not queued, in this case, software have to poll for HW_DONE doing any DDC transaction 0x1: High - Software always interrupts HW DDC if HDCP is using the same DDC bus, HW DDC will automatically resume once software DDC is completed 0x2: Reserved_1 0x3: Reserved_2

0x04A00214 HDMI_DDC_INT_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DDC Interrupt Control register

HDMI_DDC_INT_CTRL

Bits	Name	Description
31:7	RESERVED_1	
6	HW_DONE_MASK	DDC Mask bit for HW_DDC_DONE_INT. Set to 1 to enable interrupt.
5	HW_DONE_ACK	WRITE ONLY. DDC Acknowledge bit for HW_DDC_DONE_INT. Write 1 to clear interrupt.
4	HW_DONE_INT	READ ONLY. DDC HW_DONE interrupt status
3	RESERVED_2	
2	SW_DONE_MASK	Mask bit for SW_DONE_INT. Set to 1 to enable interrupt.
1	SW_DONE_ACK	WRITE ONLY. Acknowledge bit for SW_DONE_INT. Write 1 to clear interrupt.
0	SW_DONE_INT	READ ONLY. SW_DONE interrupt status

0x04A00218 HDMI_DDC_SW_STATUS

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Status fields for HDMI_DDC engine

HDMI_DDC_SW_STATUS

Bits	Name	Description
31:19	RESERVED_1	
18	SW_REQ	READ ONLY. Software requests use of HDMI_DDC interface (indicates that request is pending - i.e., queued). Cleared when request becomes active or by ABORT_SW_XFER.
17:16	RESERVED_2	
15	SW_NACK3	READ ONLY. Indicates that DDC slave did not issue an acknowledge during the fourth SW transaction. Cleared on GO.
14	SW_NACK2	READ ONLY. Indicates that DDC slave did not issue an acknowledge during the third SW transaction. Cleared on GO.
13	SW_NACK1	READ ONLY. Indicates that DDC slave did not issue an acknowledge during the second SW transaction. Cleared on GO.
12	SW_NACK0	READ ONLY. Indicates that DDC slave did not issue an acknowledge during the first SW transaction. Cleared on GO.
11	RESERVED_3	
10	RESERVED_4	
8	SW_STOPPED_ON_NACK	READ ONLY. Indicates that SW transfer was interrupted due to NACK when STOP_ON_NACK=1. Cleared on GO.
7	SW_BUFFER_OVERFLOW	READ ONLY. Indicates that buffer overflow occurred during SW transfer, stopping transfer. Cleared on GO.
6	SW_INTERRUPTED	READ ONLY. Indicates that SW transfer was interrupted by hardware request. Cleared on GO.
5	SW_TIMEOUT	READ ONLY. Indicates that timeout condition occurred during SW transfer, stopping transfer. Cleared on GO.
4	SW_ABORTED	READ ONLY. Indicates that abort request occurred during SW transfer, stopping transfer. Cleared on GO.
3	RESERVED	
2	SW_DONE	READ ONLY. Set on completion of SW transfer. Cleared by writing HDMI_DDC_INT_CTRL.SW_DONE_ACK to 1

HDMI_DDC_SW_STATUS (cont.)

Bits	Name	Description
1:0	SW_STATUS	READ ONLY. Current SW status of HDMI_DDC 0x0: Idle 0x1: In use by SW 0x2: In use by HW 0x3: Reserved

0x04A0021C HDMI_DDC_HW_STATUS

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Status fields for HDMI_DDC engine

HDMI_DDC_HW_STATUS

Bits	Name	Description
31:18	RESERVED_1	
17	HW_URG	READ ONLY. Indicates that hardware DDC request is urgent (used by arbitration logic).
16	HW_REQ	READ ONLY. Hardware requests use of HDMI_DDC interface (indicates that request is pending - i.e., queued). Cleared when request becomes active or by ABORT_HW_XFER.
15:4	RESERVED_2	
3	HW_DONE	READ ONLY. Set on completion of HW transfer. Cleared by writing HW_DONE_ACK to 1
2	RESERVED	
1:0	HW_STATUS	READ ONLY. Current HW status of HDMI_DDC 0x0: Idle 0x1: In use by SW 0x2: In use by HW 0x3: Reserved

0x04A00220 HDMI_DDC_SPEED

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000002

DDC speed setting

HDMI_DDC_SPEED

Bits	Name	Description
31:16	PRESCALE	prescale = (m * xtal_frequency) / (desired_i2c_speed), where m is multiply factor, default: m = 1
15:5	RESERVED_1	
4	DIS_FILTER_IN_STALL	Determines whether dout_filter will be disabled when receiver is clock stalling. 0x0: Disable 0x1: Don't Disable
3:2	RESERVED_2	
1:0	THRESHOLD	Select threshold to use to determine whether value sampled on SDA is a 1 or 0. Specified in terms of the ratio between the number of sampled ones and the total number of times SDA is sampled. * 0x0: >0 0x1: 1/4 of total samples 0x2: 1/2 of total samples 0x3: 3/4 of total samples

0x04A00224 HDMI_DDC_SETUP

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

DDC SETUP

HDMI_DDC_SETUP

Bits	Name	Description
31:24	TIME_LIMIT	Time limit, in units of 256 DDC fast reference (TOCLK) pulses, to wait before timeout when clock is stalled by external device.
23:16	INTRA_XFER_DELAY	Use to specify delay between transactions in units of DDC reference.
15:8	INTRA_BYTE_DELAY	Use to specify delay between bytes in units of DDC reference.
7	CLK_DRIVE_EN	Select whether SCL pad is pulled up or driven high - 0:Pullup by external resistor - 1:DDC pads drive SCL high 0x0: Pullup by external resistor 0x1: DDC pads drive SCL
6:2	RESERVED	

HDMI_DDC_SETUP (cont.)

Bits	Name	Description
1	DATA_DRIVE_SEL	Select number of clocks to drive SDA high - 0:Drive for 10 SCLKs - 1:Drive for 20 SCLKs 0x0: Drive for 10MCLKs 0x1: 20MCLKS
0	DATA_DRIVE_EN	Select whether SDA pad is pulled up or driven high - 0:Pullup by external resistor - 1:DDC pads drive SDA high 0x0: Pullup by external resistor 0x1: DDC pads drive SDA

0x04A00228 HDMI_DDC_TRANS0

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Configuration for first transaction

HDMI_DDC_TRANS0

Bits	Name	Description
31:24	RESERVED_1	
23:16	CNT0	Byte count for first transaction (excluding the first byte, which is usually the address).
15:14	RESERVED_2	
13	STOP0	Determines whether a stop bit will be sent after the first transaction 0x0: NO STOP 0x1: STOP
12	START0	Determines whether a start bit will be sent before the first transaction 0x0: NO START 0x1: START
11:9	RESERVED_3	
8	STOP_ON_NACK0	Determines whether the current transfer will stop if a NACK is received during the first transaction (current transaction always stops). 0x0: STOP CURRENT TRANSACTION, GO TO NEXT TRANSACTION 0x1: STOP ALL TRANSACTIONS, SEND STOP BIT
7:1	RESERVED_4	

HDMI_DDC_TRANS0 (cont.)

Bits	Name	Description
0	RW0	Read/write indicator for first transaction - set to 0 for write, 1 for read. This bit only controls HDMI_DDC behavior - the R/W bit in the transaction is programmed into the DDC buffer as the LSB of the address byte. 0x0: WRITE 0x1: READ

0x04A0022C HDMI_DDC_TRANS1

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Configuration for second transaction

HDMI_DDC_TRANS1

Bits	Name	Description
31:24	RESERVED_1	
23:16	CNT1	Byte count for second transaction (excluding the first byte, which is usually the address).
15:14	RESERVED_2	
13	STOP1	Determines whether a stop bit will be sent after the second transaction 0x0: NO STOP 0x1: STOP
12	START1	Determines whether a start bit will be sent before the second transaction 0x0: NO START 0x1: START
11:9	RESERVED_3	
8	STOP_ON_NACK1	Determines whether the current transfer will stop if a NACK is received during the second transaction (current transaction always stops). 0x0: STOP CURRENT TRANSACTION, GO TO NEXT TRANSACTION 0x1: STOP ALL TRANSACTIONS, SEND STOP BIT
7:1	RESERVED_4	

HDMI_DDC_TRANS1 (cont.)

Bits	Name	Description
0	RW1	Read/write indicator for second transaction - set to 0 for write, 1 for read. This bit only controls HDMI_DDC behavior - the R/W bit in the transaction is programmed into the DDC buffer as the LSB of the address byte. 0x0: WRITE 0x1: READ

0x04A00230 HDMI_DDC_TRANS2

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Configuration for third transaction

HDMI_DDC_TRANS2

Bits	Name	Description
31:24	RESERVED_1	
23:16	CNT2	Byte count for third transaction (excluding the first byte, which is usually the address).
15:14	RESERVED_2	
13	STOP2	Determines whether a stop bit will be sent after the third transaction 0x0: NO STOP 0x1: STOP
12	START2	Determines whether a start bit will be sent before the third transaction 0x0: NO START 0x1: START
11:9	RESERVED_3	
8	STOP_ON_NACK2	Determines whether the current transfer will stop if a NACK is received during the third transaction (current transaction always stops). 0x0: STOP CURRENT TRANSACTION, GO TO NEXT TRANSACTION 0x1: STOP ALL TRANSACTIONS, SEND STOP BIT
7:1	RESERVED_4	

HDMI_DDC_TRANS2 (cont.)

Bits	Name	Description
0	RW2	Read/write indicator for third transaction - set to 0 for write, 1 for read. This bit only controls HDMI_DDC behavior - the R/W bit in the transaction is programmed into the DDC buffer as the LSB of the address byte. 0x0: WRITE 0x1: READ

0x04A00234 HDMI_DDC_TRANS3

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Configuration for fourth transaction

HDMI_DDC_TRANS3

Bits	Name	Description
31:24	RESERVED_1	
23:16	CNT3	Byte count for fourth transaction (excluding the first byte, which is usually the address).
15:14	RESERVED_2	
13	STOP3	Determines whether a stop bit will be sent after the fourth transaction 0x0: NO STOP 0x1: STOP
12	START3	Determines whether a start bit will be sent before the fourth transaction 0x0: NO START 0x1: START
11:9	RESERVED_3	
8	STOP_ON_NACK3	Determines whether the current transfer will stop if a NACK is received during the fourth transaction (current transaction always stops). 0x0: STOP CURRENT TRANSACTION, GO TO NEXT TRANSACTION 0x1: STOP ALL TRANSACTIONS, SEND STOP BIT
7:1	RESERVED_4	

HDMI_DDC_TRANS3 (cont.)

Bits	Name	Description
0	RW3	Read/write indicator for fourth transaction - set to 0 for write, 1 for read. This bit only controls HDMI_DDC behavior - the R/W bit in the transaction is programmed into the DDC buffer as the LSB of the address byte. 0x0: WRITE 0x1: READ

0x04A00238 HDMI_DDC_DATA

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

This register is used to read or write the DDC buffer

HDMI_DDC_DATA

Bits	Name	Description
31	INDEX_WRITE	WRITE ONLY. To write index field, set this bit to 1 while writing HDMI_DDC_DATA.
30:24	RESERVED_1	
23:16	INDEX	Use to set index into DDC buffer for next read or current write, or to read index of current read or next write. Writable only when INDEX_WRITE=1.
15:8	DATA	Use to fill or read the DDC buffer
7:1	RESERVED_2	
0	DATA_RW	Select whether buffer access will be a read or write. For writes, address auto-increments on write to HDMI_DDC_DATA. For reads, address auto-increments on reads to HDMI_DDC_DATA. 0x0: Write 0x1: Read

0x04A00250 HPD_INT_STATUS

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HPD status

HPD_INT_STATUS

Bits	Name	Description
31:9	RESERVED_1	
8	RX_INT_STATUS	READ ONLY. Panel rx interrupt status
7:2	RESERVED_2	
1	SENSE	READ ONLY. Panel connection status 0x0: panel disconnected on HPD 0x1: panel connected on HPD
0	INT_STATUS	READ ONLY. Panel interrupt status

0x04A00254 HPD_INT_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HPD interrupt control

HPD_INT_CTRL

Bits	Name	Description
31:10	RESERVED_1	
9	RCV_PLUGIN_DET_MASK	receiver plug in interrupt mask. When programmed to 1,RCV_PLUGIN_DET_INT will toggle the interrupt line
8:6	RESERVED_2	
5	RX_INT_EN	panel rx interrupt enable 0x0: Disable 0x1: Enable
4	RX_INT_ACK	WRITE ONLY. Panel rx interrupt ack
3	RESERVED	
2	INT_EN	Panel interrupt control 0x0: Disable 0x1: Enable
1	INT_POLARITY	Panel interrupt polarity 0x0: generate interrupt on disconnect 0x1: generate interrupt on connect
0	INT_ACK	WRITE ONLY. Panel interrupt ack

0x04A00258 HPD_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x10FA09C4

HPD timer control

HPD_CTRL

Bits	Name	Description
31:29	RESERVED_1	
28	ENABLE	HPD circuit enable 0x0: Disable 0x1: Enable
27:26	RESERVED_2	
25:16	RX_INT_TIMER	Amount of time in microseconds HPD line must be de-asserted for an rx event
15:13	RESERVED	
12:0	CONNECTION_TIMER	Amount of time in microseconds HPD line must be asserted/de-asserted for a connect/disconnect

0x04A00268 HDMI_CRC_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000010

HDMI CRC control

HDMI_CRC_CTRL

Bits	Name	Description
31:9	RESERVED_1	
8	USE_PRE_N_GUARD_BAND	Indicates whether preamble and guard band should be used in CRC calculation 0x0: Do not use preamble 0x1: Use Preamble
7:4	CRC_FRAMES	Number of frame the CRC needs to be calculated for, Default is one frame. Option to program CRC calculation for 16 frames and stop.
3:1	RESERVED_2	

HDMI_CRC_CTRL (cont.)

Bits	Name	Description
0	CRC_EN	Enables CRC calculation on next VSYNC 0x0: crc disable 0x1: crc Enable

0x04A0026C HDMI_VID_CRC

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Video CRC

HDMI_VID_CRC

Bits	Name	Description
31:30	RESERVED	
29:0	CRC	READ ONLY. Video CRC

0x04A00270 HDMI_AUD_CRC

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Audio CRC

HDMI_AUD_CRC

Bits	Name	Description
31	RESERVED	
30:0	CRC	READ ONLY. Audio CRC

0x04A00274 HDMI_VBI_CRC

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

VBI CRC

HDMI_VBI_CRC

Bits	Name	Description
31	RESERVED	
30:0	CRC	READ ONLY. VBI CRC

0x04A0027C HDMI_DDC_REF

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00010005

DDC reference clock generation

HDMI_DDC_REF

Bits	Name	Description
31:17	RESERVED	
16	REFTIMER_ENABLE	Enable the timer 0x0: Disable 0x1: Enable
15:0	REFTIMER	Value to set the register in order to generate DDC strobe. This register counts on HDCP application clock

0x04A00284 HDCP_SW_UPPER_AKSV

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

SW injected AKSV

HDCP_SW_UPPER_AKSV

Bits	Name	Description
31:8	RESERVED	
7:0	UPPER_AKSV	This is the upper 8 bits of the SW injected AKSV value(AKSV[39:32]) read from the EFUSE. It's needed for HDCP authentication and must be written before enabling HDCP.

0x04A00288 HDCP_SW_LOWER_AKSV

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

SW injected AKSV

HDCP_SW_LOWER_AKSV

Bits	Name	Description
31:0	LOWER_AKSV	This is the lower 32 bits of the SW injected AKSV value(AKSV[31:0]) read from the EFUSE. It's needed for HDCP authentication and must be written before enabling HDCP.

0x04A0028C HDMI_CEC_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CEC Block Control

HDMI_CEC_CTRL

Bits	Name	Description
31:10	RESERVED_1	
9	LINE_OE	Output Enable for CEC line
8:4	FRAME_SIZE	Size of CEC frame
3	RESERVED_2	
2	SOFT_RESET	Write 1 to soft reset the CEC engine
1	SEND_TRIG	Write Trigger for CEC writes
0	ENABLE	- 0 = CEC is Disabled - 1 = CEC is Enabled 0x0: Disable 0x1: Enable

0x04A00290 HDMI_CEC_WR_DATA

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CEC Read/Write Data

HDMI_CEC_WR_DATA

Bits	Name	Description
31:16	RESERVED_1	
15:8	DATA	WRITE ONLY. CEC Write Data
7:1	RESERVED_2	
0	FRAME_TYPE	- 0 = Single Follower - 1 = Broadcast message

0x04A00294 HDMI_CEC_RETRANSMIT

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CEC Re-transmit frame

HDMI_CEC_RETRANSMIT

Bits	Name	Description
31:8	RESERVED_1	
7:4	NUM	Number of programmable times the frame needs to be retransmitted
3:1	RESERVED_2	
0	ENABLE	- 0 = Disabled - 1 = Enabled 0x0: Disable 0x1: Enable

0x04A00298 HDMI_CEC_STATUS

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CEC Status

HDMI_CEC_STATUS

Bits	Name	Description
31:12	RESERVED_1	
11:8	FRAME_RETRANSMIT	READ ONLY. Number of times frame has been retransmitted
7:4	ERROR	READ ONLY. 0=No Error - 1=No ACK - 2=read 0 or 1 invalid - 3=arbitration failed
3	FRAME_DONE	READ ONLY. 0=Frame Not Done - 1=Frame Done
2	RESERVED_2	
1:0	STATUS	READ ONLY. 00=IDLE - 01=USED

0x04A0029C HDMI_CEC_INT

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CEC Interrupt

HDMI_CEC_INT

Bits	Name	Description
31:8	RESERVED	
7	FRAME_RD_DONE_MASK	- 0=Interrupt Disabled - 1=Interrupt Enabled for FRAME_READ_DONE
6	FRAME_RD_DONE_ACK	WRITE ONLY. Acknowledge bit for FRAME_READ_DONE
6	FRAME_RD_DONE_INT	READ ONLY. CEC FRAME_READ_DONE status
5	MONITOR_MASK	- 0=Interrupt Disabled - 1=Interrupt Enabled for MONITOR_INT
4	MONITOR_INT	READ ONLY. CEC MONITOR_INT status
4	MONITOR_ACK	WRITE ONLY. Acknowledge bit for MONITOR_INT
3	FRAME_ERROR_MASK	- 0=Interrupt Disabled - 1=Interrupt Enabled for FRAME_ERROR
2	FRAME_ERROR_INT	READ ONLY. CEC FRAME_ERROR status
2	FRAME_ERROR_ACK	WRITE ONLY. Acknowledge bit for FRAME_ERROR

HDMI_CEC_INT (cont.)

Bits	Name	Description
1	FRAME_WR_DONE_MASK	- 0=Interrupt Disabled - 1=Interrupt Enabled for FRAME_WRITE_DONE
0	FRAME_WR_DONE_ACK	WRITE ONLY. Acknowledge bit for FRAME_WRITE_DONE
0	FRAME_WR_DONE_INT	READ ONLY. CEC FRAME_WRITE_DONE status

0x04A002A0 HDMI_CEC_ADDR

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CEC Logical Address

HDMI_CEC_ADDR

Bits	Name	Description
31:8	RESERVED	
7:0	LOGICAL_ADDR	CEC Logical Address

0x04A002A4 HDMI_CEC_TIME

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CEC Signal Free Time

HDMI_CEC_TIME

Bits	Name	Description
31:16	RESERVED_1	
15:7	SIGNAL_FREE_TIME	Signal Free Time counter
6:1	RESERVED_2	
0	ENABLE	- 0 = Signal Free Time counter Disabled - 1 = Signal Free Time counter Enabled 0x0: Disable 0x1: Enable

0x04A002A8 HDMI_CEC_REFTIMER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x0000004A

Microsecond reference timer

HDMI_CEC_REFTIMER

Bits	Name	Description
31:17	RESERVED	
16	REFTIMER_ENABLE	Enable the reference timer 0x0: Disable 0x1: Enable
15:0	REFTIMER	Value to set the register in order to generate a strobe every microsecond. This register counts on application clock

0x04A002AC HDMI_CEC_RD_DATA

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CEC read data

HDMI_CEC_RD_DATA

Bits	Name	Description
31:13	RESERVED	
12:8	FRAME_SIZE	READ ONLY. Read data frame size
7:0	DATA	READ ONLY. CEC Read data

0x04A002B0 HDMI_CEC_RD_FILTER

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

CEC read filter

HDMI_CEC_RD_FILTER

Bits	Name	Description
31:16	RESERVED_1	
15:4	FILTER_TIME	Number of application clocks the transition on CEC line to be filtered. Max is 4096 clocks
3:1	RESERVED_2	
0	FILTER_EN	CEC read filter enable. 0= disable, 1 - enable filter 0x0: Disable 0x1: Enable

0x04A002B4 HDMI_ACTIVE_H

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Active Horizontal Information

HDMI_ACTIVE_H

Bits	Name	Description
31:28	RESERVED_1	
27:16	END	Horizontal end
15:12	RESERVED_2	
11:0	START	Horizontal start

0x04A002B8 HDMI_ACTIVE_V

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Active Vertical Information

HDMI_ACTIVE_V

Bits	Name	Description
31:28	RESERVED_1	
27:16	END	Vertical end
15:12	RESERVED_2	

HDMI_ACTIVE_V (cont.)

Bits	Name	Description
11:0	START	Vertical start

0x04A002BC HDMI_ACTIVE_V_F2

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Active vertical information for field 2.This only takes effect if INTERLACED_EN field in HDMI_FRAME_CTRL register is enabled

HDMI_ACTIVE_V_F2

Bits	Name	Description
31:28	RESERVED_1	
27:16	END_F2	Vertical end for field2
15:12	RESERVED_2	
11:0	START_F2	Vertical start for Field2

0x04A002C0 HDMI_TOTAL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Total Horizontal and Vertical Active Counts

HDMI_TOTAL

Bits	Name	Description
31:28	RESERVED_1	
27:16	V_TOTAL	Vertical Total
15:12	RESERVED_2	
11:0	H_TOTAL	Horizontal Total

0x04A002C4 HDMI_V_TOTAL_F2

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Total Vertical Count for field 2. This only takes effect if INTERLACED_EN field in HDMI_FRAME_CTRL register is enabled

HDMI_V_TOTAL_F2

Bits	Name	Description
31:12	RESERVED	
11:0	V_TOTAL_F2	Vertical total for field2

0x04A002C8 HDMI_FRAME_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HDMI frame control for SYNC and data

HDMI_FRAME_CTRL

Bits	Name	Description
31	INTERLACED_EN	Interlaced or progressive enable bit 0x0: Frame in progressive 0x1: Frame is interlaced
30	RESERVED_1	
29	HSYNC_HDMI_POL	HSYNC polarity fed to HDMI core 0x0: Active Hi Hsync, detect the rising edge of hsync 0x1: Active lo Hsync, Detect the falling edge of Hsync
28	VSYNC_HDMI_POL	VSYNC polarity fed to HDMI core 0x0: Active Hi Vsync, detect the rising edge of vsync 0x1: Active Lo Vsync, Detect the falling edge of Vsync
27:16	VCNT_DEF	Vertical Default. This should match the initial vcount for the FIRST frame from the display engine. For engines that are capable of beginning in the middle of a frame it should be set to that value otherwise it should be set to ZERO
15:13	RESERVED_2	
12	RGB_MUX_SEL	Mux to control the input data format from mdp 0x0: mdp4 input is RGB 0x1: mdp4 input is BGR

HDMI_FRAME_CTRL (cont.)

Bits	Name	Description
11:0	HCNT_DEF	Horizontal Default. This should match the initial hcount for the FIRST frame from the display engine. For engines that are capable of beginning in the middle of a frame it should be set to that value otherwise it should be set to ZERO

0x04A002CC HDMI_AUD_INT

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HDMI Audio interrupt for fifo underrun and sample drop incase the sample count coming from lpass does not match the one in audio

HDMI_AUD_INT

Bits	Name	Description
31:4	RESERVED	
3	AUD_SAM_DROP_MASK	Audio sample drop interrupt mask. When 1 written to this bit, it AUD_SAM_DROP_INT interrupt will toggle the interrupt line
2	AUD_SAM_DROP_INT	READ ONLY. Audio sample drop interrupt. This goes hi when the audio data tag coming in from lpass does not match the count in audio engine
2	AUD_SAM_DROP_ACK	WRITE ONLY. Audio sample drop interrupt acknowledge. When 1 written to this bit, it will generate a pulse to clear the AUD_SAM_DROP_INT
1	AUD_FIFO_URUN_MASK	Audio fifo underrun interrupt mask. When 1 written to this bit, it AUD_FIFO_URUN_INT interrupt will toggle the interrupt line
0	AUD_FIFO_URUN_ACK	WRITE ONLY. Audio fifo underrun interrupt acknowledge. When 1 written to this bit, it will generate a pulse to clear the AUD_FIFO_URUN_INT
0	AUD_FIFO_URUN_INT	READ ONLY. Audio fifo underrun interrupt. This goes hi when the audio fifo requests the data put there is no request and all the fifo entries are drained out

0x04A002D0 HDMI_DEBUG_BUS_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Debug bus control register

HDMI_DEBUG_BUS_CTRL

Bits	Name	Description
31:16	DEBUG_BUS	READ ONLY. Debug bus register read
15:10	RESERVED_1	
9:4	DEBUG_SEL	Select the group of signals to be selected on debug bus, for Testing purpose 0x3D = 0xAAAA 0x3E = 0x5555, 0x3F = 0xFA05.
3:1	RESERVED_2	
0	DEBUG_BUS_EN	Enable Debug Bus 0=disable, 1= Enable

0x04A002D4 HDMI_PHY_CTRL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HDMI PHY control register

HDMI_PHY_CTRL

Bits	Name	Description
31:18	RESERVED_1	
17	PLL_UNLOCK_DET_MASK	PLL_UNLOCK_DET_INT interrupt enable. Set 1 to enable interrupt.
16	PLL_UNLOCK_DET_ACK	WRITE ONLY. Acknowledge for the PLL_UNLOCK_DET interrupt. Write 1 to clear
15	PLL_UNLOCK_DET_INT	READ ONLY. PLL in the HDMI PHY has unlocked. Set to 1 when unlock has been detected.
14:4	RESERVED_2	
3	SW_RESET_POL	Polarity of reset sent to HDMI PHY - 0= Active HIGH - 1=Active LOW
2	SW_RESET	Reset value sent to HDMI PHY
1	SW_RESET_PLL_POL	Polarity of reset sent to HDMI PHY PLL - 0= Active HIGH - 1=Active LOW
0	SW_RESET_PLL	Reset value sent to HDMI PHY PLL

0x04A002DC HDMI_CEC_WR_RANGE

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x88888888

HDMI CEC write bit range programming. This register will give the flexibility to vary the start bit/bit 0 and 1 bits to be transmitted to be of various width. This register will also give flexibility to vary the signal free time for various states mentioned in CEC spec.

HDMI_CEC_WR_RANGE

Bits	Name	Description
31:28	SF_INIT_NEW_FRAME	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x150 0=0x140, 1=0x145, 2=0x14A, 3=0x14B, 4= 0x14C, 5=0x14D, 6=0x14E, 7=0x14F, 8=0x150, 9=0x151, 10= 0x152, 11=0x153, 12=0x154, 13=0x155, 14=0x158, 15=0x15F.
27:24	SF_INIT_RETRANS	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x90, 0=0x80, 1=0x85, 2=0x8A, 3=0x8B, 4= 0x8C, 5=0x8D, 6=0x8E, 7=0x8F, 8=0x90, 9=0x91, 10= 0x92, 11=0x93, 12=0x94, 13=0x95, 14=0x98, 15=0x9F.
23:20	SF_NEW_INIT	Default to 0x8, When the count with granularity of 0.05 ms reaches 0xF0, 0=0xE0, 1=0xE5, 2=0xEA, 3=0xEB, 4= 0xEC, 5=0xED, 6=0xEE, 7=0xEF, 8=0xF0, 9=0xF1, 10= 0xF2, 11=0xF3, 12 =0xF4, 13 =0xF5,14=0xF8, 15=0xFF.
19:16	BIT_1_LO	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x0A,0=0x2, 1=0x3, 2=0x4, 3=0x5, 4= 0x6, 5=0x7, 6=0x8, 7=0x09, 8=0x0A,9=0xB, 10= 0xC, 11=0xD, 12 =0xE, 13 =0xF,14=0x10, 15=0x12.
15:12	BIT_0_LO	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x1C, 0=0x12, 1=0x14, 2=0x16, 3=0x17, 4= 0x18, 5=0x19, 6=0x1A, 7=0x1B, 8=0x1C,9=0x1D, 10= 0x1E, 11=0x1F, 12 =0x20, 13 =0x22,14=0x24, 15=0x28.
11:8	BIT_TOTAL	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x30,0=0x22, 1=0x23, 2=0x28, 3=0x2B, 4=0x2C,5=0x2D, 5=0x2E, 6=0x2F, 8=0x30, 9=0x32, 10=0x34, 11=0x35, 12=0x36, 13=0x37, 14=0x38, 15=0x40.
7:4	START_LO	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x4A,0= 0x40, 1=0x42, 2=0x44, 3=0x45, 4=0x46, 5=0x47, 6=0x48, 7=0x49, 8=0x4A, 9=0x4B, 10=0x4C, 11=0x4d, 12=0x4e, 13=0x50, 14=0x52,15 = 0x55.
3:0	START_TOTAL	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x5A, 0 = 0x50, 1= 0x52, 2=0x54, 3=0x55, 4=0x56, 5=0x57, 6=0x58, 7=0x59, 8=0x5A, 9=0x5B, 10=0x5C, 11=0x5d, 12=0x5e, 13=0x60, 14=0x62,15 = 0x65.

0x04A002E0 HDMI_CEC_RD_RANGE

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x30888888

HDMI CEC read bit range programming. This register will give the flexibility to vary validity check of bit 0 and 1 bits to be read, with various width.

HDMI_CEC_RD_RANGE

Bits	Name	Description
31	RESERVED	
30:24	READ_ACK_START	Default to 0x30, when the count of granularity 0.05m ms reaches 0x30, design takes over the CEC line to acknowledge
23:20	READ_BIT_RANGE_LO	Default to 0x8, When the count with granularity of 0.05 ms reaches 0xF 0 = 0x7, 1= 0x8, 2=0x9, 3=0xa, 4=0xb, 5=0xc, 6=0xd, 7=0xe, 8=0xf, 9=0x10, 10=0x11, 11=0x12, 12=0x13, 13=0x14, 14=0x15, 15= 0x16.
19:16	READ_BIT_RANGE_HI	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x16 0 = 0xe, 1= 0xf, 2=0x10, 3=0x11, 4=0x12, 5=0x13, 6=0x14, 7=0x15, 8=0x16, 9=0x17, 10=0x18, 11=0x19, 12=0x1a, 13=0x1b, 14=0x1c, 15= 0x1d.
15:12	BIT_1_ERR_RANGE_HI	Default to 0x8, When the count with granularity of 0.05 ms reaches 0xf 0 = 0x7, 1= 0x8, 2=0x9, 3=0xa, 4=0xb, 5=0xc, 6=0xd, 7=0xe, 8=0xf, 9=0x10, 10=0x11, 11=0x12, 12=0x13, 13=0x14, 14=0x15, 15= 0x16.
11:8	BIT_1_ERR_RANGE_LO	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x8 0 = 0x0, 1= 0x1, 2=0x2, 3=0x3, 4=0x4, 5=0x5, 6=0x6, 7=0x7, 8=0x8, 9=0x9, 10=0xa, 11=0xb, 12=0xc, 13=0xd, 14=0xe, 15= 0xf.
7:4	BIT_0_ERR_RANGE_HI	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x22 0 = 0x1a, 1= 0x1b, 2=0x1c, 3=0x1d, 4=0x1e, 5=0x1F, 6=0x20, 7=0x21, 8=0x22, 9=0x23, 10=0x24, 11=0x25, 12=0x26, 13=0x27, 14=0x28, 15= 0x29.
3:0	BIT_0_ERR_RANGE_LO	Default to 0x8, When the count with granularity of 0.05 ms reaches 0x1A. 0 = 0x10, 1= 0x12, 2=0x14, 3=0x15, 4=0x16, 5=0x17, 6=0x18, 7=0x19, 8=0x1A, 9=0x1B, 10=0x1C, 11=0x1d, 12=0x1e, 13=0x1f, 14=0x20, 15= 0x21.

0x04A002E4 HDMI_VERSION

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x02010000

HDMI Version number register

HDMI_VERSION

Bits	Name	Description
31:24	MAJOR_VERSION	READ ONLY. This read only field is the major version of HDMI controller. For this design the major version is set to 2
23:16	MINOR_VERSION	READ ONLY. This read only field is the minor version of HDMI controller. For this design the minor version is set to 0
15:0	RESERVED	

0x04A002E8 HDMI_PHY_BIST_0

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HDMI PHY BIST control register

HDMI_PHY_BIST_0

Bits	Name	Description
31	ENABLE	Global loopback testing enabled to mux onto TMDS lines
30:26	TX_FIXED_PAT_SEL	Pattern select for the pseudo-random bit sequence
25:16	TX_PRBS_POLY	Polynomial of BIST
15:14	TX_PSEL	Bist Channel RGB pattern selection
13:4	TX_PRBS_SEED	BIST seed
3	TX_PRBS_SEED_SEL	PRBS SEED selection
2:1	TX_PATGEN_MODE	Select pattern generator mode. 00=PRBS mode, 01 = 10-bit fixed pattern mode, 10 = 20 bit programmable mode, 11= TMDS mode (or iterative 32 fixed pattern
0	TX_EN_PATGEN	Transmitter Enable for the pseudo-random bit sequence

7	PWRDN_B	Global power-down signal for HDMI PHY (excluding PLL block); this is an active low signal, i.e., when PWRDN_B = 0, PHY is in power-down mode. CSR is still accessible Normal operational mode setting is 1 Default value is 0
6	PD_ASIC_CTRL	RESERVED Normal operational mode setting is 0 Default value is 0
5	PHY_SW_RESET	Reset PHY digital state machine. 1: all PHY digital is reset except control register. Normal operational mode setting is 0 Default value is 0
4	FORCE_LOCK	- 1: force the pll_rdy to high Normal operational mode setting is 0 Default value is 0
3:2	RESERVED3_2	not used in 28nm LOOK_STABLE_TIME - 00: 256 refclk cycle, e.g., 256 x 1000/148.5MHz
1	RESERVED1	not used in 28nm PLL_LOCK_DETECT_EN -0: reset pll lock state, phy_rdy goes low1: 0->1 start relock control. Normal operational mode setting is 1 Default value is 1

HDMI_PHY_REG_12 (cont.)

Bits	Name	Description
0	RETIMING_ENABLE	Rising edge of re-time enable will re-lock the re-time logic. 0 - Disable the re-timer logic (read path disabled) 1 - Enable the re-time logic (rising edge causes the read gray-code address generation to re-lock to the write path) Normal operational mode setting is 1 Default value is 1

0x04A00434 HDMI_PHY_REG_BIST_CFG

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HDMI_PHY_REG_BIST_CFG

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:3	FIXED_PAT_SEL	selection of bist fixed-pattern Normal operational mode setting is 00000 Default value is 00000
2:1	PATGEN_MODE	pattern generator mode: - 00: prbs pattern - 01: 10-bit fixed pattern - 10: 20-bit programmable pattern - 11: tmds iterative mode Normal operational mode setting is 00 Default value is 00
0	EN_PATGEN	enable BIST pattern generator Normal operational mode setting is 0 Default value is 0

0x04A00438 HDMI_PHY_DEBUG_BUS_SEL

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HDMI_PHY_DEBUG_BUS_SEL

Bits	Name	Description
31:8	RESERVED_BITS31_8	

HDMI_PHY_DEBUG_BUS_SEL (cont.)

Bits	Name	Description
7:0	DEBUG_BUS_SEL	selection of bist debug bus case (DEBUG_BUS_SEL[1:0]) - 3'b000: hdmi_phy_tx_debug_bus = 32'd0; - 3'b001: hdmi_phy_tx_debug_bus = swi_sanity_bus; - 3'b010: hdmi_phy_tx_debug_bus = tx_debug; - 3'b011: hdmi_phy_tx_debug_bus = test_debug; - 3'b100: hdmi_phy_tx_debug_bus = misc_debug; default: hdmi_phy_tx_debug_bus = 32'b0; endcase where tx_debug = {dft_pixel_clk, dft_pll_tx_clk, data_ch2, data_ch1, data_ch0}; test_debug = {13'b0, dft_inputs, dft_bist_clk, lbk_clk, lbk_data_in}; misc_debug = {2'b0, pd_pwrgen, pd_deser, pd_drv_ch, pd_drv_clk, pd_ser_ch, pd_ser_clk, pd_em, phy_rdy, prbs_chk_done, prbs_chk_err_flag, prbs_chk_err}; Normal operational mode setting is 00000000 Default value is 00000000

0x04A0043C HDMI_PHY_REG_MISC0

Type: Read/Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

HDMI_PHY_REG_MISC0

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	DTEST_BUS_SEL	selection of dtest mux case (DTEST_BUS_SEL[3:0]) - 4'b0000 : dtest = 0; - 4'b0001 : dtest = pll_lock; - 4'b0010 : dtest = prbs_chk_done; - 4'b0011 : dtest = prbs_chk_err_flag; - 4'b0100 : dtest = prbs_chk_err[0]; - 4'b0101 : dtest = data_ch0[0]; - 4'b0110 : dtest = data_ch1[0]; - 4'b0111 : dtest = data_ch2[0]; - 4'b1000 : dtest = lbk_data_in[0]; default : dtest = 0; endcase Normal operational mode setting is 00000000 Default value is 00000000

2:0	WRITE_CHECK_COUNT	Default 0x1. Program in counts of how many reference clock pulses later the check for line contention is done. 0x1 = 100us. 0x2 = 150us. 0x3 = 200us. 0x4 = 250us (max rise time as per CEC spec). Disable WRITE_CHECK_ENABLE for 50us check.

14.10 IMEM MM SS Registers (0x04B00000 IMEM_MMSS_BASE)

This section contains the IMEM registers.

14.10.1 IMEM Configuration register

0x04B00000 IMEM_MMSS_IMEM_CONFIG

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000001

General configuration register for IMEM. This register sets the IMEM accessibility for Graphics and AXI.

Power up value is based on parameters provided.

NOTE

a. All banks are 8k x 64 in size.

b. GRP and AXI memory configurations are 64-bits wide.

c. If Graphics interface is not required, set the IMEM_CONFIG_POR parameter to all AXI setting (2'b01).

IMEM_MMSS_IMEM_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	IMEM_CONFIG	(Graphics Interface = 256kbytes) (AXI Interface (and trace) = 256kbytes) (Graphics Interface = 128kbytes) (AXI Interface (and trace) = 128kbytes) Banks 0 and 1 are allocated to Graphics. Banks 2 and 3 are allocated to AXI. (Graphics Interface = 128kbytes) (AXI Interface (and trace) = 128kbytes) Banks 0 and 1 are allocated to AXI. Banks 2 and 3 are allocated to Graphics. SW : RW, HW: R 0x0: All graphics (Dedicated all to Graphics) 0x1: All axi (Dedicated all to AXI) 0x2: 0_1_Graphics_2_3_AXI 0x3: 0_1_AXI_2_3_Graphics

14.10.2 IMEM AXI Trace Configuration register

0x04B00004 IMEM_MMSS_IMEM_AXI_TRACE_CONFIG

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to enable and control the AXI trace to IMEM.

IMEM_MMSS_IMEM_AXI_TRACE_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	AXI_TRACE_ADDR_WRAP_EN	1-Enables AXI trace address to wrap
0	AXI_TRACE_EN	1-Enables AXI trace to IMEM

0x04B00008 IMEM_MMSS_IMEM_AXI_TRACE_ADDR_CNTR

Type: Read
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to read the AXI Trace Address counter value.

IMEM_MMSS_IMEM_AXI_TRACE_ADDR_CNTR

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:0	AXI_TRACE_ADDR_CNTR	Current AXI Trace address

0x04B0000C IMEM_MMSS_IMEM_AXI_TRACE_WRAP_STATUS

Type: Read
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to read the AXI Trace Address wrap status bit.

IMEM_MMSS_IMEM_AXI_TRACE_WRAP_STATUS

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	AXI_TRACE_WRAP_STATUS	0x1: AXI trace address wrapped 0x0: AXI trace address not wrapped

0x04B00010 IMEM_MMSS_IMEM_AXI_BASE_ADDR_OFFSET

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00002E00

This register is used to set the AXI Base Address offset value in order to relocate the IMEM AXI memory within the space allowed by the interconnect. The POR value of this register is based on the parameter - IMEM_BASE_ADDRESS. In case of MPSS, this is set to 0x5800. This should be set to the upper 16 bits of the Imem base address. Based on the size of the Imem, the relevant bits of this register are used for decoding the address.

IMEM_MMSS_IMEM_AXI_BASE_ADDR_OFFSET

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:0	IMEM_AXI_BASE_ADDRESS_OFFSET	IMEM AXI base address offset for decode

14.10.3 IMEM Syndrome registers

0x04B00020 IMEM_MMSS_IMEM_ERR_ADDRESS_MS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x000000000000

The IMEM_ERR_ADDRESS_MS register contains the upper bits of the address of the request that caused the bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, it will be locked until bit 8 of the ERR_CODE register is written to clear the error.

IMEM_MMSS_IMEM_ERR_ADDRESS_MS

Bits	Name	Description
31:16	RESERVED_BITS31_16	

IMEM_MMSS_IMEM_ERR_ADDRESS_MS (cont.)

Bits	Name	Description
15:0	ERROR_ADDRESS_31_16	Bits 31:16 of the address of the request that caused the bus error.

0x04B00024 IMEM_MMSS_IMEM_ERR_ADDRESS_LS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_ADDRESS_LS register contains the lower bits of the address of the request that caused the AXI GE bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, the register will be locked until bit 8 of the ERR_CODE register is written to clear the error.

IMEM_MMSS_IMEM_ERR_ADDRESS_LS

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:3	ERROR_ADDRESS_15_3	Bits 15:3 of the address of the request that caused the bus error
2:0	RESERVED_BITS2_0	Reserved if not implemented otherwise include with error address.

0x04B00028 IMEM_MMSS_IMEM_ERR_APACKET_MS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_APACKET_MS register provides various data about the request that caused the AXI GE bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, it will be locked until bit 8 of the ERR_CODE register is written to clear the error.

IMEM_MMSS_IMEM_ERR_APACKET_MS

Bits	Name	Description
31:20	RESERVED_BITS31_20	
19:18	ERROR_ALOCK_1_0	The ALOCK of the request that caused the bus error
17	ERROR_ABURST	The ABURST of the request that caused the bus error
16:12	ERROR_PORTID_4_0	The Port ID of the request that caused the bus error.
11:5	ERROR_ATID_6_0	The Transfer ID of the request that caused the bus error.

IMEM_MMSS_IMEM_ERR_APACKET_MS (cont.)

Bits	Name	Description
4	ERROR_AWRITE	The awrite of the request that caused bus error
3:0	ERROR_ALEN	The burst length of the request that caused bus error

0x04B0002C IMEM_MMSS_IMEM_ERR_APACKET_LS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_APACKET_LS register provides various data about the request that caused the AXI GE bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, the register will be locked until bit 8 of the ERR_CODE register is written to clear the error.

IMEM_MMSS_IMEM_ERR_APACKET_LS

Bits	Name	Description
31:24	RESERVED_BITS31_24	
19:9	ERROR_AMID_10_0	The master ID of the request that caused the bus error (The higher order bits will be set to 0 for MID width < 7)
8:5	ERROR_ATYPE_3_0	The ATYPE of the request that caused the bus error
4	ERROR_APROTNS	The APROTNS of the request that caused the bus error
3:0	RESERVED_BITS_3_0	

0x04B00030 IMEM_MMSS_IMEM_ERR_CODE

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_CODE register provides additional data about the bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, the register will be locked until bit 8 of the ERR_CODE register is written to clear the error.

Additionally, each slave or AXI interconnect which is capable of detecting an error is also required to have a single programmable register which can be used to optionally interrupt the ARM9 or Scorpion Processor core. This interrupt mechanism is required since write transfers may be posted on the bus and the AXI transfer may complete prior to the occurrence of the error in the AXI interconnect or slave device. The interrupt from the AXI interconnect and the AXI slave devices will be directed to both the modem and application processor's interrupt controllers. The interrupt output of the slave device shall be driven from bit 3 of the ERR_CODE register above. To clear the interrupt, it will be necessary to clear the ERR_CODE register by writing to bit 8

(ERROR_CLEAR) of the ERR_CODE register. This will clear the ERROR field (bit 3) and also unlock the ERR_ADDRESS, ERR_APACKET, and ERR_CODE registers so that a subsequent error can be recoded in these registers.

IMEM_MMSS_IMEM_ERR_CODE

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8	ERROR_CLEAR	Writing a ’1’ to this bit will clear the bus error status bit.
7:4	RESERVED_BIT7_4	
3	ERROR	Error Status bit to indicate that an error has occurred.
2	RESERVED_BIT2	
1	MPU_ERROR	0x1: memory protection error: This should be ignored, as XPU has separate syndrome registers for this indication.
0	ADDRESS_DECODE_ERRO R	0x1: slave address decode error

0x04B00034 IMEM_MMSS_IMEM_ERR_IRQ_MSK

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000001

This register is used to block decoder interrupt to ARM9 or Scorpion. Note that even if this is disabled, xpu can still drive interrupts.

IMEM_MMSS_IMEM_ERR_IRQ_MSK

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	PROCESSOR_IRQ_MASK	1 disables bus error interrupt to Processor

0x04B00040 IMEM_MMSS_IMEM_CLK_ON_EN

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x00000000

This register is used to enable/disable the clock_on circuitry. If disabled, clock on is always high.

IMEM_MMSS_IMEM_CLK_ON_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	AHB_CLK_ON_EN	1 will enable ahb clkon to go low
0	AXI_CLK_ON_EN	1 will enable the timer countdown

0x04B00044 IMEM_MMSS_IMEM_CLK_ON_TIME

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x000003FF

This register sets the starting time for a binary countdown in clock cycles.

IMEM_MMSS_IMEM_CLK_ON_TIME

Bits	Name	Description
31:10	RESERVED_BITS31_1	
9:0	CLK_ON_TIME_9_0	10 bits to count down from, for a max of 1024

0x04B00048 IMEM_MMSS_IMEM_FSCGC_TIMERS

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x000000FF

This register sets the starting time for a binary countdown in clock cycles.

IMEM_MMSS_IMEM_FSCGC_TIMERS

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:4	WAKEUP_COUNTER_3_0	4 bit count down, must be 20ns
3:0	TO_SLEEP_COUNTER_3_0	4 bit count down, must be 20ns

0x04B0004C IMEM_MMSS_IMEM_FSCGC_CONTROL

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x0000003F

Controls for head switch and periphery within IMEM.

IMEM_MMSS_IMEM_FSCGC_CONTROL

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8:6	HALT_CLOCK_2_0	Gates the clock to individual RAMS
5:3	CORE_ON_2_0	RAM Core will remain on if this is 1 (for individual rams)
2:0	PERIF_ON_2_0	RAM Periphery will remain on if this is 1 (for individual rams)

0x04B00050 IMEM_MMSS_IMEM_EX_FSCGC_CONTROL

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x0000FFFF

Controls for head switch and perfory outside of IMEM.

IMEM_MMSS_IMEM_EX_FSCGC_CONTROL

Bits	Name	Description
31:22	RESERVED_BITS31_22	
23:16	HALT_CLOCK_7_0	Gates the clock to individual RAMS
15:8	CORE_ON_7_0	RAM Core will remain on if this is 1 (for individual rams)
7:0	PERIF_ON_7_0	RAM Periphery will remain on if this is 1 (for individual rams)

0x04B00054 IMEM_MMSS_IMEM_RAM_CONFIG

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x00000004

This register configures the access to the GMEM.

IMEM_MMSS_IMEM_RAM_CONFIG

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2	EX_RAM_CLK_EN	GMEM async FIFO clock enable

IMEM_MMSS_IMEM_RAM_CONFIG (cont.)

Bits	Name	Description
1:0	EX_RAM_CONFIG_1_0	External ram access configuration 0x0: No GMEM allocated to A_2 0x1: 256K of GMEM allocated to AXI 0x2: All GMEM allocated to _2

14.10.4 Internal Memory Misc

0x04B00038 IMEM_MMSS_IMEM_MEM_ACC_CFG

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to configure the acc pins of the RAM for programming the sense amp.

IMEM_MMSS_IMEM_MEM_ACC_CFG

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	ACC_CFG	

14.11 IMEM MM SS XPU Registers (0x04B00000 IMEM_MMSS_BASE)

This section contains the IMEM XPU registers.

0x04B01000+ 4*n IMEM_MMSS_MPU_PRTn_RACR, n=[0..3]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU. These registers include a single bit per VMID granting read access

IMEM_MMSS_MPU_PRTn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x04B01400+ 4*n IMEM_MMSS_MPU_PRTn_WACR, n=[0..3]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU.

IMEM_MMSS_MPU_PRTn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x04B01800+ 4*n IMEM_MMSS_MPU_PRTn_START, n=[0..3]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition Start Address Register. This register contains the start address of the partition. Only the bit numbers indicated by MPU_IDR[MSb] through MPU_IDR[LSb] are valid and physically exist.

IMEM_MMSS_MPU_PRTn_START

Bits	Name	Description
31:25	RESERVED_31_25	Reserved
24:12	ADDR	MPU Partition Start Address
11:0	RESERVED_11_0	Reserved

0x04B01C00+4*n IMEM_MMSS_MPU_PRTn_END, n=[0..3]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition End Address Register. This register contains the start address of the partition.Only the bit numbers indicated by MPU_IDR[MSB] through MPU_IDR[LSB] are valid and physically exist.

IMEM_MMSS_MPU_PRTn_END

Bits	Name	Description
31:25	RESERVED_31_25	Reserved
24:12	ADDR	MPU Partition End Address
11:0	RESERVED_11_0	Reserved

0x04B01F80 IMEM_MMSS_MPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Configuration Register: This register includes fields governing various MPU behaviors.

IMEM_MMSS_MPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved

IMEM_MMSS_MPU_CR (cont.)

Bits	Name	Description
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set MPU_ESR. MPU_EAR and MPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set MPU_ESR. MPU_EAR and MPU_ESYNR0 updated with address and syndrome of error.
2	MPUEIE	MPU Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the MPU. Interrupt output is asserted if MPU_CR[MPUEIE] = 1 and any bit is set in MPU_ESR.
1	MPUERE	MPU Error Report Enable. MPUERE = 0 causes the MPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. MPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective MPU port. Errors from either port are terminated by the MPU as RAZ/WI Both client and configuration port errors are recorded in MPU_ESR, independent of the value of MPU_CR[MPUERE]
0	MPUE	MPU Enable. Governs whether MPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures MPU and the MID to VMID mapping tables.

0x04B01F84 IMEM_MMSS_MPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the MPU, for both the client port and the configuration port. Client port addresses are 32 bits width and configuration port addresses are 12 bits wide (the width of the configuration address port).

IMEM_MMSS_MPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x04B01F88 IMEM_MMSS_MPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the MPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the MPU's interrupt output (when enabled by MPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the MPU_ESYNRn registers, which are merely the "syndrome" of an error indicated by MPU_ESR.

IMEM_MMSS_MPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x04B01F8C IMEM_MMSS_MPU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Restore Register. This register is an aliased address for the MPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

IMEM_MMSS_MPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x04B01F90 IMEM_MMSS_MPU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

IMEM_MMSS_MPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x04B01F94 IMEM_MMSS_MPU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

IMEM_MMSS_MPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x04B01FF4 IMEM_MMSS_MPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

MPU Revision Register: This register provides major/minor revision codes for the implementation.

IMEM_MMSS_MPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x04B01FF8 IMEM_MMSS_MPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x180C2C03

MPU ID Register: Read-only register that defines various configuration attributes of the MPU instance.

IMEM_MMSS_MPU_IDR

Bits	Name	Description
31:29	RESERVED31_29	Reserved
28:24	MSB	Indicates most significant address bit number used in START/END address comparisons.
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used in START/END address comparisons.
15:14	RESERVED15_12	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only MPU_PRTn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate MPU_PRTn_RACR and MPU_PRTn_WACR registers govern read vs. write access. For single VMID, MPU_PRTn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields

IMEM_MMSS_MPU_IDR (cont.)

Bits	Name	Description
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. MPU_PRTn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMD type access control. MPU_PRTn_xACR registers include separate bit per VMID (32 bits) for governing access.
9	RESERVED9	Reserved
8:0	NPRT	Number of partitions. Indicates the number of partitions (minus 1) supported by the MPU. Values range from 0-223 (1-224 partitions)

0x04B01FFC IMEM_MMSS_MPU_MPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

MPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the MPU (including the MPU_MPU_ACR itself).

IMEM_MMSS_MPU_MPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the MPU's 4KB address region (including the MPU_MPU_ACR itself). For single VMID type MPUs (MPU_IDR[MV] = 0) the MPU_MPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

14.12 ROTATOR Registers (0x04E00000 ROTATOR_BASE)

This section describes the Rotator registers (also know as Offline Rotator). All Rotator registers are accessible by the ARM CPU through the Slow Peripheral Bus APQ interface. For read accesses, the number of cycles before data is available is variable depending on the register being read. The APQ register interface uses a request-ack protocol to hold the bus until the read data is valid, so wait states are not applicable. Writes to these registers take effect immediately.

The registers are grouped into distinct groups, according to their function.

- Interrupts (0x0000 - 0x002C)
- Operation Control Registers (0x0030 - 0x007C)
- Clock Control Registers (0x0080 - 0x008C)
- MGEN2MAXI control registers (0x00400 - 0x004FC)
- Rotator Sub-Block Registers (0x1000 - 0xFFFF)
- Command Registers (0x1000 - 0x1FFF)
- Tile Fetch Registers (0x2000 - 0x2FFF)
- Test Misr Registers (0xD000 - 0xDFFF)

14.12.1 Interrupt registers

0x04E00020 ROTATOR_INTR_ENABLE

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_INTR_ENABLE register is used to enable the ROTATOR interrupts.

ROTATOR_INTR_ENABLE

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2:0	INTR_ENABLE	Setting (1) a specific bit will enable the respective interrupt source within the ROTATOR to send a level interrupt out of the ROTATOR. Clearing (0) that bit will disable it from generating the ROTATOR interrupt. Bit0: Rotator done Bit 1: AXI Bus Error Bit 2 : DMI buffer Acknowledge

0x04E00024 ROTATOR_INTR_STATUS

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_INTR_STATUS register is the ROTATOR interrupt status register.

ROTATOR_INTR_STATUS

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2:0	INTR_STATUS	When an ROTATOR interrupt occurs, then reading this register will indicate what caused the interrupt since that each bit indicates the source of the interrupt that had happened. If multiple interrupt sources had happened, then multiple bits of this register will be. Bit0: Rotator done Bit 1: AXI Bus Error Bit 2 : DMI buffer Acknowledge

0x04E00028 ROTATOR_INTR_CLEAR

Type: Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_INTR_CLEAR register is used to clear the ROTATOR interrupts.

ROTATOR_INTR_CLEAR

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2:0	INTR_CLEAR	To clear the interrupt, make sure the interrupt has occurred, and then clear (0) this bit. Setting (1) a specific bit will clear the respective interrupt. A read from this register would indicate if the respective interrupt source is cleared (the bit is set (1)). So, at power up, it would read all 1's. Bit0: Rotator done Bit 1: AXI Bus Error Bit 2 : DMI buffer Acknowledge

14.12.2 Operation control registers

0x04E00030 ROTATOR_START

Type: Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_START register is used to kick start the image rotation..

ROTATOR_START

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	ROTATE_START	A write to this register will start the image rotation.

0x04E00034 ROTATOR_INTF_EN

Type: Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_INTF_SEL register is used to enable DMI and Context Queue interface.

This register is expected to program before kicking off Rotator.

ROTATOR_INTF_EN

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28	DMI_BUF_UPDATE_DIS	This bit is for supporting synchronization of multiple DMI buffer switching events to multiple of MDP pipes. if the bit is ’1’, current DMI buffer switching will be pended and it will be issued when next frame with the bit is ’0’.
27	RESERVED_BIT27	
26:24	MDP_PIPE_ID	MDP PIPE ID selection that the context input will be connected proper DMI interface if the DMI enable is set. 0x7: Non-DMI case for Context only 0x6: Rotator context connects to MDP DMA_E DMI interface 0x5: Rotator context connects to MDP DMA_S DMI interface 0x4: Rotator context connects to MDP DMA_P DMI interface 0x3: Rotator context connects to MDP RGB2 DMI interface 0x2: Rotator context connects to MDP RGB1 DMI interface 0x1: Rotator context connects to MDP VG2 DMI interface 0x0: Rotator context connects to MDP VG1 DMI interface

ROTATOR_INTF_EN (cont.)

Bits	Name	Description
23:22	RESERVED_BITS23_22	
21:20	CONTEXT_ID	Context ID selection for context start (0
19	RESERVED_BIT19	
18	CONTEXT_SKIP_DMA_E_EN	decide how to deal with next frame in context queue if rotator DMI buffers are full and MDP pipe displaying rate is slower than rotator. 0x1: skip mode 0x0: no skip mode
17	CONTEXT_SKIP_DMA_S_EN	decide how to deal with next frame in context queue if rotator DMI buffers are full and MDP pipe displaying rate is slower than rotator. 0x1: skip mode 0x0: no skip mode
16	CONTEXT_SKIP_DMA_P_EN	decide how to deal with next frame in context queue if rotator DMI buffers are full and MDP pipe displaying rate is slower than rotator. 0x1: skip mode 0x0: no skip mode
15	CONTEXT_SKIP_RGB2_EN	decide how to deal with next frame in context queue if rotator DMI buffers are full and MDP pipe displaying rate is slower than rotator. 0x1: skip mode 0x0: no skip mode
14	CONTEXT_SKIP_RGB1_EN	decide how to deal with next frame in context queue if rotator DMI buffers are full and MDP pipe displaying rate is slower than rotator. 0x1: skip mode 0x0: no skip mode
13	CONTEXT_SKIP_VG2_EN	decide how to deal with next frame in context queue if rotator DMI buffers are full and MDP pipe displaying rate is slower than rotator. 0x1: skip mode 0x0: no skip mode
12	CONTEXT_SKIP_VG1_EN	decide how to deal with next frame in context queue if rotator DMI buffers are full and MDP pipe displaying rate is slower than rotator. 0x1: skip mode 0x0: no skip mode
11	RESERVED_BIT11	
10	DMI_MDP_DMA_E_EN	DMI enable between Rotator and MDP DMA_E
9	DMI_MDP_DMA_S_EN	DMI enable between Rotator and MDP DMA_S
8	DMI_MDP_DMA_P_EN	DMI enable between Rotator and MDP DMA_P
7	DMI_MDP_RGB2_EN	DMI enable between Rotator and MDP RGB2
6	DMI_MDP_RGB1_EN	DMI enable between Rotator and MDP RGB1
5	DMI_MDP_VG2_EN	DMI enable between Rotator and MDP VG2
4	DMI_MDP_VG1_EN	DMI enable between Rotator and MDP VG1

ROTATOR_INTF_EN (cont.)

Bits	Name	Description
3	DMI_VG1_BUF0_CON	DMI VG1 output buffer0 mapping control 0x0: using non-dmi output buffer 0x1: using dmi output buffer
2	CONTEXT_OUT_BUF_CON	Context queue output buffer control 0x0: all context input is mapped to one output buffer and it is not shadowed when context queue only 0x1: output buffer is shadowed to have decided output for each of context input when using context queue.
1	DMI_RESET	DMI interface Software reset that DMI will be initialized by driving DMI_RESET to 1 when rotator is not busy and DMI_RESET status has to turn to 0 by manually. DMI reset sequence for rotator and MDP is reset MDP DMI firstly and hold reset status then, reset Rotator DMI is recommended. 0x1: DMI interface reset
0	CONTEXT_QUEUE_EN	Context Queue enable

0x04E00038 ROTATOR_DISPLAY_STATUS

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_DISPLAY_STATUS register is used to indicate the idle state of various blocks in the ROTATOR.

ROTATOR_DISPLAY_STATUS

Bits	Name	Description
31:19	RESERVED_BITS31_19	
18	CONTEXT_QUEUE_ACTIVE	Indicates the Context Queue is active
17	DMI_DMA_E_ACTIVE	Indicates the DMI DMA_E is active
16	DMI_DMA_S_ACTIVE	Indicates the DMI DMA_S is active
15	DMI_DMA_P_ACTIVE	Indicates the DMI DMA_P is active
14	DMI_RGB2_ACTIVE	Indicates the DMI RGB2 is active
13	DMI_RGB1_ACTIVE	Indicates the DMI RGB1 is active
12	DMI_VG2_ACTIVE	Indicates the DMI VG2 is active
11	DMI_VG1_ACTIVE	Indicates the DMI VG1 is active
10	DOWN_SCALE_ACTIVE	Indicates the down scaler is active
9	PIX_ROT_ACTIVE	Indicates the pixel rotation is active

ROTATOR_DISPLAY_STATUS (cont.)

Bits	Name	Description
8	CLKCTL_ACTIVE	Indicates the clock control is active
7	TFETCH_ACTIVE	Indicates the tile fetch is active
6	UPSAMPLE_ACTIVE	Indicates the upsample is active
5	ROTATE_ACTIVE	Indicates the rotate is active
4	DOWNSAMPLE_ACTIVE	Indicates the downsample is active
3	PACKER_ACTIVE	Indicates the packer is active
2	DMA_WR_ACTIVE	Indicates the dma_wr is active
1	DMA_RD_ACTIVE	Indicates the dma_rd is active
0	ROTATOR_ACTIVE	Rotator processing in progress. When a image is being processed or pending processing, this bit is set (1). When image processing has completed, this bit is cleared (0).

0x04E0003C ROTATOR_DMI_BUF_CON

Type: Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_01555

The ROTATOR_DMI_BUF_CON register is used to initialize the maximum number of buffer ID in each DMI interface. DMI doesn't allow to use one buffer because rotator is written output image by tile rotation order and MDP pipe fetches image by raster order.

ROTATOR_DMI_BUF_CON

Bits	Name	Description
31:14	RESERVED_BITS31_14	
13:12	MAX_BUF_ID_DMI_DMA_E	MDP DMA_E DMI Maximum number of BUF ID - 1 (1
11:10	MAX_BUF_ID_DMI_DMA_S	MDP DMA_S DMI Maximum number of BUF ID - 1 (1
9:8	MAX_BUF_ID_DMI_DMA_P	MDP DMA_P DMI Maximum number of BUF ID - 1 (1
7:6	MAX_BUF_ID_DMI_RGB2	MDP RGB2 DMI Maximum number of BUF ID - 1 (1
5:4	MAX_BUF_ID_DMI_RGB1	MDP RGB1 DMI Maximum number of BUF ID -1 (1
3:2	MAX_BUF_ID_DMI_VG2	MDP VG2 DMI Maximum number of BUF ID - 1 (1
1:0	MAX_BUF_ID_DMI_VG1	MDP VG1 DMI Maximum number of BUF ID - 1(1

0x04E00040 ROTATOR_CONN_STATUS

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_CONN_STATUS register is indicated current connection of DMI between Rotator and MDP is being rotated that is updated by rotator start event.

ROTATOR_CONN_STATUS

Bits	Name	Description
31:7	RESERVED_BITS31_7	
6:5	MDP_PIPE_BUF_ID	DMI MDP PIPE BUF ID[1:0]
4:2	MDP_PIPE_ID	DMI MDP PIPE destination ID 0x7: Non-DMI 0x6: MDP DMA_E 0x5: MDP DMA_S 0x4: MDP DMA_P 0x3: MDP RGB2 0x2: MDP RGB1 0x1: MDP VG2 0x0: MDP VG1
1:0	CONTEXT_ID	Context ID 0x3: context3 0x2: context2 0x1: context1 0x0: context0

0x04E00044 ROTATOR_CONN_QUEUE_STATUS

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_CONN_QUEUE_STATUS register is indicated queued connection of DMI between Rotator and MDP that is updated by rotator start event.

ROTATOR_CONN_QUEUE_STATUS

Bits	Name	Description
31	QUEUE3_FULL	it is indicated Queue3 Full/Empty. 0x1: Queue0 is full 0x0: Queue0 is empty

ROTATOR_CONN_QUEUE_STATUS (cont.)

Bits	Name	Description
30:29	QUEUE3_MDP_PIPE_BUF_ID	DMI MDP PIPE BUF ID[1:0] for Queue3 2 0x3: Context only
28:26	QUEUE3_MDP_PIPE_ID	DMI MDP PIPE destination ID for Queue3 0x7: Non-DMI 0x6: MDP DMA_E 0x5: MDP DMA_S 0x4: MDP DMA_P 0x3: MDP RGB2 0x2: MDP RGB1 0x1: MDP VG2 0x0: MDP VG1
25:24	QUEUE3_CONTEXT_ID	Context ID for Queue3
23	QUEUE2_FULL	it is indicated Queue2 Full/Empty. 0x1: Queue0 is full 0x0: Queue0 is empty
22:21	QUEUE2_MDP_PIPE_BUF_ID	DMI MDP PIPE BUF ID[1:0] for Queue2 2 0x3: Context only
20:18	QUEUE2_MDP_PIPE_ID	DMI MDP PIPE destination ID for Queue2 0x7: Non-DMI 0x6: MDP DMA_E 0x5: MDP DMA_S 0x4: MDP DMA_P 0x3: MDP RGB2 0x2: MDP RGB1 0x1: MDP VG2 0x0: MDP VG1
17:16	QUEUE2_CONTEXT_ID	Context ID for Queue2
15	QUEUE1_FULL	it is indicated Queue1 Full/Empty. 0x1: Queue0 is full 0x0: Queue0 is empty
14:13	QUEUE1_MDP_PIPE_BUF_ID	DMI MDP PIPE BUF ID[1:0] for Queue1 2 0x3: Non-DMI

ROTATOR_CONN_QUEUE_STATUS (cont.)

Bits	Name	Description
12:10	QUEUE1_MDP_PIPE_ID	DMI MDP PIPE destination ID for Queue1 0x7: Non-DMI 0x6: MDP DMA_E 0x5: MDP DMA_S 0x4: MDP DMA_P 0x3: MDP RGB2 0x2: MDP RGB1 0x1: MDP VG2 0x0: MDP VG1
9:8	QUEUE1_CONTEXT_ID	Context ID for Queue1
7	QUEUE0_FULL	it is indicated Queue0 Full/Empty. 0x1: Queue0 is full 0x0: Queue0 is empty
6:5	QUEUE0_MDP_PIPE_BUF_ID	DMI MDP PIPE BUF ID[1:0] for Queue0 2 0x3: Non-DMI
4:2	QUEUE0_MDP_PIPE_ID	DMI MDP PIPE destination ID for Queue0 0x7: Non-DMI 0x6: MDP DMA_E 0x5: MDP DMA_S 0x4: MDP DMA_P 0x3: MDP RGB2 0x2: MDP RGB1 0x1: MDP VG2 0x0: MDP VG1
1:0	QUEUE0_CONTEXT_ID	Context ID for Queue0

0x04E00048 ROTATOR_CONN_DONE_STATUS

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_CONN_STATUS register is indicated current connection of DMI between Rotator and MDP that will be updated by rotator start event.

ROTATOR_CONN_DONE_STATUS

Bits	Name	Description
31:7	RESERVED_BITS31_7	

ROTATOR_CONN_DONE_STATUS (cont.)

Bits	Name	Description
6:5	MDP_PIPE_BUF_ID	DMI MDP PIPE BUF ID[1:0] 2 0x3: Non-DMI
4:2	MDP_PIPE_ID	DMI MDP PIPE destination ID 0x7: Non-DMI 0x6: MDP DMA_E 0x5: MDP DMA_S 0x4: MDP DMA_P 0x3: MDP RGB2 0x2: MDP RGB1 0x1: MDP VG2 0x0: MDP VG1
1:0	CONTEXT_ID	Context ID

0x04E0004C ROTATOR_CONN_QUEUE_DONE_STATUS

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_CONN_QUEUE_STATUS register is indicated queued connection of DMI between Rotator and MDP that is updated by rotator done event.

ROTATOR_CONN_QUEUE_DONE_STATUS

Bits	Name	Description
31	QUEUE3_FULL	it is indicated Queue3 Full/Empty. 0x1: Queue0 is full 0x0: Queue0 is empty
30:29	QUEUE3_MDP_PIPE_BUF_ID	DMI MDP PIPE BUF ID[1:0] for Queue3 2 0x3: Non-DMI
28:26	QUEUE3_MDP_PIPE_ID	DMI MDP PIPE destination ID for Queue3 0x7: Non-DMI 0x6: MDP DMA_E 0x5: MDP DMA_S 0x4: MDP DMA_P 0x3: MDP RGB2 0x2: MDP RGB1 0x1: MDP VG2 0x0: MDP VG1
25:24	QUEUE3_CONTEXT_ID	Context ID for Queue3

ROTATOR_CONN_QUEUE_DONE_STATUS (cont.)

Bits	Name	Description
23	QUEUE2_FULL	it is indicated Queue2 Full/Empty. 0x1: Queue0 is full 0x0: Queue0 is empty
22:21	QUEUE2_MDP_PIPE_BUF_ID	DMI MDP PIPE BUF ID[1:0] for Queue2 2 0x3: Non-DMI
20:18	QUEUE2_MDP_PIPE_ID	DMI MDP PIPE destination ID for Queue2 0x7: Non-DMI 0x6: MDP DMA_E 0x5: MDP DMA_S 0x4: MDP DMA_P 0x3: MDP RGB2 0x2: MDP RGB1 0x1: MDP VG2 0x0: MDP VG1
17:16	QUEUE2_CONTEXT_ID	Context ID for Queue2
15	QUEUE1_FULL	it is indicated Queue1 Full/Empty. 0x1: Queue0 is full 0x0: Queue0 is empty
14:13	QUEUE1_MDP_PIPE_BUF_ID	DMI MDP PIPE BUF ID[1:0] for Queue1 2 0x3: Non-DMI
12:10	QUEUE1_MDP_PIPE_ID	DMI MDP PIPE destination ID for Queue1 0x7: Non-DMI 0x6: MDP DMA_E 0x5: MDP DMA_S 0x4: MDP DMA_P 0x3: MDP RGB2 0x2: MDP RGB1 0x1: MDP VG2 0x0: MDP VG1
9:8	QUEUE1_CONTEXT_ID	Context ID for Queue1
7	QUEUE0_FULL	it is indicated Queue0 Full/Empty. 0x1: Queue0 is full 0x0: Queue0 is empty
6:5	QUEUE0_MDP_PIPE_BUF_ID	DMI MDP PIPE BUF ID[1:0] for Queue0 2 0x3: Non-DMI

ROTATOR_CONN_QUEUE_DONE_STATUS (cont.)

Bits	Name	Description
4:2	QUEUE0_MDP_PIPE_ID	DMI MDP PIPE destination ID for Queue0 0x7: Non-DMI 0x6: MDP DMA_E 0x5: MDP DMA_S 0x4: MDP DMA_P 0x3: MDP RGB2 0x2: MDP RGB1 0x1: MDP VG2 0x0: MDP VG1
1:0	QUEUE0_CONTEXT_ID	Context ID for Queue0

0x04E00050 ROTATOR_MAX_BURST_SIZE

Type: Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0044

The register is used to modify the maximum burst size of the internal core bus write and read clients. For best performance program the beat size to 16 for Reads and Write. The burst size of 16 is assuming the client data width of 64 bits per beat.

NOTE This register should be written only when Rotator is completely idle.

ROTATOR_MAX_BURST_SIZE

Bits	Name	Description
31:7	RESERVED_BITS31_7	
6:4	MAX_RDBURST_SIZE	Maximum read burst beat size 0x4: 16 (default it is not supported if source image is samsung tile format and using fast yuv mode that HW will be automatically changed setting value to 8 if programming max_rdburst_size to 16) 0x2: 8 0x1: 4 (it is not supported if source image is samsung tile format and using fast yuv mode that HW will be automatically changed setting value to 8 if programming max_rdburst_size to 4)
3	RESERVED_BIT3	
2:0	MAX_WRBURST_SIZE	Maximum write burst beat size 0x4: 16 (default) 0x2: 8 0x1: 4

0x04E00054 ROTATOR_DMI_BUF_PEND_STATUS

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The register is indicated pended DMI buffer information for concurrent DMI buffer switching updating to MDP pipes that will be transferred to MDP pip at the rotation done which was rotated without DMI_INTF_EN.DMI_BUF_UPDATE_DIS = 1 register setting.

ROTATOR_DMI_BUF_PEND_STATUS

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:25	PEND_DMI_MDP_DMA_E_BUF_ID	pended buffer id
24	PEND_DMI_MDP_DMA_E_BUF	it is indicated the buffer updating (switching) event is pended or not. 0x1: pended MDP DMA_E buffer updating 0x0: no pending it
23	RESERVED_BIT23	
22:21	PEND_DMI_MDP_DMA_S_BUF_ID	pended buffer id
20	PEND_DMI_MDP_DMA_S_BUF	it is indicated the buffer updating (switching) event is pended or not. 0x1: pended MDP DMA_S buffer updating 0x0: no pending it
19	RESERVED_BIT19	
18:17	PEND_DMI_MDP_DMA_P_BUF_ID	pended buffer id
16	PEND_DMI_MDP_DMA_P_BUF	it is indicated the buffer updating (switching) event is pended or not. 0x1: pended MDP DMA_P buffer updating 0x0: no pending it
15	RESERVED_BIT15	
14:13	PEND_DMI_MDP_RGB2_BUF_ID	pended buffer id
12	PEND_DMI_MDP_RGB2_BUF	it is indicated the buffer updating (switching) event is pended or not. 0x1: pended MDP RGB2 buffer updating 0x0: no pending it
11	RESERVED_BIT11	
10:9	PEND_DMI_MDP_RGB1_BUF_ID	pended buffer id

ROTATOR_DMI_BUF_PEND_STATUS (cont.)

Bits	Name	Description
8	PEND_DMI_MDP_RGB1_BUF	it is indicated the buffer updating (switching) event is pended or not. 0x1: pended MDP RGB1 buffer updating 0x0: no pending it
7	RESERVED_BIT7	
6:5	PEND_DMI_MDP_VG2_BUF_ID	pended buffer id
4	PEND_DMI_MDP_VG2_BUF	it is indicated the buffer updating (switching) event is pended or not. 0x1: pended MDP VG2 buffer updating 0x0: no pending it
3	RESERVED_BIT3	
2:1	PEND_DMI_MDP_VG1_BUF_ID	pended buffer id
0	PEND_DMI_MDP_VG1_BUF	it is indicated the buffer updating (switching) event is pended or not. 0x1: pended MDP VG1 buffer updating 0x0: no pending it

0x04E00058 ROTATOR_CONTEXT_FLUSH

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The register is used to flush all of queued up contexts in Context Queue that will be removed all of queues right away if rotator is idle. otherwise, remove all of queues after finishing current frame rotation.

