LM80-P0598-5 Rev. C

Revision history

Version	Date	Description
A	June 30, 2015	Initial release
B	August 25, 2015	Chapter 1: Changed name of the chipset Chapter 5: Modified CLK_BRANCH_ENA description in three places to remove reference to it being votable All: Removed references to documents that are not available to the public
C	February 8, 2016	Chapter 1: Removed Section 1.7 with architecture diagram Chapter 14: • Removed Sections 14.3 to 14.16 • Removed Sections 14.20 to 14.22 • Removed Section 14.26 to 14.32 Table 1-3 Bases in Address Order: • Removed row for OXILI_BASE • Removed row for VFE_BASE • Removed row for CSID_BASE Table 14-2 Multi_Media_Sub_System Bases: • Removed base names where OXILI_BASE was the parent • Removed base names where VFE_BASE was the parent • Removed base names where CSID_BASE was the parent Updated TOC, LOT, and index accordingly

1 Introduction

1.1 Introduction

Customers expect their computing device to perform like a multimedia device, in addition to operating as a connectivity device. However, demand continues for increased battery life and smaller form factors. Embedded devices must continue to integrate increasingly complex functions and support more multimedia functionality, while maintaining performance and limiting board space, power consumption, and cost.

These demands are met by the Qualcomm® Snapdragon™ 600 Processor APQ8064 chipset. With its quad Krait applications processors, the 600 Processor APQ8064 device expands mass-market chipset capabilities further by making rich multimedia features accessible to more customers and end users in both developed and developing countries.

The APQ8064 device's high-level of integration significantly reduces the bill of material (BOM) to deliver board-area savings. The cost-efficient 28 nm CMOS fabrication technology significantly improves power efficiency for longer wireless connectivity, while enhancing the user's multimedia experience.

1.2 Overview

This document details the APQ8064 ARM-accessible registers. This chapter provides a register overview, along with the definitions and assumptions used. This chapter also includes a base address memory table, providing most of the major base addresses for the APQ8064 chipset. Entries in this base memory table provide links to the appropriate chapters where the register definitions at each base address are provided, in addition to the actual memory address and the top level functional area that the base address is in. See Register base address summary.

The remaining chapters are organized by core and provide detailed register information. Each core's chapter includes one or more major sections listing the core's ARM registers, as well as the address for each register, its bit assignments and bit settings. The chapter also provides an overview and detailed information on the functionality of each register. Each chapter overview starts with a more detailed base address memory table, with links to the sections within that

chapter for register definitions. In addition, the base memory addresses are provided, along with a a reference to the parent base address.

NOTE Addresses in this document are actual addresses in the total memory map, so the registers address is exactly where that register lives in memory.

NOTE The register names in this document are the complete register names with any prefixes included. The full names account for the multiple instances of register groups. Where multiple instances of register groups occur, the register names and addresses for each instance are included in this document.

This document can be used in several ways:

- If the user has the register address and wants detailed register information, the Find function of the PDF can be used to specify the address and locate the register information.
- The index at the end of the document provides an alphabetized list of all register names, with links to the appropriate register information.
- The Register Base Address Summary table in this section can be used to locate the registers at a base address location. See Register base address summary.
- The PDF bookmarks can be used to locate the registers for a specific group of registers represented by a PDF bookmark.

1.3 Definitions/guidelines

Table 1-1 offers guidance in interpreting the register definitions and covers some of the issues and assumptions made throughout this book.

Table 1-1 Register definitions

	Guidelines
Endian byte order	Endian is a term that defines the byte order to store a sequence of bytes in memory, either MSB first (big-endian) or LSB first (little endian). Hardware coding defines devide registers; in each 32-bit word, MSB = 31, LSB = 0. The chips support only little endian addressing. In little endian mode, the first byte is bits 7:0, and the fourth byte is bits 31:24.
Word addressing	All registers are word-accessible. Assume the ARM convention: a byte, 8 bits; a half-word, 16 bits; a word, 32 bits. All accesses are expected to be word size. The ARM can do byte and half-word reads, since hardware treats a read as a word access. Individual bytes accesses to a read register that triggers a hardware event will trigger an event for each read performed.
Active bit state	Unless stated otherwise, all boolean flags are active-high in register descriptions. Use a value of “1” to enable a function or indicate an event and a value of “0” do the opposite. Active-low flags are explicitly specified in the register descriptions. For example, if the BOOGA_ENA bit is set ‘1,’ it enables BOOGA mode; if cleared ‘0,’ it disables the mode.

Table 1-1 Register definitions

	Guidelines
Unused bits/ words	In the register map many bits are marked “RESERVED” or unused. Ignore undefined bits in readable registers, software cannot assume a ‘0’ upon a read. Write undefined bits with ‘0’s’ in writable registers. Bits marked “IGNORED” can be written with any desired value; in some cases this is convenient to software. Device memory and register addressing simplifies implementation and allows expansion. Many holes exist in the address space. Avoid accesses to undefined memory locations, they can cause unpredictable behavior.
Reset state	A register’s reset state is ‘unknown’ unless stated otherwise. It is better to not use a reset in hardware; it conserves area and simplifies coding and testing. Bits with a reset will be noted in the register descriptions. Assume that when a core comes out of reset, all of its programmed register bits are either in their reset state (where defined) or unknown. Do not expect a previously programmed value to be maintained.

1.4 Register categories

Most registers can be categorized using one of the types listed in Table 1-2. These categories are defined here to simplify the software interface.

Table 1-2 Register categories

	Guidelines
Write command	Command registers are always write-only, typically there is no meaningful read-back value. Use command registers to trigger events in the hardware. Often these registers serve a single purpose. You write a bit pattern to specify the desired event. Multiple events can be combined; a register may have multiple 1-bit fields, each field triggering a hardware action, such as in an interrupt clear register. A command register can also contain encoded command fields and other data fields. The bit pattern written to it is transient; i.e., there is no need to first write a value to trigger the event and another value to stop the event. If this is not the case, it will be so-stated in the register definition.
Read command	These registers return the desired data, but may also trigger a hardware event every time they are read. Often they are used to read out memory locations where each read triggers a read of the next memory location.
Control	Control registers configure the hardware to operate in a specific mode. These registers are either static or take effect at a specific time boundary (such as the next 256 chip boundary). Control bits are registered in hardware and may be readable.
Status	Status registers are read-only and reflect the current state of the hardware. There may be restrictions on when the status words can be reliably read, this ensures a self-consistent value is available. Any restrictions will be indicated in the register descriptions.
State	State registers are read/writable by the processor but also change state due to hardware events. For software to reliably read or update a state register, special “rules of engagement” may be needed to read out a self-consistent value or avoid collisions for updates by software and hardware. Each state register has these rules described in detail.
Abbreviations	
W	write register
R	read register
C	command register
X	unknown after power-on

1.6 Register definitions

In the register descriptions, the addresses shown are from the perspective of the ARM.

All non-command writable registers may have a reset condition as well as a time when the write takes effect. By default, writable registers do not have a reset condition, and a value written takes effect immediately. Registers not following the default behavior use the notation below:

Reset State: The value this register contains following a reset.

Each register also specifies the clock regime it is on:

Clock: <main regime>_<local regime>.

This information can be used by software to determine the main and/or local regime that a register is part of. Reads and writes to registers where the clock regime is disabled are not supported. The chip will not hang-up, but there is no guarantee the access will take place. Software can find where this may be an issue by enabling aborts for these types of accesses.

NOTE Register bit field values are represented in the register bit field Description table cells in multiple ways in this document. See the details below.

Register bit field values may be represented in the register bit field Description table cells in several ways. For example, the values for a 3-bit field with the middle bit on and the other two bits off is documented in the following ways in parts of this document:

- 0b010
- 3’b010
- 0x2
- 010:
- 010 :

Be aware of this when examining register bit fields. For larger bit fields, 0h constants also occasionally exist.

2 Chip Core Top Peripherals Registers

2. 2 XPU Registers (0x17300000 CFPB2_XPU_CFG_BASE)

This section contains Chip FPB 2 XPU registers.

0x17300000+4*n CFPB2_XPU_APU_RGn_ACR, n=[0..20]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 00, i.e., a single VMID, full access vs. no access permission type APU. These registers include a single 5 bit "owner" VMID field.

CFPB2_XPU_APU_RGn_ACR

Bits	Name	Description
31:26	RESERVED31_26	Reserved.
25	RESERVED25	Reserved
24	RESERVED24	Reserved
23:21	RESERVED23_21	Reserved
20:16	RESERVED20_16	Reserved
15:10	RESERVED15_10	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | APU_APU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a "valid" bit for the RWVMID field
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies "owner" VMID with full read/write access to the registers in the associated resource group.

0x17300F80 CFPB2_XPU_APU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

APU Configuration Register: This register includes fields governing various APU behaviors.

CFPB2_XPU_APU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set APU_ESR. APU_EAR and APU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set APU_ESR. APU_EAR and APU_ESYNR0 updated with address and syndrome of error.
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x17300F84 CFPB2_XPU_APU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

CFPB2_XPU_APU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x17300F88 CFPB2_XPU_APU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the APU_ESYNRn registers, which are merely the "syndrome" of an error indicated by APU_ESR.

CFPB2_XPU_APU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x17300F8C CFPB2_XPU_APU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

CFPB2_XPU_APU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x17300F90 CFPB2_XPU_APU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

CFPB2_XPU_APU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x17300F94 CFPB2_XPU_APU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

CFPB2_XPU_APU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x17300FF4 CFPB2_XPU_APU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

CFPB2_XPU_APU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved

CFPB2_XPU_APU_REV (cont.)

Bits	Name	Description
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x17300FF8 CFPB2_XPU_APU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x00001014

APU ID Register: Read-only register that defines various configuration attributes of the APU instance.

CFPB2_XPU_APU_IDR

Bits	Name	Description
31:29	RESERVED31_21	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.

CFPB2_XPU_APU_IDR (cont.)

Bits	Name	Description
9	RESERVED9	Reserved
8:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

2.3 CFPB 2 Config (System FPB) Registers (0x17400000 CSYSFPB2_BASE)

This section contains System FPB 2 registers.

0x17400000 CSYSFPB2_CFPB2_CTRL_STATUS

Type: Read/Write
Clock: CC_CFPB2_CLK
Reset State: 0x00000000

This register is a general configuration register.

CSYSFPB2_CFPB2_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0)
11	RPM_PROC_IRQ_EN	SW: RW, HW: R RPMProcInterruptEnable When set, the RPM Processor receives an interrupt whenever ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	APPS_PROC_IRQ_EN	SW: RW, HW: R AppsProcInterruptEnable When set, the Application Processor receives an interrupt whenever ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

CSYSFPB2_CFPB2_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x5: Select the S0_M0 ahb2ahb bridge test bus. 0x6: Select the S1_M1 ahb2ahb bridge test bus. 0x7: Select the M0 ahb2ahb bridge test bus. 0x8: Select the M1 ahb2ahb bridge test bus. 0x9: Select the M2 ahb2ahb bridge test bus. 0xA: Select the M3 ahb2ahb bridge test bus. 0xB: Select the M4 ahb2ahb bridge test bus. 0xC: Select the M5 ahb2ahb bridge test bus. 0xD: Select the M6 ahb2ahb bridge test bus. 0xE: Select the M7 ahb2ahb bridge test bus. 0xF: Select the M8 ahb2ahb bridge test bus. 0x10: Select the M9 ahb2ahb bridge test bus. 0x11: Select the M10 ahb2ahb bridge test bus. 0x12: Select the M11 ahb2ahb bridge test bus. 0x13: Select the M12 ahb2ahb bridge test bus. 0x14: Select the M13 ahb2ahb bridge test bus. 0x15: Select the M14 ahb2ahb bridge test bus. 0x16: Select the M15 ahb2ahb bridge test bus.

0x17400004+ 0x4*a CSYSFPB2_CFPB2_AHB2AHB_CFG_Ma, a=[0..0]

Type: Read/Write
Clock: CC_CFPB2_CLK
Reset State: 0x00000009

The CFPB2_AHB2AHB_CFG_Ma register is to configure the AHB2AHB bridge of master Ma. The AHB2AHB bridge is instantiated if the AHB interface is async (Generic: MASTER_ASYNC_IF(a) = ’1’). Otherwise this register is reserved.

CSYSFPB2_CFPB2_AHB2AHB_CFG_Ma

Bits	Name	Description
30:6	RESERVED_BITS30_6	

CSYSFPB2_CFPB2_AHB2AHB_CFG_Ma (cont.)

Bits	Name	Description
5:4	M_AHB2AHB_TEST_EN	SW: RW, HW: R Test enable for the Sa lite_bridge. Power up value is 00 0x0: DISABLED 0x1: Select slave side test signals 0x2: Select master side test signals 0x3: RESERVED_PROGRAMMING
3	M_WPOST_EN	SW: RW, HW: R MaWritePostEnable When set (1), the ahb2ahb bridge will support posting of write data. When cleared (0), each write request must complete across the bus before the next is accepted. Power up value is set (1)
2	M_HALT_ACK	SW:R, HW:W Indicates the Ma acknowledgement of halt_req asserted by software. Power up value is clear (0).
1	M_HALT_REQ	SW:RW, HW:R Software should write to this register to request the Ma lite_bridge master to cleanly halt. Power up value is clear (0).
0	M_IDLE	SW:R, HW:W Indicates that the Ma lite bridge master FSM is in IDLE state. Power up value is set (1).

0x17400044 CSYSFPB2_CFPB2_PORT_EN

Type: Read/Write
Clock: CC_CFPB2_CLK
Reset State: 0xFFFFFFFF

This register is the CFPB2 master port enable register.

CSYSFPB2_CFPB2_PORT_EN

Bits	Name	Description
31:1	RESERVED_BIT31_1	Only one master port is used.
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

0x17400050 CSYSFPB2_CFPB2_ERROR_STAT

Type: Read/Write
Clock: CC_CFPB2_CLK
Reset State: 0x00000000

This register is the bus error status register.

CSYSFPB2_CFPB2_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the channel ID that caused the detected error when CID is valid for the master of the access. If not, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Master0 0x1: Master1 0x2: Master2 0x3: Master3 0x4: Master4 0x5: Master5 0x6: Master6 0x7: Master7 0x8: Master8 0x9: Master9 0xA: Master10 0xB: Master11 0xC: Master12 0xD: Master13 0xE: Master14 0xF: Master15
11:10	RESERVED_BITS11_10	

CSYSFPB2_CFPB2_ERROR_STAT (cont.)

Bits	Name	Description
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x17400054 CSYSFPB2_CFPB2_ERROR_ADDR

Type: Read
Clock: CC_CFPB2_CLK
Reset State: 0x00000000

This register contains the bus error address.

CSYSFPB2_CFPB2_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x1740005C CSYSFPB2_CFPB2_XPU_ACR

Type: Read/Write
Clock: CC_CFPB2_CLK
Reset State: 0xFFFFFFFF

The CFPB2_XPU_ACR register is the CFPB2 Access Control Register for configuring register protection.

CSYSFPB2_CFPB2_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R CFPB2 XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the CFPB2 configure space, including this register itself. Power up value is set (1)

0x17400060 CSYSFPB2_CFPB2_HW_CLK_GATING_CFG

Type: Read/Write
Clock: CC_CFPB2_CLK
Reset State: 0x00000000

The CFPB2_HW_CLK_GATING_CFG register is for hardware clock gating configuration.

CSYSFPB2_CFPB2_HW_CLK_GATING_CFG

Bits	Name	Description
31:11	RESERVED_BITS31_11	

CSYSFPB2_CFPB2_HW_CLK_GATING_CFG (cont.)

Bits	Name	Description
10:4	HYSTERESIS_CNT_SW	SW: RW, HW: R Hysteresis Counter Value This field is used by SW to set the hysteresis counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)
3:0	WAKE_CNT_SW	SW: RW, HW: R Wakeup Counter Value This field is used by SW to set the wakeup counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)

2.4 USB_OTG_HS registers (0x18000000 USB1_FS_BASE)

This section contains FS USB OTG HS registers.

2.4.1 Identification registers

Identification registers are used to declare the slave interface presence and include a table of the hardware configuration parameter.

0x18000000 FS1_USB_OTG_HS_ID

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0042FA05

The USB_OTG_HS_ID register is the identification register. It provides a simple way to determine if the USB-HS USB 2.0 core is provided in the system. The ID register identifies the USB-HS USB 2.0 core and its revision.

FS1_USB_OTG_HS_ID

Bits	Name	Description
31:24	RESERVED_BITS31_24	These bits are reserved and should be set to zero.
23:16	REVISON_7_0	This field contains the revision number of the core - 0x42.
15:8	NID_5_0	This field contains the complement version of ID[7:0] - 0xFA.
7:0	ID_5_0	This field is the configuration number. This number is set to 0x05 and indicates that the peripheral is the USB-HS USB 2.0 core.

0x18000004 FS1_USB_OTG_HS_HWGENERAL

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x5C2

The USB_OTG_HS_HWGENERAL register contains the general hardware parameters.

FS1_USB_OTG_HS_HWGENERAL

Bits	Name	Description
31:10	RESERVED_BITS31_10	Clear (0) these bits.
9	SM	VUSB_HS_PHY_SERIAL = 2
8:6	PHYM	VUSB_HS_PHY_TYPE = 7
5:4	PHYW	VUSB_HS_PHY16_8 = 0

FS1_USB_OTG_HS_HWGENERAL (cont.)

Bits	Name	Description
3	BWT	This bit is reserved for internal testing = 0
2:1	CLCK	VUSB_HS_CLOCK_CONFIGURATION = 1
0	RT	VUSB_HS_RESET_TYPE = 0

0x18000008 FS1_USB_OTG_HS_HWHOST

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x10020001

The USB_OTG_HS_HWHOST register contains the host hardware parameters.

FS1_USB_OTG_HS_HWHOST

Bits	Name	Description
31:24	TTPER	VUSB_HS_TT_PERIODIC_CONTEXTS
23:16	TTASY	VUSB_HS_TT_ASYNC_CONTEXTS
15:4	RESERVED_BITS15_4	Clear (0) these bits.
3:1	NPORT	VUSB_HS_NUM_PORT-1
0	HC	VUSB_HS_HOST

0x1800000C FS1_USB_OTG_HS_HWDEVICE

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000021

The USB_OTG_HS_HWDEVICE register contains the device hardware parameters.

FS1_USB_OTG_HS_HWDEVICE

Bits	Name	Description
31:6	RESERVED_BITS31_6	
5:1	DEVEP	VUSB_HS_DEV_EP
0	DC	Device capable; [VUSB_HS_DEV/=0]

0x18000010 FS1_USB_OTG_HS_HWTXBUF

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x80070B08

The USB_OTG_HS_HWTXBUF register contains the Tx buffer hardware parameters.

FS1_USB_OTG_HS_HWTXBUF

Bits	Name	Description
31	TXLCR	This bit is fixed to 1'b1 so that the local context register's are included in the design. This means that the DMA context is implemented in FlipFlops.
30:24	RESERVED_BITS30_24	Clear (0) these bits.
23:16	TXCHANADD	VUSB_HS_TX_CHAN_ADD - Defines the number of address lines needed per Endpoint per the TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
15:8	TXADD	VUSB_HS_TX_ADD - Defines the number of address lines needed per the entire TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
7:0	TXBURST	VUSB_HS_TX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the TX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst lengthis will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x18000014 FS1_USB_OTG_HS_HWRXBUF

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000808

The USB_OTG_HS_HWRXBUF register contains the Rx buffer hardware parameters.

FS1_USB_OTG_HS_HWRXBUF

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits).
15:8	RX_ADD	VUSB_HS_RX_ADD - Defines the number of address lines needed per the entire RX latency buffer. It's reset value is taken from a GENERIC value passed to the core.

FS1_USB_OTG_HS_HWRXBUF (cont.)

Bits	Name	Description
7:0	RX_BURST	VUSB_HS_RX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the RX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst lengthis will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x18000040+4*n FS1_USB_OTG_HS_SCRATCH_RAMn, n=[0..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

USB_OTG_HS_SCRATCH_RAMn registers are 16 32bit scratch registers.Required for passing USB software information between different images.

FS1_USB_OTG_HS_SCRATCH_RAMn

Bits	Name	Description
31:0	SCRATCH_REGISTER	32 bit scratch register

2.4.2 Device/host timer registers

The host/device controller drivers can measure time related activities using these timer registers.

NOTE These registers are not part of the standard EHCI controller.

0x18000080 FS1_USB_OTG_HS_GPTIMER0LD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER0LD register is the general purpose timer 0 load register. This register contains the timer duration or load value. See the GPTIMER0CTRL register for a description of the timer functions.

FS1_USB_OTG_HS_GPTIMER0LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

FS1_USB_OTG_HS_GPTIMER0LD (cont.)

Bits	Name	Description
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFFF or 16.777215 seconds

0x18000084 FS1_USB_OTG_HS_GPTIMER0CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER0CTRL register is the general purpose timer 0 control register. This register contains the control for the timer and a data field can be queried to determine the running count value. This timer has a granularity of 1 ms and can be programmed to a little over 16 seconds. There are two modes supported by this timer: the first is a one-shot and the second is a looped count, which is described in the register table below. When the timer counter value transitions to zero, an interrupt can be generated though the use of the timer interrupts in the USBTS and USBINTR registers.

FS1_USB_OTG_HS_GPTIMER0CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.

FS1_USB_OTG_HS_GPTIMER0CTRL (cont.)

Bits	Name	Description
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

0x18000088 FS1_USB_OTG_HS_GPTIMER1LD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER1LD register is the general purpose timer 1 control register. This register contains the timer duration or load value. See the GPTIMER0LD register for a description of the timer functions.

FS1_USB_OTG_HS_GPTIMER1LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFFF or 16.777215 seconds.

0x1800008C FS1_USB_OTG_HS_GPTIMER1CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_GPTIMER1CTRL register is the general purpose timer 1 control register. See the description of the USB_OTG_HS_GPTIMER0CTRL register for details about this register.

FS1_USB_OTG_HS_GPTIMER1CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

2.4.3 Wrapper operational registers

0x18000090 FS1_USB_OTG_HS_AHB_BURST

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_AHB_BURST register determines the AHB master mode of the USB HS Core.

NOTE If the USB_OTG_HS_AHB_MODE is configured to be 0x0 (the AHB Transactor is used), this register must be 0x0 as well, otherwise the AHB Master bus behavior is undefined. Use values other than 0x0 only if setting USB_OTG_HS_AHB_MODE to 0x1.

FS1_USB_OTG_HS_AHB_BURST

Bits	Name	Description
31:3	RESERVED_BITS31_3	Should be set to zero.
2:0	AHB_BURST	AMBA AHB BURST. This is a r/w field that selects the following options for the m_hburst signal of the AMBA master interface: In all cases where the unspecified length burst is allowed, singles access may also occur, this is mostly true when the transaction is not 32-bit aligned. Two consecutive single accesses should not happen. When a INCRx burst size is selected and the transfer is not multiple of the INCRx burst, the burst is decomposed in the different ways. With AHBBRST[2] = 1, the smaller bursts will be unspecified length. with AHBBRST[2] = 0, the smaller bursts will be smaller INCRx or singles. For example, lets say that it's required at a given time, to transfer 22 words of information, for the following values of AHBBRST the master sequence will be: This field after reset is set to a default value that can be configured in the file vusb_hs_cfg.vhd. The AHBBRST field is only used if the AMBA-AHB system interface has been selected. It has no effect for cores featuring BVCI interface. In the later case the read will return zeros. When this field is different from zero, the value of the fields TXBURST /RXBURST in register BURSTSIZE 160h, will be ignored by the controller. Internally the BURSTSIZE will be set to the value of the INCRx AMBA burst. Since this has a direct relation with the burst sizes you must be careful with AHB burst selected. Although the TXBURST / RXBURST are bypassed, this register can still be written / read with no effect, while the AHBBRST field is non-zero. 0x0: INCR burst of unspecified length 0x1: INCR4, non-multiple transfers of INCR4 will be decomposed into singles 0x2: INCR8, non-multiple transfers of INCR8, will be decomposed into INCR4 or singles 0x3: INCR16, non-multiple transfers of INCR16, will be decomposed into INCR8, INCR4 or singles 0x4: This value is reserved and should not be used 0x5: INCR4, non-multiple transfers of INCR4 will be decomposed into smaller unspecified length bursts 0x6: INCR8, non-multiple transfers of INCR8 will be decomposed into smaller unspecified length bursts 0x7: INCR16, non-multiple transfers of INCR16 will be decomposed into smaller unspecified length bursts 0x5: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+ INCR unspec. length 0x6: INCR8+INCR8+INCR4+ INCR unspec. length 0x7: INCR16+INCR4+ INCR unspec. length 0x1: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+SINGLE+SINGLE 0x2: INCR8+INCR8+INCR4+SINGLE+SINGLE 0x3: INCR16+INCR4+SINGLE+SINGLE

0x18000094 FS1_USB_OTG_HS_XTOR_STS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_XTOR_STS register is currently a placeholder for future status bits from the AHB2AHB Transactor.

FS1_USB_OTG_HS_XTOR_STS

Bits	Name	Description
31:2	RESERVED_BITS31_2	Not used currently.
1	GRANT_STOLEN	Reports whether the arbiter removed the hgrant signal prior to completing a transaction. This is currently supported in WRITES ONLY. This bit can be cleared by writing a ’1’ to the GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register. To enable this bit again, write a ’0’ to he GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register.
0	RESERVED_BIT0	Not used currently.

0x18000098 FS1_USB_OTG_HS_AHB_MODE

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1

FS1_USB_OTG_HS_AHB_MODE

Bits	Name	Description
31	ASYNC_BRIDGES_BYPASS	Default is ’0’. When ’0’ the asynchronous bridge on the master AHB interface issued. When ’1’, it is bypassed. The bridge on the slave AHB is always used.
30:5	RESERVED_BITS30_5	Not used currently.
4	INCR_OVERRIDE	Valid only if the Transactor is bypassed: When ’1’, all INCR bursts from the USB Core will be internally transformed into SINGLE transfers. When ’0’, if the USB Core issues an INCR burst, it will propagate to the external master AHB port.

FS1_USB_OTG_HS_AHB_MODE (cont.)

Bits	Name	Description
3:2	HPROT_MODE	When ’00’ the HPROT signal out of the USB Wrapper is ’0001’, and all transactions are non-posted. When ’01’ the HPROT signal out of the USB Wrapper is ’0101’, and all transactions are posted. When ’10’ the HPROT signal out of the USB Wrapper alternates according to the context of the AHB bus access. Control structures are non-posted while data transfer is posted. When ’11’, reserved value, but currently maps to non-posted (same as ’00’).
1	GRANT_STOLEN_CLEAR	Clears the grant stolen field of the USB_OTG_HS_XTOR_STS register. To enable this bit again, write ’0’ after clearing the GRANT_STOLEN (’1’).
0	XTOR_BYPASS	When this bit is set (1), the AHB Transactor is bypassed, and the USB HS Core’s AHB Master interface is directly connected to the AHB system. In this case, the USB_OTG_HS_AHB_BURST register value will determine the bus characteristics. When this bit is reset (0), the AHB Transactor is used to connect the USB HS Core to the AHB system.

0x1800009C FS1_USB_OTG_HS_GEN_CONFIG

Type: Read/write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXX0830

The USB_OTG_HS_GEN_CONFIG register is used to configure various features that have been added to the HS USB Core.

FS1_USB_OTG_HS_GEN_CONFIG

Bits	Name	Description
31:16	USB_OTG_HS_HW_QVERSION	HW revision of the USB OTG HS core. This version changes with every official release of USB_OTG_HS core.
15	SYS_CLK_SW_EN	This bit is applicable only in SPS Device mode. When this bit is set then USB core always voting for USB_SYSTEM_CLK. Default value is 0 - USB core doesn’t request USB_SYSTEM_CLK when in Low Power Mode.
14	TESTMUX_SEL_4	See TESTMUX_SEL_3_0 the first 4 bits of this register.
13	USB_BAM_DISABLE	This bit disables the bam logic inside the USB and makes him work in Legacy mode.
12	DMA_HPROT_CTRL	When this bit is set Link Controller always does non-posted dQH writes.
11	ISO_FIX_EN	This bit enables fix for Isochronous bug in CI core (CR--0000135251).