ROTATOR_CONTEXT_FLUSH

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	DMI_FLUSH_EN	DMI Flush option 0x1: Remove all the queue in context queue and initialize DMI also when CONTEXT_QUEUE_FLUSH is ’1’. (it requires MDP DMI initialization manually by DMI_RESET to sync 2 DMI buffer numbering between Rotator DMI and MDP DMI) 0x0: Remove all the queue in context queue only when CONTEXT_QUEUE_FLUSH is ’1’.
0	CONTEXT_QUEUE_FLUSH	Flush all of pended context start control in queue. the value will be reset after flushing queue

0x04E0005C ROTATOR_DMI_BUF_VALID_STATUS

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The register shows how many DMI buffers are valid for each of MDP pipe. The valid counter will be decreased by rotator DMI buffer switching event and is increased by DMI buffer acknowledge from MDP pipe. rotator also provides DMI buffer Acknowledge interrupt source that SW needs to check the status for next DMI buffer switching event.

ROTATOR_DMI_BUF_VALID_STATUS

Bits	Name	Description
31:14	RESERVED_BITS31_14	
13:12	DMI_DMA_E_BUF_VALID	Indicates how many buffers are available for DMI for MDP DMA_E. 0x3: 3 DMI buffers are available for next DMI buffer switching 0x2: 2 DMI buffers are available for next DMI buffer switching 0x1: 1 DMI buffer is available for next DMI buffer switching 0x0: not valid DMI buffer
11:10	DMI_DMA_S_BUF_VALID	Indicates how many buffers are available for DMI for MDP DMA_S. 0x3: 3 DMI buffers are available for next DMI buffer switching 0x2: 2 DMI buffers are available for next DMI buffer switching 0x1: 1 DMI buffer is available for next DMI buffer switching 0x0: not valid DMI buffer
9:8	DMI_DMA_P_BUF_VALID	Indicates how many buffers are available for DMI for MDP DMA_P. 0x3: 3 DMI buffers are available for next DMI buffer switching 0x2: 2 DMI buffers are available for next DMI buffer switching 0x1: 1 DMI buffer is available for next DMI buffer switching 0x0: not valid DMI buffer
7:6	DMI_RGB2_BUF_VALID	Indicates how many buffers are available for DMI for MDP RGB2. 0x3: 3 DMI buffers are available for next DMI buffer switching 0x2: 2 DMI buffers are available for next DMI buffer switching 0x1: 1 DMI buffer is available for next DMI buffer switching 0x0: not valid DMI buffer
5:4	DMI_RGB1_BUF_VALID	Indicates how many buffers are available for DMI for MDP RGB1. 0x3: 3 DMI buffers are available for next DMI buffer switching 0x2: 2 DMI buffers are available for next DMI buffer switching 0x1: 1 DMI buffer is available for next DMI buffer switching 0x0: not valid DMI buffer
3:2	DMI_VG2_BUF_VALID	Indicates how many buffers are available for DMI for MDP VG2. 0x3: 3 DMI buffers are available for next DMI buffer switching 0x2: 2 DMI buffers are available for next DMI buffer switching 0x1: 1 DMI buffer is available for next DMI buffer switching 0x0: not valid DMI buffer

ROTATOR_DMI_BUF_VALID_STATUS (cont.)

Bits	Name	Description
1:0	DMI_VG1_BUF_VALID	Indicates how many buffers are available for DMI for MDP VG1. 0x3: 3 DMI buffers are available for next DMI buffer switching 0x2: 2 DMI buffers are available for next DMI buffer switching 0x1: 1 DMI buffer is available for next DMI buffer switching 0x0: not valid DMI buffer

0x04E00060 ROTATOR_DMI_FREE_RUN_EN

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The register is option for non-blocking rotator DMI mode that rotator will transfer buffer switching event through DMI whenever rotator is done for rotation and MDP pipe will pick up latest buffer id if MDP DMI is also non-blocking mode. The mode is not recommended because the mode will consume more power and bandwidth if rotator frame rate is faster than mdp pipe frame rate.

To save more power and bandwidth, using Context replace function + rotator DMI blocking mode + mdp DMI blocking mode is recommended for rotator frame rate is faster than mdp pipe frame rate case.

ROTATOR_DMI_FREE_RUN_EN

Bits	Name	Description
31:7	RESERVED_BITS31_7	
6	DMI_MDP_DMA_E_FREE_RUN_EN	MDP DMA_E dmi free running enable 0x1: updated rotated buffer information to MDP pipe regardless of DMI acknowledge from the MDP pipe that DMI in MDP has to be programmed to skip mode. 0x0: check DMI acknowledge from MDP pipe to update new rotated buffer.
5	DMI_MDP_DMA_S_FREE_RUN_EN	MDP DMA_S dmi free running enable 0x1: updated rotated buffer information to MDP pipe regardless of DMI acknowledge from the MDP pipe that DMI in MDP has to be programmed to skip mode. 0x0: check DMI acknowledge from MDP pipe to update new rotated buffer.
4	DMI_MDP_DMA_P_FREE_RUN_EN	MDP DMA_Pdmi free running enable 0x1: updated rotated buffer information to MDP pipe regardless of DMI acknowledge from the MDP pipe that DMI in MDP has to be programmed to skip mode. 0x0: check DMI acknowledge from MDP pipe to update new rotated buffer.

ROTATOR_DMI_FREE_RUN_EN (cont.)

Bits	Name	Description
3	DMI_MDP_RGB2_FREE_RUN_EN	MDP RGB2 dmi free running enable 0x1: updated rotated buffer information to MDP pipe regardless of DMI acknowledge from the MDP pipe that DMI in MDP has to be programmed to skip mode. 0x0: check DMI acknowledge from MDP pipe to update new rotated buffer.
2	DMI_MDP_RGB1_FREE_RUN_EN	MDP RGB1 dmi free running enable 0x1: updated rotated buffer information to MDP pipe regardless of DMI acknowledge from the MDP pipe that DMI in MDP has to be programmed to skip mode. 0x0: check DMI acknowledge from MDP pipe to update new rotated buffer.
1	DMI_MDP_VG2_FREE_RUN_EN	MDP VG2 dmi free running enable 0x1: updated rotated buffer information to MDP pipe regardless of DMI acknowledge from the MDP pipe that DMI in MDP has to be programmed to skip mode. 0x0: check DMI acknowledge from MDP pipe to update new rotated buffer.
0	DMI_MDP_VG1_FREE_RUN_EN	MDP VG1 dmi free running enable 0x1: updated rotated buffer information to MDP pipe regardless of DMI acknowledge from the MDP pipe that DMI in MDP has to be programmed to skip mode. 0x0: check DMI acknowledge from MDP pipe to update new rotated buffer.

0x04E00070 ROTATOR_HW_VERSION

Type: Read Only
Clock: CC_ROTATOR_CLK
Reset State: 0x0102030A

The ROTATOR_HW_VERSION register contains the major and minor versions and release number of the ROTATOR core.

ROTATOR_HW_VERSION

Bits	Name	Description
31:24	MAJOR_VERSION	ROTATOR core major version.
23:16	MINOR_VERSION	ROTATOR core minor version.
15:8	RELEASE_PHASE	ROTATOR core release phase.
7:0	REVISION	ROTATOR core revision number.

0x04E00074 ROTATOR_SW_RESET

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_SW_RESET register is used to reset the blocks inside ROTATOR.

ROTATOR_SW_RESET

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	SW_RESET	Self cleared when reset sequence is completed. 0x1: Rotator SW reset.

0x04E00084 ROTATOR_SW_SCRATCHPAD_TEST_REG

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

This 32-bit register can be used by display software driver as a scratch pad register. It doesn't control or monitor any functionality within ROTATOR core. It can also be used to see whether the value written to this register is also seen on the Rotator testbus. Refer to the TEST MISR SW register section on how to select this register to see its value on the testbus.

ROTATOR_SW_SCRATCHPAD_TEST_REG

Bits	Name	Description
31:0	SCRATCHPAD	Scratch pad register space for software. One can also see the value written to this register on the testbus

14.12.3 Clock control registers

0x04E00100 ROTATOR_CGC_EN

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_01FF

The ROTATOR_CGC_EN register is used to enable the automatic functional clock gating mechanism inside the ROTATOR, where the clocks are gated depending on the operation mode. Each bit is assigned to a gated clock tree. For maximum power saving, leave all bits at 1 during initialization. To force a block to have the clock on always regardless of the operation scenario, set the associated enable bit to 0.

ROTATOR_CGC_EN

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8	CONTEXT_QUEUE	Enable auto functional gating on CONTEXT_QUEUE clock
7	DMI	Enable auto functional gating on DMI clock
6	PIXROT	Enable auto functional gating on pixel rotator clock
5	DOWNSCALER	Enable auto functional gating on Downscaler clock
4	AXI	Enable auto functional gating on AXI interface clock
3	DOWNSAMPLE	Enables auto functional gating on Downsample clock.
2	ROTATE	Enables auto functional gating on Rotate clock.
1	UPSAMPLE	Enables auto functional gating on Upsample clock.
0	TOP	Enables auto functional gating on top clock.

14.12.4 MGEN2MAXI control registers

NOTE1: Registers in this section (mGEN2mAXI) are only for future 8K APQs that use Rotator.

NOTE2: Program the mgen2maxi registers only when Rotator is in idle mode.

NOTE3: The following registers are defined for 2 generic clients (1 read + 1write) and 1 AXI r0p0++ master port.

XBAR_IN0 - Rotator read;

XBAR_IN1- Rotator write;

0x04E00400 ROTATOR_XBAR_IN_RD_LIM

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0008

The maximum number of pending reads from each client is programmed in this register.

ROTATOR_XBAR_IN_RD_LIM

Bits	Name	Description
31:4	RESERVED31_4	This field has no function and should be set to zero for future compatibility
3:0	XBAR_IN0_RD_LIM	The maximum number of pending reads from each client. Must be <= the HW parameter that limits the same. Range [0,8]

0x04E00404 ROTATOR_XBAR_IN_WR_LIM

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0008

The maximum number of pending writes from each client is programmed in this register.

ROTATOR_XBAR_IN_WR_LIM

Bits	Name	Description
31:4	RESERVED31_4	This field has no function and should be set to zero for future compatibility
3:0	XBAR_IN1_WR_LIM	The maximum number of pending writes from each client. Must be <= the HW parameter that limits the same. Range [0,8]

0x04E00408 ROTATOR_XBAR_OUT_RD_LIM

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0008

The maximum number of pending reads from Rotator's AXI Master port is programmed in this register.

ROTATOR_XBAR_OUT_RD_LIM

Bits	Name	Description
31:4	RESERVED31_4	This field has no function and should be set to zero for future compatibility
3:0	XBAR_OUT_RD_LIM	The maximum number of pending reads from the ROTATOR Master. Must be <= the HW parameter that limits the same. Range [0,8]

0x04E0040C ROTATOR_XBAR_OUT_WR_LIM

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0008

The maximum number of pending writes from Rotator's AXI Master port is programmed in this register.

ROTATOR_XBAR_OUT_WR_LIM

Bits	Name	Description
31:4	RESERVED31_4	This field has no function and should be set to zero for future compatibility
3:0	XBAR_OUT_WR_LIM	The maximum number of pending writes from the ROTATOR Master. Must be <= the HW parameter that limits the same. Range [0,8]

0x04E00410 ROTATOR_XBAR_OUT_MAX_BURST

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0008_0008

The maximum number of pending writes from Rotator's AXI Master port is programmed in this register.

ROTATOR_XBAR_OUT_MAX_BURST

Bits	Name	Description
31:20	RESERVED31_20	This field has no function and should be set to zero for future compatibility
19:16	XBAR_OUT_MAX_RD_BURST	The maximum number of read beats minus 1 (128 bits per beat) allowed on the AXI bus (arbiter outputs). Must be < the HW parameter that limits the same. Range [0,8]
15:4	RESERVED15_4	This field has no function and should be set to zero for future compatibility
3:0	XBAR_OUT_MAX_WR_BURST	The maximum number of write beats minus 1 (128 bits per beat) allowed on the AXI bus (arbiter outputs). Must be < the HW parameter that limits the same. Range [0,8]

0x04E00414 ROTATOR_XBAR_ARB_CTL

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

Each arbiter can be programmed to utilize fixed priority (higher client numbers have higher priority) or last-client-granted (default when fixed priority is not enabled.

.

ROTATOR_XBAR_ARB_CTL

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility
0	FIXED_PRIOR_EN	Enables fixed priority arbitration. If enabled, CLIENT_LIM setting is ignored. When disabled, last-client granted scheme is used for arbitration utilizing the CLIENT_LIM

0x04E00418 ROTATOR_XBAR_ARB_FIXED_PRIOR_LIST

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0001

The priority list contains a list of client numbers with the highest priority client on the left side (MSBs). The length of the priority list is [1:0] to support 2 clients encoded using one bit each.

ROTATOR_XBAR_ARB_FIXED_PRIOR_LIST

Bits	Name	Description
31:2	RESERVED31_2	This field has no function and should be set to zero for future compatibility
1:0	FIXED_PRIOR_LIST	Default priority - Client0(read) >Client1(write)

0x04E0041C ROTATOR_XBAR_ARB_CLIENT_LIM

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0088

The maximum number of (consecutive grants - 1) to one client before allowing requests from other clients. This is used for last-client-granted arbitration, but not fixed priority arbitration. NOTE: A client may receive more than this number of consecutive grants if no other clients are making requests to the same arbiter.

ROTATOR_XBAR_ARB_CLIENT_LIM

Bits	Name	Description
31:8	RESERVED31_8	This field has no function and should be set to zero for future compatibility
7:4	CLIENT1_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]

ROTATOR_XBAR_ARB_CLIENT_LIM (cont.)

Bits	Name	Description
3:0	CLIENT0_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]

0x04E00420 ROTATOR_XBAR_AXI_AOOORD

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0001

When a request is granted by the arbiter, AOOORD signal (AXI r0p0++) may be controlled on a per-client basis.

ROTATOR_XBAR_AXI_AOOORD

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility
0	AXI_AOOORD	'Out of order' enable for reads, one bit per read client. If zero, the AXI bus and slaves must ensure that all reads from that client are completed in the order they are requested from the client.

0x04E00424 ROTATOR_XBAR_AXI_AOOOWR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0001

When a request is granted by the arbiter, AOOOWR signal (AXI r0p0++) may be controlled on a per-client basis.

ROTATOR_XBAR_AXI_AOOOWR

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility
0	AXI_AOOOWR	'Out of order' enable for writes, one bit per write client. If zero, the AXI bus and slaves must ensure that all writes from this client are completed in the order they are requested from the client.

0x04E00428 ROTATOR_XBAR_AXI_ATYPE

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0044

When a request is granted by the arbiter, ATYPE signal (AXI r0p0++) may be controlled on a per-client basis. ATYPE indicates the memory type and attributes of an access.

ROTATOR_XBAR_AXI_ATYPE

Bits	Name	Description
31:8	RESERVED31_8	This field has no function and should be set to zero for future compatibility
7:0	AXI_ATYPE	The value to drive on ATYPE signal, 4 bits per client: 0x4: Normal, Non-cacheable, Non-shared 0x6: Normal, Cacheable, Writeback, Write-allocate, Non-shared 0x7: Normal, Cacheable, Writeback, Write-allocate, Shared

0x04E0042C ROTATOR_XBAR_AXI_AREQPRIORITY

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

When a request is granted by the arbiter, AREQPRIORITY signal (AXI r0p0++) may be controlled on a per-client basis.

ROTATOR_XBAR_AXI_AREQPRIORITY

Bits	Name	Description
31:4	RESERVED31_4	This field has no function and should be set to zero for future compatibility
3:0	AXI_AREQPRIORITY	Request priority, 2 bits per client. This value is driven onto AXI bus only, not used internally for client arbitration. These two bits of relative priority can be decoded as shown below. ’00’ - normal ’01’ - high ’10’ - higher ’11’ - highest.

0x04E00430 ROTATOR_XBAR_AXI_APROTNS

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

NOTE This register is RESERVED. AXI signal 'aprotns' is tied to one (non-secure) at MMSS level for Rotator AXI Master port. This tie in MMSS overrides the value set by this register.

ROTATOR_XBAR_AXI_APROTNS

Bits	Name	Description
31:2	RESERVED31_2	This field has no function and should be set to zero for future compatibility
1:0	AXI_APROTNS	(RESERVED) Enable 'non-secure' bus access, one bit per client. If zero, the corresponding client accesses are secure accesses.

0x04E00440 ROTATOR_XBAR_AXI_ERROR_CTL

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_XBAR_AXI_ERROR_CTL

Bits	Name	Description
31:9	RESERVED31_9	This field has no function and should be set to zero for future compatibility
8	AXI_ERR_CLR	One bit per AXI master port. When AXI error occurs, SW can read the error info and then can assert this bit (for 1+ AXI cycles) to clear the AXI error and enable next AXI error to be captured.
7:5	RESERVED7_5	This field has no function and should be set to zero for future compatibility
4	AXI_HALT_ON_WR_ERR	When set (1), a write error response from AXI (on bresp) acts like a HALT_REQ and also disables all ARB-XIN interfaces - instead, fake write data to AXI (zero write enables) and discard read data from AXI. SW should wait for AXI_IDLE (or HALT_ACK) and then reset the core.
3:1	RESERVED3_1	This field has no function and should be set to zero for future compatibility
0	AXI_HALT_ON_RD_ERR	When set (1), a read error response from AXI (on rresp) acts like a HALT_REQ and also disables all ARB-XIN interfaces - instead, fake write data to AXI (zero write enables) and discard read data from AXI. SW should wait for AXI_IDLE (or HALT_ACK) and then reset the core.

0x04E00444 ROTATOR_XBAR_AXI_ERROR_INFO

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: Undefined

ROTATOR_XBAR_AXI_ERROR_INFO

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11	AXI_ERR	Indicates than an AXI error occurred since the last AXI reset. The AXI error interrupt status may be more useful than this bit.
10	AXI_ERR_TYPE	The type of the last error that occurred. 0x0: axi_rresp 0x1: axi_bresp (has priority over rresp if happens at same time)
9:8	AXI_RESP	The value of axi_rresp or axi_bresp when the last error occurred.
7:5	RESERVED	This field has no function and should be set to zero for future compatibility
4	AXI_MID	The value on axi_rmid or axi_bmid when the last error occurred.
3:0	AXI_TID	The value on axi_rtid or axi_btid when the last error occurred.

0x04E00448 ROTATOR_XBAR_AXI_WDATA_TIMEOUT_CTL

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_00F0

ROTATOR_XBAR_AXI_WDATA_TIMEOUT_CTL

Bits	Name	Description
31:8	RESERVED31_8	This field has no function and should be set to zero for future compatibility
7:4	WDTIMEOUT_LOG2	Bit number of the 16-bit time waiting counter that indicates timeout.
3:1	RESERVED3_1	This field has no function and should be set to zero for future compatibility
0	AXI_HALT_WDTIMEOUT	When set (1), this will generate a "halt" (similar to HALT_ON_WR_ERR) if the core is not able to provide a write data burst to AXI within a SW specified time after the previous write data burst was sent. This is either because client does not provide write data fast enough or AXI is not accepting write data fast enough.

0x04E0044C ROTATOR_XBAR_AXI_STATUS

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0001

ROTATOR_XBAR_AXI_STATUS

Bits	Name	Description
31:5	RESERVED31_5	This field has no function and should be set to zero for future compatibility
4	WDATA_TIMEOUT_HALT	Indicates that AXI halt occurred because of write data timeout. Once asserted will remain high till AXI reset.
3:1	RESERVED3_1	This field has no function and should be set to zero for future compatibility
0	AXI_IDLE	Indicates that the AXI master port is idle (no pending requests on AXI).

0x04E00450 ROTATOR_XBAR_AXI_PROFILE_CTL

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

Each arbiter includes bandwidth counters, min & max latency counters, a MISR for capturing AXI write data, and an LFSR for generating AXI read data (faking the response from AXI slaves).

ROTATOR_XBAR_AXI_PROFILE_CTL

Bits	Name	Description
31:25	RESERVED31_25	This field has no function and should be set to zero for future compatibility
24	RD_LAT_REP_EN	When enabled, each beat of read data is replaced with the read access latency (of AXI cycles from request until read data is returned)
23:17	RESERVED23_17	This field has no function and should be set to zero for future compatibility
16	MISR_RES	Mgen2maxi MISR Reset. Need to write 1 and then write 0
15:13	RESERVED15_13	This field has no function and should be set to zero for future compatibility
12	MISR_EN	Enable the Misr in mgen2maxi
11:9	RESERVED11_9	This field has no function and should be set to zero for future compatibility

ROTATOR_XBAR_AXI_PROFILE_CTL (cont.)

Bits	Name	Description
8	MISR_WD	select misr input 0x0: read data (coming back from AXI) 0x1: write data (going to AXI)
7	CTR_EN	Enable all profiling counters
6	CTR_RES	Reset all profiling counters (they are also reset by AXI_RESET)
5:4	RESERVED5_4	This field has no function and should be set to zero for future compatibility
3:0	TEST_OUT_SEL	Select which test data is read via ROTATOR_AXI_PROFILE_OUT. 0x0: num read bursts (32 bits) 0x1: total read BW (32 bits - up to 68GB) 0x2: max outstanding reads (8 bits) 0x3: avg wait for read accept (10 bits over 128 reads) 0x4: min read latency (16 bits) 0x5: max read latency (16 bits) 0x6: avg read latency (16 bits over 1K read beats) 0x8: num write bursts (32 bits) 0x9: total write BW (32 bits - up to 68GB) 0xA: max outstanding writes (8 bits) 0xB: avg wait for write accept (10 bits over 128 writes) 0xC: MISR signature word 0 0xD: MISR signature word 1 0xE: MISR signature word 2 0xF: MISR signature word 3

0x04E00454 ROTATOR_XBAR_AXI_PROFILE_OUT

Type: Read
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_XBAR_AXI_PROFILE_OUT

Bits	Name	Description
31:0	AXI_TEST_OUT	The output selected by ROTATOR_AXI_PROFILE_CTL reg.

14.12.5 Rotator Sub-Block Registers

0x04E01010 ROTATOR_PROFILE_EN

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_PROFILE_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	EN	Enable the ROI cycle counter for profiling

0x04E01014 ROTATOR_PROFILE_COUNT

Type: Read Only
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	TOTAL_CYCLE	Total cycle count in a ROI, from new ROI to last pixel out of Packer (Rotator goes back to Idle)

0x04E01108 ROTATOR_SRC_SIZE

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0020_0020

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_SRC_SIZE

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_H	Height of input ROI image that needs to be fetched in pixel, including any amount of over-fetching/under-fetching necessary.
15:13	RESERVED_BITS15_13	

ROTATOR_SRC_SIZE (cont.)

Bits	Name	Description
12:0	SRC_W	Width of input ROI image that needs to be fetched in pixel, including any amount of over-fetching/under-fetching necessary.

0x04E0110C ROTATOR_SRCP0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP0_ADDR

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format or planar color0 plane

0x04E01110 ROTATOR_SRCP1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_SRCP1_ADDR

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format or planar color1 plane

0x04E01114 ROTATOR_SRCP2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_SRCP2_ADDR

Bits	Name	Description
31:0	SRCP2_ADDR	Base byte address of the Image's planar color2 plane

0x04E01118 ROTATOR_SRCP3_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP3_ADDR

Bits	Name	Description
31:0	SRCP3_ADDR	Base byte address of the Image's color3 component (alpha) used in pseudo planar + alpha format or planar

0x04E0111C ROTATOR_SRC_YSTRIDE1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0080

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_SRC_YSTRIDE1

Bits	Name	Description
31	RESERVED_BIT31	
30:16	SRCP1_YSTRIDE	Plane 1 y stride in bytes.
15	RESERVED_BIT15	
14:0	SRCP0_YSTRIDE	Plane 0 y stride in bytes.

0x04E01120 ROTATOR_SRC_YSTRIDE2

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_SRC_YSTRIDE2

Bits	Name	Description
31	RESERVED_BIT31	
30:16	SRCP3_YSTRIDE	Plane 3 y stride in bytes.
15	RESERVED_BIT15	
14:0	SRCP2_YSTRIDE	Plane 2 y stride in bytes.

0x04E01124 ROTATOR_SRC_FORMAT

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0042_67FF

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_SRC_FORMAT

Bits	Name	Description
31	RESERVED_BIT31	
30:29	FRAME_FORMAT	0x0: Linear Frame (default) 0x1: RESERVED 0x2: 64x32 super-tile, YCbCr 420 non folding
28:26	RESERVED_BITS28_26	
25:24	FORMAT_CONV	0x0: No format conversion 0x1: ARGB32bpp to RGB24bpp 0x2: RESERVED_1 0x3: RESERVED_2
23:22	FETCH_TILE_SIZE	Specify the fetch tile size. 0x0: RESERVED_1 0x1: 64x64 (default) 0x2: RESERVED_2 0x3: RESERVED_3
21	RESERVED_BITS_21	
20:19	FETCH_PLANES	Determines the number of planes to fetch and write back. When this parameter is set to planer format the output of Rotator is forced to write out a Pseudo planar format. When this parameter is set to fetch H2V1 422 interleaved format the output of Rotator is forced to write back 422 Pseudo planar format. For all the other cases the Rotators output write back format is same as the input fetch format. 0x0: Interleaved 0x1: Planar 0x2: Pseudo planar
18	UNPACK_ALIGN	0x0: To LSB 0x1: To MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
16:13	UNPACK_COUNT	Valid unpacking pattern count: 0 = 1 component, 1 = 2 components, ..., 15 = 16 components. Unpacking pattern only applies to the interleaved plane (chroma plane in pseudo-planar).
12:11	RESERVED_BITS12_11	Reserved for backward compatibility.

ROTATOR_SRC_FORMAT (cont.)

Bits	Name	Description
10:9	SRC_BPP	Effective source byte per pixel: 0 = 1 byte, 1 = 2 bytes, 2 = 3 bytes, 3 = 4 bytes. This is only used when unpacking the interleaved plane.
8	SRCC3_EN	0x1: Source has alpha
7:6	SRCC3_BITS	Number of bits for component 3 (alpha) input, this is not used for dither: 0 = RESERVED, 1 = RESERVED, 2 = RESERVED, 3 = 8 bits.
5:4	SRCC2_BITS	Number of bits for component 2 (R / Cr) input: 0 = RESERVED, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	SRCC1_BITS	Number of bits for component 1 (B / Cb) input: 0 = RESERVED, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	SRCC0_BITS	Number of bits for component 0 (G / luma) input: 0 = RESERVED, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x04E01128 ROTATOR_SRC_UNPACK_PATTERN1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0302_0001

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4). Default is ARGB or C3-C2-C0-C1. If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_SRC_UNPACK_PATTERN1

Bits	Name	Description
31:26	RESERVED31_26	
25:24	ELEMENT3	0x0: C0 0x1: C1 0x2: C2 0x3: C3
23:18	RESERVED23_18	
17:16	ELEMENT2	0x0: C0 0x1: C1 0x2: C2 0x3: C3
15:10	RESERVED15_10	
9:8	ELEMENT1	0x0: C0 0x1: C1 0x2: C2 0x3: C3

ROTATOR_SRC_UNPACK_PATTERN1 (cont.)

Bits	Name	Description
7:2	RESERVED7_2	
1:0	ELEMENT0	0x0: C0 0x1: C1 0x2: C2 0x3: C3

0x04E01138 ROTATOR_SUB_BLOCK_CFG

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_SUB_BLOCK_CFG

Bits	Name	Description
31:24	RESERVED_BIT31_24	
23	RESERVED_BIT23	
22:21	RESERVED_BITS22_21	.
20	RESERVED_BIT20	
19:18	SRC_CHROMA_SAMP	Source chroma sampling (used by upsample block): 0x0: 4:4:4/RGB 0x1: H2V1 0x2: H1V2 0x3: 4:2:0.
17:12	RESERVED_BITS17_12	
11:9	ROT_MODE	Rotation mode: Bit 0: Rotate 90 degrees Bit 1: Left/right flip Bit 2: Up/down flip.
8	ROT_EN	Rotate buffer enable. When this bit is set (1), the ping-pong tile buffer is always used independent of the rotation mode.
7:6	RESERVED_BIT7_6	
5	ALPHA_DOWN_SCALE	ALPHA Channel Down-scale option 0x1: using 1/N scaling 0x0: using pixel drop

ROTATOR_SUB_BLOCK_CFG (cont.)

Bits	Name	Description
4	FAST_YUV_TRANS	Fast YUV(YCbCr) data transaction 0x1: enable Fast yuv transaction for YUV420 planer and psuedo-planer. (not support YUV422 input format) 0x0: using normal YUV transaction (default)
3:2	DOWN_SCALE_V_RATIO	Down Scaling ratio for Vertical 0x3: 1/8 down scaling 0x2: 1/4 down scaling 0x1: 1/2 down scaling 0x0: no down scaling (default)
1:0	DOWN_SCALE_H_RATIO	Down Scaling ratio for Horizontal 0x3: 1/8 down scaling 0x2: 1/4 down scaling 0x1: 1/2 down scaling 0x0: no down scaling (default)

0x04E01154 ROTATOR_OUT_PACK_PATTERN1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0302_0001

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_OUT_PACK_PATTERN1

Bits	Name	Description
31:26	RESERVED31_26	
25:24	ELEMENT3	0x0: C0 0x1: C1 0x2: C2 0x3: C3

15:10	RESERVED15_10	
9:8	ELEMENT1	0x0: C0 0x1: C1 0x2: C2 0x3: C3

ROTATOR_OUT_PACK_PATTERN1 (cont.)

Bits	Name	Description
7:2	RESERVED7_2	
1:0	ELEMENT0	0x0: C0 0x1: C1 0x2: C2 0x3: C3

0x04E01168 ROTATOR_OUTP0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP0_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E0116C ROTATOR_OUTP1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP1_ADDR

Bits	Name	Description
31:0	DSTP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x04E01170 ROTATOR_OUTP2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP2_ADDR

Bits	Name	Description
31:0	DSTP2_ADDR	Base byte address of the Image's planar color2 plane if using fast_yuv mode for planer YUV420 input

0x04E01174 ROTATOR_OUTP3_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP3_ADDR

Bits	Name	Description
31:0	DSTP3_ADDR	Base byte address of the Image's color3 (alpha) component, used in pseudo planar + alpha format, or planar.

0x04E01178 ROTATOR_OUT_YSTRIDE1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0080

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_OUT_YSTRIDE1

Bits	Name	Description
31	RESERVED_BIT31	
30:16	DSTP1_YSTRIDE	Plane 1 y stride in bytes.
15	RESERVED_BIT15	
14:0	DSTP0_YSTRIDE	Plane 0 y stride in bytes.

0x04E0117C ROTATOR_OUT_YSTRIDE2

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_OUT_YSTRIDE2

Bits	Name	Description
31	RESERVED_BIT31	
30:16	DSTP3_YSTRIDE	Plane 3 y stride in bytes.
15	RESERVED_BIT15	
14:0	DSTP2_YSTRIDE	Plane 2 y stride in bytes

0x04E01200 ROTATOR_SRC_XY

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_SRC_XY

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_Y	Source ROI origin screen Y coordinate (pixel) in the source image (i.e., Y offset of source ROI in the source image).
15:13	RESERVED_BITS15_13	
12:0	SRC_X	Source ROI origin screen X coordinate (pixel) in the source image (i.e., X offset of source ROI in the source image).

0x04E01208 ROTATOR_SRC_IMAGE_SIZE

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0020_0020

If CONTEXT_QUEUE is enable, this register is being used for context0.

ROTATOR_SRC_IMAGE_SIZE

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_IMG_H	Source image height (to determine if lines should be over-fetched or repeated).
15:13	RESERVED_BITS15_13	
12:0	SRC_IMG_W	Source image width (to determine if pixels should be over-fetched or repeated).

0x04E01308 ROTATOR_SRC_SIZE_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0020_0020

ROTATOR_SRC_SIZE_C1 is used for rotator source size for context1.

ROTATOR_SRC_SIZE_C1

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_H	Height of input ROI image that needs to be fetched in pixel, including any amount of over-fetching/under-fetching necessary.
15:13	RESERVED_BITS15_13	
12:0	SRC_W	Width of input ROI image that needs to be fetched in pixel, including any amount of over-fetching/under-fetching necessary.

0x04E0130C ROTATOR_SRCP0_ADDR_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP0_ADDR_C1 is context1 rotator source plane0 offset address.

ROTATOR_SRCP0_ADDR_C1

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format or planar color0 plane

0x04E01310 ROTATOR_SRCP1_ADDR_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP1_ADDR_C1 is for context1 rotator source plane1 offset address.

ROTATOR_SRCP1_ADDR_C1

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format or planar color1 plane

0x04E01314 ROTATOR_SRCP2_ADDR_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP2_ADDR_C1 is for context1 rotator source plane2 offset address.

ROTATOR_SRCP2_ADDR_C1

Bits	Name	Description
31:0	SRCP2_ADDR	Base byte address of the Image's planar color2 plane

0x04E0131C ROTATOR_SRC_YSTRIDE1_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0080

ROTATOR_SRC_YSTRIDE1_C1 is used for context1 rotator plane0 and plane1 Y stride.

ROTATOR_SRC_YSTRIDE1_C1

Bits	Name	Description
31	RESERVED_BIT31	
30:16	SRCP1_YSTRIDE	Plane 1 y stride in bytes.
15	RESERVED_BIT15	
14:0	SRCP0_YSTRIDE	Plane 0 y stride in bytes.

0x04E01320 ROTATOR_SRC_YSTRIDE2_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRC_YSTRIDE1_C1 is used for context1 rotator plane2 Y stride.

ROTATOR_SRC_YSTRIDE2_C1

Bits	Name	Description
31:15	RESERVED_BI31_15	
14:0	SRCP2_YSTRIDE	Plane 2 y stride in bytes.

0x04E01324 ROTATOR_SRC_FORMAT_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0042_67FF

ROTATOR_SRC_FORMAT_C1 is used for context1 rotator source format.

ROTATOR_SRC_FORMAT_C1

Bits	Name	Description
31	RESERVED_BIT31	
30:29	FRAME_FORMAT	0x0: Linear Frame (default) 0x1: RESERVED 0x2: 64x32 super-tile, YCbCr 420 non folding
28:26	RESERVED_BITS_28_26	
25:24	FORMAT_CONV	0x0: No format conversion 0x1: ARGB32bpp to RGB24bpp 0x2: RESERVED_1 0x3: RESERVED_2
23:22	FETCH_TILE_SIZE	Specify the fetch tile size. 0x0: RESERVED_1 0x1: 64x64 (default) 0x2: RESERVED_2 0x3: RESERVED_3
21	RESERVED_BITS_21	
20:19	FETCH_PLANES	Determines the number of planes to fetch and write back. When this parameter is set to planer format the output of Rotator is forced to write out a Pseudo planar format. When this parameter is set to fetch H2V1 422 interleaved format the output of Rotator is forced to write back 422 Pseudo planar format. For all the other cases the Rotators output write back format is same as the input fetch format. 0x0: Interleaved 0x1: Planar 0x2: Pseudo planar
18	UNPACK_ALIGN	0x0: To LSB 0x1: To MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
16:13	UNPACK_COUNT	Valid unpacking pattern count: 0 = 1 component, 1 = 2 components, ..., 15 = 16 components. Unpacking pattern only applies to the interleaved plane (chroma plane in pseudo-planar).
12:11	RESERVED_BITS12_11	Reserved for backward compatibility.

ROTATOR_SRC_FORMAT_C1 (cont.)

Bits	Name	Description
10:9	SRC_BPP	Effective source byte per pixel: 0 = 1 byte, 1 = 2 bytes, 2 = 3 bytes, 3 = 4 bytes. This is only used when unpacking the interleaved plane.
8	SRCC3_EN	0x1: Source has alpha
7:6	SRCC3_BITS	Number of bits for component 3 (alpha) input, this is not used for dither: 0 = RESERVED, 1 = RESERVED, 2 = RESERVED, 3 = 8 bits.
5:4	SRCC2_BITS	Number of bits for component 2 (R / Cr) input: 0 = RESERVED, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	SRCC1_BITS	Number of bits for component 1 (B / Cb) input: 0 = RESERVED, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	SRCC0_BITS	Number of bits for component 0 (G / luma) input: 0 = RESERVED, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x04E01328 ROTATOR_SRC_UNPACK_PATTERN1_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0302_0001

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4) for context1. Default is ARGB or C3-C2-C0-C1.

ROTATOR_SRC_UNPACK_PATTERN1_C1

Bits	Name	Description

0x04E01368 ROTATOR_OUTP0_ADDR_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

Context1 output address for RGB or Y for Pseudo-planer or Planer.

ROTATOR_OUTP0_ADDR_C1

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E0136C ROTATOR_OUTP1_ADDR_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

Context1 output address for UV for Pseudo-planer or U for Planer.

ROTATOR_OUTP1_ADDR_C1

Bits	Name	Description
31:0	DSTP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x04E01370 ROTATOR_OUTP2_ADDR_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

Context1 output address for V for Planer.

ROTATOR_OUTP2_ADDR_C1

Bits	Name	Description
31:0	DSTP2_ADDR	Base byte address of the Image's planar color2 plane if using fast_yuv mode for planer YUV420 input

0x04E01378 ROTATOR_OUT_YSTRIDE1_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0080

ROTATOR_OUT_YSTRIDE1_C1 is used for context1.

ROTATOR_OUT_YSTRIDE1_C1

Bits	Name	Description
31	RESERVED_BIT31	
30:16	DSTP1_YSTRIDE	Plane 1 y stride in bytes.
15	RESERVED_BIT15	
14:0	DSTP0_YSTRIDE	Plane 0 y stride in bytes.

0x04E0137C ROTATOR_OUT_YSTRIDE2_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0080

ROTATOR_OUT_YSTRIDE2_C1 is used for context1.

ROTATOR_OUT_YSTRIDE2_C1

Bits	Name	Description
31:15	RESERVED_BITS_31_15	
14:0	DSTP2_YSTRIDE	Plane 2y stride in bytes.

0x04E01400 ROTATOR_SRC_XY_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRC_XY_C1 is used for context1.

ROTATOR_SRC_XY_C1

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_Y	Source ROI origin screen Y coordinate (pixel) in the source image (i.e., Y offset of source ROI in the source image).
15:13	RESERVED_BITS15_13	
12:0	SRC_X	Source ROI origin screen X coordinate (pixel) in the source image (i.e., X offset of source ROI in the source image).

0x04E01408 ROTATOR_SRC_IMAGE_SIZE_C1

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0020_0020

ROTATOR_SRC_IMAGE_SIZE_C1 is used for context1.

ROTATOR_SRC_IMAGE_SIZE_C1

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_IMG_H	Source image height (to determine if lines should be over-fetched or repeated).
15:13	RESERVED_BITS15_13	
12:0	SRC_IMG_W	Source image width (to determine if pixels should be over-fetched or repeated).

0x04E01508 ROTATOR_SRC_SIZE_C2

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0020_0020

ROTATOR_SRC_SIZE_C2 is used for rotator source size for context2.

ROTATOR_SRC_SIZE_C2

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_H	Height of input ROI image that needs to be fetched in pixel, including any amount of over-fetching/under-fetching necessary.
15:13	RESERVED_BITS15_13	
12:0	SRC_W	Width of input ROI image that needs to be fetched in pixel, including any amount of over-fetching/under-fetching necessary.

0x04E0150C ROTATOR_SRCP0_ADDR_C2

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP0_ADDR_C2 is context2 rotator source plane0 offset address.

ROTATOR_SRCP0_ADDR_C2

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format or planar color0 plane

0x04E01510 ROTATOR_SRCP1_ADDR_C2

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP1_ADDR_C2 is for context2 rotator source plane1 offset address.

ROTATOR_SRCP1_ADDR_C2

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format or planar color1 plane

0x04E01514 ROTATOR_SRCP2_ADDR_C2

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP2_ADDR_C2 is for context2 rotator source plane2 offset address.

ROTATOR_SRCP2_ADDR_C2

Bits	Name	Description
31:0	SRCP2_ADDR	Base byte address of the Image's planar color2 plane

0x04E0151C ROTATOR_SRC_YSTRIDE1_C2

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0080

ROTATOR_SRC_YSTRIDE1_C2 is used for context2 rotator plane0 and plane1 Y stride.

ROTATOR_SRC_YSTRIDE1_C2

Bits	Name	Description
31	RESERVED_BIT31	
30:16	SRCP1_YSTRIDE	Plane 1 y stride in bytes.
15	RESERVED_BIT15	
14:0	SRCP0_YSTRIDE	Plane 0 y stride in bytes.

0x04E01520 ROTATOR_SRC_YSTRIDE2_C2

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRC_YSTRIDE1_C2 is used for context2 rotator plane2 Y stride.

ROTATOR_SRC_YSTRIDE2_C2

Bits	Name	Description
31:15	RESERVED_BI31_15	
14:0	SRCP2_YSTRIDE	Plane 2 y stride in bytes.

0x04E01524 ROTATOR_SRC_FORMAT_C2

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0042_67FF

ROTATOR_SRC_FORMAT_C2 is used for context2 rotator source format.

ROTATOR_SRC_FORMAT_C2

Bits	Name	Description
31	RESERVED_BIT31	
30:29	FRAME_FORMAT	0x0: Linear Frame (default) 0x1: RESERVED 0x2: 64x32 super-tile, YCbCr 420 non folding
28:26	RESERVED_BITS_28_26	
25:24	FORMAT_CONV	0x0: No format conversion 0x1: ARGB32bpp to RGB24bpp 0x2: RESERVED_1 0x3: RESERVED_2
23:22	FETCH_TILE_SIZE	Specify the fetch tile size. 0x0: RESERVED_1 0x1: 64x64 (default) 0x2: RESERVED_2 0x3: RESERVED_3
21	RESERVED_BITS_21	
20:19	FETCH_PLANES	Determines the number of planes to fetch and write back. When this parameter is set to planer format the output of Rotator is forced to write out a Pseudo planar format. When this parameter is set to fetch H2V1 422 interleaved format the output of Rotator is forced to write back 422 Pseudo planar format. For all the other cases the Rotators output write back format is same as the input fetch format. 0x0: Interleaved 0x1: Planar 0x2: Pseudo planar
18	UNPACK_ALIGN	0x0: To LSB 0x1: To MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
16:13	UNPACK_COUNT	Valid unpacking pattern count: 0 = 1 component, 1 = 2 components, ..., 15 = 16 components. Unpacking pattern only applies to the interleaved plane (chroma plane in pseudo-planar).
12:11	RESERVED_BITS12_11	Reserved for backward compatibility.

ROTATOR_SRC_FORMAT_C2 (cont.)

Bits	Name	Description
10:9	SRC_BPP	Effective source byte per pixel: 0 = 1 byte, 1 = 2 bytes, 2 = 3 bytes, 3 = 4 bytes. This is only used when unpacking the interleaved plane.
8	SRCC3_EN	0x1: Source has alpha
7:6	SRCC3_BITS	Number of bits for component 3 (alpha) input, this is not used for dither: 0 = RESERVED, 1 = RESERVED, 2 = RESERVED, 3 = 8 bits.
5:4	SRCC2_BITS	Number of bits for component 2 (R / Cr) input: 0 = RESERVED, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	SRCC1_BITS	Number of bits for component 1 (B / Cb) input: 0 = RESERVED, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	SRCC0_BITS	Number of bits for component 0 (G / luma) input: 0 = RESERVED, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x04E01528 ROTATOR_SRC_UNPACK_PATTERN1_C2

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0302_0001

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4) for context2. Default is ARGB or C3-C2-C0-C1.

ROTATOR_SRC_UNPACK_PATTERN1_C2

0x04E01708 ROTATOR_SRC_SIZE_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0020_0020

ROTATOR_SRC_SIZE_C3 is used for rotator source size for context3.

ROTATOR_SRC_SIZE_C3

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_H	Height of input ROI image that needs to be fetched in pixel, including any amount of over-fetching/under-fetching necessary.
15:13	RESERVED_BITS15_13	
12:0	SRC_W	Width of input ROI image that needs to be fetched in pixel, including any amount of over-fetching/under-fetching necessary.

0x04E0170C ROTATOR_SRCP0_ADDR_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP0_ADDR_C3 is context3 rotator source plane0 offset address.

ROTATOR_SRCP0_ADDR_C3

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format or planar color0 plane

0x04E01710 ROTATOR_SRCP1_ADDR_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP1_ADDR_C3 is for context3 rotator source plane1 offset address.

ROTATOR_SRCP1_ADDR_C3

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format or planar color1 plane

0x04E01714 ROTATOR_SRCP2_ADDR_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRCP2_ADDR_C3 is for context3 rotator source plane2 offset address.

ROTATOR_SRCP2_ADDR_C3

Bits	Name	Description
31:0	SRCP2_ADDR	Base byte address of the Image's planar color2 plane

0x04E0171C ROTATOR_SRC_YSTRIDE1_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0080

ROTATOR_SRC_YSTRIDE1_C3 is used for context3 rotator plane0 and plane1 Y stride.

ROTATOR_SRC_YSTRIDE1_C3

Bits	Name	Description
31	RESERVED_BIT31	
30:16	SRCP1_YSTRIDE	Plane 1 y stride in bytes.
15	RESERVED_BIT15

Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SUB_BLOCK_CFG_C3 is used for context3.

ROTATOR_SUB_BLOCK_CFG_C3

Bits	Name	Description
31:24	RESERVED_BIT31_24	
23	RESERVED_BIT23	
22:21	RESERVED_BITS22_21	.
20	RESERVED_BIT20	
19:18	SRC_CHROMA_SAMP	Source chroma sampling (used by upsample block): 0x0: 4:4:4/RGB 0x1: H2V1 0x2: H1V2 0x3: 4:2:0.
17:12	RESERVED_BITS17_12	
11:9	ROT_MODE	Rotation mode: Bit 0: Rotate 90 degrees Bit 1: Left/right flip Bit 2: Up/down flip.
8	ROT_EN	Rotate buffer enable. When this bit is set (1), the ping-pong tile buffer is always used independent of the rotation mode.
7:6	RESERVED_BIT7_6	
5	ALPHA_DOWN_SCALE	ALPHA Channel Down-scale option 0x1: using 1/N scaling 0x0: using pixel drop

ROTATOR_SUB_BLOCK_CFG_C3 (cont.)

Bits	Name	Description
4	FAST_YUV_TRANS	Fast YUV(YCbCr) data transaction <WAVERIDER:NEW:FAST_YUV> 0x1: enable Fast yuv transaction for YUV420 planer and psuedo-planer 0x0: using normal YUV transaction (default)
3:2	DOWN_SCALE_V_RATIO	Down Scaling ratio for Vertical <WAVERIDER:NEW:DOWN_SCALE> 0x3: 1/8 down scaling 0x2: 1/4 down scaling 0x1: 1/2 down scaling 0x0: no down scaling (default)
1:0	DOWN_SCALE_H_RATIO	Down Scaling ratio for Horizontal <WAVERIDER:NEW:DOWN_SCALE> 0x3: 1/8 down scaling 0x2: 1/4 down scaling 0x1: 1/2 down scaling 0x0: no down scaling (default)

0x04E01754 ROTATOR_OUT_PACK_PATTERN1_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0302_0001

ROTATOR_OUT_PACK_PATTERN1_C3 is used for context3.

ROTATOR_OUT_PACK_PATTERN1_C3

Bits	Name	Description
31:26	RESERVED31_26	
25:24	ELEMENT3	0x0: C0 0x1: C1 0x2: C2 0x3: C3
23:18	RESERVED23_18	
17:16	ELEMENT2	0x0: C0 0x1: C1 0x2: C2 0x3: C3
15:10	RESERVED15_10	

ROTATOR_OUT_PACK_PATTERN1_C3 (cont.)

Bits	Name	Description
9:8	ELEMENT1	0x0: C0 0x1: C1 0x2: C2 0x3: C3
7:2	RESERVED7_2	
1:0	ELEMENT0	0x0: C0 0x1: C1 0x2: C2 0x3: C3

0x04E01768 ROTATOR_OUTP0_ADDR_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

Context1 output address for RGB or Y for Pseudo-planer or Planer.

ROTATOR_OUTP0_ADDR_C3

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E0176C ROTATOR_OUTP1_ADDR_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

Context3 output address for UV for Pseudo-planer or U for Planer.

ROTATOR_OUTP1_ADDR_C3

Bits	Name	Description
31:0	DSTP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x04E01770 ROTATOR_OUTP2_ADDR_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

Context3 output address for V for Planer.

ROTATOR_OUTP2_ADDR_C3

Bits	Name	Description
31:0	DSTP2_ADDR	Base byte address of the Image's planar color2 plane if using fast_yuv mode for planer YUV420 input

0x04E01778 ROTATOR_OUT_YSTRIDE1_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0080

ROTATOR_OUT_YSTRIDE1_C3 is used for context3.

ROTATOR_OUT_YSTRIDE1_C3

Bits	Name	Description
31	RESERVED_BIT31	
30:16	DSTP1_YSTRIDE	Plane 1 y stride in bytes.
15	RESERVED_BIT15	
14:0	DSTP0_YSTRIDE	Plane 0 y stride in bytes.

0x04E0177C ROTATOR_OUT_YSTRIDE2_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0080

ROTATOR_OUT_YSTRIDE2_C3 is used for context3.

ROTATOR_OUT_YSTRIDE2_C3

Bits	Name	Description
31:15	RESERVED_BITS31_15	
14:0	DSTP2_YSTRIDE	Plane 2y stride in bytes.

0x04E01800 ROTATOR_SRC_XY_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_SRC_XY_C3 is used for context3.

ROTATOR_SRC_XY_C3

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_Y	Source ROI origin screen Y coordinate (pixel) in the source image (i.e., Y offset of source ROI in the source image).
15:13	RESERVED_BITS15_13	
12:0	SRC_X	Source ROI origin screen X coordinate (pixel) in the source image (i.e., X offset of source ROI in the source image).

0x04E01808 ROTATOR_SRC_IMAGE_SIZE_C3

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0020_0020

ROTATOR_SRC_IMAGE_SIZE_C3 is used for context3.

ROTATOR_SRC_IMAGE_SIZE_C3

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_IMG_H	Source image height (to determine if lines should be over-fetched or repeated).
15:13	RESERVED_BITS15_13	
12:0	SRC_IMG_W	Source image width (to determine if pixels should be over-fetched or repeated).

0x04E018F4 ROTATOR_OUTP0_DMI_VG1_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP0_DMI_VG1_BUF0_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E018F8 ROTATOR_OUTP1_DMI_VG1_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP1_DMI_VG1_BUF0_ADDR

Bits	Name	Description
31:0	DSTP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x04E018FC ROTATOR_OUTP2_DMI_VG1_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP2_DMI_VG1_BUF0_ADDR

Bits	Name	Description
31:0	DSTP2_ADDR	Base byte address of the Image's planar color2 plane if using fast_yuv mode for planer YUV420 input.

0x04E01900 ROTATOR_OUTP0_DMI_VG1_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP0_DMI_VG1_BUF1_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01904 ROTATOR_OUTP1_DMI_VG1_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP1_DMI_VG1_BUF1_ADDR

Bits	Name	Description
31:0	DSTP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x04E01908 ROTATOR_OUTP2_DMI_VG1_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP2_DMI_VG1_BUF1_ADDR

Bits	Name	Description
31:0	DSTP2_ADDR	Base byte address of the Image's planar color2 plane if using fast_yuv mode for planer YUV420 input.

0x04E0190C ROTATOR_OUTP0_DMI_VG1_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP0_DMI_VG1_BUF2_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01910 ROTATOR_OUTP1_DMI_VG1_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP1_DMI_VG1_BUF2_ADDR

Bits	Name	Description
31:0	DSTP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x04E01914 ROTATOR_OUTP2_DMI_VG1_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP2_DMI_VG1_BUF2_ADDR

Bits	Name	Description
31:0	DSTP2_ADDR	Base byte address of the Image's planar color2 plane if using fast yuv mode for planer YUV420 input.

0x04E01918 ROTATOR_OUTP0_DMI_VG2_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP0_DMI_VG2_BUF0_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E0191C ROTATOR_OUTP1_DMI_VG2_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP1_DMI_VG2_BUF0_ADDR

Bits	Name	Description
31:0	DSTP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x04E01920 ROTATOR_OUTP2_DMI_VG2_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP2_DMI_VG2_BUF0_ADDR

Bits	Name	Description
31:0	DSTP2_ADDR	Base byte address of the Image's planar color2 plane if using fast yuv mode for planer YUV420 input.

0x04E01924 ROTATOR_OUTP0_DMI_VG2_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP0_DMI_VG2_BUF1_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01928 ROTATOR_OUTP1_DMI_VG2_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP1_DMI_VG2_BUF1_ADDR

Bits	Name	Description
31:0	DSTP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x04E0192C ROTATOR_OUTP2_DMI_VG2_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_OUTP2_DMI_VG2_BUF1_ADDR

Bits	Name	Description
31:0	DSTP2_ADDR	Base byte address of the Image's planar color2 plane if using fast yuv mode for planer YUV420 input.

0x04E01930 ROTATOR_OUTP0_DMI_VG2_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP VG2 destination buffer2.

ROTATOR_OUTP0_DMI_VG2_BUF2_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01934 ROTATOR_OUTP1_DMI_VG2_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane1 DMI MDP VG2 destination buffer2.

ROTATOR_OUTP1_DMI_VG2_BUF2_ADDR

Bits	Name	Description
31:0	DSTP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x04E01938 ROTATOR_OUTP2_DMI_VG2_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane2 DMI MDP VG2 destination buffer2.

ROTATOR_OUTP2_DMI_VG2_BUF2_ADDR

Bits	Name	Description
31:0	DSTP2_ADDR	Base byte address of the Image's planar color2 plane if using fast yuv mode for planer YUV420 input.

0x04E0193C ROTATOR_OUTP0_DMI_RGB1_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP RGB1 destination buffer0.

ROTATOR_OUTP0_DMI_RGB1_BUF0_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01940 ROTATOR_OUTP0_DMI_RGB1_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP RGB1 destination buffer1.

ROTATOR_OUTP0_DMI_RGB1_BUF1_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01944 ROTATOR_OUTP0_DMI_RGB1_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP RGB1 destination buffer2.

ROTATOR_OUTP0_DMI_RGB1_BUF2_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01948 ROTATOR_OUTP0_DMI_RGB2_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP RGB2 destination buffer0.

ROTATOR_OUTP0_DMI_RGB2_BUF0_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E0194C ROTATOR_OUTP0_DMI_RGB2_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP RGB2 destination buffer1.

ROTATOR_OUTP0_DMI_RGB2_BUF1_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01950 ROTATOR_OUTP0_DMI_RGB2_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP RGB2 destination buffer2.

ROTATOR_OUTP0_DMI_RGB2_BUF2_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01954 ROTATOR_OUTP0_DMI_DMA_P_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP DMA_P destination buffer0.

ROTATOR_OUTP0_DMI_DMA_P_BUF0_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01958 ROTATOR_OUTP0_DMI_DMA_P_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP DMA_P destination buffer1.

ROTATOR_OUTP0_DMI_DMA_P_BUF1_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E0195C ROTATOR_OUTP0_DMI_DMA_P_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP DMA_P destination buffer2.

ROTATOR_OUTP0_DMI_DMA_P_BUF2_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01960 ROTATOR_OUTP0_DMI_DMA_S_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP DMA_S destination buffer0.

ROTATOR_OUTP0_DMI_DMA_S_BUF0_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01964 ROTATOR_OUTP0_DMI_DMA_S_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP DMA_S destination buffer1.

ROTATOR_OUTP0_DMI_DMA_S_BUF1_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01968 ROTATOR_OUTP0_DMI_DMA_S_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP DMA_S destination buffer2.<WAVERIDER:NEW:DMI>

ROTATOR_OUTP0_DMI_DMA_S_BUF2_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E0196C ROTATOR_OUTP0_DMI_DMA_E_BUF0_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP DMA_E destination buffer0.

ROTATOR_OUTP0_DMI_DMA_E_BUF0_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01970 ROTATOR_OUTP0_DMI_DMA_E_BUF1_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP DMA_E destination buffer1.

ROTATOR_OUTP0_DMI_DMA_E_BUF1_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E01974 ROTATOR_OUTP0_DMI_DMA_E_BUF2_ADDR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

it is used for plane0 DMI MDP DMA_E destination buffer2.

ROTATOR_OUTP0_DMI_DMA_E_BUF2_ADDR

Bits	Name	Description
31:0	DSTP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x04E02004 ROTATOR_TFETCH_TEST_MODE

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_TFETCH_TEST_MODE

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	TFETCH_SOLID_FILL	This takes precedence over tfetch_unpack_bypass. If this bit is set (1), the output color is forced to the value written into register 0x20040.This is useful in filling a ROI with a constant color.
0	TFETCH_UNPACK_BYPASS	Setting (1)this bit enables a bypass in the unpacker. Therefore, each data read would be treated as color0, color1, color2, and color3 from lower byte to upper byte.

0x04E02008 ROTATOR_TFETCH_STATUS

Type: Read Only
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_001F

ROTATOR_TFETCH_STATUS

Bits	Name	Description
31:12	RESERVED_BITS31_12	
11:8	FIFO_ERRORS	TileFetch internal FIFO errors. These error bits are pulse catching, and returned to zero when this register is read: Bit 11 = control FIFO error Bit 10 = burstbuf FIFO error Bit 9= line_gen luma FIFO error Bit 8= line_gen chroma FIFO error
7:5	RESERVED_BITS7_5	

ROTATOR_TFETCH_STATUS (cont.)

Bits	Name	Description
4:0	IDLES	TileFetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 4= dma_rd idle Bit 3= ctl idle Bit 2= burstbuf idle Bit 1= unpack idle Bit 0= line_gen idle

0x04E02010 ROTATOR_TFETCH_TILE_COUNT

Type: Read Only
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_TFETCH_TILE_COUNT

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:16	NUM_CHROMA_TILE	Number of chroma tiles in an ROI
15:11	RESERVED_BITS15_11	
10:0	NUM_LUMA_TILE	Number of luma/RGB tiles in an ROI

0x04E02014 ROTATOR_TFETCH_FETCH_COUNT

Type: Read Only
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

ROTATOR_TFETCH_FETCH_COUNT

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	P1_FETCH_COUNT	Plane 1 fetch count in an ROI
15	RESERVED_BIT15	
14:0	P0_FETCH_COUNT	Plane 0 fetch count in an ROI

0x04E02040 ROTATOR_TFETCH_CONSTANT_COLOR

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0xFFFF_FFFF

ROTATOR_TFETCH_CONSTANT_COLOR

Bits	Name	Description
31:24	FORCED_COLOR3	Constant color driven for color3 during color force mode.
23:16	FORCED_COLOR2	Constant color driven for color2 during color force mode.
15:8	FORCED_COLOR1	Constant color driven for color1 during color force mode.
7:0	FORCED_COLOR0	Constant color driven for color0 during color force mode.

14.12.6 Test MISR registers

0x04E0D000 ROTATOR_TEST_MODE_CLK

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_TEST_MODE_CLK register is used to select the test points for a specified ROTATOR block.

ROTATOR_TEST_MODE_CLK

Bits	Name	Description
31:9	RESERVED_BITS31_9	This field has no function and should be set to zero for future compatibility.

ROTATOR_TEST_MODE_CLK (cont.)

Bits	Name	Description
8:4	BLOCK_ID	These bits select the test points for the specified ROTATOR block into the test bus. 0x0: Disabled 0x1: Tile fetch 0x2: Upsample 0x3: Rotate 0x4: packer1a 0x5: packer1b 0x6: Downsample 0x7: cmd 0x8: ebi_gen2axi 0x9: top 0xA: mGEN2mAXI Client0 core clock (Rotator Core read) 0xB: mGEN2mAXI Client1 core clock (Rotator Core write) 0xC: scratchpad reg 0xD: DMI 0xE: Context Queue 0xF: Down Scaler 0x10: Pixel Rotator 0x11: 0x55555555 0x12: 0xAAAAAAAA
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within a ROTATOR block.

0x04E0D004 ROTATOR_TEST_MISR_RESET_CLK

Type: Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_TEST_MISR_RESET_CLK register is used to reset the MISR state.

ROTATOR_TEST_MISR_RESET_CLK

Bits	Name	Description
31:1	RESERVED_BITS31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_SW_RESET	A write of ’1’ to this address will reset the MISR state. It is a self clearing reset. The reset must be asserted after ROTATOR_TEST_MISR_MODE_CLK is set to a non-zero value. 0x1: MISR reset.

0x04E0D008 ROTATOR_TEST_EXPORT_MISR_CLK

Type: Read-Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_TEST_EXPORT_MISR_CLK register controls what is sent on the testbus. A value of ’0’ (reset value) will send the data that is going into the MISR on the testbus. A value of ’1’ will send the current MISR state onto the testbus. The latter option is typically used for debug purposes. For example, if your final MISR signature failed, you might want to know where it failed (i.e., right in the beginning or somewhere else’)

ROTATOR_TEST_EXPORT_MISR_CLK

Bits	Name	Description
31:1	RESERVED_BITS31_1	Field has no function and should be set to zero for future compatibility.
0	MISR_EXPORT	When clear(0), testbus is driven by what is sent into the MISR. (i.e., What is the result of the MUXing of all the input data streams with ROTATOR_TEST_ MODE_CLK) When set (1), testbus is driven by the current state of the MISR (debug typically)

0x04E0D00C ROTATOR_TEST_MISR_CURR_VAL_CLK

Type: Read-Only
Clock: CC_ROTATOR_CLK
Reset State: Undefined

A read from the address in the ROTATOR_TEST_MISR_CURR_VAL_CLK register will return the current MISR state for this block. Keep in mind that this could change every cycle depending on how it is used.

ROTATOR_TEST_MISR_CURR_VAL_CLK

Bits	Name	Description
31:0	MISR_VAL	It holds the current MISR state.

0x04E0D100 ROTATOR_TEST_MODE_AXI_CLK

Type: Read/Write
Clock: CC_ROTATOR_CLK
Reset State: 0x0000_0000

The ROTATOR_TEST_MODE_AXI_CLK register selects the test points for the specified mgen2maxi clients and master ports. This register is only valid for Rotator core that uses mgen2maxi.

ROTATOR_TEST_MODE_AXI_CLK

Bits	Name	Description
31:6	RESERVED31_6	This field has no function and should be set to zero for future compatibility.
5:4	BLOCK_ID	These bits select the test points for the specified Rotator block into the test bus. 0x0: Disabled 0x1: mGEN2mAXI Client0 (Rotator Core read) 0x2: mGEN2mAXI Client1 (Rotator Core write) 0x3: mGEN2mAXI AXI Arbiter/Master 0
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within a ROTATOR mgen2maxi block.

14.13 TV ENC Registers (0x04F00000 TV_ENC_BASE)

The TV_ENC registers in this section are accessed by the ARM. Software will be responsible for setting up all the programmable registers contained within the TV Encoder. TV Encoder Control and Timing registers

0x04F00000 TV_ENC_CTL

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00E08FC0

This register contains the basic control and mode registers for the TV_ENC. It is important that the Software must program this register in two steps. In the first step the Software should program all the necessary register bits except the "TV_ENC_EN" bit (which should be in disabled state). The second write to this register should enable the "TV_ENC_EN" bit without touching any other bit in this register. This will ensure that the TV Encoder Block is programmed to a valid state before it is enabled

TV_ENC_CTL

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23	CC_PEDESTAL_EN	0x0: disable pedestal on closed captioning line 0x1: enable pedestal on closed captioning line (default)
22	CHROMA_SAT_EN	This enable is valid only in S-Video Mode. It gives the flexibility to saturate the chroma output (post sinx and dc offset) to 0 or 1023 when saturation bit asserts 0x0: saturate the 10 bit chroma output to 0 0x1: saturate the 10 bit chroma output to1023 (default)
21	SINX_FILTER_EN_CH	This enable is valid only in S-Video Mode. It will enable/disable the Sinx filter on the Cb/Cr channel. 0x0: bypass Sin (x/x correction filter on Chroma Channel) 0x1: enable Sin (x/x correction filter on Chroma Channel default)
20	TV_DAC_TEST_SEL	This bit selects the data that will drive the TV_DAC (TV_ENC output OR the DAC test data specified by TV_DAC_CTL register) 0x0: Select TV Encoder data 0x1: Select DAC test data specified by TV_DAC_CTL
19	S_VIDEO_EN	0x0: disable S-VIDEO channel 0x1: enable S-VIDEO channel

TV_ENC_CTL (cont.)

Bits	Name	Description
18:15	TPG_SEL	0x0: color bar test pattern 100 pc white 0x1: modulated ramp test pattern 0x2: red frame test pattern 0x3: ntsc color bar 75 pc white 0x4: Mono color bar test pattern Black 0x5: Mono color bar test pattern White100 0x6: Mono color bar test pattern Yellow75 0x7: Mono color bar test pattern Cyan75 0x8: Mono color bar test pattern Green75 0x9: Mono color bar test pattern Magenta75 0xA: Mono color bar test pattern Red75 0xB: Mono color bar test pattern Blue75 0xC: Mono color bar test pattern White75 0xD: 100 pc while color bar test pattern with smooth transition
14	NTSCJ	This bit is ignored for all other tv_mode settings. 0x0: NTSC mode when tv_mode = "00" 0x1: NTSC-J mode when tv_mode = "00"
13	PAL60	This bit is ignored for all other tv_mode settings. 0x0: NTSC mode when tv_mode = "00" 0x1: PAL60 mode when tv_mode = "00"
12	OUTPUT_INV	0x0: do not subtract the encoder output from 1024 to invert 0x1: subtract the encoder output from 1024 to invert
11	TEST_PATT_EN	0x0: disable test pattern generator (normal video from MDP) 0x1: enable 75% color bar test pattern output.
10	SINX_FILTER_EN	0x0: bypass Sin (x/x correction filter) 0x1: enable Sin (x/x correction filter)
9	CB_FILTER_EN	0x0: bypass Cb channel LPF 0x1: enable Cb channel LPF
8	CR_FILTER_EN	0x0: bypass Cr channel LPF 0x1: enable Cr channel LPF
7	Y_FILTER_EN	0x0: bypass Y channel LPF 0x1: enable Y channel LPF
6	Y_FILTER_SEL	0x0: Select Y low pass filter w/o notch 0x1: Select Y low pass filter w/ notch
5	RESERVED_BIT5	
4	CGMS_EN	0x0: disable CGMS insertion 0x1: enable CGMS insertion
3	CC_EN	0x0: disable closed captioning 0x1: enable closed captioning

TV_ENC_CTL (cont.)

Bits	Name	Description
2	TV_ENC_EN	This register turns off/on the encoder. 0x0: TV_ENC off 0x1: TV_ENC on
1:0	TV_MODE	This register defines the TV standard and the corresponding sub-carrier frequency. See bit 13 for differentiation of mode 00. 0x0: NTSC-M, PAL60 (3.57954545 Mhz) 0x1: PAL-M (3.57961149 Mhz) 0x2: PAL-B,D,G,H,I, PAL-N (non-Argentina 4.3361875 Mhz) 0x3: PAL-N (Argentina 3.582055625 Mhz)

0x04F00004 TV_LEVEL

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register defines the DC level offset for the encoder. This is typically 16, although may be changed to satisfy the output driver swing. Translates into the sync level.

TV_LEVEL

Bits	Name	Description
31:20	BLANK_LEVEL_CHROMA	Blanking level to be added to the Chroma Channel (pre sinx filter) during the S-Video mode. This value won't affect the chroma channel when TV_ENC is in composite mode.
19	RESERVED_BIT19	
18:8	DC_OFFSET_CHROMA	DC offset of chroma output (Valid only when S-Video is enabled)
7:0	DC_OFFSET	DC offset of output (in practice, the sync level)

0x04F00008 TV_GAIN

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0081B697

This register defines the independent gain factors for the 8 bit Y, Cr, and Cb channels. Each gain is a 8 bit value that represents an 8 bit fraction (0.8). This format gives the channel gains a range of 0 to 0.99609375. The normal gain values for PAL and NTSC are from 0.752 down to 0.504 so the range of the register allows for scaling above and below the normal amount.

TV_GAIN

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	CB_GAIN	8 bit Cb channel gain (0.8 fixed point format).
15:8	CR_GAIN	8 bit Cr channel gain (0.8 fixed point format).
7:0	Y_GAIN	8 bit Y channel gain (0.8 fixed point format).

0x04F0000C TV_OFFSET

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x008080F0

This register defines the independent offset factors for the 8 bit Y, Cr, and Cb channels. Each offset is a 8 bit 2's complement number. For normal operation, the Cr and Cb offsets should be set to 0x80 (-128) and the Y offset should be set to 0xF0 (-16)

TV_OFFSET

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	CB_OFFSET	2's complement 8 bit Cb channel offset.
15:8	CR_OFFSET	2's complement 8 bit Cr channel offset.
7:0	Y_OFFSET	2's complement 8 bit Y channel offset.

0x04F00010 TV_CGMS

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00012345

This register defines the 20 bit CGMS value that is driven on lines 20 and 283 when the CGMS mode is enabled.

TV_CGMS

Bits	Name	Description
31:20	RESERVED_BITS31_20	
19:0	CGMS_DATA	20 bit CGMS data value

0x04F00014 TV_SYNC_1

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0020009E

This register defines the horizontal front porch and sync times with respect to a 27MHz clock.

TV_SYNC_1

Bits	Name	Description
31:25	RESERVED_BITS31_25	
24:16	HFP	Defines end of horizontal front porch with respect to the 27MHz clock.
15:9	RESERVED_BITS15_9	
8:0	HSYNC	Defines end of horizontal sync with respect to the 27Mhz clock.

0x04F00018 TV_SYNC_2

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x011306B4

This register defines the horizontal blanking and line times with respect to a 27MHz clock.

TV_SYNC_2

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	HBLANK	Defines end of horizontal blanking with respect the 27Mhz clock.
15:11	RESERVED_BITS16_11	
10:0	HTOTAL	Defines horizontal line length with respect to the 27Mhz clock.

0x04F0001C TV_SYNC_3

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0006000C

This register defines the vertical front porch and sync times with respect to HLINES.

TV_SYNC_3

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	VFP	Defines End of vertical front porch in terms of HLines.
15:10	RESERVED_BITS15_10	
9:0	VSYNC	Defines End of vertical sync in terms of HLines.

0x04F00020 TV_SYNC_4

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0028020D

This register defines the vertical blank and vertical total lines with respect to HLines.

TV_SYNC_4

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	VBLANK	Defines End of vertical blank in terms of HLines.
15:10	RESERVED_BITS15_10	
9:0	VTOTAL	Defines End of vertical Field in terms of Hlines.

0x04F00024 TV_SYNC_5

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x005E02FB

This register defines the equalization and serration end times with respect to a 27Mhz clock.

TV_SYNC_5

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	EQU	Defines End of Horizontal Equalization with respect to a 27Mhz clock
15:10	RESERVED_BITS15_10	
9:0	SERR	Defines End of Horizontal Serration with respect to a 27Mhz clock

0x04F00028 TV_SYNC_6

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0006000C

This register defines the start and end of the serration pulses with respect to the number of HLines.

TV_SYNC_6

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	V_SERR_START	Defines Start of Serration Pulses in terms of HLines.
15:8	RESERVED_BITS15_8	
7:0	V_SERR_END	Defines Start of Serration Pulses in terms of HLines.

0x04F0002C TV_SYNC_7

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x000000012

This register defines the start and end of the equalization pulses with respect to the number of HLines. The pulse interval includes all equalization pulses with serration pulses embedded.

TV_SYNC_7

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	PULSE_START	Defines Start of Equalization in terms of HLines
15:8	RESERVED_BITS15_8	
7:0	PULSE_END	Defines End of Equalization in terms of HLines.

0x04F00030 TV_BURST_V1

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0013020D

This register defines the vertical half line counts where burst is present in the first color field. The start and end points are inclusive.

TV_BURST_V1

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	START	Defines Start of Chroma Burst in terms of HLines
15:10	RESERVED_BITS15_10	
9:0	END	Defines End of Chroma Burst in terms of HLines.

0x04F00034 TV_BURST_V2

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0014020C

This register defines the vertical half line counts where burst is present in the second color field. The start and end points are inclusive.

TV_BURST_V2

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	START	Defines Start of Chroma Burst in terms of HLines
15:10	RESERVED_BITS15_10	
9:0	END	Defines End of Chroma Burst in terms of HLines.

0x04F00038 TV_BURST_V3

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0013020D

This register defines the vertical half line counts where burst is present in the third color field. The start and end points are inclusive.

TV_BURST_V3

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	START	Defines Start of Chroma Burst in terms of HLines
15:10	RESERVED_BITS15_10	
9:0	END	Defines End of Chroma Burst in terms of HLines.

0x04F0003C TV_BURST_V4

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0014020C

This register defines the vertical half line counts where burst is present in the fourth color field. The start and end points are inclusive.

TV_BURST_V4

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	START	Defines Start of Chroma Burst in terms of HLines
15:10	RESERVED_BITS15_10	
9:0	END	Defines End of Chroma Burst in terms of HLines.

0x04F00040 TV_BURST_H

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00AE00F2

This register defines the horizontal start and stop points of color burst. These values need to be changed for each tv mode.

TV_BURST_H

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	START	Defines Start of Chroma Burst w.r.t. 27 MHz clock.
15:10	RESERVED_BITS15_10	
9:0	END	Defines End of Chroma Burst w.r.t. 27 MHz clock.

0x04F00044 TV_SOL_REQ_ODD

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00280208

This register defines the first and last lines with SOL_REQ_WR pulses in terms of full lines in the frame. This register refers specifically to the odd field.

TV_SOL_REQ_ODD

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	REQ_START	Defines first line with sol_wr_req w.r.t. full lines.
15:10	RESERVED_BITS15_10	
9:0	REQ_END	Defines last line with sol_wr_req w.r.t. full lines.

0x04F00048 TV_SOL_REQ_EVEN

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00290209

This register defines the first and last lines with SOL_REQ_WR pulses in terms of full lines in the frame. This register refers specifically to the even field.

TV_SOL_REQ_EVEN

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	REQ_START	Defines first line with sol_wr_req w.r.t. full lines.
15:10	RESERVED_BITS15_10	
9:0	REQ_END	Defines last line with sol_wr_req w.r.t. full lines.

0x04F0004C TV_DAC_TEST_DATA

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register allows a control of the DAC through the tv encoder's peripheral interface.This register is only for test purpose and should never be enabled during the normal mode

TV_DAC_TEST_DATA

Bits	Name	Description
31:26	RESERVED_BITS31_26	
25:16	CHROMA_SVID_DATA	Chroma Data to be output to Chroma DAC (Valid only when S-Video is enabled)
15:10	RESERVED_BITS15_10	

TV_DAC_TEST_DATA (cont.)

Bits	Name	Description
9:0	Y_OR_COMP_DATA	Luma or Composite Value to be output to DAC

0x04F00050 TV_TESTBUS_MUX

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register defines output sent to the debug port.