FS1_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
10	DSC_PE_RST_EN	This bit enables an automatic reset of Device PE State Machine on disconnection event when operating as device. This reset is a HW fix for CR-000940.
9	HOST_SIM_TIMERS_EN_SUSP	When this bit is set (1), the timers used for the USB suspend process short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB suspend process are according to the USB specification.
8	HOST_SIM_TIMERS_EN_STD	When this bit is set (1), the timers used for the USB reset on the ULPI are short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB reset on the ULPI are according to the USB specification.
7	PE_RX_BUF_PENDING_EN	This is only valid in Device Mode. Setting this bit will cause to store a Transaction Status Tag in the Pending register instead of RX Buffer if the RX Buffer is full. The Tag will move from Pending register to RX Buffer as soon as it becomes not full.
6	STREAM_RX_BYPASS_ENABLE	This is only valid in Device Mode. If SDIS bit is set (bit 4 of USB_OTG_HS_USBMODE (0x1A8)), i.e., streaming mode is disabled, setting this bit will cause the RX traffic to override the SDIS bit, and to receive in streaming mode. TX will still be in non-streaming mode.
5	ULPI_SERIAL_EN	This bit must be set to enable operation of ULPI Serial FS/LS mode. Default state is ’1’ - ULPI Serial mode is supported.
4	PE_DP_TXFIFO_IDLE_FORCE	This is only valid in Device Mode. Setting this bit to ’1’ forces the dp_tx_fifo_cmd_dev to be equal to PE_DP_TXFIFO_IDLE when Device PE state machine in REPORT_NAK state and the RX Buffer is full. This bit is used to enable fix of CR-001612. Reset value is ’1’.

FS1_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
3:0	TESTMUX_SEL_3_0	With TESTMUX_SEL_4 select one of the following test buses: Value 00001 Key state machines 01101 hsic_test_bus1 01110 hsic_test_bus2 10000 dma_eng_3 dma_dev_sm_2 10001 dma_eng_4 dma_traf others zeros 0x2: dma_eng_0 dma_dev_sm_1 0x3: dma_eng_1 dma_context 0x4: dma_eng_2 dma_mem_arb 0x5: prot_eng_0 0x6: prot_eng_1 0x7: prot_eng_2 0x8: port_ctrl_0 0x9: port_ctrl_1 0xA: tx_buffer 0xB: rx_buffer 0xC: otg

0x180000A0 FS1_USB_OTG_HS_GEN_CONFIG_2

Type: Read/write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0001F60

Register for the chicken bits. The USB_OTG_HS_GEN_CONFIG_2 register is used to configure various features that have been added to the HS USB Core. By default, all chicken bits are off and the fix is applicable.

FS1_USB_OTG_HS_GEN_CONFIG_2

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	LINESTATE_DIFF_WAKEUP_EN	chicken bit for CR-0000155486.when this bit is set the USB enables the HW fix for Race condition between the attempt to enter LPM and USB bus reset.Default value is 1.
11	ULPI_LPM_PEND_EN	chicken bit for CR-0000153486.when this bit is set the USB enables the HW fix for Function Control and LPM race condition.Default value is 1.
10	RX_FULL_NAK_EN	chicken bit for CR-0000152878.when this bit is set the USB will respond with NAK's for Host Tokens with very slow AHB and when Streaming mode is enabled. Default value is 1.

FS1_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Description
9	ENDLESS_TD_EN	chicken bit for CR-0000152976. When this bit is set Performance enhancements for 'infinite' Producer pipe (out endpoint with eTD that points to itself) are enabled. Default value is 1.
8	SCRATCH_RAM_EN	chicken bit for CR-0000149922. When this bit is set the use of scratch ram is enabled and the SW can read/write from addresses 0x040 - 0x07c. when this bit is clear SW can no longer access those registers. Default value is 1.
7	SESS_VLD_CTRL_EN	When this bit is set then bit 25 of USBCMD register controls sess_vld signal inside the Link Controller. When this bit is clear then Link Controller receives sess_vld directly from PHY. Default value is 0.
6	CI_T_WTSUSRSTHS_EN	When this bit is 0 then Device Port Control State Machine waits 2.5 us from USB Reset detection until starting driving Chirp K. When this bit is 1 then Device Port Control State Machine waits 1.5 ms from USB Reset detection until starting driving Chirp K. Default value is 1 - legacy behavior.
5	CI_T_UCH_EN	When this bit is 0 then Device Port Control State Machine drives Chirp K for 1 ms. When this bit is 1 then Device Port Control State Machine drives Chirp K for 2ms. Default value is 1 - legacy behavior.
4	DP_RESET	chicken bit for fix CI2687: When the OTG core is acting as a Host, and VBUS is turned off, and the attached Device attempts to perform a Session Request Protocol by using Data-line Pulsing, it will not be recognized by the Host. Also, when doing HNP and becoming a Host, a SE0 is forced in the line causing the OPT TD5.4 test to fail, without the software workaround.
3	ZLP_PRIME	chicken bit for fix CI2655: When using ISO IN endpoints with MULT=3 and low bandwidth system bus access, the controller may enter into a wait loop situation without warning the software. Due to the low bandwidth the last packet from a mult3 sequence may not be fetched in time before the last token IN is received (for that uframe/endpoint). This will cause the controller to reply with a zero length packet (ZLP), breaking the prime sequence.
2	NO_SOF_RX_FIFO_FULL	chicken bit for fix CI2581: During normal operation, if the RX Fifo becomes full and the protocol engine needs to send a command to the DMA state machine, it will wait in that state until the RX Fifo becomes not full. As the protocol state machine also handles the SOF generation, the SOFs will no longer be sent. If one SOF is missed, the Host controller will issue a false babble detection. If more than 3.125ms are elapsed without SOFs the peripheral will recognize the idle bus as a USB reset.
1	WRONG_OPMODE_SUSP	chicken bit for fix CI1274: When the Controller enters a Suspend state it asserts opmode with the wrong value, according to specifications 'UTMI+ Specification, Revision 1.0, Section 3.2' and 'UTMI+ Low Pin Interface Specification, Revision 1.1, Section 3.8.5.3'. This causes no issue in actual usage.

FS1_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Description
0	RESUME_END_INTER	chicken bit for fix CI1179: Working as host, when doing resume a port change interrupt was fired at the end of resume. According to the EHCI spec no interrupt should be fired.

2.4.4 Device/host capability registers

0x18000100 FS1_USB_OTG_HS_CAPLENGTH

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x01000040

The USB_OTG_HS_CAPLENGTH register is the capability register length. It is used to indicate which offset to add to the register base address at the beginning of the operational register.

FS1_USB_OTG_HS_CAPLENGTH

Bits	Name	Description
31:16	HCIVERSION_15_0	BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision.
7:0	CAPLENGTH_7_0	Offset at beginning of operational register

0x18000104 FS1_USB_OTG_HS_HCSPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00010011

The USB_OTG_HS_HCSPARAMS register contains the host control structural parameters. The port steering logic capabilities are described in this register.

FS1_USB_OTG_HS_HCSPARAMS

Bits	Name	Description
31:28	RESERVED_BITS31_28	Clear (0) these bits.
27:24	N_TT_3_0	Number of transaction translators This field indicates the number of embedded transaction translators associated with the USB2.0 host controller. For a multi-port host, this field will always equal 0001. For all other implementations, N_TT = 0000. This in a non-EHCI field to support embedded TT.

FS1_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
23:20	N_PTT_3_0	Number of ports per transaction translator This field indicates the number of ports assigned to each transaction translator within the USB2.0 host controller. For a multi-port host this field will always equal N_PORTS. For all other implementations, N_PTT = 0000. This in a non-EHCI field to support embedded TT.
19:17	RESERVED_BITS19_17	Clear (0) these bits.
16	PI_3_0	Port indicator This bit indicates whether the ports support port indicator control. When set (1), the port status and control registers include a read/writable field for controlling the state of the port indicator. This field will always be set (1).
15:12	N_CC_3_0	Number of companion controllers This field indicates the number of companion controllers associated with this USB2.0 host controller. A zero in this field indicates there are no internal companion controllers. Port-ownership hand-off is not supported. A value larger than zero in this field indicates that there are companion USB1.1 host controller(s). Port-ownership hand-offs are supported. High-, full-, and low-speed devices are supported on the host controller root ports. In this implementation, this field will always be clear (0).
11:8	N_PCC_3_0	Number of ports per companion controller This field indicates the number of ports supported per internal companion controller. It is used to indicate the port routing configuration to the system software. For example, if N_PORTS has a value of 6 and N_CC has a value of 2, then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller 1, the next N_PCC ports to companion controller 2, and so on. In the previous example, the N_PCC could have been 4, where the first 4 are routed to companion controller 1 and the last two are routed to companion controller 2. The number in this field must be consistent with N_PORTS and N_CC. In this implementation, this field will always be clear (0).
7:5	RESERVED_BITS7_5	Clear (0) these bits.
4	PPC	Port power control This field indicates whether the host controller implementation includes port power control. Set (1) indicates that the ports have port power switches. Clear (0) indicates that the ports do not have port power switches. The value of this field affects the functionality of the port power field in each port status and control register. This bit will always be clear (0) for a device only implementation.

FS1_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
3:0	N_PORTS_3_0	Number of downstream ports This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the operational register. Valid values are in the range of 1h to Fh. A zero in this field is undefined. The number of ports for a host implementation is configurable from 1 to 8. This field will always be set (1) for device-only implementation.

0x18000108 FS1_USB_OTG_HS_HCCPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0006

The USB_OTG_HS_HCCPARAMS register contains the host control capability parameters. This register identifies multiple mode control (time-base bit functionality) addressing capability.

FS1_USB_OTG_HS_HCCPARAMS

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15:8	EECP_7_0	EHCI extended capabilities pointer Default = 0 This optional field indicates the existence of a capabilities list. A value of 00h indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in PCI configuration space of the first EHCI extended capability. The pointer value must be 40h or greater if implemented to maintain the consistency of the PCI header defined for this class of device. For this implementation, all of these bits are clear (0).
7:4	IST_7_4	Isochronous scheduling threshold Default = implementation dependent This field indicates, relative to the current position of the executing host controller, where the software can reliably update the isochronous schedule. When bit [7] is clear (0), the value of the least significant 3 bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set (1), then host software assumes the host controller may cache an isochronous data structure for an entire frame. All of the bits in this field will always be clear (0).
3	RESERVED_BIT3	Clear (0) this bit.

FS1_USB_OTG_HS_HCCPARAMS (cont.)

Bits	Name	Description
2	ASP	Asynchronous schedule park capability Default = 1 If this bit is set (1), then the host controller supports the park feature for high-speed queue heads in the asynchronous schedule. The feature can be disabled, or enabled and set to a specific level by using the (ASPE) and (ASP[1:0]) fields in the USB_OTG_HS_USBCMD register. This field will always be set (1).
1	PFL	Programmable frame list flag If this bit is clear (0), then the system software must use a frame list length of 1024 elements with this host controller. The FS[2:0] field in the USBCMD register is read-only and must be cleared (0). If this bit is set (1), then the system software can specify and use a smaller frame list, and configure the host controller using the FS[2:0] field in the USBCMD register. The frame list must always be aligned on a 4k-page boundary. This requirement ensures that the frame list is always physically contiguous. This bit in this field will always be set (1).
0	ADC	64-bit addressing capability This field will always be clear (0). No 64-bit addressing capability is supported.

0x18000120 FS1_USB_OTG_HS_DCIVERSION

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1

The USB_OTG_HS_DCIVERSION register contains the device interface version number. The device controller interface conforms to the two-byte BCD encoding of the interface version number contained in this register.

FS1_USB_OTG_HS_DCIVERSION

Bits	Name	Description
15:0	DCIVERSION_15_0	Device interface version number

0x18000124 FS1_USB_OTG_HS_DCCPARAMS

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x190

The USB_OTG_HS_DCCPARAMS register contains the device control capability parameters. These fields describe the overall host/device capability of the controller.

FS1_USB_OTG_HS_DCCPARAMS

Bits	Name	Description
31:9	RESERVED_BITS31_9	Clear (0) these bits.
8	HC	Host capable When this bit is set (1), this controller is capable of operating as an EHCI-compatible USB 2.0 host controller.
7	DC	Device capable When this bit is set (1), this controller is capable of operating as a USB 2.0 device.
6:5	RESERVED_BITS6_5	Clear (0) these bits.
4:0	DEN_4_0	Device endpoint number This field indicates the number of endpoints build into the device controller. If this controller is not device capable, then this field will be al zeroes. Valid values for this field are 0 through 16.

2.4.5 Device/host operational registers

0x18000140 FS1_USB_OTG_HS_USBCMD

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00080000

The USB_OTG_HS_USBCMD register is the USB command register. The serial bus host/device controller executes the command indicated in this register.

FS1_USB_OTG_HS_USBCMD

Bits	Name	Description
31	RST_CTRL	Default value = 0. Set to 1 to block operational reset to xcvr (ser and ulpi) clock domains.
30	ULPI_STP_CTRL	Default value = 0. Set to 1 to block the ulpi_stp signal from going out to ULPI PHY
29	ASYNC_INTR_CTRL	Default value = 0. Set to 1 to allow the async interrupt out from the HS core.
28	SE0_GLITCH_FIX_CTRL	Default value = 0. Set to 1 to activate the SE0 glitch fix mechanism
27	FS_3_WIRE_2_WIRE_SELECT	Default value = 0. Set this bit for enabling the two wire interface on the fs_dat and fs_se0 pins

FS1_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
26	ULPI_SER3_NOT6_SEL	ULPI serial 3 bits select. Read/write Read: Current status of serial data bus wide Write: SW writes ’1’ to this bit to request 3 pins ULPI data wide, or ’0’ to request 6 bit data wide in FsLsSerial Mode.
25	SESS_VLD_CTRL	Default value = 0. Set this bit to enable Link Controller operation after switching interface from Serial to ULPI.
24	RESERVED_BIT24	Clear (0) these bit
23:16	ITC_7_0	Interrupt threshold control Read/write Default 08h The system software uses this field to set the maximum rate at which the host/device controller will issue interrupts. This field contains the maximum interrupt interval measured in micro-frames. Valid values are shown below. Value Maximum interrupt interval 00h Immediate (no threshold) 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames 10h 16 micro-frames 20h 32 micro-frames 40h 64 micro-frames
15	FS2	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.

FS1_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
14	ATDTW	Add dTD tripwire Read/write (Device mode only) This bit is used as a semaphore to ensure the proper addition of a new dTD to an active (primed) endpoint's linked list. This bit is set (1) and cleared (0) by the software. This bit shall also be cleared (0) by the hardware when the state machine is a hazard region for which adding a dTD to a primed endpoint may go unrecognized.
13	SUTW	Setup tripwire (device mode only) Read/write This bit is used as a semaphore to ensure that the setup data payload of 8 bytes is extracted from a QH by the DCD without being corrupted. If the setup lockout mode is off (see USBMODE) then there exists a hazard when new setup data arrives while the DCD is copying the setup data payload from the QH for a previous setup packet. This bit is set (1) and cleared (0) by software, and will be cleared (0) by hardware when a hazard exists.
12	RESERVED_BITS12	Clear (0) this bit
11	ASPE	Asynchronous schedule park mode enable (OPTIONAL) Read/write If the asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this bit defaults to a 1h and is R/W. Otherwise, the bit must be cleared (0) and is RO. The software uses this bit to enable or disable the park mode. value 1 = Park mode is enabled. value 0 = Park mode is disabled. This field is set (1) in this implementation.
10	RESERVED_BIT10	Clear (0) this bit.
9:8	ASP_1_0	Asynchronous schedule park mode count (OPTIONAL) Read/write If the Asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this field defaults to 3h and is R/W. Otherwise it defaults to zero and is RO. This field contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1h to 3h. The software must not clear (0) this bit when the ASPE bit in this register is set (1), as this will result in undefined behavior. This field is set to 3h in this implementation.
7	LR	Light host/device controller reset (OPTIONAL) Read only Not implemented. This bit will always be clear (0).

FS1_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
6	IAA	Interrupt on async advance doorbell Read/write This bit is used as a doorbell by the software to tell the host controller to issue an interrupt the next time it advances the asynchronous schedule. The software must set (1) this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule states, it sets (1) the interrupt on the async advance status (AAI) bit in the USBSTS register. If the interrupt on async advance enable (AAE) bit in the USBINTR register is set (1), then the host controller will assert an interrupt at the next interrupt threshold. The host controller clears (0) this bit after it has set (1) the interrupt on async advance status (AAI) bit in the USBSTS register. The software should not set (1) this bit when the asynchronous schedule is inactive. Doing so will yield undefined results. This bit is only used in the host mode. Setting (1) this bit when the device mode is selected will produce undefined results.
5	ASE	Asynchronous Schedule Enable Read/write Default = 0b This bit controls whether the host controller skips processing the asynchronous schedule. value 0 = Do not process the asynchronous schedule value 1 = Use the ASYNCLISTADDR register to access the asynchronous schedule. Only the host controller uses this bit.
4	PSE	Periodic schedule enable Read/write Default 0b This bit controls whether the host controller skips processing the periodic schedule. value 0 = Do not process the periodic schedule value 1 = Use the PERIODICLISTBASE register to access the periodic schedule. Only the host controller uses this bit.

FS1_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
3:2	FS_1_0	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.
1	RST	Controller reset (RESET) Read/write The software uses this bit to reset the controller. This bit is cleared (0) by the host/device controller when the reset process is complete. The software cannot terminate the reset process early by clearing (0) this bit. Host controller: When the software sets (1) this bit, the host controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Any transaction currently in progress on the USB is immediately terminated. A USB reset is not driven on downstream ports. The software should not set (1) this bit when the HCHalted bit in the USBSTS register is clear (0). Attempting to reset an actively running host controller will result in undefined behavior. Device controller: When the software sets (1) this bit, the device controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Setting this bit when the device is in the attached state is not recommended, since the effect on an attached host is undefined. In order to ensure that the device is not in an attached state before initiating a device controller reset, all primed endpoints should be flushed and the USBCMD run/stop bit should be cleared (0).

FS1_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
0	RS	Run/stop Read/Write Default 0b value 1 = Run value 0 = Stop Host controller: When this bit is set (1), the host controller proceeds with the execution of the schedule. The host controller continues execution as long as this bit remains set (1). When this bit is clear (0), the host controller completes the current transaction on the USB and then halts. The HC halted bit in the status register indicates when the host controller has finished the transaction and has entered the stopped state. The software should not set (1) this bit unless the host controller is in the halted state (that is, the HCHalted bit in the USBSTS register is set (1)). Device controller: Setting (1) this bit will cause the device controller to enable a pull-up on D+ and initiate an attach event. This control bit is not directly connected to the pull-up enable, as the pull-up will become disabled upon transitioning into high-speed mode. The software should use this bit to prevent an attach event before the device controller has been properly initialized. Clearing (0) this bit will cause a detach event.

0x18000144 FS1_USB_OTG_HS_USBSTS

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_USBSTS register is the USB status register. This register indicates various states of the host/device controller and any pending interrupts. This register does not indicate status resulting from a transaction on the serial bus. The software clears certain bits in this register by setting (1) them.

FS1_USB_OTG_HS_USBSTS

Bits	Name	Description
31	ULPI_INTR	Default value = 0.This bit is set when Interrupt during ULPI -Serial mode or ULPI Interrupt during LPM occurs. Writing a 1 to this bit will clear it.
30	PHY_SESS_VLD_CHG	This bit is set when PHY_SESS_VLD bit changes its value.
29	PHY_SESS_VLD	This bit presents the SESS_VLD status of PHY.

FS1_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
28	PHY_ALT_INT	This bit is asserted when a non-USB interrupt from PHY is detected. This interrupt is used for procedures like Battery Charging. This bit is set when bit 7 (alt_int) of RX CMD is high. Writing a 1 to this bit will clear it.
27:26	RESERVED_BITS27_26	Clear (0) these bits.
25	TI1	General purpose timer interrupt 1 (GPTINT1) Read/write control This bit is set (1) when the counter in the GPTIMER1CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
24	TI0	General purpose timer interrupt 0 (GPTINT0) Read/write control This bit is set (1) when the counter in the GPTIMER0CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPI	USB host periodic interrupt (USBHSTPERINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set (1) and the TD was from the periodic schedule. This bit is also set (1) by the host controller when a short packet is detected AND the packet is on the periodic schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
18	UAI	USB host asynchronous interrupt (USBHSTASYNCINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set AND the TD was from the asynchronous schedule. This bit is also set (1) by the host when a short packet is detected AND the packet is on the asynchronous schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
17	RESERVED_BIT17	Clear (0) these bits.
16	NAKI	NAK interrupt bit Read only This bit is set (1) by the hardware when, for a particular endpoint, both the Tx/Rx endpoint NAK bit and the corresponding Tx/Rx endpoint NAK enable bit are set (1). This bit is automatically cleared (0) by the hardware when all of the enabled Tx/Rx endpoint NAK bits are cleared (0).

FS1_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
15	AS	Asynchronous schedule status Read only Default = 0 This bit reports the current real status of the asynchronous schedule. When cleared (0), the asynchronous schedule status is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the asynchronous schedule when software transitions the asynchronous schedule enable bit in the USBCMD register. When this bit and the asynchronous schedule enable bit are the same value, the asynchronous schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
14	PS	Periodic schedule status Read only Default = 0 This bit reports the current real status of the periodic schedule. When cleared (0), the periodic schedule is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the periodic schedule when software transitions the periodic schedule enable bit in the USBCMD register. When this bit and the periodic schedule enable bit are the same value, the periodic schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
13	RCL	Reclamation Read only Default = 0 This is a read-only status bit that is used to detect an empty asynchronous schedule. This bit is only used by the host controller.
12	HCH	HC halted Read only Default = 1 This bit is a clear (0) whenever the run/stop bit is set (1). The host controller sets (1) this bit after it has stopped executing, because of the run/stop bit being cleared (0), either by the software or by the host controller hardware (for example, an internal error). This bit is only used by the host controller.
11	RESERVED_BIT11	Clear (0) this bit.
10	ULPII	ULPI interrupt Read/write control Default = 0 When the ULPI viewport is present in the design, an event completion will set (1) this interrupt. This bit is used by both the host and device controllers. It is only present in designs where the configuration constant VUSB_HS_PHY_ULPI = 1.

FS1_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
9	RESERVED_BIT9	Clear (0) this bit.
8	SLI	DC suspend Read/write control Default = 0 When a device controller enters a suspend state from an active state, this bit will be set (1). The device controller clears (0) the bit upon exiting from a suspend state. This bit is only used by the device controller.
7	SRI	SOF received Read/write control Default = 0 When the device controller detects a start of (micro) frame, this bit will be set (1). When a SOF is extremely late, the device controller will automatically set (1) this bit to indicate that an SOF was expected. Therefore, this bit will be set (1) roughly every 1 ms in the device FS mode and every 125 ms in the HS mode, and will be synchronized to the actual SOF that is received. Since the device controller is initialized to FS before connect, this bit will be set (1) at an interval of 1 ms during the prelude to connect and chirp. In the host mode, this bit will be set (1) every 125 us and can be used by the host controller driver as a time base. The software writes a 1 to this bit to clear it. This is a non-EHCI status bit.
6	URI	USB reset received Read/write control Default = 0 When the device controller detects a USB reset and enters the default state, this bit will be set (1). The software can set (1) this bit to clear the USB reset received status bit. This bit is only used by the device controller.
5	AAI	Interrupt on async advance Read/write control Default = 0 The system software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by setting (1) the interrupt on async advance doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source. This bit is only used by the host controller.
4	SEI	System error Read/write control This interrupt is triggered when there is an AHB error (HRESP = ERROR) on the AHB Master interface.

FS1_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
3	FRI	Frame list rollover Read/write control The host controller sets (1) this bit when the frame list index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the frame list size field of the USBCMD register) is 1024, the frame index register rolls over every time FRINDEX [1 3] toggles. Similarly, if the size is 512, the host controller sets (1) this bit to a one every time FHINDEX [12] toggles. This bit is only used by the host controller.
2	PCI	Port change detect Read/write control The host controller sets (1) this bit when a connect status occurs on any port, a port enable/disable change occurs on any port, or the force port resume bit is set (1) as the result of a J-K transition on the suspended port. The device controller sets (1) this bit when the port controller enters the full or high-speed operational state. When the port controller exits the full or high-speed operation states due to reset or suspend events, the notification mechanisms are the USB reset received bit and the DC suspend bits, respectively. This bit is not EHCI compatible.
1	UEI	USB error interrupt (USBERRINT) Read/write control When completion of a USB transaction results in an error condition, this bit is set (1) by the host/device controller. This bit is set (1) along with the USBINT bit, if the TD on which the error interrupt occurred also had its interrupt-on-complete (IOC) bit set (1). The device controller detects resume signaling only.
0	UI	USB interrupt (USBINT) Read/write control This bit is set (1) by the host/device controller when the cause of an interrupt is a completion of a USB transaction where the transfer descriptor (TD) has an interrupt-on-complete (IOC) bit set (1). This bit is also set (1) by the host/device controller when a short packet is detected. A short packet is when the actual number of bytes received was less than the expected number of bytes.

0x18000148 FS1_USB_OTG_HS_USBINTR

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_USBINTR register is the USB interrupt enable register. The interrupts to the software are enabled with this register. An interrupt is generated when a bit is set (1) and the corresponding interrupt is active. The USB status register (USBSTS) still shows interrupt sources, even if they are disabled by the USBINTR register, which allows polling of interrupt events by the software.

FS1_USB_OTG_HS_USBINTR

Bits	Name	Description
31	ULPI_INTR_EN	Default value =0.When this bit is a 1 and ULPI_INTR is a 1, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the ULPI_INTR bit.
30	PHY_SESS_VLD_CHG_EN	Default value =0. When this bit is set then Link Controller will issue an interrupt when PHY_SESS_VLD changes its value.
29:26	RESERVED_BITS29_26	Clear (0) these bits.
25	TIE1	General purpose timer interrupt enable 1 When this bit is set (1), and the GPTINT1 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT1 bit.
24	TIE0	General purpose timer interrupt enable 0 When this bit is set (1), and the GPTINT0 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT0 bit.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPIE	USB host periodic interrupt enable When this bit is set (1), and the USBHSTPERINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTPERINT bit.
18	UAIE	USB host asynchronous interrupt enable When this bit is set (1), and the USBHSTASYNCINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTASYNCINT bit.
17	RESERVED_BIT17	Clear (0) this bit.
16	NAKE	NAK interrupt enable This bit is set (1) by the software if it wants to enable the hardware interrupt for the NAK interrupt bit. If both this bit and the corresponding NAK interrupt bit are set (1), a hardware interrupt is generated.
15:11	RESERVED_BITS15_11	Clear (0) these bits.

FS1_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
10	ULPIE	ULPI enable When this bit is set (1), and the ULPI Interrupt bit in the USBSTS register transitions, the controller will issue and interrupt. The interrupt is acknowledged by the software setting (1) the ULPI interrupt bit. This bit is used by both the host and device controllers. It is only present in designs where configuration constant VUSB_HS_PHY_ULPI = 1.
9	RESERVED_BIT9	Clear (0) this bit.
8	SLE	Sleep enable When this bit is set (1) and the DC suspend bit in the USBSTS register transitions, the device controller will issue an interrupt. The interrupt is acknowledged by the software setting (1) the DC suspend bit. This bit is only used by the device controller.
7	SRE	SOF received enable When this bit is set (1) and the SOF received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the SOF received bit.
6	URE	USB reset enable When this bit is set (1) and the USB reset received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the USB reset received bit.
5	AAE	Interrupt on async advance enable When this bit is set (1) and the interrupt on async advance bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the interrupt on async advance bit. This bit is only used by the host controller.
4	SEE	System error enable When this bit is set (1) and the system error bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the system error bit.
3	FRE	Frame list rollover enable When this bit is set (1) and the frame list rollover bit in the USBSTS register is set (1), the host controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the frame list rollover bit. This bit is only used by the host controller.