TV_TESTBUS_MUX

Bits	Name	Description
31:10	RESERVED_BITS31_10	
9:0	SEL	TESTBUS MUX select signal

0x04F00054 TV_TEST_MODE

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register selects whether the testbus signals goes out of TV Encoder block.

TV_TEST_MODE

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	TEST_MODE	TEST MODE select signal 0x0: Disable TV Encoder Test Bus 0x1: Enable TV Encoder Test Bus and MISR calculation 0x2: Enable TV Encoder Test_1 0x3: Enable TV Encoder Test_2

0x04F00058 TV_TEST_MISR_RESET

Type: Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register resets the registers within the MISR engine.

TV_TEST_MISR_RESET

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	MISR_RESET	MISR engine can only be reset by writing this bit from the SW. The power-up reset cannot reset the MISR engine. Hence, it is required that SW resets the MISR engine before enabling the test MISR.

0x04F0005C TV_TEST_EXPORT_MISR

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register drives the MISR signature onto the testbus.

TV_TEST_EXPORT_MISR

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	EXPORT_MISR	Drives the signature onto the testbus. When the test_mode is not meant for MISR calculation, SW should not attempt to drive MISR signature with this command set.

0x04F00060 TV_TEST_MISR_CURR_VAL

Type: Read
Clock: CC_TV_ENC_CLK
Reset State: Unknown

This register drives the MISR signature onto the testbus.

TV_TEST_MISR_CURR_VAL

Bits	Name	Description
31:0	MISR_CURR_VAL	Current MISR signature value. This is read directly off this register. Another way is to export this value onto the testbus. Software needs to apply a MISR reset before reading this value; otherwise, the initial value is unknown.

0x04F00064 TV_TEST_SOF_CFG

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register contains programmable SOF count and one bit for force MISR test bus enable.

TV_TEST_SOF_CFG

Bits	Name	Description
31	FORCE_TESTBUS_EN	This bit allows software to allow the test MISR signature on all the time. This enable bit takes precedence over the enable generated by the SOF programmable counter hardware. Needless to say, force_testbus_en will only be useful when the test MISR is in the correct test mode.
30:3	RESERVED_BITS30_3	
2:0	TEST_SOF_PROG_CNT	When the actual SOF counts goes beyond this threshold, hardware will shut the test MISR signature registration off until software applies a test MISR reset or a regular reset via the clock block.

0x04F00068 TV_ADV_BURST_H

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register defines the horizontal start points of a color burst when advanced burst start is enabled (colorstripe lines only). These values need to be changed for each tv mode.

TV_ADV_BURST_H

Bits	Name	Description
31:10	RESERVED_BITS31_10	
9:0	START	Defines Advanced Start of Chroma Burst w.r.t. 27 MHz clock.

0x04F0006C TV_HW_VERSION

Type: Read Only
Clock: CC_TV_ENC_CLK
Reset State: 0x0201030C

The TV_HW_VERSION register contains the major and minor versions and release number of the TV_ENC core.

TV_HW_VERSION

Bits	Name	Description
31:24	MAJOR_VERSION	TV_ENC core major version
23:16	MINOR_VERSION	TV_ENC core minor version
15:8	RELEASE_PHASE	TV_ENC core release phase
7:0	REVISION	TV_ENC core revision number

14.13.1 TV Encoder Macrovision Registers

0x04F00070 TV_ENC_MV_CTL_REG0

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000004

Copy Protection process control register (On/Off/Mode byte)

TV_ENC_MV_CTL_REG0

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5	N0_5	VBI Pulse On/Off 0x0: VBI Pulses Off 0x1: VBI Pulses On
4	N0_4	End of Field Back Porch Pulses On/Off 0x0: End of Field Back Porch Pulses Off 0x1: End of Field Back Porch Pulses On
3	N0_3	This register turns off/on the Macrovision Colorstripe Process 0x0: Colorstripe process off 0x1: Colorstripe process on
2	N0_2	AGC pulse normal (Amplitude cycling) static mode select (Cycling = Default = 1)
1	N0_1	Sync amplitude reduction outside VBI 0x0: Sync Amplitude reduction outside VBI is Off 0x1: Sync Amplitude reduction outside VBI is On
0	N0_0	Sync amplitude reduction inside VBI 0x0: Sync Amplitude reduction inside VBI is Off 0x1: Sync Amplitude reduction inside VBI is On

0x04F00074 TV_ENC_MV_REG1

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

For a given field this register specifies the first line number with the modified burst in the first stripe. It also defines the spacing between the first line with modified burst in first stripe and first line with modified burst in second stripe.

TV_ENC_MV_REG1

Bits	Name	Description
31:30	RESERVED_BITS31_30	
29:24	N4	Spacing between first line with modified burst in first stripe and first line with modified burst in second stripe; Field2/Odd Field
23:22	RESERVED_BITS23_22	
21:16	N3	First line with modified burst in first stripe; Field 2/Odd field
15:14	RESERVED_BITS15_14	
13:8	N2	Spacing between first line with modified burst in first stripe and first line with modified burst in second stripe; Field1/Even Field
7:6	RESERVED_BITS7_6	
5:0	N1	First line with modified burst in first stripe; Field 1/Even field

0x04F00078 TV_ENC_MV_REG2

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register defines the colorstripe spacing, after second strip. It also defines the number of colorstripes per field and Number of lines per colorstripe

TV_ENC_MV_REG2

Bits	Name	Description
31:18	RESERVED_BITS31_18	
17:16	N7	Number of lines per colorstripe
15:11	RESERVED_BITS15_11	
10:8	N6	Number of colorstripes per field
7:3	RESERVED_BITS7_3	
2:0	N5	Colorstripe spacing, after second stripe

0x04F0007C TV_ENC_MV_REG3

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register defines the Pseudo-sync pulse duration, First pseudo-sync pulse location and Pseudo-sync pulse spacing.

TV_ENC_MV_REG3

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:16	N10	Pseudo-sync pulse spacing
15:14	RESERVED_BITS15_14	
13:8	N9	First pseudo-sync pulse location
7:6	RESERVED_BITS7_6	
5:0	N8	Pseudo-sync pulse duration

0x04F00080 TV_ENC_MV_REG4

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register specifies the line numbers for which the Pseudo-sync/AGC pulses will be included (Line Formats A +B)

TV_ENC_MV_REG4

Bits	Name	Description
31:15	RESERVED_BITS31_15	
14:0	N11	Line Number selection for PS/AGC pulses (Line Formats A + B)

0x04F00084 TV_ENC_MV_REG5

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register specifies the line numbers for which the Pseudo-sync/AGC pulses will be included has Line Format A or Line Format B

TV_ENC_MV_REG5

Bits	Name	Description
31:15	RESERVED_BITS31_15	
14:0	N12	Line Number selection for PS/AGC pulses (Line FormatB)

0x04F00088 TV_ENC_MV_REG6

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register allows us to control the individual Pseudo-sync/AGC pulse On/Off for line format A

TV_ENC_MV_REG6

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	N13_LOC8	PSP and AGC On/Off in 8th location for format A 0x0: PSP and AGC is Off in 8th location 0x1: PSP and AGC is On in 8th location
6	N13_LOC7	PSP and AGC On/Off in 7th location for format A 0x0: PSP and AGC is Off in 7th location 0x1: PSP and AGC is On in 7th location
5	N13_LOC6	PSP and AGC On/Off in 6th location for format A 0x0: PSP and AGC is Off in 6th location 0x1: PSP and AGC is On in 6th location
4	N13_LOC5	PSP and AGC On/Off in 5th location for format A 0x0: PSP and AGC is Off in 5th location 0x1: PSP and AGC is On in 5th location
3	N13_LOC4	PSP and AGC On/Off in 4th location for format A 0x0: PSP and AGC is Off in 4th location 0x1: PSP and AGC is On in 4th location
2	N13_LOC3	PSP and AGC On/Off in 3rd location for format A 0x0: PSP and AGC is Off in 3rd location 0x1: PSP and AGC is On in 3rd location
1	N13_LOC2	PSP and AGC On/Off in 2st location for format A 0x0: PSP and AGC is Off in 2nd location 0x1: PSP and AGC is On in 2nd location
0	N13_LOC1	PSP and AGC On/Off in 1st location for format A 0x0: PSP and AGC is Off in 1st location 0x1: PSP and AGC is On in 1st location

0x04F0008C TV_ENC_MV_REG7

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register allows us to control the individual Pseudo-sync/AGC pulse On/Off for line format B

TV_ENC_MV_REG7

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7	N14_LOC8	PSP and AGC On/Off in 8th location for format B 0x0: PSP and AGC is Off in 8th location 0x1: PSP and AGC is On in 8th location
6	N14_LOC7	PSP and AGC On/Off in 7th location for format B 0x0: PSP and AGC is Off in 7th location 0x1: PSP and AGC is On in 7th location
5	N14_LOC6	PSP and AGC On/Off in 6th location for format B 0x0: PSP and AGC is Off in 6th location 0x1: PSP and AGC is On in 6th location
4	N14_LOC5	PSP and AGC On/Off in 5th location for format B 0x0: PSP and AGC is Off in 5th location 0x1: PSP and AGC is On in 5th location
3	N14_LOC4	PSP and AGC On/Off in 4th location for format B 0x0: PSP and AGC is Off in 4th location 0x1: PSP and AGC is On in 4th location
2	N14_LOC3	PSP and AGC On/Off in 3rd location for format B 0x0: PSP and AGC is Off in 3rd location 0x1: PSP and AGC is On in 3rd location
1	N14_LOC2	PSP and AGC On/Off in 2st location for format B 0x0: PSP and AGC is Off in 2nd location 0x1: PSP and AGC is On in 2nd location
0	N14_LOC1	PSP and AGC On/Off in 1st location for format B 0x0: PSP and AGC is Off in 1st location 0x1: PSP and AGC is On in 1st location

0x04F00090 TV_ENC_MV_REG8

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register configures the number of end of field Back Porch pulses prior to Vsync and following the Vsync pulse

TV_ENC_MV_REG8

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:4	N15_PRIOR	Adds 0 to 15 back porch pulses according to value of this parameter. The first pulse is inserted in the last line prior to the V-sync pulse, with additional pulses being inserted as required until 15 lines prior to the Vsync pulse when this parameter has value of 0xF
3:0	N15_AFTER	Adds 0 to 15 back porch pulses according to value of this parameter. The first pulse is inserted in the first line following the V-sync pulse, with additional pulses being inserted as required until 15 lines following the Vsync pulse when this parameter has value of 0xF

0x04F00094 TV_ENC_MV_REG9

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register controls whether the Burst Advanced start is On/Off (applicable to colorstripe lines only)

TV_ENC_MV_REG9

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	N16	Burst Advanced Start On/Off (colorstripe lines only) 0x0: Burst Advanced Start is Off 0x1: Burst Advanced Start is On

0x04F00098 TV_ENC_MV_REG10

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register specifies the duration of each zone in the colorburst (applicable only when colorstripe process in On)

TV_ENC_MV_REG10

Bits	Name	Description
31:20	RESERVED_BITS31_20	
19:16	N19	2nd phase switch point to end of burst duration (Zone 3)
15:12	RESERVED_BITS15_12	
11:8	N18	1st to 2nd phase point duration (Zone 2)
7:4	RESERVED_BITS7_4	
3:0	N17	Start of Burst to 1st Phase Switch Point duration (Zone 1)

0x04F0009C TV_ENC_MV_REG11

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register is used for selecting the phase of the sub-carrier within a zone of a color burst. The sub-carries phase switch points create up to 3 zones within the burst. Each zone may incorporate sub-carrier with either normal or modified phase sub-carrier. Each zone may be of normal (unmodified) phase or modified phase as set by this register. A phase discontinuity will only exist between adjacent zones of differing sub-carrier phase. (colorstripe lines only)

TV_ENC_MV_REG11

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2	N20_ZONE1	Select the Sub-carrier Phase for Zone 1 0x0: Normal Phase for Zone1 0x1: Modified Phase for Zone1
1	N20_ZONE2	Select the Sub-carrier Phase for Zone 2 0x0: Normal Phase for Zone2 0x1: Modified Phase for Zone2
0	N20_ZONE3	Select the Sub-carrier Phase for Zone 3 0x0: Normal Phase for Zone3 0x1: Modified Phase for Zone3

0x04F000A0 TV_ENC_MV_REG12

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register is used for specifying the modified phase characteristics. For both NTSC and PAL the phase of the sub-carrier may be modified by 180 degrees. In the case of PAL, the phase may also be modified by +90 or -90 degrees compared with the phase which would otherwise be present on that line. Two control bits are used for each of the 5 possible lines which can comprise a colorstripe (10 bits total). (colorstripe lines only)

TV_ENC_MV_REG12

Bits	Name	Description
31:10	RESERVED_BITS31_10	
9:8	N21_LINE1	Colorstripe 1st line phase: 0x0: Normal sub-carrier Phase (Valid for both NTSC and PAL) 0x1: U-axis component inverted in PAL (N/A for NTSC) 0x2: V-axis component inverted in PAL (N/A for NTSC) 0x3: 180 degrees phase inversion (Valid for both NTSC and PAL)
7:6	N21_LINE2	Colorstripe 2nd line phase: 0x0: Normal sub-carrier Phase (Valid for both NTSC and PAL) 0x1: U-axis component inverted in PAL (N/A for NTSC) 0x2: V-axis component inverted in PAL (N/A for NTSC) 0x3: 180 degrees phase inversion (Valid for both NTSC and PAL)
5:4	N21_LINE3	Colorstripe 3rd line phase: 0x0: Normal sub-carrier Phase (Valid for both NTSC and PAL) 0x1: U-axis component inverted in PAL (N/A for NTSC) 0x2: V-axis component inverted in PAL (N/A for NTSC) 0x3: 180 degrees phase inversion (Valid for both NTSC and PAL)
3:2	N21_LINE4	Colorstripe 4th line phase: 0x0: Normal sub-carrier Phase (Valid for both NTSC and PAL) 0x1: U-axis component inverted in PAL (N/A for NTSC) 0x2: V-axis component inverted in PAL (N/A for NTSC) 0x3: 180 degrees phase inversion (Valid for both NTSC and PAL)
1:0	N21_LINE5	Colorstripe 5th line phase: 0x0: Normal sub-carrier Phase (Valid for both NTSC and PAL) 0x1: U-axis component inverted in PAL (N/A for NTSC) 0x2: V-axis component inverted in PAL (N/A for NTSC) 0x3: 180 degrees phase inversion (Valid for both NTSC and PAL)

0x04F000A4 TV_ENC_TEST_CTL_REG13

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000002

This is a control register used for test control purpose only.

TV_ENC_TEST_CTL_REG13

Bits	Name	Description
31:3	RESERVED_BITS31_3	
2	MV_PULSE_RAMP_MODE_EN	This bit enables the ramp on the PS, AGC and BP pulse edges. 0x0: disable the ramp mode (default) 0x1: enable the ramp mode
1	DELAY_PHASE_CHANGE_EXT_NTSC	This register bit enables phase change at near zero crossing for NTSC. 0x0: disable enhanced burst_phase_change feature 0x1: enable enhanced burst_phase_change feature (default)
0	DELAY_PHASE_CHANGE_EXT_PAL	This register bit enables phase change at near zero crossing for PAL. 0x0: disable enhanced burst_phase_change feature (default) 0x1: enable enhanced burst_phase_change feature

0x04F000A8 TV_ENC_TEST_REG14

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000030

With this register one can select the different values to enable or disable the burst phase switch point.

TV_ENC_TEST_REG14

Bits	Name	Description
31:7	RESERVED_BITS31_7	
6:4	BURST_PHASE_CHANGE_CNTR_NTSC	Counter to delay change of phase of the color burst in NTSC mode
3	RESERVED_BIT3	
2:0	BURST_PHASE_CHANGE_CNTR_PAL	Counter to delay change of phase of the color burst in NTSC mode

14.13.2 TV Encoder DAC Interface Control Registers

0x04F00100 TV_DAC_INTF_CTL_REG

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

This register contains the various control modes for TV DAC

TV_DAC_INTF_CTL_REG

Bits	Name	Description
31:10	RESERVED_BITS31_10	
9	LOAD_DETECT_EN_PWM_BYPASS	Bypass Pulse Width Modulation (PWM) Load Detect circuit. 0x0: Don't bypass PWM load detect circuit 0x1: Bypass PWM load detect circuit
8	LOAD_DET_ENABLE	Enable/disable load detection, independent of video activity 0x0: Disable load detection 0x1: Enable Load detection
7:6	RESERVED_BITS7_6	
5	DAC_HI	Video 1,2 DAC current select 0x0: 1 mA 0x1: 2 mA
4	REF_IN_SEL	Selects external reference 0x0: don't select external reference 0x1: select external reference
3	R_SET_SEL	Select external V-to-I resistor 0x0: don't select external V-to-I connector 0x1: select external V-toI connector
2	ACTIVE_ROUT_DISABLE	Also known as BUFFER_BYPASS. It enables/disables video1,2 active termination circuitry. In disabled mode, it bypasses the integrated buffer and load detection is not available. The output is voltage mode 0x0: Enable active termination circuitry 0x1: Disable active termination circuitry
1	FILTER_BYPASS	Bypass video 1,2 internal reconstruction filters 0x0: Disable bypass of internal reconstruction filter 0x1: Enable bypass of internal reconstruction filter
0	LEGACY_SEL	Connect single-ended video 1/2 DAC out to video 1/2 out pin 0x0: Do not connect single ended video DAC out to video_out pin 0x1: Connect single ended video DAC out to video_out pin

0x04F00104 TV_DAC_VIDEO_GAIN

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000F0F

This register contains the fine gain adjustment bits for Video DAC1 and DAC2

TV_DAC_VIDEO_GAIN

Bits	Name	Description
31:13	RESERVED_BITS31_13	
12:8	VIDEO2_GAIN	Fine gain adjust bits for Video2
7:5	RESERVED_BITS7_5	
4:0	VIDEO1_GAIN	Fine gain adjust bits for Video1

0x04F00108 TV_DAC_VIDEO3_GAIN

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0000000F

This register contains the fine gain adjustment bits for Video DAC3

TV_DAC_VIDEO3_GAIN

Bits	Name	Description
31:5	RESERVED_BITS31_5	
4:0	VIDEO3_GAIN	Fine gain adjust bits for Video3

0x04F0010C TV_DAC_INTF_CTL_REG2

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000077

This register contains the various control modes for DSUB DAC

TV_DAC_INTF_CTL_REG2

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10	FILTER_MODE	Enable for filter mode 0x0: set to 0 when in Svideo or composite mode 0x1: set to 1 when in DSUB mode
9	DRIVER_MODE	Enable for driver mode 0x0: set to 0 when in Svideo or composite mode 0x1: set to 1 when in DSUB mode

TV_DAC_INTF_CTL_REG2 (cont.)

Bits	Name	Description
8	SYNC_ON_G_EN	Enable Sync on Green 0x0: disable Sync on Green 0x1: enable Sync on Green
7	RESERVED_BITS7	
6:4	R_SEL	Selects DAC internal load
3	RESERVED_BITS3	
2:0	I_SEL	Selects DAC current. 000 means 1 mA 111 means 15 mA

0x04F00110 TV_DAC_INTF_CTL_REG3

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

The DSUB triple DAC is a generic DAC which can be used for Composite, S-Video or DSUB (mini VGA) mode. This register should be used only when the DSUB triple DAC is in S_video or Composite mode.

In composite mode by default the composite signal is sent over video1 output of the DSUB DAC. Use this register to send the composite signal over the video3 output of the DSUB DAC instead of video1.

In SVideo mode by default the luma is sent over Video1 and Chroma over Video2 output of the DSUB DAC.Use this register to send the luma over Video3 output of the DSUB DAC. The Chroma remains on the Video2 output of the DSUB DAC.

TV_DAC_INTF_CTL_REG3

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	DAC3_EN	0x0: Disable Video3 and enable Video1 (default) 0x1: Enable Video3 and disable Video1

0x04F00114 TV_DAC_INTF_CTL_REG4

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x0000000

This register contains miscellaneous control bits for the DSUB triple DAC

TV_DAC_INTF_CTL_REG4

Bits	Name	Description
31:12	RESERVED_BITS31_12	
11:0	DSUB_CONTROL_BITS	Misc DAC control bits

14.13.3 TV Encoder Interrupt Registers

0x04F00200 TV_INTR_ENABLE

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

The TV_INTR_ENABLE register is used to enable the TV_ENC interrupts

TV_INTR_ENABLE

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5:0	INTR_ENABLE	Setting (1) a specific bit will enable the respective interrupt source within the TV to send a level interrupt out of the TV_ENC. Clearing (0) that bit will disable it from generating the TV_ENC interrupt. Bit0: Load present on Video1 Bit1: Load present on Video2 Bit 2 : Load removed on Video1 Bit 3 : Load removed on Video2 Bit 4 : Load present on Video3 Bit 5 : Load removed on Video3

0x04F00204 TV_INTR_STATUS

Type: Read
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

The TV_INTR_STATUS register is the TV_ENC interrupt status register

TV_INTR_STATUS

Bits	Name	Description
31:6	RESERVED_BITS31_6	

TV_INTR_STATUS (cont.)

Bits	Name	Description
5:0	INTR_STATUS	When a TV_ENC interrupt occurs, then reading this register will indicate what caused the interrupt since that each bit indicates the source of the interrupt that had happened. If multiple interrupt sources had happened, then multiple bits of this register will be set Bit0: Load present on Video1 Bit1: Load present on Video2 Bit 2 : Load removed on Video1 Bit 3 : Load removed on Video2 Bit 4 : Load present on Video3 Bit 5 : Load removed on Video3

0x04F00208 TV_INTR_CLEAR

Type: Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000000

The TV_INTR_CLEAR register is used to clear the TV_ENC interrupts

TV_INTR_CLEAR

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5:0	INTR_CLEAR	To clear the interrupt, make sure the interrupt has occurred, and then clear the corresponding bit by setting it to 1. This is a write only register. So a read from this register would be all 0's. Bit0: Load present on Video1 Bit1: Load present on Video2 Bit 2 : Load removed on Video1 Bit 3 : Load removed on Video2 Bit 4 : Load present on Video3 Bit 5 : Load removed on Video3

14.13.4 TV Encoder Clock Gating Register

0x04F00250 TV_CGC_ENABLE

Type: Read/Write
Clock: CC_TV_ENC_CLK
Reset State: 0x00000001

The TV_CGC_ENABLE register is used to enable the automatic functional clock gating mechanism inside the TV_ENC core, where the clocks are gated depending on the operation

mode. For maximum power saving leave the register bit set to 1 during initialization. To force the clock to be ON regardless of the operation scenario, set the associated enable bit to 0

TV_CGC_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	TV_CGC_EN	Enables auto functional gating 0x0: disable auto functional gating 0x1: enable auto functional gating (default)

14.14 JPEG Registers (0x05000000 JPEGD_BASE)

This section contains the JPEG registers.

14.14.1 JPEG decoder registers

0x05000000 JPEG_CTRL_COMMON

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG common control register.

JPEG_CTRL_COMMON

Bits	Name	Description
31:5	UNUSED	Unused.
4	JPEG_CTRL_COMMON_ZZ_OVERRIDE_EN	Normally quantization tables are accessed in the JPEG zig zag pattern. This override switch allows the tables to be accessed in raster order, that is, from left to right in a rows from the top to the bottom. 0x0: Disable zig zag override 0x1: Enable zig zag override
3:0	JPEG_CTRL_COMMON_MODE	Controls the current processing mode of the JPEG block. One modes is currently defined. The decode mode (0x0) is the mode in which the JPEG block performs decodes of baseline JPEG scans. 0x0: Decode mode 0x1: Encode mode 0x2: Reserved_1 0x3: Reserved_2 0x4: Reserved_3 0x5: Reserved_4 0x6: Reserved_5 0x7: Reserved_6 0x8: Reserved_7 0x9: Reserved_8 0xA: Reserved_9 0xB: Reserved_10 0xC: Reserved_11 0xD: Reserved_12 0xE: Reserved_13 0xF: Reserved_14

0x05000008 JPEG_CTRL_ENCODE

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG encode control register.

JPEG_CTRL_ENCODE

Bits	Name	Description
31:5	UNUSED_1	Unused.
4	JPEG_CTRL_ENCODE_EOI_MARKER_EN	An option for adding EOI marker at the end of SCAN. 0x0: Stop after JPEG scan completes 0x1: Suffix JPEG scan with EOI marker
3:0	UNUSED_2	Unused.

0x05000010 JPEG_STATUS

Type: Read
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG status register.

JPEG_STATUS

Bits	Name	Description
31:14	UNUSED_1	Unused.
13	JPEG_STATUS_REGISTER_TIMEOUT	This field is set to 1 when JPEG register interface is hanged or overrun JPEG_REGISTER_TIMEOUT setting value. 0x0: No JPEG register interface time-out 0x1: JPEG register interface time-out
12	JPEG_STATUS_DHDQ_EOI	This field is set to 1 when the end-of-image marker is encountered during a decode. 0x0: EOI marker not yet encountered 0x1: EOI marker encountered
11	JPEG_STATUS_DHDQ_ERR_UNESCAPED_FF	This field is set to 1 if during a decode a 0xff sequence is encountered which is not part of a marker and not escaped with 0x00. 0x0: No un-escaped 0xFF in stream 0x1: Encountered 0xFF in stream which was not followed by 0x00

JPEG_STATUS (cont.)

Bits	Name	Description
10	JPEG_STATUS_DHDQ_ERR_INV_HUFFCODE	This field is set to 1 if during a decode a series of bits is encountered which does not conform to a valid Huffman decode value. 0x0: No Huffman error 0x1: Encountered invalid Huffman code in JPEG scan
9	JPEG_STATUS_DHDQ_ERR_INV_MARKER	This field is set to 1 if during a decode a restart marker is expected, and the marker decoded does not look like a restart marker. 0x0: No marker error 0x1: Encountered unknown marker in JPEG scan
8	JPEG_STATUS_DHDQ_ERR_RSTRT_SEQ	This field is set to 1 if during a decode a restart marker is encountered which contains an incorrect count value 0x0: No restart marker sequence error 0x1: Encountered restart marker with incorrect sequence number
7	JPEG_STATUS_DHDQ_ERR_RSTRT_OVRFLW	This field is set to 1 if during a decode the JPEG scan data contains an unexpected RESTART marker. 0x0: No overflow error with restart markers 0x1: Restart marker encountered in unexpected position in scan
6	JPEG_STATUS_DHDQ_ERR_RSTRT_UNDFLW	This field is set to 1 if during a decode the JPEG scan data is missing an expect restart marker. 0x0: No underflow error with restart markers 0x1: Restart missing from expected position in scan
5	JPEG_STATUS_DHDQ_ERR_SCAN_OVRFLW	This field is set to 1 if during a decode the JPEG scan data contains too many bits. 0x0: No overflow in scan data 0x1: JPEG image data contains too many bits
4	JPEG_STATUS_DHDQ_ERR_SCAN_UNDFLW	This field is set to 1 if during a decode the JPEG scan data ends prematurely. 0x0: No underflow in scan data 0x1: JPEG image data ended early
3:0	UNUSED_2	Unused.

0x05000014 JPEG_SOF_REG_0

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG start-of-frame register 0.

JPEG_SOF_REG_0

Bits	Name	Description
31:8	UNUSED	Unused.

JPEG_SOF_REG_0 (cont.)

Bits	Name	Description
7:0	JPEG_SOF_REG_0_NF	This is the number of image components in current frame as defined in CCITT T.81 B.2.2. Currently, 1 or 3 components are supported. It is for decoding.

0x05000018 JPEG_SOF_REG_1

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG start-of-frame register 1.

JPEG_SOF_REG_1

Bits	Name	Description
31:24	UNUSED	Unused.
23:16	JPEG_SOF_REG_1_C	This is the component identifier as defined in CCITT T.81 B.2.2. It is for decoding or encoding.
15:12	JPEG_SOF_REG_1_H	This is the horizontal sampling factor as defined in CCITT T.81 B.2.2. It is for decoding and encoding.
11:8	JPEG_SOF_REG_1_V	This is the vertical sampling factor as defined in CCITT T.81 B.2.2. It is for decoding and encoding.
7:0	JPEG_SOF_REG_1_TQ	This is the destination specifier as defined in CCITT T.81 B.2.2. It is for decoding and encoding.

0x0500001C JPEG_SOF_REG_2

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG start-of-frame register 2.

JPEG_SOF_REG_2

Bits	Name	Description
31:16	JPEG_SOF_REG_2_Y	This is the image height as defined in CCITT T.81 B.2.2. It is for decoding.
15:0	JPEG_SOF_REG_2_X	This is the image width as defined in CCITT T.81 B.2.2. It is for decoding.

0x05000020 JPEG_SOS_REG_0

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG start-of-scan register 0.

JPEG_SOS_REG_0

Bits	Name	Description
31:24	JPEG_SOS_REG_0_NS	Number of components in scan as defined CCITT T.81 B.2.3. It is for encoding.
23:0	UNUSED	Unused.

0x05000024 JPEG_SOS_REG_1

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG start-of-scan register 1.

JPEG_SOS_REG_1

Bits	Name	Description
31:16	UNUSED	Unused.
15:8	JPEG_SOS_REG_1_CS	Component specifier as defined in CCITT T.81 B.2.3. It is for decoding and encoding.
7:4	JPEG_SOS_REG_1_TD	DC entropy coding destination specifier as defined in CCITT T.81 B.2.3. It is for decoding and encoding.
3:0	JPEG_SOS_REG_1_TA	AC entropy coding destination specifier as defined in CCITT T.81 B.2.3. It is for decoding and encoding.

0x05000030 JPEG_QT_IDX

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG quantize table index register. The operation of this register is closely connected to the JPEG_DWT register.

JPEG_QT_IDX

Bits	Name	Description
31:16	UNUSED	Unused.
15:8	JPEG_QT_IDX_TABLE_1	This field works similarly to JPEG_QT_IDX_TABLE_0. Write 0xff to this field to select quantize 1 for subsequent reads from JPEG_DQT. It is for decoding and encoding.
7:0	JPEG_QT_IDX_TABLE_0	This field is used to define an index into quantization table 0 for reading or writing, and is also used to select table 0 for reading. When the value 0xff is written to this field, the index is reset to 0, and subsequent reads from the JPEG_DQT table will come from quantize table 0. When reads take place from JPEG_DQT, this index must be incremented with a separate write operation. When writes to quantize table 0 take place via the JPEG_DQT register, this value is auto incremented. The interpretation of this value is affected by the JPEG_CTRL_COMMON_ZZ_OVERRIDE_EN switch. It is for decoding and encoding.

0x05000034 JPEG_DQT

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG define-quantize-table register. This register is used to read and write values to quantize table, and its operation is closely connected to that of the JPEG_QT_IDX register. When reads take place from this register, the quantize table is selected via a write of 0xff to the corresponding field in JPEG_QT_IDX. For writes, the selected table is specified in the JPEG_DQT_Tq field.

NOTE Reads from this register are only valid if the JPEG block is otherwise idle; during encoding or decoding operations, internal pointers take priority.

JPEG_DQT

Bits	Name	Description
31:28	UNUSED_1	Unused.
27:24	JPEG_DQT_TQ	Quantize table destination identifier as defined by CCITT T.81 B.2.4.1. It is for decoding or encoding.
23:16	UNUSED_2	Unused.
15:0	JPEG_DQT_QK	Quantize table entry as defined by CCITT T.81 B.2.4.1. It is for decoding or encoding.

0x05000040 JPEG_DRI

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG define restart interval register.

JPEG_DRI

Bits	Name	Description
31:16	UNUSED	Unused.
15:0	JPEG_DRI_RI	This is the restart interval as defined by CCITT T.81 B.2.4.4. It is for decoding and encoding.

0x05000050 JPEG_DHT_REG_0

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG define Huffman table register 0.

JPEG_DHT_REG_0

Bits	Name	Description
31:8	UNUSED	Unused.
7:4	JPEG_DHT_REG_0_TH	Huffman table destination specified by CCITT T.81 B.2.4.2. It is for decoding.
3:0	JPEG_DHT_REG_0_TC	Table class as defined by CCITT T.81 B.2.4.2. It is for decoding. 0x0: DC 0x1: AC

0x05000054 JPEG_DHT_IDX

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG define Huffman table index.

JPEG_DHT_IDX

Bits	Name	Description
31:12	UNUSED	Unused.
11:8	JPEG_DHT_IDX_CCC_MAX	Index into the CCC and MAX memory of the Huffman decode table specified by the last write to JPEG_DHT_REG_0. These values are defined in the dHdQ block spec. It is for decoding.
7:0	JPEG_DHT_IDX_VIJ	Index into the VIJ memory of the Huffman decode table specified by the last write to JPEG_DHT_REG_0. The VIJ values are defined by CCITT T.81 B.2.4.2. It is for decoding.

0x05000058 JPEG_DHT_REG_1

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG define Huffman table register 1.

JPEG_DHT_REG_1

Bits	Name	Description
31:24	JPEG_DHT_REG_1_VIJ_0	This is the VIJ value for the Huffman table defined by the last write to JPEG_DHT_REG_0 and the index specified by JPEG_DHT_IDX_VIJ + 3. It is for decoding.
23:16	JPEG_DHT_REG_1_VIJ_1	This is the VIJ value for the Huffman table defined by the last write to JPEG_DHT_REG_0 and the index specified by JPEG_DHT_IDX_VIJ + 2. It is for decoding.
15:8	JPEG_DHT_REG_1_VIJ_2	This is the VIJ value for the Huffman table defined by the last write to JPEG_DHT_REG_0 and the index specified by JPEG_DHT_IDX_VIJ + 1. It is for decoding.
7:0	JPEG_DHT_REG_1_VIJ_3	This is the VIJ value for the Huffman table defined by the last write to JPEG_DHT_REG_0 and the index specified by JPEG_DHT_IDX_VIJ. It is for decoding.

0x0500005C JPEG_DHT_CCC_MAX

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG define Huffman table CCC and maximum.

JPEG_DHT_CCC_MAX

Bits	Name	Description
31:16	JPEG_DHT_CCC_MAX_MAX	The max code value register value as defined in the dHdQ specification for the Huffman table defined by the last write to JPEG_DHT_REG_0 and the index specified by JPEG_DHT_IDX_CCC_MAX. It is for decoding.
15:0	JPEG_DHT_CCC_MAX_CCC	The cumulative code register value as defined by the dHdQ specification for the Huffman table defined by the last write to JPEG_DHT_REG_0 and the index specified by JPEG_DHT_IDX_CCC_MAX. It is for decoding.
15:8	UNUSED	Unused.
7:0	JPEG_DHT_LI	Number of Huffman codes of length 1 to 16. Specifies the number of Huffman codes for each of the 16 possible lengthis allowed by JPEG specification. Li's are the elements of the list BITS. It is for decoding.

0x05000060 JPEG_DEC_SCALE

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG decode scaler control.

JPEG_DEC_SCALE

Bits	Name	Description
31:2	UNUSED	Unused.
1:0	JPEG_DEC_SCALE_RATIO	During JPEG decode, a limited in-line downscale function may be applied to 8x8 blocks as they are produced. The downscale ratio is defined 2 to the power specified in this field down to 1. In case of image with vertical YUV422 sampling factor, only support x1, x2 and x4. 0x0: x1 0x1: x2 0x2: x4 0x3: x8

0x05000064 JPEG_CONVERT

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG format conversion control.

JPEG_CONVERT

Bits	Name	Description
31:24	JPEG_CONVERT_MONO_CB_VALUE	This field sets the value of the cb color component for 4:2:0 gray scale encode format. 0x0: Set this field to the Cb value for monochrome images
23:16	JPEG_CONVERT_MONO_CR_VALUE	This field sets the value of the Cr color component for 4:2:0 monochrome encode format. 0x0: Set this field to the Cr value for monochrome images.
15:13	UNUSED_1	Unused.
12	JPEG_CONVERT_CLAMP_EN	This bit switches on clamping of the decoded pixel data to the range 16-255 to ensure color-key alpha works properly. 0x0: Pass through decoded data 0x1: Clamp all decoded values to [16-255]
11:10	UNUSED_2	Unused.
9	JPEG_CONVERT_CBCR_SWITCH	This field enables the switching of the chroma order from CbCr (default) to CrCb. 0x0: Chroma order - CbCr 0x1: Chroma order - CrCb
8	JPEG_CONVERT_MONOCHROME_EN	This field enables monochrome mode. In this mode all chroma data coming into the block is replaced by the single values stored in JPEG_CONVERT_MONO_CB_VALUE and JPEG_CONVERT_MONO_CR_VALUE. 0x0: Disabled 0x1: Enabled
7:6	JPEG_CONVERT_MEM_ORG	This field specifies the memory organization used by RTDMA (either as a data source or destination). The valid values depend on the format to some degree, for example there is no single-plane (packed) 4:2:0 mode. 0x0: Packed (single-plane) 0x1: nv12 (two-plane) 0x2: Three-plane 0x3: Reserved
5:4	JPEG_CONVERT_422_MCU_TYPE	This field indicates YUV422 sampling factor. 0x0: HY=2, HCb=1, HCr=1, VY=2, VCb=2, VCr=2 0x1: HY=2, HCb=1, HCr=1, VY=1, VCb=1, VCr=1 0x2: HY=1, HCb=1, HCr=1, VY=2, VCb=1, VCr=1
3:2	JPEG_CONVERT_OUTPUT_FORMAT	This field specifies the format of data leaving the convert block. 0x0: Luma only (1 plane) 0x1: 4:1:1 0x2: 4:2:0 0x3: 4:2:2

JPEG_CONVERT (cont.)

Bits	Name	Description
1:0	JPEG_CONVERT_INPUT_FORMAT	This field specifies the format of data entering the convert block. For encoding, this data either comes from the high-speed lower-video pipe or the RTDMA, and goes to the DCT block. The IDCT block is for decoding the source. The output is sent to the RTDMA. Note that 4:1:1 input data may only be input as a decode source and may only be converted to 8-block 4:2:2 organized as 4-wide by 1-high blocks. 0x0: Luma only (1 plane) 0x1: 4:1:1 0x2: 4:2:0 0x3: 4:2:2

0x05000070 JPEG_ENC_BYTE_CNT

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG encode byte counter.

JPEG_ENC_BYTE_CNT

Bits	Name	Description
31:0	JPEG_ENC_BYTE_CNT_TOT	This register indicates the total number of encoded bytes written out during the current encode. This value is reset when a new encode begins. This register may also be written to. Since any value written here will be cleared to zero when JPEG data is written, it can be used for debug purposes to ensure that encodes are proceeding normally.

0x05000080 JPEG_DEBUG

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x4a504547

JPEG debug register.

JPEG_DEBUG

Bits	Name	Description
31:0	JPEG_DEBUG	[Write operation] - 1st write operation: written data[4:0] goes to debug_bus_selection internally. Switch(debug_bus_selection) - 1:{31'd0,pixel_dct RTR} - 3:{31'd0,pixel_rtdma RTR} - 4:{31'd0,pixel_read RTR} - 7:{28'd0,decode RTR, decode RTS, encode RTR, encode RTS} - 19:{24'd0,unescape_ff_err, underflow_err, overflow_err,restart_marker_err, invalid_marker_err, invalid_huffman_err, restart_marker_underflow_err, restart_marker_overflow_err} - 23:current BYTE counter[31:0] or previous frame BYTE counter[31:0] - it will be determined 2nd write operation. - 2nd write operation: written data[3:0]==0 or 1 is selected current or previous BYTE counter. - 0: Previous frame BYTE counter - 1: Current BYTE counter if written data[3:0]==8, then it allows to receive data for DCT debug mode. - 3rd write operation: if 2nd write operation is selected DCT debug mode, the data is used to override data for input of DCT unit. written data[12]:DCT override enable. written data[11:0]:DCT override all of DCT input data. [Read operation] Each of debug information will be read back with proper selection information from 1st write operation.

0x05000084 JPEGD_SPARE

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Spare register.

JPEGD_SPARE

Bits	Name	Description
31:0	JPEGD_SPARE_00	Spare register.

0x05000088 JPEG_REGISTER_TIMEOUT

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x0000FFFF

JPEG register access time-out.

JPEG_REGISTER_TIMEOUT

Bits	Name	Description
31:16	UNUSED	Unused.
15:0	JPEG_TIMEOUT_VALUE	This field specifies the time out value of register interface.

0x05000258 JPEGD_STATUS_BUS_DATA

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEGD debug bus read back register.

JPEGD_STATUS_BUS_DATA

Bits	Name	Description
31:0	STATUS_BUS_DATA	Read back the debug bus output.

0x0500025C JPEGD_STATUS_BUS_CONFIG

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG debug signal selection.

JPEGD_STATUS_BUS_CONFIG

Bits	Name	Description
31:5	UNUSED	Unused.

JPEGD_STATUS_BUS_CONFIG (cont.)

Bits	Name	Description
4:0	STATUS_BUS_SEL	Debug bus output selection. 4 0x0: Not used_1 0x1: Not used_2 0x2: Debug bus check with 32'hAAAAAAAA 0x3: Debug bus check with 32'h55555555

0x05000260 RTDMA_JPEG_AXI_CONFIG

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000024

AXI master configuration register.

RTDMA_JPEG_AXI_CONFIG

Bits	Name	Description
31:12	UNUSED	Unused.
11	OUT_OF_ORDER_WR	Out-of-order in AXI write memory channel. Current version does not support out-of-order operation. 0x0: Disable 0x1: Enable
10	OUT_OF_ORDER_RD	Out-of-order in AXI read memory channels. Current version does not support out-of-order operation. 0x0: Disable 0x1: Enable
9:8	BOUND_LIMIT	Defines the boundary limitation of the address increment. The bursts must not cross 4-kB boundaries. 0x0: 1 k 0x1: 2 k 0x2: 4 k 0x3: No boundary
7:4	PACK_TIMEOUT	Defines the number of idle cycles to wait before incomplete burst is closed.
3:0	PACK_MAX_BLEN	Defines the maximum number of data transfers that occur within each burst. Valid value: 1 <= len <= 15

0x05000264 JPEGD_CLK_CONTROL

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x000001F5

JPEGD_CLK_CONTROL

Bits	Name	Description
31:9	UNUSED	Unused.
8	RTDMA_ENCODE_CLKON	0x0: Dynamic HW Clock Gating Enabled 0x1: Always CLock on
7	RTDMA_IDCT_CLKON	0x0: Dynamic HW Clock Gating Enabled 0x1: Always CLock on
6	RTDMA_PIXEL_CLKON	0x0: Dynamic HW Clock Gating Enabled 0x1: Always CLock on
5	RTDMA_WCIF_CLKON	0x0: Dynamic HW Clock Gating Enabled 0x1: Always CLock on
4	AHB_CLKON	0x0: Disable 0x1: Enable
3	JPEG_CLKIDLE	0x0: Disable 0x1: Enable
2	JPEG_CLKON	0x0: Disable 0x1: Enable
1	AXI_CLKIDLE	0x0: Disable 0x1: Enable
0	AXI_CLKON	0x0: Disable 0x1: Enable

0x05000200 RTDMA_JPEG_WR_BUF_CONFIG

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Buffer configuration register.

This register is a non-shadowed register.

RTDMA_JPEG_WR_BUF_CONFIG

Bits	Name	Description
31:5	UNUSED	Unused.

RTDMA_JPEG_WR_BUF_CONFIG (cont.)

Bits	Name	Description
4:2	BUF_FORMAT	Defines the color format of the buffer. 0x0: YUV 4:2:2 0x1: YUV 4:2:0 0x2: Reserved_1 0x3: Reserved_2 0x4: Reserved_3 0x5: Reserved_4 0x6: Byte
1:0	NUM_OF_PLANES	Defines the number of planes per buffer (minus 1 - zero based). This value can be one, two or three planes, depends on format of the buffer.

0x05000204 RTDMA_JPEG_WR_OP

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Defines the primary operations for the normal data write buffer.

This is a shadowed register.

RTDMA_JPEG_WR_OP

Bits	Name	Description
31:5	UNUSED_1	Unused.
4	ALIGN	Set the video plane in the memory to be either left or right qualified-word alignment. 0x0: Left alignment 0x1: Right alignment
3:2	UNUSED_2	Unused.
1	FLIP	Enables vertical flip during transfer. Data is transferred from the video capture port to memory by writing the data in a rotated manor. 0x0: Disable 0x1: Enable
0	MIRROR	Enables horizontal mirroring during transfer. Data is transferred from the video capture port to memory by writing the data in a rotated manor. 0x0: Disable 0x1: Enable

0x05000208 RTDMA_JPEG_WR_BUF_Y_PNTR

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG buffer Y pointer register.

This register defines a pointer in memory to the buffer for the Y plane.

This is a shadowed register.

RTDMA_JPEG_WR_BUF_Y_PNTR

Bits	Name	Description
31:0	PNTR	Defines the value of the video capture port Y buffer pointer. Bits 0:2 of this field are preset in the factory to 0. It is not possible to change the setting of bits 0:2.

0x0500020C RTDMA_JPEG_WR_BUF_U_PNTR

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG buffer U pointer register.

This register defines a pointer in memory to the buffer for the U plane.

This is a shadowed register.

RTDMA_JPEG_WR_BUF_U_PNTR

Bits	Name	Description
31:0	PNTR	Defines the value of the video capture port U buffer pointer. Bits 0:2 of this field are preset in the factory to 0. It is not possible to change the setting of bits 0:2.

0x05000210 RTDMA_JPEG_WR_BUF_V_PNTR

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG buffer V pointer register.

This register defines a pointer in memory to the buffer for the V plane.

This is a shadowed register.

RTDMA_JPEG_WR_BUF_V_PNTR

Bits	Name	Description
31:0	PNTR	Defines the value of the video capture port V buffer pointer. Bits 0:2 of this field are preset in the factory to 0. It is not possible to change the setting of bits 0:2.

0x05000214 RTDMA_JPEG_WR_BUF_PITCH

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG buffer pitch register.

RTDMA_JPEG_BUF_PITCH register defines the pitch for buffer Y. The pitches for buffer U and V are calculated automatically.

RTDMA_JPEG_WR_BUF_PITCH

Bits	Name	Description
31:14	UNUSED	Unused.
13:0	PITCH	Defines the pitch value for the Y buffer. Bits 0:2 of this field are preset in the factory to 0. It is not possible to change the setting of bits 0:2.

0x05000218 RTDMA_JPEG_WR_PLANE_SIZE

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 00000000

JPEG plane size register.

RTDMA_JPEG_WR_PLANE_SIZE

Bits	Name	Description
31:29	UNUSED_1	Unused.
28:16	PLANE_VSIZE	Plane vertical size. Note: PLANE_VSIZE has to be a multiple of BLOCK_VSIZE at RTDMA_JPEG_WR_BLOCK_SIZE. (For Encode and decode)
15:13	UNUSED_2	Unused.

RTDMA_JPEG_WR_PLANE_SIZE (cont.)

Bits	Name	Description
12:0	PLANE_HSIZE	Plane horizontal size. Note: PLANE_HSIZE has to be a multiple of BLOCK_HSIZE at RTDMA_JPEG_WR_BLOCK_SIZE(For Encode and decode)

0x0500021C RTDMA_JPEG_WR_BLOCK_SIZE

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG block size register.

RTDMA_JPEG_WR_BLOCK_SIZE

Bits	Name	Description
31:12	UNUSED	Unused.
11:6	BLOCK_VSIZE	Block vertical size.
5:0	BLOCK_HSIZE	Block horizontal size.

0x05000220 RTDMA_JPEG_WR_BUFFER_SIZE

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG buffer size register.

This register defines the vertical size of the luminance (Y) plane. The size of the chroma (U and V) planes are calculated automatically.

RTDMA_JPEG_WR_BUFFER_SIZE

Bits	Name	Description
31:13	UNUSED	Unused.
12:0	BUFFER_VSIZE	Defines the vertical size (minus one) of the buffer. Current version supports long buffer mode only therefore, BUFFER_VSIZE has to be equal to PLANE_VSIZE.

0x05000224 RTDMA_JPEG_WR_STA_ACK

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG interrupt status/acknowledge register.

RTDMA_JPEG_WR_STA_ACK register is used to obtain status of interrupts and is used to acknowledge (clear) these interrupts when they are triggered. The interrupts can be enabled/disabled.

This is a non-shadowed register.

RTDMA_JPEG_WR_STA_ACK

Bits	Name	Description
31:4	UNUSED	Unused.
3	SW_RESET_ABORT_RDY_ACK	Acknowledgment of SW reset abort ready interrupt. 0x0: No effect 0x1: Reset status bit
3	SW_RESET_ABORT_RDY_STA	SW reset abort ready interrupt status. 0x0: No software reset abort ready interrupt occurred 0x1: Software reset abort ready interrupt occurred
2	ERR_STA	Error interrupt status. 0x0: No error interrupt occurred 0x1: Error interrupt occurred
2	ERR_ACK	Acknowledgment of error interrupt. 0x0: No effect 0x1: Reset status bit
1	EOF_ACK	Acknowledgment of EOF interrupt. 0x0: No effect 0x1: Reset status bit
1	EOF_STA	EOF interrupt status. 0x0: No EOF interrupt occurred 0x1: EOF interrupt occurred
0	SOF_ACK	Acknowledgment of SOF interrupt. 0x0: No effect 0x1: Reset status bit
0	SOF_STA	SOF interrupt status. 0x0: No SOF interrupt occurred 0x1: SOF interrupt occurred

0x05000228 RTDMA_JPEG_WR_INT_EN

Type: Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Interrupt enable register.

RTDMA_JPEG_WR_INT_EN

Bits	Name	Description
31:4	UNUSED	Unused.
3	SW_RESET_ABORT_RDY_EN	SW reset abort ready interrupt enable. 0x0: Interrupt disabled 0x1: Interrupt enabled
2	ERR_EN	Error interrupt enable. 0x0: Interrupt disabled 0x1: Interrupt enabled
1	EOF_EN	EOF interrupt enable. 0x0: Interrupt disabled 0x1: Interrupt enabled
0	SOF_EN	SOF interrupt enable. 0x0: Interrupt disabled 0x1: Interrupt enabled

0x05000100 RTDMA_JPEG_RD_BUF_CONFIG

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG read client buffer configuration register.

This is a non-shadowed register.

RTDMA_JPEG_RD_BUF_CONFIG

Bits	Name	Description
31:5	UNUSED	Unused.

RTDMA_JPEG_RD_BUF_CONFIG (cont.)

Bits	Name	Description
4:2	BUF_FORMAT	Defines the color format of the buffer. 0x0: YUV 4:2:2 0x1: YUV 4:2:0 0x2: Reserved_1 0x3: Reserved_2 0x4: Reserved_3 0x5: Reserved_4 0x6: Byte
1:0	NUM_OF_PLANES	Defines the number of planes per buffer (minus 1 - zero based). This value can be one, two or three planes.

0x05000104 RTDMA_JPEG_RD_BUF_MNGR_BUF_ID_FIFO

Type: Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

The entry of the BUF ID FIFO.

RTDMA_JPEG_RD_BUF_MNGR_BUF_ID_FIFO

Bits	Name	Description
31:5	UNUSED	Unused.
4	BUF_APPLY	Buffer apply attribute. To start JPEG encoding or decoding, this field must to be set.
3	BUF_EOF	Buffer end-of-field attribute. To start JPEG encoding or decoding, this field must to be set.
2	BUF_SOF	Buffer start-of-field attribute. To start JPEG encoding or decoding, this field must to be set.
1:0	RESERVED	Reserved.

0x0500010C RTDMA_JPEG_RD_BUF_Y_PNTR

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG buffer 0 Y pointer register.

This register defines a pointer in memory to the 0 Buffer for the Y plane.

This is a shadowed register.

RTDMA_JPEG_RD_BUF_Y_PNTR

Bits	Name	Description
31:0	PNTR	Defines the value of the video capture port Y buffer pointer with ID 0. Bits 0:2 of this field are preset in the factory to 0. It is not possible to change the setting of bits 0:2.

0x05000110 RTDMA_JPEG_RD_BUF_U_PNTR

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG buffer 0 U pointer register.

This register defines a pointer in memory to the 0 buffer for the U plane.

This is a shadowed register.

RTDMA_JPEG_RD_BUF_U_PNTR

Bits	Name	Description
31:0	PNTR	Defines the value of the video capture port U buffer pointer with ID 0. Bits 0:2 of this field are preset in the factory to 0. It is not possible to change the setting of bits 0:2.

0x05000114 RTDMA_JPEG_RD_BUF_V_PNTR

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG buffer 0 V pointer register.

This register defines a pointer in memory to the 0 buffer for the V plane. This register is a shadowed register.

This is a shadowed register.

RTDMA_JPEG_RD_BUF_V_PNTR

Bits	Name	Description
31:0	PNTR	Defines the value of the video capture port V buffer pointer with ID 0. Bits 0:2 of this field are preset in the factory to 0. It is not possible to change the setting of bits 0:2.

0x05000118 RTDMA_JPEG_RD_BUF_PITCH

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG read buffer pitch register.

RTDMA_VUP_BUF_PITCH register defines the pitch for buffer Y. The pitches for buffer U and V are calculated automatically.

RTDMA_JPEG_RD_BUF_PITCH

Bits	Name	Description
31:14	UNUSED	Unused.
13:0	PITCH	Defines the pitch value for the Y buffer. Bits 0:2 of this field are preset in the factory to 0. It is not possible to change the setting of bits 0:2.

0x0500011C RTDMA_JPEG_RD_PLANE_SIZE

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG buffer plane size.

RTDMA_VUP_PLANE_SIZE register defines the horizontal and vertical dimensions of the image plane that is being transferred.

This is a shadowed register.

RTDMA_JPEG_RD_PLANE_SIZE

Bits	Name	Description
31:29	UNUSED_1	Unused.

RTDMA_JPEG_RD_PLANE_SIZE (cont.)

Bits	Name	Description
28:16	PLANE_VSIZE	Defines the vertical size (minus one) of the image plane. Note: PLANE_VSIZE has to be a multiple of BLOCK_VSIZE at RTDMA_JPEG_RD_BLOCK_SIZE (decode only)
15:13	UNUSED_2	Unused.
12:0	PLANE_HSIZE	Defines the horizontal size (minus one) of the image plane. Note: PLANE_HSIZE has to be a multiple of BLOCK_HSIZE at RTDMA_JPEG_RD_BLOCK_SIZE (decode only).

0x05000120 RTDMA_JPEG_RD_BLOCK_SIZE

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x000003CF

JPEG block size register.

Each image plane is transferred to memory in rectangular blocks. This register defines the horizontal and vertical sizes of the luminance (Y) plane. The size of the chroma (U and V) planes are calculated automatically.

RTDMA_JPEG_RD_BLOCK_SIZE

Bits	Name	Description
31:12	UNUSED	Unused.
11:6	BLOCK_VSIZE	Defines the vertical size (minus one) of the block transferred to memory.
5:0	BLOCK_HSIZE	Defines the horizontal size (minus one) of the block transferred to memory.

0x05000124 RTDMA_JPEG_RD_BUFFER_SIZE

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG buffer size register.

This register defines the vertical size of the luminance (Y) plane. The size of the chroma (U and V) planes are calculated automatically.

RTDMA_JPEG_RD_BUFFER_SIZE

Bits	Name	Description
31:13	UNUSED	Unused.
12:0	BUFFER_VSIZE	Defines the vertical size (minus one) of the buffer. When the format of buffer is defined as 4:2:0 mode, the buffer vertical size should be an even number only. Current version just support long buffer mode only, therefore BUFFER_VSIZE has to be equal to PLANE_VSIZE.

0x05000128 RTDMA_JPEG_RD_STA_ACK

Type: Read/write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

JPEG interrupt status/acknowledge register.

RTDMA_JPEG_RD_STA_ACK register is used to obtain status of interrupts and is used to acknowledge (clear) these interrupts when they are triggered. The interrupts can be enabled/disabled.

This is a shadowed register.

RTDMA_JPEG_RD_STA_ACK

Bits	Name	Description
31:2	UNUSED	Unused.
1	EOF_STA	EOF interrupt status. 0x0: No EOF occurred 0x1: EOF occurred
1	EOF_ACK	EOF interrupt. 0x0: No effect 0x1: Reset status bit
0	SOF_ACK	SOF interrupt. 0x0: No effect 0x1: Reset status bit
0	SOF_STA	SOF interrupt status. 0x0: No SOF occurred 0x1: SOF occurred

0x0500012C RTDMA_JPEG_RD_INT_EN

Type: Write
Clock: AHB_SLAVE_HCLK
Reset State: 0x00000000

Interrupt enable register.

RTDMA_JPEG_RD_INT_EN

Bits	Name	Description
31:2	UNUSED	Unused.
1	EOF_EN	EOF interrupt enable. 0x0: Interrupt disabled 0x1: Interrupt enabled
0	SOF_EN	SOF interrupt enable. 0x0: Interrupt disabled 0x1: Interrupt enabled

14.15 MDP Registers (0x05100000 MDP_BASE)

This section describes the registers of Mobile Display Processor (MDP) version 4. All MDP4 registers are accessible by the ARM CPU through the Peripheral Bus AHB interface. For read accesses, the number of cycles before data is available is variable depending on the register being read.

The registers are grouped into distinct groups, according to their function or individual sub-block/pipe's local register accesses.

NOTE RGB3 and Video/Graphics3 Pipe are used for the border color feature in LM. These two pipes don't have fetch logic and just provide a solid background color for LM0/1. RGB3 is dedicated to LM0 and VG3 to LM1.

- Global general operation (0x00000 - 0x0004C)
- Interrupts (0x00050 - 0x0005C)
- EBI2 LCD parameters (0x00060 - 0x0007C)
- MDDI parameters (0x00090 - 0x0009C) : MDDI registers exist in HW but MDDP interface module has been removed in MDP4.2
- DSI 1 Command Mode parameters (0x000A0 - 0x000AC)
- DSI 2 Command Mode parameters (0x000B0 - 0x000BC)
- Internal memory chip select control register (0x000C0 - 0x000C4)
- Synchronization controls
- VSYNC_CLK registers (0x00100 - 0x001FC)
- MDP_CLK registers (0x00200 - 0x002FC)
- MGEN2MAXI control registers (0x00400 - 0x004FC)
- Overlay Processor settings (0x10000 - 0x8FFFC)
- Layer Mixer 0 (0x10004 - 0x17FFC)
- Layer Mixer 1 (0x18004 - 0x1FFFC)
- Video/Graphics1 Pipe (0x20000 - 0x2FFFC)
- Video/Graphics2 Pipe (0x30000 - 0x3FFFC)
- RGB1 Pipe (0x40000 - 0x4FFFC)
- RGB2 Pipe (0x50000 - 0x5FFFC)
- RGB3 Pipe (0x60000 - 0x6FFFC)
- Video/Graphics3 Pipe (0x70000 - 0x7FFFC)

- Layer Mixer 2 (0x80000 - 0x8FFFC)
- Primary Display Driver settings (0x90000 - 0x9FFFC)
- Secondary Display Driver settings (0xA0000 - 0xAFFFC)
- External Display Driver settings (0xB0000 - 0xBFFFC)
- DSI 2 Video Mode / LCDC Timing Generator (0xC0000 - 0xCFFFC)
- DTV Timing Generator (0xD0000 - 0xDFFFC)
- DSI 1 Video Mode Timing Generator (0xE0000 - 0xEFFFC)
- Test Bus and MISR Access (0xF0000 - 0xFFFFC)
- MDP_CLK (0xF0000 - 0xF00FC)
- HCLK (0xF0100 - 0xF01FC)
- DCLK [P2CLK](0xF0200 - 0xF02FC)
- TV_CLK (0xF0300 - 0xF03FC)
- DSI_PCLK [P1CLK](0xF0400 - 0xF04FC)
- AXI_CLK (0xF0500 - 0xF05FC)

14.15.1 Operation control registers

0x05100000 MDP_HW_VERSION

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0404_0306

The MDP_HW_VERSION register contains the major and minor versions and release number of the MDP core.

MDP_HW_VERSION

Bits	Name	Description
31:24	MAJOR_VERSION	MDP core major version.
23:16	MINOR_VERSION	MDP core minor version.
15:10	REVISION	MDP core revision number.
9:8	RELEASE_PHASE	MDP core release phase.
7:0	RELEASE	MDP core release number.

0x05100004 MDP_OVERLAYPROC0_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

This register is used to start Overlay Processor 0 (output port 0) fetching and processing Note, Overlay Processor 0 is associated strictly with DMA_P and its interfaces. If the Overlay Processor is connected directly to interface output, this start will also trigger interface write.

MDP_OVERLAYPROC0_START

Bits	Name	Description
31:0	OVERLAYPROC0_START	A write to register will start Overlay Processor 0 if the Overlay Processor's output port 0 is in On-Demand mode. Otherwise, the interface vsync automatically starts the processor and a write to this register has no effect, except for the initial start before the interface is enabled; this register could be used to make that initial starts.

0x05100008 MDP_OVERLAYPROC1_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

This register is used to start Overlay Processor 1 (output port 1) fetching and processing. Note, Overlay Processor 1 is associated strictly with DMA_S and DMA_E and its interfaces. If the Overlay Processor1 is connected directly to interface output, this start will also trigger interface write. Regarding selecting control of DMA_S and DMA_E, refer to MDP_OVERLAYPROC1_DMA_MUX_CON(0x18018)

MDP_OVERLAYPROC1_START

Bits	Name	Description
31:0	OVERLAYPROC1_START	A write to register will start Overlay Processor 1 if the Overlay Processor's output port 1 is in On-Demand mode. Otherwise, the interface vsync automatically starts the processor and a write to this register has no effect, except for the initial start before the interface is enabled; this register could be used to make that initial starts.

0x0510000C MDP_DMA_P_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_P_START register is used to start a primary DMA channel transfer.

MDP_DMA_P_START

Bits	Name	Description
31:0	DMA_P_START	A write to this register will start a DMA_P channel transfer which is only useful when output is connected to a smart panel and using Frame Buffer to refresh. If the output is LCDC, for example, DMA transfer is started automatically every vsync and a write to this register has no effect.

0x05100010 MDP_DMA_S_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_S_START register is used to start a secondary DMA channel transfer.

MDP_DMA_S_START

Bits	Name	Description
31:0	DMA_S_START	A write to this register will start a DMA_S channel transfer.

0x05100014 MDP_DMA_E_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_E_START register is used to start a external DMA channel transfer.

MDP_DMA_E_START

Bits	Name	Description
31:0	DMA_E_START	A write to this register will start a DMA_E channel transfer. This register was used to trigger the MDDI in legacy MDP4 but it doesn't do anything in MDP4.2 since MDP4.2 doesn't have smart panel connection in DMA_E. If the output is TV/DTV, for example, DMA transfer is started automatically every vsync and a write to this register has no effect.

0x05100018 MDP_DISPLAY_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DISPLAY_STATUS register is used to indicate the MDP display status.

MDP_DISPLAY_STATUS

Bits	Name	Description
31:12	RESERVED31_12	
11	OVERLAYPROC2_ACTIVE	Overlay Processor 2 is active.
10	DSI_VIDEO_ACTIVE	DSI1 Video interface is active
9	MDDI_E_ACTIVE	Reserved
8	MDDI_S_ACTIVE	DSI_S_CMD active when enabled
7	MDDI_P_ACTIVE	DSI_P_CMD active when enabled
6	DTV_ACTIVE	DTV/TV Enc interface is active.
5	LCDC_ACTIVE	DSI2 Video interface is active.
4	DMA_E_ACTIVE	DMA_E channel is active.
3	DMA_S_ACTIVE	DMA_S channel is active.
2	DMA_P_ACTIVE	DMA_P channel is active
1	OVERLAYPROC1_ACTIVE	Overlay Processor 1 is active.
0	OVERLAYPROC0_ACTIVE	Overlay Processor 0 is active.

0x0510001C MDP_SW_RESET

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_SW_RESET register is used to reset the individual pipes inside MDP.

MDP_SW_RESET

Bits	Name	Description
31:6	RESERVED31_6	
5	OVERLAYPROC2_RESET	Self cleared when reset sequence is completed. 0x1: Overlay2 reset

MDP_SW_RESET (cont.)

Bits	Name	Description
4	DMA_S_RESET	Self cleared when reset sequence is completed. 0x1: DMA_S reset
3	DMA_E_RESET	Self cleared when reset sequence is completed. 0x1: DMA_E reset
2	OVERLAYPROC1_RESET	Self cleared when reset sequence is completed. 0x1: Overlay1 reset
1	DMA_P_RESET	Self cleared when reset sequence is completed. 0x1: DMA_P reset
0	OVERLAYPROC0_RESET	Self cleared when reset sequence is completed. 0x1: Overlay0 reset

0x05100020 MDP_AXI_RD_ARB_CONFIG1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0xFFFF_FFFF

The MDP_AXI_ARB_CONFIG register is used to change how many consecutive grants are allowed by the arbiter to each of the masters. Setting to 0 means only allows 1 grant at a time to the same master, no consecutive grants. Maximum value of 0xf means 16 consecutive grants.

NOTE This register should be written only when MDP is completely IDLE.

MDP_AXI_RD_ARB_CONFIG1

Bits	Name	Description
31:28	MASTER7_WEIGHT	Number of consecutive grants allowed to Master 7 (P cursor).
27:24	MASTER6_WEIGHT	Number of consecutive grants allowed to Master 6 (DMA_P).
23:20	MASTER5_WEIGHT	Number of consecutive grants allowed to Master 5 (VG3).
19:16	MASTER4_WEIGHT	Number of consecutive grants allowed to Master 4 (RGB3).
15:12	MASTER3_WEIGHT	Number of consecutive grants allowed to Master 3 (RGB2).
11:8	MASTER2_WEIGHT	Number of consecutive grants allowed to Master 2 (RGB1).
7:4	MASTER1_WEIGHT	Number of consecutive grants allowed to Master 1 (VG2).
3:0	MASTER0_WEIGHT	Number of consecutive grants allowed to Master 0 (VG1).

0x05100024 MDP_AXI_RD_ARB_CONFIG2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0FFF

The MDP_AXI_ARB_CONFIG register is used to change how many consecutive grants are allowed by the arbiter to each of the masters. Setting to 0 means only allows 1 grant at a time to the same master, no consecutive grants. Maximum value of 0xf means 16 consecutive grants.

NOTE This register should be written only when MDP is completely IDLE.

MDP_AXI_RD_ARB_CONFIG2

Bits	Name	Description
31:12	RESERVED31_12	
11:8	MASTER10_WEIGHT	Number of consecutive grants allowed to Master 10 (E cursor).
7:4	MASTER9_WEIGHT	Number of consecutive grants allowed to Master 9 (DMA_E).
3:0	MASTER8_WEIGHT	Number of consecutive grants allowed to Master 8 (DMA_S).

0x05100028 MDP_AXI_RDMASTER_CONFIG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0001_0000

There are four AXI ports in MDP4 for Halcyon, two for each memory bus system (i.e., EBI0 and EBI1). The bus system is selected by HW automatically based on RD/WR buffer address. MDP_AXI_RDMASTER_CONFIG register selects the port (corresponding to the addressed bus system) that will be used by each MDP internal read master. This register can be changed only when the corresponding read master is idle or when MDP core is idle.

NOTE Each AXI port has a unique Master ID. SW can (a) assign different priorities for these ports in the bus arbiter (e.g) EBI0, Port0 -> High Priority; EBI0, Port1 -> Low Priority; EBI1, Port0 -> High Priority; EBI1, Port1 -> Low Priority and (b) assign MDP internal read masters to these ports based on priority requirements.

NOTE Master IDs for MDP4 AXI ports in Halcyon - 0x1C -> EBI0, Port0; 0x1D -> EBI0, Port1; 0x1E -> EBI1, Port0; 0x1F -> EBI1, Port1;

MDP_AXI_RDMASTER_CONFIG

Bits	Name	Description
31:22	RESERVED31_22	

MDP_AXI_RDMASTER_CONFIG (cont.)

Bits	Name	Description
21:20	MASTER10	DMA_E cursor 0x0: MDP0 Port 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2
19:18	MASTER9	DMA_E fetch 0x0: MDP0 Port 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2
17:16	MASTER8	DMA_S fetch 0x0: MDP0 Port 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2
15:14	MASTER7	DMA_P cursor 0x0: MDP0 Port 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2
13:12	MASTER6	DMA_P fetch 0x0: MDP0 Port 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2

9:8	MASTER4	RGB 3 pipe (Reserved for future support) 0x0: MDP0 Port 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2
7:6	MASTER3	RGB 2 pipe 0x0: MDP0 Port 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2

MDP_AXI_RDMASTER_CONFIG (cont.)

Bits	Name	Description
5:4	MASTER2	RGB 1 pipe 0x0: MDP0 Port 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2
3:2	MASTER1	Video/Graphics 2 pipe 0x0: MDP0 Port 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2
1:0	MASTER0	Video/Graphics 1 pipe 0x0: MDP0 Port 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2

0x0510002C MDP_AXI_PORT_CONFIG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_AXI_PORT_CONFIG

Bits	Name	Description
31:4	RESERVED31_4	
3	PORT3_WR_PRIORITY	Gen2AXI bridge 3, rd_wr_priority: default 0 = read has priority.
2	PORT2_WR_PRIORITY	Gen2AXI bridge 2, rd_wr_priority: default 0 = read has priority.
1	PORT1_WR_PRIORITY	Gen2AXI bridge 1, rd_wr_priority: default 0 = read has priority.
0	PORT0_WR_PRIORITY	Gen2AXI bridge 0, rd_wr_priority: default 0 = read has priority.

0x05100030 MDP_AXI_WRMASTER_CONFIG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0004

There are four AXI ports in MDP4 for Halcyon, two for each memory bus system (i.e., EBI0 and EBI1). The bus system is selected by HW automatically based on RD/WR buffer address. MDP_AXI_RDMASTER_CONFIG register selects the port (corresponding to the addressed bus

system) that will be used by each MDP internal write master. This register can be changed only when the corresponding write master is idle or when MDP core is idle.

NOTE Each AXI port has a unique Master ID. SW can (a) assign different priorities for these ports in the bus arbiter (e.g) EBI0, Port0 -> High Priority; EBI0, Port1 -> Low Priority; EBI1, Port0 -> High Priority; EBI1, Port1 -> Low Priority and (b) assign MDP internal write masters to these ports based on priority requirements.

NOTE There is no arbitration between the write masters. Therefore both masters need to be programmed to be mutual exclusive (i.e.) a unique port has to be selected for each write master.

NOTE Master IDs for MDP4 AXI ports in Halcyon - 0x1C -> EBI0, Port0; 0x1D -> EBI0, Port1; 0x1E -> EBI1, Port0; 0x1F -> EBI1, Port1;

MDP_AXI_WRMASTER_CONFIG

Bits	Name	Description
31:4	RESERVED31_4	
3:2	MASTER1	Overlay Processor Out Port 1 0x0: MDP0 Port 0x1: MDP1 Port (default) 0x2: Reserved_1 0x3: Reserved_2
1:0	MASTER0	Overlay Processor Out Port 0 0x0: MDP0 Port (default) 0x1: MDP1 Port 0x2: Reserved_1 0x3: Reserved_2

0x05100034 MDP_MAX_WRBURST_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0044

This register is used to modify the max burst size for the bus write masters. There are only 2 write masters in the MDP.

NOTE This register should be written only when MDP is completely IDLE.

MDP_MAX_WRBURST_SIZE

Bits	Name	Description
31:7	RESERVED31_7	
6:4	MASTER1	Maximum burst beat size for Overlay Processor Out Port 1. Possible values: 0x4: 16 (default) 0x2: 8 0x1: 4
3	RESERVED3	
2:0	MASTER0	Maximum burst beat size for Overlay Processor Out Port 0. Possible values: 0x4: 16 (default) 0x2: 8 0x1: 4

0x05100038 MDP_DISP_INTF_SEL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0008

This register configures the primary, secondary and external interface.

Following charts show all possible External interface connection with pipes.

Note) Since LCDC and DSI 2 video interface are sharing HW module inside MDP4, these two interfaces should be considered as the same interface.

MDP_DISP_INTF_SEL

Bits	Name	Description
31:14	RESERVED31_14	
13:12	E_SEL	External additional interface selection 0x0: DSI 1 Video 0x1: not used_1 0x2: not used_2 0x3: not used_3
11:10	S_SEL	Secondary additional interface selection 0x0: DSI 1 Video or Command 0x1: DSI 2 Video or Command 0x2: not used_1 0x3: not used_2

MDP_DISP_INTF_SEL (cont.)

Bits	Name	Description
9:8	P_SEL	Primary additional interface selection 0x0: DSI 1 Video or Command 0x1: DSI 2 Video or Command 0x2: not used_1 0x3: not used_2
7	DSI_CMD_INTF_SEL	Interface select for the DSI Command mode. If set to 1 it disables the MDDI interface on Primary and Secondary interface 0x0: DSI Command mode is not selected 0x1: DSI Command mode is selected
6	DSI_VIDEO_INTF_SEL	Interface select for the DSI Video mode 0x0: DSI Video interface is not selected 0x1: DSI VIdeo interface is selected
5:4	EXT_INTF_SEL	Overlay Processor 1/DMA_E output interface select: 0x0: DTV 0x1: DSI Video Mode 0x2: Reserved 0x3: TV Encoder (Analog TV)
3:2	SEC_INTF_SEL	DMA_S output interface select: 0x0: Reserved for LCDC RGB or LVDS Interface 0x1: DSI Video Mode 0x2: DSI Command Mode 0x3: Reserved for EBI2
1:0	PRIM_INTF_SEL	Overlay Processor 0/DMA_P output interface select: 0x0: Reserved for LCDC RGB or LVDS Interface 0x1: DSI Video Mode 0x2: DSI Command Mode 0x3: Reserved for EBI2

0x0510003C MDP_SW_SCRATCHPAD_REG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This 32-bit register can be used by display software driver as a scratch pad register. It doesn't control or monitor any functionality within MDP core.

MDP_SW_SCRATCHPAD_REG

Bits	Name	Description
31:0	SCRATCHPAD	Scratch pad register space for software

0x05100040 MDP_CGC_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x003F_FFFF

The MDP_CGC_EN register is used to enable the automatic functional clock gating mechanism inside the MDP, where the clocks are gated depending on the operation mode. Each bit is assigned to a gated clock tree. For maximum power saving, leave all bits at 1 during initialization. To force a block to have the clock on always regardless of the operation scenario, set the associated enable bit to 0.

MDP_CGC_EN

Bits	Name	Description
31:22	RESERVED31_22	
21	LAYER_MIXER2	Enables auto clock gating on Layer Mixer 2output path.
20	DMI	Enables auto clock gating on DMI core clock
19	SPLIT_DISPLAY	Enables auto clock gating on SPLIT_DISPLAY core clock
18	DSI2_CMD	Enables auto clock gating on DSI 2 Command mode core clock
17	DSI_CMD	Enables auto clock gating on DSI 1 Command mode core clock
16	DSI_VIDEO	Enables auto clock gating on DSI 1 Video mode timing generator core clock
15	MISR	Enables auto clock gating on MISR registers
14	MDDI	Reserved for EBI2 : Enables auto clock gating on AHB_M(EBI2) blocks core clocks.
13	AXI	Enables auto clock gating on AXI interface clocks.
12	DTV	Enables auto clock gating on DTV Timing Generator (external display) core clock.
11	LCDC	Enables auto clock gating on DSI 2 Video / LCDC Timing Generator core clock.
10	DMA_E	Enables auto clock gating on DMA_E clock.
9	DMA_S	Enables auto clock gating on DMA_S clock.
8	DMA_P	Enables auto clock gating on DMA_P clock.
7	VG3	Enables auto clock gating on V/G3 pipe. (Reserved for future support)
6	RGB3	Enables auto clock gating on RGB3 pipe. (Reserved for future support)
5	RGB2	Enables auto clock gating on RGB2 pipe.
4	RGB1	Enables auto clock gating on RGB1 pipe.
3	VG2	Enables auto clock gating on V/G2 pipe.