FS1_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
2	PCE	Port change detect enable When this bit is set (1) and the port change detect bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the port change detect bit.
1	UEE	USB error interrupt enable When this bit is set (1) and the USBERRINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBERRINT bit in the USBSTS register.
0	UE	USB interrupt enable When this bit is set (1) and the USBINT bit in the USBSTS register is set (1), the host/device controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBINT bit.

0x1800014C FS1_USB_OTG_HS_FRINDEX

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_FRINDEX register is the USB frame index register. This register is used by the host controller to index the periodic frame list. The register updates every 125 microseconds (once each micro-frame). Bits [N:3] are used to select a particular entry in the periodic frame list during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by the system software in the frame list size field in the USBCMD register.

This register must be written as a DWord. Byte writes produce-undefined results. This register cannot be written unless the host controller is in the 'halted' state, as indicated by the HC halted bit. A write to this register while the run/stop bit is set (1) produces undefined results. Writes to this register also affect the SOF value.

In the device mode, this register is read-only and the device controller updates the FRINDEX [13:3] register from the frame number indicated by the SOF marker. Whenever a SOF is received by the USB bus, FRINDEX [13:3] will be checked against the SOF marker. If FRINDEX [13:3] is different from the SOF marker, FRINDEX [13:3] will be set to the SOF value and FRINDEX [2:0] will be cleared (0) (that is, SOF for a 1-ms frame). If FRINDEX [13:3] is equal to the SOF value, FRINDEX [2:0] will be incremented (that is, SOF for 125-ms micro-frame.

FS1_USB_OTG_HS_FRINDEX

Bits	Name	Description
31:14	RESERVED_BITS31_14	Clear (0) these bits.

FS1_USB_OTG_HS_FRINDEX (cont.)

Bits	Name	Description
13:0	FRINDEX_13_0	Frame index The value in this register increments at the end of each time frame (for example, a micro-frame). Bits [N:3] are used for the frame list current index. This means that each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following data shows the values of N based on the value of the frame list size field in the USBCMD register when used in host mode. USBCMD [Frame list size] number Elements N 000b (1024) 12 001b (512) 11 010b (256) 10 011b (128) 9 100b (64) 8 101b (32) 7 110b (16) 6 111b (8) 5 In the device mode, the value is the current frame number of the last frame transmitted. It is not used as an index. In either mode, bits 2:0 indicate the current microframe.

0x18000154 FS1_USB_OTG_HS_PERIODICLISTBASE

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_PERIODICLISTBASE register is the periodic list base address register. This 32-bit register contains the beginning address of the periodic frame list in the system memory. The HCD loads this register prior to starting the schedule execution by the host controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the frame index register (FRINDEX) to enable the host controller to step through the periodic frame list in sequence.

NOTE This device is shared between the host controller and device controller operation. For host controller operation, this is the USB_OTG_HS_ PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

FS1_USB_OTG_HS_PERIODICLISTBASE

Bits	Name	Description
31:12	PERBASE_31_12	Base address (low) These bits correspond to memory address signals [31:12], respectively. Only used by the host controller.
11:0	RESERVED_BITS11_0	This field must be written as zeros. During runtime, the values of these bits are undefined.

0x18000154 FS1_USB_OTG_HS_DEVICEADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_DEVICEADDR register is the USB device address register. The upper seven bits of this register represent the device address. After any controller reset or a USB reset, the device address is set to the default address (0). The default address will match all incoming addresses. The software shall reprogram the address after receiving a SET_ADDRESS descriptor.

The USBADRA is used to accelerate the SET_ADDRESS sequence by allowing the DCD to preset the USBADR register before the status phase of the SET_ADDRESS descriptor.

NOTE This device is shared between the host controller and device controller operations. For host controller operation, this is the USB_OTG_HS_ PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

FS1_USB_OTG_HS_DEVICEADDR

Bits	Name	Description
31:25	USBADR_31_25	Device address These bits correspond to the USB device address.

FS1_USB_OTG_HS_DEVICEADDR (cont.)

Bits	Name	Description
24	USBADRA	Device address advance Default = 0 When this bit is clear (0), any writes to USBADR are instantaneous. When this bit is set (1) at the same time or before USBADR is written, the write to the USBADR field is staged and held in a hidden register. After an IN occurs on endpoint 0 and is ACKed, USBADR will be loaded from the holding register. The hardware will automatically clear (0) this bit on the following conditions: 1. IN is ACKed to endpoint 0 (USBADR is updated from staging register). 2. OUT/SETUP occur to endpoint 0 (USBADR is not updated). 3. Device reset occurs (USBADR is reset to 0). Note: After the status phase of the SET_ADDRESS descriptor, the DCD has 2 ms to program the USBADR field. This mechanism will ensure this specification is met when the DCD can not write of the device address within 2 ms from the SET_ADDRESS status phase. If the DCD writes the USBADR with USBADRA = 1 after the SET_ADDRESS data phase (before the prime of the status phase), the USBADR will be programmed instantly at the correct time and meet the 2-ms USB requirement.
23:0	RESERVED_BITS23_0	These bits must be written as zeros. During runtime, the values of these bits are undefined.

0x18000158 FS1_USB_OTG_HS_ASYNCLISTADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ASYNCLISTADDR register is the next asynchronous list address register. This 32-bit register contains the address of the next asynchronous queue head to be executed by the host. Bits [4:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

FS1_USB_OTG_HS_ASYNCLISTADDR

Bits	Name	Description
31:5	ASYBASE_31_15	Link pointer low (LPL). These bits correspond to memory address signals [31:5], respectively. This field may only reference a queue head (OH). This field is only used by the host controller.
4:0	RESERVED_BITS4_0	The values of these bits has no effect on circuit operation.

0x18000158 FS1_USB_OTG_HS_ENDPOINTLISTADDR

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPOINTLISTADDR register is the endpointlist address register. In the device mode, this register contains the address of the top of the endpoint list in system memory. Bits [10:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

FS1_USB_OTG_HS_ENDPOINTLISTADDR

Bits	Name	Description
31:11	EPBASE_31_11	Endpoint list pointer (low) These bits correspond to memory address signals [31:11], respectively. This field will reference a list of up to 32 queue heads (QH). That is, one queue head per endpoint & direction.
10:0	RESERVED_BITS10_0	The values of these bits has no effect on circuit operation.

0x1800015C FS1_USB_OTG_HS_TTCTRL

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_TTCTRL register is the TT status and control register. This register contains parameters needed for internal TT operations.

NOTE This register is not used in the device controller operation.

FS1_USB_OTG_HS_TTCTRL

Bits	Name	Description
31	RESERVED_BIT31	Not used.
30:24	TTHA	Not used.
23:0	RESERVED_BITS23_0	Not used.

0x18000160 FS1_USB_OTG_HS_BURSTSIZE

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x1010

The USB_OTG_HS_BURSTSIZE register is the programmable burst size register. This register is used to control dynamically change the burst size used during data movement on the initiator (master) interface.

FS1_USB_OTG_HS_BURSTSIZE

Bits	Name	Description
31:16	RESERVED_BITS31_16	The value of these bits has no effect on circuit operation.
15:8	TXPBURST	Programmable Tx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from system memory to the USB bus.
7:0	RXPBURST	Programmable Rx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from the USB bus to system memory.

0x18000164 FS1_USB_OTG_HS_TXFILLTUNING

Type: Read/write (writes must be DWord writes)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_TXFILLTUNING register is the host transmit pre-buffer packet tuning register. The fields in this register control performance tuning associated with how the host controller posts data to the Tx latency FIFO before moving the data onto the USB bus. The specific areas of performance include the how much data to post into the FIFO and an estimate for how long that operation should take in the target system.

Definitions:

T0 = Standard packet overhead

T1 = Time to send data payload

Tff = Time to fetch packet into TX FIFO up to specified level.

Ts = Total packet flight time (send-only) packet

Ts = T0 + T1

Tp = Total packet time (fetch and send) packet

Tp = Tff + T0 + T1

Upon discovery of a transmit (OUT/SETUP) packet in the data structures, the host controller checks to ensure Tp remains before the end of the [micro] frame. If so it proceeds to pre-fill the TX FIFO. If at anytime during the pre-fill operation the time remaining the [micro] frame is < Ts, then the packet attempt ceases and the packet is tried at a later time. Although this is not an error condition and the host controller will eventually recover, a mark will be made the scheduler health counter to note the occurrence of a ’back-off’ event. When a back-off event is detected, the partial packet fetched may need to be discarded from the latency buffer to make room for periodic traffic that will begin after the next SOF. Too many back-off events can waste bandwidth and power on the system bus, and thus should be minimized (not necessarily eliminated). Back-offs can be minimized with use of the TSCHHEALTH (Tff), as described in the register table.

FS1_USB_OTG_HS_TXFILLTUNING

Bits	Name	Description
31:22	RESERVED_BITS31_22	The value of these bits has no effect on circuit operation.
21:16	TXFIFOTHRES	FIFO burst threshold Default = 2 This register controls the number of data bursts that are posted to the TX latency FIFO in the host mode before the packet begins on to the bus. The minimum value is 2 and this value should be a low as possible to maximize USB performance. A higher value can be used in systems with unpredictable latency and/or insufficient bandwidth, where the FIFO may underrun because the data transferred from the latency FIFO to USB occurs before it can be replenished from system memory. This value is ignored if the stream disable bit in USBMODE register is set (1).
15:13	RESERVED_BITS15_13	The value of these bits has no effect on circuit operation.

FS1_USB_OTG_HS_TXFILLTUNING (cont.)

Bits	Name	Description
12:8	TXSCHHEALTH	Scheduler health counter Read/write to clear Default = 0 This register increments when the host controller fails to fill the Tx latency FIFO to the level programmed by TXFIFOTHRES before running out of time to send the packet before the next start-of-frame. This health counter measures the number of times this occurs to provide feedback to selecting a proper TXSCHOH. Writing to this register will clear the counter and this counter will be at a maximum at 31.
7:0	TXSCHOH	Scheduler overhead Default = 0 This register adds an additional fixed offset to the schedule time estimator described above as Tff. As an approximation, the value chosen for this register should limit the number of back-off events captured in the TXSCHHEALTH to less than 10 per second in a highly-utilized bus. Choosing a value that is too high for this register is not desired, as it can needlessly reduce USB utilization. The time unit represented in this register is 1.267 ms when a device is connected in the high-speed mode for OTG and SPH. The time unit represented in this register is 6.333 ms when a device is connected in the low/full speed mode for OTG and SPH. The time unit represented in this register is always 1.267 times the MPH product.

0x18000170 FS1_USB_OTG_HS_ULPI_VIEWPORT

Type: Read/write (unless otherwise indicated)
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x08000000

The USB_OTG_HS_ULPI_VIEWPORT register provides indirect access to the ULPI PHY register set. Although the core performs access to the ULPI PHY register set, there may be extraordinary circumstances where software may need direct access.

CAUTION Writes to the ULPI through the viewport can substantially harm standard USB operations. Currently, no usage model has been defined where the software should need to execute writes directly to the ULPI - see the exception regarding optional features below.

Executing read operations though the ULPI viewport should have no harmful side effects to standard USB operations.

NOTE The ULPI viewport is only synthesized in the design if the constant VUSB_HS_PHY_ULPI is set (1). If the ULPI interface is not enabled, this register will always read zeros.

Two operations can be performed with the ULPI viewport: wake-up and read/write operations. The wake-up operation is used to put the ULPI interface into normal operation mode and re-enable the clock, if necessary. A wake-up operation is required before accessing the registers when the ULPI interface is operating in the low power mode, serial mode, or car kit mode.

The ULPI state can be determined by reading the sync state bit (ULPISS). If this bit is set (1), then the ULPI interface is running in the normal operation mode and can accept read/write operations. If the ULPISS is clear (0), then read/write operations will not be able to execute. Undefined behavior will result if ULPISS = 0, and a read or write operation is performed.

To execute a wake-up operation, write all 32-bits of the ULPI Viewport where ULPIPORT is constructed appropriately, and the ULPIWU bit is set (1) and the ULPIRUN bit is clear (0). Poll the ULPI viewport until ULPIWU is zero for the operation to complete.

To execute a read or write operation, write all 32-bits of the ULPI viewport where ULPIDATWR, ULPIADDR, ULPIPORT, and ULPIRW are constructed appropriately, and the ULPIRUN bit is set (1). Poll the ULPI viewport until ULPIRUN is zero for the operation to complete. Once ULPIRUN is zero, the ULPIDATRD will be valid if the operation was a read.

The polling method above could also be replaced and an interrupt driven using the ULPI interrupt defined in the USBTS and USBINTR registers. When a wake-up or read/write operation completes, the ULPI interrupt will be set (1).

Several optional features may need to be enabled or disabled by the system software as part of system configuration. These bits are contained in the interface and OTG control registers of the ULPI PHY register set. These registers also contain bits that are controlled by the link dynamically and, therefore, should only be modified by the system software using the set/clear access method. Direct writes to these registers could have harmful side effects to the standard USB operations. The following bits are optional bits:

- Bits 3 through 7 in the interface control register
- Bits 6 and 7 in the OTG control register.

For more information on the use of the optional features, see http://www.ulpi.org/documents.html.

FS1_USB_OTG_HS_ULPI_VIEWPORT

Bits	Name	Description
31	ULPIWU	ULPI wake-up Setting (1) this bit begins the wake-up operation. The bit will automatically transition to 0 after the wake-up is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wake-up and a read/write operation at the same time.
30	ULPIRUN	ULPI read/write run Setting (1) this bit will begin the read/write operation. The bit will automatically transition to 0 after the read/write is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time.

FS1_USB_OTG_HS_ULPI_VIEWPORT (cont.)