MDP_CGC_EN (cont.)

Bits	Name	Description
2	VG1	Enables auto clock gating on V/G1 pipe.
1	LAYER_MIXER1	Enables auto clock gating on Layer Mixer 1 output path.
0	LAYER_MIXER0	Enables auto clock gating on Layer Mixer 0 output path.

0x05100044 MDP_SEL_TEST_BUS_CLK_DOMAIN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_SEL_TEST_BUS_CLK_DOMAIN register is used to select whether the MDP_TEST_BUS output is driven with selected MDP CLK or HCLK or DSI 2 / LCDC PCLK or TV CLK or DSI 1 PCLK or AXI CLK domain test points.

MDP_SEL_TEST_BUS_CLK_DOMAIN

Bits	Name	Description
31:3	RESERVED31_3	
2:0	SEL_CLK_DOMAIN	0x0: core_clk_domain 0x1: hclk_domain 0x2: pclk_domain 0x3: tv_clk_domain 0x4: dsi_pclk_domain 0x5: axi_clk_domain

0x05100048 MDP_EBI1_ADDR_BASE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0040

MDP can access memory salves on two bus systems (e.g) EBI0 and EBI1.
MDP_EBI1_ADDR_BASE register defines the top address bits that define the address partition between the two buses

MDP_EBI1_ADDR_BASE

Bits	Name	Description
31:8	RESERVED31_8	
7:0	EBI1_ADDR_BASE	Bits <31..24> of the start address base for EBI1

0x0510004C MDP_MAX_RD_PENDING_CMD_CONFIG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_3333

MDP_MAX_RD_PENDING_CMD_CONFIG register sets the maximum limit for the number of read pending commands per MDP AXI port. This register should be written only when the corresponding AXI port is idle or when MDP is idle.

NOTE Since the read data FIFO in the AXI ports is sized as 48, max. possible pending commands of 8 cannot be supported (at burst size of 16) if MDP core clock frequency is lower than AXI frequency. But if MDP core clk frequency >= AXI clock frequency, max. pending commands for the AXI ports should be increased to 8 (programmed value = 7) for higher performance.

NOTE When MDP core clk frequency < AXI clk frequency, max. pending commands (for all ports) should be 3 (programmed value = 2) to prevent overflow of read data FIFO.

MDP_MAX_RD_PENDING_CMD_CONFIG

Bits	Name	Description
31:16	RESERVED31_16	
15	RESERVED15	
14:12	EBI1_PORT1_RD_CMD	The actual number of pending commands for the AXI port is one more than the programmed value. Default 0x1 means maximum of 2 pending requests.
11	RESERVED11	
10:8	EBI1_PORT0_RD_CMD	The actual number of pending commands for the AXI port is one more than the programmed value. Default 0x1 means maximum of 2 pending requests.
7	RESERVED7	
6:4	EBI0_PORT1_RD_CMD	The actual number of pending commands for the AXI port is one more than the programmed value. Default 0x1 means maximum of 2 pending requests.
3	RESERVED3	
2:0	EBI0_PORT0_RD_CMD	The actual number of pending commands for the AXI port is one more than the programmed value. Default 0x1 means maximum of 2 pending requests.

14.15.2 Interrupt registers

0x05100050 MDP_INTR_ENABLE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_INTR_ENABLE register is used to enable the MDP interrupts. For interrupts generated by histogram block, a further step is required: the appropriate local histogram interrupt enable registers (MDP_*_HIST_INTR_ENABLE) must be programmed.

MDP_INTR_ENABLE

Bits	Name	Description
31:0	INTR_ENABLE	Setting (1) a specific bit will enable the respective interrupt source within the MDP to send a level interrupt out of the MDP. Clearing (0) that bit will disable it from generating the MDP interrupt. Bit0: Overlay Processor 0 processing done Bit1: Overlay Processor 1 processing done Bit 2 : DMA_S transfer done Bit 3 : DMA_E transfer done Bit 4 : DMA_P transfer done Bit 5 : Video/Graphics1 histogram interrupt Bit 6 : Video/Graphics2 histogram interrupt Bit 7 : Primary vsync interrupt Bit 8 : Primary interface under run Bit 9 : External vsync interrupt Bit 10 : External interface under run Bit 11 : Sync primary line (rd_ptr) interrupt Bit 12 : Sync secondary line (rd_ptr) interrupt Bit 13 : Sync external line (rd_ptr) interrupt Bit 14 : Primary output line (wr_ptr) interrupt Bit 15 : Secondary output line (wr_ptr) interrupt Bit 16 : External output line (wr_ptr) interrupt Bit 17 : DMA_P ABL histogram interrupt Bit 18 : AXI port 0 read/write error Bit 19 : AXI port 1 read/write error Bit 20 : AXI port0 write data timeout Bit 21 : AXI port1 write data timeout Bit 22 : Primary DSI Command Autorefresh start interrupt Bit 23 : Secondary DSI Command Autorefresh start interrupt Bit 24 : Reserved Bit 25 : Reserved Bit 26 : DMA_S ABL histogram interrupt Bit 27 : Secondary vsync interrupt Bit 28 : Secondary interface under run Bit 29 : TE interval interrupt Bit 30 : Overlay Processor 2 processing done Bit 31 : LVDS PLL unlocks

0x05100054 MDP_INTR_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_INTR_STATUS register is the MDP interrupt status register.

MDP_INTR_STATUS

Bits	Name	Description
31:0	INTR_STATUS	When an MDP interrupt occurs, then reading this register will indicate what caused the interrupt since that each bit indicates the source of the interrupt that had happened. If multiple interrupt sources had happened, then multiple bits of this register will be. Bit0: Overlay Processor 0 processing done Bit1: Overlay Processor 1 processing done Bit 2 : DMA_S transfer done Bit 3 : DMA_E transfer done Bit 4 : DMA_P transfer done Bit 5 : Video/Graphics1 histogram interrupt Bit 6 : Video/Graphics2 histogram interrupt Bit 7 : Primary vsync interrupt Bit 8 : Primary interface under run Bit 9 : External vsync interrupt Bit 10 : External interface under run Bit 11 : Sync primary line (rd_ptr) interrupt Bit 12 : Sync secondary line (rd_ptr) interrupt Bit 13 : Sync external line (rd_ptr) interrupt Bit 14 : Primary output line (wr_ptr) interrupt Bit 15 : Secondary output line (wr_ptr) interrupt Bit 16 : External output line (wr_ptr) interrupt Bit 17 : DMA_P ABL histogram interrupt Bit 18 : AXI port 0 read/write error Bit 19 : AXI port 1 read/write error Bit 20 : AXI port0 write data timeout Bit 21 : AXI port1 write data timeout Bit 22 : Primary DSI Command Autorefresh start interrupt Bit 23 : Secondary DSI Command Autorefresh start interrupt Bit 24 : Reserved Bit 25 : Reserved Bit 26 : DMA_S ABL histogram interrupt Bit 27 : Secondary vsync interrupt Bit 28 : Secondary interface under run Bit 29 : TE interval interrupt Bit 30 : Overlay Processor 2 processing done Bit 31 : LVDS PLL unlocks

0x05100058 MDP_INTR_CLEAR

Type: Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_INTR_CLEAR register is used to clear all the MDP interrupts, except interrupts generated by the histogram blocks. To clear interrupts generated by histogram blocks, use specific local clear registers (MDP_*_HIST_INTR_CLEAR).

MDP_INTR_CLEAR

Bits	Name	Description
31:0	INTR_CLEAR	To clear the interrupt, make sure the interrupt has occurred, and then clear (0) this bit. Setting (1) a specific bit will clear the respective interrupt. A read from this register would indicate if the respective interrupt source is cleared (the bit is set (1)). So, at power up, it would read all 1's. Bit0: Overlay Processor 0 processing done Bit1: Overlay Processor 1 processing done Bit 2 : DMA_S transfer done Bit 3 : DMA_E transfer done Bit 4 : DMA_P transfer done Bit 5 : Reserved Bit 6 : Reserved Bit 7 : Primary vsync interrupt Bit 8 : Primary interface under run Bit 9 : External vsync interrupt Bit 10 : External interface under run Bit 11 : Sync primary line (rd_ptr) interrupt Bit 12 : Sync secondary line (rd_ptr) interrupt Bit 13 : Sync external line (rd_ptr) interrupt Bit 14 : Primary output line (wr_ptr) interrupt Bit 15 : Secondary output line (wr_ptr) interrupt Bit 16 : External output line (wr_ptr) interrupt Bit 17 : Reserved Bit 18 : AXI port 0 read/write error Bit 19 : AXI port 1 read/write error Bit 20 : AXI port0 write data timeout Bit 21 : AXI port1 write data timeout Bit 22 : Primary DSI Command Autorefresh start interrupt Bit 23 : Secondary DSI Command Autorefresh start interrupt Bit 24 : Reserved Bit 25 : Reserved Bit 26 : Reserved Bit 27 : Secondary vsync interrupt Bit 28 : Secondary interface under run Bit 29 : TE interval interrupt Bit 30 : Overlay Processor 2 processing done Bit 31 : LVDS PLL unlocks

14.15.3 EBI2 registers

MDP4.2 core has EBI2 interface only for core level verification purpose. Do not use EBI2 registers at the chip level.

0x05100060 MDP_EBI2_LCD0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_EBI2_LCD0 register stores the base address of a primary LCD panel connected to EBI2.

MDP_EBI2_LCD0

Bits	Name	Description
31:0	BASE_ADDR	This address is assumed to be at least half-word aligned, so bit [0] is ignored.

0x05100064 MDP_EBI2_LCD1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_EBI2_LCD1 register stores the base address of a secondary LCD panel connected to EBI2.

MDP_EBI2_LCD1

Bits	Name	Description
31:0	BASE_ADDR	This address is assumed to be at least half-word aligned, so bit [0] is ignored.

0x05100068 MDP_EBI2_LCD0_YSTRIDE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_EBI2_LCD0_YSTRIDE register provides the y-stride for a primary panel connected to EBI2

MDP_EBI2_LCD0_YSTRIDE

Bits	Name	Description
31:15	RESERVED_BITS31_15	
14	EBI2_YSTRIDE_EN	In memory mapped devices, if this bit is set (1) it indicates that the display size (width) is larger than the ROI width. When set, ebi2_ystride is used to write to a memory-mapped panel at EBI2_LCD0_ADDR. This bit can also be set to write to an external memory device in EBI2 space for TEST PURPOSES.
13:0	EBI2_YSTRIDE	The ystride of the LCD device attached to ebi2 interface in bytes.

0x0510006C MDP_EBI2_LCD1_YSTRIDE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_EBI2_LCD1_YSTRIDE register provides the y-stride for a secondary panel connected to EBI2

MDP_EBI2_LCD1_YSTRIDE

Bits	Name	Description
31:15	RESERVED_BITS31_15	
14	EBI2_YSTRIDE_EN	In memory mapped devices, if this bit is set (1) it indicates that the display size (width) is larger than the ROI width. When set, ebi2_ystride is used to write to a memory-mapped panel at EBI2_LCD1_ADDR. This bit can also be set to write to an external memory device in EBI2 space for TEST PURPOSES.
13:0	EBI2_YSTRIDE	The ystride of the LCD device attached to ebi2 interface in bytes.

0x05100070 MDP_EBI2_PORTMAP_MODE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_EBI2_PORTMAP_MODE register is the EBI2 LCD portmap mode register.

MDP_EBI2_PORTMAP_MODE

Bits	Name	Description
31:2	RESERVED_BITS31_2	

MDP_EBI2_PORTMAP_MODE (cont.)

Bits	Name	Description
1	LCD1_PORTMAP_MODE	When this bit is set (1), it indicates that the LCD1 on EBI2 requires a port-mapped write. Otherwise, the writes to EBI2 use the regular memory map one starting from the base address.
0	LCD0_PORTMAP_MODE	When this bit is set (1), it indicates that the LCD0 on EBI2 requires a port-mapped write. Otherwise, the writes to EBI2 use the regular memory map one starting from the base address.

14.15.4 DMI registers

0x05100080 MDP_DMI_CON

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x1555_0000

The MDP_PIPE_BUF_CON is used to control DMI interface for each MDP pipe.

MDP_DMI_CON

Bits	Name	Description
31:30	RESERVED31_30	
29:28	DMA_E_NUM_BUF	DMA_E number of buffer -1(0
27:26	DMA_S_NUM_BUF	DMA_S number of buffer -1(0
25:24	DMA_P_NUM_BUF	DMA_P number of buffer -1(0
23:22	RGB2_NUM_BUF	RGB2 number of buffer -1(0
21:20	RGB1_NUM_BUF	RGB1 number of buffer -1(0
19:18	VG2_NUM_BUF	VG2 number of buffer -1(0
17:16	VG1_NUM_BUF	VG1 number of buffer -1(0
15	DMI_SYNC_SEL	DMI frame synchronization source selection 0x1: frame synchronization by DMA pipe start 0x0: frame synchronization by DMA pipe done
14	DMA_E_BUF_SKIP_EN	If the control bit set to `1', DMI interface for DMA_E is only picked up latest DMI buffer ID what rotator DMI sent even if Rotator DMI sent several Buffer IDs that is non-block DMI mode.
13	DMA_S_BUF_SKIP_EN	If the control bit set to `1', DMI interface for DMA_S is only picked up latest DMI buffer ID what rotator DMI sent even if Rotator DMI sent several Buffer IDs that is non-block DMI mode
12	DMA_P_BUF_SKIP_EN	If the control bit set to `1', DMI interface for DMA_P is only picked up latest DMI buffer ID what rotator DMI sent even if Rotator DMI sent several Buffer IDs that is non-block DMI mode

MDP_DMI_CON (cont.)

Bits	Name	Description
11	RGB2_BUF_SKIP_EN	If the control bit set to `1', DMI interface for RGB2 is only picked up latest DMI buffer ID what rotator DMI sent even if Rotator DMI sent several Buffer IDs that is non-block DMI mode
10	RGB1_BUF_SKIP_EN	If the control bit set to `1', DMI interface for RGB1is only picked up latest DMI buffer ID what rotator DMI sent even if Rotator DMI sent several Buffer IDs that is non-block DMI mode
9	VG2_BUF_SKIP_EN	If the control bit set to `1', DMI interface for VG2 is only picked up latest DMI buffer ID what rotator DMI sent even if Rotator DMI sent several Buffer IDs that is non-block DMI mode
8	VG1_BUF_SKIP_EN	If the control bit set to `1', DMI interface for VG1is only picked up latest DMI buffer ID what rotator DMI sent even if Rotator DMI sent several Buffer IDs that is non-block DMI mode
7	DMI_RESET	DMI acknowledge buffer and strobe interface initializes to 0
6	DMA_E_DMI_EN	DMA_E pipe DMI interface enable
5	DMA_S_DMI_EN	DMA_S pipe DMI interface enable
4	DMA_P_DMI_EN	DMA_P pipe DMI interface enable
3	RGB2_DMI_EN	RGB2 pipe DMI interface enable
2	RGB1_DMI_EN	RGB1 pipe DMI interface enable
1	VG2_DMI_EN	VG2 pipe DMI interface enable
0	VG1_DMI_EN	VG1 pipe DMI interface enable

0x05100084 MDP_DMI_BUF_ID_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_PIPE_BUF_ID_STATUS is used to check BUF_ID in each MDP PIPE.

MDP_DMI_BUF_ID_STATUS

Bits	Name	Description
31:14	RESERVED31_14	
13:12	DMA_E_BUF_ID_STATUS	BUF ID is being used in DMA_E pipe
11:10	DMA_S_BUF_ID_STATUS	BUF ID is being used in DMA_S pipe
9:8	DMA_P_BUF_ID_STATUS	BUF ID is being used in DMA_P pipe
7:6	RGB2_BUF_ID_STATUS	BUF ID is being used in RGB2 pipe
5:4	RGB1_BUF_ID_STATUS	BUF ID is being used in RGB1 pipe

MDP_DMI_BUF_ID_STATUS (cont.)

Bits	Name	Description
3:2	VG2_BUF_ID_STATUS	BUF ID is being used in VG2 pipe
1:0	VG1_BUF_ID_STATUS	BUF ID is being used in VG1 pipe

14.15.5 Split Display registers

0x05100088 MDP_SPLIT_DISPLAY_CON

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_SPLIT_DISPLAY_CON is used to control MDP split display.

MDP_SPLIT_DISPLAY_CON

Bits	Name	Description
31:29	RESERVED31_29	
28	DMAP_DMAS_LINE_SPLIT	Static control signal to dictate the even split of an overlay line onto the DMA_P and then DMA_S pathis 0x1: Split the overlay width evenly between DMA_P and DMA_S 0x0: Do not split the incoming overlay between DMA_P and DMA_S
27:16	TE_LINE_INTERVAL_WATERMARK	the watermark is to generate TE interval interrupt if smart panels for split display are not synchronized that MDP will generate TE interval interrupt if TE line interval between 2 smart panels is large then TE_LINE_INTERVAL_WATERMARK value
15:8	RESERVED15_8	
7	PRIM_TIM_SYNC_EN	DSI1 Video Timing generator sync mode enable. If DSI2 Video timing generator is connected to DMA_P pipe and the timing engine has already turned on for dumb panel by MDP_LCDC_EN register prior to tuning on split display enable then, it is required to set to high accompany with split display enable to support exact-sync mode between 2 dumb panels. video split display mode 0x1: Timing generator sync to DSI2 Video timing generator in 0x0: not use sync mode

MDP_SPLIT_DISPLAY_CON (cont.)

Bits	Name	Description
6	SEC_TIM_SYNC_EN	DSI2 Video Timing generator sync mode enable. If DSI1 Video timing generator is connected to DMA_P pipe and the timing engine has already turned on for dumb panel by MDP_DSI_VIDEO_EN register prior to tuning on split display enable then, it is required to set to high accompany with split display enable to support exact-sync mode between 2 dumb panels. split display mode 0x1: Timing generator sync to DSI1 Video timing generator in video 0x0: not use sync mode
5	SPLIT_DISPLAY_EN_DB_DIS	Reserved. This bit must be "1".
4	PRIM_TIM_GEN_SEL	Reserved. This bit must be "0".
3	USE_LAYER_MIX0_2PANEL	Reserved.
2	SMART_PANEL_FREE_RUN	Select Smart Panel operation mode 0x1: Free running mode between 2 panels 0x0: Synchronous mode between 2 panels
1	SPLIT_DISPLAY_TYPE	Type of split display 0x1: Smart Panel (with frame buffer in Panel) 0x0: Dumb Panel (without frame buffer in Panel)
0	SPLIT_DISPLAY_EN	Enable split display. The ownership of 2panels start control and timing generator will be in Layer Mix0 or DMA_P registers.

0x0510008C MDP_TE_LINE_INTERVAL_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TE_LINE_INTERVAL_STATUS is indicated the number of TE line interval between 2 smart panels.

MDP_TE_LINE_INTERVAL_STATUS

Bits	Name	Description
31:12	RESERVED31_12	
11:0	TE_LINE_INTERVAL_STATUS	Status of the number of TE line interval between 2 smart panels.

14.15.6 MDDI parameter registers

MDDI registers exist in HW but MDDI interface has been removed in MDP4.2.

0x05100090 MDP_MDDI_PARAM_WR_SEL

Type: Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_MDDI_PARAM_WR_SEL register is used to select a MDDI type for writing display parameters. It also writes CLIENTID to the selected register.

MDP_MDDI_PARAM_WR_SEL

Bits	Name	Description
31:16	MDDI_VID_CLIENTID	MDDI video client id parameter
15:2	RESERVED15_2	
1:0	MDDI_LD_PARAM_SEL	Parameter register write select: 0x0: Primary MDDI set 0x1: Secondary MDDI set 0x2: External MDDI set

0x05100094 MDP_MDDI_PARAM

Type: Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_MDDI_PARAM register writes the display parameters to the MDDI type selected by MDP_MDDI_PARAM_WR_SEL

MDP_MDDI_PARAM

Bits	Name	Description
31:16	MDDI_VID_FORMAT_DESC	MDDI video format description parameter
15:0	MDDI_PIX_DATA_ATTR	MDDI pixel data attribute parameter

0x05100098 MDP_MDDI_DATA_XFR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_MDDI_DATA_XFR register determines if the data would be sent out of MDDI every cycle or every alternate cycle

MDP_MDDI_DATA_XFR

Bits	Name	Description
31:2	RESERVED31_2	
1	MDDI_DATA_XFR_EXT	Note: For External MDDI 0x0: Alternate cycle data transfer (default) 0x1: Every cycle data transfer
0	MDDI_DATA_XFR_PRIM	Note: For Primary MDDI 0x0: Alternate cycle data transfer (default) 0x1: Every cycle data transfer.

14.15.7 DSI 1 Command Mode parameter registers

0x051000A0 MDP_DSI_CMD_MODE_ID_MAP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0001

The MDP_DSI_COMMAND_MODE_ID_MAP register is used to MAP the DSI ID to Primary and Secondary interface. This is for DSI1 command interface.

NOTE Make sure that the ID selected for Primary and Secondary Interface are mutually exclusive.

MDP_DSI_CMD_MODE_ID_MAP

Bits	Name	Description
31:5	RESERVED31_5	
4	SEC_DSI_CMD_ID	DSI Command ID for Secondary interface. Make sure it is different from the primary ID 0x0: Secondary DSI CMD ID is set to zero (default) 0x1: Secondary DSI CMD ID is set to one
3:1	RESERVED3_1	
0	PRIM_DSI_CMD_ID	DSI Command ID for Primary interface. Make sure it is different from the secondary ID 0x0: Primary DSI CMD ID is set to zero 0x1: Primary DSI CMD ID is set to one (default)

0x051000A4 MDP_DSI_CMD_MODE_TRIGGER_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DSI_COMMAND_MODE_TRIGGER_EN register is used to enable the DSI TRIGGER processing on Primary or Secondary interface. This is for DSI1 command interface.

NOTE Only one DSI trigger is supported at any given time, i.e., the trigger processing can be enabled either for Primary or for Secondary interface but not both at the same time.

MDP_DSI_CMD_MODE_TRIGGER_EN

Bits	Name	Description
31:5	RESERVED31_5	
4	DSI_CMD_TG_INTF_SEL	Takes effect only if DSI_CMD_TG_EN is set to 1. 0x0: Use trigger mode on Primary Interface (default) 0x1: Use trigger mode on Secondary Interface
3:1	RESERVED3_1	
0	DSI_CMD_TG_EN	DSI Command Trigger enable. Set it to 1 to enable trigger processing 0x0: Disable trigger processing (default) 0x1: Enable trigger processing

14.15.8 DSI 2 Command Mode parameter registers

0x051000B0 MDP_DSI2_CMD_MODE_ID_MAP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0001

The MDP_DSI_COMMAND_MODE_ID_MAP register is used to MAP the DSI ID to Primary and Secondary interface.

NOTE Make sure that the ID selected for Primary and Secondary Interface are mutually exclusive.

MDP_DSI2_CMD_MODE_ID_MAP

Bits	Name	Description
31:5	RESERVED31_5	

MDP_DSI2_CMD_MODE_ID_MAP (cont.)

Bits	Name	Description
4	SEC_DSI_CMD_ID	DSI Command ID for Secondary interface. Make sure it is different from the primary ID 0x0: Secondary DSI CMD ID is set to zero (default) 0x1: Secondary DSI CMD ID is set to one
3:1	RESERVED3_1	
0	PRIM_DSI_CMD_ID	DSI Command ID for Primary interface. Make sure it is different from the secondary ID 0x0: Primary DSI CMD ID is set to zero 0x1: Primary DSI CMD ID is set to one (default)

0x051000B4 MDP_DSI2_CMD_MODE_TRIGGER_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DSI_COMMAND_MODE_TRIGGER_EN register is used to enable the DSI TRIGGER processing on Primary or Secondary interface.

NOTE Only one DSI trigger is supported at any given time, i.e., the trigger processing can be enabled either for Primary or for Secondary interface but not both at the same time.

MDP_DSI2_CMD_MODE_TRIGGER_EN

Bits	Name	Description
31:5	RESERVED31_5	
4	DSI_CMD_TG_INTF_SEL	Takes effect only if DSI_CMD_TG_EN is set to 1. 0x0: Use trigger mode on Primary Interface (default) 0x1: Use trigger mode on Secondary Interface
3:1	RESERVED3_1	
0	DSI_CMD_TG_EN	DSI Command Trigger enable. Set it to 1 to enable trigger processing 0x0: Disable trigger processing (default) 0x1: Enable trigger processing

14.15.9 Internal memory chip select advanced control register

0x051000C0 MDP_CS_CONTROL_0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The legacy MDP doesn't control internal memory CS (chip select) efficiently in terms of power. This register controls the memory CS control method and can be used for power consumption comparison.

MDP_CS_CONTROL_0

Bits	Name	Description
31:24	RGB2_PIPE_CS_MODE	RGB2 pipe memory CS control mode. Each bit controls different module and `0" is legacy mode and `1' is advanced mode. bit 7 : Reserved bit 6 : Reserved bit 5 : Reserved bit 4 : Reserved bit 3 : Reserved bit 2 : IGC LUT bit1: Scaler bit0: Fetch line buffer
23:16	RGB1_PIPE_CS_MODE	RGB1 pipe memory CS control mode. Each bit controls different module and `0" is legacy mode and `1' is advanced mode. bit 7 : Reserved bit 6 : Reserved bit 5 : Reserved bit 4 : Reserved bit 3 : Reserved bit 2 : IGC LUT bit1: Scaler bit0: Fetch line buffer
15:8	VG2_PIPE_CS_MODE	VG2 pipe memory CS control mode. Each bit controls different module and `0" is legacy mode and `1' is advanced mode. bit 7 : IGC_LUT bit 6 : QSEED bit 5 : Scaler line buffer bit 4 : HIST LUT bit 3 : HIST BIN bit 2 : de-interlace bit1: Upsampler bit 0: Fetch line buffer

MDP_CS_CONTROL_0 (cont.)

Bits	Name	Description
7:0	VG1_PIPE_CS_MODE	VG1 pipe memory CS control mode. Each bit controls different module and `0" is legacy mode and `1' is advanced mode. bit 7 : IGC_LUT bit 6 : QSEED bit 5 : Scaler line buffer bit 4 : HIST LUT bit 3 : HIST BIN bit 2 : de-interlace bit1: Upsampler bit0: Fetch line buffer

0x051000C4 MDP_CS_CONTROL_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The legacy MDP doesn't control internal memory CS (chip select) efficiently in terms of power. This register controls the memory CS control method and can be used for power consumption comparison.

MDP_CS_CONTROL_1

Bits	Name	Description
31:24	LM_PIPE_CS_MODE	LM pipe memory CS control mode. Each bit controls different module and `0" is legacy mode and `1' is advanced mode. bit 7 : Reserved bit 6 : Reserved bit 5 : Reserved bit 4 : Reserved bit 3 : Reserved bit 2 : Reserved bit1: LM1 Packer bit0: LM0 Packer
23:16	DMA_E_PIPE_CS_MODE	DMA_E pipe memory CS control mode. Each bit controls different module and `0" is legacy mode and `1' is advanced mode. bit 7 : Reserved bit 6 : Reserved bit 5 : Reserved bit 4 : Reserved bit 3 : Reserved bit 2 : Deflickering Filter bit1: Cursor Fetch line buffer bit0: Image Fetch line buffer

MDP_CS_CONTROL_1 (cont.)

Bits	Name	Description
15:8	DMA_S_PIPE_CS_MODE	DMA_S pipe memory CS control mode. Each bit controls different module and `0" is legacy mode and `1' is advanced mode. bit 7: Reserved bit 6: Reserved bit 5: Packer bit 4: IGC LUT bit 3: HIST LUT bit 2: HIST BIN bit1: Reserved bit 0: Image Fetch
7:0	DMA_P_PIPE_CS_MODE	DMA_P pipe memory CS control mode. Each bit controls different module and `0" is legacy mode and `1' is advanced mode. bit 7: Reserved bit 6: Reserved bit 5: Packer bit 4: IGC LUT bit 3: HIST LUT bit 2: HIST BIN bit 1: Cursor Fetch bit 0: Image Fetch

0x051000D0 MDP_OVERLAYPROC2_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

This register is used to start Overlay Processor 2 fetching and processing Note, Overlay Processor 2is NOT associated with ANY DMA or external interfaces. The only path for the Overlay Processor 2 is back to memory.

MDP_OVERLAYPROC2_START

Bits	Name	Description
31:0	OVERLAYPROC2_START	A write to register will start Overlay Processor 2 since it is always in On-Demand mode. There is no way to route an interface vsync to kick start Overlay Processor 2. All register programming should be complete before kick starting the operation.

14.15.10 Synchronization registers

0x05100100 MDP_SYNC_CONFIG_P

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0xFFE7_FFFF

The MDP_SYNC_CONFIG_P register is a primary synchronization configuration register.

If the height is greater than 2048, the MDP_SYNC_CONFIG_P_OVERRIDE register must be used.

MDP_SYNC_CONFIG_P

Bits	Name	Description
31:21	HEIGHT	Display height - 1. It is the vertical total number of lines.
20	VSYNC_IN_EN	Setting (1) this bit will sync with the external frame sync input
19	VSYNC_COUNTER_EN	Setting (1) this bit to enable the internal counter
18:0	VSYNC_COUNT	This scale value to be programmed is the ratio of the MDP VSYNC clock frequency to LCD panel frequency divided by the no. of rows (lines) in the LCD panel. For example, if the VSYNC clock is 133 MHz and the LCD is 176 lines (rows) and 220 pixels (columns) at 60 Hz, then the value to be programmed is 133 * 10^6 / (60 * 176) = 12594 That is, it takes 12594 MDP clocks to complete writing one line in the LCD panel.

0x05100104 MDP_SYNC_CONFIG_S

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0xFFE7_FFFF

The MDP_SYNC_CONFIG_S register is a secondary synchronization configuration register.

If the height is greater than 2048, the MDP_SYNC_CONFIG_S_OVERRIDE register must be used.

MDP_SYNC_CONFIG_S

Bits	Name	Description
31:21	HEIGHT	Display height - 1. It is the vertical total number of lines.
20	VSYNC_IN_EN	Setting (1) this bit will sync with external frame sync input
19	VSYNC_COUNTER_EN	Setting (1) this bit will enable the internal counter

MDP_SYNC_CONFIG_S (cont.)

Bits	Name	Description
18:0	VSYNC_COUNT	This scale value to be programmed is the ratio of the MDP VSYNC clock frequency to LCD panel frequency divided by the no. of rows (lines) in the LCD panel. For example, if the VSYNC clock is 133 MHz and the LDC is 176 lines (rows) and 220 pixels (columns) at 60 Hz, then the value to be programmed is 133 * 10^6 / (60 * 176) = 12594 That is, it takes 12594 MDP clocks to complete writing one line in the LCD panel.

0x05100108 MDP_SYNC_CONFIG_E

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0xFFE7_FFFF

The MDP_SYNC_CONFIG_E register is an external synchronization configuration register.

If the height is greater than 2048, the MDP_SYNC_CONFIG_E_OVERRIDE register must be used.

MDP_SYNC_CONFIG_E

Bits	Name	Description
31:21	HEIGHT	Display height - 1. It is the vertical total number of lines.
20	VSYNC_IN_EN	Setting (1) this bit will sync with external frame sync input
19	VSYNC_COUNTER_EN	Setting (1) this bit will enable the internal counter
18:0	VSYNC_COUNT	This scale value to be programmed is the ratio of the MDP VSYNC clock frequency to LCD panel frequency divided by the no. of rows (lines) in the LCD panel. For example, if the VSYNC clock is 133 MHz and the LDC is 176 lines (rows) and 220 pixels (columns) at 60 Hz, then the value to be programmed is 133 * 10^6 / (60 * 176) = 12594 That is, it takes 12594 MDP clocks to complete writing one line in the LCD panel.

0x0510010C MDP_SYNC_WRCOUNT_P

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

The MDP_SYNC_STATUS_P register is a primary synchronization status register. Writing to this register loads the line counter and is equivalent to providing a software Vsync.

MDP_SYNC_WRCOUNT_P

Bits	Name	Description
31:28	RESERVED31_28	
27:16	FRAME_COUNT	Writing to this register will load the counter according to the written value.
15:12	RESERVED15_12	
11:0	LINE_COUNT	Writing to this register will load the counter according to the written value.

0x05100110 MDP_SYNC_WRCOUNT_S

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

The MDP_SYNC_STATUS_S register is a secondary synchronization status register. Writing to this register loads the line counter and is equivalent to providing a software Vsync.

MDP_SYNC_WRCOUNT_S

Bits	Name	Description
31:28	RESERVED31_28	
27:16	FRAME_COUNT	Writing to this register will load the counter according to the written value.
15:12	RESERVED15_12	
11:0	LINE_COUNT	Writing to this register will load the counter according to the written value.

0x05100114 MDP_SYNC_WRCOUNT_E

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

The MDP_SYNC_STATUS_E register is an external synchronization status register. Writing to this register loads the line counter and is equivalent to providing a software Vsync.

MDP_SYNC_WRCOUNT_E

Bits	Name	Description
31:28	RESERVED31_28	

MDP_SYNC_WRCOUNT_E (cont.)

Bits	Name	Description
27:16	FRAME_COUNT	Writing to this register will load the counter according to the written value.
15:12	RESERVED15_12	
11:0	LINE_COUNT	Writing to this register will load the counter according to the written value.

0x05100118 MDP_PRIMARY_VSYNC_OUT_CTRL

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0001

The MDP_PRIMARY_VSYNC_OUT_CTRL register is used to configure the primary vsync output.

MDP_PRIMARY_VSYNC_OUT_CTRL

Bits	Name	Description
31	VSYNC_OUT_EN	Set (1) this bit to enable the vsync pulse Clear (0) this bit to not enable the vsync pulse If vsync pulse is enabled, the enable pin is asserted and sync output is the pulse specified. If vsync pulse is disabled, the enabled ID is de-asserted and sync output is gated to ground.
30	VSYNC_OUT_INVERT	Set (1) this bit to invert the vsync pulse Clear (0) this bit to not invert the vsync pulse If vsync is not inverted, pulse will be active high if vsync is inverted, pulse will be active low Note: This register bit is also used to invert the incoming vsync when there is no external outgoing vsync.
29:20	RESERVED29_20	
19:0	VSYNC_OUT_WIDTH	The cycle count of the pulse width

0x0510011C MDP_SECONDARY_VSYNC_OUT_CTRL

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0001

The MDP_SECONDARY_VSYNC_OUT_CTRL register is used to configure the secondary vsync output.

MDP_SECONDARY_VSYNC_OUT_CTRL

Bits	Name	Description
31	VSYNC_OUT_EN	Set (1) this bit to enable the vsync pulse Clear (0) this bit to not enable the vsync pulse If the vsync pulse is enabled, the enable pin is asserted and the sync output is the pulse specified. If the vsync pulse is disabled, the enabled ID is de-asserted and the sync output is gated to ground.
30	VSYNC_OUT_INVERT	Set (1) this bit to invert the vsync pulse Clear (0) this bit to not invert the vsync pulse If vsync is not inverted, the pulse will be active high If vsync is inverted, the pulse will be active low Note: This register bit is also used to invert the incoming Vsync when there is no external outgoing vsync
29:20	RESERVED29_20	
19:0	VSYNC_OUT_WIDTH	The cycle count of the pulse width

0x05100120 MDP_EXTERNAL_VSYNC_OUT_CTRL

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0001

The MDP_EXTERNAL_VSYNC_OUT_CTRL register is used to configure the external vsync output.

MDP_EXTERNAL_VSYNC_OUT_CTRL

Bits	Name	Description
31	VSYNC_OUT_EN	Set (1) this bit to enable the vsync pulse Clear (0) this bit to not enable the vsync pulse If the vsync pulse is enabled, the enable pin is asserted and the sync output is the pulse specified. If the vsync pulse is disabled, the enabled ID is de-asserted and the sync output is gated to ground.
30	VSYNC_OUT_INVERT	Set (1) this bit to invert the vsync pulse Clear (0) this bit to not invert the vsync pulse If vsync is not inverted, the pulse will be active high If vsync is inverted, the pulse will be active low Note: This register bit is also used to invert the incoming vsync when there is no external outgoing vsync.
29:20	RESERVED29_20	
19:0	VSYNC_OUT_WIDTH	The cycle count of the pulse width

0x05100124 MDP_VSYNC_SEL

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0024

The MDP_VSYNC_SEL register is used to select either the vsyncs from GPIOs or DSI blocks to be used internally as primary, secondary and external vsyncs.

MDP_VSYNC_SEL

Bits	Name	Description
31:9	RESERVED31_9	
8	EXTERNAL_VSYNC_SEL_EXTEND	Bit added to maintain SW compatibility. Detailed information in EXTERNAL_VSYNC_SEL field.
7	SECONDARY_VSYNC_SEL_EXTEND	Bit added to maintain SW compatibility. Detailed information in SECONDARY_VSYNC_SEL field.
6	PRIMARY_VSYNC_SEL_EXTEND	Bit added to maintain SW compatibility. Detailed information in PRIMARY_VSYNC_SEL field.
5:4	EXTERNAL_VSYNC_SEL	External vsync sel If EXTERNAL_VSYNC_SEL_EXTEND = 0 (legacy mode) If EXTERNAL_VSYNC_SEL_EXTEND = 1 (extended mode) 0x0: Vsync primary from GPIO 0x1: Reserved 0x2: Vsync external from GPIO (default) 0x3: External vsync from MDDI block 0x0: Vsync from DSI1 Controller Interface 0x1: Vsync from DSI2 Controller Interface
3:2	SECONDARY_VSYNC_SEL	Secondary vsync sel If SECONDARY_VSYNC_SEL_EXTEND = 0 (legacy mode) If SECONDARY_VSYNC_SEL_EXTEND = 1 (extended mode) 0x0: Vsync0 from GPIO 0x1: Vsync1 from GPIO (default) 0x2: Vsync2 from GPIO 0x3: Secondary vsync from MDDI block 0x0: Vsync from DSI1 Controller Interface 0x1: Vsync from DSI2 Controller Interface
1:0	PRIMARY_VSYNC_SEL	Primary vsync sel If PRIMARY_VSYNC_SEL_EXTEND = 0 (legacy mode) If PRIMARY_VSYNC_SEL_EXTEND = 1 (extended mode) 0x0: Vsync primary from GPIO (default) 0x1: Reserved 0x2: Vsync external from GPIO 0x3: Primary vsync from MDDI block 0x0: Vsync from DSI1 Controller Interface 0x1: Vsync from DSI2 Controller Interface

0x05100128 MDP_PRIM_VSYNC_INIT_VAL

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

MDP_PRIM_VSYNC_INIT_VAL defines the value with which the read pointer gets loaded at primary vsync edge.

MDP_PRIM_VSYNC_INIT_VAL

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	PRIM_VSYNC_INIT_VAL	Specify the init value to which the read pointer gets loaded at vsync edge.

0x0510012C MDP_SEC_VSYNC_INIT_VAL

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

MDP_SEC_VSYNC_INIT_VAL defines the value with which the read pointer gets loaded at secondary vsync edge.

MDP_SEC_VSYNC_INIT_VAL

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	SEC_VSYNC_INIT_VAL	Specify the init value to which the read pointer gets loaded at vsync edge.

0x05100130 MDP_EXT_VSYNC_INIT_VAL

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

MDP_EXT_VSYNC_INIT_VAL defines the value with which the read pointer gets loaded at external vsync edge.

MDP_EXT_VSYNC_INIT_VAL

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	EXT_VSYNC_INIT_VAL	Specify the init value to which the read pointer gets loaded at vsync edge.

0x05100134 MDP_PRIM_VSYNC_OUT_VAL

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

MDP_PRIM_VSYNC_OUT_VAL defines the value of the internally generated read pointer at which the primary outgoing vsync is generated.

MDP_PRIM_VSYNC_OUT_VAL

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	PRIM_VSYNC_OUT_VAL	Specify the value of the read pointer at which the outgoing primary vsync is generated.

0x05100138 MDP_SEC_VSYNC_OUT_VAL

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

MDP_SEC_VSYNC_OUT_VAL defines the value of the internally generated read pointer at which the secondary outgoing vsync is generated.

MDP_SEC_VSYNC_OUT_VAL

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	SEC_VSYNC_OUT_VAL	Specify the value of the read pointer at which the secondary outgoing vsync is generated.

0x0510013C MDP_EXT_VSYNC_OUT_VAL

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

MDP_EXT_VSYNC_OUT_VAL defines the value of the internally generated read pointer at which the external outgoing vsync is generated.

MDP_EXT_VSYNC_OUT_VAL

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	EXT_VSYNC_OUT_VAL	Specify the value of the read pointer at which the external outgoing vsync is generated.

0x05100140 MDP_PRIM_INT_CNT_VAL

Type: Read
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

The MDP_PRIM_INT_CNT_VAL register shows the internal line and frame counter for primary vsync.

MDP_PRIM_INT_CNT_VAL

Bits	Name	Description
31:28	RESERVED31_28	
27:16	FRAME_COUNT	Internal frame count value for primary vsync.
15:12	RESERVED15_12	
11:0	LINE_COUNT	Internal line count value for primary vsync.

0x05100144 MDP_SEC_INT_CNT_VAL

Type: Read
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

The MDP_SEC_INT_CNT_VAL register shows the internal line and frame counter for secondary vsync.

MDP_SEC_INT_CNT_VAL

Bits	Name	Description
31:28	RESERVED31_28	
27:16	FRAME_COUNT	Internal frame count value for secondary vsync.
15:12	RESERVED15_12	
11:0	LINE_COUNT	Internal line count value for secondary vsync.

0x05100148 MDP_EXT_INT_CNT_VAL

Type: Read
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0000

The MDP_EXT_INT_CNT_VAL register shows the internal line and frame counter for external vsync.

MDP_EXT_INT_CNT_VAL

Bits	Name	Description
31:28	RESERVED31_28	
27:16	FRAME_COUNT	Internal frame count value for the external vsync.
15:12	RESERVED15_12	
11:0	LINE_COUNT	Internal line count value for the external vsync.

0x0510014C MDP_AUTOREFRESH_CONFIG_P

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0001

The MDP_AUTOREFRESH_CONFIG_P register enables primary autorefresh and set the frame count for autorefresh.

MDP_AUTOREFRESH_CONFIG_P

Bits	Name	Description
31:29	RESERVED31_29	
28	ENABLE	Enable autorefresh. 0x0: disable 0x1: enable

MDP_AUTOREFRESH_CONFIG_P (cont.)

Bits	Name	Description
27:12	RESERVED27_12	
11:0	FRAME_NUM	Frame number at which an autorefresh start pulse is generated.

0x05100150 MDP_AUTOREFRESH_CONFIG_S

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0001

The MDP_AUTOREFRESH_CONFIG_S register enables secondary autorefresh and set the frame count for autorefresh.

MDP_AUTOREFRESH_CONFIG_S

Bits	Name	Description
31:29	RESERVED31_29	
28	ENABLE	Enable autorefresh. 0x0: disable 0x1: enable
27:12	RESERVED27_12	
11:0	FRAME_NUM	Frame number at which an autorefresh start pulse is generated.

0x05100154 MDP_SYNC_CONFIG_P_OVERRIDE

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0FFF

This register is used to extend the height field for the MDP_SYNC_CONFIG_P register. When the OVERRIDE bit is set, the height in this register will override the height in MDP_SYNC_CONFIG.

MDP_SYNC_CONFIG_P_OVERRIDE

Bits	Name	Description
31:17	RESERVED31_17	
16	OVERRIDE	Setting this bit will allow the height in this register to override that of the MDP_SYNC_CONFIG_P register.
15:12	RESERVED15_12	
11:0	HEIGHT	Display height - 1. It is the vertical total number of lines.

0x05100158 MDP_SYNC_CONFIG_S_OVERRIDE

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0FFF

This register is used to extend the height field for the MDP_SYNC_CONFIG_S register. When the OVERRIDE bit is set, the height in this register will override the height in MDP_SYNC_CONFIG.

MDP_SYNC_CONFIG_S_OVERRIDE

Bits	Name	Description
31:17	RESERVED31_17	
16	OVERRIDE	Setting this bit will allow the height in this register to override that of the MDP_SYNC_CONFIG_S register.
15:12	RESERVED15_12	
11:0	HEIGHT	Display height - 1. It is the vertical total number of lines.

0x0510015C MDP_SYNC_CONFIG_E_OVERRIDE

Type: Read/Write
Clock: CC_MDP_VSYNC_CLK
Reset State: 0x0000_0FFF

This register is used to extend the height field for the MDP_SYNC_CONFIG_E register. When the OVERRIDE bit is set, the height in this register will override the height in MDP_SYNC_CONFIG.

MDP_SYNC_CONFIG_E_OVERRIDE

Bits	Name	Description
31:17	RESERVED31_17	
16	OVERRIDE	Setting this bit will allow the height in this register to override that of the MDP_SYNC_CONFIG_E register.
15:12	RESERVED15_12	
11:0	HEIGHT	Display height - 1. It is the vertical total number of lines.

0x05100200 MDP_SYNC_THRESH_P

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0010_0000

The MDP_SYNC_THRESH_P register is a primary synchronization threshold register.

MDP_SYNC_THRESH_P

Bits	Name	Description
31:28	RESERVED31_28	
27:16	CONTINUE_THRESHOLD	The minimum number of lines the write pointer needs to be above the read pointer so that it is safe to write to the primary LCD. (This check is not done for the first ROI line write of an update).
15:12	RESERVED15_12	
11:0	START_THRESHOLD	Allows the first ROI line write to an primary LCD update when read pointer is between the range of ROI start line and ROI start line plus this setting.

0x05100204 MDP_SYNC_THRESH_S

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0010_0000

The MDP_SYNC_THRESH_S register is a secondary synchronization threshold register.

MDP_SYNC_THRESH_S

Bits	Name	Description
31:28	RESERVED31_28	
27:16	CONTINUE_THRESHOLD	The minimum number of lines the write pointer needs to be above the read pointer so that it is safe to write to the secondary LCD. (This check is not done for the first ROI line write of an update).
15:12	RESERVED15_12	
11:0	START_THRESHOLD	Allows the first ROI line write to an secondary LCD update when read pointer is between the range of ROI start line and ROI start line plus this setting.

0x05100208 MDP_SYNC_THRESH_E

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0010_0000

The MDP_SYNC_THRESH_E register is an external synchronization threshold register.

MDP_SYNC_THRESH_E

Bits	Name	Description
31:28	RESERVED31_28	
27:16	CONTINUE_THRESHOLD	The minimum number of lines the write pointer needs to be above the read pointer so that it is safe to write to the external LCD. (This check is not done for the first ROI line write of an update).
15:12	RESERVED15_12	
11:0	START_THRESHOLD	Allows the first ROI line write to an external LCD update when read pointer is between the range of ROI start line and ROI start line plus this setting.

0x0510020C MDP_TEAR_CHECK_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEAR_CHECK_EN register is used to enable tearing check on different displays.

MDP_TEAR_CHECK_EN

Bits	Name	Description
31:3	RESERVED31_3	
2	EXTERNAL_TEAR_CHECK_EN	0x0: Disable (default) 0x1: Enable
1	SECONDARY_TEAR_CHECK_EN	0x0: Disable (default) 0x1: Enable
0	PRIMARY_TEAR_CHECK_EN	0x0: Disable (default) 0x1: Enable

0x05100210 MDP_PRIM_START_POS

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_PRIM_START_POS defines the starting y position value for the vsync line counter at every frame (for the primary display).

MDP_PRIM_START_POS

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	START_POS	Specify the y position from which the start_threshold value is added and write is kicked off if the read pointer falls within that region.

0x05100214 MDP_SEC_START_POS

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_SEC_START_POS defines the y position value for the kick off condition (for the secondary display).

MDP_SEC_START_POS

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	START_POS	Specify the y position from which the start_threshold value is added and write is kicked off if the read pointer falls within that region.

0x05100218 MDP_EXT_START_POS

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_EXT_START_POS defines the starting y position value for the vsync line counter at every frame (for the external display).

MDP_EXT_START_POS

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	START_POS	Specify the y position from which the start_threshold value is added and write is kicked off if the read pointer falls within that region.

0x0510021C MDP_PRIMARY_RD_PTR_IRQ

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0FFF

MDP_PRIMARY_RD_PTR_IRQ defines the read pointer of the primary display at which an interrupt has to be generated.

MDP_PRIMARY_RD_PTR_IRQ

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	IRQ_LINE	Specify the read pointer value at which an interrupt has to be generated.

0x05100220 MDP_SECONDARY_RD_PTR_IRQ

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0FFF

MDP_SECONDARY_RD_PTR_IRQ defines the read pointer of the secondary display at which an interrupt has to be generated.

MDP_SECONDARY_RD_PTR_IRQ

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	IRQ_LINE	Specify the read pointer value at which an interrupt has to be generated.

0x05100224 MDP_EXTERNAL_RD_PTR_IRQ

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0FFF

MDP_EXTERNAL_RD_PTR_IRQ defines the read pointer of the external display at which an interrupt has to be generated.

MDP_EXTERNAL_RD_PTR_IRQ

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	IRQ_LINE	Specify the read pointer value at which an interrupt has to be generated.

14.15.11 MGEN2MAXI control registers

NOTE1: The following registers are defined for 11 generic clients (9 read + 2 write) and 2 arbiters (AXI r0p0++ master ports).

Client0 - VG1 read;

Client1 - VG2 read;

Client2 - RGB1 read;

Client3 - RGB2 read;

Client4 - DMA_P Image read;

Client5 - DMA_P Cursor read;

Client6 - DMA_S read;

Client7 - DMA_E Image read;

Client8 - DMA_E Cursor read;

Client9 - Overlay0 write;

Client10 - Overlay1 write

0x05100400 MDP_XBAR_FIXED_ARB_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_07FF

Client requests are assigned to one of the arbiters (AXI master ports) using several possible methods. If none of these methods apply to a particular request, it is sent to arbiter 0.

The first method is fixed arbiter assignment. This allows some or all clients to be forced to a particular AXI master port, for example if you want a dedicated AXI master port for one of the clients. If this is applied to a request, it takes highest priority over the other methods.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_FIXED_ARB_EN

Bits	Name	Description
31:11	RESERVED31_11	This field has no function and should be set to zero for future compatibility
10:0	FIXED_ARB_EN	Enables fixed arbiter assignment, 1 bit per client.

0x05100404 MDP_XBAR_FIXED_ARB_SEL_RD

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0001_0000

MDP_XBAR_FIXED_ARB_SEL_RD register selects the AXI master port that will be assigned for each internal read client if the corresponding client is enabled by FIXED_ARB_EN.

NOTE This register should be written only when the corresponding read client or MDP core is idle.

MDP_XBAR_FIXED_ARB_SEL_RD

Bits	Name	Description
31:21	RESERVED31_21	
20	CLIENT8	DMA_E cursor 0x0: AXI Port0 0x1: AXI Port1
19	RESERVED19	
18	CLIENT7	DMA_E fetch 0x0: AXI Port0 0x1: AXI Port1
17	RESERVED17	
16	CLIENT6	DMA_S fetch 0x0: AXI Port0 0x1: AXI Port1

0x05100408 MDP_XBAR_FIXED_ARB_SEL_WR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0004

MDP_XBAR_FIXED_ARB_SEL_WR register selects the AXI master port that will be assigned for each internal write client if the corresponding client is enabled by FIXED_ARB_EN.

NOTE This register should be written only when the corresponding write client is idle or when MDP core is idle.

MDP_XBAR_FIXED_ARB_SEL_WR

Bits	Name	Description
31:3	RESERVED31_3	
2	CLIENT10	Overlay Processor Out Port 1 0x0: AXI Port0 0x1: AXI Port1

MDP_XBAR_FIXED_ARB_SEL_WR (cont.)

Bits	Name	Description
1	RESERVED1	
0	CLIENT9	Overlay Processor Out Port 0 0x0: AXI Port0 0x1: AXI Port1

0x0510040C MDP_XBAR_ARANGE1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The second method is by address range detection. If enabled and the request's address (or start address if it is a burst) is within the programmed range, the request is assigned to the programmed arbiter and this takes priority over the remaining sorting methods. Two ranges may be programmed - where they overlap, range 1 has priority over range 2. Note that only start address is used - be aware of bursts that may cross the end of the address range.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_ARANGE1

Bits	Name	Description
31:17	RESERVED31_17	This field has no function and should be set to zero for future compatibility
16	ARANGE1_ARB	The arbiter to assign all requests within address range 1. 0x0: AXI Port 0 0x1: AXI Port1
15:11	RESERVED15_11	This field has no function and should be set to zero for future compatibility
10:0	ARANGE1_EN	Enables address range 1 detection, 1 bit per client.

0x05100410 MDP_XBAR_ARANGE1_BASE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_ARANGE1_BASE

Bits	Name	Description
31:0	ARANGE1_BASE	The base address of address range 1.

0x05100414 MDP_XBAR_ARANGE1_HIGH

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_ARANGE1_HIGH

Bits	Name	Description
31:0	ARANGE1_HIGH	The highest address of address range 1.

0x05100418 MDP_XBAR_ARANGE2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_ARANGE2

Bits	Name	Description
31:17	RESERVED31_17	This field has no function and should be set to zero for future compatibility
16	ARANGE2_ARB	The arbiter to assign all requests within address range 2. 0x0: AXI Port 0 0x1: AXI Port1
15:11	RESERVED15_11	This field has no function and should be set to zero for future compatibility
10:0	ARANGE2_EN	Enables address range 2 detection, 1 bit per client.

0x0510041C MDP_XBAR_ARANGE2_BASE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_ARANGE2_BASE

Bits	Name	Description
31:0	ARANGE2_BASE	The base address of address range 2.

0x05100420 MDP_XBAR_ARANGE2_HIGH

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_ARANGE2_HIGH

Bits	Name	Description
31:0	ARANGE2_HIGH	The highest address of address range 2

0x05100424 MDP_XBAR_ABIT_SORT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The third method is by address bit. When enabled, this will select one of two arbiters, based on the value of a particular address bit. This is useful for address range interleaving - for example, if two memory slaves respond to interleaved address ranges of 1KB each, then address bit 10 can be used to sort requests and achieve 1:1 mapping from AXI master to AXI slave. This can also be used to sort based on two large address ranges as long as they can be separated by a power-of-2 address.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_ABIT_SORT

Bits	Name	Description
31:25	RESERVED31_25	This field has no function and should be set to zero for future compatibility
24:20	ABIT_NUM	Address bit number (0 to 31) to use for sorting requests.
19	RESERVED19	This field has no function and should be set to zero for future compatibility
18	ABIT_VAL_0	The arbiter number (AXI master port) to assign requests which have that address bit equal to zero. 0x0: AXI Port 0 0x1: AXI Port1
17	RESERVED17	This field has no function and should be set to zero for future compatibility
16	ABIT_VAL_1	The arbiter number (AXI master port) to assign requests which have that address bit equal to one. 0x0: AXI Port 0 0x1: AXI Port1
15:11	RESERVED15_11	This field has no function and should be set to zero for future compatibility
10:0	ABIT_SORT_EN	Enables address bit request sorting, 1 bit per client..

0x05100430 MDP_XBAR_IN_RD_LIM_0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0808_0808

The maximum number of pending reads from each client is programmed in this register.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_IN_RD_LIM_0

Bits	Name	Description
31:28	RESERVED31_28	This field has no function and should be set to zero for future compatibility
27:24	CLIENT3_RD_LIM	The maximum number of pending reads from each client. Must be <= the HW parameter that limits the same. Range [0,8]
23:20	RESERVED23_20	This field has no function and should be set to zero for future compatibility
19:16	CLIENT2_RD_LIM	The maximum number of pending reads from each client. Must be <= the HW parameter that limits the same. Range [0,8]

MDP_XBAR_IN_RD_LIM_0 (cont.)

Bits	Name	Description
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility
11:8	CLIENT1_RD_LIM	The maximum number of pending reads from each client. Must be <= the HW parameter that limits the same. Range [0,8]
7:4	RESERVED7_4	This field has no function and should be set to zero for future compatibility
3:0	CLIENT0_RD_LIM	The maximum number of pending reads from each client. Must be <= the HW parameter that limits the same. Range [0,8]

0x05100434 MDP_XBAR_IN_RD_LIM_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0808_0808

The maximum number of pending reads from each client is programmed in this register.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_IN_RD_LIM_1

Bits	Name	Description
31:28	RESERVED31_28	This field has no function and should be set to zero for future compatibility
27:24	CLIENT7_RD_LIM	The maximum number of pending reads from each client. Must be <= the HW parameter that limits the same. Range [0,8]
23:20	RESERVED23_20	This field has no function and should be set to zero for future compatibility
19:16	CLIENT6_RD_LIM	The maximum number of pending reads from each client. Must be <= the HW parameter that limits the same. Range [0,8]
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility
11:8	CLIENT5_RD_LIM	The maximum number of pending reads from each client. Must be <= the HW parameter that limits the same. Range [0,8]
7:4	RESERVED7_4	This field has no function and should be set to zero for future compatibility
3:0	CLIENT4_RD_LIM	The maximum number of pending reads from each client. Must be <= the HW parameter that limits the same. Range [0,8]

0x05100438 MDP_XBAR_IN_RD_LIM_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0008

The maximum number of pending reads from each client is programmed in this register.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_IN_RD_LIM_2

Bits	Name	Description
31:4	RESERVED31_4	This field has no function and should be set to zero for future compatibility
3:0	CLIENT8_RD_LIM	The maximum number of pending reads from each client. Must be <= the HW parameter that limits the same. Range [0,8]

0x05100440 MDP_XBAR_IN_WR_LIM

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_1010

The maximum number of pending reads from each client is programmed in this register.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_IN_WR_LIM

Bits	Name	Description
31:13	RESERVED31_13	This field has no function and should be set to zero for future compatibility
12:8	CLIENT10_WR_LIM	The maximum number of pending writes from each client. Must be <= the HW parameter that limits the same. Range [0,16]
7:5	RESERVED7_5	This field has no function and should be set to zero for future compatibility
4:0	CLIENT9_WR_LIM	The maximum number of pending writes from each client. Must be <= the HW parameter that limits the same. Range [0,16]

0x05100450 MDP_XBAR_OUT_RD_LIM

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_1010

The maximum number of pending reads from each arbiter (AXI master port) is programmed in this register.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_OUT_RD_LIM

Bits	Name	Description
31:13	RESERVED31_13	This field has no function and should be set to zero for future compatibility
12:8	ARB1_RD_LIM	The maximum number of pending reads from Arbiter 1. Must be <= the HW parameter that limits the same. Range [0,16]
7:5	RESERVED7_5	This field has no function and should be set to zero for future compatibility
4:0	ARB0_RD_LIM	The maximum number of pending reads from Arbiter 0. Must be <= the HW parameter that limits the same. Range [0,16]

0x05100454 MDP_XBAR_OUT_WR_LIM

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_1010

The maximum number of pending writes from each arbiter (AXI master port) is programmed in this register.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_OUT_WR_LIM

Bits	Name	Description
31:13	RESERVED31_13	This field has no function and should be set to zero for future compatibility
12:8	ARB1_WR_LIM	The maximum number of pending writes from Arbiter 1. Must be <= the HW parameter that limits the same. Range [0,16]
7:5	RESERVED7_5	This field has no function and should be set to zero for future compatibility

MDP_XBAR_OUT_WR_LIM (cont.)

Bits	Name	Description
4:0	ARB0_WR_LIM	The maximum number of pending writes from Arbiter 0. Must be <= the HW parameter that limits the same. Range [0,16]

0x05100458 MDP_XBAR_OUT_MAX_BURST

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0808

The maximum burst length for all arbiters (AXI master ports) is programmed in this register.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_OUT_MAX_BURST

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:8	MAX_WR_BURST	The maximum number of write beats minus 1 (128 bits per beat) allowed on the AXI bus (arbiter outputs). Must be < the HW parameter that limits the same. Range [0,8]
7:4	RESERVED7_4	This field has no function and should be set to zero for future compatibility
3:0	MAX_RD_BURST	The maximum number of read beats minus 1 (128 bits per beat) allowed on the AXI bus (arbiter outputs). Must be < the HW parameter that limits the same. Range [0,8]

0x05100460 MDP_XBAR_ARB_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Each arbiter can be programmed to utilize fixed priority (higher client numbers have higher priority) or last-client-granted (default when fixed priority is not enabled.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_ARB_CTL

Bits	Name	Description
31:2	RESERVED31_2	This field has no function and should be set to zero for future compatibility
1:0	FIXED_PRIOR_EN	Enables fixed priority arbitration, one bit per arbiter. If enabled, CLIENT_LIM setting is ignored. When disabled, last-client granted scheme is used for arbitration utilizing the CLIENT_LIM.

0x05100464 MDP_XBAR_ARB_FIXED_PRIOR_LIST_0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x3584_79A6

The priority list contains a list of client numbers with the highest priority client on the left side (MSBs). The length of the priority list is [43:0] to support 11 clients encoded using 4 bits.

NOTE This register should be written only when MDP is IDLE

MDP_XBAR_ARB_FIXED_PRIOR_LIST_0

Bits	Name	Description
31:0	PRIOR_LIST	Bits[31:0] of the fixed priority list. Default priority - client0 (VG1) > client1(VG1) > client2(RGB1) > client3(RGB2) > client5(DMA_P cursor) > client8(DMA_E cursor) > client4(DMA_P image) > client7(DMA_E image) > client9(Overlay0 write) > client10(Overlay1 write) > client6(DMA_S).

0x05100468 MDP_XBAR_ARB_FIXED_PRIOR_LIST_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0012

The priority list contains a list of client numbers with the highest priority client on the left side (MSBs). The length of the priority list is [43:0] to support 11 clients encoded using 4 bits.

NOTE This register should be written only when MDP is IDLE.

MDP_XBAR_ARB_FIXED_PRIOR_LIST_1

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	PRIOR_LIST	Bits [43:32] of the fixed priority list. Default priority - client0 (VG1) > client1(VG1) > client2(RGB1) > client3(RGB2) > client5(DMA_P cursor) > client8(DMA_E cursor) > client4(DMA_P image) > client7(DMA_E image) > client9(Overlay0 write) > client10(Overlay1 write) > client6(DMA_S).

0x0510046C MDP_XBAR_ARB_CLIENT_LIM_0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0xFFFF_FFFF

The maximum number of (consecutive grants - 1) to one client before allowing requests from other clients. This is used for last-client-granted arbitration, but not fixed priority arbitration. NOTE: A client may receive more than this number of consecutive grants if no other clients are making requests to the same arbiter.

NOTE This register should be written only when MDP is IDLE

MDP_XBAR_ARB_CLIENT_LIM_0

Bits	Name	Description
31:28	CLIENT7_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]
27:24	CLIENT6_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]
23:20	CLIENT5_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]
19:16	CLIENT4_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]
15:12	CLIENT3_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]
11:8	CLIENT2_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]
7:4	CLIENT1_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]
3:0	CLIENT0_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]

0x05100470 MDP_XBAR_ARB_CLIENT_LIM_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0FFF

The maximum number of (consecutive grants - 1) to one client before allowing requests from other clients. This is used for last-client-granted arbitration, but not fixed priority arbitration. NOTE: A client may receive more than this number of consecutive grants if no other clients are making requests to the same arbiter.

NOTE This register should be written only when MDP is IDLE

MDP_XBAR_ARB_CLIENT_LIM_1

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:8	CLIENT10_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]
7:4	CLIENT9_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]
3:0	CLIENT8_LIM	The maximum number of (consecutive grants - 1) to a client before allowing requests from other clients. Range [0, 15]

0x05100480 MDP_XBAR_AXI_AOOORD

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_01FF

When a request is granted by the arbiter, AOOORD signal (AXI r0p0++) may be controlled on a per-client basis.

NOTE This register should be written only when MDP is IDLE

MDP_XBAR_AXI_AOOORD

Bits	Name	Description
31:9	RESERVED31_9	This field has no function and should be set to zero for future compatibility
8:0	AXI_AOOORD	"Out of order" enable for reads, one bit per read client. If zero, the AXI bus and slaves must ensure that all reads from that client are completed in the order they are requested from the client.

0x05100484 MDP_XBAR_AXI_AOOOWR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0003

When a request is granted by the arbiter, AOOOWR signal (AXI r0p0++) may be controlled on a per-client basis.

NOTE This register should be written only when MDP is IDLE

MDP_XBAR_AXI_AOOOWR

Bits	Name	Description
31:2	RESERVED31_2	This field has no function and should be set to zero for future compatibility
1:0	AXI_AOOOWR	"Out of order" enable for writes, one bit per write client. If zero, the AXI bus and slaves must ensure that all writes from this client are completed in the order they are requested from the client.

0x05100488 MDP_XBAR_AXI_ATYPE_0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x6666_6666

When a request is granted by the arbiter, ATYPE signal (AXI r0p0++) may be controlled on a per-client basis. ATYPE indicates the memory type and attributes of an access.

NOTE This register should be written only when MDP is IDLE

MDP_XBAR_AXI_ATYPE_0

Bits	Name	Description
31:0	AXI_ATYPE	The value to drive on ATYPE signal, 4 bits per client. Probably one of these: 0x4: Normal, Non-cacheable, Non-shared 0x6: Normal, Cacheable, Writeback, Write-allocate, Non-shared 0x7: Normal, Cacheable, Writeback, Write-allocate, Shared

0x0510048C MDP_XBAR_AXI_ATYPE_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0666

When a request is granted by the arbiter, ATYPE signal (AXI r0p0++) may be controlled on a per-client basis. ATYPE indicates the memory type and attributes of an access.

NOTE This register should be written only when MDP is IDLE

MDP_XBAR_AXI_ATYPE_1

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	AXI_ATYPE	The value to drive on ATYPE signal, 4 bits per client. Probably one of these: 0x4: Normal, Non-cacheable, Non-shared 0x6: Normal, Cacheable, Writeback, Write-allocate, Non-shared 0x7: Normal, Cacheable, Writeback, Write-allocate, Shared

0x05100490 MDP_XBAR_AXI_AREQPRIORITY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_00AA

When a request is granted by the arbiter, AREQPRIORITY signal (AXI r0p0++) may be controlled on a per-client basis.

NOTE This register should be written only when MDP is IDLE

.

MDP_XBAR_AXI_AREQPRIORITY

Bits	Name	Description
31:22	RESERVED31_22	This field has no function and should be set to zero for future compatibility

MDP_XBAR_AXI_AREQPRIORITY (cont.)

Bits	Name	Description
21:0	AXI_AREQPRIORITY	Request priority, 2 bits per client. This value is driven onto AXI bus only, not used internally for client arbitration. These two bits of relative priority can be decoded as shown below. NOTE: By default, `higher' priority has been assigned for RGB1/2 and VG1/2 assuming direct-out mode is the most common mode of operation. 0x0: normal 0x1: high 0x2: higher 0x3: highest

0x05100494 MDP_XBAR_AXI_APROTNS

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

NOTE This register is RESERVED. AXI signal `aprotns' is tied to one (non-secure) at MMSS level for both MDP4 AXI ports. This tie in MMSS overrides the value set by this register.

MDP_XBAR_AXI_APROTNS

Bits	Name	Description
31:11	RESERVED31_11	This field has no function and should be set to zero for future compatibility
10:0	AXI_APROTNS	(RESERVED) Enable "non-secure" bus access, one bit per client. If zero, the corresponding client accesses are secure accesses.

0x051004B0 MDP_XBAR_AXI_ERROR_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

NOTE This register's parameters should be written only when MDP is IDLE unless otherwise specified.

MDP_XBAR_AXI_ERROR_CTL

Bits	Name	Description
31:10	RESERVED31_10	This field has no function and should be set to zero for future compatibility
9:8	AXI_ERR_CLR	One bit per AXI master port. When AXI error occurs, SW can read the error info and then can assert this bit to clear the AXI error and enable next AXI error to be captured. Note: Write `1' and then `0' when corresponding AXI Port error interrupt is received.
7:6	RESERVED7_6	This field has no function and should be set to zero for future compatibility
5:4	AXI_HALT_ON_WR_ERR	One bit per AXI master port. When set (1), a write error response from AXI (on bresp) acts like a HALT_REQ and also disables all ARB-XIN interfaces - instead, fake write data to AXI (zero write enables) and discard read data from AXI. SW should wait for AXI_IDLE (or HALT_ACK) and then reset the core.
3:2	RESERVED3_2	This field has no function and should be set to zero for future compatibility
1:0	AXI_HALT_ON_RD_ERR	One bit per AXI master port. When set (1), a read error response from AXI (on rresp) acts like a HALT_REQ and also disables all ARB-XIN interfaces - instead, fake write data to AXI (zero write enables) and discard read data from AXI. SW should wait for AXI_IDLE (or HALT_ACK) and then reset the core.

0x051004B4 MDP_XBAR_AXI_PORT0_ERROR_INFO

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

NOTE The contents of this register are valid (for read) only when AXI Port0 error interrupt is received.

MDP_XBAR_AXI_PORT0_ERROR_INFO

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11	AXI_ERR	Indicates than an AXI error occurred since the last AXI reset. The AXI error interrupt status may be more useful than this bit.
10	AXI_ERR_TYPE	The type of the last error that occurred. 0x0: axi_rresp 0x1: axi_bresp (has priority over rresp if happen same time)

MDP_XBAR_AXI_PORT0_ERROR_INFO (cont.)

Bits	Name	Description
9:8	AXI_RESP	The value of axi_rresp or axi_bresp when the last error occurred.
7:4	AXI_MID	The value on axi_rmid or axi_bmid when the last error occurred.
3:0	AXI_TID	The value on axi_rtid or axi_btid when the last error occurred.

0x051004B8 MDP_XBAR_AXI_PORT1_ERROR_INFO

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

NOTE The contents of this register are valid (for read) only when AXI Port1 error interrupt is received.

MDP_XBAR_AXI_PORT1_ERROR_INFO

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11	AXI_ERR	Indicates than an AXI error occurred since the last AXI reset. The AXI error interrupt status may be more useful than this bit.
10	AXI_ERR_TYPE	The type of the last error that occurred. 0x0: axi_rresp 0x1: axi_bresp (has priority over rresp if happen same time)
9:8	AXI_RESP	The value of axi_rresp or axi_bresp when the last error occurred.
7:4	AXI_MID	The value on axi_rmid or axi_bmid when the last error occurred.
3:0	AXI_TID	The value on axi_rtid or axi_btid when the last error occurred.

0x051004C4 MDP_XBAR_AXI_WDATA_TIMEOUT_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_00F0

NOTE This register should be written only when MDP is IDLE

MDP_XBAR_AXI_WDATA_TIMEOUT_CTL

Bits	Name	Description
31:8	RESERVED31_8	This field has no function and should be set to zero for future compatibility
7:4	WDTIMEOUT_LOG2	Bit number of the 16-bit time waiting counter that indicates timeout.
3:2	RESERVED3_2	This field has no function and should be set to zero for future compatibility
1:0	AXI_HALT_WDTIMEOUT	One bit per AXI master port. When set (1), this will generate a "halt" (similar to HALT_ON_WR_ERR) if the core is not able to provide a write data burst to AXI within a SW specified time after the previous write data burst was sent. This is either because client does not provide write data fast enough or AXI is not accepting write data fast enough.

0x051004C8 MDP_XBAR_AXI_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0003

MDP_XBAR_AXI_STATUS

Bits	Name	Description
31:6	RESERVED31_6	This field has no function and should be set to zero for future compatibility
5:4	WDATA_TIMEOUT_HALT	Indicates that AXI halt occurred because of write data timeout. Once asserted will remain high till AXI reset. One bit per AXI master port.
3:2	RESERVED3_2	This field has no function and should be set to zero for future compatibility
1:0	AXI_IDLE	Indicates that the AXI master port is idle (no pending requests on AXI). One bit per AXI master port.

0x051004D0 MDP_XBAR_AXI_PROFILE_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Each arbiter includes bandwidth counters, min & max latency counters, a MISR for capturing AXI write data, and an LFSR for generating AXI read data (faking the response from AXI slaves).

NOTE This register should be written only when MDP is IDLE

MDP_XBAR_AXI_PROFILE_CTL

Bits	Name	Description
31:26	RESERVED31_26	This field has no function and should be set to zero for future compatibility
25:24	RD_LAT_REP_EN	1 bit per arb. when enabled, each beat of read data is replaced with the read access latency (of AXI cycles from request till read data returned)
23:18	RESERVED23_18	This field has no function and should be set to zero for future compatibility
17:16	MISR_RES	1 bit per arb, to reset MISR Note: Write `1' and then `0' to reset MISR corresponding to an arbiter.
15:14	RESERVED15_14	This field has no function and should be set to zero for future compatibility
13:12	MISR_EN	1 bit per arb
11:10	RESERVED11_10	This field has no function and should be set to zero for future compatibility
9:8	MISR_WD	1 bit per arb, to select misr input 0x0: read data (coming back from AXI) 0x1: write data (going to AXI)
7	CTR_EN	Enable all profiling counters
6	CTR_RES	Reset all profiling counters (they are also reset by AXI_RESET). Note: Write `1' and then `0' to reset all profiling counters.
5	RESERVED5	This field has no function and should be set to zero for future compatibility
4	TEST_ARB_SEL	Select which arbiter will drive MDP_AXI_PROFILE_OUT. 0x0: Arbiter 0 0x1: Arbiter 1

MDP_XBAR_AXI_PROFILE_CTL (cont.)

Bits	Name	Description
3:0	TEST_OUT_SEL	Select which profile data is read via MDP_AXI_PROFILE_OUT. 0x0: num read bursts (32 bits) 0x1: total read BW (32 bits - up to 68GB) 0x2: max outstanding reads (8 bits) 0x3: avg wait for read accept (10 bits over 128 reads) 0x4: min read latency (16 bits) 0x5: max read latency (16 bits) 0x6: avg read latency (16 bits over 1K read beats) 0x8: num write bursts (32 bits) 0x9: total write BW (32 bits - up to 68GB) 0xA: max outstanding writes (8 bits) 0xB: avg wait for write accept (10 bits over 128 writes) 0xC: MISR signature word 0 0xD: MISR signature word 1 0xE: MISR signature word 2 0xF: MISR signature word 3

0x051004D4 MDP_XBAR_AXI_PROFILE_OUT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

NOTE The contents of this register are valid (for read) when MDP is IDLE or when the arbiter (AXI Port) selected for profiling is IDLE.

MDP_XBAR_AXI_PROFILE_OUT

Bits	Name	Description
31:0	AXI_TEST_OUT	The output selected by MDP_AXI_PROFILE_CTL reg.

14.15.12 Overlay Processor registers

0x05110000 MDP_OVERLAY_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_00FF

Indicates internal idle state of the Overlay Processor.

MDP_OVERLAY_STATUS

Bits	Name	Description
31:9	RESERVED31_9	
8	OVERLAYPROC2_IDLE	Overlay Processor output port 2 path is idle.
7	RGB3_IDLE	RGB3 input pipe idle.
6	RGB2_IDLE	RGB2 input pipe is idle.
5	RGB1_IDLE	RGB1 input pipe is idle.
4	VG3_IDLE	Video/Graphisc3 input pipe idle.
3	VG2_IDLE	Video/Graphisc2 input pipe is idle.
2	VG1_IDLE	Video/Graphisc1 input pipe is idle.
1	OVERLAYPROC1_IDLE	Overlay Processor output port 1 path is idle.
0	OVERLAYPROC0_IDLE	Overlay Processor output port 0 path is idle.

0x051100F0 MDP_LAYERMIXER2_IN_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register describes the input connections to Layer Mixer2. This is Double Buffered. The relevant value is shadowed at every refresh initiation of the associated Overlay Processor for internal used. For example, if VG1 pipe is set to be an input, the selection will be registered at the next Overlay Processor's refresh initiation.

NOTE Connecting multiple pipes' output to the same single Layer Mixer layer's input is prohibited. If by mistake that multiple pipes are connected to the same layer, the most significant field takes priority, i.e., in the order of VG3, RGB3, RGB2, RGB1, VG2, and VG1.

The onus is on SW to prevent duplicate connections of pipelines between source pipelines to LayerMixer2 and LayerMixer0/1. As such care should be taken to correctly MDP_LAYERMIXER2_IN_CFG in relation to MDP_LAYERMIXER_IN_CFG

MDP_LAYERMIXER2_IN_CFG

Bits	Name	Description
31:28	RESERVED31_24	
27:24	BORDER_OUT	LayerMixer2 Border pipe output connection. Others: Reserved 0x0: This pipe is not used 0x9: LayerMixer2 Base layer

MDP_LAYERMIXER2_IN_CFG (cont.)

Bits	Name	Description
23:16	RESERVED23_16	
15:12	RGB2_OUT	RGB 2 pipe output connection 0x0: This pipe is not used 0x9: LayerMixer2 Base layer 0xA: LayerMixer2 Stage 0 FG layer 0xB: LayerMixer2 Stage 1 FG layer 0xC: LayerMixer2 Stage 2 FG layer 0xD: LayerMixer2 Stage 3 FG layer

0x051100F4 MDP_LAYERMIXER_WB_MUX_SEL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Indicates internal idle state of the Overlay Processor.

MDP_LAYERMIXER_WB_MUX_SEL

Bits	Name	Description
31:2	RESERVED31_2	

MDP_LAYERMIXER_WB_MUX_SEL (cont.)

Bits	Name	Description
1	LMIX1_WB_SEL	LayerMixer2 output path connection 0x0: LayerMixer1 is connected to LayerMixer1's AXI writeback path 0x1: LayerMixer2 is connected to LayerMixer1's AXI writeback path
0	LMIX0_WB_SEL	LayerMixer2 output path connection 0x0: LayerMixer0 is connected to LayerMixer0's AXI writeback path 0x1: LayerMixer2 is connected to LayerMixer0's AXI writeback path

0x051100FC MDP_LAYERMIXER_IN_CFG_UPDATE_METHOD

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

.MDP4 assumes layermixer configuration(MDP_LAYERMIXER_IN_CFG) and register flush control (MDP_OVERLAY_REG_FLUSH) are written within same frame but it can't be guaranteed at some circumstance. In MDP4.2, new update method is introduced for the above case but SW should do dummy write at MDP_OVERLAY_REG_FLUSH for smart panel case after changing MDP_LAYERMIXER_IN_CFG, which are not really required for smart panel.

When SW do dummy write on MDP_OVERLAY_REG_FLUSH, the write value should be all zero which does not affect anything.

For dumb panel case, SW shouldn't do any dummy write and just write MDP_OVERLAY_REG_FLUSH when SW wants to do.

MDP_LAYERMIXER_IN_CFG_UPDATE_METHOD

Bits	Name	Description
31:1	RESERVED31_1	
0	NEW_UPDATE_METHOD	Controls MDP_LAYERMIXER_IN_CFG(ox10100) update method 0x0(default) : Update MDP_LAYERMIXER_IN_CFG when SW writes it. (same to mdp4.0/1 behavior) 0x1: Update MDP_LAYERMIXER_IN_CFG when SW writes MDP_OVERLAY_REG_FLUSH (0x18000. SW should do dummy write at MDP_OVERLAY_REG_FLUSH even for smart panel.)

0x05110100 MDP_LAYERMIXER_IN_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register describes the input connections to the Layer Mixers. This is Double Buffered. The relevant value is shadowed at every refresh initiation of the associated Overlay Processor for internal used. For example, if VG1 pipe is set to be an Layer Mixer 0 input, the selection will be registered at the next Overlay Processor 0's refresh initiation.

NOTE Connecting multiple pipes' output to the same single Layer Mixer layer's input is prohibited. If by mistake that multiple pipes are connected to the same layer, the most significant field takes priority, i.e., in the order of VG3, RGB3, RGB2, RGB1, VG2, and VG1.

MDP_LAYERMIXER_IN_CFG

Bits	Name	Description
31:24	RESERVED31_24	
23:20	VG3_OUT	Video/Graphics 3 pipe output connection. Border Color (LayerMixer1) pipe output connection This border color can only be used with LayerMixer1. Others: Reserved 0x0: This pipe is not used 0x9: LayerMixer1 Base layer

0x05118000 MDP_OVERLAY_REG_FLUSH

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The flush register is used to indicate a pipe/layermixer's registers are all programmed, and are safe to update to the back copy of the double buffered registers. Each pipes/layermixer's flush mask bit will be used only when the associated pipe/layermixer is running at active refresh pull mode, e.g., direct out going to dsi video. In such operation mode, the associated pipe/layermixer's double buffered registers' back copies are updated with the new values at the vsync boundary only when the flush mask bit has already been written a '1'. Each flush mask bit would also returned a `0' once the back copies are updated. Before the back copies are updated, the associate mask bit would returned a `1' if it has been previously written a `1'.

MDP_OVERLAY_REG_FLUSH

Bits	Name	Description
31:8	RESERVED31_8	
7	RESERVED7	Reserved for future VG3 input pipe
6	RESERVED6	Reserved for future RGB3 input pipe
5	RGB2	Set to indicate RGB2 input pipe registers are ready for flush.
4	RGB1	Set to indicate RGB1 input pipe registers are ready for flush.
3	VG2	Set to indicate VG2 input pipe registers are ready for flush.
2	VG1	Set to indicate VG1 input pipe registers are ready for flush.
1	LAYERMIX1	Set to indicate Layer Mixer 1 registers are ready for flush.
0	LAYERMIX0	Set to indicate Layer Mixer 0 registers are ready for flush.

14.15.12.1 Layer Mixer 0

0x05110004 MDP_OVERLAYPROC0_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0003

This register configures the OVERLAY PROCESSOR 0's starting behavior. When the DIRECT_OUT is set, the input pipes that are assigned to this processor will be initiated by the active refresh if the interface selected is dsi video, regardless refresh_mode selection. If going through a Frame Buffer, the pipes for the Overlay Processor can be kick-started by the REFRESH_MODE selected. The value only take effect at the next refresh initiation of the Overlay Processor 0. However, it is not recommended to switch Overlay Processor's mode of operation at tun time, the switch should be done only when an Overlay Processor and its associated interface are in idle.

MDP_OVERLAYPROC0_CFG

Bits	Name	Description
31:6	RESERVED31_6	

MDP_OVERLAYPROC0_CFG (cont.)

Bits	Name	Description
5	CON_WB_MODE	RESERVED.
4	CON_WB_EN	Concurrent display and write back mode selection. Only valid when not in BLT mode and when DIRECT_OUT is 1. 0x0: Disabled 0x1: Enabled
3	BLT_MODE	Puts this Overlay Processor into BLT (MDP3) type of SW operation mode, which means both the Overlay Processor 0 and DMA_P fetch will be fully controlled by the SW. There will be no passing of Frame Buffer pointers between the Overlay Processor 0 and DMA_P. This setting takes priority over REFRESH_MODE and DIRECT_OUT settings.
2:1	REFRESH_MODE	Overlay Processor refresh mode (only valid when not in BLT mode and not in direct-out mode, otherwise don't care): 0x0: On-Demand (software initiated, FrameBuffer push or Direct Out push for smart panel) 0x1: Vsync rate (FrameBuffer pull) 0x2: Vsync/2 rate (FrameBuffer pull) 0x3: Vsync/4 rate (FrameBuffer pull)
0	DIRECT_OUT	Overlay Processor output direction select (only valid when not in BLT mode, otherwise don't care): 0x0: Via FrameBuffer 0x1: Direct to interface (internally refresh_mode is forced to Vsync rate if connected to DSI_VIDEO/LCDC)

0x05110008 MDP_OVERLAYPROC0_OUT_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

This register designates the output size of the Overlay Processor 0 and is also used as the Frame Buffer/Active Region size for DMA_P.

MDP_OVERLAYPROC0_OUT_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_H	Output ROI height (pixel).
15:12	RESERVED15_12	
11:0	DST_W	Output ROI width (pixel).

0x0511000C MDP_OVERLAYPROC0_FB_ADDR1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This is the 1st Frame Buffer base address (for ping-ponging) that is used when this Overlay Processor is in Frame Buffer mode, where the value is registered and used at every other frame initiation of this Overlay Processor. In other modes, this is the only effective Frame Buffer base address used, where this register is Double Buffered and the value takes effect at the next refresh initiation of this Overlay Processor.

MDP_OVERLAYPROC0_FB_ADDR1

Bits	Name	Description
31:0	ADDR	Starting base byte address for Frame Buffer

0x05110010 MDP_OVERLAYPROC0_FB_Y_STRIDE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC0_FB_Y_STRIDE register defines the line jump value (in bytes) in the Frame Buffer.

MDP_OVERLAYPROC0_FB_Y_STRIDE

Bits	Name	Description
31:13	RESERVED31_13	
12:0	BUF_Y_STRIDE	Y-stride (or) line jump in bytes in the Frame Buffer.

0x05110014 MDP_OVERLAYPROC0_OPMODE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The FB_FORMAT field is also used by DMA_P to decipher what Frame Buffer format to fetch in FrameBuffer Pull mode of operation.

MDP_OVERLAYPROC0_OPMODE

Bits	Name	Description
31	BYPASS_COLOR3_EN	Enables propagation of color component 3 to the packer 0x1: color3 is taken from register 0x0: color3 is propagated from the pipe
30:3	RESERVED30_3	RESERVED
2	PGC_EN	Panel Gamma Correction enable. If disabled, the colors are mapped linearly from 12-bit to 8-bit.
1:0	FB_FORMAT	This field actually controls memory write back pixel format in LM0 with regard to operation mode (direct with concurrent write back, FB or BLT). If the concurrent write back is enabled, only RGB888 is supported. 0x0: RGB888 0x1: RGB565 0x2: Reserved

0x0511001C MDP_OVERLAYPROC0_FB_ADDR2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This is the 2nd Frame Buffer base address (for ping-ponging) that is used only when this Overlay Processor is in Frame Buffer mode. The value is registered and used at every other frame initiation of this Overlay Processor.

MDP_OVERLAYPROC0_FB_ADDR2

Bits	Name	Description
31:0	ADDR	Starting base byte address for Frame Buffer

0x05110020 MDP_OVERLAYPROC0_PROFILE_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC0_PROFILE_EN

Bits	Name	Description
31:1	RESERVED31_1	
0	EN	Enable the ROI cycle counter for profiling

0x05110024 MDP_OVERLAYPROC0_PROFILE_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC0_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED31_24	
23:0	TOTAL_CYCLE	Total cycle count in a ROI, from new ROI to last pixel out of the processor (OVERLAYPROC0 goes back to Idle)

0x05110104 MDP_OVERLAYPROC0_BLEND0_OP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0040

This register describes the blend operation done by Layer Mixer 0 on Stage 0 FG/BG, where this register is Double Buffered and the value takes effect at the next refresh initiation of this Overlay Processor.

MDP_OVERLAYPROC0_BLEND0_OP

Bits	Name	Description
31:10	RESERVED31_10	
9	BG_TRANSP_EN	BG transparency color check enable. When color matches, the FG pixel is passed; otherwise, the blended result is passed. However, if both FG and BG Transparency checks are enabled and both matches, BG pixel is passed.
8	FG_TRANSP_EN	FG transparency color check enable. When color matches, the BG pixel is passed; otherwise, the blended result is passed.
7	BG_MOD_ALPHA	When set (1), bg constant alpha modulates the alpha selected by ALPHA_SEL before performing pixel blending.
6	BG_INV_ALPHA	When set (1) the alpha selected by BG_ALPHA_SEL is inverted (1-alpha).
5:4	BG_ALPHA_SEL	Blending alpha select: 0x0: fg constant alpha 0x1: bg constant alpha 0x2: fg per pixel alpha 0x3: bg per pixel alpha
3	FG_MOD_ALPHA	When set (1), fg constant alpha modulates the alpha selected by ALPHA_SEL before performing pixel blending.

MDP_OVERLAYPROC0_BLEND0_OP (cont.)

Bits	Name	Description
2	FG_INV_ALPHA	When set (1) the alpha selected by FG_ALPHA_SEL is inverted (1-alpha).
1:0	FG_ALPHA_SEL	Blending alpha select: 0x0: fg constant alpha 0x1: bg constant alpha 0x2: fg per pixel alpha 0x3: bg per pixel alpha

0x05110108 MDP_OVERLAYPROC0_BLEND0_FG_ALPHA

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_00FF

This register is Double Buffered. The value is shadowed at every refresh initiation of this Overlay Processor for internal used.

MDP_OVERLAYPROC0_BLEND0_FG_ALPHA

Bits	Name	Description
31:8	RESERVED31_8	
7:0	CONSTANT_ALPHA	Alpha value for constant alpha blend or modulation alpha.

0x0511010C MDP_OVERLAYPROC0_BLEND0_BG_ALPHA

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every refresh initiation of this Overlay Processor for internal used.

MDP_OVERLAYPROC0_BLEND0_BG_ALPHA

Bits	Name	Description
31:8	RESERVED31_8	
7:0	CONSTANT_ALPHA	Alpha value for constant alpha blend or modulation alpha.

0x05110110 MDP_OVERLAYPROC0_BLEND0_TRANSP_LOW0

Type: Read/Write

0x05110124 MDP_OVERLAYPROC0_BLEND1_OP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0040

This register describes the blend operation done by Layer Mixer 0 on Stage 1 FG/BG, where this register is Double Buffered and the value takes effect at the next refresh initiation of this Overlay Processor.

MDP_OVERLAYPROC0_BLEND1_OP

Bits	Name	Description
31:10	RESERVED31_10	
9	BG_TRANSP_EN	BG transparency color check enable. When color matches, the FG pixel is passed; otherwise, the blended result is passed. However, if both FG and BG Transparency checks are enabled and both matches, BG pixel is passed.
8	FG_TRANSP_EN	FG transparency color check enable. When color matches, the BG pixel is passed; otherwise, the blended result is passed.
7	BG_MOD_ALPHA	When set (1), bg constant alpha modulates the alpha selected by ALPHA_SEL before performing pixel blending.
6	BG_INV_ALPHA	When set (1) the alpha selected by BG_ALPHA_SEL is inverted (1-alpha).
5:4	BG_ALPHA_SEL	Blending alpha select: 0x0: fg constant alpha 0x1: bg constant alpha 0x2: fg per pixel alpha 0x3: bg per pixel alpha
3	FG_MOD_ALPHA	When set (1), fg constant alpha modulates the alpha selected by ALPHA_SEL before performing pixel blending.
2	FG_INV_ALPHA	When set (1) the alpha selected by FG_ALPHA_SEL is inverted (1-alpha).

MDP_OVERLAYPROC0_BLEND1_OP (cont.)

Bits	Name	Description
1:0	FG_ALPHA_SEL	Blending alpha select: 0x0: fg constant alpha 0x1: bg constant alpha 0x2: fg per pixel alpha 0x3: bg per pixel alpha

0x05118004 MDP_OVERLAYPROC1_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0003

This register configures the OVERLAY PROCESSOR 1's starting behavior. When the DIRECT_OUT is set, the input pipes that are assigned to this processor will be initiated by the active refresh if the interface selected is DTV or TV Encoder, regardless refresh_mode selection. If going through a Frame Buffer, the pipes for the Overlay Processor can be kick-started by the REFRESH_MODE selected. The value only take effect at the next refresh initiation of the Overlay Processor 0. However, it is not recommended to switch Overlay Processor's mode of operation at tun time, the switch should be done only when an Overlay Processor and its associated interface are in idle.

MDP_OVERLAYPROC1_CFG

Bits	Name	Description
31:6	RESERVED31_6	

MDP_OVERLAYPROC1_CFG (cont.)

Bits	Name	Description
5	CON_WB_MODE	RESERVED.
4	CON_WB_EN	Concurrent display and write back mode selection. Only valid when not in BLT mode and when DIRECT_OUT is 1. 0x0: Disabled 0x1: Enabled
3	BLT_MODE	Puts this Overlay Processor into BLT (MDP3) type of SW operation mode, which means both the Overlay Processor 1 and DMA_E fetch will be fully controlled by the SW. There will be no passing of Frame Buffer pointers between the Overlay Processor 1 and DMA_E. This setting takes priority over REFRESH_MODE and DIRECT_OUT settings.
2:1	REFRESH_MODE	Overlay Processor refresh mode (only valid when not in BLT mode and not in direct-out mode, otherwise don't care): 0x0: On-Demand (software initiated, FrameBuffer push or Direct Out push for smart panel) 0x1: Vsync rate (FrameBuffer pull) 0x2: Vsync/2 rate (FrameBuffer pull) 0x3: Vsync/4 rate (FrameBuffer pull)
0	DIRECT_OUT	Overlay Processor output direction select (only valid when not in BLT mode, otherwise don't care): 0x0: Via FrameBuffer 0x1: Direct to interface (internally refresh_mode is forced to Vsync rate if connected to LCDC/DTV/TV_Enc)

0x05118008 MDP_OVERLAYPROC1_OUT_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

This register designates the output size of the Overlay Processor 1 and is also used as the Frame Buffer/Active Region size for DMA_E or DMA_S.

MDP_OVERLAYPROC1_OUT_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_H	Output ROI height (pixel).
15:12	RESERVED15_12	
11:0	DST_W	Output ROI width (pixel).

0x0511800C MDP_OVERLAYPROC1_FB_ADDR1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This is the 1st Frame Buffer base address (for ping-ponging) that is used when this Overlay Processor is in Frame Buffer mode, where the value is registered and used at every other frame initiation of this Overlay Processor. In other modes, this is the only effective Frame Buffer base address used, where this register is Double Buffered and the value takes effect at the next refresh initiation of this Overlay Processor.

MDP_OVERLAYPROC1_FB_ADDR1

Bits	Name	Description
31:0	ADDR	Starting base byte address for Frame Buffer

0x05118010 MDP_OVERLAYPROC1_FB_Y_STRIDE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC1_FB_Y_STRIDE register defines the line jump value (in bytes) in the Frame Buffer.

MDP_OVERLAYPROC1_FB_Y_STRIDE

Bits	Name	Description
31:13	RESERVED31_13	
12:0	BUF_Y_STRIDE	Y-stride (or) line jump in bytes in the Frame Buffer.

0x05118014 MDP_OVERLAYPROC1_OPMODE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The FB_FORMAT field is also used by DMA_E to decipher what Frame Buffer format to fetch in FrameBuffer Pull mode of operation.

MDP_OVERLAYPROC1_OPMODE

Bits	Name	Description
31	BYPASS_COLOR3_EN	Enables propagation of color component 3 to the packer 0x1: color3 is taken from register 0x0: color3 is propagated from the pipe
30:4	RESERVED30_4	RESERVED
3	INTRLACE_FETCH	Enable interlace fetch for interlace-in and interlace-out mode of operation for all VG pipes on this Overlay Processor. This mode of operation should not be used when any pipes other than VG pipes are involved, i.e., even cursor blend; and it is valid only when Overlay Processor 1 is driving directly to an interlace output interface (DTV or ATV).
2	PGC_EN	Panel Gamma Correction enable. If disabled, the colors are mapped linearly from 12-bit to 8-bit.
1:0	FB_FORMAT	This field actually controls memory write back pixel format in LM1 with regard to operation mode (direct with concurrent write back, FB or BLT). If the concurrent write back is enabled, only RGB888 is supported. 0x0: RGB888 0x1: RGB565 0x2: 422 h2v1 interleaved

0x05118018 MDP_OVERLAYPROC1_DMA_MUX_CON

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0004

This register configures how DMA_S and DMA_E are connected to overlay processor1 pipe.

Following table shows all possible scenarios for MUX selection between DMA_S and DMA_E.

Note) MDP_OVERLAYPROC1_CFG register has to re-program whenever changing Layer Mix1 destination PIPE (MDP_OVERLAYPROC1_DMA_MUX_CON.OVP1_DMA_PIPE_SEL control bit).

MDP_OVERLAYPROC1_DMA_MUX_CON

Bits	Name	Description
31:4	RESERVED31_4	
3	DMA_E_DEST_SEL	DMA_E destination interface selection 0x0: DMA_E destination (default) 0x1: DMA_S destination

MDP_OVERLAYPROC1_DMA_MUX_CON (cont.)

Bits	Name	Description
2	DMA_S_ABL_IN_PIPE_SEL	DMA_S ABL input pipe selection 0x0: DMA_E 0x1: DMA_S (default)
1	DMA_E_BLEND_IN_PIPE_SEL	DMA_E Blend input fetch engine selection 0x0: DMA_E (default) 0x1: DMA_S
0	OVP1_DMA_PIPE_SEL	OVP1 DMA PIPE Selection for Frame Buffer and Direct mode 0x0: DMA_E (default) 0x1: DMA_S

0x0511801C MDP_OVERLAYPROC1_FB_ADDR2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This is the 2nd Frame Buffer base address (for ping-ponging) that is used only when this Overlay Processor is in Frame Buffer mode. The value is registered and used at every other frame initiation of this Overlay Processor.

MDP_OVERLAYPROC1_FB_ADDR2

Bits	Name	Description
31:0	ADDR	Starting base byte address for Frame Buffer

0x05118020 MDP_OVERLAYPROC1_PROFILE_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC1_PROFILE_EN

Bits	Name	Description
31:1	RESERVED31_1	
0	EN	Enable the ROI cycle counter for profiling

0x05118024 MDP_OVERLAYPROC1_PROFILE_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC1_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED31_24	
23:0	TOTAL_CYCLE	Total cycle count in a ROI, from new ROI to last pixel out of the processor (OVERLAYPROC1 goes back to Idle)

0x05118104 MDP_OVERLAYPROC1_BLEND0_OP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0040

This register describes the blend operation done by Layer Mixer 0 on Stage 0 FG/BG, where this register is Double Buffered and the value takes effect at the next refresh initiation of this Overlay Processor.

MDP_OVERLAYPROC1_BLEND0_OP

Bits	Name	Description
31:10	RESERVED31_10	
9	BG_TRANSP_EN	BG transparency color check enable. When color matches, the FG pixel is passed; otherwise, the blended result is passed. However, if both FG and BG Transparency checks are enabled and both matches, BG pixel is passed.
8	FG_TRANSP_EN	FG transparency color check enable. When color matches, the BG pixel is passed; otherwise, the blended result is passed.
7	BG_MOD_ALPHA	When set (1), bg constant alpha modulates the alpha selected by ALPHA_SEL before performing pixel blending.
6	BG_INV_ALPHA	When set (1) the alpha selected by BG_ALPHA_SEL is inverted (1-alpha).
5:4	BG_ALPHA_SEL	Blending alpha select: 0x0: fg constant alpha 0x1: bg constant alpha 0x2: fg per pixel alpha 0x3: bg per pixel alpha
3	FG_MOD_ALPHA	When set (1), fg constant alpha modulates the alpha selected by ALPHA_SEL before performing pixel blending.

MDP_OVERLAYPROC1_BLEND0_OP (cont.)

Bits	Name	Description
2	FG_INV_ALPHA	When set (1) the alpha selected by FG_ALPHA_SEL is inverted (1-alpha).
1:0	FG_ALPHA_SEL	Blending alpha select: 0x0: fg constant alpha 0x1: bg constant alpha 0x2: fg per pixel alpha 0x3: bg per pixel alpha

0x05118108 MDP_OVERLAYPROC1_BLEND0_FG_ALPHA

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_00FF

This register is Double Buffered. The value is shadowed at every refresh initiation of this Overlay Processor for internal used.

MDP_OVERLAYPROC1_BLEND0_FG_ALPHA

Bits	Name	Description
31:8	RESERVED31_8	
7:0	CONSTANT_ALPHA	Alpha value for constant alpha blend or modulation alpha.

0x0511810C MDP_OVERLAYPROC1_BLEND0_BG_ALPHA

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every refresh initiation of this Overlay Processor for internal used.

MDP_OVERLAYPROC1_BLEND0_BG_ALPHA

Bits	Name	Description
31:8	RESERVED31_8	
7:0	CONSTANT_ALPHA	Alpha value for constant alpha blend or modulation alpha.

0x05118110 MDP_OVERLAYPROC1_BLEND0_TRANSP_LOW0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC1_BLEND0_TRANSP_LOW0

Bits	Name	Description
31:28	RESERVED31_28	
27:16	TRANSPARENCY_C1	Transparent color check lower limit for Color1
15:12	RESERVED15_12	
11:0	TRANSPARENCY_C0	Transparent color check lower limit for Color0

0x05118114 MDP_OVERLAYPROC1_BLEND0_TRANSP_LOW1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC1_BLEND0_TRANSP_LOW1

Bits	Name	Description
31:12	RESERVED31_12	
11:0	TRANSPARENCY_C2	Transparent color check lower limit for Color2

0x05118118 MDP_OVERLAYPROC1_BLEND0_TRANSP_HIGH0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC1_BLEND0_TRANSP_HIGH0

Bits	Name	Description
31:28	RESERVED31_28	
27:16	TRANSPARENCY_C1	Transparent color check high limit for Color1
15:12	RESERVED15_12	
11:0	TRANSPARENCY_C0	Transparent color check high limit for Color0

0x0511811C MDP_OVERLAYPROC1_BLEND0_TRANSP_HIGH1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

0x0511A400+ 4*n MDP_OVERLAYPROC1_CSC_MV1n, n=[0..8]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_OVERLAYPROC1_CSC_MV1n register contains the set1 matrix vector.

MDP_OVERLAYPROC1_CSC_MV1n

Bits	Name	Description
31:13	RESERVED31_13	
12:0	MV1	MV1 = Matrix vector set1 (s4.9). Matrices are indexed left to right, top to bottom. That is, row 1, col 0 index = 3 (index range - 0 to 8).

0x0511A500+ 4*n MDP_OVERLAYPROC1_CSC_PRE_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_OVERLAYPROC1_CSC_PRE_BV1n register contains the set1 pre-bias vector.

MDP_OVERLAYPROC1_CSC_PRE_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	PRE_BV1	PRE_BV1= Pre-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x0511A580+ 4*n MDP_OVERLAYPROC1_CSC_POST_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_OVERLAYPROC1_CSC_POST_BV1n register contains the set1 post-bias vector.

MDP_OVERLAYPROC1_CSC_POST_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	POST_BV1	POST_BV1 = Post-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x0511A600+ 4*n MDP_OVERLAYPROC1_CSC_PRE_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_OVERLAYPROC1_CSC_PRE_LV1n register contains the set1 pre-limit vector.

MDP_OVERLAYPROC1_CSC_PRE_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	PRE_LV1	PRE_LV1 = Pre-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x0511A680+ 4*n MDP_OVERLAYPROC1_CSC_POST_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_OVERLAYPROC1_CSC_POST_LV1n register contains the set1 post-limit vector.

MDP_OVERLAYPROC1_CSC_POST_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	POST_LV1	POST_LV1 = Post-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x0511C800+ 4*n MDP_OVERLAYPROC1_GC_START_COLOR_0_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation enable and stage start value setting for component0.

MDP_OVERLAYPROC1_GC_START_COLOR_0_STAGEn

Bits	Name	Description
31:17	RESERVED31_17	
16	STAGE_ENABLE	Stage enable.
15:12	RESERVED15_12	
11:0	STAGE_START_VALUE	Stage start value

0x0511C880+ 4*n MDP_OVERLAYPROC1_GC_PARAM_COLOR_0_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation gain and offset setting for component0.

MDP_OVERLAYPROC1_GC_PARAM_COLOR_0_STAGEn

Bits	Name	Description
31	RESERVED31	
30:16	STAGE_OFFSET	Stage offset (U8.7).
15	RESERVED15	
14:0	STAGE_GAIN	Stage gain (U3.12)

0x0511C900+ 4*n MDP_OVERLAYPROC1_GC_START_COLOR_1_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation enable and stage start value setting for component1.

MDP_OVERLAYPROC1_GC_START_COLOR_1_STAGEn

Bits	Name	Description
31:17	RESERVED31_17	
16	STAGE_ENABLE	Stage enable.
15:12	RESERVED15_12	
11:0	STAGE_START_VALUE	Stage start value

0x0511C980+ 4*n MDP_OVERLAYPROC1_GC_PARAM_COLOR_1_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation gain and offset setting for component1.

MDP_OVERLAYPROC1_GC_PARAM_COLOR_1_STAGEn

Bits	Name	Description
31	RESERVED31	
30:16	STAGE_OFFSET	Stage offset (U8.7).
15	RESERVED15	
14:0	STAGE_GAIN	Stage gain (U3.12)

0x0511CA00+4*n MDP_OVERLAYPROC1_GC_START_COLOR_2_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation enable and stage start value setting for component2.

MDP_OVERLAYPROC1_GC_START_COLOR_2_STAGEn

Bits	Name	Description
31:17	RESERVED31_17	
16	STAGE_ENABLE	Stage enable.
15:12	RESERVED15_12	
11:0	STAGE_START_VALUE	Stage start value

0x0511CA80+4*n MDP_OVERLAYPROC1_GC_PARAM_COLOR_2_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation gain and offset setting for component2.

MDP_OVERLAYPROC1_GC_PARAM_COLOR_2_STAGEn

Bits	Name	Description
31	RESERVED31	
30:16	STAGE_OFFSET	Stage offset (U8.7).
15	RESERVED15	
14:0	STAGE_GAIN	Stage gain (U3.12)

0x0511D004 MDP_OVERLAYPROC1_LSP_BORDER_COLOR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Least Significant Portion (lower 24 bits of total 36 bits) of border color values.

MDP_OVERLAYPROC1_LSP_BORDER_COLOR

Bits	Name	Description
31:28	RESERVED31_28	
27:16	BORDER_COLOR1	Border color value for color 1
15:12	RESERVED15_12	
11:0	BORDER_COLOR0	Border color value for color 0

0x0511D008 MDP_OVERLAYPROC1_MSP_BORDER_COLOR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Most Significant Portion (upper 12 bits of total 36 bits) of border color values.

MDP_OVERLAYPROC1_MSP_BORDER_COLOR

Bits	Name	Description
31:12	RESERVED31_12	
11:0	BORDER_COLOR2	Border color value for color 2

14.15.12.3 Video/Graphics1 Input Pipe registers

0x05120000 MDP_VG1_SRC_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SRC_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	SRC_H	Height of input ROI data
15:12	RESERVED15_12	
11:0	SRC_W	Width of input ROI data

0x05120004 MDP_VG1_SRC_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This represents the offset from the top-left corner of the source image. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SRC_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	SRC_Y	Y offset of source ROI in the source image
15:12	RESERVED15_12	
11:0	SRC_X	X offset of source ROI in the source image

0x05120008 MDP_VG1_OUT_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

If scale is not enabled, this register value will be ignored, and the hardware assumes that the output size is the same as SRC_SIZE register setting. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_OUT_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_H	Height of output ROI data
15:12	RESERVED15_12	

MDP_VG1_OUT_SIZE (cont.)

Bits	Name	Description
11:0	DST_W	Width of output ROI data

0x0512000C MDP_VG1_OUT_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This represents the offset from the top-left corner of the base layer image. If this pipe is processing the base layer then this register is all zeros. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_OUT_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_Y	Y offset of this layer output in the Frame Buffer
15:12	RESERVED15_12	
11:0	DST_X	X offset of this layer output in the Frame Buffer

0x05120010 MDP_VG1_SRCP0_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SRCP0_ADDR

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x05120014 MDP_VG1_SRCP1_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SRCP1_ADDR

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x05120018 MDP_VG1_SRCP2_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SRCP2_ADDR

Bits	Name	Description
31:0	SRCP2_ADDR	Base byte address of the Image's planar color2 plane.

0x0512001C MDP_VG1_SRCP3_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SRCP3_ADDR

Bits	Name	Description
31:0	SRCP3_ADDR	Base byte address of the Image's color3 (alpha) component, used in pseudo planar + alpha format, or planar.

0x05120020 MDP_VG1_SRCP0_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for VG1 pipe.

MDP_VG1_SRCP0_ADDR_1

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x05120024 MDP_VG1_SRCP1_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for VG1 pipe.

MDP_VG1_SRCP1_ADDR_1

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x05120028 MDP_VG1_SRCP2_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for VG1 pipe.

MDP_VG1_SRCP2_ADDR_1

Bits	Name	Description
31:0	SRCP2_ADDR	Base byte address of the Image's planar color2 plane.

0x05120030 MDP_VG1_SRCP0_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for VG1 pipe.

MDP_VG1_SRCP0_ADDR_2

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x05120034 MDP_VG1_SRCP1_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for VG1 pipe.

MDP_VG1_SRCP1_ADDR_2

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x05120038 MDP_VG1_SRCP2_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for VG1 pipe.

MDP_VG1_SRCP2_ADDR_2

Bits	Name	Description
31:0	SRCP2_ADDR	Base byte address of the Image's planar color2 plane.

0x05120040 MDP_VG1_SRC_YSTRIDE1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0060

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SRC_YSTRIDE1

Bits	Name	Description
31	RESERVED31	
30:16	SRCP1_YSTRIDE	Plane 1 y stride in bytes.
15	RESERVED15	
14:0	SRCP0_YSTRIDE	Plane 0 y stride in bytes.

0x05120044 MDP_VG1_SRC_YSTRIDE2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SRC_YSTRIDE2

Bits	Name	Description
31	RESERVED31	
30:16	SRCP3_YSTRIDE	Plane 3 y stride in bytes.
15	RESERVED15	
14:0	SRCP2_YSTRIDE	Plane 2 y stride in bytes.

0x05120048 MDP_VG1_SSTILE_FRAME_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x02D0_0500

The frame size of a whole super tile format frame is needed to calculate the proper addressing.

The minimum super tile height is 96.

MDP_VG1_SSTILE_FRAME_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	FRAME_H	Video Super Tile format frame height
15:12	RESERVED15_12	
11:0	FRAME_W	Video Super Tile format frame width

0x05120050 MDP_VG1_SRC_FORMAT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0002_44FF

This register describes the input surface for this pipe. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SRC_FORMAT

Bits	Name	Description
31	RESERVED31	
30:29	FRAME_FORMAT	0x0: Linear, No tile (Default) 0x1: Reserved for ARGB 4x4 tile 0x2: Video in 64x32 supertile, YCbCr 420 PP only
28	SRC_CHROMA_SITE	Source chroma siting. 1 = offsite, 0 = cosite.
27:26	SRC_CHROMA_SAMP	Source chroma sampling: 0x0: 4:4:4/RGB 0x1: H2V1 0x2: H1V2 0x3: 4:2:0.
25:23	RESERVED25_23	
22	SOLID_FILL	If this bit is set (1), Fetch uses the CONSTANT_COLOR register value as its output. Nothing is fetched.
21	VC1_REDUCE	VC1 range reduction enable for YUV source, the reduce range is set by a separate register VC1_RANGE.
20:19	FETCH_PLANES	Determines the number of planes to fetch: 0x0: Interleaved 0x1: Planar 0x2: pseudo planar
18	UNPACK_ALIGN	0x0: To LSB 0x1: To MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
16:15	RESERVED16_15	
14:13	UNPACK_COUNT	Valid unpacking pattern count: 0 = 1 component,..., 3 = 4 components. Unpacking pattern only applies to the interleaved plane (chroma plane in pseudo-planar).
12	ROT90	Source has been rotated 90 degree
11	RESERVED11	

MDP_VG1_SRC_FORMAT (cont.)

Bits	Name	Description
10:9	SRC_BPP	Effective source byte per pixel: 0 = 1 byte, 1 = 2 bytes, 2 = 3 bytes, 3 = 4 bytes. This is only used when unpacking the interleaved plane.
8	SRCC3_EN	0x1: Source has alpha
7:6	SRCC3	Number of bits for component 3 (alpha) input, this is not used for dither: 0 = 1 bit, 1 = 4 bits, 2 = 6 bits, 3 = 8 bits.
5:4	SRCC2	Number of bits for component 2 (R / Cr) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	SRCC1	Number of bits for component 1 (B / Cb) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	SRCC0	Number of bits for component 0 (G / luma) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x05120054 MDP_VG1_SRC_UNPACK_PATTERN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0302_0001

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4). Default is ARGB or C3-C2-C0-C1. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SRC_UNPACK_PATTERN

Bits	Name	Description
31:26	RESERVED31_26	
25:24	ELEMENT3	0x0: C0 0x1: C1 0x2: C2 0x3: C3
23:18	RESERVED23_18	
17:16	ELEMENT2	0x0: C0 0x1: C1 0x2: C2 0x3: C3
15:10	RESERVED15_10	
9:8	ELEMENT1	0x0: C0 0x1: C1 0x2: C2 0x3: C3

MDP_VG1_SRC_UNPACK_PATTERN (cont.)

Bits	Name	Description
7:2	RESERVED7_2	
1:0	ELEMENT0	0x0: C0 0x1: C1 0x2: C2 0x3: C3

0x05120058 MDP_VG1_OP_MODE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_OP_MODE

Bits	Name	Description
31:20	RESERVED31_20	
19	DEINT_ODD_REF	De-interlace uses Odd field as Reference when set.
18	DEINT_EN	De-interlace enable
17	HIST_LUT_EN	Component 0 LUT enable for histogram enhancement.
16	IGC_LUT_EN	Inverse Gamma Correction LUT enable. If disabled, the colors are mapped linearly from 8-bit to 12-bit.
15	DITHER_EN	Dither enable.
14:13	FLIP_MODE	Flip operation: Bit 1: Left/right flip Bit 2: Up/down flip
12	RESERVED12	
11	CSC_EN	This enables the color matrix conversion.
10	DST_DATA_FORMAT	Color converter output data format setting: 0x0: RGB 0x1: YCbCr
9	SRC_DATA_FORMAT	Color converter input data format setting: 0x0: RGB 0x1: YCbCr
8:6	RESERVED8_6	

MDP_VG1_OP_MODE (cont.)

Bits	Name	Description
5:4	SCALEY_UNIT_SEL	Select Polyphase FIR or M/N filter for Y scaler. M/N should be used at low-end of down-scaling (between 1/8 and 1/4). Pixel Repeat is special scaling mode used for upscale only. Otherwise, QSEED should be selected in other cases. This field must be set to 0x0 when SCALEY_EN is 0x0. 0x0: FIR (QSEED) 0x1: M/N phase-controlled 0x2: Pixel Repeat
3:2	SCALEX_UNIT_SEL	Select Polyphase FIR or M/N filter for X scaler. M/N should be used at low-end of down-scaling (between 1/8 and 1/4). Pixel Repeat is special scaling mode used for upscale only. Otherwise, QSEED should be selected in other cases. This field must be set to 0x0 when SCALEX_EN is 0x0. 0x0: FIR (QSEED) 0x1: M/N phase-controlled 0x2: Pixel Repeat
1	SCALEY_EN	Y scaling enable
0	SCALEX_EN	X scaling enable

0x0512005C MDP_VG1_SCALE_PHASEX_STEP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SCALE_PHASEX_STEP

Bits	Name	Description
31:0	PHASEX_STEP	X phase step for scaling, which is input width/output width in u3.29, i.e., (src_size / out_size)<<29, phase step of 8 (1/8 scale) is encoded by setting this value to 0 (representing 0x1_0000_0000).

0x05120060 MDP_VG1_SCALE_PHASEY_STEP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_SCALE_PHASEY_STEP

Bits	Name	Description
31:0	PHASEY_STEP	Y phase step for scaling, which is input height/output height in u3.29, i.e., (src_size / out_size)<<29, phase step of 8 (1/8 scale) is encoded by setting this value to 0 (representing 0x1_0000_0000).

0x05120064 MDP_VG1_HIST_LUT_SEL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG1_HIST_LUT_SEL

Bits	Name	Description
31:1	RESERVED31_1	
0	LUT_SEL	Selects which LUT to use for histogram enhancement 0x0: Set1 0x1: Set2

0x05120068 MDP_VG1_DITHER_STRENGTH

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_003F

MDP_VG1_DITHER_STRENGTH

Bits	Name	Description
31:6	RESERVED31_6	
5:4	C2_BITS	Number of MSBits on component 2 (R/Cr) to indicate the dithering boundary: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	C1_BITS	Number of MSBits on component 1 (B/Cb) to indicate the dithering boundary: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	C0_BITS	Number of MSBits on component 0 (G/Y) to indicate the dithering boundary: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x05121000 MDP_VG1_FETCH_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_003F

MDP_VG1_FETCH_STATUS

Bits	Name	Description
31:12	RESERVED31_12	
11:8	FIFO_ERRORS	TileFetch internal FIFO errors. These error bits are pulse catching, and returned to zero when this register is read: Bit 11= control FIFO error Bit 10= burstbuf FIFO error Bit 9= line_gen luma FIFO error Bit 8= line_gen chroma FIFO error
7:6	RESERVED7_6	
5:0	IDLES	TileFetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 5= dma_rd idle Bit 4= ctl idle Bit 3= burstbuf idle Bit 2= unpack idle Bit 1= unpack chroma idle Bit 0= line_gen idle

0x05121004 MDP_VG1_FETCH_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0047

MDP_VG1_FETCH_CFG

Bits	Name	Description
31:9	RESERVED31_9	
8	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes: 0x0: frame (default) 0x1: line
7	FETCH_OPT_EN	Fetch Optimization Enable. Fetch optimization is supported only for interleave RGB formats. This setting is ignored when in others. 0x0: Disable (default) 0x1: Enable

MDP_VG1_FETCH_CFG (cont.)

Bits	Name	Description
6:4	MAX_BURST_SIZE	Maximum burst beat size. Possible values: 0x4: 16 (default) 0x2: 8 0x1: 4
3	RESERVED3	
2:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design, anything less limits the bus requests to that number + 1.

0x05121008 MDP_VG1_CONSTANT_COLOR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0xFFFF_FFFF

MDP_VG1_CONSTANT_COLOR

Bits	Name	Description
31:24	COLOR3	Constant color driven for color3 during solid fill mode.
23:16	COLOR2	Constant color driven for color2 during solid fill mode.
15:8	COLOR1	Constant color driven for color1 during solid fill mode.
7:0	COLOR0	Constant color driven for color0 during solid fill mode.

0x0512100C MDP_VG1_FETCH_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_VG1_FETCH_COUNT

Bits	Name	Description
31:28	RESERVED31_28	
27:16	CHROMA_LINE	Current chroma line number
15:12	RESERVED15_12	
11:0	LUMA_LINE	Current luma line number

0x05121010 MDP_VG1_FETCH_STATISTIC

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_VG1_FETCH_STATISTIC

Bits	Name	Description
31:13	FETCH_KCYCLES	Accumulated kilo-cycles spent in wait for read data in the current frame.
12:0	FETCH_KBYTES	Accumulated KByte received in the current frame.

0x05121020 MDP_VG1_VC1_RANGE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0707

MDP_VG1_VC1_RANGE

Bits	Name	Description
31:11	RESERVED31_11	
10:8	RANGE_MAPUV	Chroma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.
7:3	RESERVED7_3	
2:0	RANGE_MAPY	Luma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.

0x05122000 MDP_VG1_DEINT_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_000F

MDP_VG1_DEINT_STATUS

Bits	Name	Description
31:4	RESERVED31_4	
3:0	IDLES	Internal idles

0x05122004 MDP_VG1_DEINT_DECISION

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0003_0032

MDP_VG1_DEINT_DECISION

Bits	Name	Description
31:19	RESERVED31_19	
18:16	ATTENU	Attenuation (the shift value) for less temporal resolution; valid range is 0
15:11	RESERVED15_11	
10:0	THRESH	Threshold (u11) for de-interlace attenuation decision

0x05122010 MDP_VG1_DEINT_COEFF0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0360_03E0

The MDP_VG1_DEINT_COEFFn registers contain the set of luma filter coefficients, where w3 is for the center pixel, w2 is for (+1, -1) pixels, w1 is for (+2, -2) pixels, and w0 is for (+3, -3) pixels.

MDP_VG1_DEINT_COEFF0

Bits	Name	Description
31:26	RESERVED31_26	
25:16	COEFF1	Luma filter coefficient w1 (s10 Q5).
15:10	RESERVED31_10	
9:0	COEFF0	Luma filter coefficient w0 (s10 Q5).

0x05122014 MDP_VG1_DEINT_COEFF1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0140_0120

The MDP_VG1_DEINT_COEFFn registers contain the set of luma filter coefficients, where w3 is for the center pixel, w2 is for (+1, -1) pixels, w1 is for (+2, -2) pixels, and w0 is for (+3, -3) pixels.

MDP_VG1_DEINT_COEFF1

Bits	Name	Description
31:26	RESERVED31_26	
25:16	COEFF1	Luma filter coefficient w3 (s10 Q5).
15:10	RESERVED31_10	
9:0	COEFF0	Luma filter coefficient w2 (s10 Q5).

0x05123400+ 4*n MDP_VG1_HIST_LUT1n, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG1_HIST_LUT1n registers contains the color lookup values for histogram enhancement set1.

MDP_VG1_HIST_LUT1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	LUT_COLOR0	LUT value for color0.

0x05123800+ 4*n MDP_VG1_HIST_LUT2n, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG1_HIST_LUT2n registers contains the color lookup values for histogram enhancement set2.

MDP_VG1_HIST_LUT2n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	LUT_COLOR0	LUT value for color0.

0x05124400+ 4*n MDP_VG1_CSC_MV1n, n=[0..8]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG1_CSC_MV1n register contains the set1 matrix vector.

MDP_VG1_CSC_MV1n

Bits	Name	Description
31:13	RESERVED31_13	
12:0	MV1	MV1 = Matrix vector set1 (s4.9). Matrices are indexed left to right, top to bottom. That is, row 1, col 0 index = 3 (index range - 0 to 8).

0x05124500+ 4*n MDP_VG1_CSC_PRE_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG1_CSC_PRE_BV1n register contains the set1 pre-bias vector.

MDP_VG1_CSC_PRE_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	PRE_BV1	PRE_BV1= Pre-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05124580+ 4*n MDP_VG1_CSC_POST_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG1_CSC_POST_BV1n register contains the set1 post-bias vector.

MDP_VG1_CSC_POST_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	POST_BV1	POST_BV1 = Post-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05124600+ 4*n MDP_VG1_CSC_PRE_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG1_CSC_PRE_LV1n register contains the set1 pre-limit vector.

MDP_VG1_CSC_PRE_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	PRE_LV1	PRE_LV1 = Pre-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05124680+ 4*n MDP_VG1_CSC_POST_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG1_CSC_POST_LV1n register contains the set1 post-limit vector.

MDP_VG1_CSC_POST_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	POST_LV1	POST_LV1 = Post-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05125000+ 4*n MDP_VG1_IGC_LSP_LUTn, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG1_IGC_LSP_LUTn registers contains contains the Least Significant Portion (lower 24 bits of total 36 bits) of the color lookup values for IGC LUT.

MDP_VG1_IGC_LSP_LUTn

Bits	Name	Description
31:28	RESERVED31_28	

MDP_VG1_IGC_LSP_LUTn (cont.)

Bits	Name	Description
27:16	LUT_COLOR1	LUT value for color1.
15:12	RESERVED15_12	
11:0	LUT_COLOR0	LUT value for color0.

0x05125800+ 4*n MDP_VG1_IGC_MSP_LUTn, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG1_IGC_MSP_LUTn registers contains the most significant portion (color component 2) of the color lookup values for IGC LUT. The whole LUT should be written to in the sequence of LSP write first followed by MSP write, writing from lower address to higher address. Each MSP register write actually triggers the write of whole 36-bit LUT entry into the RAM.

MDP_VG1_IGC_MSP_LUTn

Bits	Name	Description
31:12	RESERVED31_12	
11:0	LUT_COLOR2	LUT value for color2.

0x05126000 MDP_VG1_HIST_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_VG1_HIST_START register kicks off histogram generation.

MDP_VG1_HIST_START

Bits	Name	Description
31:0	HIST_START	A write to this register kicks off histogram generation. Actual accumulation begins at the start of next ROI. Histogram accumulation can be started only when histogram reset sequence is not currently active.

0x05126004 MDP_VG1_HIST_FRAME_CNT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0001

The MDP_VG1_HIST_FRAME_CNT register is used to program the frame count for histogram accumulation.

MDP_VG1_HIST_FRAME_CNT

Bits	Name	Description
31:6	RESERVED31_6	
5:0	FRAME_CNT	Program the number of frames over which the histogram data has to be collected. If the frame count programmed is more than what each 24-bit bin can support, the bin count will saturate at the maximum value. Here are some max. frame counts that can be programmed for different image sizes for a 24-bit bin. XGA (1024 x 768) - 21 WSVGA (1024 x 600) - 27 WVGA (800 x 480) - 43 VGA (640 x 480) - 54

0x0512600C MDP_VG1_HIST_RESET_SEQ_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_VG1_HIST_RESET_SEQ_START kicks off a reset sequence.

MDP_VG1_HIST_RESET_SEQ_START

Bits	Name	Description
31:0	RESET_SEQ_START	Writing to this register kicks off a reset sequence.This reset sequence clears all RAM locations and RAM rd/wr pointers. The reset sequence can be initiated only when histogram generation is not currently active. Note: Functional clock gating will shut off the clock to VG1 sub-blocks when a ROI is not being processed. So VG1 clock should be forced ON for the reset sequence to complete.

0x05126010 MDP_VG1_HIST_CONTROL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG1_HIST_CONTROL register controls histogram operation.

MDP_VG1_HIST_CONTROL

Bits	Name	Description
31:1	RESERVED31_1	
0	AUTO_CLEAR_EN	When set (1), the bin from which data has been read is cleared automatically.

0x05126014 MDP_VG1_HIST_INTR_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG1_HIST_INTR_STATUS register provides histogram interrupt status.

MDP_VG1_HIST_INTR_STATUS

Bits	Name	Description
31:2	RESERVED31_2	
1	HIST_DONE	When set (1) implies histogram generation is complete.
0	RESET_SEQ_DONE	When set (1) implies the reset sequence is complete.

0x05126018 MDP_VG1_HIST_INTR_CLEAR

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_VG1_HIST_INTR_CLEAR is used to clear the interrupts generated by histogram block.

MDP_VG1_HIST_INTR_CLEAR

Bits	Name	Description
31:2	RESERVED31_2	

MDP_VG1_HIST_INTR_CLEAR (cont.)

Bits	Name	Description
1	HIST_DONE	Write (1) to this bit to clear the status.
0	RESET_SEQ_DONE	Write (1) to this bit to clear the status.

0x0512601C MDP_VG1_HIST_INTR_ENABLE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG1_HIST_INTR_ENABLE is used to enable the interrupt sources within the histogram block.

MDP_VG1_HIST_INTR_ENABLE

Bits	Name	Description
31:2	RESERVED31_2	
1	HIST_DONE	Write (1) to this bit to enable the interrupt source.
0	RESET_SEQ_DONE	Write (1) to this bit to enable the interrupt source.

0x05126020 MDP_VG1_HIST_STOP_REQ

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_VG1_HIST_STOP_REQ kicks off a histogram operation stop request which is stopping HIST HW at the end of frame even if the frame count is less than programmed frame count.

MDP_VG1_HIST_STOP_REQ

Bits	Name	Description
31:0	STOP_REQ	Writing to this register kicks off a stop request which is stopping HIST HW at the end of frame even if the processed frame count is less than programmed frame count.

0x05126024 MDP_VG1_HIST_CANCEL_REQ

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_VG1_HIST_CANCEL_REQ kicks off a histogram operation cancel request which is stopping HIST HW at any state rather than RESET state.

MDP_VG1_HIST_CANCEL_REQ

Bits	Name	Description
31:0	CANCEL_REQ	Writing to this register kicks off a cancel request which is stopping HIST HW at any state rather than RESET state.

0x05126028 MDP_VG1_HIST_EXTRA_INFO_0

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x007F_0000

The MDP_VG1_HIST_EXTRA_INFO_0 register provides histogram extra information. These values are only valid when HIST HW are IDLE state and this register values are reset automatically whenever HIST HW starts.

MDP_VG1_HIST_EXTRA_INFO_0

Bits	Name	Description
31	RESERVED31	
30:24	Y_MAX_VALUE	Maximum pixel value for component Y
23	RESERVED23	
22:16	Y_MIN_VALUE	Minimum pixel value for component Y
15:6	RESERVED15_6	
5:0	CUR_FRAME_COUNT	This value provides the processed number of frame from start to HIST_DONE.

0x05126200+4*n MDP_VG1_HIST_LUMA_DATAn, n=[0..127]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG1_HIST_LUMA_DATAn register provides the histogram data corresponding to the luma component.

MDP_VG1_HIST_LUMA_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_LUMA_DATA	Reading this register provides histogram bin data for luma.

0x05128000 MDP_VG1_SCALE_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_03FF

MDP_VG1_SCALE_STATUS

Bits	Name	Description
31:10	RESERVED31_10	
9:0	IDLES	Internal block idles

0x05128100+4*n MDP_VG1_QSEED_TABLE0_n, n=[0..3]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Each MDP_VG1_QSEED_TABLE0_n register space contains 16 table entries of QSEED Table0.

MDP_VG1_QSEED_TABLE0_n

Bits	Name	Description
31:30	ENTRY15	2 bit lookup value of Table0, entry n*16+15
29:28	ENTRY14	2 bit lookup value of Table0, entry n*16+14
27:26	ENTRY13	2 bit lookup value of Table0, entry n*16+13
25:24	ENTRY12	2 bit lookup value of Table0, entry n*16+12
23:22	ENTRY11	2 bit lookup value of Table0, entry n*16+11
21:20	ENTRY10	2 bit lookup value of Table0, entry n*16+10
19:18	ENTRY9	2 bit lookup value of Table0, entry n*16+9
17:16	ENTRY8	2 bit lookup value of Table0, entry n*16+8
15:14	ENTRY7	2 bit lookup value of Table0, entry n*16+7
13:12	ENTRY6	2 bit lookup value of Table0, entry n*16+6
11:10	ENTRY5	2 bit lookup value of Table0, entry n*16+5

MDP_VG1_QSEED_TABLE0_n (cont.)

Bits	Name	Description
9:8	ENTRY4	2 bit lookup value of Table0, entry n*16+4
7:6	ENTRY3	2 bit lookup value of Table0, entry n*16+3
5:4	ENTRY2	2 bit lookup value of Table0, entry n*16+2
3:2	ENTRY1	2 bit lookup value of Table0, entry n*16+1
1:0	ENTRY0	2 bit lookup value of Table0, entry n*16

0x05128200+4*n MDP_VG1_QSEED_TABLE1_n, n=[0..1]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Each MDP_VG1_QSEED_TABLE1_n register space contains 8 table entries of QSEED Table1. When source image is RGB, the gradient calculation is bypassed and only bicubic scaling applies. Thus, in such case, QSEED_TABLE1_0 entry 0 is used to select which bicubic coeffcient table set (out of XTABLE2) to used (U1, D0, D1, or D2 set) per scaling ratio range for X scaling. QSEED_TABLE1_0 entry 1 is used to select which bicubic coeffcient table set (out of YTABLE2) to used per scaling ratio range for Y scaling.

MDP_VG1_QSEED_TABLE1_n

Bits	Name	Description
31:28	ENTRY7	4 bit lookup value of Table1, entry n*8+7
27:24	ENTRY6	4 bit lookup value of Table1, entry n*8+6
23:20	ENTRY5	4 bit lookup value of Table1, entry n*8+5
19:16	ENTRY4	4 bit lookup value of Table1, entry n*8+4
15:12	ENTRY3	4 bit lookup value of Table1, entry n*8+3
11:8	ENTRY2	4 bit lookup value of Table1, entry n*8+2
7:4	ENTRY1	4 bit lookup value of Table1, entry n*8+1
3:0	ENTRY0	4 bit lookup value of Table1, entry n*8

0x05129000+8*n MDP_VG1_QSEED_XTABLE2_LSPn, n=[0..511]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG1_QSEED_TABLE2_LSPn register contains the Least Significant Portion of the whole coefficient word, i.e., coefficients for k-1 and k samples. Note, each coefficient value is aligned to 16-bit word boundary.

MDP_VG1_QSEED_XTABLE2_LSPn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	COEFF1	12 bit (signed) poly-phase scale coefficient for k sample.
15:12	RESERVED15_12	
11:0	COEFF0	12 bit (signed) poly-phase scale coefficient for k-1 sample.

0x05129004+8*n MDP_VG1_QSEED_XTABLE2_MSPn, n=[0..511]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG1_QSEED_TABLE2_MSPn register contains the Most Significant Portion of the whole coefficient word, i.e., coefficients for k+1 and k+2 samples. Note, each coefficient value is aligned to 16-bit word boundary. The FIR coefficient tables should be written to in sequence of LSP write first followed by MSP write, writing from lower address to higher address. Each MSP register write actually triggers the write of whole 48-bit coefficient word into the RAM. There are actually 16 tables of 32 entries (phases) each. They are grouped from table 0 at the lowest addresses (0x27000-0x270fc) to table 15 at the highest addresses (0x27f00-0x27ffc).

MDP_VG1_QSEED_XTABLE2_MSPn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	COEFF3	12 bit (signed) poly-phase scale coefficient for k+2 sample.
15:12	RESERVED15_12	
11:0	COEFF2	12 bit (signed) poly-phase scale coefficient for k+1 sample.

0x0512A000+8*n MDP_VG1_QSEED_YTABLE2_LSPn, n=[0..511]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG1_QSEED_TABLE2_LSPn register contains the Least Significant Portion of the whole coefficient word, i.e., coefficients for k-1 and k samples. Note, each coefficient value is aligned to 16-bit word boundary.

MDP_VG1_QSEED_YTABLE2_LSPn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	COEFF1	12 bit (signed) poly-phase scale coefficient for k sample.
15:12	RESERVED15_12	
11:0	COEFF0	12 bit (signed) poly-phase scale coefficient for k-1 sample.

0x0512A004+ 8*n MDP_VG1_QSEED_YTABLE2_MSPn, n=[0..511]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG1_QSEED_TABLE2_MSPn register contains the Most Significant Portion of the whole coefficient word, i.e., coefficients for k+1 and k+2 samples. Note, each coefficient value is aligned to 16-bit word boundary. The FIR coefficient tables should be written to in sequence of LSP write first followed by MSP write, writing from lower address to higher address. Each MSP register write actually triggers the write of whole 48-bit coefficient word into the RAM. There are actually 16 tables of 32 entries (phases) each. They are grouped from table 0 at the lowest addresses (0x27000-0x270fc) to table 15 at the highest addresses (0x27f00-0x27ffc).

MDP_VG1_QSEED_YTABLE2_MSPn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	COEFF3	12 bit (signed) poly-phase scale coefficient for k+2 sample.
15:12	RESERVED15_12	
11:0	COEFF2	12 bit (signed) poly-phase scale coefficient for k+1 sample.

14.15.12.4 Video/Graphics2 Input Pipe registers

0x05130000 MDP_VG2_SRC_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SRC_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	SRC_H	Height of input ROI data
15:12	RESERVED15_12	
11:0	SRC_W	Width of input ROI data

0x05130004 MDP_VG2_SRC_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This represents the offset from the top-left corner of the source image. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SRC_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	SRC_Y	Y offset of source ROI in the source image
15:12	RESERVED15_12	
11:0	SRC_X	X offset of source ROI in the source image

0x05130008 MDP_VG2_OUT_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

If scale is not enabled, this register value will be ignored, and the hardware assumes that the output size is the same as SRC_SIZE register setting. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_OUT_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_H	Height of output ROI data
15:12	RESERVED15_12	

MDP_VG2_OUT_SIZE (cont.)

Bits	Name	Description
11:0	DST_W	Width of output ROI data

0x0513000C MDP_VG2_OUT_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This represents the offset from the top-left corner of the base layer image. If this pipe is processing the base layer then this register is all zeros. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_OUT_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_Y	Y offset of this layer output in the Frame Buffer
15:12	RESERVED15_12	
11:0	DST_X	X offset of this layer output in the Frame Buffer

0x05130010 MDP_VG2_SRCP0_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SRCP0_ADDR

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x05130014 MDP_VG2_SRCP1_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SRCP1_ADDR

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x05130018 MDP_VG2_SRCP2_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SRCP2_ADDR

Bits	Name	Description
31:0	SRCP2_ADDR	Base byte address of the Image's planar color2 plane.

0x0513001C MDP_VG2_SRCP3_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SRCP3_ADDR

Bits	Name	Description
31:0	SRCP3_ADDR	Base byte address of the Image's color3 (alpha) component, used in pseudo planar + alpha format, or planar.

0x05130020 MDP_VG2_SRCP0_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for VG2 pipe.

MDP_VG2_SRCP0_ADDR_1

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x05130024 MDP_VG2_SRCP1_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for VG2 pipe.

MDP_VG2_SRCP1_ADDR_1

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x05130028 MDP_VG2_SRCP2_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for VG2 pipe.

MDP_VG2_SRCP2_ADDR_1

Bits	Name	Description
31:0	SRCP2_ADDR	Base byte address of the Image's planar color2 plane.

0x05130030 MDP_VG2_SRCP0_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for VG2 pipe.

MDP_VG2_SRCP0_ADDR_2

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane, the luma component plane in pseudo-planar format, or planar color0 plane.

0x05130034 MDP_VG2_SRCP1_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for VG2 pipe.

MDP_VG2_SRCP1_ADDR_2

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format, or planar color1 plane.

0x05130038 MDP_VG2_SRCP2_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for VG2 pipe.

MDP_VG2_SRCP2_ADDR_2

Bits	Name	Description
31:0	SRCP2_ADDR	Base byte address of the Image's planar color2 plane.

0x05130040 MDP_VG2_SRC_YSTRIDE1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0060

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SRC_YSTRIDE1

Bits	Name	Description
31	RESERVED31	
30:16	SRCP1_YSTRIDE	Plane 1 y stride in bytes.
15	RESERVED15	
14:0	SRCP0_YSTRIDE	Plane 0 y stride in bytes.

0x05130044 MDP_VG2_SRC_YSTRIDE2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SRC_YSTRIDE2

Bits	Name	Description
31	RESERVED31	
30:16	SRCP3_YSTRIDE	Plane 3 y stride in bytes.
15	RESERVED15	
14:0	SRCP2_YSTRIDE	Plane 2 y stride in bytes.

0x05130048 MDP_VG2_SSTILE_FRAME_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x02D0_0500

The frame size of a whole super tile format frame is needed to calculate the proper addressing.

The minimum super tile height is 96.

MDP_VG2_SSTILE_FRAME_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	FRAME_H	Video Super Tile format frame height
15:12	RESERVED15_12	
11:0	FRAME_W	Video Super Tile format frame width

0x05130050 MDP_VG2_SRC_FORMAT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0002_44FF

This register describes the input surface for this pipe. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SRC_FORMAT

Bits	Name	Description
31	RESERVED31	
30:29	FRAME_FORMAT	0x0: Linear, No tile (Default) 0x1: Reserved for ARGB 4x4 tile 0x2: Video in 64x32 supertile, YCbCr 420 only
28	SRC_CHROMA_SITE	Source chroma siting. 1 = offsite, 0 = cosite.
27:26	SRC_CHROMA_SAMP	Source chroma sampling: 0x0: 4:4:4/RGB 0x1: H2V1 0x2: H1V2 0x3: 4:2:0.
25:23	RESERVED25_23	
22	SOLID_FILL	If this bit is set (1), Fetch uses the CONSTANT_COLOR register value as its output. Nothing is fetched.
21	VC1_REDUCE	VC1 range reduction enable for YUV source, the reduce range is set by a separate register in the fetch.
20:19	FETCH_PLANES	Determines the number of planes to fetch: 0x0: Interleaved 0x1: Planar 0x2: pseudo planar
18	UNPACK_ALIGN	0x0: To LSB 0x1: To MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
16:15	RESERVED16_15	
14:13	UNPACK_COUNT	Valid unpacking pattern count: 0 = 1 component, ..., 3 = 4 components. Unpacking pattern only applies to the interleaved plane (chroma plane in pseudo-planar).
12	ROT90	Source has been rotated 90 degree
11	RESERVED11	

MDP_VG2_SRC_FORMAT (cont.)

Bits	Name	Description
10:9	SRC_BPP	Effective source byte per pixel: 0 = 1 byte, 1 = 2 bytes, 2 = 3 bytes, 3 = 4 bytes. This is only used when unpacking the interleaved plane.
8	SRCC3_EN	0x1: Source has alpha
7:6	SRCC3	Number of bits for component 3 (alpha) input, this is not used for dither: 0 = 1 bit, 1 = 4 bits, 2 = 6 bits, 3 = 8 bits.
5:4	SRCC2	Number of bits for component 2 (R / Cr) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	SRCC1	Number of bits for component 1 (B / Cb) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	SRCC0	Number of bits for component 0 (G / luma) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x05130054 MDP_VG2_SRC_UNPACK_PATTERN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0302_0001

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4). Default is ARGB or C3-C2-C0-C1. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SRC_UNPACK_PATTERN

Bits	Name	Description
31:26	RESERVED31_26	
25:24	ELEMENT3	0x0: C0 0x1: C1 0x2: C2 0x3: C3
23:18	RESERVED23_18	
17:16	ELEMENT2	0x0: C0 0x1: C1 0x2: C2 0x3: C3
15:10	RESERVED15_10	
9:8	ELEMENT1	0x0: C0 0x1: C1 0x2: C2 0x3: C3

MDP_VG2_SRC_UNPACK_PATTERN (cont.)

Bits	Name	Description
7:2	RESERVED7_2	
1:0	ELEMENT0	0x0: C0 0x1: C1 0x2: C2 0x3: C3

0x05130058 MDP_VG2_OP_MODE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_OP_MODE

Bits	Name	Description
31:20	RESERVED31_20	
19	DEINT_ODD_REF	de-interlace uses Odd field as Reference when set.
18	DEINT_EN	de-interlace enable
17	HIST_LUT_EN	Component 0 LUT enable for histogram enhancement.
16	IGC_LUT_EN	Inverse Gamma Correction LUT enable. If disabled, the colors are mapped linearly from 8-bit to 12-bit.
15	DITHER_EN	Dither enable.
14:13	FLIP_MODE	Flip operation: Bit 1: Left/right flip Bit 2: Up/down flip
12	RESERVED12	
11	CSC_EN	This enables the color matrix conversion.
10	DST_DATA_FORMAT	Color converter output data format setting: 0x0: RGB 0x1: YCbCr
9	SRC_DATA_FORMAT	Color converter input data format setting: 0x0: RGB 0x1: YCbCr
8:6	RESERVED8_6	

MDP_VG2_OP_MODE (cont.)

Bits	Name	Description
5:4	SCALEY_UNIT_SEL	Select Polyphase FIR or M/N filter for Y scaler. M/N should be used at low-end of downscaling (between 1/8 and 1/4). Pixel Repeat is special scaling mode used for upscale only. Otherwise, QSEED should be selected in other cases. This field must be set to 0x0 when SCALEY_EN is 0x0. 0x0: FIR (QSEED) 0x1: M/N phase-controlled 0x2: Pixel Repeat
3:2	SCALEX_UNIT_SEL	Select Polyphase FIR or M/N filter for X scaler. M/N should be used at low-end of downscaling (between 1/8 and 1/4). Pixel Repeat is special scaling mode used for upscale only. Otherwise, QSEED should be selected in other cases. This field must be set to 0x0 when SCALEX_EN is 0x0. 0x0: FIR (QSEED) 0x1: M/N phase-controlled 0x2: Pixel Repeat
1	SCALEY_EN	Y scaling enable
0	SCALEX_EN	X scaling enable

0x0513005C MDP_VG2_SCALE_PHASEX_STEP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SCALE_PHASEX_STEP

Bits	Name	Description
31:0	PHASEX_STEP	X phase step for scaling, which is input width/output width in u3.29, i.e., (src_size / out_size)<<29, phase step of 8 (1/8 scale) is encoded by setting this value to 0 (representing 0x1_0000_0000).

0x05130060 MDP_VG2_SCALE_PHASEY_STEP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_VG2_SCALE_PHASEY_STEP

Bits	Name	Description
31:0	PHASEY_STEP	Y phase step for scaling, which is input height/output height in u3.29, i.e., (src_size / out_size)<<29, phase step of 8 (1/8 scale) is encoded by setting this value to 0 (representing 0x1_0000_0000).

0x05130064 MDP_VG2_HIST_LUT_SEL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every refresh initiation for internal use.

MDP_VG2_HIST_LUT_SEL

Bits	Name	Description
31:1	RESERVED31_1	
0	LUT_SEL	Selects which LUT to use for histogram enhancement 0x0: Set1 0x1: Set2

0x05130068 MDP_VG2_DITHER_STRENGTH

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_003F

MDP_VG2_DITHER_STRENGTH

Bits	Name	Description
31:6	RESERVED31_6	
5:4	C2_BITS	Number of MSBits on component 2 (R/Cr) to indicate the dithering boundary: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	C1_BITS	Number of MSBits on component 1 (B/Cb) to indicate the dithering boundary: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	C0_BITS	Number of MSBits on component 0 (G/Y) to indicate the dithering boundary: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x05131000 MDP_VG2_FETCH_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_003F

MDP_VG2_FETCH_STATUS

Bits	Name	Description
31:12	RESERVED31_12	
11:8	FIFO_ERRORS	TileFetch internal FIFO errors. These error bits are pulse catching, and returned to zero when this register is read: Bit 11= control FIFO error Bit 10= burstbuf FIFO error Bit 9= line_gen luma FIFO error Bit 8= line_gen chroma FIFO error
7:6	RESERVED7_6	
5:0	IDLES	TileFetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 5= dma_rd idle Bit 4= ctl idle Bit 3= burstbuf idle Bit 2= unpack idle Bit 1= unpack chroma idle Bit 0= line_gen idle

0x05131004 MDP_VG2_FETCH_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0047

MDP_VG2_FETCH_CFG

Bits	Name	Description
31:9	RESERVED31_9	
8	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes: 0x0: frame (default) 0x1: line
7	FETCH_OPT_EN	Fetch Optimization Enable. Fetch optimization is supported only for interleave RGB formats. This setting is ignored when in others. 0x0: Disable (default) 0x1: Enable

MDP_VG2_FETCH_CFG (cont.)

Bits	Name	Description
6:4	MAX_BURST_SIZE	Maximum burst beat size. Possible values: 0x4: 16 (default) 0x2: 8 0x1: 4
3	RESERVED3	
2:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design, anything less limits the bus requests to that number + 1.

0x05131008 MDP_VG2_CONSTANT_COLOR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0xFFFF_FFFF

MDP_VG2_CONSTANT_COLOR

Bits	Name	Description
31:24	COLOR3	Constant color driven for color3 during solid fill mode.
23:16	COLOR2	Constant color driven for color2 during solid fill mode.
15:8	COLOR1	Constant color driven for color1 during solid fill mode.
7:0	COLOR0	Constant color driven for color0 during solid fill mode.

0x0513100C MDP_VG2_FETCH_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_VG2_FETCH_COUNT

Bits	Name	Description
31:28	RESERVED31_28	
27:16	CHROMA_LINE	Current chroma line number
15:12	RESERVED15_12	
11:0	LUMA_LINE	Current luma line number

0x05131010 MDP_VG2_FETCH_STATISTIC

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_VG2_FETCH_STATISTIC

Bits	Name	Description
31:13	FETCH_KCYCLES	Accumulated kilo-cycles spent in wait for read data in the current frame.
12:0	FETCH_KBYTES	Accumulated KByte received in the current frame.

0x05131020 MDP_VG2_VC1_RANGE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0707

MDP_VG2_VC1_RANGE

Bits	Name	Description
31:11	RESERVED31_11	
10:8	RANGE_MAPUV	Chroma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.
7:3	RESERVED7_3	
2:0	RANGE_MAPY	Luma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.

0x05132000 MDP_VG2_DEINT_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_000F

MDP_VG2_DEINT_STATUS

Bits	Name	Description
31:4	RESERVED31_4	
3:0	IDLES	Internal idles

0x05132004 MDP_VG2_DEINT_DECISION

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0003_0032

MDP_VG2_DEINT_DECISION

Bits	Name	Description
31:19	RESERVED31_19	
18:16	ATTENU	Attenuation (the shift value) for less temporal resolution; valid range is 0
15:11	RESERVED15_11	
10:0	THRESH	Threshold (u11) for de-interlace attenuation decision

0x05132010 MDP_VG2_DEINT_COEFF0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0360_03E0

The MDP_VG2_DEINT_COEFFn registers contain the set of luma filter coefficients, where w3 is for the center pixel, w2 is for (+1, -1) pixels, w1 is for (+2, -2) pixels, and w0 is for (+3, -3) pixels.

MDP_VG2_DEINT_COEFF0

Bits	Name	Description
31:26	RESERVED31_26	
25:16	COEFF1	Luma filter coefficient w1 (s10 Q5).
15:10	RESERVED31_10	
9:0	COEFF0	Luma filter coefficient w0 (s10 Q5).

0x05132014 MDP_VG2_DEINT_COEFF1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0140_0120

The MDP_VG2_DEINT_COEFFn registers contain the set of luma filter coefficients, where w3 is for the center pixel, w2 is for (+1, -1) pixels, w1 is for (+2, -2) pixels, and w0 is for (+3, -3) pixels.

MDP_VG2_DEINT_COEFF1

Bits	Name	Description
31:26	RESERVED31_26	
25:16	COEFF1	Luma filter coefficient w3 (s10 Q5).
15:10	RESERVED31_10	
9:0	COEFF0	Luma filter coefficient w2 (s10 Q5).

0x05133400+ 4*n MDP_VG2_HIST_LUT1n, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG2_HIST_LUT1n registers contains the color lookup values for histogram enhancement set1.

MDP_VG2_HIST_LUT1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	LUT_COLOR0	LUT value for color0.

0x05133800+ 4*n MDP_VG2_HIST_LUT2n, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG2_HIST_LUT2n registers contains the color lookup values for histogram enhancement set2.