Bits	Name	Description
29	ULPIRW	ULPI read/write control This bit selects between running a read or write operation. value 0 = Read value 1 = Write
28	ULPIFORCE	ULPI read/write force This bit enables forcing register access during RX packet value 0 = register access is not forced during RX packet (default) value 1 = register access is forced during RX packet reception
27	ULPISS	ULPI sync state Read Only value 1 = Normal sync state value 0 = In another state (for example, car kit, serial, low power) This bit represents the state of the ULPI interface. Before reading this bit, the ULPIPORT field should be set accordingly if used with the multi-port host. Otherwise, this field should always remain 0.
26:24	ULPIPORT	ULPI port number For the wakeup or read/write operation to be executed, this value selects the port number the ULPI PHY is attached to in the multi-port host. The valid range is 0 to 7. This field should always be written as a 0 for the non-multi port products.
23:16	ULPIADDR	ULPI data address When a read or write operation is commanded, the address of the operation is written to this field.
15:8	ULPIDATRD	ULPI data read Read only After a read operation completes, the result is placed in this field.
7:0	ULPIDATWR	ULPI data write When a write operation is commanded, the data to be sent is written to this field.

0x18000178 FS1_USB_OTG_HS_ENDPTNAK

Type: Read/write clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTNAK register is the endpoint NAK register.

FS1_USB_OTG_HS_ENDPTNAK

Bits	Name	Description
31:16	EPTN_15_0	Tx endpoint NAK Each tx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received IN token for the corresponding endpoint. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0
15:0	EPRN_15_0	Rx endpoint NAK Each rx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received OUT or PING token for the corresponding endpoint. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x1800017C FS1_USB_OTG_HS_ENDPTNAKEN

Type: Read/write clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTNAKEN register is the endpoint NAK enable register.

FS1_USB_OTG_HS_ENDPTNAKEN

Bits	Name	Description
31:16	EPTNE_15_0	Tx endpoint NAK enable Each bit is an enable bit for the corresponding Tx endpoint NAK bit. If this bit is set (1) and the corresponding Tx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0
15:0	EPRNE_15_0	Rx endpoint NAK enable Each bit is an enable bit for the corresponding Rx endpoint NAK bit. If this bit is set (1) and the corresponding Rx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x18000184 FS1_USB_OTG_HS_PORTSC

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xCC000004

This is the USB_OTG_HS_PORTSC register.

FS1_USB_OTG_HS_PORTSC

Bits	Name	Description
31:30	PTS	Parallel transceiver select Read/write This register bit pair is used in conjunction with the configuration constant VUSB_HS_PHY_TYPE to control which parallel transceiver interface is selected. If VUSB_HS_PHY_ TYPE is set for 0, 1, 2, or 3, then this bit is read only. If VUSB_HS_PHY_TYPE is 4, 5, 6, or 7, then this bit is read/write. This field is reset to the following values: 00 if VUSB_HS_PHY_TYPE = 0,4 - UTMI/UTMI+ 01 if VUSB_HS_PHY_TYPE = 1,5 - Reserved 10 if VUSB_HS_PHY_TYPE = 2,6 - ULPI 11 if VUSB_HS_PHY_TYPE = 3,7 - Serial/1.1 PHY (FS only) This bit is not defined in the EHCI specification.
29	STS	Serial transceiver select Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY_SERIAL to control whether the parallel or serial transceiver interface is selected for FS and LS operation. The serial interface engine can be used in combination with the UTMI+ or ULPI physical interface to provide FS/LS signaling instead of the parallel interface. ’ If VUSB_HS_PHY_SERIAL is 0 or 1, then this bit is read only. ’ If VUSB_HS_PHY_SERIAL is 2 or 3, then this bit is read/write. This bit has no effect unless the parallel transceiver select is set to UTMI+ or ULPI. The Serial/1.1 physical interface will use the serial interface engine for FS/LS signaling regardless of this bit value. Note: This bit was reserved for future operation, and is now adding for dynamic use of the serial engine in accord with UMTI+ and ULPI characterization logic. This bit is not defined in the EHCI specification.

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
28	PTW	Parallel transceiver width Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY16_8 to control the data bus width of the UTMI transceiver interface. ' If VUSB_HS_PHY16_8 is 0 or 1, then this bit is read only. ' If VUSB_HS_PHY16_8 is 2 or 3, then this bit is read/write. This bit is reset to 1 if VUSB_HS_PHY16_8 selects a default UTMI interface width of 16-bits, else it is reset to 0. ' Writing this bit to 0 selects the 8-bit [60MHz] UTMI interface. ' Writing this bit to 1 selects the 16-bit [30MHz] UTMI interface. This bit has no effect if the serial interface is selected. This bit is not defined in the EHCI specification.
27:26	PSPD	Port speed Read only This register field indicates the speed at which the port is operating. For HS mode operation in the host controller and HS/FS operation in the device controller, the port routing steers data to the protocol engine. For FS and LS mode operation in the host controller, the port routing steers data to the protocol engine with the embedded transaction translator. value 00 = Full speed value 01 = Low speed value 10 = High speed This bit is not defined in the EHCI specification.
25	SPRT	Short Port Reset Time. shortens port reset time for simulation.
24	PFSC	Port force full speed connect Read/write Default = 0 Setting (1) this bit will force the port to only connect at full speed. It also disables the chirp sequence that allows the port to identify itself as high speed. This is useful for testing FS configurations with a HS host, hub or device. This bit is not defined in the EHCI specification. This bit is for debugging purposes.

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
23	PHCD	PHY low power suspend - clock disable (PLPSCD) Read/write Default = 0 value 1 = Disable the PHY clock. value 0 = Enable the PHY clock. Reading this bit will indicate the status of the PHY clock. Note: The PHY clock cannot be disabled if it is being used as the system clock. In the device mode, The PHY can be put into low power suspend - clock disable when the device is not running (USBCMD run/stop = 0) or the host has signaled suspend (PORTSC SUSPEND = 1). Low power suspend will be cleared automatically when the host has signaled resume. Before forcing a resume from the device, the device controller driver must clear this bit. In the host mode, the PHY can be put into low power suspend - clock disable when the downstream device has been put into the suspend mode or when no downstream device is connected. Low power suspend is completely under the control of the software. This bit is not defined in the EHCI specification.
22	WKOC	Wake on over-current enable (WKOC_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to over-current conditions as wake-up events. This bit is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0). This bit is output from the controller as signal pwrctl_wake_ ovrcurr_en (OTG/host core only) for use by an external power control circuit.
21	WKDS	Wake on disconnect enable (WKDSCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device disconnects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_ dscnnt_en (OTG/host core only) for use by an external power control circuit.

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
20	WKCN	Wake on connect enable (WKCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device connects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_ dscnnt_en (OTG/host core only) for use by an external power control circuit.

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
19:16	PTC_3_0	Port test control Read/write Default = 0000 Any other value than zero indicates that the port is operating in the test mode. Value Specific test The FORCE_ENABLE_FS and FORCE ENABLE_LS tests are extensions to the test mode support, as specified in the EHCI specification. Writing the PTC field to any of the FORCE_ENABLE_{HS/FS/LS} values will force the port into the connected and enabled state at the selected speed. Writing the PTC field back to TEST_MODE_DISABLE will allow the port state machines to progress normally from that point. Note: Low speed operations are not supported as a peripheral device. 0x0: TEST_MODE_DISABLE 0x1: J_ STATE 0x8: K_STATE 0x9: SE0 (host / NAK device) 0x40: Packet 0x41: FORCE_ENABLE_HS 0x48: FORCE_ENABLE_FS 0x49: FORCE_ENABLE_LS 0x3E8: Reserved_1 0x3E9: Reserved_2 0x3EA: Reserved_3 0x3EB: Reserved_4 0x3EC: Reserved_5 0x3ED: Reserved_6 0x3EE: Reserved_7 0x3EF: Reserved_8 0x3F0: Reserved_9 0x3F1: Reserved_10 0x3F2: Reserved_11 0x3F3: Reserved_12 0x3F4: Reserved_13 0x3F5: Reserved_14 0x3F6: Reserved_15 0x3F7: Reserved_16 0x3F8: Reserved_17 0x3F9: Reserved_18 0x3FA: Reserved_19 0x3FB: Reserved_20 0x3FC: Reserved_21 0x3FD: Reserved_22 0x3FE: Reserved_23 0x3FF: Reserved_24 0x400: Reserved_25 0x401: Reserved_26 0x402: Reserved_27 0x403: Reserved_28 0x404: Reserved_29 0x405: Reserved_30 0x406: Reserved_31 0x407: Reserved_32 0x408: Reserved_33 0x409: Reserved_34 0x40A: Reserved_35 0x40B: Reserved_36 0x40C: Reserved_37 0x40D: Reserved_38 0x40E: Reserved_39 0x40F: Reserved_40 0x410: Reserved_41 0x411: Reserved_42

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
		0x412: Reserved_43 0x413: Reserved_44 0x414: Reserved_45 0x415: Reserved_46 0x416: Reserved_47 0x417: Reserved_48 0x418: Reserved_49 0x419: Reserved_50 0x41A: Reserved_51 0x41B: Reserved_52 0x41C: Reserved_53 0x41D: Reserved_54 0x41E: Reserved_55 0x41F: Reserved_56 0x420: Reserved_57 0x421: Reserved_58 0x422: Reserved_59 0x423: Reserved_60 0x424: Reserved_61 0x425: Reserved_62 0x426: Reserved_63 0x427: Reserved_64 0x428: Reserved_65 0x429: Reserved_66 0x42A: Reserved_67 0x42B: Reserved_68 0x42C: Reserved_69 0x42D: Reserved_70 0x42E: Reserved_71 0x42F: Reserved_72 0x430: Reserved_73 0x431: Reserved_74 0x432: Reserved_75 0x433: Reserved_76 0x434: Reserved_77 0x435: Reserved_78 0x436: Reserved_79 0x437: Reserved_80 0x438: Reserved_81 0x439: Reserved_82 0x43A: Reserved_83 0x43B: Reserved_84 0x43C: Reserved_85 0x43D: Reserved_86 0x43E: Reserved_87 0x43F: Reserved_88 0x440: Reserved_89 0x441: Reserved_90 0x442: Reserved_91 0x443: Reserved_92 0x444: Reserved_93 0x445: Reserved_94 0x446: Reserved_95 0x447: Reserved_96 0x448: Reserved_97 0x449: Reserved_98 0x44A: Reserved_99 0x44B: Reserved_100 0x44C: Reserved_101 0x44D: Reserved_102 0x44E: Reserved_103 0x44F: Reserved_104 0x450: Reserved_105 0x451: Reserved_106 0x452: Reserved_107 0x453: Reserved_108 0x454: Reserved_109 0x455: Reserved_110 0x456: Reserved_111 0x457: Reserved_112

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
15:14	PIC_1_0	Port indicator control Read/write Default = 0 Writing to this field has no effect if the P_INDICATOR bit in the HCSPARAMS register is a zero. If the P_INDICATOR bit is set (1), then this field has the following meanings: Bit value Meaning value 00 Port indicators are off value 01 Amber value 10 Green value 11 Undefined Refer to the USB Specification Revision 2.0 [3] for a description on how these bits are to be used. This field is output from the controller as signals port_ind_ctl_1 and port_ind_ctl_0 for use by an external LED driving circuit.
13	PO	Port owner Read only Port owner hand-off is not implemented in this design, therefore this bit will always read back as clear (0). Default = 0 The EHCI definition is include here for reference: ’ This bit unconditionally goes clear (0) when the configured bit in the CONFIGFLAG register makes a 0-to-1 transition. ’ This bit unconditionally goes set (1) whenever the configured bit is clear (0). The system software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). The software sets (1) this bit when the attached device is not a high-speed device. When this bit is set (1), it indicates that an internal companion controller owns and controls the port.

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
12	PP	Port power (PP) Read/write or read-only The function of this bit depends on the value of the port power switching (PPC) field in the HCSPARAMS register. ’ PPC = 0: PP is read-only. A device controller with no OTG capability does not have port power control switches. ’ PPC = 1: PP is read/write. The host/OTG controller requires port power control switches. This bit represents the current setting of the switch (0 = off, 1 = on). When power is not available on a port (and PP equals a 0), the port is non-functional and will not report attaches, detaches, and so on. When an over-current condition is detected on a powered port and PPC is set (1), the PP bit in each affected port may be transitioned by the host controller driver from a one to a zero, removing power from the port. This feature is implemented in the host/OTG controller (PPC = 1). In a device-only implementation, port power control is not necessary. So, PPC and PP = 0.
11:10	LS_1_0	Line status Read-only These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines: Value Meaning value 00 SE0 value 10 J-state value 01 K-state value 11 Undefined In the host mode, the use of linestate by the host controller driver is not necessary (unlike EHCI), because the port controller state machine and the port routing manage the connection of LS and FS. In the device mode, the use of linestate by the device controller driver is not necessary.
9	HSP	High-speed port Read-only Default = 0 When the bit is set (1), the host/device connected to the port is in the high-speed mode. When this bit is clear (0), the host/device connected to the port is not in a high-speed mode. Note: HSP is redundant with PSPD(27:26), but will remain in the design for compatibility. This bit is not defined in the EHCI specification.