MDP_VG2_HIST_LUT2n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	LUT_COLOR0	LUT value for color0.

0x05134400+ 4*n MDP_VG2_CSC_MV1n, n=[0..8]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG2_CSC_MV1n register contains the set1 matrix vector.

MDP_VG2_CSC_MV1n

Bits	Name	Description
31:13	RESERVED31_13	
12:0	MV1	MV1 = Matrix vector set1 (s4.9). Matrices are indexed left to right, top to bottom. That is, row 1, col 0 index = 3 (index range - 0 to 8).

0x05134500+ 4*n MDP_VG2_CSC_PRE_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG2_CSC_PRE_BV1n register contains the set1 pre-bias vector.

MDP_VG2_CSC_PRE_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	PRE_BV1	PRE_BV1= Pre-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05134580+ 4*n MDP_VG2_CSC_POST_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG2_CSC_POST_BV1n register contains the set1 post-bias vector.

MDP_VG2_CSC_POST_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	POST_BV1	POST_BV1 = Post-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05134600+ 4*n MDP_VG2_CSC_PRE_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG2_CSC_PRE_LV1n register contains the set1 pre-limit vector.

MDP_VG2_CSC_PRE_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	PRE_LV1	PRE_LV1 = Pre-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05134680+ 4*n MDP_VG2_CSC_POST_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG2_CSC_POST_LV1n register contains the set1 post-limit vector.

MDP_VG2_CSC_POST_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	POST_LV1	POST_LV1 = Post-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05135000+ 4*n MDP_VG2_IGC_LSP_LUTn, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG2_IGC_LSP_LUTn registers contains the Least Significant Portion (lower 24 bits of total 36 bits) of the color lookup values for IGC LUT.

MDP_VG2_IGC_LSP_LUTn

Bits	Name	Description
31:28	RESERVED31_28	

MDP_VG2_IGC_LSP_LUTn (cont.)

Bits	Name	Description
27:16	LUT_COLOR1	LUT value for color1.
15:12	RESERVED15_12	
11:0	LUT_COLOR0	LUT value for color0.

0x05135800+4*n MDP_VG2_IGC_MSP_LUTn, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG2_IGC_MSP_LUTn registers contains the most significant portion (color component 2) of the color lookup values for IGC LUT. The whole LUT should be written to in the sequence of LSP write first followed by MSP write, writing from lower address to higher address. Each MSP register write actually triggers the write of whole 36-bit LUT entry into the RAM.

MDP_VG2_IGC_MSP_LUTn

Bits	Name	Description
31:12	RESERVED31_12	
11:0	LUT_COLOR2	LUT value for color2.

0x05136000 MDP_VG2_HIST_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_VG2_HIST_START register kicks off histogram generation.

MDP_VG2_HIST_START

Bits	Name	Description
31:0	HIST_START	A write to this register kicks off histogram generation. Actual accumulation begins at the start of next ROI. Histogram accumulation can be started only when histogram reset sequence is not currently active.

0x05136004 MDP_VG2_HIST_FRAME_CNT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0001

The MDP_VG2_HIST_FRAME_CNT register is used to program the frame count for histogram accumulation.

MDP_VG2_HIST_FRAME_CNT

Bits	Name	Description
31:6	RESERVED31_6	
5:0	FRAME_CNT	Program the number of frames over which the histogram data has to be collected. If the frame count programmed is more than what each 24-bit bin can support, the bin count will saturate at the maximum value. Here are some max. frame counts that can be programmed for different image sizes for a 24-bit bin. XGA (1024 x 768) - 21 WSVGA (1024 x 600) - 27 WVGA (800 x 480) - 43 VGA (640 x 480) - 54

0x0513600C MDP_VG2_HIST_RESET_SEQ_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_VG2_HIST_RESET_SEQ_START kicks off a reset sequence.

MDP_VG2_HIST_RESET_SEQ_START

Bits	Name	Description
31:0	RESET_SEQ_START	Writing to this register kicks off a reset sequence.This reset sequence clears all RAM locations and RAM rd/wr pointers. The reset sequence can be initiated only when histogram generation is not currently active. Note: Functional clock gating will shut off the clock to VG2 sub-blocks when a ROI is not being processed. So VG2 clock should be forced ON for the reset sequence to complete.

0x05136010 MDP_VG2_HIST_CONTROL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG2_HIST_CONTROL register controls histogram operation.

MDP_VG2_HIST_CONTROL

Bits	Name	Description
31:1	RESERVED31_1	
0	AUTO_CLEAR_EN	When set (1), the bin from which data has been read is cleared automatically.

0x05136014 MDP_VG2_HIST_INTR_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG2_HIST_INTR_STATUS register provides histogram interrupt status.

MDP_VG2_HIST_INTR_STATUS

Bits	Name	Description
31:2	RESERVED31_2	
1	HIST_DONE	When set (1) implies histogram generation is complete.
0	RESET_SEQ_DONE	When set (1) implies the reset sequence is complete.

0x05136018 MDP_VG2_HIST_INTR_CLEAR

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_VG2_HIST_INTR_CLEAR is used to clear the interrupts generated by histogram block.

MDP_VG2_HIST_INTR_CLEAR

Bits	Name	Description
31:2	RESERVED31_2	

MDP_VG2_HIST_INTR_CLEAR (cont.)

Bits	Name	Description
1	HIST_DONE	Write (1) to this bit to clear the status.
0	RESET_SEQ_DONE	Write (1) to this bit to clear the status.

0x0513601C MDP_VG2_HIST_INTR_ENABLE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_VG2_HIST_INTR_ENABLE is used to enable the interrupt sources within the histogram block.

MDP_VG2_HIST_INTR_ENABLE

Bits	Name	Description
31:2	RESERVED31_2	
1	HIST_DONE	Write (1) to this bit to enable the interrupt source.
0	RESET_SEQ_DONE	Write (1) to this bit to enable the interrupt source.

0x05136020 MDP_VG2_HIST_STOP_REQ

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_VG2_HIST_STOP_REQ kicks off a histogram operation stop request which is stopping HIST HW at the end of frame even if the frame count is less than programmed frame count.

MDP_VG2_HIST_STOP_REQ

Bits	Name	Description
31:0	STOP_REQ	Writing to this register kicks off a stop request which is stopping HIST HW at the end of frame even if the processed frame count is less than programmed frame count.

0x05136024 MDP_VG2_HIST_CANCEL_REQ

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_VG2_HIST_CANCEL_REQ kicks off a histogram operation cancel request which is stopping HIST HW at any state rather than RESET state.

MDP_VG2_HIST_CANCEL_REQ

Bits	Name	Description
31:0	CANCEL_REQ	Writing to this register kicks off a cancel request which is stopping HIST HW at any state rather than RESET state.

0x05136028 MDP_VG2_HIST_EXTRA_INFO_0

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x007F_0000

The MDP_VG2_HIST_EXTRA_INFO_0 register provides histogram extra information. These values are only valid when HIST HW are IDLE state and this register values are reset automatically whenever HIST HW starts.

MDP_VG2_HIST_EXTRA_INFO_0

Bits	Name	Description
31	RESERVED31	
30:24	Y_MAX_VALUE	Maximum pixel value for component Y
23	RESERVED23	
22:16	Y_MIN_VALUE	Minimum pixel value for compound Y
15:6	RESERVED15_6	
5:0	CUR_FRAME_COUNT	This value provides the processed number of frame from start to HIST_DONE.

0x05136200+4*n MDP_VG2_HIST_LUMA_DATAn, n=[0..127]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG2_HIST_LUMA_DATAn register provides the histogram data corresponding to the luma component.

MDP_VG2_HIST_LUMA_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_LUMA_DATA	Reading this register provides histogram bin data for luma.

0x05138000 MDP_VG2_SCALE_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_03FF

MDP_VG2_SCALE_STATUS

Bits	Name	Description
31:10	RESERVED31_10	
9:0	IDLES	Internal block idles

0x05138100+4*n MDP_VG2_QSEED_TABLE0_n, n=[0..3]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Each MDP_VG2_QSEED_TABLE0_n register space contains 16 table entries of QSEED Table0.

MDP_VG2_QSEED_TABLE0_n

Bits	Name	Description
31:30	ENTRY15	2 bit lookup value of Table0, entry n*16+15
29:28	ENTRY14	2 bit lookup value of Table0, entry n*16+14
27:26	ENTRY13	2 bit lookup value of Table0, entry n*16+13
25:24	ENTRY12	2 bit lookup value of Table0, entry n*16+12
23:22	ENTRY11	2 bit lookup value of Table0, entry n*16+11
21:20	ENTRY10	2 bit lookup value of Table0, entry n*16+10
19:18	ENTRY9	2 bit lookup value of Table0, entry n*16+9
17:16	ENTRY8	2 bit lookup value of Table0, entry n*16+8
15:14	ENTRY7	2 bit lookup value of Table0, entry n*16+7
13:12	ENTRY6	2 bit lookup value of Table0, entry n*16+6
11:10	ENTRY5	2 bit lookup value of Table0, entry n*16+5

MDP_VG2_QSEED_TABLE0_n (cont.)

Bits	Name	Description
9:8	ENTRY4	2 bit lookup value of Table0, entry n*16+4
7:6	ENTRY3	2 bit lookup value of Table0, entry n*16+3
5:4	ENTRY2	2 bit lookup value of Table0, entry n*16+2
3:2	ENTRY1	2 bit lookup value of Table0, entry n*16+1
1:0	ENTRY0	2 bit lookup value of Table0, entry n*16

0x05138200+4*n MDP_VG2_QSEED_TABLE1_n, n=[0..1]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Each MDP_VG2_QSEED_TABLE1_n register space contains 8 table entries of QSEED Table1. When source image is RGB, the gradient calculation is bypassed and only bicubic scaling applies. Thus, in such case, QSEED_TABLE1_0 entry 0 is used to select which bicubic coefficient table set (out of XTABLE2) to used (U1, D0, D1, or D2 set) per scaling ratio range for X scaling. QSEED_TABLE1_0 entry 1 is used to select which bicubic coefficient table set (out of YTABLE2) to used per scaling ratio range for Y scaling.

MDP_VG2_QSEED_TABLE1_n

Bits	Name	Description
31:28	ENTRY7	4 bit lookup value of Table1, entry n*8+7
27:24	ENTRY6	4 bit lookup value of Table1, entry n*8+6
23:20	ENTRY5	4 bit lookup value of Table1, entry n*8+5
19:16	ENTRY4	4 bit lookup value of Table1, entry n*8+4
15:12	ENTRY3	4 bit lookup value of Table1, entry n*8+3
11:8	ENTRY2	4 bit lookup value of Table1, entry n*8+2
7:4	ENTRY1	4 bit lookup value of Table1, entry n*8+1
3:0	ENTRY0	4 bit lookup value of Table1, entry n*8

0x05139000+8*n MDP_VG2_QSEED_XTABLE2_LSPn, n=[0..511]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG2_QSEED_TABLE2_LSPn register contains the Least Significant Portion of the whole coefficient word, i.e., coefficients for k-1 and k samples. Note, each coefficient value is aligned to 16-bit word boundary.

MDP_VG2_QSEED_XTABLE2_LSPn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	COEFF1	12 bit (signed) poly-phase scale coefficient for k sample.
15:12	RESERVED15_12	
11:0	COEFF0	12 bit (signed) poly-phase scale coefficient for k-1 sample.

0x05139004+ 8*n MDP_VG2_QSEED_XTABLE2_MSPn, n=[0..511]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG2_QSEED_TABLE2_MSPn register contains the Most Significant Portion of the whole coefficient word, i.e., coefficients for k+1 and k+2 samples. Note, each coefficient value is aligned to 16-bit word boundary. The FIR coefficient tables should be written to in sequence of LSP write first followed by MSP write, writing from lower address to higher address. Each MSP register write actually triggers the write of whole 48-bit coefficient word into the RAM. There are actually 16 tables of 32 entries (phases) each. They are grouped from table 0 at the lowest addresses (0x37000-0x370fc) to table 15 at the highest addresses (0x37f00-0x37ffc).

MDP_VG2_QSEED_XTABLE2_MSPn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	COEFF3	12 bit (signed) poly-phase scale coefficient for k+2 sample.
15:12	RESERVED15_12	
11:0	COEFF2	12 bit (signed) poly-phase scale coefficient for k+1 sample.

0x0513A000+ 8*n MDP_VG2_QSEED_YTABLE2_LSPn, n=[0..511]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG2_QSEED_TABLE2_LSPn register contains the Least Significant Portion of the whole coefficient word, i.e., coefficients for k-1 and k samples. Note, each coefficient value is aligned to 16-bit word boundary.

MDP_VG2_QSEED_YTABLE2_LSPn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	COEFF1	12 bit (signed) poly-phase scale coefficient for k sample.
15:12	RESERVED15_12	
11:0	COEFF0	12 bit (signed) poly-phase scale coefficient for k-1 sample.

0x0513A004+ 8*n MDP_VG2_QSEED_YTABLE2_MSPn, n=[0..511]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_VG2_QSEED_TABLE2_MSPn register contains the Most Significant Portion of the whole coefficient word, i.e., coefficients for k+1 and k+2 samples. Note, each coefficient value is aligned to 16-bit word boundary. The FIR coefficient tables should be written to in sequence of LSP write first followed by MSP write, writing from lower address to higher address. Each MSP register write actually triggers the write of whole 48-bit coefficient word into the RAM. There are actually 16 tables of 32 entries (phases) each. They are grouped from table 0 at the lowest addresses (0x37000-0x370fc) to table 15 at the highest addresses (0x37f00-0x37ffc).

MDP_VG2_QSEED_YTABLE2_MSPn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	COEFF3	12 bit (signed) poly-phase scale coefficient for k+2 sample.
15:12	RESERVED15_12	
11:0	COEFF2	12 bit (signed) poly-phase scale coefficient for k+1 sample.

14.15.12.5 RGB1 Input Pipe registers

0x05140000 MDP_RGB1_SRC_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_SRC_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	SRC_H	Height of input ROI data
15:12	RESERVED15_12	
11:0	SRC_W	Width of input ROI data

0x05140004 MDP_RGB1_SRC_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This represents the offset from the top-left corner of the source image. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_SRC_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	SRC_Y	Y offset of source ROI in the source image
15:12	RESERVED15_12	
11:0	SRC_X	X offset of source ROI in the source image

0x05140008 MDP_RGB1_OUT_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

If scale is not enabled, this register value will be ignored, and the hardware assumes that the output size is the same as SRC_SIZE register setting. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_OUT_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_H	Height of output ROI data
15:12	RESERVED15_12	

MDP_RGB1_OUT_SIZE (cont.)

Bits	Name	Description
11:0	DST_W	Width of output ROI data

0x0514000C MDP_RGB1_OUT_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This represents the offset from the top-left corner of the base layer image. If this pipe is processing the base layer then this register is all zeros. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_OUT_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_Y	Y offset of this layer output in the Frame Buffer
15:12	RESERVED15_12	
11:0	DST_X	X offset of this layer output in the Frame Buffer

0x05140010 MDP_RGB1_SRCP0_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_SRCP0_ADDR

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane.

0x05140014 MDP_RGB1_SRCP0_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for RGB1 pipe.

MDP_RGB1_SRCP0_ADDR_1

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane.

0x05140018 MDP_RGB1_SRCP0_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for RGB1 pipe.

MDP_RGB1_SRCP0_ADDR_2

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane.

0x05140040 MDP_RGB1_SRC_YSTRIDE1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0060

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_SRC_YSTRIDE1

Bits	Name	Description
31:15	RESERVED31_15	
14:0	SRCP0_YSTRIDE	Plane 0 y stride in bytes.

0x05140050 MDP_RGB1_SRC_FORMAT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0002_44FF

This register describes the input surface for this pipe. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_SRC_FORMAT

Bits	Name	Description
31:23	RESERVED31_23	
22	SOLID_FILL	If this bit is set (1), Fetch uses the CONSTANT_COLOR register value as its output. Nothing is fetched.
21:19	RESERVED21_19	
18	UNPACK_ALIGN	0x0: To LSB 0x1: To MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
16:15	RESERVED16_15	
14:13	UNPACK_COUNT	Valid unpacking pattern count: 0 = 1 component,..., 3 = 4 components. Unpacking pattern only applies to the interleaved plane (chroma plane in pseudo-planar).
12	RESERVED12	
11	RESERVED11	
10:9	SRC_BPP	Effective source byte per pixel: 0 = 1 byte, 1 = 2 bytes, 2 = 3 bytes, 3 = 4 bytes. This is only used when unpacking the interleaved plane.
8	SRCC3_EN	0x1: Source has alpha
7:6	SRCC3	Number of bits for component 3 (alpha) input, this is not used for dither: 0 = 1 bit, 1 = 4 bits, 2 = 6 bits, 3 = 8 bits.
5:4	SRCC2	Number of bits for component 2 (R / Cr) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	SRCC1	Number of bits for component 1 (B / Cb) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	SRCC0	Number of bits for component 0 (G / luma) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x05140054 MDP_RGB1_SRC_UNPACK_PATTERN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0302_0001

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4). Default is ARGB or C3-C2-C0-C1. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_SRC_UNPACK_PATTERN

Bits	Name	Description
31:26	RESERVED31_26	
25:24	ELEMENT3	0x0: C0 0x1: C1 0x2: C2 0x3: C3
23:18	RESERVED23_18	
17:16	ELEMENT2	0x0: C0 0x1: C1 0x2: C2 0x3: C3
15:10	RESERVED15_10	
9:8	ELEMENT1	0x0: C0 0x1: C1 0x2: C2 0x3: C3
7:2	RESERVED7_2	
1:0	ELEMENT0	0x0: C0 0x1: C1 0x2: C2 0x3: C3

0x05140058 MDP_RGB1_OP_MODE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_OP_MODE

Bits	Name	Description
31:17	RESERVED31_17	
16	IGC_LUT_EN	Inverse Gamma Correction LUT enable. If disabled, the colors are mapped linearly from 8-bit to 12-bit.
15	RESERVED15	
14:13	FLIP_MODE	Flip operation: Bit 1: Left/right flip Bit 2: Up/down flip

MDP_RGB1_OP_MODE (cont.)

Bits	Name	Description
12:5	RESERVED12_5	
4	ENHANCED_MODE_EN	Enables enhanced RGB scaler mode. Turns on bilinear or new algorithm of pixel repeat/drop. When disabled RGB scaler operates in a legacy mode as it was in MDP4.0 and MDP4.1 0x1: enable 0x0: disabled
3	RGB_SCALE_METHOD	Scaling method for rgb components scaling. 0x1: Bilinear. 0x0: Pixel repeat/drop.
2	ALPHA_SCALE_METHOD	Scaling method for alpha component scaling. 0x1: Bilinear. 0x0: Pixel repeat/drop.
1	SCALEY_EN	Y scaling enable
0	SCALEX_EN	X scaling enable

0x0514005C MDP_RGB1_SCALE_PHASEX_STEP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_SCALE_PHASEX_STEP

Bits	Name	Description
31:0	PHASEX_STEP	X phase step for scaling, which is input width/output width in u3.29, i.e., (src_size / out_size)<<29.

0x05140060 MDP_RGB1_SCALE_PHASEY_STEP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB1_SCALE_PHASEY_STEP

Bits	Name	Description
31:0	PHASEY_STEP	Y phase step for scaling, which is input height/output height in u3.29, i.e., (src_size / out_size)<<29.

0x05141000 MDP_RGB1_FETCH_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_003F

MDP_RGB1_FETCH_STATUS

Bits	Name	Description
31:6	RESERVED31_6	
5:0	IDLES	TileFetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 5= dma_rd idle Bit 4 =setup idle Bit 3 = ctl idle Bit 2 = burst buf idle Bit 1 = unpack idle Bit 0 = out_gen idle

0x05141004 MDP_RGB1_FETCH_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0047

MDP_RGB1_FETCH_CFG

Bits	Name	Description
31:9	RESERVED31_9	
8	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes: 0x0: frame (default) 0x1: line
7	FETCH_OPT_EN	Fetch Optimization Enable 0x0: Disabled (default) 0x1: Enabled

MDP_RGB1_FETCH_CFG (cont.)

Bits	Name	Description
6:4	MAX_BURST_SIZE	Maximum burst beat size. Possible values: 0x4: 16 (default) 0x2: 8 0x1: 4
3	RESERVED3	
2:0	REQ_DEPTH_LIMIT	Pending request limit, default 0x7 means maximum of 8 pending requests, anything less limits the AXI requests to that number + 1.

0x05141008 MDP_RGB1_CONSTANT_COLOR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0xFFFF_FFFF

MDP_RGB1_CONSTANT_COLOR

Bits	Name	Description
31:24	COLOR3	Constant color driven for color3 during solid fill mode.
23:16	COLOR2	Constant color driven for color2 during solid fill mode.
15:8	COLOR1	Constant color driven for color1 during solid fill mode.
7:0	COLOR0	Constant color driven for color0 during solid fill mode.

0x0514100C MDP_RGB1_FETCH_STATISTIC

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_RGB1_FETCH_STATISTIC

Bits	Name	Description
31:13	FETCH_KCYCLE	Accumulated KCycles spent in wait for read data in the current frame
12:0	FETCH_KBYTES	Accumulated KByte received in the current frame.

0x05145000+ 4*n MDP_RGB1_IGC_LSP_LUTn, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_RGB1_IGC_LSP_LUTn registers contains the Least Significant Portion (lower 24 bits of total 36 bits) of the color lookup values for IGC LUT.

MDP_RGB1_IGC_LSP_LUTn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	LUT_COLOR1	LUT value for color1.
15:12	RESERVED15_12	
11:0	LUT_COLOR0	LUT value for color0.

0x05145800+ 4*n MDP_RGB1_IGC_MSP_LUTn, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_RGB1_IGC_MSP_LUTn registers contains the most significant portion (color component 2) of the color lookup values for IGC LUT. The whole LUT should be written to in the sequence of LSP write first followed by MSP write, writing from lower address to higher address. Each MSP register write actually triggers the write of whole 36-bit LUT entry into the RAM.

MDP_RGB1_IGC_MSP_LUTn

Bits	Name	Description
31:12	RESERVED31_12	
11:0	LUT_COLOR2	LUT value for color2.

14.15.12.6 RGB2 Input Pipe registers

0x05150000 MDP_RGB2_SRC_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_SRC_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	SRC_H	Height of input ROI data
15:12	RESERVED15_12	
11:0	SRC_W	Width of input ROI data

0x05150004 MDP_RGB2_SRC_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This represents the offset from the top-left corner of the source image. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_SRC_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	SRC_Y	Y offset of source ROI in the source image
15:12	RESERVED15_12	
11:0	SRC_X	X offset of source ROI in the source image

0x05150008 MDP_RGB2_OUT_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

If scale is not enabled, this register value will be ignored, and the hardware assumes that the output size is the same as SRC_SIZE register setting. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_OUT_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_H	Height of output ROI data
15:12	RESERVED15_12	

MDP_RGB2_OUT_SIZE (cont.)

Bits	Name	Description
11:0	DST_W	Width of output ROI data

0x0515000C MDP_RGB2_OUT_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This represents the offset from the top-left corner of the base layer image. If this pipe is processing the base layer then this register is all zeros. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_OUT_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_Y	Y offset of this layer output in the Frame Buffer
15:12	RESERVED15_12	
11:0	DST_X	X offset of this layer output in the Frame Buffer

0x05150010 MDP_RGB2_SRCP0_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_SRCP0_ADDR

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane.

0x05150014 MDP_RGB2_SRCP0_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for RGB2 pipe.

MDP_RGB2_SRCP0_ADDR_1

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane.

0x05150018 MDP_RGB2_SRCP0_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for RGB2 pipe.

MDP_RGB2_SRCP0_ADDR_2

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane.

0x05150040 MDP_RGB2_SRC_YSTRIDE1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0060

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_SRC_YSTRIDE1

Bits	Name	Description
31:15	RESERVED31_15	
14:0	SRCP0_YSTRIDE	Plane 0 y stride in bytes.

0x05150050 MDP_RGB2_SRC_FORMAT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0002_44FF

This register describes the input surface for this pipe. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_SRC_FORMAT

Bits	Name	Description
31:23	RESERVED31_23	
22	SOLID_FILL	If this bit is set (1), Fetch uses the CONSTANT_COLOR register value as its output. Nothing is fetched.
21:19	RESERVED21_19	
18	UNPACK_ALIGN	0x0: To LSB 0x1: To MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
16:15	RESERVED16_15	
14:13	UNPACK_COUNT	Valid unpacking pattern count: 0 = 1 component,..., 3 = 4 components. Unpacking pattern only applies to the interleaved plane (chroma plane in pseudo-planar).
12	RESERVED12	
11	RESERVED11	
10:9	SRC_BPP	Effective source byte per pixel: 0 = 1 byte, 1 = 2 bytes, 2 = 3 bytes, 3 = 4 bytes. This is only used when unpacking the interleaved plane.
8	SRCC3_EN	0x1: Source has alpha
7:6	SRCC3	Number of bits for component 3 (alpha) input, this is not used for dither: 0 = 1 bit, 1 = 4 bits, 2 = 6 bits, 3 = 8 bits.
5:4	SRCC2	Number of bits for component 2 (R / Cr) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
3:2	SRCC1	Number of bits for component 1 (B / Cb) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
1:0	SRCC0	Number of bits for component 0 (G / luma) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.

0x05150054 MDP_RGB2_SRC_UNPACK_PATTERN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0302_0001

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4). Default is ARGB or C3-C2-C0-C1. This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_SRC_UNPACK_PATTERN

Bits	Name	Description
31:26	RESERVED31_26	
25:24	ELEMENT3	0x0: C0 0x1: C1 0x2: C2 0x3: C3
23:18	RESERVED23_18	
17:16	ELEMENT2	0x0: C0 0x1: C1 0x2: C2 0x3: C3
15:10	RESERVED15_10	
9:8	ELEMENT1	0x0: C0 0x1: C1 0x2: C2 0x3: C3
7:2	RESERVED7_2	
1:0	ELEMENT0	0x0: C0 0x1: C1 0x2: C2 0x3: C3

0x05150058 MDP_RGB2_OP_MODE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_OP_MODE

Bits	Name	Description
31:17	RESERVED31_17	
16	IGC_LUT_EN	Inverse Gamma Correction LUT enable. If disabled, the colors are mapped linearly from 8-bit to 12-bit.
15	RESERVED15	
14:13	FLIP_MODE	Flip operation: Bit 1: Left/right flip Bit 2: Up/down flip

MDP_RGB2_OP_MODE (cont.)

Bits	Name	Description
12:5	RESERVED12_5	
4	ENHANCED_MODE_EN	Enables enhanced RGB scaler mode. Turns on bilinear or new algorithm of pixel repeat/drop. When disabled RGB scaler operates in a legacy mode as it was in MDP4.0 and MDP4.1 0x1: enable 0x0: disable
3	RGB_SCALE_METHOD	Scaling method for rgb components scaling. 0x1: Bilinear. 0x0: Pixel repeat/drop.
2	ALPHA_SCALE_METHOD	Scaling method for alpha component scaling. 0x1: Bilinear. 0x0: Pixel repeat/drop.
1	SCALEY_EN	Y scaling enable
0	SCALEX_EN	X scaling enable

0x0515005C MDP_RGB2_SCALE_PHASEX_STEP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_SCALE_PHASEX_STEP

Bits	Name	Description
31:0	PHASEX_STEP	X phase step for scaling, which is input width/output width in u3.29, i.e., (src_size / out_size)<<29.

0x05150060 MDP_RGB2_SCALE_PHASEY_STEP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every pipe start initiation.

MDP_RGB2_SCALE_PHASEY_STEP

Bits	Name	Description
31:0	PHASEY_STEP	Y phase step for scaling, which is input height/output height in u3.29, i.e., (src_size / out_size)<<29.

0x05151000 MDP_RGB2_FETCH_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_003F

MDP_RGB2_FETCH_STATUS

Bits	Name	Description
31:6	RESERVED31_6	
5:0	IDLES	TileFetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 5= dma_rd idle Bit 4 =setup idle Bit 3 = ctl idle Bit 2 = burst buf idle Bit 1 = unpack idle Bit 0 = out_gen idle

0x05151004 MDP_RGB2_FETCH_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0047

MDP_RGB2_FETCH_CFG

Bits	Name	Description
31:9	RESERVED31_9	
8	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes: 0x0: frame (default) 0x1: line
7	FETCH_OPT_EN	Fetch Optimization Enabled 0x0: Disabled (default) 0x1: Enabled

MDP_RGB2_FETCH_CFG (cont.)

Bits	Name	Description
6:4	MAX_BURST_SIZE	Maximum burst beat size. Possible values: 0x4: 16 (default) 0x2: 8 0x1: 4
3	RESERVED3	
2:0	REQ_DEPTH_LIMIT	Pending request limit, default 0x7 means maximum of 8 pending requests, anything less limits the AXI requests to that number + 1.

0x05151008 MDP_RGB2_CONSTANT_COLOR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0xFFFF_FFFF

MDP_RGB2_CONSTANT_COLOR

Bits	Name	Description
31:24	COLOR3	Constant color driven for color3 during solid fill mode.
23:16	COLOR2	Constant color driven for color2 during solid fill mode.
15:8	COLOR1	Constant color driven for color1 during solid fill mode.
7:0	COLOR0	Constant color driven for color0 during solid fill mode.

0x0515100C MDP_RGB2_FETCH_STATISTIC

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_RGB2_FETCH_STATISTIC

Bits	Name	Description
31:13	FETCH_KCYCLE	Accumulated KCycles spent in wait for read data in the current frame
12:0	FETCH_KBYTES	Accumulated KByte received in the current frame.

0x05155000+ 4*n MDP_RGB2_IGC_LSP_LUTn, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_RGB2_IGC_LSP_LUTn registers contains the Least Significant Portion (lower 24 bits of total 36 bits) of the color lookup values for IGC LUT.

MDP_RGB2_IGC_LSP_LUTn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	LUT_COLOR1	LUT value for color1.
15:12	RESERVED15_12	
11:0	LUT_COLOR0	LUT value for color0.

0x05155800+ 4*n MDP_RGB2_IGC_MSP_LUTn, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_RGB2_IGC_MSP_LUTn registers contains the most significant portion (color component 2) of the color lookup values for IGC LUT. The whole LUT should be written to in the sequence of LSP write first followed by MSP write, writing from lower address to higher address. Each MSP register write actually triggers the write of whole 36-bit LUT entry into the RAM.

MDP_RGB2_IGC_MSP_LUTn

Bits	Name	Description
31:12	RESERVED31_12	
11:0	LUT_COLOR2	LUT value for color2.

14.15.12.7 Layer Mixer 2

0x05188004 MDP_OVERLAYPROC2_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0008

This register configures the OVERLAY PROCESSOR 2's starting behavior. There is no way to configure the Overlay Processor 2 to drive a active display which is triggered by the incoming vysnc. As such all registers are reserved.

MDP_OVERLAYPROC2_CFG

Bits	Name	Description
31:6	RESERVED31_6	
5	RESERVED5	CON_WB_MODE CANNOT be tied to active panel.
4	RESERVED4	CON_WB_EN CANNOT be tied to active panel
3	BLT_MODE	Puts this Overlay Processor into BLT (MDP3) type of SW operation mode, which means the Overlay Processor will be fully controlled by the SW.
2:1	RESERVED2_1	REFRESH_MODE CANNOT be tied to active panel
0	RESERVED0	DIRECT_OUT field CANNOT be tied to active panel

0x05188008 MDP_OVERLAYPROC2_OUT_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0020_0020

This register designates the output size of the Overlay Processor 1 and is also used as the Frame Buffer/Active Region size for DMA_E or DMA_S.

MDP_OVERLAYPROC2_OUT_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DST_H	Output ROI height (pixel).
15:12	RESERVED15_12	
11:0	DST_W	Output ROI width (pixel).

0x0518800C MDP_OVERLAYPROC2_FB_ADDR1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This is the 1st Frame Buffer base address (for ping-ponging) that is used when this Overlay Processor is in Frame Buffer mode, where the value is registered and used at every other frame initiation of this Overlay Processor. In other modes, this is the only effective Frame Buffer base address used, where this register is Double Buffered and the value takes effect at the next refresh initiation of this Overlay Processor.

MDP_OVERLAYPROC2_FB_ADDR1

Bits	Name	Description
31:0	ADDR1	Starting base byte address for Frame Buffer. When overlay processor is in pseudo-planer format this register is used for Y plain in Frame buffer

0x05188010 MDP_OVERLAYPROC2_FB_STRIDE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC1_FB_STRIDE register defines the line jump value (in bytes) in the Frame Buffer.

MDP_OVERLAYPROC2_FB_STRIDE

Bits	Name	Description
31:29	RESERVED31_29	RESERVED
28:16	BUF_UV_STRIDE	UV-stride (or) line jump in bytes in the frame buffer. Used for UV components plane only when pseudo-planer write-back is enabled.
15:13	RESERVED15_13	RESERVED
12:0	BUF_Y_STRIDE	Y-stride (or) line jump in bytes in the Frame Buffer.

0x05188014 MDP_OVERLAYPROC2_OPMODE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x8000_0000

This register defines the output format of the Overlay Processor2..

MDP_OVERLAYPROC2_OPMODE

Bits	Name	Description
31	BYPASS_COLOR3_EN	Enables propagation of color component 3 to the packer 0x0: color3 is taken from register 0x1: color3 is propagated from the pipe
30:16	RESERVED30_16	RESERVED
15:8	ALPHA_COMP_XRGB	Programmable alpha component for xRGB write back. Used only in RGB8888 mode
7:5	RESERVED7_5	RESERVED
4	WR_BACK_PP	Enable to write to the frame buffer in YUV420 pseudo planer format. When YUV420PP writeback is required, this register must be set to 0x1 and FB_FORMAT must also be set to 0x2.
3	INTRLACE_FETCH	RESERVED
2	PGC_EN	Panel Gamma Correction enable. If disabled, the colors are mapped linearly from 12-bit to 8-bit.
1:0	FB_FORMAT	This field actually controls memory write back pixel format in LM2 with regard to operation mode. 0x0: RGB888 0x1: RGB565 0x2: 422 h2v1 interleaved 0x3: RGB8888

0x0518801C MDP_OVERLAYPROC2_FB_ADDR2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This is the 2nd Frame Buffer base address (for ping-ponging) that is used only when this Overlay Processor is in Frame Buffer mode. The value is registered and used at every other frame initiation of this Overlay Processor.

MDP_OVERLAYPROC2_FB_ADDR2

Bits	Name	Description
31:0	ADDR2	Starting base byte address for Frame Buffer. When the overlay processor is in pseudo-planer format this register is used for the secondary address of Y plane in the Frame buffer

0x05188020 MDP_OVERLAYPROC2_FB_UV_ADDR1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This is the Frame Buffer base address of the UV plane that is used only when this Overlay Processor is in Frame Buffer mode and pseudo planer output is enabled.

MDP_OVERLAYPROC2_FB_UV_ADDR1

Bits	Name	Description
31:0	UV_ADDR1	Starting base byte address for UV plane of the Frame Buffer

0x05188024 MDP_OVERLAYPROC2_FB_UV_ADDR2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Reserved

MDP_OVERLAYPROC2_FB_UV_ADDR2

Bits	Name	Description
31:0	UV_ADDR2	Second address of the UV stream. Reserved. Not used in the current implementation

0x05188028 MDP_OVERLAYPROC2_PROFILE_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC2_PROFILE_EN

Bits	Name	Description
31:1	RESERVED31_1	
0	EN	Enable the ROI cycle counter for profiling

0x0518802C MDP_OVERLAYPROC2_PROFILE_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_OVERLAYPROC2_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED31_24	
23:0	TOTAL_CYCLE	Total cycle count in a ROI, from new ROI to last pixel out of the processor (OVERLAYPROC1 goes back to Idle)

0x05188030 MDP_OVERLAYPROC2_PACK_PATTERN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0302_0100

NOTE The only source for "Color3" comes from ALPHA_COMPONENT provided in the register MDP_OVERLAYPROC2_OPMODE

MDP_OVERLAYPROC2_PACK_PATTERN

Bits	Name	Description
31:26	RESERVED31_26	UNUSED
25:24	ELEMENT3	0x0: Color0; 1:Color1; 2:Color2; 3:Color3
23:18	RESERVED23_18	UNUSED

1:0	ELEMENT0	0x0: Color0; 1:Color1; 2:Color2; 3:Color3

0x05188104 MDP_OVERLAYPROC2_BLEND0_OP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0040

This register describes the blend operation done by Layer Mixer on Stage 0 FG/BG, where this register is Double Buffered and the value takes effect at the next refresh initiation of this Overlay Processor.

MDP_OVERLAYPROC2_BLEND0_OP

Bits	Name	Description
31:10	RESERVED31_10	
9	BG_TRANSP_EN	BG transparency color check enable. When color matches, the FG pixel is passed; otherwise, the blended result is passed. However, if both FG and BG Transparency checks are enabled and both matches, BG pixel is passed.
8	FG_TRANSP_EN	FG transparency color check enable. When color matches, the BG pixel is passed; otherwise, the blended result is passed.
7	BG_MOD_ALPHA	When set (1), bg constant alpha modulates the alpha selected by ALPHA_SEL before performing pixel blending.
6	BG_INV_ALPHA	When set (1) the alpha selected by BG_ALPHA_SEL is inverted (1-alpha).
5:4	BG_ALPHA_SEL	Blending alpha select: 0x0: fg constant alpha 0x1: bg constant alpha 0x2: fg per pixel alpha 0x3: bg per pixel alpha
3	FG_MOD_ALPHA	When set (1), fg constant alpha modulates the alpha selected by ALPHA_SEL before performing pixel blending.
2	FG_INV_ALPHA	When set (1) the alpha selected by FG_ALPHA_SEL is inverted (1-alpha).
1:0	FG_ALPHA_SEL	Blending alpha select: 0x0: fg constant alpha 0x1: bg constant alpha 0x2: fg per pixel alpha 0x3: bg per pixel alpha

0x05188108 MDP_OVERLAYPROC2_BLEND0_FG_ALPHA

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_00FF

This register is Double Buffered. The value is shadowed at every refresh initiation of this Overlay Processor for internal used.

MDP_OVERLAYPROC2_BLEND0_FG_ALPHA

Bits	Name	Description
31:8	RESERVED31_8	
7:0	CONSTANT_ALPHA	Alpha value for constant alpha blend or modulation alpha.

0x0518810C MDP_OVERLAYPROC2_BLEND0_BG_ALPHA

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The value is shadowed at every refresh initiation of this Overlay Processor for internal used.

MDP_OVERLAYPROC2_BLEND0_BG_ALPHA

Bits	Name	Description
31:8	RESERVED31_8	
7:0	CONSTANT_ALPHA	Alpha value for constant alpha blend or modulation alpha.

0x05188110 MDP_OVERLAYPROC2_BLEND0_TRANSP_LOW0

Bits	Name	Description
31:1	RESERVED31_1	

MDP_OVERLAYPROC2_BLEND3_COLOR3_OUT (cont.)

Bits	Name	Description
0	C3_OUT_SEL	Selects which source to drive on the color3 component output in the blending region: 0x0: Background layer color3 0x1: Foreground color3

0x0518A400+ 4*n MDP_OVERLAYPROC2_CSC_MV1n, n=[0..8]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_OVERLAYPROC1_CSC_MV1n register contains the set1 matrix vector.

MDP_OVERLAYPROC2_CSC_MV1n

Bits	Name	Description
31:13	RESERVED31_13	
12:0	MV1	MV1 = Matrix vector set1 (s4.9). Matrices are indexed left to right, top to bottom. That is, row 1, col 0 index = 3 (index range - 0 to 8).

0x0518A500+ 4*n MDP_OVERLAYPROC2_CSC_PRE_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_OVERLAYPROC1_CSC_PRE_BV1n register contains the set1 pre-bias vector.

MDP_OVERLAYPROC2_CSC_PRE_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	PRE_BV1	PRE_BV1= Pre-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x0518A580+ 4*n MDP_OVERLAYPROC2_CSC_POST_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_OVERLAYPROC1_CSC_POST_BV1n register contains the set1 post-bias vector.

MDP_OVERLAYPROC2_CSC_POST_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	POST_BV1	POST_BV1 = Post-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x0518A600+ 4*n MDP_OVERLAYPROC2_CSC_PRE_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_OVERLAYPROC1_CSC_PRE_LV1n register contains the set1 pre-limit vector.

MDP_OVERLAYPROC2_CSC_PRE_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	PRE_LV1	PRE_LV1 = Pre-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x0518A680+ 4*n MDP_OVERLAYPROC2_CSC_POST_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_OVERLAYPROC1_CSC_POST_LV1n register contains the set1 post-limit vector.

MDP_OVERLAYPROC2_CSC_POST_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	POST_LV1	POST_LV1 = Post-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x0518C800+ 4*n MDP_OVERLAYPROC2_GC_START_COLOR_0_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation enable and stage start value setting for component0.

MDP_OVERLAYPROC2_GC_START_COLOR_0_STAGEn

Bits	Name	Description
31:17	RESERVED31_17	
16	STAGE_ENABLE	Stage enable.
15:12	RESERVED15_12	
11:0	STAGE_START_VALUE	Stage start value

0x0518C880+ 4*n MDP_OVERLAYPROC2_GC_PARAM_COLOR_0_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation gain and offset setting for component0.

MDP_OVERLAYPROC2_GC_PARAM_COLOR_0_STAGEn

Bits	Name	Description
31	RESERVED31	
30:16	STAGE_OFFSET	Stage offset (U8.7).
15	RESERVED15	
14:0	STAGE_GAIN	Stage gain (U3.12)

0x0518C900+ 4*n MDP_OVERLAYPROC2_GC_START_COLOR_1_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation enable and stage start value setting for component1.

MDP_OVERLAYPROC2_GC_START_COLOR_1_STAGEn

Bits	Name	Description
31:17	RESERVED31_17	
16	STAGE_ENABLE	Stage enable.
15:12	RESERVED15_12	
11:0	STAGE_START_VALUE	Stage start value

0x0518C980+4*n MDP_OVERLAYPROC2_GC_PARAM_COLOR_1_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation gain and offset setting for component1.

MDP_OVERLAYPROC2_GC_PARAM_COLOR_1_STAGEn

Bits	Name	Description
31	RESERVED31	
30:16	STAGE_OFFSET	Stage offset (U8.7).
15	RESERVED15	
14:0	STAGE_GAIN	Stage gain (U3.12)

0x0518CA00+4*n MDP_OVERLAYPROC2_GC_START_COLOR_2_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation enable and stage start value setting for component2.

MDP_OVERLAYPROC2_GC_START_COLOR_2_STAGEn

Bits	Name	Description
31:17	RESERVED31_17	
16	STAGE_ENABLE	Stage enable.
15:12	RESERVED15_12	
11:0	STAGE_START_VALUE	Stage start value

0x0518CA80+4*n MDP_OVERLAYPROC2_GC_PARAM_COLOR_2_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation gain and offset setting for component2.

MDP_OVERLAYPROC2_GC_PARAM_COLOR_2_STAGEn

Bits	Name	Description
31	RESERVED31	
30:16	STAGE_OFFSET	Stage offset (U8.7).
15	RESERVED15	
14:0	STAGE_GAIN	Stage gain (U3.12)

0x0518D004 MDP_OVERLAYPROC2_LSP_BORDER_COLOR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Least Significant Portion (lower 24 bits of total 36 bits) of border color values.

MDP_OVERLAYPROC2_LSP_BORDER_COLOR

Bits	Name	Description
31:28	RESERVED31_28	
27:16	BORDER_COLOR1	Border color value for color 1
15:12	RESERVED15_12	
11:0	BORDER_COLOR0	Border color value for color 0

0x0518D008 MDP_OVERLAYPROC2_MSP_BORDER_COLOR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Most Significant Portion (upper 12 bits of total 36 bits) of border color values.

MDP_OVERLAYPROC2_MSP_BORDER_COLOR

Bits	Name	Description
31:12	RESERVED31_12	
11:0	BORDER_COLOR2	Border color value for color 2

14.15.13 Primary Display Driver (DMA_P) registers

0x05190000 MDP_DMA_P_CONFIG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_2100

j

MDP_DMA_P_CONFIG

Bits	Name	Description
31	RESERVED31	
30	PIGC_EN	Panel Inverse Panel Gamma Correction enable
29	PCC_EN	Polynomial Color Correction enable
28	PGC_EN	Panel Gamma Correction enable
27	BUF_FORMAT_EXTEND	In order to maintain SW backward compatible and support other input formats, this bit is added. Detail description is in the BUF_FORMAT field
26:25	BUF_FORMAT	The fetch buffer format setting (This field is only valid when Overlay Processor 0 is in BLT mode; otherwise this is not used, and the format is taken from FB_FORMAT in MDP_OVERLAYPROC0_OUT_OPMODE): If BUF_FORMAT_EXTEND is 0 (legacy mode + added format) If BUF_FORMAT_EXTEND is 1 (extended mode) 0x0: RGB888 format (Default) 0x1: RGB565 format 0x2: xRGB8888 format <new> 0x3: xRGB1555 format <new> 0x0: Reserved_1 0x1: Reserved_2 0x2: RGBx8888 format <new> 0x3: RGBx5551 format <new>
24	DITHER_EN	Dither enable
23:19	RESERVED23_19	

MDP_DMA_P_CONFIG (cont.)

Bits	Name	Description
18	BIT_MASK_POLARITY	Select the bit mask polarity. 0x0: Masked bits are set to `0' 0x1: Masked bits are set to `1'
17	RESERVED17	
16	COMP2_BIT_FLIP_EN	When set (1) flips all the bits of component2.
15	COMP1_BIT_FLIP_EN	When set (1) flips all the bits of component1.
14	COMP0_BIT_FLIP_EN	When set (1) flips all the bits of component0.
13:8	PACK_PATTERN	Packing pattern used by the packer. 0x21: Data packed as RGB (default) 0x24: Data packed as RBG 0x12: Data packed as BGR 0x18: Data packed as BRG 0x6: Data packed as GBR 0x9: Data packed as GRB
7	PACK_ALIGN	Packing alignment (within a byte) for each color component. This is valid only in parallel LCDC case where the output is packed loose. Not valid for MDDI based LCDC where the output is packed tight. 0x0: LSB (default) 0x1: MSB
6	EBI2_SPLIT_PIX	Set (1) to split one pixel (in 888 format) in to two 12 bit writes. This should be set only if output is to AHB.
5:4	COMP2_OUT	Number of bits for component 2 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
3:2	COMP1_OUT	Number of bits for component 1 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
1:0	COMP0_OUT	Number of bits for component 0 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).

0x05190004 MDP_DMA_P_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_SIZE register defines the primary DMA fetch width and height in pixels. This register is only valid when Overlay Processor 0 is in BLT mode; otherwise this is not used, and the size is taken from MDP_OVERLAYPROC0_OUT_SIZE.

MDP_DMA_P_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DMA_H	DMA fetch image height (in pixels). For LCDC, this specifies the active region height also.
15:12	RESERVED15_12	
11:0	DMA_W	DMA fetch image width (in pixels). For LCDC, this specifies the active region width also.

0x05190008 MDP_DMA_P_BUF_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Writing to this register forces an update to the back copy (the copy that is used currently by the DMA_P's fetch) of the frame buffer address. This register should only be done when one needs to override and switch to a new buffer in the middle of a frame. Or, when Overlay Processor 0 is in BLT mode, this address is used for DMA_P in stand-alone fetch decoupled from the Overlay Processor 0. When not in BLT mode, each new DMA_P fetch buffer address would be passed directly from MDP_OVERLAYPROC0_FB_ADDR after the Overlay Processor 0 has finished processing a frame.

MDP_DMA_P_BUF_ADDR

Bits	Name	Description
31:0	BUF_ADDR	Fetch buffer base address (byte-aligned). This defines the start of fetch pixel.

0x0519000C MDP_DMA_P_BUF_Y_STRIDE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_BUF_Y_STRIDE register defines the line jump value (in bytes) in the fetch buffer.This register is only valid when Overlay Processor 0 is in BLT mode; otherwise this is not used, and the size is taken from MDP_OVERLAYPROC0_FB_Y_STRIDE.

MDP_DMA_P_BUF_Y_STRIDE

Bits	Name	Description
31:13	RESERVED31_13	This field has no function and should be set to zero for future compatibility
12:0	BUF_Y_STRIDE	Y-stride (or) line jump value in bytes in the fetch buffer. Irrespective of whether the data is contiguous or non-contiguous, line jump value has to be provided since all the fetch requests are line-based.

0x05190010 MDP_DMA_P_OUT_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_OUT_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DMA_OUT_Y	Display (or) screen y coordinate (pixel) where the first line of a ROI will be written. Program this parameter to zero if the output interface is LCDC since all LCDC updates are full screen.
15:12	RESERVED15_12	
11:0	DMA_OUT_X	Display (or) screen x coordinate (pixel) where the first pixel of a ROI will be written. Program this parameter to zero if the output interface is LCDC since all LCDC updates are full screen.

0x05190014 MDP_DMA_P_LINE_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_LINE_COUNT

Bits	Name	Description
31:12	RESERVED31_12	
11:0	LINE_COUNT	Provides the line count or write pointer value (read pointer if output to LCDC). This value is w.r.t. display height and not ROI height.

0x05190018 MDP_DMA_P_LINE_IRQ

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0FFF

MDP_DMA_P_LINE_IRQ defines the line count or write_pointer value at which an interrupt has to be generated.

MDP_DMA_P_LINE_IRQ

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	IRQ_LINE	Specify the line count or write pointer value at which an interrupt has to be generated. Specify this value w.r.t. display height and not ROI height.

0x0519001C MDP_DMA_P_MASK_PATTERN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_MASK_PATTERN register defines the pattern that will be used when bit masking is enabled.

MDP_DMA_P_MASK_PATTERN

Bits	Name	Description
31:24	RESERVED31_24	
23:0	BIT_MASK_PATTERN	This pattern is used to mask the pixel bits when bit masking is enabled. If a pattern bit is set (1) the corresponding pixel bit is masked. The pattern is specified as {C2, C1, C0} where each color component is loosely packed according to the output format in to 8-bits and LSB aligned.

0x05190020 MDP_DMA_P_PROFILE_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_PROFILE_EN

Bits	Name	Description
31:1	RESERVED31_1	
0	EN	Enable the ROI cycle counter for profiling

0x05190024 MDP_DMA_P_PROFILE_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED31_24	
23:0	TOTAL_CYCLE	Total cycle count (in AXI cycles) in a ROI, from ROI start to last pixel out of Packer (DMA_P goes back to Idle). This count will be reset automatically at the beginning of each ROI start.

0x05190030 MDP_DMA_P_BUF_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for DMA_P pipe.

MDP_DMA_P_BUF_ADDR_1

Bits	Name	Description
31:0	BUF_ADDR	Fetch buffer base address (byte-aligned). This defines the start of fetch pixel.

0x05190034 MDP_DMA_P_BUF_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

.This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for DMA_P pipe.

MDP_DMA_P_BUF_ADDR_2

Bits	Name	Description
31:0	BUF_ADDR	Fetch buffer base address (byte-aligned). This defines the start of fetch pixel.

0x05190040 MDP_DMA_P_CURSOR_FORMAT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_CURSOR_FORMAT

Bits	Name	Description
31:3	RESERVED31_2	
2:0	CURSOR_FORMAT	0x0: ARGB8888 format (Default) 0x1: RGB888 format 0x2: ARGB1555 format 0x3: RGB565 format 0x4: ARGB4444 format 0x5: RGB444 format

0x05190044 MDP_DMA_P_CURSOR_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_CURSOR_SIZE register defines the hardware cursor width and height in pixels.

MDP_DMA_P_CURSOR_SIZE

Bits	Name	Description
31:23	RESERVED31_23	This field has no function and should be set to zero for future compatibility
22:16	CURSOR_H	Cursor height (in lines). Max. supported height = 64 lines.
15:7	RESERVED15_7	This field has no function and should be set to zero for future compatibility
6:0	CURSOR_W	Cursor width (in pixels). Max. supported width = 64 pixels

0x05190048 MDP_DMA_P_CURSOR_BUF_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_CURSOR_BUF_ADDR register defines the cursor buffer address. This register is Double Buffered and the programmed value is latched in to the second buffer every Vsync.

MDP_DMA_P_CURSOR_BUF_ADDR

Bits	Name	Description
31:0	CURSOR_BUF_ADDR	Cursor buffer base address (byte-aligned).

0x0519004C MDP_DMA_P_CURSOR_POSITION

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_CURSOR_POSITION register defines the start x and y positions of the cursor relative to ROI start x and y. This register is Double Buffered and the programmed value is latched in to the second buffer every Vsync.

MDP_DMA_P_CURSOR_POSITION

Bits	Name	Description
31	CURSOR_SIZE_SEL	0x1: Start positions below are of s13 format (if required) 0x0: Start positions below are of s12 format (legacy mode - bit 13 in CURSOR_X_START and CURSOR_Y_START will be ignored.)
30:29	RESERVED30_29	This field has no function and should be set to zero for future compatibility
28:16	CURSOR_Y_START	Define the start (y) position of the cursor relative to ROI start (y). This is a signed value and has to be programmed in (s12 or s13) format depending on CURSOR_SIZE_SEL.
15:13	RESERVED15_13	This field has no function and should be set to zero for future compatibility
12:0	CURSOR_X_START	Define the start (x) position of the cursor relative to ROI start (x). This is a signed value and has to be programmed in (s12 or s13) format depending on CURSOR_SIZE_SEL.

0x05190060 MDP_DMA_P_CURSOR_BLEND_CONFIG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0002

MDP_DMA_P_CURSOR_BLEND_CONFIG register enables cursor blend and defines some blend parameters.

MDP_DMA_P_CURSOR_BLEND_CONFIG

Bits	Name	Description
31:4	RESERVED31_4	
3	BLEND_TRANSP_EN	Transparency check enable: 0x0: Off (Output is according to blend_alpha_sel blend output.) 0x1: On (Color keying is done on the cursor and blended result specified from the 2 layers is passed if non-matching; otherwise, the background image layer is sent.)
2:1	BLEND_ALPHA_SEL	Blending alpha select: 0x1: Cursor per pixel alpha (Default) 0x2: Constant alpha
0	BLEND_EN	Cursor blend enable (when disabled, output pixels would be the same as the background image pixels).

0x05190064 MDP_DMA_P_CURSOR_BLEND_PARAM

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_CURSOR_BLEND_PARAM

Bits	Name	Description
31:8	RESERVED31_8	
7:0	CONSTANT_ALPHA	Constant alpha value.

0x05190068 MDP_DMA_P_CURSOR_BLEND_TRANS_LOW

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_CURSOR_BLEND_TRANS_LOW

Bits	Name	Description
31:24	RESERVED31_24	
23:0	TRANSPARENCY_LOW	Transparent color check lower limit (Color2,Color1,Color0 each 8 bits from MSB to LSB).

0x0519006C MDP_DMA_P_CURSOR_BLEND_TRANS_HIGH

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_CURSOR_BLEND_TRANS_HIGH

Bits	Name	Description
31:24	RESERVED31_24	
23:0	TRANSPARENCY_HIGH	Transparent color check upper limit (Color2,Color1,Color0 each 8 bits from MSB to LSB).

0x05190070 MDP_DMA_P_OP_MODE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_P_OP_MODE register defines the color and gamma correct parameters. This register is Double Buffered and the programmed value is latched in to the second buffer every Vsync.

MDP_DMA_P_OP_MODE

Bits	Name	Description
31:14	RESERVED31_14	
13	PCC_SEL	Selects which set of PCC coefficients to use during processing 0x0: Set1 0x1: Set2
12	CSC_FMT_OUT	Select the output color format after correction/conversion 0x0: RGB (default) 0x1: YCbCr
11	CSC_FMT_IN	Select the input color format for correction/conversion 0x0: RGB (default) 0x1: YCbCr

MDP_DMA_P_OP_MODE (cont.)

Bits	Name	Description
10	LUT_SEL	Selects which LUT to use during processing 0x0: Set1 0x1: Set2
9:4	RESERVED9_4	
3	CONVERT_MATRIX_EN	Enable color convert. This enables the matrix conversion in the convert block.
2	LUT_C2_EN	Component 2 LUT enable.
1	LUT_C1_EN	Component 1 LUT enable.
0	LUT_C0_EN	Component 0 LUT enable.

0x05191000 MDP_DMA_P_FETCH_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_000F

MDP_DMA_P_FETCH_STATUS

Bits	Name	Description
31:4	RESERVED31_4	
3:0	IDLES	Fetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 3= dma_rd idle Bit 2= ctl idle Bit 1= burstbuf idle Bit 0= unpack idle

0x05191004 MDP_DMA_P_FETCH_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0047

MDP_DMA_P_FETCH_CFG

Bits	Name	Description
31:8	RESERVED31_8	
7	SYNC_MODE	Boundary on which fetch synchronizes certain registers in BLT mode: 0x0: frame (default) 0x1: line

MDP_DMA_P_FETCH_CFG (cont.)

Bits	Name	Description
6:4	MAX_BURST_SIZE	Maximum burst beat size. Possible values: 0x4: 16 (default) 0x2: 8 0x1: 4
3	RESERVED3	
2:0	REQ_DEPTH_LIMIT	Pending request limit, default 0x7 means maximum of 8 pending requests, anything less limits the AXI requests to that number + 1.

0x05192000 MDP_DMA_P_CUR_FETCH_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_000F

MDP_DMA_P_CUR_FETCH_STATUS

Bits	Name	Description
31:4	RESERVED31_4	
3:0	IDLES	Fetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 3= dma_rd idle Bit 2= ctl idle Bit 1= burstbuf idle Bit 0= unpack idle

0x05193400+4*n MDP_DMA_P_CSC_MV1n, n=[0..8]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_CSC_MV1n register contains the set1 matrix vector.

MDP_DMA_P_CSC_MV1n

Bits	Name	Description
31:13	RESERVED31_13	
12:0	MV1	MV1 = Matrix vector set1 (s4.9). Matrices are indexed left to right, top to bottom. That is, row 1, col 0 index = 3 (index range - 0 to 8).

0x05193500+ 4*n MDP_DMA_P_CSC_PRE_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_CSC_PRE_BV1n register contains the set1 pre-bias vector.

P_

MDP_DMA_P_CSC_PRE_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	PRE_BV1	PRE_BV1= Pre-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05193580+ 4*n MDP_DMA_P_CSC_POST_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_CSC_POST_BV1n register contains the set1 post-bias vector.

MDP_DMA_P_CSC_POST_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	POST_BV1	POST_BV1 = Post-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x05193600+ 4*n MDP_DMA_P_CSC_PRE_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_CSC_PRE_LV1n register contains the set1 pre-limit vector.

MDP_DMA_P_CSC_PRE_LV1n

Bits	Name	Description
31:8	RESERVED31_8	

MDP_DMA_P_CSC_PRE_LV1n (cont.)

Bits	Name	Description
7:0	PRE_LV1	PRE_LV1 = Pre-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05193680+4*n MDP_DMA_P_CSC_POST_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_CSC_POST_LV1n register contains the set1 post-limit vector.

MDP_DMA_P_CSC_POST_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	POST_LV1	POST_LV1 = Post-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x05194800+4*n MDP_DMA_P_DISP_LUT1n, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_DISP_LUT1n registers contains the color lookup values for LUT set1.

MDP_DMA_P_DISP_LUT1n

Bits	Name	Description
31:24	RESERVED31_24	
23:16	LUT_COLOR2	LUT value for color2.
15:8	LUT_COLOR1	LUT value for color1.
7:0	LUT_COLOR0	LUT value for color0.

0x05194C00+4*n MDP_DMA_P_DISP_LUT2n, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_DISP_LUT2n registers contains the color lookup values for LUT set2.

MDP_DMA_P_DISP_LUT2n

Bits	Name	Description
31:24	RESERVED31_24	
23:16	LUT_COLOR2	LUT value for color2.
15:8	LUT_COLOR1	LUT value for color1.
7:0	LUT_COLOR0	LUT value for color0.

0x05195000 MDP_DMA_P_HIST_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_P_HIST_START register kicks off histogram generation.

MDP_DMA_P_HIST_START

Bits	Name	Description
31:0	HIST_START	A write to this register kicks off histogram generation. Actual accumulation begins at the start of next ROI. Histogram accumulation can be started only when histogram reset sequence is not currently active.

0x05195004 MDP_DMA_P_HIST_FRAME_CNT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0001

The MDP_DMA_P_HIST_FRAME_CNT register is used to program the frame count for histogram accumulation.

MDP_DMA_P_HIST_FRAME_CNT

Bits	Name	Description
31:6	RESERVED31_6	
5:0	FRAME_CNT	Program the number of frames over which the histogram data has to be collected. If the frame count programmed is more than what each 24-bit bin can support, the bin count will saturate at the maximum value. Here are some max. frame counts that can be programmed for different image sizes for a 24-bit bin. XGA (1024 x 768) - 21 WSVGA (1024 x 600) - 27 WVGA (800 x 480) - 43 VGA (640 x 480) - 54

0x05195008 MDP_DMA_P_HIST_BIT_MASK

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x8000_0000

The MDP_DMA_P_HIST_BIT_MASK register specifies which MSBs need to be masked before histogram binning.

MDP_DMA_P_HIST_BIT_MASK

Bits	Name	Description
31	BIT_MASK_POLARITY	If set to (1) masked bits are compared to `1' else compared to `0'
30:2	RESERVED30_2	
1:0	BIT_MASK	Select which MSBs of the input color component have to be masked before histogram binning. The five unmasked MSBs will be used for bin address generation if the polarity of all the masked bits matches BIT_MASK_POLARITY. 0x0: No masking (default) 0x1: Mask one MSB 0x2: Mask two MSBs 0x3: Mask three MSBs

0x0519500C MDP_DMA_P_HIST_RESET_SEQ_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_P_HIST_RESET_SEQ_START kicks off a reset sequence.

MDP_DMA_P_HIST_RESET_SEQ_START

Bits	Name	Description
31:0	RESET_SEQ_START	Writing to this register kicks off a reset sequence.This reset sequence clears all RAM locations and RAM rd/wr pointers. The reset sequence can be initiated only when histogram generation is not currently active. Note: Functional clock gating will shut off the clock to DMA_P sub-blocks when a ROI is not being processed. So DMA_P clock should be forced ON for the reset sequence to complete.

0x05195010 MDP_DMA_P_HIST_CONTROL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_HIST_CONTROL register controls histogram operation.

MDP_DMA_P_HIST_CONTROL

Bits	Name	Description
31:1	RESERVED31_1	
0	AUTO_CLEAR_EN	When set (1), the bin from which data has been read is cleared automatically.

0x05195014 MDP_DMA_P_HIST_INTR_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_HIST_INTR_STATUS register provides histogram interrupt status.

MDP_DMA_P_HIST_INTR_STATUS

Bits	Name	Description
31:2	RESERVED31_2	
1	HIST_DONE	When set (1) implies histogram generation is complete.
0	RESET_SEQ_DONE	When set (1) implies the reset sequence is complete.

0x05195018 MDP_DMA_P_HIST_INTR_CLEAR

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_P_HIST_INTR_CLEAR is used to clear the interrupts generated by histogram block.

MDP_DMA_P_HIST_INTR_CLEAR

Bits	Name	Description
31:2	RESERVED31_2	
1	HIST_DONE	Write (1) to this bit to clear the status.
0	RESET_SEQ_DONE	Write (1) to this bit to clear the status.

0x0519501C MDP_DMA_P_HIST_INTR_ENABLE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_HIST_INTR_ENABLE is used to enable the interrupt sources within the histogram block.

MDP_DMA_P_HIST_INTR_ENABLE

Bits	Name	Description
31:2	RESERVED31_2	
1	HIST_DONE	Write (1) to this bit to enable the interrupt source.
0	RESET_SEQ_DONE	Write (1) to this bit to enable the interrupt source.

0x05195020 MDP_DMA_P_HIST_STOP_REQ

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_P_HIST_STOP_REQ kicks off a histogram operation stop request which is stopping HIST HW at the end of frame even if the frame count is less than programmed frame count.

MDP_DMA_P_HIST_STOP_REQ

Bits	Name	Description
31:0	STOP_REQ	Writing to this register kicks off a stop request which is stopping HIST HW at the end of frame even if the processed frame count is less than programmed frame count.

0x05195024 MDP_DMA_P_HIST_CANCEL_REQ

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_P_HIST_CANCEL_REQ kicks off a histogram operation cancel request which is stopping HIST HW at any state rather than RESET state.

MDP_DMA_P_HIST_CANCEL_REQ

Bits	Name	Description
31:0	CANCEL_REQ	Writing to this register kicks off a cancel request which is stopping HIST HW at any state rather than RESET state.

0x05195028 MDP_DMA_P_HIST_EXTRA_INFO_0

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x007F_0000

The MDP_DMA_P_HIST_EXTRA_INFO_0 register provides histogram extra information. These values are only valid when HIST HW are IDLE state and this register values are reset automatically whenever HIST HW starts.

MDP_DMA_P_HIST_EXTRA_INFO_0

Bits	Name	Description
31	RESERVED31	
30:24	R_MAX_VALUE	Maximum pixel value for component R
23	RESERVED23	
22:16	R_MIN_VALUE	Minimum pixel value for compound R
15:6	RESERVED15_6	
5:0	CUR_FRAME_COUNT	This value provides the processed number of frame from start to HIST_DONE.

0x0519502C MDP_DMA_P_HIST_EXTRA_INFO_1

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x007F_007F

The MDP_DMA_P_HIST_EXTRA_INFO_1 register provides histogram extra information. These values are only valid when HIST HW are IDLE state and this register values are reset automatically whenever HIST HW starts.

MDP_DMA_P_HIST_EXTRA_INFO_1

Bits	Name	Description
31	RESERVED31	
30:24	B_MAX_VALUE	Maximum pixel value for component B
23	RESERVED23	
22:16	B_MIN_VALUE	Minimum pixel value for component B
15	RESERVED15	
14:8	G_MAX_VALUE	Maximum pixel value for component G
7	RESERVED7	
6:0	G_MIN_VALUE	Minimum pixel value for component G

0x05195100+4*n MDP_DMA_P_HIST_R_DATAn, n=[0..31]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_HIST_R_DATAn register provides the histogram data corresponding to the color component R.This register field will not be used in MDP4.2 and SW should use new register address which is MDP_DMA_P_128BIN_HIST_R_DATAn

MDP_DMA_P_HIST_R_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_R_DATA	Reading this register provides histogram bin data for component R.

0x05195200+ 4*n MDP_DMA_P_HIST_G_DATAn, n=[0..31]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_HIST_G_DATAn register provides the histogram data corresponding to the color component G. This register field will not be used in MDP4.2 and SW should use new register address which is MDP_DMA_P_128BIN_HIST_G_DATAn

MDP_DMA_P_HIST_G_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_G_DATA	Reading this register provides histogram bin data for component G.

0x05195300+ 4*n MDP_DMA_P_HIST_B_DATAn, n=[0..31]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_HIST_B_DATAn register provides the histogram data corresponding to the color component B.This register field will not be used in MDP4.2 and SW should use new register address which is MDP_DMA_P_128BIN_HIST_B_DATAn

MDP_DMA_P_HIST_B_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_B_DATA	Reading this register provides histogram bin data for component B.

0x05195400+ 4*n MDP_DMA_P_128BIN_HIST_R_DATAn, n=[0..127]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_128BIN_HIST_R_DATAn register provides the histogram data corresponding to the color component R. This register field is extended from 32 to 128.

MDP_DMA_P_128BIN_HIST_R_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_R_DATA	Reading this register provides histogram bin data for component R.

0x05195800+ 4*n MDP_DMA_P_128BIN_HIST_G_DATAn, n=[0..127]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_128BIN_HIST_G_DATAn register provides the histogram data corresponding to the color component G. This register field is extended from 32 to 128.

MDP_DMA_P_128BIN_HIST_G_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_G_DATA	Reading this register provides histogram bin data for component G.

0x05195C00+ 4*n MDP_DMA_P_128BIN_HIST_B_DATAn, n=[0..127]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_128BIN_HIST_B_DATAn register provides the histogram data corresponding to the color component B.This register field will be extended from 32 to 128.

MDP_DMA_P_128BIN_HIST_B_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_B_DATA	Reading this register provides histogram bin data for component B.

0x05198800+ 4*n MDP_DMA_P_GC_START_COLOR_0_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation enable and stage start value setting for component0

MDP_DMA_P_GC_START_COLOR_0_STAGEn

Bits	Name	Description
31:17	RESERVED31_17	
16	STAGE_ENABLE	Stage enable.
15:12	RESERVED15_12	
11:0	STAGE_START_VALUE	Stage start value

0x05198880+ 4*n MDP_DMA_P_GC_PARAM_COLOR_0_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation gain and offset setting for component0.

MDP_DMA_P_GC_PARAM_COLOR_0_STAGEn

Bits	Name	Description
31	RESERVED31	
30:16	STAGE_OFFSET	Stage offset (U8.7).
15	RESERVED15	
14:0	STAGE_GAIN	Stage gain (U3.12)

0x05198900+ 4*n MDP_DMA_P_GC_START_COLOR_1_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation enable and stage start value setting for component1

MDP_DMA_P_GC_START_COLOR_1_STAGEn

Bits	Name	Description
31:17	RESERVED31_17	
16	STAGE_ENABLE	Stage enable.
15:12	RESERVED15_12	
11:0	STAGE_START_VALUE	Stage start value

0x05198980+ 4*n MDP_DMA_P_GC_PARAM_COLOR_1_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation gain and offset setting for component1

MDP_DMA_P_GC_PARAM_COLOR_1_STAGEn

Bits	Name	Description
31	RESERVED31	
30:16	STAGE_OFFSET	Stage offset (U8.7).
15	RESERVED15	
14:0	STAGE_GAIN	Stage gain (U13.2)

0x05198A00+ 4*n MDP_DMA_P_GC_START_COLOR_2_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation enable and stage start value setting for component2

MDP_DMA_P_GC_START_COLOR_2_STAGEn

Bits	Name	Description
31:17	RESERVED31_17	
16	STAGE_ENABLE	Stage enable.
15:12	RESERVED15_12	
11:0	STAGE_START_VALUE	Stage start value

0x05198A80+ 4*n MDP_DMA_P_GC_PARAM_COLOR_2_STAGEn, n=[0..15]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

16 stage of Panel GC linear equation gain and offset setting for component2

MDP_DMA_P_GC_PARAM_COLOR_2_STAGEn

Bits	Name	Description
31	RESERVED31	
30:16	STAGE_OFFSET	Stage offset (U8.7).
15	RESERVED15	
14:0	STAGE_GAIN	Stage gain (U13.2)

0x05199000+ 4*n MDP_DMA_P_IGC_LSP_LUTn, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_IGC_LSP_LUTn registers contains the Least Significant Portion (lower 24 bits of total 36 bits) of the color lookup values for IGC LUT.

MDP_DMA_P_IGC_LSP_LUTn

Bits	Name	Description
31:28	RESERVED31_28	
27:16	LUT_COLOR1	LUT value for color1.
15:12	RESERVED15_12	
11:0	LUT_COLOR0	LUT value for color0.

0x05199800+ 4*n MDP_DMA_P_IGC_MSP_LUTn, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_IGC_MSP_LUTn registers contains the most significant portion (color component 2) of the color lookup values for IGC LUT. The whole LUT should be written to in the sequence of LSP write first followed by MSP write, writing from lower address to higher address. Each MSP register write actually triggers the write of whole 36-bit LUT entry into the RAM.

MDP_DMA_P_IGC_MSP_LUTn

Bits	Name	Description
31:12	RESERVED31_12	
11:0	LUT_COLOR2	LUT value for color2.

0x0519A000 MDP_DMA_P_PCC1_R_C

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_P_PCC1_R_C is the red plane constant coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_C

Bits	Name	Description
31:16	RESERVED31_16	
15:0	PCC_DATA	Reading this register provides PCC coefficient data (S13.3)

0x0519A004 MDP_DMA_P_PCC1_R_R

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_R is the red plane red coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_R

Bits	Name	Description
31:17	RESERVED31_17	
16:0	PCC_DATA	Reading this register provides PCC coefficient data (S2.15)

0x0519A008 MDP_DMA_P_PCC1_R_G

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_G is the red plane green coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_G

Bits	Name	Description
31:17	RESERVED31_17	
16:0	PCC_DATA	Reading this register provides PCC coefficient data (S2.15)

0x0519A00C MDP_DMA_P_PCC1_R_B

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_B is the red plane blue coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_B

Bits	Name	Description
31:17	RESERVED31_17	
16:0	PCC_DATA	Reading this register provides PCC coefficient data (S2.15)

0x0519A010 MDP_DMA_P_PCC1_R_RR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_RR is the red plane red coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_RR

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A014 MDP_DMA_P_PCC1_R_GG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_GG is the red plane green coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_GG

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A018 MDP_DMA_P_PCC1_R_BB

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_BB is the red plane blue coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_BB

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A01C MDP_DMA_P_PCC1_R_RG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_RG is the red plane red green coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_RG

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A020 MDP_DMA_P_PCC1_R_GB

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_GB is the red plane green blue coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_GB

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A024 MDP_DMA_P_PCC1_R_RB

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_RB is the red plane red blue coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_RB

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A028 MDP_DMA_P_PCC1_R_RGB_0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_RGB_0 is the first part of the red plane RGB coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_RGB_0

Bits	Name	Description
31:8	RESERVED31_16	
7:0	PCC_DATA	Reading this register provides PCC coefficient data (sign + 7 fractional bits - S1.39 for RGB_0 and RGB_1 field

0x0519A02C MDP_DMA_P_PCC1_R_RGB_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_RGB_1 is the second part of the red plane RGB coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_R_RGB_1

Bits	Name	Description
31:0	PCC_DATA	Reading this register provides PCC coefficient data (remaining 32 fractional bits - S1.39 for RGB_0 and RGB_1 field

0x0519A030 MDP_DMA_P_PCC1_G_C

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_C is the green plane constant coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_C

Bits	Name	Description
31:16	RESERVED31_16	
15:0	PCC_DATA	Reading this register provides PCC coefficient data (S13.3)

0x0519A034 MDP_DMA_P_PCC1_G_R

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_C is the green plane red coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_R

Bits	Name	Description
31:17	RESERVED31_17	
16:0	PCC_DATA	Reading this register provides PCC coefficient data (S2.15)

0x0519A038 MDP_DMA_P_PCC1_G_G

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_G is the green plane green coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_G

Bits	Name	Description
31:17	RESERVED31_17	
16:0	PCC_DATA	Reading this register provides PCC coefficient data (S2.15)

0x0519A03C MDP_DMA_P_PCC1_G_B

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_B is the green plane blue coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_B

Bits	Name	Description
31:17	RESERVED31_17	
16:0	PCC_DATA	Reading this register provides PCC coefficient data (S2.15)

0x0519A040 MDP_DMA_P_PCC1_G_RR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_RR is the green plane red coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_RR

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A044 MDP_DMA_P_PCC1_G_GG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_GG is the green plane green coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_GG

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A048 MDP_DMA_P_PCC1_G_BB

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_BB is the green plane blue coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_BB

Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_RG is the green plane red green coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_RG

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A050 MDP_DMA_P_PCC1_G_GB

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_GB is the green plane green blue coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_GB

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A054 MDP_DMA_P_PCC1_G_RB

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_R_RB is the green plane red blue coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_RB

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A058 MDP_DMA_P_PCC1_G_RGB_0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_RGB_0 is the first part of the green plane RGB coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_RGB_0

Bits	Name	Description
31:8	RESERVED31_16	

MDP_DMA_P_PCC1_G_RGB_0 (cont.)