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
8	PR	Port reset This bit is clear (0) if the port power (PP) bit (bit 12) of this register is clear (0). Host mode: ’ Read/write ’ Default = 0 When the software sets (1) this bit, the bus-reset sequence as defined in the USB Specification Revision 2.0 is started. This bit will automatically clear (go to 0) after the reset sequence is complete. Note: This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the reset duration is timed in the driver. Device mode: This bit is a read-only status bit. Device reset from the USB bus is also indicated in the USBSTS register. 0x1: Port is in reset 0x0: Port is not in reset

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
7	SUSP	Suspend Host mode: ’ Read/write ’ Default = 0 The port enabled bit and suspend bit of this register define the port states: Bit value Port state value 0x Disable value 10 Enable value 11 Suspend When in the suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction if a transaction was in progress when this bit set (1). In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. The host controller will unconditionally clear (0) this bit when the software clears (0) the force port resume bit. The host controller ignores a write of zero to this bit. If the host software sets (1) this bit when the port is not enabled (port enabled bit is a zero), the results are undefined. This field is clear (0) if port power (PP) is clear (0) in the host mode. Device mode: ’ Read only ’ Default = 0 In the device mode, this bit is a read-only status bit. 0x1: Port in suspend state_1 0x0: Port not in suspend st_1 0x1: Port in suspend state_2 0x0: Port not in suspend st_2

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
6	FPR	Force port resume ’ Read/write ’ Default = 0 Host mode: The software sets (1) this bit to drive resume signaling. The host controller sets (1) this bit if a J-to-K transition is detected while the port is in the suspend state. When this bit transitions to a one because a J-to-K transition is detected, the port change detect bit in the USBSTS register is also set (1). This bit will automatically clear (go to 0) after the resume sequence is complete. This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the resume duration is timed in the driver. Note that, when the host controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (full-speed 'K') is driven on the port as long as this bit remains set (1). This bit will remain set (1) until the port has switched to the high-speed idle. Clearing (0) this bit has no affect, because the port controller will time the resume operation and clear (0) the bit when the port control state switches to HS or FS idle. This bit is clear if the port power (PP) is clear (0) in the host mode. This bit is not-EHCI compatible. Device mode: After the device has been in the suspend state for 5 ms or more, the software must set (1) this bit to drive resume signaling before clearing. The device controller will set (1) this bit if a J-to-K transition is detected while the port is in the suspend state. The bit will be cleared (0) when the device returns to normal operation. Also, when this bit transitions to a one because a J-to-K transition was detected, the port change detect bit in the USBSTS register is also set (1). 0x1: Resume detected/driven on port 0x0: No resume (K-state detected/driven on port)
5	OCC	Over-current change Read/write control Default = 0 This bit gets is set (1) when there is a change to over-current active. The software clears this bit by setting (1) this bit position. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
4	OCA	Over-current active Read-only Default = 0 value 1 = This port currently has an over-current condition. value 0 = This port does not have an over-current condition. This bit will automatically transition from set (1) to clear (0) when the over current condition is removed. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).
3	PEC	Port enable/disable change Read/write control value 1 = Port enabled/disabled status has changed value 0 = No change Default = 0 Host mode: For the root hub, this bit gets set (1) only when a port is disabled due to disconnect on the port or due to the appropriate conditions existing at the EOF2 point. The software clears this bit by writing a one to it. This field is clear (0) if the port power (PP) bit in the register is clear (0). Device mode: The device port is always enabled (this bit will be zero).
2	PE	Port enabled/disabled Read/write value 1 = Enable value 0 = Disable Default 0 Host mode: Ports can only be enabled by the host controller as a part of the reset and enable. The software cannot enable a port by setting (1) this field. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by the host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port, due to other host controller and bus events. When the port is disabled, (0) downstream propagation of data is blocked except for reset. This field is clear (0) if the port power (PP) bit is cleared (0) in the host mode. Device mode: The device port is always enabled (this bit will be set [1])

FS1_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
1	CSC	Connect status change Read/write control value 1 = Change in current connect status value 0 = No change Default = 0 Host mode: Indicates that a change has occurred in the port's current connect status. The host/device controller sets (1) this bit for all changes to the port device connect status, even if the system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, the hub hardware will be 'setting' an already-set bit (that is, the bit will remain set). The software clears this bit by writing a one to it. This field is zero if the port power (PP) bit in this register is zero in the host mode. Device mode: This bit is undefined in the device controller mode.
0	CCS	Current connect status Read-only Host mode: value 1 = Device is present on port value 0 = No device is present Default = 0 This value reflects the current state of the port, and may not correspond directly to the event that caused the connect status change bit (bit 1) to be set (1). This field is clear if the port power (PP) bit in this register is clear (0) in host mode. Device mode: value 1 = Attached value 0 = Not attached Default = 0 If this bit is set (1), this indicates that the device successfully attached, and is operating in either high speed or full speed, as indicated by the high speed port bit in this register. If this bit is clear (0), this indicates that the device did not attach successfully or was forcibly disconnected by the software clearing (0) the run bit in the USBCMD register. It does not state the device being disconnected or suspended.

Reset State: 0x00000E20

FS1_USB_OTG_HS_OTGSC

Bits	Name	Description
31	RESERVED_BIT31	Clear (0) this bit.
30	DPIE	Data pulse interrupt enable
29	B_1MSE	1 millisecond timer interrupt enable - read/write
28	BSEIE	B session end interrupt enable Read/write Setting (1) this bit enables the B session end interrupt.
27	BSVIE	B session valid interrupt enable Read/write Setting (1) this bit enables the B session valid interrupt.
26	ASVIE	A session valid interrupt enable Read/write Setting (1) this bit enables the A session valid interrupt.
25	AVVIE	A Vbus valid interrupt enable Read/write Setting (1) this bit enables the A Vbus valid interrupt.
24	IDIE	USB ID interrupt enable Read/write Setting (1) this bit enables the USB ID interrupt.
23	RESERVED_BIT23	Clear (0) this bit.
22	DPIS	Data pulse interrupt status Read/write to clear This bit is set (1) when data bus pulsing occurs on DP or DM. Data bus pulsing is only detected when USBMODE.CM = Host (11) and PORTSC(0). PortPower = Off (0). The software must write a one to clear this bit.
21	B_1MSS	1 millisecond timer interrupt status Read/write to clear This bit is set (1) once every millisecond. The software must write a one to clear this bit.
20	BSEIS	B session end interrupt status Read/write to clear This bit is set (1) when the Vbus has fallen below the B session end threshold. The software must write a one to clear this bit
19	BSVIS	B session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the B session valid threshold (0.8 VDC). The software must write a one to clear this bit.

FS1_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Description
18	ASVIS	A session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the A session valid threshold (0.8 VDC). The software must write a one to clear this bit.
17	AVVIS	A Vbus valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the Vbus valid threshold (4.4 VDC) on an A device. The software must write a one to clear this bit.
16	IDIS	USB ID interrupt status Read/write This bit is set (1) when a change on the ID input has been detected. The software must write a one to clear this bit.
15	RESERVED_BIT15	Clear (0) this bit.
14	DPS	Data bus pulsing status Read-only If this bit is set (1), it indicates that the data bus pulsing is being detected on the port.
13	B_1MST	1 millisecond timer toggle Read-only This bit toggles once per millisecond.
12	BSE	B session end Read-only Indicates that the Vbus is below the B session end threshold.
11	BSV	B session valid Read-only Indicates that the Vbus is above the B session valid threshold.
10	ASV	A session valid Read-only Indicates that the Vbus is above the A session valid threshold.
9	AVV	A Vbus valid Read-only Indicates that the Vbus is above the A Vbus valid threshold.
8	ID	USB ID Read-only value 0 = A device value 1 = B device

FS1_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Description
7	HABA	Hardware assist B-disconnect to A-connect Read/write value 0 = Disabled value 1 = Enable automatic B-disconnect to A-connect sequence.
6	HADP	Hardware assist data-pulse Write to set
5	IDPU	ID pull-up Read/write This bit provides control over the ID pull-up register. value 0 = Off value 1 = On (default) When this bit is clear (0), the ID input will not be sampled.
4	DP	Data pulsing Read/write Setting (1) this bit causes the pull-up on DP to be asserted for data pulsing during SRP.
3	OT	OTG termination Read/write This bit must be set (1) when the OTG device is in the device mode. This controls the pull-down on DM.
2	HAAR	Hardware assist auto-reset Read/write value 0 = Disabled value 1 = Enable automatic reset after connect on host port.
1	VC	Vbus charge Read/write Setting (1) this bit causes the Vbus line to be charged. This is used for Vbus pulsing during SRP.
0	VD	Vbus discharge Read/write Setting (1) this bit causes the Vbus to discharge through a resistor.

0x180001A8 FS1_USB_OTG_HS_USBMODE

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_USBMODE register is the USB device mode register.

FS1_USB_OTG_HS_USBMODE

Bits	Name	Description
31:6	RESERVED_BITS31_6	Clear (0) these bits.
5	VBPS	Vbus power select value 0 - Output is 0 value 1 - Output is 1 This bit is connected to the vbus_pwr_select output and can be used for any generic control, but is named to be used by logic that selects between an on-chip Vbus power source (charge pump) and an off-chip source in systems when both are available.
4	SDIS	Stream disable mode value 0 = Inactive (default) value 1 = Active Device mode: Setting (1) this bit disables double priming on both the Rx and Tx for low bandwidth systems. This mode ensures that, when the Rx and Tx buffers are sufficient to contain an entire packet, the standard double buffering scheme is disabled to prevent overruns/underruns in bandwidth-limited systems. Note: In the high speed mode, a NYET handshake will respond to all packets received when the stream disable is active. Host mode: Setting (1) this bit ensures that overruns/underruns of the latency FIFO are eliminated for low bandwidth systems where the Rx and Tx buffers are sufficient to contain the entire packet. Enabling the stream disable also has the effect of ensuring that the Tx latency is filled to capacity before the packet is launched onto the USB. Note: Time duration to pre-fill the FIFO becomes significant when the stream disable is active. See TXFILLTUNING and TXTTFILLTUNING [MPH only] to characterize the adjustments needed for the scheduler when using this feature. Note: The use of this feature substantially limits of the overall USB performance.
3	SLOM	Setup lockout mode. In the device mode, this bit controls the behavior of the setup lock mechanism. value 0 = Setup lockouts on (default) value 1 = Setup lockouts off (DCD requires use of a setup data buffer tripwire in USBCMD)

FS1_USB_OTG_HS_USBMODE (cont.)

Bits	Name	Description
2	ES	Endian select Read/write This bit can change the byte ordering of the transfer buffers to match the host microprocessor bus architecture. The bit fields in the microprocessor interface and the DMA data structures (including the setup buffer within the device QH) are unaffected by the value of this bit, because they are based upon 32-bit words. value 0 = Little endian (default) - first byte referenced in the least significant byte of a 32-bit word. value 1 = Big endian - first byte referenced in most significant byte of a 32-bit word.
1:0	CM	Controller mode Read/write once The controller mode is defaulted to the proper mode for host-only and device-only implementations. For those designs that contain both host and device capability, the controller will default to an idle state and will need to be initialized to the desired operating mode after reset. For combination host/device controllers, this register can only be written once after reset. If it is necessary to switch modes, the software must reset the controller by writing to the RESET bit in the USBCMD register before reprogramming this register. value 00 = Idle [default for combination host/device] value 01 = Reserved value 10 = Device controller [default for device only controller] value 11 = Host controller [default for host only controller]

0x180001AC FS1_USB_OTG_HS_ENPDTSETUPSTAT

Type: Read/write control
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENPDTSETUPSTAT register is the endpoint set-up status register.

FS1_USB_OTG_HS_ENPDTSETUPSTAT

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.

FS1_USB_OTG_HS_ENPDTSETUPSTAT (cont.)

Bits	Name	Description
15:0	ENDPTSETUPSTAT_15_0	Set-up endpoint status For every set-up transaction that is received, a corresponding bit in this register is set (1). The software must clear or acknowledge the setup transfer by setting (1) a respective bit after it has read the setup data from the queue head. The response to a set-up packet as in the order of operations and total response time is crucial to limit bus time outs while the set-up lock-out mechanism is engaged. This register is only used in the device mode.

0x180001B0 FS1_USB_OTG_HS_ENDPTPRIME

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTPRIME register is the endpoint initialization register. This register is only used in the device mode.

FS1_USB_OTG_HS_ENDPTPRIME

Bits	Name	Description
31:16	PETB_15_0	Prime endpoint transmit buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a transmit operation in order to respond to a USB IN/INTERRUPT transaction. The software should set (1) the corresponding bit when posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a transmit buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. PETB[15] - Endpoint 15 PETB[1] - Endpoint 1 PETB[0] - Endpoint 0

FS1_USB_OTG_HS_ENDPTPRIME (cont.)

Bits	Name	Description
15:0	PERB_15_0	Prime endpoint receive buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a receive operation for when a USB host initiates a USB OUT transaction. The software should set (1) the corresponding bit whenever posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x180001B4 FS1_USB_OTG_HS_ENDPTFLUSH

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTFLUSH register is the endpoint de-initialize register. This register is only used in the device mode.

FS1_USB_OTG_HS_ENDPTFLUSH

Bits	Name	Description
31:16	FETB_15_0	Flush endpoint transmit buffer Setting (1) a bit in this register will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. FETB[15] - Endpoint 15 FETB[1] - Endpoint 1 FETB[0] - Endpoint 0
15:0	FERB_15_0	Flush endpoint receive buffer Setting a bit (1) will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. Bit 15 - Endpoint 15 Bit 1 - Endpoint 1 Bit 0 - Endpoint 0

0x180001B8 FS1_USB_OTG_HS_ENDPTSTAT

Type: Read-only
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTSTAT register is the endpoint status register. This register is only used in the device mode.

FS1_USB_OTG_HS_ENDPTSTAT

Bits	Name	Description
31:16	ETBR_15_0	Endpoint transmit buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ETBR[15] - Endpoint 15 ETBR[1] - Endpoint 1 ETBR[0] - Endpoint 0
15:0	ERBR_15_0	Endpoint receive buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ERBR[15] - Endpoint 15 ERBR[1] - Endpoint 1 ERBR[0] - Endpoint 0

0x180001BC FS1_USB_OTG_HS_ENDPTCOMPLETE

Type: Read/write control
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The register is the endpoint complete register. This register is only used in the device mode.

FS1_USB_OTG_HS_ENDPTCOMPLETE

Bits	Name	Description
31:16	ETCE_15_0	Endpoint transmit complete event Each bit indicates that a transmit event (IN/INTERRUPT) occurred and the software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ETCE[15] - Endpoint 15 ETCE[1] - Endpoint 1 ETCE[0] - Endpoint 0
15:0	ERCE_15_0	Endpoint receive complete event Each bit indicates that a received event (OUT/SETUP) occurred and the software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ERCE[15] - Endpoint 15 ERCE[1] - Endpoint 1 ERCE[0] - Endpoint 0

0x180001C0 FS1_USB_OTG_HS_ENDPTCTRL0

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00800080

The USB_OTG_HS_ENDPTCTRL0 register is the endpoint control 0 register. Every device will implement endpoint0 as a control endpoint.