Bits	Name	Description
7:0	PCC_DATA	Reading this register provides PCC coefficient data (sign + 7 fractional bits - S1.39 for RGB_0 and RGB_1 field

0x0519A05C MDP_DMA_P_PCC1_G_RGB_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_G_RGB_1 is the second part of the green plane RGB coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_G_RGB_1

Bits	Name	Description
31:0	PCC_DATA	Reading this register provides PCC coefficient data (remaining 32 fractional bits - S1.39 for RGB_0 and RGB_1 field

0x0519A060 MDP_DMA_P_PCC1_B_C

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC1_B_C is the blue plane constant coefficient (set 1) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC1_B_C

Bits	Name	Description

MDP_DMA_P_PCC2_B_GB

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A184 MDP_DMA_P_PCC2_B_RB

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC2_B_RB is the blue plane red blue coefficient (set 2) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC2_B_RB

Bits	Name	Description
31:28	RESERVED31_28	
27:0	PCC_DATA	Reading this register provides PCC coefficient data (S1.27)

0x0519A188 MDP_DMA_P_PCC2_B_RGB_0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC2_B_RGB_0 is the first part of the blue plane RGB coefficient (set 2) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC2_B_RGB_0

Bits	Name	Description
31:8	RESERVED31_8	
7:0	PCC_DATA	Reading this register provides PCC coefficient data (sign + 7 fractional bits - S1.39 for RGB_0 and RGB_1 field

0x0519A18C MDP_DMA_P_PCC2_B_RGB_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_P_PCC2_B_RGB_1 is the second part of the blue plane RGB coefficient (set 2) for the DMA_P Polynomial Color Correction block.

MDP_DMA_P_PCC2_B_RGB_1

Bits	Name	Description
31:0	PCC_DATA	Reading this register provides PCC coefficient data (remaining 32 fractional bits - S1.39 for RGB_0 and RGB_1 field

14.15.14 Secondary Display Driver (DMA_S) registers

0x051A0000 MDP_DMA_S_CONFIG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_2100

MDP_DMA_S_CONFIG

Bits	Name	Description
31	RESERVED31	
30	PIGC_EN	Panel Inverse Panel Gamma Correction enable

MDP_DMA_S_CONFIG (cont.)

Bits	Name	Description
29	PCC_EN	Polynomial Color Correction enable
28	PGC_EN	Panel Gamma Correction enable
27	IBUF_FORMAT_EXTEND	In order to maintain SW backward compatible and support other input formats, this bit added. Detail description is in the IBUF_FORMAT field
26:25	IBUF_FORMAT	The fetch buffer format setting (This field is only valid when Overlay Processor 1is in BLT mode or Overlay Processor 1 is not connected to DMA_S; otherwise this is not used, and the format is taken from FB_FORMAT in MDP_OVERLAYPROC1_OUT_OPMODE): If IBUF_FORMAT_EXTEND is 0 (legacy mode + added format) If IBUF_FORMAT_EXTEND is 1 (extended mode) 0x0: RGB888 format (Default) 0x1: RGB565 format 0x2: xRGB8888 format 0x3: xRGB1555 format <new> 0x0: Reserved_1 0x1: Reserved_2 0x2: RGBx8888 format <new> 0x3: RGBx5551 format <new>
24	DITHER_EN	Dither enable.
23:19	RESERVED23_19	
18	BIT_MASK_POLARITY	Select the bit mask polarity. 0x0: Masked bits are set to `0' 0x1: Masked bits are set to `1'
17	RESERVED17	
16	COMP2_BIT_FLIP_EN	When set (1) flips all the bits of component2.
15	COMP1_BIT_FLIP_EN	When set (1) flips all the bits of component1.
14	COMP0_BIT_FLIP_EN	When set (1) flips all the bits of component0.
13:8	PACK_PATTERN	Packing pattern used by the packer. 0x21: Data packed as RGB (default) 0x24: Data packed as RBG 0x12: Data packed as BGR 0x18: Data packed as BRG 0x6: Data packed as GBR 0x9: Data packed as GRB
7	PACK_ALIGN	Packing alignment (within a byte) for each color component. This is valid only in parallel LCDC case where the output is packed loose. Not valid for MDDI based LCDC where the output is packed tight. 0x0: LSB (default) 0x1: MSB

MDP_DMA_S_CONFIG (cont.)

Bits	Name	Description
6	EBI2_SPLIT_PIX	Set to (1) to split the pixel (in 888 format) into two 12 bit writes. THis bit should only be set if the output interface in AHB.
5:4	COMP2_OUT	Number of bits for component 2 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
3:2	COMP1_OUT	Number of bits for component 1 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
1:0	COMP0_OUT	Number of bits for component 0 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).

0x051A0004 MDP_DMA_S_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_S_SIZE register defines the secondary DMA output width and height in pixels.

MDP_DMA_S_SIZE

Bits	Name	Description
31:28	RESERVED31_28	This field has no function and should be set to zero for future compatibility
27:16	DMA_H	DMA output image height (in pixels).
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility
11:0	DMA_W	DMA output image width (in pixels).

0x051A0008 MDP_DMA_S_IBUF_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_S_IBUF_ADDR register defines the secondary DMA IBUF address.

MDP_DMA_S_IBUF_ADDR

Bits	Name	Description
31:0	IBUF_ADDR	Intermediate buffer base address (byte-aligned).

0x051A000C MDP_DMA_S_IBUF_Y_STRIDE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_S_IBUF_Y_STRIDE register defines the line jump value (in bytes) in the intermediate buffer.

MDP_DMA_S_IBUF_Y_STRIDE

Bits	Name	Description
31:14	RESERVED31_14	This field has no function and should be set to zero for future compatibility
13:0	IBUF_Y_STRIDE	Y-stride (or) line jump value in bytes in the intermediate buffer. Irrespective of whether the data in IBUF is contiguous or non-contiguous, line jump value has to be provided since all the DMA requests are line requests.

0x051A0010 MDP_DMA_S_OUT_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_S_OUT_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DMA_OUT_Y	Screen y coordinate (pixel) where the first line of a ROI will be written.
15:12	RESERVED15_12	
11:0	DMA_OUT_X	Screen x coordinate (pixel) where the first pixel of a ROI will be written.

0x051A0014 MDP_DMA_S_LINE_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_S_LINE_COUNT

Bits	Name	Description
31:12	RESERVED31_12	

MDP_DMA_S_LINE_COUNT (cont.)

Bits	Name	Description
11:0	LINE_COUNT	Provides the line count or write pointer value. This value is w.r.t. display height and not ROI height.

0x051A0018 MDP_DMA_S_LINE_IRQ

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0FFF

MDP_DMA_S_LINE_IRQ defines the line count or write_pointer value at which an interrupt has to be generated.

MDP_DMA_S_LINE_IRQ

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	IRQ_LINE	Specify the line count or write pointer value at which an interrupt has to be generated. Specify this value w.r.t. display height and not ROI height.

0x051A001C MDP_DMA_S_MASK_PATTERN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_S_MASK_PATTERN register defines the pattern that will be used when bit masking is enabled.

MDP_DMA_S_MASK_PATTERN

Bits	Name	Description
31:24	RESERVED31_24	
23:0	BIT_MASK_PATTERN	This pattern is used to mask the pixel bits when bit masking is enabled. If a pattern bit is set (1) the corresponding pixel bit is masked. The pattern is specified as {C2, C1, C0} where each color component is loosely packed according to the output format in to 8-bits and LSB aligned.

0x051A0020 MDP_DMA_S_PROFILE_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_S_PROFILE_EN

Bits	Name	Description
31:1	RESERVED31_1	
0	EN	Enable the ROI cycle counter for profiling

0x051A0024 MDP_DMA_S_PROFILE_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_S_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED31_24	
23:0	TOTAL_CYCLE	Total cycle count (in AXI cycles) in a ROI, from ROI start to last pixel out of Packer (DMA_S goes back to Idle). This count will be reset automatically at the beginning of each ROI start.

0x051A0028 MDP_DMA_S_OP_MODE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_S_OP_MODE register defines the color and gamma correct parameters. This register is Double Buffered and the programmed value is latched in to the second buffer every Vsync.

MDP_DMA_S_OP_MODE

Bits	Name	Description
31:14	RESERVED31_14	
13	PCC_SEL	Selects which set of PCC coefficients to use during processing 0x0: Set1 0x1: Set2

MDP_DMA_S_OP_MODE (cont.)

Bits	Name	Description
12	CSC_FMT_OUT	Select the output color format after correction/conversion 0x0: RGB (default) 0x1: YCbCr
11	CSC_FMT_IN	Select the input color format for correction/conversion 0x0: RGB (default) 0x1: YCbCr
10	LUT_SEL	Selects which LUT to use during processing 0x0: Set1 0x1: Set2
9:4	RESERVED9_4	
3	CONVERT_MATRIX_EN	Enable color convert. This enables the matrix conversion in the convert block.
2	LUT_C2_EN	Component 2 LUT enable.
1	LUT_C1_EN	Component 1 LUT enable.
0	LUT_C0_EN	Component 0 LUT enable.

0x051A0030 MDP_DMA_S_IBUF_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for DMA_S pipe.

MDP_DMA_S_IBUF_ADDR_1

Bits	Name	Description
31:0	IBUF_ADDR	Intermediate buffer base address (byte-aligned).

0x051A0034 MDP_DMA_S_IBUF_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for DMA_S pipe.

MDP_DMA_S_IBUF_ADDR_2

Bits	Name	Description
31:0	IBUF_ADDR	Intermediate buffer base address (byte-aligned).

0x051A1000 MDP_DMA_S_FETCH_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_000F

MDP_DMA_S_FETCH_STATUS

Bits	Name	Description
31:4	RESERVED31_4	
3:0	IDLES	Fetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 3= dma_rd idle Bit 2= ctl idle Bit 1= burstbuf idle Bit 0= unpack idle

0x051A1004 MDP_DMA_S_FETCH_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0047

MDP_DMA_S_FETCH_CFG

Bits	Name	Description
31:8	RESERVED31_8	
7	SYNC_MODE	Boundary on which fetch synchronizes certain registers in BLT mode: 0x0: frame (default) 0x1: line
6:4	MAX_BURST_SIZE	Maximum burst beat size. Possible values: 0x4: 16 (default) 0x2: 8 0x1: 4
3	RESERVED3	
2:0	REQ_DEPTH_LIMIT	Pending request limit, default 0x7 means maximum of 8 pending requests, anything less limits the AXI requests to that number + 1.

0x051A3400+ 4*n MDP_DMA_S_CSC_MV1n, n=[0..8]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_S_CSC_MV1n register contains the set1 matrix vector.

MDP_DMA_S_CSC_MV1n

Bits	Name	Description
31:13	RESERVED31_13	
12:0	MV1	MV1 = Matrix vector set1 (s4.9). Matrices are indexed left to right, top to bottom. That is, row 1, col 0 index = 3 (index range - 0 to 8).

0x051A3500+ 4*n MDP_DMA_S_CSC_PRE_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_S_CSC_PRE_BV1n register contains the set1 pre-bias vector.

P_

MDP_DMA_S_CSC_PRE_BV1n

Bits	Name	Description
31:9	RESERVED31_9	
8:0	PRE_BV1	PRE_BV1= Pre-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x051A3580+ 4*n MDP_DMA_S_CSC_POST_BV1n, n=[0..2]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_S_CSC_POST_BV1n register contains the set1 post-bias vector.

MDP_DMA_S_CSC_POST_BV1n

Bits	Name	Description
31:9	RESERVED31_9	

MDP_DMA_S_CSC_POST_BV1n (cont.)

Bits	Name	Description
8:0	POST_BV1	POST_BV1 = Post-bias vector set1 (s9). 0=R (or) Ybias, 1=G (or) Cb bias, 2=B (or) Cr bias.

0x051A3600+ 4*n MDP_DMA_S_CSC_PRE_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_S_CSC_PRE_LV1n register contains the set1 pre-limit vector.

MDP_DMA_S_CSC_PRE_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	PRE_LV1	PRE_LV1 = Pre-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x051A3680+ 4*n MDP_DMA_S_CSC_POST_LV1n, n=[0..5]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_S_CSC_POST_LV1n register contains the set1 post-limit vector.

MDP_DMA_S_CSC_POST_LV1n

Bits	Name	Description
31:8	RESERVED31_8	
7:0	POST_LV1	POST_LV1 = Post-limit vector set1 (u8). For limit vectors, 0 = R (or) Y low, 1 = R (or) Y high, 2= G (or) Cb low, 3= G (or) Cb high, 4 = B (or) Cr low, 5= B (or) Cr high.

0x051A4800+ 4*n MDP_DMA_S_DISP_LUT1n, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_S_DISP_LUT1n registers contains the color lookup values for LUT set1.

MDP_DMA_S_DISP_LUT1n

Bits	Name	Description
31:24	RESERVED31_24	
23:16	LUT_COLOR2	LUT value for color2.
15:8	LUT_COLOR1	LUT value for color1.
7:0	LUT_COLOR0	LUT value for color0.

0x051A4C00+4*n MDP_DMA_S_DISP_LUT2n, n=[0..255]

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_S_DISP_LUT2n registers contains the color lookup values for LUT set2.

MDP_DMA_S_DISP_LUT2n

Bits	Name	Description
31:24	RESERVED31_24	
23:16	LUT_COLOR2	LUT value for color2.
15:8	LUT_COLOR1	LUT value for color1.
7:0	LUT_COLOR0	LUT value for color0.

0x051A5000 MDP_DMA_S_HIST_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_S_HIST_START register kicks off histogram generation.

MDP_DMA_S_HIST_START

Bits	Name	Description
31:0	HIST_START	A write to this register kicks off histogram generation. Actual accumulation begins at the start of next ROI. Histogram accumulation can be started only when histogram reset sequence is not currently active.

0x051A5004 MDP_DMA_S_HIST_FRAME_CNT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0001

The MDP_DMA_S_HIST_FRAME_CNT register is used to program the frame count for histogram accumulation.

MDP_DMA_S_HIST_FRAME_CNT

Bits	Name	Description
31:6	RESERVED31_6	
5:0	FRAME_CNT	Program the number of frames over which the histogram data has to be collected. If the frame count programmed is more than what each 24-bit bin can support, the bin count will saturate at the maximum value. Here are some max. frame counts that can be programmed for different image sizes for a 24-bit bin. XGA (1024 x 768) - 21 WSVGA (1024 x 600) - 27 WVGA (800 x 480) - 43 VGA (640 x 480) - 54

0x051A5008 MDP_DMA_S_HIST_BIT_MASK

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x8000_0000

The MDP_DMA_S_HIST_BIT_MASK register specifies which MSBs need to be masked before histogram binning.

MDP_DMA_S_HIST_BIT_MASK

Bits	Name	Description
31	BIT_MASK_POLARITY	If set to (1) masked bits are compared to `1' else compared to `0'
30:2	RESERVED30_2	
1:0	BIT_MASK	Select which MSBs of the input color component have to be masked before histogram binning. The five unmasked MSBs will be used for bin address generation if the polarity of all the masked bits matches BIT_MASK_POLARITY. 0x0: No masking (default) 0x1: Mask one MSB 0x2: Mask two MSBs 0x3: Mask three MSBs

0x051A500C MDP_DMA_S_HIST_RESET_SEQ_START

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_S_HIST_RESET_SEQ_START kicks off a reset sequence.

MDP_DMA_S_HIST_RESET_SEQ_START

Bits	Name	Description
31:0	RESET_SEQ_START	Writing to this register kicks off a reset sequence.This reset sequence clears all RAM locations and RAM rd/wr pointers. The reset sequence can be initiated only when histogram generation is not currently active. Note: Functional clock gating will shut off the clock to DMA_P sub-blocks when a ROI is not being processed. So DMA_P clock should be forced ON for the reset sequence to complete.

0x051A5010 MDP_DMA_S_HIST_CONTROL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_S_HIST_CONTROL register controls histogram operation.

MDP_DMA_S_HIST_CONTROL

Bits	Name	Description
31:1	RESERVED31_1	
0	AUTO_CLEAR_EN	When set (1), the bin from which data has been read is cleared automatically.

0x051A5014 MDP_DMA_S_HIST_INTR_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_S_HIST_INTR_STATUS register provides histogram interrupt status.

MDP_DMA_S_HIST_INTR_STATUS

Bits	Name	Description
31:2	RESERVED31_2	
1	HIST_DONE	When set (1) implies histogram generation is complete.
0	RESET_SEQ_DONE	When set (1) implies the reset sequence is complete.

0x051A5018 MDP_DMA_S_HIST_INTR_CLEAR

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_P_HIST_INTR_CLEAR is used to clear the interrupts generated by histogram block.

MDP_DMA_S_HIST_INTR_CLEAR

Bits	Name	Description
31:2	RESERVED31_2	
1	HIST_DONE	Write (1) to this bit to clear the status.
0	RESET_SEQ_DONE	Write (1) to this bit to clear the status.

0x051A501C MDP_DMA_S_HIST_INTR_ENABLE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_S_HIST_INTR_ENABLE is used to enable the interrupt sources within the histogram block.

MDP_DMA_S_HIST_INTR_ENABLE

Bits	Name	Description
31:2	RESERVED31_2	
1	HIST_DONE	Write (1) to this bit to enable the interrupt source.
0	RESET_SEQ_DONE	Write (1) to this bit to enable the interrupt source.

0x051A5020 MDP_DMA_S_HIST_STOP_REQ

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_S_HIST_STOP_REQ kicks off a histogram operation stop request which is stopping HIST HW at the end of frame even if the frame count is less than programmed frame count.

MDP_DMA_S_HIST_STOP_REQ

Bits	Name	Description
31:0	STOP_REQ	Writing to this register kicks off a stop request which is stopping HIST HW at the end of frame even if the processed frame count is less than programmed frame count.

0x051A5024 MDP_DMA_S_HIST_CANCEL_REQ

Type: Write
Clock: CC_MDP_CLK
Reset State: N/A

The MDP_DMA_S_HIST_CANCEL_REQ kicks off a histogram operation cancel request which is stopping HIST HW at any state rather than RESET state.

MDP_DMA_S_HIST_CANCEL_REQ

Bits	Name	Description
31:0	CANCEL_REQ	Writing to this register kicks off a cancel request which is stopping HIST HW at any state rather than RESET state.

0x051A5028 MDP_DMA_S_HIST_EXTRA_INFO_0

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x007F_0000

The MDP_DMA_S_HIST_EXTRA_INFO_0 register provides histogram extra information. These values are only valid when HIST HW are IDLE state and this register values are reset automatically whenever HIST HW starts.

MDP_DMA_S_HIST_EXTRA_INFO_0

Bits	Name	Description
31	RESERVED31	
30:24	R_MAX_VALUE	Maximum pixel value for component R
23	RESERVED23	
22:16	R_MIN_VALUE	Minimum pixel value for component R
15:6	RESERVED15_6	
5:0	CUR_FRAME_COUNT	This value provides the processed number of frame from start to HIST_DONE.

0x051A502C MDP_DMA_S_HIST_EXTRA_INFO_1

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x007F_007F

The MDP_DMA_S_HIST_EXTRA_INFO_1 register provides histogram extra information. These values are only valid when HIST HW are IDLE state and this register values are reset automatically whenever HIST HW starts.

MDP_DMA_S_HIST_EXTRA_INFO_1

Bits	Name	Description
31	RESERVED31	
30:24	B_MAX_VALUE	Maximum pixel value for component B
23	RESERVED23	
22:16	B_MIN_VALUE	Minimum pixel value for component B
15	RESERVED15	
14:8	G_MAX_VALUE	Maximum pixel value for component G
7	RESERVED7	
6:0	G_MIN_VALUE	Minimum pixel value for component G

0x051A5100+4*n MDP_DMA_S_HIST_R_DATAn, n=[0..31]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_S_HIST_R_DATAn register provides the histogram data corresponding to the color component R. This register field will not be used in MDP4.2 and SW should use new register address which is MDP_DMA_S_128BIN_HIST_R_DATAn

MDP_DMA_S_HIST_R_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_R_DATA	Reading this register provides histogram bin data for component R.

0x051A5200+ 4*n MDP_DMA_S_HIST_G_DATAn, n=[0..31]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_S_HIST_G_DATAn register provides the histogram data corresponding to the color component G. This register field will not be used in MDP4.2 and SW should use new register address which is MDP_DMA_S_128BIN_HIST_G_DATAn

MDP_DMA_S_HIST_G_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_G_DATA	Reading this register provides histogram bin data for component G.

0x051A5300+ 4*n MDP_DMA_S_HIST_B_DATAn, n=[0..31]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_S_HIST_B_DATAn register provides the histogram data corresponding to the color component B. This register field will not be used in MDP4.2 and SW should use new register address which is MDP_DMA_S_128BIN_HIST_B_DATAn

MDP_DMA_S_HIST_B_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_B_DATA	Reading this register provides histogram bin data for component B.

0x051A5400+4*n MDP_DMA_S_128BIN_HIST_R_DATAn, n=[0..127]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_S_128BIN_HIST_R_DATAn register provides the histogram data corresponding to the color component R.This register field is extended from 32 to 128.

MDP_DMA_S_128BIN_HIST_R_DATAn

Bits	Name	Description
31:24	RESERVED31_24	
23:0	HIST_R_DATA	Reading this register provides histogram bin data for component R.

0x051A5800+4*n MDP_DMA_S_128BIN_HIST_G_DATAn, n=[0..127]

Type: Read
Clock: CC_MDP_CLK
Reset State: Undefined

The MDP_DMA_S_128BIN_HIST_G_DATAn register provides the histogram data corresponding to the color component G.This register field is extended from 32 to 128.

MDP_DMA_S_128BIN_HIST_G_DATAn

Bits	Name	Description
31:24	RESERVED31_24

Bits	Name	Description
31:0	PCC_DATA	Reading this register provides PCC coefficient data (remaining 32 fractional bits - S1.39 for RGB_0 and RGB_1 field

14.15.15 External Display Driver (DMA_E) registers

0x051B0000 MDP_DMA_E_CONFIG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_213f

MDP_DMA_E_CONFIG

Bits	Name	Description
31:27	RESERVED31_27	
26:25	BUF_FORMAT	The fetch buffer format setting (This field is only valid when Overlay Processor 1 is in BLT mode; otherwise this is not used, and the format is taken from FB_FORMAT in MDP_OVERLAYPROC1_OUT_OPMODE): 0x0: RGB888 (Default) 0x1: RGB565 0x2: 422 h2v1 interleaved
24	DEFLKR_EN	Deflicker Filter / Interlacer enable 0x0: disable (default) 0x1: enable
23:19	RESERVED23_19	

MDP_DMA_E_CONFIG (cont.)

Bits	Name	Description
18	BIT_MASK_POLARITY	Select the bit mask polarity. 0x0: Masked bits are set to `0' 0x1: Masked bits are set to `1'
17	RESERVED17	
16	COMP2_BIT_FLIP_EN	When set (1) flips all the bits of component2.
15	COMP1_BIT_FLIP_EN	When set (1) flips all the bits of component1.
14	COMP0_BIT_FLIP_EN	When set (1) flips all the bits of component0.
13:8	PACK_PATTERN	Packing pattern used by the packer. 0x21: Data packed as RGB (default) 0x24: Data packed as RBG 0x12: Data packed as BGR 0x18: Data packed as BRG 0x6: Data packed as GBR 0x9: Data packed as GRB
7	PACK_ALIGN	Packing alignment (within a byte) for each color component. This is valid only in parallel LCDC case where the output is packed loose. Not valid for MDDI based LCDC where the output is packed tight. 0x0: LSB (default) 0x1: MSB
6	RESERVED6	
5:4	COMP2_OUT	Number of bits for component 2 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
3:2	COMP1_OUT	Number of bits for component 1 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).
1:0	COMP0_OUT	Number of bits for component 0 output: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits (valid output formats are 444/565/666/888).

0x051B0004 MDP_DMA_E_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_SIZE register defines the primary DMA fetch width and height in pixels. This register is only valid when Overlay Processor 1 is in BLT mode; otherwise this is not used, and the size is taken from MDP_OVERLAYPROC1_OUT_SIZE.

MDP_DMA_E_SIZE

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DMA_H	DMA fetch image height (in pixels). For DTV, this specifies the active region height also.
15:12	RESERVED15_12	
11:0	DMA_W	DMA fetch image width (in pixels). For DTV, this specifies the active region width also.

0x051B0008 MDP_DMA_E_BUF_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

Writing to this register forces an update to the back copy (the copy that is used currently by the DMA_E's fetch) of the frame buffer address. This register should only be done when one needs to override and switch to a new buffer in the middle of a frame. Or, when Overlay Processor 0 is in BLT mode, this address is used for DMA_E in stand-alone fetch decoupled from the Overlay Processor 1. When not in BLT mode, each new DMA_E fetch buffer address would be passed directly from MDP_OVERLAYPROC1_FB_ADDR after the Overlay Processor 1 has finished processing a frame.

MDP_DMA_E_BUF_ADDR

Bits	Name	Description
31:0	BUF_ADDR	Fetch buffer base address (byte-aligned). This defines the start of fetch pixel.

0x051B000C MDP_DMA_E_BUF_Y_STRIDE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_BUF_Y_STRIDE register defines the line jump value (in bytes) in the fetch buffer.This register is only valid when Overlay Processor 1 is in BLT mode; otherwise this is not used, and the size is taken from MDP_OVERLAYPROC1_FB_Y_STRIDE.

MDP_DMA_E_BUF_Y_STRIDE

Bits	Name	Description
31:13	RESERVED31_13	This field has no function and should be set to zero for future compatibility
12:0	BUF_Y_STRIDE	Y-stride (or) line jump value in bytes in the fetch buffer. Irrespective of whether the data is contiguous or non-contiguous, line jump value has to be provided since all the fetch requests are line-based.

0x051B0010 MDP_DMA_E_OUT_XY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_OUT_XY

Bits	Name	Description
31:28	RESERVED31_28	
27:16	DMA_OUT_Y	Display (or) screen y coordinate (pixel) where the first line of a ROI will be written. Program this parameter to zero if the output interface is TV/DTV since all TV updates are full screen.
15:12	RESERVED15_12	
11:0	DMA_OUT_X	Display (or) screen x coordinate (pixel) where the first pixel of a ROI will be written. Program this parameter to zero if the output interface is TV/DTV since all TV updates are full screen.

0x051B0014 MDP_DMA_E_LINE_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_LINE_COUNT

Bits	Name	Description
31:12	RESERVED31_12	
11:0	LINE_COUNT	Provides the line count or write pointer value (read pointer if output to TV/DTV). This value is w.r.t. display height and not ROI height.

0x051B0018 MDP_DMA_E_LINE_IRQ

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0FFF

MDP_DMA_E_LINE_IRQ defines the line count or write_pointer value at which an interrupt has to be generated.

MDP_DMA_E_LINE_IRQ

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	IRQ_LINE	Specify the line count or write pointer value at which an interrupt has to be generated. Specify this value w.r.t. display height and not ROI height.

0x051B001C MDP_DMA_E_MASK_PATTERN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_MASK_PATTERN register defines the pattern that will be used when bit masking is enabled.

MDP_DMA_E_MASK_PATTERN

Bits	Name	Description
31:24	RESERVED31_24	
23:0	BIT_MASK_PATTERN	This pattern is used to mask the pixel bits when bit masking is enabled. If a pattern bit is set (1) the corresponding pixel bit is masked. The pattern is specified as {C2, C1, C0} where each color component is loosely packed according to the output format in to 8-bits and LSB aligned.

0x051B0020 MDP_DMA_E_PROFILE_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_PROFILE_EN

Bits	Name	Description
31:1	RESERVED31_1	
0	EN	Enable the ROI cycle counter for profiling

0x051B0024 MDP_DMA_E_PROFILE_COUNT

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED31_24	
23:0	TOTAL_CYCLE	Total cycle count (in AXI cycles) in a ROI, from ROI start to last pixel out of Packer (DMA_E goes back to Idle). This count will be reset automatically at the beginning of each ROI start.

0x051B0030 MDP_DMA_E_BUF_ADDR_1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 1 is used for DMA_E pipe.

MDP_DMA_E_BUF_ADDR_1

Bits	Name	Description
31:0	BUF_ADDR	Fetch buffer base address (byte-aligned). This defines the start of fetch pixel.

0x051B0034 MDP_DMA_E_BUF_ADDR_2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is Double Buffered. The register is used in DMI mode when DMI buffer ID 2 is used for DMA_E pipe.

MDP_DMA_E_BUF_ADDR_2

Bits	Name	Description
31:0	BUF_ADDR	Fetch buffer base address (byte-aligned). This defines the start of fetch pixel.

0x051B0040 MDP_DMA_E_CURSOR_FORMAT

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_CURSOR_FORMAT

Bits	Name	Description
31:3	RESERVED31_2	
2:0	CURSOR_FORMAT	0x0: ARGB8888 format (Default) 0x1: RGB888 format 0x2: ARGB1555 format 0x3: RGB565 format 0x4: ARGB4444 format 0x5: RGB444 format

0x051B0044 MDP_DMA_E_CURSOR_SIZE

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_CURSOR_SIZE register defines the hardware cursor width and height in pixels.

MDP_DMA_E_CURSOR_SIZE

Bits	Name	Description
31:23	RESERVED31_23	This field has no function and should be set to zero for future compatibility
22:16	CURSOR_H	Cursor height (in lines). Max. supported height = 64 lines.
15:7	RESERVED15_7	This field has no function and should be set to zero for future compatibility
6:0	CURSOR_W	Cursor width (in pixels). Max. supported width = 64 pixels

0x051B0048 MDP_DMA_E_CURSOR_BUF_ADDR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_CURSOR_BUF_ADDR register defines the cursor buffer address. This register is Double Buffered and the programmed value is latched in to the second buffer every Vsync.

MDP_DMA_E_CURSOR_BUF_ADDR

Bits	Name	Description
31:0	CURSOR_BUF_ADDR	Cursor buffer base address (byte-aligned).

0x051B004C MDP_DMA_E_CURSOR_POSITION

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_CURSOR_POSITION register defines the start x and y positions of the cursor relative to ROI start x and y. This register is Double Buffered and the programmed value is latched in to the second buffer every Vsync.

MDP_DMA_E_CURSOR_POSITION

Bits	Name	Description
31	CURSOR_SIZE_SEL	0x1: Start positions below are of s13 format (if required) 0x0: Start positions below are of s12 format (legacy mode - bit 13 in CURSOR_X_START and CURSOR_Y_START will be ignored.)
30:29	RESERVED30_29	This field has no function and should be set to zero for future compatibility
28:16	CURSOR_Y_START	Define the start (y) position of the cursor relative to ROI start (y). This is a signed value and has to be programmed in (s12 or s13) format, depending on CURSOR_SIZE_SEL.
15:13	RESERVED15_13	This field has no function and should be set to zero for future compatibility
12:0	CURSOR_X_START	Define the start (x) position of the cursor relative to ROI start (x). This is a signed value and has to be programmed in (s12 or s13) format, depending on CURSOR_SIZE_SEL.

0x051B0060 MDP_DMA_E_CURSOR_BLEND_CONFIG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0002

MDP_DMA_E_CURSOR_BLEND_CONFIG register enables cursor blend and defines some blend parameters.

MDP_DMA_E_CURSOR_BLEND_CONFIG

Bits	Name	Description
31:4	RESERVED31_4	
3	BLEND_TRANSP_EN	Transparency check enable: 0x0: Off (Output is according to blend_alpha_sel blend output.) 0x1: On (Color keying is done on the cursor and blended result specified from the 2 layers is passed if non-matching; otherwise, the background image layer is sent.)
2:1	BLEND_ALPHA_SEL	Blending alpha select: 0x1: Cursor per pixel alpha (Default) 0x2: Constant alpha
0	BLEND_EN	Cursor blend enable (when disabled, output pixels would be the same as the background image pixels).

0x051B0064 MDP_DMA_E_CURSOR_BLEND_PARAM

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_CURSOR_BLEND_PARAM

Bits	Name	Description
31:8	RESERVED31_8	
7:0	CONSTANT_ALPHA	Constant alpha value.

0x051B0068 MDP_DMA_E_CURSOR_BLEND_TRANS_LOW

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_CURSOR_BLEND_TRANS_LOW

Bits	Name	Description
31:24	RESERVED31_24	
23:0	TRANSPARENCY_LOW	Transparent color check lower limit (Color2,Color1,Color0 each 8 bits from MSB to LSB).

0x051B006C MDP_DMA_E_CURSOR_BLEND_TRANS_HIGH

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DMA_E_CURSOR_BLEND_TRANS_HIGH

Bits	Name	Description
31:24	RESERVED31_24	
23:0	TRANSPARENCY_HIGH	Transparent color check upper limit (Color2,Color1,Color0 each 8 bits from MSB to LSB).

0x051B0070 MDP_DMA_E_Y_CLAMP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x00EB_0010

The MDP_DMA_E_Y_CLAMP register contains the 16-bit luna clamp value. The clamping can be disabled by programming a value of x00 in Y_min and xFF in Y_max

MDP_DMA_E_Y_CLAMP

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	Y_MAX	8-bit upper luma clamp value
15:8	RESERVED_BITS15_8	
7:0	Y_MIN	8-bit lower luma clamp value.

0x051B0074 MDP_DMA_E_CB_CLAMP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x00F0_0010

The MDP_DMA_E_CB_CLAMP register contains the 16-bit Cb clamp value.The clamping can be disabled by programming a value of x00 in Cb_min and xFF in Cb_max

MDP_DMA_E_CB_CLAMP

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	CB_MAX	8-bit upper Cb clamp value
15:8	RESERVED_BITS15_8	
7:0	CB_MIN	8-bit lower Cb clamp value.

0x051B0078 MDP_DMA_E_CR_CLAMP

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x00F0_0010

The MDP_DMA_E_CR_CLAMP register contains the 16-bit Cr clamp value. The clamping can be disabled by programming a value of x00 in Cr_min and xFF in Cr_max

MDP_DMA_E_CR_CLAMP

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	CR_MAX	8-bit upper Cr clamp value
15:8	RESERVED_BITS15_8	
7:0	CR_MIN	8-bit lower Cr clamp value.

0x051B1000 MDP_DMA_E_FETCH_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_000f

MDP_DMA_E_FETCH_STATUS

Bits	Name	Description
31:4	RESERVED31_4	
3:0	IDLES	Fetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 3= dma_rd idle Bit 2= ctl idle Bit 1 = burstbuf idle Bit 0= unpack idle

0x051B1004 MDP_DMA_E_FETCH_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0047

MDP_DMA_E_FETCH_CFG

Bits	Name	Description
31:8	RESERVED31_8	
7	SYNC_MODE	Boundary on which fetch synchronizes certain registers in BLT mode: 0x0: frame (default) 0x1: line
6:4	MAX_BURST_SIZE	Maximum burst beat size. Possible values: 0x4: 16 (default) 0x2: 8 0x1: 4
3	RESERVED3	
2:0	REQ_DEPTH_LIMIT	Pending request limit, default 0x7 means maximum of 8 pending requests, anything less limits the AXI requests to that number + 1.

0x051B2000 MDP_DMA_E_CUR_FETCH_STATUS

Type: Read
Clock: CC_MDP_CLK
Reset State: 0x0000_000F

MDP_DMA_E_CUR_FETCH_STATUS

Bits	Name	Description
31:4	RESERVED31_4	

MDP_DMA_E_CUR_FETCH_STATUS (cont.)

Bits	Name	Description
3:0	IDLES	Fetch internal sub-block idle state. Idle means no internal pending data for processing: Bit 3= dma_rd idle Bit 2= ctl idle Bit 1= burstbuf idle Bit 0= unpack idle

0x051B3000 MDP_DMA_E_DEFLICK_CONFIG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0080

MDP_DMA_E_DEFLICK_CONFIG

Bits	Name	Description
31:9	RESERVED31_9	
8:0	THRESHOLD	Threshold value for the Sobel filtering (u9)

0x051B3010 MDP_DMA_E_DEFLICK_COEFF0

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0180_0040

The MDP_DMA_E_DEFLICK_COEFFn registers contain the set of deflicker filter coefficients, where coeff1 is for the center pixel, coeff0 is for (k-1) pixel and (k+1) pixel. Set 0 is for less than or equal to threshold filtering.

MDP_DMA_E_DEFLICK_COEFF0

Bits	Name	Description
31:26	RESERVED31_26	
25:16	COEFF1	Filter coefficient for k sample (s10).
15:10	RESERVED15_10	
9:0	COEFF0	Filter coefficient for k-1 and k+1 sample (s10).

0x051B3014 MDP_DMA_E_DEFLICK_COEFF1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0100_0080

The MDP_DMA_E_DEFLICK_COEFFn registers contain the set of deflicker filter coefficients, where coeff1 is for the center pixel, coeff0 is for (k-1) pixel and (k+1) pixel. Set 1 is for greater than threshold filtering.

MDP_DMA_E_DEFLICK_COEFF1

Bits	Name	Description
31:26	RESERVED31_26	
25:16	COEFF1	Filter coefficient for k sample (s10).
15:10	RESERVED15_10	
9:0	COEFF0	Filter coefficient for k-1 and k+1 sample (s10).

0x051B4004 MDP_DMA_E_ATV_CC_DATA

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_DMA_E_ATV_CC_DATA register contains the closed caption data for the analog TV OUT Interface

MDP_DMA_E_ATV_CC_DATA

Bits	Name	Description
31:16	CC_DATA_EVEN	CC data for the even field. Driven to the TV encoder at the next start of frame.
15:0	CC_DATA_ODD	CC data for the odd field. Driven to the TV encoder at the next start of frame.

14.15.16 DSI 2 Video / LCDC Timing Generator registers

0x051C0000 MDP_LCDC_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_EN register is used to enable the LCD controller.

NOTE Before enabling this bit make sure that the LCDC interface is selected by appropriately setting the PRIM_INTF_SEL bits in the MDP_DISP_INTF_SEL register.

MDP_LCDC_EN

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	LCDC_EN	Enable timing generation and kick start LCDC operation. NOTE If LCDC is disabled by SW in the middle of a frame period, internally the hardware will disable LCDC only at the end of the current frame (just before next Vsync).

0x051C0004 MDP_LCDC_HSYNC_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_HSYNC_CTL register defines HSYNC parameters like period and width.

MDP_LCDC_HSYNC_CTL

Bits	Name	Description
31:29	RESERVED31_29	This field has no function and should be set to zero for future compatibility.
28:16	HSYNC_PERIOD	HSYNC period in dot_clk cycles. This is the time between start of hsync pulse and the start of next hsync pulse. Note: hsync_period = Width + h_porch where, Width = Output image width h_porch = (h_back_porch + h_front_porch) h_back_porch starts at the beginning of hsync pulse Please refer to the panel data sheet or VESA specs to obtain accurate values for hsync parameters.
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility
11:0	HSYNC_PULSE_WIDTH	HSYNC pulse width in dot_clk cycles.

0x051C0008 MDP_LCDC_VSYNC_PERIOD

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_VSYNC_PERIOD register defines the VSYNC period.

MDP_LCDC_VSYNC_PERIOD

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility.
23:0	VSYNC_PERIOD	VSYNC period in dot_clk cycles. This is the time between start of vsync pulse and the start of next vsync pulse. Note: vsync_period = Height + v_porch where, Height = Output image height v_porch = (v_back_porch + v_front_porch) v_back_porch starts at the beginning of vsync pulse Please refer to the panel data sheet or VESA specs to obtain accurate values for vsync parameters.

0x051C000C MDP_LCDC_VSYNC_PULSE_WIDTH

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_VSYNC_PULSE_WIDTH register defines the VSYNC pulse width.

MDP_LCDC_VSYNC_PULSE_WIDTH

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility.
23:0	VSYNC_PULSE_WIDTH	VSYNC pulse width in dot_clk cycles.

0x051C0010 MDP_LCDC_DISPLAY_HCTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_DISPLAY_HCTL register defines the horizontal display region (active + inactive) which can be obtained from hsync period and horizontal blanking (back and front porch) parameters.

MDP_LCDC_DISPLAY_HCTL

Bits	Name	Description
31:29	RESERVED31_29	This field has no function and should be set to zero for future compatibility
28:16	DISPLAY_END_X	Defines the time period between the start of hsync pulse and the last displayed pixel position in dot_clk cycles. Note: display_end_x = hsync_period - h_front_porch - 1 where, h_porch (dot cycles) = hsync_period - Width h_porch = (h_back_porch + h_front_porch)
15:13	RESERVED15_13	This field has no function and should be set to zero for future compatibility
12:0	DISPLAY_START_X	Defines the time period between the start of hsync pulse and the first displayed pixel position in dot_clk cycles. Note: display_start_x = h_back_porch where, h_porch (dot cycles) = hsync_period - Width h_porch = (h_back_porch + h_front_porch)

0x051C0014 MDP_LCDC_DISPLAY_V_START

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_DISPLAY_V_START register defines the vertical display region (active + inactive) which can be obtained from vsync period and vertical blanking (back and front porch) parameters.

MDP_LCDC_DISPLAY_V_START

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility

MDP_LCDC_DISPLAY_V_START (cont.)

Bits	Name	Description
23:0	DISPLAY_START_Y	Defines the time period between the start of vsync pulse and the first displayed line position in dot_clk cycles. Note: display_start_y = v_back_porch where, v_porch = vsync_period - Height v_porch = (v_back_porch + v_front_porch)

0x051C0018 MDP_LCDC_DISPLAY_V_END

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_DISPLAY_V_END register defines the vertical display region (active + inactive) which can be obtained from vsync period and vertical blanking (back and front porch) parameters.

MDP_LCDC_DISPLAY_V_END

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	DISPLAY_END_Y	Defines the time period between the start of vsync pulse and the last displayed line position in dot_clk cycles. Note: display_end_y = vsync_period - v_front_porch - 1 where, v_porch = vsync_period - Height v_porch = (v_back_porch + v_front_porch)

0x051C001C MDP_LCDC_ACTIVE_HCTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_ACTIVE_HCTL register defines the horizontal parameters of LCDC active display area.

MDP_LCDC_ACTIVE_HCTL

Bits	Name	Description
31	ACTIVE_H_EN	Horizontal active region enable

MDP_LCDC_ACTIVE_HCTL (cont.)

Bits	Name	Description
30:29	RESERVED30_29	This field has no function and should be set to zero for future compatibility
28:16	ACTIVE_END_X	Defines the time period between the start of hsync pulse and the last active pixel position in dot_clk cycles (a value between `display_start_x' and `display_end_x').
15:13	RESERVED15_13	This field has no function and should be set to zero for future compatibility.
12:0	ACTIVE_START_X	Defines the time period between the start of hsync pulse and the first active pixel position in dot_clk cycles (a value between `display_start_x' and `display_end_x').

0x051C0020 MDP_LCDC_ACTIVE_V_START

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_ACTIVE_V_START register defines the vertical parameters of LCDC active display area.

MDP_LCDC_ACTIVE_V_START

Bits	Name	Description
31	ACTIVE_V_EN	Vertical active region enable
30:24	RESERVED30_24	This field has no function and should be set to zero for future compatibility
23:0	ACTIVE_START_Y	Defines the time period between the start of vsync pulse and the first active line position in dot_clk cycles (a value between `display_start_y' and `display_end_y').

0x051C0024 MDP_LCDC_ACTIVE_V_END

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_ACTIVE_V_END register defines the vertical parameters of LCDC active display area.

MDP_LCDC_ACTIVE_V_END

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	ACTIVE_END_Y	Defines the time period between the start of vsync pulse and the last active line position in dot_clk cycles (a value between `display_start_y' and `display_end_y').

0x051C0028 MDP_LCDC_BORDER_CLR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_BORDER_CLR register defines border (inactive) area color for LCD display.

MDP_LCDC_BORDER_CLR

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	BORDER_COLOR	Define 24-bit border (background) color value of the inactive region of display. This color value should be packed loose for parallel LCDC and should match the output format, pack pattern and packing alignment defined in MDP_DMA_P_CONFIG. The border color programmed should be packed tight for MDDI based LCDC.

0x051C002C MDP_LCDC_UNDERFLOW_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x8000_0000

MDP_LCDC_UNDERFLOW_CTL register defines the displayed color in case of data underflow and enables the auto recovery mechanism.

MDP_LCDC_UNDERFLOW_CTL

Bits	Name	Description
31	ERR_RECOVERY_EN	Enable auto recovery during error conditions like underflow etc. 0x0: Disable 0x1: Enable (default)
30:24	RESERVED30_24	This field has no function and should be set to zero for future compatibility

MDP_LCDC_UNDERFLOW_CTL (cont.)

Bits	Name	Description
23:0	UNDERFLOW_COLOR	Define the 24 bit color value to be displayed in case of underflow. This color value should be packed loose for parallel LCDC and should match the output format, pack pattern and packing alignment defined in MDP_DMA_P_CONFIG. The border color programmed should be packed tight for MDDI based LCDC.

0x051C0030 MDP_LCDC_HSYNC_SKEW

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_HSYNC_SKEW defines the relative skew between HSYNC and VSYNC active edges.

MDP_LCDC_HSYNC_SKEW

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	HSYNC_SKEW	Define the number of dot_clk cycles HSYNC active edge is delayed from VSYNC active edge

0x051C0034 MDP_LCDC_TEST_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_TEST_CTL controls test pattern generation and defines its parameters.

MDP_LCDC_TEST_CTL

Bits	Name	Description
31	TEST_PATTERN_EN	Enable hardware test pattern generation (color rectangles)

MDP_LCDC_TEST_CTL (cont.)

Bits	Name	Description
30:28	TEST_PATTERN_SEL	Select Test Pattern 0x0: Checkered Pattern (default) 0x1: 16 Grayscale Test Pattern 0x2: 256 Grayscale of Red 0x3: 256 Grayscale of Green 0x4: 256 Grayscale of Blue 0x5: Basic Color Changing pattern 0x6: 100 Pixels of Color Var1 followed by Color Var2 repeating 0x7: Constant 24 bit Color of Color Var1
27:16	RESERVED29_16	This field has no function and should be set to zero for future compatibility
15:8	TPG_VAR1	Color rectangle height (y). Applicable only when TEST_PATTERN_SEL is 0
7:0	TPG_VAR0	Color rectangle width (x) Applicable only when TEST_PATTERN_SEL is 0

0x051C0038 MDP_LCDC_CTL_POLARITY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_CTL_POLARITY register defines the polarity of control signals to the LCD panel.

MDP_LCDC_CTL_POLARITY

Bits	Name	Description
31:3	RESERVED31_3	This field has no function and should be set to zero for future compatibility.
2	DEN_NEG	Data enable polarity 0x0: enable active high (default) 0x1: enable active low
1	VSYNC_NEG	VSYNC polarity: 0x0: VSYNC active high (default) 0x1: VSYNC active low
0	HSYNC_NEG	HSYNC polarity: 0x0: HSYNC active high (default) 0x1: HSYNC active low

0x051C003C MDP_LCDC_TEST_COL_VAR1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x00ff_ffff

MDP_LCDC_TEST_COL_VAR1 defines the color value for Var1. Only used when test pattern 6 o 7 is enabled.

MDP_LCDC_TEST_COL_VAR1

Bits	Name	Description
31:24	RESERVED31_12	This field has no function and should be set to zero for future compatibility
23:0	TPG_COLOR1	24 bit color value for Var 1 in test pattern 6 and constant color in test pattern 7

0x051C0040 MDP_LCDC_TEST_COL_VAR2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_TEST_COL_VAR2 defines the color value for Var2. Only used when test pattern 6.is enabled

MDP_LCDC_TEST_COL_VAR2

Bits	Name	Description
31:24	RESERVED31_12	This field has no function and should be set to zero for future compatibility
23:0	TPG_COLOR2	24 bit color value for Var 2 in test pattern 6

0x051C0044 MDP_LCDC_UNDERFLOW_HIDING_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0006_0FFF

MDP_LCDC_UNDERFLOW_HIDING_CTL register defines maximum lost pixel count value for interrupt generation, underflow hiding feature on/off and reset condition for accumulated lost pixel count value. This register is not Double Buffered and SW is requested to set this register before LCDC enabled. If SW wants to change this control register after LCDC enabled, SW should change this value as soon as VYNC interrupt occurs.

MDP_LCDC_UNDERFLOW_HIDING_CTL

Bits	Name	Description
31:20	RESERVED31_20	This field has no function and should be set to zero for future compatibility.
19	UNDERFLOW_COLOR_SEL	Select display color during underflow situation 0x0: UNDERFLOW_COLOR (default) 0x1: Last pixel color
18	USE_ACCUM_CNT_FOR_INT	Underflow can be detected by accumulated lost pixel count or current lost pixel count. 0x0: current lost pixel count (internal asynchronous counter value debugging purpose) 0x1: accumulated lost pixel count value (default)
17	ACCUM_LOST_PIXEL_CNT_AUTO_CLR_EN	This bit defines reset condition for internal accumulated lost pixel counter. If it is disabled (set to `0'), the internal counter is not cleared by HW so SW can check how many pixels are lost over multiple frames. Accumulated lost pixel counter is reset to zero at the every vsync when this bit is `1'or at the time SW changing this bit from `0' to `1'. 0x0: disable auto clear (debugging purpose) 0x1: enable auto clear at every vsync start time (default)
16	UNDERFLOW_HIDING_EN	Underflow hiding feature on/off, if this is disabled, the underflow interrupt is generated by legacy method. 0x0: Underflow hiding feature off (legacy method, default) 0x1: Underflow hiding feature on
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility.
11:0	MAX_LOST_PIXEL_CNT	This value defines the maximum number of lost pixel, if the lost pixel counter (accumulated or current) is greater than this value, underflow interrupt is generated. Since LCDC/DSI2 internal FIFO is 4 pixel based, this field is also 4-pixel based. For example, if this value is 2, the real pixel count is 8. The default value is 0xFFF.

0x051C0048 MDP_LCDC_LOST_PIXEL_CNT_VALUE

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_LOST_PIXEL_CNT gives accumulated lost pixel count value and current lost pixel count value.

MDP_LCDC_LOST_PIXEL_CNT_VALUE

Bits	Name	Description
31:28	RESERVED31_28	This field has no function and should be set to zero for future compatibility.
27:16	CUR_LOST_PIXEL_CNT	This counter value indicates the internal asynchronous counter's output value which is the number of pixels lost at the moment. This value is increased in case pixels is not ready and pixel is supposed to be output to display and is decreased in case pixel data is provided by upper pipe and this lost_pixel counter value is not zero. Since LCDC/DSI2 internal FIFO is 4 pixel based, this field is also 4-pixel based. For example, if this value is 2, the real pixel count is 8.
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility.
11:0	ACCUM_LOST_PIXEL_CNT	This counter value indicates the total number of lost pixels. This counter value can be cleared at the every vsync by HW, this is normal mode operation, however it can be programmed to maintain the counter value at the vsync, this mode is mainly debugging purpose so we can check how much pixels are lost in multi-frames. Since LCDC/DSI2 internal FIFO is 4 pixel based, this field is also 4-pixel based. For example, if this value is 2, the real pixel count is 8.

0x051C2000 MDP_LCDC_LVDS_INTF_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_LCDC_LVDS_INTF_CTL register controls the mode of operation of the LVDS interface. Depending whether we are in Single channel (Single Pixel) or Dual channel (Dual Pixel) mode the SW should set the appropriate bits in this register. Finally the SW should enable the LCDC (LCDC_EN bit in MDP_LCDC_EN registers)

NOTE Don't write to these register bits when LCDC_EN bit is set to `1' in MDP_LCDC_EN register

.

MDP_LCDC_LVDS_INTF_CTL

Bits	Name	Description
31:18	RESERVED31_18	This field has no function and should be set to zero for future compatibility.

MDP_LCDC_LVDS_INTF_CTL (cont.)

Bits	Name	Description
17	LVDS_CH2_CLK_LANE_EN	Enable clock lane on channel 2. 0x0: disable 0x1: enable
16	LVDS_CH1_CLK_LANE_EN	Enable clock lane on channel 1. 0x0: disable 0x1: enable
15	LVDS_CH2_DATA_LANE3_EN	Enable data lane 3 on channel 2. 0x0: disable 0x1: enable
14	LVDS_CH2_DATA_LANE2_EN	Enable data lane 2 on channel 2. 0x0: disable 0x1: enable
13	LVDS_CH2_DATA_LANE1_EN	Enable data lane 1on channel 2. 0x0: disable 0x1: enable
12	LVDS_CH2_DATA_LANE0_EN	Enable data lane 0 on channel 2. 0x0: disable 0x1: enable
11	LVDS_CH1_DATA_LANE3_EN	Enable data lane 3 on channel 1. 0x0: disable 0x1: enable
10	LVDS_CH1_DATA_LANE2_EN	Enable data lane 2 on channel 1. 0x0: disable 0x1: enable
9	LVDS_CH1_DATA_LANE1_EN	Enable data lane 1on channel 1. 0x0: disable 0x1: enable
8	LVDS_CH1_DATA_LANE0_EN	Enable data lane 0on channel 1. 0x0: disable 0x1: enable
7	LVDS_EN	Select LVDS output or RGB output. 0x0: RGB output 0x1: LVDS output
6	LVDS_CH2_RES_BIT	LVDS reserved bit on channel 2 in (valid only in 24 bpp mode) 0x0: set the reserved bit to 0 (default) 0x1: set the reserved bit to 1
5	LVDS_CH1_RES_BIT	LVDS reserved bit on channel 1 (valid only in 24 bpp mode) 0x0: set the reserved bit to 0 (default) 0x1: set the reserved bit to 1

MDP_LCDC_LVDS_INTF_CTL (cont.)

Bits	Name	Description
4	LVDS_CH_SWAP	Valid only in LVDS dual channel mode 0x0: Do not swap pixels on Channel1 and Channel2 (default) 0x1: Swap the Channel1 pixel with Channel2 pixel
3	LVDS_RGB_OUT	Specify Which LVDS RGB out Channels to use for 24bpp or 18bpp modes. Each LVDS Channel has 4 sub-channels of seven-bits each 0x0: Use all the four seven-bit sub-channels to pack the 24 bpp pixel and control data. (default) 0x1: Use the lower three seven-bit sub-channels to pack the 18 bpp pixel and control data
2	LVDS_MODE_SEL	One should enable these drives 10 usec after setting the LVDS_BG_EN bit to 1 0x0: Dual Channel mode (default1) 0x1: Single Channel mode
1:0	RESERVED1_0	This field is reserved and should be set to zero for future compatibility

0x051C2004 MDP_LCDC_LVDS_RESERVED1

MDP_LCDC_LVDS_PHY_RESET

Bits	Name	Description
31:6	RESERVED31_6	This field is reserved and should be set to zero for future compatibility.

MDP_LCDC_LVDS_PHY_RESET (cont.)

Bits	Name	Description
5	PLL_RESET_POL	polarity of reset signals for LVDS PLL 0x0: active high 0x1: active low
4	PLL_HW_RESET	LVDS hardware reset for LVDS PLL. A reset pulse is issued by writing 1 followed by 0 to this bit.
3:2	RESERVED3_2	This field is reserved and should be set to zero for future compatibility.
1	PHY_RESET_POL	polarity of reset signals for LVDS PHY. 0x0: active high 0x1: active low
0	PHY_HW_RESET	LVDS hardware reset for LVDS PHY. A reset pulse is issued by writing 1 followed by 0 to this bit.

0x051C3000 MDP_LVDSPHY_PLL_CTRL_0

Type: Read/Write
Clock: WCLK
Reset State: 0x00000000

NOTE The preferred names for all MDP_LVDSPHY_PLL_CTRL_n registers would be MDP_LVDSPHY_PLL_CFGn.

Output Clock Control (Debug Purpose). When it is `1`, the output clocks will be generated from reference clock. When it is '0', output clocks will be generated from PLL VCO clock.

Normal operational mode setting is 0

Power up value is 0

MDP_LVDSPHY_PLL_CTRL_0

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5	LVDSPLL_BYPASS	
4	LVDSPLL_OPEN_LOOP	Open Loop Setting. When this bit is set to 1, the Lock Time is significantly reduced compared to lock time in closed loop mode. 0=Closed Loop Mode 1= Open Loop Mode Normal operational mode setting is 0.

MDP_LVDSPHY_PLL_CTRL_0 (cont.)

Bits	Name	Description
3	LVDSPLL_PWR_MODE	PLL const-gm bias select 0: Resistor div bias is selected 1: PLL Const-gm bias is selected Normal operational mode setting is 0.
2	RESERVED_BITS2	
1	LVDSPLL_SWCAL_EN	S/W Calibration Enable Control. If the bit is `1`, then the PLL will ignore CAL_MODE and perform S/W calibration. VCO OFFSET and SLOPE will be set by MAN_OFFSET and MAN_SLOPE.We are not using the SW calibration anymore. So this bit should be set to '0'. Normal operational mode setting is 0.
0	LVDSPLL_PLL_EN	PLL Enable Signal. Analog power down. 1 = Normal Mode of operation 0 = Power Down State Normal operational mode setting is 1.

14.15.17 DTV Timing Generator registers

0x051D0000 MDP_DTV_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_EN register is used to enable DTV timing generator. The timing generator should be enabled only after all the timing registers are programmed.

OTE: Before enabling this bit make sure that the DTV/LCDC interface is selected by appropriately setting the EXT_INTF_SEL bits in the MDP_DISP_INTF_SEL register

MDP_DTV_EN

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	DTV_EN	Enable timing generation and kick start DTV operation. Note: If DTV is disabled by SW in the middle of a frame period, internally the hardware will disable DTV only at the end of the current frame (just before next Vsync).

0x051D0004 MDP_DTV_HSYNC_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x035a_003e

MDP_DTV_HSYNC_CTL register defines HSYNC parameters like period and width.

MDP_DTV_HSYNC_CTL

Bits	Name	Description
31:29	RESERVED31_29	This field has no function and should be set to zero for future compatibility.

MDP_DTV_HSYNC_CTL (cont.)

Bits	Name	Description
28:16	HSYNC_PERIOD	HSYNC period in dot_clk cycles. This is the time between start of hsync pulse and the start of next hsync pulse. Note: hsync_period = Width + h_porch where, Width = Output image width h_porch = (h_back_porch + h_front_porch) h_back_porch starts at the beginning of hsync pulse Please refer to the panel data sheet or CEA-861-D specs to obtain accurate values for hsync parameters.
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility
11:0	HSYNC_PULSE_WIDTH	HSYNC pulse width in dot_clk cycles.

0x051D0008 MDP_DTV_VSYNC_PERIOD_F1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0006_df92

MDP_DTV_VSYNC_PERIOD_F1 register defines the VSYNC period.

MDP_DTV_VSYNC_PERIOD_F1

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility.
23:0	VSYNC_PERIOD_F1	Field1 VSYNC period in dot_clk cycles. In progressive mode this is the time between start of vsync pulse and the start of next vsync pulse Interlace mode this is the time between start of Field1 vsync pulse and the start of Field2 vsync pulse. Note: vsync_period = Height + v_porch where, Height = Output image height v_porch = (v_back_porch + v_front_porch) v_back_porch starts at the beginning of vsync pulse Please refer to the panel data sheet or CEA-861-D specs to obtain accurate values for vsync parameters.

0x051D000C MDP_DTV_VSYNC_PULSE_WIDTH_F1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_141c

MDP_DTV_VSYNC_PULSE_WIDTH_F1 register defines the VSYNC pulse width..

MDP_DTV_VSYNC_PULSE_WIDTH_F1

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility.
23:0	VSYNC_PULSE_WIDTH_F1	Field1 VSYNC pulse width in dot_clk cycles.

0x051D0010 MDP_DTV_VSYNC_PERIOD_F2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_VSYNC_PERIOD_F2 register defines the VSYNC period. This register is valid for Interlace Mode only.

MDP_DTV_VSYNC_PERIOD_F2

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility.
23:0	VSYNC_PERIOD_F2	Field2 VSYNC period in dot_clk cycles. In progressive mode this register is not used Interlace mode this is the time between start of Field2 vsync pulse and the start of Field1 vsync pulse. Note: vsync_period = Height + v_porch where, Height = Output image height v_porch = (v_back_porch + v_front_porch) v_back_porch starts at the beginning of vsync pulse Please refer to the panel data sheet or CEA-861-D specs to obtain accurate values for vsync parameters.

0x051D0014 MDP_DTV_VSYNC_PULSE_WIDTH_F2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_VSYNC_PULSE_WIDTH_F2 register defines the VSYNC pulse width. This register is valid for Interlace Mode only.

MDP_DTV_VSYNC_PULSE_WIDTH_F2

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility.
23:0	VSYNC_PULSE_WIDTH_F2	Field2 VSYNC pulse width in dot_clk cycles. Not valid for Progressive mode

0x051D0018 MDP_DTV_DISPLAY_HCTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0349_007a

MDP_DTV_DISPLAY_HCTL register defines the horizontal display region (active + inactive) which can be obtained from hsync period and horizontal blanking (back and front porch) parameters.

MDP_DTV_DISPLAY_HCTL

Bits	Name	Description
31:29	RESERVED31_29	This field has no function and should be set to zero for future compatibility
28:16	DISPLAY_END_X	Defines the time period between the start of hsync pulse and the last displayed pixel position in dot_clk cycles. Note: display_end_x = hsync_period - h_front_porch - 1 where, h_porch (dot cycles) = hsync_period - Width h_porch = (h_back_porch + h_front_porch)
15:13	RESERVED15_13	This field has no function and should be set to zero for future compatibility

MDP_DTV_DISPLAY_HCTL (cont.)

Bits	Name	Description
12:0	DISPLAY_START_X	Defines the time period between the start of hsync pulse and the first displayed pixel position in dot_clk cycles. Note: display_start_x = h_back_porch where, h_porch (dot cycles) = hsync_period - Width h_porch = (h_back_porch + h_front_porch)

0x051D001C MDP_DTV_DISPLAY_V_START_F1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_78a8

MDP_DTV_DISPLAY_V_START_F1 register defines the vertical display region (active + inactive) which can be obtained from vsync period and vertical blanking (back and front porch) parameters.

MDP_DTV_DISPLAY_V_START_F1

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	DISPLAY_START_Y_F1	Defines the time period between the field1 start of vsync pulse and the first displayed line position in dot_clk cycles. Note: display_start_y = v_back_porch where, v_porch = vsync_period - Height v_porch = (v_back_porch + v_front_porch)

0x051D0020 MDP_DTV_DISPLAY_V_END_F1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0006_c167

MDP_DTV_DISPLAY_V_END_F1 register defines the vertical display region (active + inactive) which can be obtained from vsync period and vertical blanking (back and front porch) parameters.

MDP_DTV_DISPLAY_V_END_F1

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	DISPLAY_END_Y_F1	Defines the time period between the field1 start of vsync pulse and the last displayed line position in dot_clk cycles. Note: display_end_y = vsync_period - v_front_porch - 1 where, v_porch = vsync_period - Height v_porch = (v_back_porch + v_front_porch)

0x051D0024 MDP_DTV_DISPLAY_V_START_F2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_DISPLAY_V_START_F2 register defines the vertical display region (active + inactive) which can be obtained from vsync period and vertical blanking (back and front porch) parameters.

MDP_DTV_DISPLAY_V_START_F2

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	DISPLAY_START_Y_F2	Defines the time period between the field2 start of vsync pulse and the first displayed line position in dot_clk cycles. Note: display_start_y = v_back_porch where, v_porch = vsync_period - Height v_porch = (v_back_porch + v_front_porch)

0x051D0028 MDP_DTV_DISPLAY_V_END_F2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_DISPLAY_V_END_F2 register defines the vertical display region (active + inactive) which can be obtained from vsync period and vertical blanking (back and front porch) parameters.

MDP_DTV_DISPLAY_V_END_F2

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	DISPLAY_END_Y_F2	Defines the time period between the field2 start of vsync pulse and the last displayed line position in dot_clk cycles. Note: display_end_y = vsync_period - v_front_porch - 1 where, v_porch = vsync_period - Height v_porch = (v_back_porch + v_front_porch)

0x051D002C MDP_DTV_ACTIVE_HCTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_ACTIVE_HCTL register defines the horizontal parameters of DTV active display area.

MDP_DTV_ACTIVE_HCTL

Bits	Name	Description
31	ACTIVE_H_EN	Horizontal active region enable
30:29	RESERVED30_29	This field has no function and should be set to zero for future compatibility
28:16	ACTIVE_END_X	Defines the time period between the start of hsync pulse and the last active pixel position in dot_clk cycles (a value between `display_start_x' and `display_end_x').
15:13	RESERVED15_13	This field has no function and should be set to zero for future compatibility.
12:0	ACTIVE_START_X	Defines the time period between the start of hsync pulse and the first active pixel position in dot_clk cycles (a value between `display_start_x' and `display_end_x').

0x051D0030 MDP_DTV_ACTIVE_V_START_F1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_ACTIVE_V_START_F1 register defines the vertical parameters of DTV active display area.

MDP_DTV_ACTIVE_V_START_F1

Bits	Name	Description
31	ACTIVE_V_EN	Vertical active region enable
30:24	RESERVED30_24	This field has no function and should be set to zero for future compatibility
23:0	ACTIVE_START_Y_F1	Defines the time period between the start of vsync pulse and the first active line position in dot_clk cycles (a value between `display_start_y' and `display_end_y').

0x051D0034 MDP_DTV_ACTIVE_V_START_F2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_ACTIVE_V_START_F2 register defines the vertical parameters of DTV active display area.

MDP_DTV_ACTIVE_V_START_F2

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	ACTIVE_START_Y_F2	Defines the time period between the start of field2 vsync pulse and the first active line position in dot_clk cycles (a value between `display_start_y' and `display_end_y').

0x051D0038 MDP_DTV_ACTIVE_V_END_F1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_ACTIVE_V_END_F1register defines the vertical parameters of DTV active display area.

MDP_DTV_ACTIVE_V_END_F1

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility

MDP_DTV_ACTIVE_V_END_F1 (cont.)

Bits	Name	Description
23:0	ACTIVE_END_Y_F1	Defines the time period between the start of field1 vsync pulse and the last active line position in dot_clk cycles (a value between `display_start_y' and `display_end_y').

0x051D003C MDP_DTV_ACTIVE_V_END_F2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_ACTIVE_V_END_F2 register defines the vertical parameters of DTV active display area. This register is valid in Interlace mode only

MDP_DTV_ACTIVE_V_END_F2

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	ACTIVE_END_Y_F2	Defines the time period between the start of field2 vsync pulse and the last active line position in dot_clk cycles (a value between `display_start_y' and `display_end_y').

0x051D0040 MDP_DTV_BORDER_CLR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_BORDER_CLR register defines border(inactive) area color for LCD display.

MDP_DTV_BORDER_CLR

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	BORDER_COLOR	Define 24-bit border (background) color value of the inactive region of display. This color value should be packed loose for parallel DTV and should match the output format, pack pattern and packing alignment defined in MDP_DMA_P_CONFIG.

0x051D0044 MDP_DTV_UNDERFLOW_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x8000_0000

MDP_DTV_UNDERFLOW_CTL register defines the displayed color in case of data underflow and enables the auto recovery mechanism.

MDP_DTV_UNDERFLOW_CTL

Bits	Name	Description
31	ERR_RECOVERY_EN	Enable auto recovery during error conditions like underflow etc. 0x0: Disable 0x1: Enable (default)
30:24	RESERVED30_24	This field has no function and should be set to zero for future compatibility
23:0	UNDERFLOW_COLOR	Define the 24 bit color value to be displayed in case of underflow. This color value should be packed loose for parallel DTV and should match the output format, pack pattern and packing alignment defined in MDP_DMA_P_CONFIG. The border color programmed should be packed tight for MDDI based DTV.

0x051D0048 MDP_DTV_HSYNC_SKEW

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_HSYNC_SKEW defines the relative skew between HSYNC and VSYNC active edges.

MDP_DTV_HSYNC_SKEW

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	HSYNC_SKEW	Define the number of dot_clk cycles HSYNC active edge is delayed from VSYNC active edge

0x051D004C MDP_DTV_TEST_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_TEST_CTL controls test pattern generation and defines its parametersh

MDP_DTV_TEST_CTL

Bits	Name	Description
31	TEST_PATTERN_EN	Enable hardware test pattern generation (color rectangles)
30:28	TEST_PATTERN_SEL	Select Test Pattern 0x0: Checkered Pattern (default) 0x1: 16 Grayscale Test Pattern 0x2: 256 Grayscale of Red 0x3: 256 Grayscale of Green 0x4: 256 Grayscale of Blue 0x5: Basic Color Changing pattern 0x6: 100 Pixels of Color Var1 followed by Color Var2 repeating 0x7: Constant 24 bit Color of Color Var1
27:16	RESERVED29_16	This field has no function and should be set to zero for future compatibility
15:8	TPG_VAR1	Color rectangle height (y). Applicable only when TEST_PATTERN_SEL is 0
7:0	TPG_VAR0	Color rectangle width (x) Applicable only when TEST_PATTERN_SEL is 0

0x051D0050 MDP_DTV_CTL_POLARITY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_CTL_POLARITY register defines the polarity of control signals to the LCD panel.

MDP_DTV_CTL_POLARITY

Bits	Name	Description
31:3	RESERVED31_3	This field has no function and should be set to zero for future compatibility.
2	DEN_NEG	Data enable polarity 0x0: enable active high (default) 0x1: enable active low
1	VSYNC_NEG	VSYNC polarity: 0x0: VSYNC active high (default) 0x1: VSYNC active low
0	HSYNC_NEG	HSYNC polarity: 0x0: HSYNC active high (default) 0x1: HSYNC active low

0x051D0058 MDP_DTV_CFG

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_CFG register is used to configure the output mode and to enable the DTV timing generator

NOTE Don't write to these registe bits when DTV_EN bit is set to `1' in MDP_DTV_EN register

MDP_DTV_CFG

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility.
11	DSUB_EN	Select RGB DSUB Interface over HDMI interface 0x0: Disable DSUB interface (default) 0x1: Enable DSUB interface
10	DTV_PACK_ALIGN	Packing alignment (within a 24 bit dtv out data bus). This is valid only in DTV 16 bit, 12 bit & 8 bit modes. For eg: In DTV 16 bit mode if this bit is `0' then the 16 bit out maps to LSB bits of the 24 bit dtv out bus( i.e pixel value in [15:0] maps to [15:0] of the dtv out bus). If this bit is set to `1' then the 16 bit bus is mapped to MSB bits of 24 bit out bus (i.e., pixel vallue [15:0] maps to [23:8] of dtv out bus). This mode isnNot valid for MDDI based LCDC where the output is packed tight. 0x0: LSB (default) 0x1: MSB
9:8	PACK_422	This field allows one to configure the DTV OUT packing for YCbCr4:2:2 format (MSB to LSB byte). For eg: If we are in 16 bit OUT mode and this field is set to 0x2 then we will send Y1Cr1 in first cycle followed by Y2Cb1. The process will then repeat every two cycles 0x0: Y2Cr1Y1Cb1 (default) 0x1: Cr1Y2Cb1Y1 0x2: Y2Cb1Y1Cr1 0x3: Cb1Y2Cr1Y1
7	RESERVED7	This field has no function and should be set to zero for future compatibility
6:4	OUT_MODE	Output Mode. 0x0: YCbCr or RGB 4:4:4 Separate Syncs 24 bit interface (default) 0x1: Reserved 0x2: YCbCr 4:2:2 Separate Syncs 16 bit interface
3:2	RESERVED3_2	This field has no function and should be set to zero for future compatibility.

MDP_DTV_CFG (cont.)

Bits	Name	Description
1	DTV_REPEAT_PIXEL	Repeat the pixel in active area. This mode is intended to be used for 720x480i, 720x576i, 720x240p, 720x288p DTV resolutions. 0x0: Do not Repeat the Pixel (default) 0x1: Repeat the pixel
0	INTRLACE_MODE	Interlace enable 0x0: Progressive Out (default) 0x1: Interlace Out

0x051D005C MDP_DTV_TEST_COL_VAR1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x00ff_ffff

MDP_DTV_TEST_COL_VAR1 defines the color value for Var1 . Only used when test pattern 6 or7 is enabled.

MDP_DTV_TEST_COL_VAR1

Bits	Name	Description
31:24	RESERVED31_12	This field has no function and should be set to zero for future compatibility
23:0	TPG_COLOR1	24 bit color value for Var 1 in test pattern 6 and constant color in test pattern 7

0x051D0060 MDP_DTV_TEST_COL_VAR2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_TEST_COL_VAR2 defines the color value for Var2. Only used when test pattern 6 is enabled.

MDP_DTV_TEST_COL_VAR2

Bits	Name	Description
31:24	RESERVED31_12	This field has no function and should be set to zero for future compatibility
23:0	TPG_COLOR2	24 bit color value for Var 1 in test pattern 6

0x051D0064 MDP_DTV_UNDERFLOW_HIDING_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0006_0FFF

MDP_DTV_UNDERFLOW_HIDING_CTL register defines maximum lost pixel count value for interrupt generation, underflow hiding feature on/off and reset condition for accumalated lost pixel count value. This register is not Double Buffered and SW is requested to set this register before LCDC enabled. If SW wants to change this control register after LCDC enabled, SW should change this value as soon as VYNC interrupt occurs.

MDP_DTV_UNDERFLOW_HIDING_CTL

Bits	Name	Description
31:20	RESERVED31_20	This field has no function and should be set to zero for future compatibility.
19	UNDERFLOW_COLOR_SEL	Select display color during underfow situation 0x0: UNDERFLOW_COLOR (default) 0x1: Last pixel color
18	USE_ACCUM_CNT_FOR_INT	Underflow can be detected by accumulated lost pixel count or current lost pixel count. 0x0: current lost pixel count (internal asynchronous counter value debugging purpose) 0x1: accumulated lost pixel count value (default)
17	ACCUM_LOST_PIXEL_CNT_AUTO_CLR_EN	This bit defines reset condition for internal accumulated lost pixel counter. If it is disabled(set to `0'), the internal counter is not cleared by HW so SW can check how many pixels are lost over multiple frames. Accumulated lost pixel counter is reset to zero at the every vsync when this bit is `1'or at the time SW changing this bit from `0' to `1'. 0x0: disalbe auto clear (debugging purpose) 0x1: enable auto clear at every vsync start time (default)
16	UNDERFLOW_HIDING_EN	Underflow hiding feature on/off, if this is disabled, the underflow interrupt is generated by legacy method. 0x0: Underflow hiding feature off (legacy method, default) 0x1: Underflow hiding feature on
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility.
11:0	MAX_LOST_PIXEL_CNT	This value defines the maximum number of lost pixel, if the lost pixel counter(accumulated or current) is greater than this value, underflow interrupt is generated. Since DSI1 internal FIFO is 2 pixel based, this field is also 2-pixel based. For example, if this value is 2, the real pixel count is 4.The default value is 0xFFF.

0x051D0068 MDP_DTV_LOST_PIXEL_CNT_VALUE

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DTV_LOST_PIXEL_CNT gives accumulated lost pixel count value and current lost pixel count value.

MDP_DTV_LOST_PIXEL_CNT_VALUE

Bits	Name	Description
31:28	RESERVED31_28	This field has no function and should be set to zero for future compatibility.
27:16	CUR_LOST_PIXEL_CNT	This counter value indicates the internal asynchronous counter's output value which is the number of pixels losted at the moment. This value is increased in case pixels is not ready and pixel is supposed to be output to display and is decreased in case pixel data is provided by upper pipe and this lost_pixel counter value is not zero. Since DSI1 internal FIFO is 2 pixel based, this field is also 2-pixel based. For example, if this value is 2, the real pixel count is 4.
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility.
11:0	ACCUM_LOST_PIXEL_CNT	This counter value indicates the total number of lost pixels. This counter value can be cleared at the every vsync by HW, this is normal mode operation, however it can be programmed to maintain the counter value at the vsync, this mode is mainly debugging purpose so we can check how much pixels are lost in multi-frames. Since DSI1 internal FIFO is 2 pixel based, this field is also 2-pixel based. For example, if this value is 2, the real pixel count is 4.

14.15.18 DSI 1 Video Mode Timing Generator registers

0x051E0000 MDP_DSI_VIDEO_EN

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_EN register is used to enable the LCD controller.

NOTE Before enabling this bit make sure that the DSI_VIDEO interface is selected by appropriately setting the PRIM_INTF_SEL bits in the MDP_DISP_INTF_SEL register.

MDP_DSI_VIDEO_EN

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	DSI_VIDEO_EN	Enable timing generation and kick start DSI_VIDEO operation. NOTE If DSI_VIDEO is disabled by SW in the middle of a frame period, internally the hardware will disable DSI_VIDEO only at the end of the current frame (just before next Vsync).

0x051E0004 MDP_DSI_VIDEO_HSYNC_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_HSYNC_CTL register defines HSYNC parameters like period and width.

MDP_DSI_VIDEO_HSYNC_CTL

Bits	Name	Description
31:29	RESERVED31_29	This field has no function and should be set to zero for future compatibility.
28:16	HSYNC_PERIOD	HSYNC period in dot_clk cycles. This is the time between start of hsync pulse and the start of next hsync pulse. Note: hsync_period = Width + h_porch where, Width = Output image width h_porch = (h_back_porch + h_front_porch) h_back_porch starts at the beginning of hsync pulse Please refer to the panel data sheet or VESA specs to obtain accurate values for hsync parameters.
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility
11:0	HSYNC_PULSE_WIDTH	HSYNC pulse width in dot_clk cycles.

0x051E0008 MDP_DSI_VIDEO_VSYNC_PERIOD

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_VSYNC_PERIOD register defines the VSYNC period.

MDP_DSI_VIDEO_VSYNC_PERIOD

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility.
23:0	VSYNC_PERIOD	VSYNC period in dot_clk cycles. This is the time between start of vsync pulse and the start of next vsync pulse. Note: vsync_period = Height + v_porch where, Height = Output image height v_porch = (v_back_porch + v_front_porch) v_back_porch starts at the beginning of vsync pulse Please refer to the panel data sheet or VESA specs to obtain accurate values for vsync parameters.

0x051E000C MDP_DSI_VIDEO_VSYNC_PULSE_WIDTH

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_VSYNC_PULSE_WIDTH register defines the VSYNC pulse width.

MDP_DSI_VIDEO_VSYNC_PULSE_WIDTH

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility.
23:0	VSYNC_PULSE_WIDTH	VSYNC pulse width in dot_clk cycles.

0x051E0010 MDP_DSI_VIDEO_DISPLAY_HCTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_DISPLAY_HCTL register defines the horizontal display region (active + inactive) which can be obtained from hsync period and horizontal blanking (back and front porch) parameters.

MDP_DSI_VIDEO_DISPLAY_HCTL

Bits	Name	Description
31:29	RESERVED31_29	This field has no function and should be set to zero for future compatibility
28:16	DISPLAY_END_X	Defines the time period between the start of hsync pulse and the last displayed pixel position in dot_clk cycles. Note: display_end_x = hsync_period - h_front_porch - 1 where, h_porch (dot cycles) = hsync_period - Width h_porch = (h_back_porch + h_front_porch)
15:13	RESERVED15_13	This field has no function and should be set to zero for future compatibility
12:0	DISPLAY_START_X	Defines the time period between the start of hsync pulse and the first displayed pixel position in dot_clk cycles. Note: display_start_x = h_back_porch where, h_porch (dot cycles) = hsync_period - Width h_porch = (h_back_porch + h_front_porch)

0x051E0014 MDP_DSI_VIDEO_DISPLAY_V_START

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_DISPLAY_V_START register defines the vertical display region (active + inactive) which can be obtained from vsync period and vertical blanking (back and front porch) parameters.

MDP_DSI_VIDEO_DISPLAY_V_START

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	DISPLAY_START_Y	Defines the time period between the start of vsync pulse and the first displayed line position in dot_clk cycles. Note: display_start_y = v_back_porch where, v_porch = vsync_period - Height v_porch = (v_back_porch + v_front_porch)

0x051E0018 MDP_DSI_VIDEO_DISPLAY_V_END

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_DISPLAY_V_END register defines the vertical display region (active + inactive) which can be obtained from vsync period and vertical blanking (back and front porch) parameters.

MDP_DSI_VIDEO_DISPLAY_V_END

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	DISPLAY_END_Y	Defines the time period between the start of vsync pulse and the last displayed line position in dot_clk cycles. Note: display_end_y = vsync_period - v_front_porch - 1 where, v_porch = vsync_period - Height v_porch = (v_back_porch + v_front_porch)

0x051E001C MDP_DSI_VIDEO_ACTIVE_HCTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_ACTIVE_HCTL register defines the horizontal parameters of DSI_VIDEO active display area.

MDP_DSI_VIDEO_ACTIVE_HCTL

Bits	Name	Description
31	ACTIVE_H_EN	Horizontal active region enable
30:29	RESERVED30_29	This field has no function and should be set to zero for future compatibility
28:16	ACTIVE_END_X	Defines the time period between the start of hsync pulse and the last active pixel position in dot_clk cycles (a value between `display_start_x' and `display_end_x').
15:13	RESERVED15_13	This field has no function and should be set to zero for future compatibility.
12:0	ACTIVE_START_X	Defines the time period between the start of hsync pulse and the first active pixel position in dot_clk cycles (a value between `display_start_x' and `display_end_x').

0x051E0020 MDP_DSI_VIDEO_ACTIVE_V_START

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_ACTIVE_V_START register defines the vertical parameters of DSI_VIDEO active display area.

MDP_DSI_VIDEO_ACTIVE_V_START

Bits	Name	Description
31	ACTIVE_V_EN	Vertical active region enable
30:24	RESERVED30_24	This field has no function and should be set to zero for future compatibility
23:0	ACTIVE_START_Y	Defines the time period between the start of vsync pulse and the first active line position in dot_clk cycles (a value between `display_start_y' and `display_end_y').

0x051E0024 MDP_DSI_VIDEO_ACTIVE_V_END

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_ACTIVE_V_END register defines the vertical parameters of DSI_VIDEO active display area.

MDP_DSI_VIDEO_ACTIVE_V_END

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	ACTIVE_END_Y	Defines the time period between the start of vsync pulse and the last active line position in dot_clk cycles (a value between `display_start_y' and `display_end_y').

0x051E0028 MDP_DSI_VIDEO_BORDER_CLR

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_BORDER_CLR register defines border (inactive) area color for LCD display.

MDP_DSI_VIDEO_BORDER_CLR

Bits	Name	Description
31:24	RESERVED31_24	This field has no function and should be set to zero for future compatibility
23:0	BORDER_COLOR	Define 24-bit border (background) color value of the inactive region of display. This color value should be packed loose for parallel DSI_VIDEO and should match the output format, pack pattern and packing alignment defined in MDP_DMA_P_CONFIG. The border color programmed should be packed tight for MDDI based DSI_VIDEO.

0x051E002C MDP_DSI_VIDEO_UNDERFLOW_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x8000_0000

MDP_DSI_VIDEO_UNDERFLOW_CTL register defines the displayed color in case of data underflow and enables the auto recovery mechanism.

MDP_DSI_VIDEO_UNDERFLOW_CTL

Bits	Name	Description
31	ERR_RECOVERY_EN	Enable auto recovery during error conditions like underflow etc. 0x0: Disable 0x1: Enable (default)
30:24	RESERVED30_24	This field has no function and should be set to zero for future compatibility
23:0	UNDERFLOW_COLOR	Define the 24 bit color value to be displayed in case of underflow. This color value should be packed loose for parallel DSI_VIDEO and should match the output format, pack pattern and packing alignment defined in MDP_DMA_P_CONFIG. The border color programmed should be packed tight for MDDI based DSI_VIDEO.

0x051E0030 MDP_DSI_VIDEO_HSYNC_SKEW

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_HSYNC_SKEW defines the relative skew between HSYNC and VSYNC active edges.

MDP_DSI_VIDEO_HSYNC_SKEW

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility
11:0	HSYNC_SKEW	Define the number of dot_clk cycles HSYNC active edge is delayed from VSYNC active edge

0x051E0034 MDP_DSI_VIDEO_TEST_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_TEST_CTL controls test pattern generation and defines its parameters.

MDP_DSI_VIDEO_TEST_CTL

Bits	Name	Description
31	TEST_PATTERN_EN	Enable hardware test pattern generation (color rectangles)
30:28	TEST_PATTERN_SEL	Select Test Pattern 0x0: Checkered Pattern (default) 0x1: 16 Grayscale Test Pattern 0x2: 256 Grayscale of Red 0x3: 256 Grayscale of Green 0x4: 256 Grayscale of Blue 0x5: Basic Color Changing pattern 0x6: 100 Pixels of Color Var1 followed by Color Var2 repeating 0x7: Constant 24 bit Color of Color Var1
27:16	RESERVED29_16	This field has no function and should be set to zero for future compatibility
15:8	TPG_VAR1	Color rectangle height (y). Applicable only when TEST_PATTERN_SEL is 0
7:0	TPG_VAR0	Color rectangle width (x) Applicable only when TEST_PATTERN_SEL is 0

0x051E0038 MDP_DSI_VIDEO_CTL_POLARITY

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_CTL_POLARITY register defines the polarity of control signals to the LCD panel.

MDP_DSI_VIDEO_CTL_POLARITY

Bits	Name	Description
31:3	RESERVED31_3	This field has no function and should be set to zero for future compatibility.
2	DEN_NEG	Data enable polarity 0x0: enable active high (default) 0x1: enable active low
1	VSYNC_NEG	VSYNC polarity: 0x0: VSYNC active high (default) 0x1: VSYNC active low
0	HSYNC_NEG	HSYNC polarity: 0x0: HSYNC active high (default) 0x1: HSYNC active low

0x051E003C MDP_DSI_VIDEO_TEST_COL_VAR1

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x00ff_ffff

MDP_DSI_VIDEO_TEST_COL_VAR1 defines the color value for Var1. Only used when test pattern 6 o 7 is enabled.

MDP_DSI_VIDEO_TEST_COL_VAR1

Bits	Name	Description
31:24	RESERVED31_12	This field has no function and should be set to zero for future compatibility
23:0	TPG_COLOR1	24 bit color value for Var 1 in test pattern 6 and constant color in test pattern 7

0x051E0040 MDP_DSI_VIDEO_TEST_COL_VAR2

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_VIDEO_TEST_COL_VAR2 defines the color value for Var2. Only used when test pattern 6.is enabled

MDP_DSI_VIDEO_TEST_COL_VAR2

Bits	Name	Description
31:24	RESERVED31_12	This field has no function and should be set to zero for future compatibility
23:0	TPG_COLOR2	24 bit color value for Var 2 in test pattern 6

0x051E0044 MDP_DSI_VIDEO_UNDERFLOW_HIDING_CTL

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0006_0FFF

MDP_DSI_UNDERFLOW_HIDING_CTL register defines maximum lost pixel count value for interrupt generation, underflow hiding feature on/off and reset condition for accumulated lost pixel count value. This register is not Double Buffered and SW is requested to set this register before LCDC enabled. If SW wants to change this control register after LCDC enabled, SW should change this value as soon as VYNC interrupt occurs.

MDP_DSI_VIDEO_UNDERFLOW_HIDING_CTL

Bits	Name	Description
31:20	RESERVED31_20	This field has no function and should be set to zero for future compatibility.
19	UNDERFLOW_COLOR_SEL	Select display color during underflow situation 0x0: UNDERFLOW_COLOR (default) 0x1: Last pixel color
18	USE_ACCUM_CNT_FOR_INT	Underflow can be detected by accumulated lost pixel count or current lost pixel count. 0x0: current lost pixel count (internal asynchronous counter value debugging purpose) 0x1: accumulated lost pixel count value (default)
17	ACCUM_LOST_PIXEL_CNT_AUTO_CLR_EN	This bit defines reset condition for internal accumulated lost pixel counter. If it is disabled (set to `0'), the internal counter is not cleared by HW so SW can check how many pixels are lost over multiple frames. Accumulated lost pixel counter is reset to zero at the every vsync when this bit is `1'or at the time SW changing this bit from `0' to `1'. 0x0: disable auto clear (debugging purpose) 0x1: enable auto clear at every vsync start time (default)
16	UNDERFLOW_HIDING_EN	Underflow hiding feature on/off, if this is disabled, the underflow interrupt is generated by legacy method. 0x0: Underflow hiding feature off (legacy method, default) 0x1: Underflow hiding feature on

MDP_DSI_VIDEO_UNDERFLOW_HIDING_CTL (cont.)

Bits	Name	Description
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility.
11:0	MAX_LOST_PIXEL_CNT	This value defines the maximum number of lost pixel, if the lost pixel counter (accumulated or current) is greater than this value, underflow interrupt is generated. Since DSI1 internal FIFO is 4 pixel based, this field is also 4-pixel based. For example, if this value is 2, the real pixel count is 8.The default value is 0xFFF.

0x051E0048 MDP_DSI_VIDEO_LOST_PIXEL_CNT_VALUE

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

MDP_DSI_LOST_PIXEL_CNT gives accumulated lost pixel count value and current lost pixel count value.

MDP_DSI_VIDEO_LOST_PIXEL_CNT_VALUE

Bits	Name	Description
31:28	RESERVED31_28	This field has no function and should be set to zero for future compatibility.
27:16	CUR_LOST_PIXEL_CNT	This counter value indicates the internal asynchronous counter's output value which is the number of pixels lost at the moment. This value is increased in case pixels is not ready and pixel is supposed to be output to display and is decreased in case pixel data is provided by upper pipe and this lost_pixel counter value is not zero.Since DSI1 internal FIFO is 4 pixel based, this field is also 4-pixel based. For example, if this value is 2, the real pixel count is 8.
15:12	RESERVED15_12	This field has no function and should be set to zero for future compatibility.
11:0	ACCUM_LOST_PIXEL_CNT	This counter value indicates the total number of lost pixels. This counter value can be cleared at the every vsync by HW, this is normal mode operation, however it can be programmed to maintain the counter value at the vsync, this mode is mainly debugging purpose so we can check how much pixels are lost in multi-frames.Since DSI1 internal FIFO is 4 pixel based, this field is also 4-pixel based. For example, if this value is 2, the real pixel count is 8.

14.15.19 Test Bus and MISR registers

0x051F0000 MDP_TEST_MODE_CLK

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MODE_CLK register is used to select the test points for a specified MDP block.

MDP_TEST_MODE_CLK

Bits	Name	Description
31:12	RESERVED31_12	This field has no function and should be set to zero for future compatibility.

MDP_TEST_MODE_CLK (cont.)

Bits	Name	Description

MDP_TEST_MODE_CLK (cont.)

Bits	Name	Description
11:4	BLOCK_ID	These bits select the test points for the specified MDP block into the test bus. 0x0: Disabled 0x1: Command 0x2: VG1_top 0x3: VG1_fetch 0x4: VG1_upsample 0x5: VG1_deint 0x6: VG1_hist 0x7: VG1_lut 0x8: VG1_scale 0x9: VG1_convert 0xA: VG1_dither 0xB: VG1_igclut 0xC: VG2_top 0xD: VG2_fetch 0xE: VG2_upsample 0xF: VG2_deint 0x10: VG2_hist 0x11: VG2_lut 0x12: VG2_scale 0x13: VG2_convert 0x14: VG2_dither 0x15: VG2_igclut 0x16: RGB1_top 0x17: RGB1_fetch 0x18: RGB1_scale 0x19: RGB1_igclut 0x1A: RGB2_top 0x1B: RGB2_fetch 0x1C: RGB2_scale 0x1D: RGB2_igclut 0x1E: RGB3_top 0x1F: RGB3_fetch 0x20: RGB3_scale 0x21: RGB3_igclut 0x22: LMIX0_blend0 0x23: LMIX0_blend1 0x24: LMIX0_blend2 0x25: LMIX0_blend3 0x26: LMIX0_argclut 0x27: LMIX0_csc 0x28: LMIX0_packer0 0x29: LMIX0_packer1 0x2A: LMIX0_top
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within a MDP block.

0x051F0004 MDP_TEST_MISR_RESET_CLK

Type: Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MISR_RESET_CLK register is used to reset the MISR state.

MDP_TEST_MISR_RESET_CLK

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_SW_RESET	A write of `1' to this address will reset the MISR state. It is a self clearing reset. The reset must be asserted after MDP_TEST_MISR_MODE_CLK is set to a non-zero value. 0x1: MISR reset.

0x051F0008 MDP_TEST_EXPORT_MISR_CLK

Type: Read-Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_EXPORT_MISR_CLK register controls what is sent on the testbus. A value of `0' (reset value) will send the data that is going into the MISR on the testbus. A value of `1' will send the current MISR state onto the testbus. The latter option is typically used for debug purposes. For example, if your final MISR signature failed, you might want to know where it failed (i.e., right in the beginning or somewhere else')

MDP_TEST_EXPORT_MISR_CLK

Bits	Name	Description
31:1	RESERVED31_1	Field has no function and should be set to zero for future compatibility.
0	MISR_EXPORT	When clear(0), testbus is driven by what is sent into the MISR. (i.e., What is the result of the MUXing of all the input data streams with MDP_TEST_ MODE_CLK) When set (1), testbus is driven by the current state of the MISR (debug typically)

0x051F000C MDP_TEST_MISR_CURR_VAL_CLK

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

A read from the address in the MDP_TEST_MISR_CURR_VAL_CLK register will return the current MISR state for this block. Keep in mind that this could change every cycle depending on how it is used.

MDP_TEST_MISR_CURR_VAL_CLK

Bits	Name	Description
31:0	MISR_VAL	It holds the current MISR state.

0x051F0100 MDP_TEST_MODE_HCLK

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MODE_HCLK register selects the test points for the specified MDP block.

MDP_TEST_MODE_HCLK

Bits	Name	Description
31:7	RESERVED31_7	This field has no function and should be set to zero for future compatibility.
6:4	BLOCK_ID	These bits select the test points for the specified MDP block into the test bus. 0x0: Disabled 0x1: MDDI1 0x2: MDDI2 0x3: AHBM
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within a MDP block.

0x051F0104 MDP_TEST_MISR_RESET_HCLK

Type: Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MISR_RESET_HCLK is used to reset the MISR state.

MDP_TEST_MISR_RESET_HCLK

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_SW_RESET	A write of `1' to this address will reset the MISR state. It is a self clearing reset. The reset must be asserted after MDP_TEST_MISR_MODE_HCLK is set to a non-zero value. 0x1: MISR reset.

0x051F0108 MDP_TEST_EXPORT_MISR_HCLK

Type: Read-Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_EXPORT_MISR_HCLK register controls what is sent on the testbus. A value of `0' (reset value) will send the data that is going into the MISR on the testbus. A value of `1' will send the current MISR state onto the testbus. The latter option is typically used for debug purposes. For example, if your final MISR signature failed, you might want to know where it failed (i.e., right in the beginning or somewhere else')

MDP_TEST_EXPORT_MISR_HCLK

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., What is the result of the MUXing of all the input data streams with MDP_TEST_MODE_HCLK) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x051F010C MDP_TEST_MISR_CURR_VAL_HCLK

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

A read of the address in the MDP_TEST_MISR_CURR_VAL_HCLK register will return the current MISR state for this block. Keep in mind that this could change every cycle depending on how it is used.

MDP_TEST_MISR_CURR_VAL_HCLK

Bits	Name	Description
31:0	MISR_VAL	This field holds the current MISR state.

0x051F0200 MDP_TEST_MODE_DCLK

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MODE_DCLK register selects the test points for the specified MDP block.

MDP_TEST_MODE_DCLK

Bits	Name	Description
31:7	RESERVED31_7	This field has no function and should be set to zero for future compatibility.
6:4	BLOCK_ID	These bits select the test points for the specified MDP block into the test bus. 0x0: Disabled 0x1: LCDC1 0x2: LCDC2 0x3: DSI_CMD
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within a MDP block.

0x051F0204 MDP_TEST_MISR_RESET_DCLK

Type: Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MISR_RESET_DCLK is used to reset the MISR state.

MDP_TEST_MISR_RESET_DCLK

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_SW_RESET	A write of `1' to this address will reset the MISR state. It is a self clearing reset. The reset must be asserted after MDP_TEST_MISR_MODE_DCLK is set to a non-zero value. 0x1: MISR reset.

0x051F0208 MDP_TEST_EXPORT_MISR_DCLK

Type: Read-Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_EXPORT_MISR_DCLK register controls what is sent on the testbus. A value of `0' (reset value) will send the data that is going into the MISR on the testbus. A value of `1' will send the current MISR state onto the testbus. The latter option is typically used for debug purposes. For example, if your final MISR signature failed, you might want to know where it failed (i.e., right in the beginning or somewhere else')

MDP_TEST_EXPORT_MISR_DCLK

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., What is the result of the MUXing of all the input data streams with MDP_TEST_MODE_DCLK) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x051F020C MDP_TEST_MISR_CURR_VAL_DCLK

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

A read from this address will return the current MISR state for this block. Keep in mind that this could change every cycle depending on how it is used.

MDP_TEST_MISR_CURR_VAL_DCLK

Bits	Name	Description
31:0	MISR_VAL	This field holds the current MISR state.

0x051F0210 MDP_TEST_CAPTURED_DCLK

Type: Read-Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is set to 1 by hardware when a capture strobe is sent to the MISR. If the micro reads a `1' from this register, it means that it can read the captured MISR value from

MDP_TEST_CAPT_MISR_VAL_DCLK register. The microprocessor can write a `0' or `1' into this register to clear it.

MDP_TEST_CAPTURED_DCLK

Bits	Name	Description
31:10	RESERVED31_3	This field has no function and should be set to zero for future compatibility.
9:2	MAX_FRAME_COUNT	MISR is reset when number of frames generated by video mode engine reaches this number. MISR will be updated in MISR_CAPT_VAL register before reset
1	STOP_EN	Capture every MAX_FRAME_COUNT frames or Stop after MAX_FRAME_COUNT
0	CAPTURED	Value up to MAX_FRAME_COUNT frames are captured

0x051F0214 MDP_TEST_MISR_CAPT_VAL_DCLK

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: Undefined

A read from this address will return the captured MISR state for this block

MDP_TEST_MISR_CAPT_VAL_DCLK

Bits	Name	Description
31:0	MISR_VAL	This field holds the captured MISR state.

0x051F0300 MDP_TEST_MODE_TVCLK

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MODE_TVCLK register selects the test points for the specified MDP block.

K

MDP_TEST_MODE_TVCLK

Bits	Name	Description
31:7	RESERVED31_7	This field has no function and should be set to zero for future compatibility.

MDP_TEST_MODE_TVCLK (cont.)

Bits	Name	Description
6:4	BLOCK_ID	These bits select the test points for the specified MDP block into the test bus. 0x0: Disabled 0x1: ATV 0x2: DTV1 0x3: DTV2
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within a MDP block.

0x051F0304 MDP_TEST_MISR_RESET_TVCLK

Type: Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MISR_RESET_TVCLK is used to reset the MISR state.

MDP_TEST_MISR_RESET_TVCLK

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_SW_RESET	A write of `1' to this address will reset the MISR state. It is a self clearing reset. The reset must be asserted after MDP_TEST_MISR_MODE_TVCLK is set to a non-zero value. 0x1: MISR reset.

0x051F0308 MDP_TEST_EXPORT_MISR_TVCLK

Type: Read-Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_EXPORT_MISR_TVCLK register controls what is sent on the testbus. A value of `0' (reset value) will send the data that is going into the MISR on the testbus. A value of `1' will send the current MISR state onto the testbus. The latter option is typically used for debug purposes. For example, if your final MISR signature failed, you might want to know where it failed (i.e., right in the beginning or somewhere else')

MDP_TEST_EXPORT_MISR_TVCLK

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.

MDP_TEST_EXPORT_MISR_TVCLK (cont.)

Bits	Name	Description
0	MISR_EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., What is the result of the MUXing of all the input data streams with MDP_TEST_MODE_TVCLK) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x051F030C MDP_TEST_MISR_CURR_VAL_TVCLK

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

A read from this address will return the current MISR state for this block. Keep in mind that this could change every cycle depending on how it is used.

MDP_TEST_MISR_CURR_VAL_TVCLK

Bits	Name	Description
31:0	MISR_VAL	This field holds the current MISR state.

0x051F0310 MDP_TEST_CAPTURED_TVCLK

Type: Read-Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is set to 1 by hardware when a capture strobe is sent to the MISR. If the micro reads a `1' from this register, it means that it can read the captured MISR value from MDP_TEST_CAPT_MISR_VAL_TVCLK register. The microprocessor can write a `0' or `1' into this register to clear it.

MDP_TEST_CAPTURED_TVCLK

Bits	Name	Description
31:10	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
9:2	MAX_FRAME_COUNT	MISR is reset when number of frames generated by video mode engine reaches this number. MISR will be updated in MISR_CAPT_VAL register before reset.
1	STOP_EN	Capture every MAX_FRAME_COUNT frames or Stop after MAX_FRAME_COUNT
0	CAPTURED	Value up to MAX_FRAME_COUNT frames are captured

0x051F0314 MDP_TEST_MISR_CAPT_VAL_TVCLK

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: Undefined

A read from this address will return the captured MISR state for this block

MDP_TEST_MISR_CAPT_VAL_TVCLK

Bits	Name	Description
31:0	MISR_VAL	This field holds the captured MISR state.

0x051F0400 MDP_TEST_MODE_DSI_PCLK

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MODE_DSI_PCLK register selects the test points for the specified MDP block.

MDP_TEST_MODE_DSI_PCLK

Bits	Name	Description
31:7	RESERVED31_7	This field has no function and should be set to zero for future compatibility.
6:4	BLOCK_ID	These bits select the test points for the specified MDP block into the test bus. 0x0: Disabled 0x1: DSI_VIDEO1 0x2: DSI_VIDEO2 0x3: DSI_CMD
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within a MDP block.

0x051F0404 MDP_TEST_MISR_RESET_DSI_PCLK

Type: Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MISR_RESET_DSI_PCLK is used to reset the MISR state.

MDP_TEST_MISR_RESET_DSI_PCLK

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_SW_RESET	A write of `1' to this address will reset the MISR state. It is a self clearing reset. The reset must be asserted after MDP_TEST_MISR_MODE_DSI_PCLK is set to a non-zero value. 0x1: MISR reset.

0x051F0408 MDP_TEST_EXPORT_MISR_DSI_PCLK

Type: Read-Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_EXPORT_MISR_DSI_PCLK register controls what is sent on the testbus. A value of `0' (reset value) will send the data that is going into the MISR on the testbus. A value of `1' will send the current MISR state onto the testbus. The latter option is typically used for debug purposes. For example, if your final MISR signature failed, you might want to know where it failed (i.e., right in the beginning or somewhere else')

MDP_TEST_EXPORT_MISR_DSI_PCLK

Bits	Name	Description
31:1	RESERVED31_1	This field has no function and should be set to zero for future compatibility.
0	MISR_EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., What is the result of the MUXing of all the input data streams with MDP_TEST_MODE_DSI_PCLK) When set (1), testbus is driven by the current state of the MISR. (debug typically)

0x051F040C MDP_TEST_MISR_CURR_VAL_DSI_PCLK

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

A read from this address will return the current MISR state for this block. Keep in mind that this could change every cycle depending on how it is used.

MDP_TEST_MISR_CURR_VAL_DSI_PCLK

Bits	Name	Description
31:0	MISR_VAL	This field holds the current MISR state.

0x051F0410 MDP_TEST_CAPTURED_DSI_PCLK

Type: Read-Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

This register is set to 1 by hardware when a capture strobe is sent to the MISR. If the micro reads a `1' from this register, it means that it can read the captured MISR value from MDP_TEST_CAPT_MISR_VAL_P1CLK register. The microprocessor can write a `0' or `1' into this register to clear it.

MDP_TEST_CAPTURED_DSI_PCLK

Bits	Name	Description
31:10	RESERVED31_10	This field has no function and should be set to zero for future compatibility.
9:2	MAX_FRAME_COUNT	MISR is reset when number of frames generated by video mode engine reaches this number. MISR will be updated in MISR_CAPT_VAL register before reset
1	STOP_EN	Capture every MAX_FRAME_COUNT frames or Stop after MAX_FRAME_COUNT
0	CAPTURED	Value up to MAX_FRAME_COUNT frames are captured

0x051F0414 MDP_TEST_MISR_CAPT_VAL_DSI_PCLK

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: Undefined

A read from this address will return the captured MISR state for this block

MDP_TEST_MISR_CAPT_VAL_DSI_PCLK

Bits	Name	Description
31:0	MISR_VAL	This field holds the captured MISR state.

0x051F0500 MDP_TEST_MODE_AXI_CLK

Type: Read/Write
Clock: CC_MDP_CLK
Reset State: 0x0000_0000

The MDP_TEST_MODE_AXI_CLK register selects the test points for the specified MDP block.

MDP_TEST_MODE_AXI_CLK

Bits	Name	Description
31:8	RESERVED31_8	This field has no function and should be set to zero for future compatibility.
7:4	BLOCK_ID	These bits select the test points for the specified MDP block into the test bus. 0x0: Disabled 0x1: mGEN2mAXI Client0 (VG1 read) 0x2: mGEN2mAXI Client1 (VG2 read) 0x3: mGEN2mAXI Client2 (RGB1 read) 0x4: mGEN2mAXI Client3 (RGB2 read) 0x5: mGEN2mAXI Client4 (DMA_P image read) 0x6: mGEN2mAXI Client5 (DMA_P cursor read) 0x7: mGEN2mAXI Client6 (DMA_S read) 0x8: mGEN2mAXI Client7 (DMA_E image read) 0x9: mGEN2mAXI Client8 (DMA_E cursor read) 0xA: mGEN2mAXI Client9 (Overlay0 write) 0xB: mGEN2mAXI Client10 (Overlay1 write) 0xC: mGEN2mAXI AXI Arbiter/Master 0 0xD: mGEN2mAXI AXI Arbiter/Master 1
3:0	TEST_PT_SEL	These bits select a set of 32-bit test points within a MDP block.

0x051F0600 MDP_TEST_MISR_TESTBUS_CAPT_VAL

Type: Read-Only
Clock: CC_MDP_CLK
Reset State: Undefined

A read from this address will return the captured testbus state at the output of MDP. The test_mode must be enabled (BLOCK_ID selected) for the respective clock domain. The clock domain is selected using the MDP_SEL_TEST_BUS_CLK_DOMAIN register.

Programming Notes:

This section is reserved for special programming instructions to facilitate the software development teams in programming related to the Mobile Display Processor 4.2

Sleep retention signals.

There exists a cc_lut_mdp_clk which is synchronous and balanced with cc_mdp_clk. The cc_lut_mdp_clk is used exclusively to clock LUT related SRAMs, where the related sleep retention signals are used to power down the memories when required.

It is important to note that when the cc_mdp_clk is shut down (mdp in general is not used or required in the specific use case), but MDP's island is not powered down, the cc_lut_mdp_clk should remain on and not powered down to retain the state of the LUTs.

MDP_TEST_MISR_TESTBUS_CAPT_VAL

Bits	Name	Description
31:0	MISR_VAL	This field holds the captured testbus state.

14.16 VPE Registers (0x05300000 VPE_BASE)

The Video Processing Engine (VPE) registers in this section are accessed by the ARM.

Other than the global registers (0x00000 ’ 0x0FFFF), the individual sub-block/pipe register accesses are further distinctly grouped into:

- PPP ACCESS (0x10000 ’ 0x8FFFF)
- COMMAND ACCESS (0x10000 ’ 0x1FFFF)
- TILE FETCH ACCESS (0x20000 ’ 0x2FFFF)
- DEINT ACCESS (0x30000 ’ 0x3FFFF)
- CONVERT ACCESS (0x40000 ’ 0x4FFFF)
- SCALE ACCESS (0x50000 ’ 0x5FFFF)
- ROTATE ACCESS (0x60000 ’ 0x6FFFF)
- BLEND ACCESS (0x70000 ’ 0x7FFFF)
- DITHER ACCESS (0x80000 ’ 0x8FFFF)
- DMA_P ACCESS (0x90000 ’ 0x9FFFF)
- DMA_S ACCESS (0xA0000 ’ 0xAFFFF)
- DMA_E ACCESS (0xB0000 ’ 0xBFFFF)
- TV OUT ACCESS (0xC0000 ’ 0xCFFFF)
- TEST MISR ACCESS (0xD0000 ’ 0xDFFFF)
- TEST MISR1mgen2maxi ACCESS CLK (0xD0000 ’ 0xD00FF)
- TEST MISR2 ACCESS HCLK (0xD0100 ’ 0xD01FF)
- TEST MISR3 ACCESS DCLK (0xD0200 ’ 0xD02FF)
- LCDC ACCESS (0xE0000 ’ 0xEFFFF)
- mgen2maxi Block Control (0x00400 - 0x0041F)

NOTE The VPE registers are inherited from MDP3.1 registers list. Only the PPP path is active in VPE, so other non-related registers have been removed in the RTL (all vsync, dma, tv out and lcdc are removed). To keep the software programming as similar to MDP 3.1, the registers are still listed in this document, although writes to those registers has no effect, and reads from those register will always be all 0's. Each register contains details on whether or not they are used in VPE.

14.16.1 Synchronization registers

0x05300300 VPE_SYNC_CONFIG_0

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_SYNC_CONFIG_0 register is a primary synchronization configuration register.

VPE_SYNC_CONFIG_0

Bits	Name	Description
31:21	HEIGHT	Display height - 1. It is the vertical total number of lines.
20	VSYNC_IN_EN	Setting (1) this bit will sync with the external frame sync input
19	VSYNC_COUNTER_EN	Setting (1) this bit to enable the internal counter
18:0	VSYNC_COUNT	This scale value to be programmed is the ratio of the VPE VSYNC clock frequency to LCD panel frequency divided by the no. of rows (lines) in the LCD panel. For example, if the VSYNC clock is 133 MHz and the LCD is 176 lines (rows) and 220 pixels (columns) at 60 Hz, then the value to be programmed is 133 * 10^6 / (60 * 176) = 12594 That is, it takes 12594 VPE clocks to complete writing one line in the LCD panel.

0x05300304 VPE_SYNC_CONFIG_1

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_SYNC_CONFIG_1 register is a secondary synchronization configuration register.

VPE_SYNC_CONFIG_1

Bits	Name	Description
31:21	HEIGHT	Display height - 1. It is the vertical total number of lines.
20	VSYNC_IN_EN	Setting (1) this bit will sync with external frame sync input
19	VSYNC_COUNTER_EN	Setting (1) this bit will enable the internal counter

VPE_SYNC_CONFIG_1 (cont.)

Bits	Name	Description
18:0	VSYNC_COUNT	This scale value to be programmed is the ratio of the VPE VSYNC clock frequency to LCD panel frequency divided by the no. of rows (lines) in the LCD panel. For example, if the VSYNC clock is 133 MHz and the LDC is 176 lines (rows) and 220 pixels (columns) at 60 Hz, then the value to be programmed is 133 * 10^6 / (60 * 176) = 12594 That is, it takes 12594 VPE clocks to complete writing one line in the LCD panel.

0x05300308 VPE_SYNC_CONFIG_2

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_SYNC_CONFIG_2 register is an external synchronization configuration register.

VPE_SYNC_CONFIG_2

Bits	Name	Description
31:21	HEIGHT	Display height - 1. It is the vertical total number of lines.
20	VSYNC_IN_EN	Setting (1) this bit will sync with external frame sync input
19	VSYNC_COUNTER_EN	Setting (1) this bit will enable the internal counter
18:0	VSYNC_COUNT	This scale value to be programmed is the ratio of the VPE VSYNC clock frequency to LCD panel frequency divided by the no. of rows (lines) in the LCD panel. For example, if the VSYNC clock is 133 MHz and the LDC is 176 lines (rows) and 220 pixels (columns) at 60 Hz, then the value to be programmed is 133 * 10^6 / (60 * 176) = 12594 That is, it takes 12594 VPE clocks to complete writing one line in the LCD panel.

0x0530030C VPE_SYNC_STATUS_0

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_SYNC_STATUS_0 register is a primary synchronization status register. Writing to this register loads the line counter and is equivalent to providing a software Vsync.

VPE_SYNC_STATUS_0

Bits	Name	Description
31:28	RESERVED_BITS31_28	
27:16	FRAME_COUNT	This is a free running counter that is incremented once per frame (that is, when line count resets). Writing to this register will load the counter according to the written value.
15:11	RESERVED_BITS15_11	
10:0	LINE_COUNT	This is the value of the line counter or the current read pointer of the panel mapped to primary vsync according to VPE_VSYNC_SEL. Writing to this register will load the counter according to the written value.

0x05300310 VPE_SYNC_STATUS_1

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_SYNC_STATUS_1 register is a secondary synchronization status register. Writing to this register loads the line counter and is equivalent to providing a software Vsync.

VPE_SYNC_STATUS_1

Bits	Name	Description
31:28	RESERVED_BITS31_28	
27:16	FRAME_COUNT	This is a free running counter that is incremented once per frame (that is, when line count resets). Writing to this register will load the counter according to the written value.
15:11	RESERVED_BITS15_11	
10:0	LINE_COUNT	This is the value of the line counter or the current read pointer of the panel mapped to secondary vsync according to VPE_VSYNC_SEL. Writing to this register will load the counter according to the written value.

0x05300314 VPE_SYNC_STATUS_2

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_SYNC_STATUS_2 register is an external synchronization status register. Writing to this register loads the line counter and is equivalent to providing a software Vsync.

VPE_SYNC_STATUS_2

Bits	Name	Description
31:28	RESERVED_BITS31_28	
27:16	FRAME_COUNT	This is a free running counter that is incremented once per frame (that is, when line count resets). Writing to this register will load the counter according to the written value.
15:11	RESERVED_BITS15_11	
10:0	LINE_COUNT	This is the value of the line counter or the current read pointer of the panel mapped to external vsync according to VPE_VSYNC_SEL. Writing to this register will load the counter according to the written value.

0x05300318 VPE_PRIMARY_VSYNC_OUT_CTRL

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_PRIMARY_VSYNC_OUT_CTRL register is used to configure the primary vsync output.

VPE_PRIMARY_VSYNC_OUT_CTRL

Bits	Name	Description
31	VSYNC_OUT_EN	Set (1) this bit to enable the vsync pulse Clear (0) this bit to not enable the vsync pulse If vsync pulse is enabled, the enable pin is asserted and sync output is the pulse specified. If vsync pulse is disabled, the enabled ID is de-asserted and sync output is gated to ground.

VPE_PRIMARY_VSYNC_OUT_CTRL (cont.)

Bits	Name	Description
30	VSYNC_OUT_INVERT	Set (1) this bit to invert the vsync pulse Clear (0) this bit to not invert the vsync pulse If vsync is not inverted, pulse will be active high if vsync is inverted, pulse will be active low Note: This register bit is also used to invert the incoming vsync when there is no external outgoing vsync.
29:20	RESERVED_BITS29_20	
19:0	VSYNC_OUT_WIDTH	The cycle count of the pulse width

0x0530031C VPE_SECONDARY_VSYNC_OUT_CTRL

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_SECONDARY_VSYNC_OUT_CTRL register is used to configure the secondary vsync output.

VPE_SECONDARY_VSYNC_OUT_CTRL

Bits	Name	Description
31	VSYNC_OUT_EN	Set (1) this bit to enable the vsync pulse Clear (0) this bit to not enable the vsync pulse If the vsync pulse is enabled, the enable pin is asserted and the sync output is the pulse specified. If the vsync pulse is disabled, the enabled ID is de-asserted and the sync output is gated to ground.
30	VSYNC_OUT_INVERT	Set (1) this bit to invert the vsync pulse Clear (0) this bit to not invert the vsync pulse If vsync is not inverted, the pulse will be active high If vsync is inverted, the pulse will be active low Note: This register bit is also used to invert the incoming Vsync when there is no external outgoing vsync
29:20	RESERVED_BITS29_20	
19:0	VSYNC_OUT_WIDTH	The cycle count of the pulse width

0x05300320 VPE_EXTERNAL_VSYNC_OUT_CTRL

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_EXTERNAL_VSYNC_OUT_CTRL register is used to configure the external vsync output.

VPE_EXTERNAL_VSYNC_OUT_CTRL

Bits	Name	Description
31	VSYNC_OUT_EN	Set (1) this bit to enable the vsync pulse Clear (0) this bit to not enable the vsync pulse If the vsync pulse is enabled, the enable pin is asserted and the sync output is the pulse specified. If the vsync pulse is disabled, the enabled ID is de-asserted and the sync output is gated to ground.
30	VSYNC_OUT_INVERT	Set (1) this bit to invert the vsync pulse Clear (0) this bit to not invert the vsync pulse If vsync is not inverted, the pulse will be active high If vsync is inverted, the pulse will be active low Note: This register bit is also used to invert the incoming vsync when there is no external outgoing vsync.
29:20	RESERVED_BITS29_20	
19:0	VSYNC_OUT_WIDTH	The cycle count of the pulse width

0x05300324 VPE_VSYNC_SEL

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_VSYNC_SEL register is used to select either the vsyncs from GPIOs or from MDDI block to be used internally as primary, secondary and external vsyncs.

VPE_VSYNC_SEL

Bits	Name	Description
31:6	RESERVED_BITS31_6	

VPE_VSYNC_SEL (cont.)

Bits	Name	Description
5:4	EXTERNAL_VSYNC_SEL	External vsync sel 0x0: Vsync0 from GPIO 0x1: Vsync1 from GPIO 0x2: Vsync2 from GPIO (default) 0x3: External vsync from MDDI block
3:2	SECONDARY_VSYNC_SEL	Secondary vsync sel 0x0: Vsync0 from GPIO 0x1: Vsync1 from GPIO (default) 0x2: Vsync2 from GPIO 0x3: Secondary vsync from MDDI block
1:0	PRIMARY_VSYNC_SEL	Primary vsync sel 0x0: Vsync0 from GPIO (default) 0x1: Vsync1 from GPIO 0x2: Vsync2 from GPIO 0x3: Primary vsync from MDDI block

0x05300328 VPE_PRIM_VSYNC_INIT_VAL

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_PRIM_VSYNC_INIT_VAL defines the value with which the read pointer gets loaded at primary vsync edge.

VPE_PRIM_VSYNC_INIT_VAL

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	PRIM_VSYNC_INIT_VAL	Specify the init value to which the read pointer gets loaded at vsync edge.

0x0530032C VPE_SEC_VSYNC_INIT_VAL

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_SEC_VSYNC_INIT_VAL defines the value with which the read pointer gets loaded at secondary vsync edge.

VPE_SEC_VSYNC_INIT_VAL

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	SEC_VSYNC_INIT_VAL	Specify the init value to which the read pointer gets loaded at vsync edge.

0x05300330 VPE_EXT_VSYNC_INIT_VAL

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_EXT_VSYNC_INIT_VAL defines the value with which the read pointer gets loaded at external vsync edge.

VPE_EXT_VSYNC_INIT_VAL

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	EXT_VSYNC_INIT_VAL	Specify the init value to which the read pointer gets loaded at vsync edge.

0x05300334 VPE_PRIM_VSYNC_OUT_VAL

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_PRIM_VSYNC_OUT_VAL defines the value of the internally generated read pointer at which the primary outgoing vsync is generated.

VPE_PRIM_VSYNC_OUT_VAL

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	PRIM_VSYNC_OUT_VAL	Specify the value of the read pointer at which the outgoing primary vsync is generated.

0x05300338 VPE_SEC_VSYNC_OUT_VAL

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_SEC_VSYNC_OUT_VAL defines the value of the internally generated read pointer at which the secondary outgoing vsync is generated.

VPE_SEC_VSYNC_OUT_VAL

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	SEC_VSYNC_OUT_VAL	Specify the value of the read pointer at which the secondary outgoing vsync is generated.

0x0530033C VPE_EXT_VSYNC_OUT_VAL

Type: Read/Write
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

VPE_EXT_VSYNC_OUT_VAL defines the value of the internally generated read pointer at which the external outgoing vsync is generated.

VPE_EXT_VSYNC_OUT_VAL

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility

VPE_EXT_VSYNC_OUT_VAL (cont.)

Bits	Name	Description
10:0	EXT_VSYNC_OUT_VAL	Specify the value of the read pointer at which the external outgoing vsync is generated.

0x05300340 VPE_PRIM_INT_CNT_VAL

Type: Read
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_PRIM_INT_CNT_VAL register shows the internal line and frame counter for primary vsync.

VPE_PRIM_INT_CNT_VAL

Bits	Name	Description
31:28	RESERVED_BITS31_28	
27:16	FRAME_COUNT	Internal frame count value for primary vsync.
15:11	RESERVED_BITS15_11	
10:0	LINE_COUNT	Internal line count value for primary vsync.

0x05300344 VPE_SEC_INT_CNT_VAL

Type: Read
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_SEC_INT_CNT_VAL register shows the internal line and frame counter for secondary vsync.

VPE_SEC_INT_CNT_VAL

Bits	Name	Description
31:28	RESERVED_BITS31_28	
27:16	FRAME_COUNT	Internal frame count value for secondary vsync.
15:11	RESERVED_BITS15_11	

VPE_SEC_INT_CNT_VAL (cont.)

Bits	Name	Description
10:0	LINE_COUNT	Internal line count value for secondary vsync.

0x05300348 VPE_EXT_INT_CNT_VAL

Type: Read
Clock: CC_VPE_VSYNC_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_EXT_INT_CNT_VAL register shows the internal line and frame counter for external vsync.

VPE_EXT_INT_CNT_VAL

Bits	Name	Description
31:28	RESERVED_BITS31_28	
27:16	FRAME_COUNT	Internal frame count value for the external vsync.
15:11	RESERVED_BITS15_11	
10:0	LINE_COUNT	Internal line count value for the external vsync.

0x05300200 VPE_SYNC_THRESH_0

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0010_0000

This register is not used in VPE.

The VPE_SYNC_THRESH_0 register is a primary synchronization threshold register.

VPE_SYNC_THRESH_0

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:16	CONTINUE_THRESHOLD	The minimum number of lines the write pointer needs to be above the read pointer so that it is safe to write to the primary LCD. (This check is not done for the first ROI line write of an update).
15:11	RESERVED_BITS15_11	

VPE_SYNC_THRESH_0 (cont.)

Bits	Name	Description
10:0	START_THRESHOLD	Allows the first ROI line write to an primary LCD update when read pointer is between the range of ROI start line and ROI start line plus this setting.

0x05300204 VPE_SYNC_THRESH_1

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0010_0000

This register is not used in VPE.

The VPE_SYNC_THRESH_1 register is a secondary synchronization threshold register.

VPE_SYNC_THRESH_1

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:16	CONTINUE_THRESHOLD	The minimum number of lines the write pointer needs to be above the read pointer so that it is safe to write to the secondary LCD. (This check is not done for the first ROI line write of an update).
15:11	RESERVED_BITS15_11	
10:0	START_THRESHOLD	Allows the first ROI line write to an secondary LCD update when read pointer is between the range of ROI start line and ROI start line plus this setting.

0x05300208 VPE_SYNC_THRESH_2

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0010_0000

This register is not used in VPE.

The VPE_SYNC_THRESH_2 register is an external synchronization threshold register.

VPE_SYNC_THRESH_2

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:16	CONTINUE_THRESHOLD	The minimum number of lines the write pointer needs to be above the read pointer so that it is safe to write to the external LCD. (This check is not done for the first ROI line write of an update).

VPE_SYNC_THRESH_2 (cont.)

Bits	Name	Description
15:11	RESERVED_BITS15_11	
10:0	START_THRESHOLD	Allows the first ROI line write to an external LCD update when read pointer is between the range of ROI start line and ROI start line plus this setting.

0x0530020C VPE_TEAR_CHECK_EN

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE. Writes to this register has no effect. Reads from this register returns 0.

The VPE_TEAR_CHECK_EN register is used to enable tearing check on different displays.

VPE_TEAR_CHECK_EN

Bits	Name	Description
2	EXTERNAL_TEAR_CHECK_EN	0x0: Disable (default) 0x1: Enable
1	SECONDARY_TEAR_CHECK_EN	0x0: Disable (default) 0x1: Enable
0	PRIMARY_TEAR_CHECK_EN	0x0: Disable (default) 0x1: Enable

0x05300210 VPE_PRIM_START_POS

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

VPE_PRIM_START_POS defines the y position value at which the kick off condition is evaluated (for the primary display).

VPE_PRIM_START_POS

Bits	Name	Description
10:0	START_POS	Specify the y position from which the start_threshold value is added and write is kicked off if the read pointer falls within that region.

0x05300214 VPE_SEC_START_POS

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

VPE_SEC_START_POS defines the y position value for the kick off condition (for the secondary display).

VPE_SEC_START_POS

Bits	Name	Description
10:0	START_POS	Specify the y position from which the start_threshold value is added and write is kicked off if the read pointer falls within that region.

0x05300218 VPE_EXT_START_POS

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

VPE_EXT_START_POS defines the y position value at which the kick off condition is evaluated (for the external display).

VPE_EXT_START_POS

Bits	Name	Description
10:0	START_POS	Specify the y position from which the start_threshold value is added and write is kicked off if the read pointer falls within that region.

0x0530021C VPE_PRIMARY_RD_PTR_IRQ

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_07FF

This register is not used in VPE.

VPE_PRIMARY_RD_PTR_IRQ defines the read pointer of the primary display at which an interrupt has to be generated.

VPE_PRIMARY_RD_PTR_IRQ

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	IRQ_LINE	Specify the read pointer value at which an interrupt has to be generated.

0x05300220 VPE_SECONDARY_RD_PTR_IRQ

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_07FF

This register is not used in VPE.

VPE_SECONDARY_RD_PTR_IRQ defines the read pointer of the secondary display at which an interrupt has to be generated.

VPE_SECONDARY_RD_PTR_IRQ

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	IRQ_LINE	Specify the read pointer value at which an interrupt has to be generated.

0x05300224 VPE_EXTERNAL_RD_PTR_IRQ

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_07FF

This register is not used in VPE.

VPE_EXTERNAL_RD_PTR_IRQ defines the read pointer of the external display at which an interrupt has to be generated.

VPE_EXTERNAL_RD_PTR_IRQ

Bits	Name	Description
31:11	RESERVED_BITS31_11	This field has no function and should be set to zero for future compatibility
10:0	IRQ_LINE	Specify the read pointer value at which an interrupt has to be generated.

14.16.2 Interrupt registers

0x05300020 VPE_INTR_ENABLE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_INTR_ENABLE register is used to enable the VPE interrupts. For VPE, only bit 0 is active, all other bits should be set to 0.

VPE_INTR_ENABLE

Bits	Name	Description
31:23	RESERVED_BITS31_23	
22:0	INTR_ENABLE	Setting (1) a specific bit will enable the respective interrupt source within the VPE to send a level interrupt out of the VPE. Clearing (0) that bit will disable it from generating the VPE interrupt. Bit0: Display list 0 ROI done Bit1: Display list 1 ROI done Bit 2 : DMA_S transfer done Bit 3 : DMA_E transfer done Bit 4 : Display list 0 PPP terminal frame done Bit 5 : Display list 1 PPP terminal frame done Bit 6 : TV out DMA transfer frame done Bit 7 : TV encoder under run Bit 8 : Sync primary line (rd_ptr) interrupt Bit 9 : Sync secondary line (rd_ptr) interrupt Bit 10 : Sync external line (rd_ptr) interrupt Bit 11 : Display list 0 fetched done Bit 12 : Display list 1 fetched done Bit 13 : TV out frame start Bit 14 : DMA_P transfer done Bit 15 : LCDC vsync (or end of frame) interrupt Bit 16 : LCDC underflow Bit 17 : DMA_P line (wr_ptr) interrupt Bit 18 : DMA_S line (wr_ptr) interrupt Bit 19 : DMA_E line (wr_ptr) interrupt Bit 20 : DMA_P histogram interrupt Bit 21 : AXI bus error Bit 22 : AXI write data timeout

0x05300024 VPE_INTR_STATUS

Type: Read
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_INTR_STATUS register is the VPE interrupt status register. For VPE, only bit 0 is active, all other bits should be ignored.

VPE_INTR_STATUS

Bits	Name	Description
31:23	RESERVED_BITS31_23	
22:0	INTR_STATUS	When an VPE interrupt occurs, then reading this register will indicate what caused the interrupt since that each bit indicates the source of the interrupt that had happened. If multiple interrupt sources had happened, then multiple bits of this register will be. Bit0: Display list 0 ROI done Bit1: Display list 1 ROI done Bit 2 : DMA_S transfer done Bit 3 : DMA_E transfer done Bit 4 : Display list 0 PPP terminal frame done Bit 5 : Display list 1 PPP terminal frame done Bit 6 : TV out DMA transfer frame done Bit 7 : TV encoder under run Bit 8 : Sync primary line (rd_ptr) interrupt Bit 9 : Sync secondary line (rd_ptr) interrupt Bit 10 : Sync external line (rd_ptr) interrupt Bit 11 : Display list 0 fetched done Bit 12 : Display list 1 fetched done Bit 13 : TV out frame start Bit 14 : DMA_P transfer done Bit 15 : LCDC vsync (or end of frame) interrupt Bit 16 : LCDC underflow Bit 17 : DMA_P line (wr_ptr) interrupt Bit 18 : DMA_S line (wr_ptr) interrupt Bit 19 : DMA_E line (wr_ptr) interrupt Bit 20 : DMA_P histogram interrupt Bit 21 : AXI bus error Bit 22 : AXI write data timeout

0x05300028 VPE_INTR_CLEAR

Type: Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_INTR_CLEAR register is used to clear the VPE interrupts. For VPE, only bit 0 is active, all other bits should be set to 0.

VPE_INTR_CLEAR

Bits	Name	Description
31:23	RESERVED_BITS31_23	
22:0	INTR_CLEAR	To clear the interrupt, make sure the interrupt has occurred, and then clear (0) this bit. Setting (1) a specific bit and holding at lest 2 clock cycles will clear the respective interrupt. A read from this register would indicate if the respective interrupt source is cleared (the bit is set (1)). So, at power up, it would read all 1's. Bit0: Display list 0 ROI done Bit1: Display list 1 ROI done Bit 2 : DMA_S transfer done Bit 3 : DMA_E transfer done Bit 4 : Display list 0 PPP terminal frame done Bit 5 : Display list 1 PPP terminal frame done Bit 6 : TV out DMA transfer frame done Bit 7 : TV encoder under run Bit 8 : Sync primary line (rd_ptr) interrupt Bit 9 : Sync secondary line (rd_ptr) interrupt Bit 10 : Sync external line (rd_ptr) interrupt Bit 11 : Display list 0 fetched done Bit 12 : Display list 1 fetched done Bit 13 : TV out frame start Bit 14 : DMA_P transfer done Bit 15 : LCDC vsync (or end of frame) interrupt Bit 16 : LCDC underflow Bit 17 : DMA_P line (wr_ptr) interrupt Bit 18 : DMA_S line (wr_ptr) interrupt Bit 19 : DMA_E line (wr_ptr) interrupt Bit 20 : DMA_P histogram interrupt Bit 21 : AXI bus error Bit 22 : AXI write data timeout

14.16.3 Operation control registers

0x05300030 VPE_PPP_DL0_START

Type: Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

A write to the VPE_PPP_DL0_START address register indicates to the VPE that there is a display list available to start processing at the VPE_PPP_DL0_ADDR pointer in command auto mode

(VPE_PPP_CMD_MODE register). In addition, a write to this register also starts PPP processing in the command direct program mode.

Note that bits 2:0 are always ignored as they are assumed to be 0.

VPE_PPP_DL0_START

Bits	Name	Description
31:0	DONT_CARE_BITS31_0	While a display list is being fetched or the PPP is still processing, any writes to this register are ignored.

0x05300034 VPE_PPP_DL1_START

Type: Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

A write to the VPE_PPP_DL1_START address register indicates to the VPE that there is a display list available to start processing at the VPE_PPP_DL1_ADDR pointer in command auto mode.

Note that bits 2:0 are always ignored as they are assumed to be 0.

VPE_PPP_DL1_START

Bits	Name	Description
31:0	DONT_CARE_BITS31_0	While a display list is being fetched or the PPP is still processing, any writes to this register are ignored.

0x05300038 VPE_DISPLAY_STATUS

Type: Read
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_DISPLAY_STATUS register is used to indicate the VPE display status.

VPE_DISPLAY_STATUS

Bits	Name	Description
31:10	RESERVED_BITS31_10	
9	AHBM_ACTIVE	AHBM interface is active..
8	DMA_E_ACTIVE	DMA_E channel is active.

VPE_DISPLAY_STATUS (cont.)

Bits	Name	Description
7	DMA_S_ACTIVE	DMA_S channel is active.
6	DMA_P_ACTIVE	DMA_P channel is active
5	LIST1_FETCHING	Display list 1 is being fetched or pending fetching. When a display list has been fetched, this bit is cleared (0).
4	LIST0_FETCHING	Display list 0 is being fetched or pending fetching. When a display list has been fetched, this bit is cleared (0).
3	TVOUT_ACTIVE	TV out DMA channel is active.
2	RESERVED_BIT2	
1	DISPLAY1_ACTIVE	Display list 1 processing in progress. When a display list is being processed or pending processing, this bit is set (1). When a display list has completed, this bit is cleared (0).
0	DISPLAY0_ACTIVE	Display list 0 processing in progress. When a display list is being processed or pending processing, this bit is set (1). When a display list has completed, this bit is cleared (0).

0x05300044 VPE_DMA_P_START

Type: Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_DMA_P_START register is used to start a primary DMA channel transfer.

VPE_DMA_P_START

Bits	Name	Description
31:0	DMA_P_START	A write to this register will start a DMA_P channel transfer if the output interface is not LCDC. If the output is LCDC, DMA transfer is started automatically every vsync and a write to this register has no effect.

0x05300048 VPE_DMA_S_START

Type: Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_DMA_S_START register is used to start a secondary DMA channel transfer.

VPE_DMA_S_START

Bits	Name	Description
31:0	DMA_S_START	A write to this register will start a DMA_S channel transfer.

0x0530004C VPE_DMA_E_START

Type: Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_DMA_E_START register is used to start a external DMA channel transfer.

VPE_DMA_E_START

Bits	Name	Description
31:0	DMA_E_START	A write to this register will start a DMA_E channel transfer.

0x05300070 VPE_HW_VERSION

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x010A_030A

The VPE_HW_VERSION register contains the major and minor versions and release number of the VPE core (p'q'_x'r', q-value is not contained).

VPE_HW_VERSION

Bits	Name	Description
31:24	MAJOR_VERSION	VPE core major version (x-value). 0x1: RESET_VAL
23:16	MINOR_VERSION	VPE core minor version (r-value). 0xA: RESET_VAL
15:8	RELEASE_PHASE	VPE core release phase (p-value). 0x3: RESET_VAL
7:0	REVISION	VPE core revision number (r-value). 0xA: RESET_VAL

0x05300074 VPE_SW_RESET

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_SW_RESET register is used to reset the individual pipes inside VPE.

VPE_SW_RESET

Bits	Name	Description
31:1	RESERVED_BITS31_1	
4	PPP_SW_RESET	Self cleared when reset sequence is completed. 0x1: PPP reset.
3	DMA_P_SW_RESET	0x1: DMA_P reset. (Only supported when DMA_P is in LCDC mode Self cleared when reset sequence is completed.)
2	DMA_S_SW_RESET	Self cleared when reset sequence is completed. 0x1: DMA_S reset. (Currently not supported)
1	DMA_E_SW_RESET	Self cleared when reset sequence is completed. 0x1: DMA_E reset. (Currently not supported)
0	DMA_TV_SW_RESET	Self cleared when reset sequence is completed. 0x1: DMA_TV reset.

0x05300078 VPE_AXI_RD_ARB_CONFIG

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0011_2924

The VPE_AXI_ARB_CONFIG register is used to change how many consecutive grants are allowed by the arbiter to each of the masters. Note that the only supported value for the weights is 4.

VPE_AXI_RD_ARB_CONFIG

Bits	Name	Description
31:21	RESERVED_BITS31_21	
20:18	MASTER7_WEIGHT	Number of consecutive grants (1 to 4) allowed to Master 7.
17:15	MASTER6_WEIGHT	Number of consecutive grants (1 to 4) allowed to Master 6.
14:12	MASTER5_WEIGHT	Number of consecutive grants (1 to 4) allowed to Master 5.
11:9	MASTER3_WEIGHT	Number of consecutive grants (1 to 4) allowed to Master 3.
8:6	MASTER2_WEIGHT	Number of consecutive grants (1 to 4) allowed to Master 2.

VPE_AXI_RD_ARB_CONFIG (cont.)

Bits	Name	Description
5:3	MASTER1_WEIGHT	Number of consecutive grant (1 to 4) allowed to Master 1.
2:0	MASTER0_WEIGHT	Number of consecutive grant (1 to 4) allowed to Master 0.

0x0530007C VPE_SEL_CLK_OR_HCLK_TEST_BUS

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_SEL_CLK_OR_HCLK_TEST_BUS register is used to select whether the VPE_TEST_BUS output is driven with selected VPE CLK or HCLK or LCDC DOT CLK domain test points.

VPE_SEL_CLK_OR_HCLK_TEST_BUS

Bits	Name	Description
31:2	RESERVED_BITS31_1	
1:0	SEL_CLKTB_OR_HCLKTB	0x0: axi_clk_domain 0x1: hclk_domain 0x2: dclk_domain

14.16.4 EBI2 registers

0x0530003C VPE_EBI2_LCD0

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_EBI2_LCD0 register stores the base address of a primary LCD panel connected to EBI2.

VPE_EBI2_LCD0

Bits	Name	Description
31:0	BASE_ADDR	This address is assumed to be at least half-word aligned, so bit [0] is ignored.

0x05300040 VPE_EBI2_LCD1

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_EBI2_LCD1 register stores the base address of a secondary LCD panel connected to EBI2.

VPE_EBI2_LCD1

Bits	Name	Description
31:0	BASE_ADDR	This address is assumed to be at least half-word aligned, so bit [0] is ignored.

0x05300050 VPE_EBI2_LCD0_YSTRIDE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_EBI2_LCD0_YSTRIDE register provides the y-stride for a primary panel connected to EBI2

VPE_EBI2_LCD0_YSTRIDE

Bits	Name	Description
31:15	RESERVED_BITS31_15	
14	EBI2_YSTRIDE_EN	In memory mapped devices, if this bit is set (1) it indicates that the display size (width) is larger than the ROI width. When set, ebi2_ystride is used to write to a memory-mapped panel at EBI2_LCD0_ADDR. This bit can also be set to write to an external memory device in EBI2 space for TEST PURPOSES.
13:0	EBI2_YSTRIDE	The ystride of the LCD device attached to ebi2 interface in bytes.

0x05300054 VPE_EBI2_LCD1_YSTRIDE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_EBI2_LCD1_YSTRIDE register provides the y-stride for a secondary panel connected to EBI2

VPE_EBI2_LCD1_YSTRIDE

Bits	Name	Description
31:15	RESERVED_BITS31_15	
14	EBI2_YSTRIDE_EN	In memory mapped devices, if this bit is set (1) it indicates that the display size (width) is larger than the ROI width. When set, ebi2_ystride is used to write to a memory-mapped panel at EBI2_LCD1_ADDR. This bit can also be set to write to an external memory device in EBI2 space for TEST PURPOSES.
13:0	EBI2_YSTRIDE	The ystride of the LCD device attached to ebi2 interface in bytes.

0x0530005C VPE_EBI2_PORTMAP_MODE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_EBI2_PORTMAP_MODE register is the EBI2 LCD portmap mode register.

VPE_EBI2_PORTMAP_MODE

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	LCD1_PORTMAP_MODE	When this bit is set (1), it indicates that the LCD1 on EBI2 requires a portmapped write. Otherwise, the writes to EBI2 use the regular memory map one starting from the base address.
0	LCD0_PORTMAP_MODE	When this bit is set (1), it indicates that the LCD0 on EBI2 requires a portmapped write. Otherwise, the writes to EBI2 use the regular memory map one starting from the base address.

14.16.5 MDDI parameter registers

0x05300090 VPE_MDDI_PARAM_WR_SEL

Type: Write Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_MDDI_PARAM_WR_SEL register is used to select a MDDI type for writing display parameters. It also writes CLIENTID to the selected register.

VPE_MDDI_PARAM_WR_SEL

Bits	Name	Description
31:16	MDDI_VID_CLIENTID	MDDI video client id parameter
15:2	RESERVED_BITS15_2	
1:0	MDDI_LD_PARAM_SEL	Parameter register write select: 0x0: Primary MDDI set 0x1: Secondary MDDI set 0x2: External MDDI set

0x05300094 VPE_MDDI_PARAM

Type: Write Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_MDDI_PARAM register writes the display parameters to the MDDI type selected by VPE_MDDI_PARAM_WR_SEL

VPE_MDDI_PARAM

Bits	Name	Description
31:16	MDDI_VID_FORMAT_DESC	MDDI video format description parameter
15:0	MDDI_PIX_DATA_ATTR	MDDI pixel data attribute parameter

0x05300098 VPE_MDDI_DATA_XFR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

This register is not used in VPE.

The VPE_MDDI_DATA_XFR register determines if the data would be sent out of MDDI every cycle or every alternate cycle

VPE_MDDI_DATA_XFR

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	MDDI_DATA_XFR_EXT	Note: For External MDDI 0x0: Alternate cycle data transfer (default) 0x1: Every cycle data transfer
0	MDDI_DATA_XFR_PRIM	Note: For Primary MDDI 0x0: Alternate cycle data transfer (default) 0x1: Every cycle data transfer.

14.16.6 Clock control registers

0x05300100 VPE_CGC_EN

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_FFFF

The VPE_CGC_EN register is used to enable the automatic functional clock gating mechanism inside the VPE, where the clocks are gated depending on the operation mode. Each bit is assigned to a gated clock tree. For maximum power saving, leave all bits at 1 during initialization. To force a block to have the clock on always regardless of the operation scenario, set the associated enable bit to 0.

VPE_CGC_EN

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15	MDDI	Enables auto functional gating on MDDI block core clocks.
14	AHB	Enables auto functional gating on AHB_M core clock.
13	AXI	Enables auto functional gating on AXI interface clocks.
12	LCDC	Enables auto functional gating on LCDC block core clock.
11	TV_OUT	Enables auto functional gating on TV_Out clock.
10	DMA_P	Enables auto functional gating on DMA_P clock.
9	DMA_S	Enables auto functional gating on DMA_S clock.
8	DMA_E	Enables auto functional gating on DMA_E clock.
7	DOWNSAMPLE	Enables auto functional gating on PPP Downsample clock.
6	DITHER	Enables auto functional gating on PPP Dither clock.
5	BLEND	Enables auto functional gating on PPP Blend clock.

VPE_CGC_EN (cont.)

Bits	Name	Description
4	ROTATE	Enables auto functional gating on PPP Rotate clock.
3	SCALE	Enables auto functional gating on PPP Scale clock.
2	CONVERT	Enables auto functional gating on PPP Convert clock.
1	UPSAMPLE	Enables auto functional gating on PPP Upsample/Deint clock.
0	PPP	Enables auto functional gating on PPP top clock.

14.16.7 PPP registers

0x05310000 VPE_PPP_DL0_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_DL0_ADDR register points to the beginning of the display list 0.

VPE_PPP_DL0_ADDR

Bits	Name	Description
31:0	BASE_ADDR	This address is assumed to be 64-bit word aligned, so bits [2:0] are ignored.

0x05310004 VPE_PPP_DL1_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_DL1_ADDR register points to the beginning of the display list 1.

VPE_PPP_DL1_ADDR

Bits	Name	Description
31:0	BASE_ADDR	This address is assumed to be 64-bit word aligned, so bits [2:0] are ignored.

0x05310008 VPE_PPP_CMD_STATUS

Type: Read
Clock: CC_VPE_CLK
Reset State: 0x0000_3FFF

The VPE_PPP_CMD_STATUS register indicates the internal status of the VPE PPP Command block.

VPE_PPP_CMD_STATUS

Bits	Name	Description
31:14	RESERVED_BITS31_14	
13	CLKCTL_IDLE	Indicates the clock control is idle in PPP.
12	TFETCH_IDLE	Indicates the tile fetch is idle in PPP.
11	DEINT_IDLE	Indicates the de-interlace is idle in PPP.
10	UPSAMPLE_IDLE	Indicates the upsample is idle in PPP.
9	CONVERT_IDLE	Indicates the convert is idle in PPP.
8	SCALE_IDLE	Indicates the scale is idle in PPP.
7	ROTATE_IDLE	Indicates the rotate is idle in PPP.
6	BLEND_IDLE	Indicates the blend is idle in PPP.
5	DITHER_IDLE	Indicates the dither is idle in PPP.
4	DOWNSAMPLE_IDLE	Indicates the downsample is idle in PPP.
3	PACKER_IDLE	Indicates the packer is idle in PPP.
2	DMA_WR_IDLE	Indicates the dma_wr is idle in PPP.
1	DMA_RD_IDLE	Indicates the dma_rd is idle in PPP.
0	DECODE_READY	When this bit is set (1), the command is done decoding.

0x05310010 VPE_PPP_PROFILE_EN

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_PROFILE_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	EN	Enable the ROI cycle counter for profiling

0x05310014 VPE_PPP_PROFILE_COUNT

Type: Read Only
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_PROFILE_COUNT

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:0	TOTAL_CYCLE	Total cycle count in a ROI, from new ROI to last pixel out of Packer (PPP goes back to Idle)

0x05310060 VPE_PPP_CMD_MODE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0001

The VPE_PPP_CMD_MODE register is the VPE command list fetch mode register. When in the direct program mode, the peripheral bus interface is used to program all of the PPP registers directly. Writing to the PPP_DL0_START register in this case after all the control is set, starts the ROI processing.

When in the auto mode, the VPE PPP Command block will fetch the display list from the addresses in VPE_PPP_DLn_ADDR, after a respective VPE_PPP_DLn_START register write.

VPE_PPP_CMD_MODE

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	MODE_BIT	0x0: AUTO 0x1: DIRECT PROGRAM

0x05310064 VPE_PPP_DL0_SIZE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_DL0_SIZE register specifies the number of register writes that Display List 0 image has, which is the size to be fetched.

VPE_PPP_DL0_SIZE

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:0	REG_COUNT	Total number of register writes in the Display List, coincide with number of 64-bit words in the image.

0x05310068 VPE_PPP_DL1_SIZE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

The VPE_PPP_DL1_SIZE register specifies the number of register writes that Display List 1 image has, which is the size to be fetched.

VPE_PPP_DL1_SIZE

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:0	REG_COUNT	Total number of register writes in the Display List, coincide with number of 64-bit words in the image.

0x05310108 VPE_PPP_SRC_SIZE

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0020_0020

VPE_PPP_SRC_SIZE

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:16	SRC_H	Height of input ROI image that needs to be fetched in pixel, including any amount of over-fetching/under-fetching necessary.
15:13	RESERVED_BITS15_13	
12:0	SRC_W	Width of input ROI image that needs to be fetched in pixel, including any amount of over-fetching/under-fetching necessary.

0x0531010C VPE_PPP_SRCP0_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_SRCP0_ADDR

Bits	Name	Description
31:0	SRCP0_ADDR	Base byte address of the Image's single interleave color plane or the luma component plane in pseudo-planar format.

0x05310110 VPE_PPP_SRCP1_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_SRCP1_ADDR

Bits	Name	Description
31:0	SRCP1_ADDR	Base byte address of the Image's chroma plane in pseudo planar format.

0x05310118 VPE_PPP_SRCP3_ADDR

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_SRCP3_ADDR

Bits	Name	Description
31:0	SRCP3_ADDR	Base byte address of the Image's component plane 3 (alpha), used in pseudo planar + alpha format.

0x0531011C VPE_PPP_SRC_YSTRIDE1

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0080

VPE_PPP_SRC_YSTRIDE1

Bits	Name	Description
31	RESERVED_BIT31	
30:16	SRCP1_YSTRIDE	Plane 1 y stride in bytes.
15	RESERVED_BIT15	
14:0	SRCP0_YSTRIDE	Plane 0 y stride in bytes.

0x05310120 VPE_PPP_SRC_YSTRIDE2

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0000_0000

VPE_PPP_SRC_YSTRIDE2

Bits	Name	Description
31	RESERVED_BIT31	
30:16	SRCP3_YSTRIDE	Plane 3 y stride in bytes.
15:0	RESERVED_BITS15_0	

0x05310124 VPE_PPP_SRC_FORMAT

Type: Read/Write
Clock: CC_VPE_CLK
Reset State: 0x0002_67FF

VPE_PPP_SRC_FORMAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21	WMV9_MODE	0x1: WMV9 mode on
20:19	FETCH_PLANES	Determines the number of planes to fetch: 0x0: Interleaved 0x2: pseudo planar
18	UNPACK_ALIGN	0x0: To LSB 0x1: To MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight

VPE_PPP_SRC_FORMAT (cont.)

Bits	Name	Description
16:13	UNPACK_COUNT	Valid unpacking pattern count: 0 = 1 component, 1 = 2 components, ..., 15 = 16 components. Unpacking pattern only applies to the interleaved plane (chroma plane in pseudo-planar).
12:11	RESERVED_BITS12_11	Reserved for backward compatibility.
10:9	SRC_BPP	Effective source byte per pixel: 0 = 1 byte, 1 = 2 bytes, 2 = 3 bytes, 3 = 4 bytes. This is only used when unpacking the interleaved plane.
8	SRCC3_EN	0x1: Source has alpha
7:6	SRCC3_BITS	Number of bits for component 3 (alpha) input, this is not used for dither: 0 = 1 bit, 1 = 4 bits, 2 = 6 bits, 3 = 8 bits.
5:4	SRCC2_BITS	Number of bits for component 2 (R / Cr) input: 0 = 4 bits, 1 = 5 bits, 2 = 6 bits, 3 = 8 bits.