FS1_USB_OTG_HS_ENDPTCTRL0

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

FS1_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
23	TXE	Tx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
22:20	RESERVED_BITS22_20	Clear (0) these bits.
19:18	TXT	Tx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
17	RESERVED_BIT17	Clear (0) this bit.
16	TXS	Tx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
6:4	RESERVED_BITS6_4	Clear (0) these bits.
3:2	RXT	Rx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
1	RESERVED_BIT1	Clear (0) this bit.

FS1_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
0	RXS	Rx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

0x180001C0+4*n FS1_USB_OTG_HS_ENDPTCTRLn, n=[1..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_ENDPTCTRLn register is the endpoint control n register. There is an ENDPTCTRLn register for each endpoint in a device.

CAUTION If one endpoint direction is enabled and the paired endpoint of the opposite direction is disabled, then the unused direction type must be changed from the default control-type to any other type (such as bulk-type). Leaving an unconfigured endpoint control will cause undefined behavior for the data PID tracking on the active endpoint/direction.

FS1_USB_OTG_HS_ENDPTCTRLn

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23	TXE	Tx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

FS1_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
22	TXR	Tx data toggle reset (WS) value 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and device.
21	TXI	Tx data toggle inhibit value 0 = PID sequencing enabled (default) value 1 = PID sequencing disabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always transmit DATA0 for a data packet.
20	RESERVED_BIT20	Clear (0) this bit.
19:18	TXT	Tx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
17	TXD	Tx endpoint data source value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
16	TXS	Tx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. in most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

FS1_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
6	RXR	Rx data toggle reset (WS) Write 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and the device.
5	RXI	Rx data toggle inhibit value 0 = Disabled (default) value 1 = Enabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always accept a data packet regardless of their data PID.
4	RESERVED_BIT4	Clear (0) this bit.
3:2	RXT	Rx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
1	RXD	Rx endpoint data sink value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
0	RXS	Rx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. in most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

0x180001FC+4*n FS1_USB_OTG_HS_ENDPT_PIPE_IDn, n=[1..15]

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x001F001F

The USB_OTG_HS_ENDPT_PIPE_IDn register is the endpoint pipe number register. There is an USB_OTG_HS_ENDPT_PIPE_IDn register for each endpoint in a device.

NOTE Reset value of TX_PIPE_ID and RX_PIPE_ID is 0x1F, which means that Endpoint is not mapped to any pipe.

FS1_USB_OTG_HS_ENDPT_PIPE_IDn

Bits	Name	Description
31:21	RESERVED_BITS31_21	Clear (0) these bits.
20:16	TX_PIPE_ID	This field indicate the pipe number that this tx end point (n) will use in pipe mode.
15:5	RESERVED_BITS15_5	Clear (0) these bits.
4:0	RX_PIPE_ID	This field indicate the pipe number that this rx end point (n) will use in pipe mode.

0x18000240 FS1_USB_OTG_HS_PHY_CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0b1110000111010

The USB_OTG_HS_PHY_CTRL register is used to configure various features in the Synopsys 28nm PHY.

FS1_USB_OTG_HS_PHY_CTRL

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	USB2_PHY_IDHV_CLAMP_EN	Clamp enable for IDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and IDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped high. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
11	USB2_PHY_OTGSESSVLDHV_CLAMP_EN	Clamp enable for OTGSESSVLDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and OTGSESSVLDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.

FS1_USB_OTG_HS_PHY_CTRL (cont.)

Bits	Name	Description
10	PHY_MPM_HV_CLAMP_EN	Clamp enable for HV interrupts level shifters from USB VDD180 domain to VDDPAD MPM in usb2 phy wrapper. When set (1), VLS is active and HV interrupts are translated from 1.8V domain to MPM Vdd domain. When clear (0), VLS is clamped to inactive state. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
9	USB2_PHY_OTGSESSVLD HV_INTEN	Enable HV session valid interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
8	USB2_PHY_IDHV_INTEN	Enable HV id pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
7	USB2_PHY_ULPI_POR	Reset for ULPI PHY Wrapper and ULPI clock domain logic in usb2_phy_wrapper.
6:4	USB2_PHY_FSEL	Reference Clock Frequency Select 011 (Assumes 19.2MHz default)
3	HOST_PORTCTRL_FORCE _SUSEN	Chicken bit for CR-0000153908 - when this bit set the core will enter to low power mode when portctrl host sm enter to suspend mode. Default value is 1.
2	USB2_PHY_SIDDQ	IDDQ Test Enable.
1	USB2_PHY_RETEN	Retention mode enable/disable
0	USB2_PHY_POR	Power-On-Reset (Analog configuration needs to happen before POR is set to 0)

0x18000244 FS1_USB_OTG_HS_GENERIC1

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

The USB_OTG_HS_GENERIC1 register.

FS1_USB_OTG_HS_GENERIC1

Bits	Name	Description
31:16	USB_HS_TX_DEPTH	TX_DEPTH is the number of words in the TX buffer. This number is calculated by the number of bytes allocated per Endpoint divided by 4, times the number of endpoints. The RAM width is 36. In HS USB this value is usually 512 bytes per EP, and for FS ONLY USB it is usually 64 Bytes per EP.
15:0	USB_HS_RX_DEPTH	RX_DEPTH is the number of words in the RX buffer. This number is usually 256, but can support powers of 2 up to 4096. The RAM width is 36.

0x18000248 FS1_USB_OTG_HS_GENERIC2

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0xXXXXXXXX

The USB_OTG_HS_GENERIC2 register.

FS1_USB_OTG_HS_GENERIC2

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15	USE_SPS_AHB2AHB	USE_SPS_AHB2AHB generic specifies if AHB2AHB bridge is connected between BAM and SPS Fabric AHB.
14	LPM_SUPPORT	The LPM_SUPPORT generic specifies if USB support Link Power Management.
13:9	USB_HS_DEV_EP	The number of USB endpoints. Valid values for the number of Endpoints are 4, 8, and 16
8:3	MAX_PIPES	The number of simultaneous parallel pipes supported by the BAM. Supported values are 2 to 30
2	USE_SPS	The USE_SPS generic specifies if Bam is connected to USB core.
1	USE_HSIC	The USE_HSIC generic specifies if an HSIC is connected to USB core.
0	UTMI_PHY_SW_IF_EN	The UTMI_PHY_SW_IF_EN generic specifies if UTMI phy Register Interface is enabled

0x18000250 FS1_USB_OTG_HS_L1_EP_CTRL

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0000FFFF

The USB_OTG_HS_L1_EP_CTRL register enables/disables transition to L1 and exit from L1 state when specific TX endpoints are primed.

FS1_USB_OTG_HS_L1_EP_CTRL

Bits	Name	Description
31:16	TX_EP_PRIME_L1_EXIT	Those bit's enables Remote Wakeup in L1 state when SW starts Priming The specific Endpoint.
15:0	TX_EP_PRIME_L1_EN	Control bit's that enables/disables transition to L1 when the specific TX Endpoint is active.

0x18000254 FS1_USB_OTG_HS_L1_CONFIG

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x00000000

The USB_OTG_HS_L1_CONFIG register is used to configure various L1 features.

FS1_USB_OTG_HS_L1_CONFIG

Bits	Name	Description
31:12	RESERVED_BITS31_12	Clear (0) these bits.
11	PLL_PWR_DWN_EN	Control bit that enables/disables power down of 480 MHZ PLL in L1 state.
10	PHY_LPM_EN	Control bit that enable/disables entering ULPI Low Power Mode in L1 state
9	GATE_AHB_CLK_EN	Control bit that enable/disables clock request signaling for usb_ahb_clk in L1 state
8	GATE_FS_XCVR_CLK_EN	Control bit that enable/disables clock gating of usb_fs_xcvr_clk in L1 state
7	GATE_SYS_CLK_EN	Control bit that enable/disables clock gating of usb_system_clk in L1 state
6	GATE_XCVR_CLK_EN	Control bit that enable/disables power-down of 480 MHz PLL in L1 state
5	L1_REMOTE_WAKEUP_EN	Control bit that enables/disables Remote Wakeup in L1 state. When this bit is low, then Link Controller never initiates Remote Wakeup in L1 state. When this bit is high, Link Controller can initiate Remote Wakeup.
4	LPM_EN	Control bit that enables/disables LPM support. When this bit is zero a full backward compatibility is ensured - no LPM support and no response for LPM Extended Transaction
3:0	PLL_TURNOFF_MIN_HIRD	Specifying a minimum expected HIRD value from Host that enables HW mechanism for turning off the 480 MHz PLL. The default value is 50us.

0x18000258 FS1_USB_OTG_HS_LPM_DEBUG_1

Type: Read/Clear
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_DEBUG_1 register is for debug and testing purposes mostly.

FS1_USB_OTG_HS_LPM_DEBUG_1

Bits	Name	Description
31:16	DEBUG_L1_LONG_ENT_CNT	Count number of exits from L1 where duration in L1 is > 200us. Writing to this register clears the counter.
15:0	DEBUG_L1_SHORT_ENT_CNT	Count number of exits from L1 where duration in L1 is <= 200us. Writing to this register clears the counter.

0x1800025C FS1_USB_OTG_HS_LPM_DEBUG_2

Type: Read/Write
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_DEBUG_2 register is for debug and testing purposes mostly.

FS1_USB_OTG_HS_LPM_DEBUG_2

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12:9	L1_RMT_WKUP_TIME	Read/write Specifying How much time the device drives remote wakeup. The default Value is 50us for reset value. Add the value of this register (in us) to the remote wakeup time.
8	L1_FPR	Read/write L1 Force port resume, The software sets (1) this bit to drive resume signaling.
7	HSIC_CLK_PLL_BYPASSNL	Read only. Disables PLL analog logic. Active low. Connects to bypassnl input of NT_PLL.
6	HSIC_CLK_PLL_RESET	Read only. Resets all FF in PLL. Active low. Connects to reset_n input of NT_PLL.
5	HSIC_CLK_GATE	Read only. Clock gating of hsic_clk and ulpi_clk, without turning off HSIC PLL.
4	FS_XCVR_CLK_GATE	Read only. Clock gating of cc_usb_xcvr_fs_clk
3	SYS_CLK_GATE	Read only. Clock gating of cc_usb_system_clk
2	AHB_CLK_GATE	Read only. Clock gating of usb_ahb_clk

FS1_USB_OTG_HS_LPM_DEBUG_2 (cont.)

Bits	Name	Description
1	L1_STATE	Read only. Status bit indicating if Device is in L1 state. When this bit high, Link Controller and HSIC PHY are in L1 state
0	DEBUG_L1_EN	Read/write Control bit that enable/disables DEBUG counters operation.

0x18000260 FS1_USB_OTG_HS_LPM_ATTRIBUTES

Type: Read
Clock: CC_USB_OTG_HS_CLK
Reset State: 0x0

The USB_OTG_HS_LPM_ATTRIBUTES register store the bmAttribute Field of the LPM transaction.

FS1_USB_OTG_HS_LPM_ATTRIBUTES

Bits	Name	Description
31:5	RESERVED_BITS31_5	Clear (0) these bits.
4	BREMOTEWAKE	A value of one (1B) in this field enables the addressed device to wake the host upon any meaningful application-specific event (e.g. an interrupt for a device with one or more interrupt endpoints). A value of zero (0B) disables the device from initiating remote wake.
3:0	HIRD	Host Initiated Resume Duration.

2.5 TSIF Registers (0x18200000 TSIF_BASE)

This section contains TSIF registers.

2.5.1 TSIF status and control

0x18200000 TSIF_STATUS_AND_CONTROL

Type: Read/Write
Clock: CRIF_WR_CLK
Reset State: 0x04000000

The Status and Control Register contains six fields: Interrupt Enable, Status, Polarity, Configuration, Stop, and Start.

The Start field is located in bit[0] and controls overall operation of the TSIF. A zero value in this field indicates the TSIF is disabled and not running. A one written to this field starts the TSIF.

The Stop field is located in bit 3. Writing a one to this bit clears the Start field to zero and stops the TSIF while writing a zero has no effect. It always reads the value zero.

The EHI Configuration field is located in bits[11:9] and controls the configuration of the EHI as detailed in the description. The Internal Configuration field is located in bits[6:4] and controls internal TSIF operations.

The Polarity field is located in bits [21:16] and controls the expected polarity of signals of the EHI.

After the Start field has been written to a one, the Polarity, Configuration, and Start fields are write protected. Only the Stop field may be written. This protects the operational state of the TSIF and facilitates manipulation of the Status field when the TSIF is running.

The Status field is located in bits [27:23] and contains packet available, first packet, overflow, lost sync and timeout state respectively. The last three apply regardless of Internal Configuration. Packet available applies only when the Data Mover is not used.

Bit 28 controls the generation of interrupts. The TSIF interrupt output is a level that remains asserted as long as TSIF_EN_INTER is set and bit 27, 25, or 24 is set.

TSIF_STATUS_AND_CONTROL

Bits	Name	Description
31:29	RESERVED_1	Writes have no effect but by convention, always write zero. Reads zero.
28	TSIF_EN_INTER	Enables tsif_intr output to be asserted on an interrupt condition if high. If enabled, the interrupt level is asserted by the TSIF as the 'OR' of bits 27, 25, and 24.

TSIF_STATUS_AND_CONTROL (cont.)

Bits	Name	Description
27	TSIF_PACK_AVAIL	Set by TSIF when a 188 byte HTS packet plus four byte status are available. Only set when TSIF_EN_DM is set low. When set, it indicates that software should read 192 bytes from the Data Register. Cleared by software by writing a one. Writing zero has no effect. Never cleared by the TSIF
26	TSIF_FIRST_PACKET	Reflects the current state of the first-packet-flag. Read only from software. Never generates an interrupt.
25	TSIF_OVERFLOW	Set by TSIF when an overflow condition occurs. Cleared by software by writing a one. Writing a zero has no effect. Never cleared by the TSIF.
24	TSIF_LOST_SYNC	Set by TSIF when a lost sync condition occurs. Cleared by software by writing a one. Writing a zero has no effect. Never cleared by the TSIF.
23	TSIF_TIMEOUT	Set by TSIF when a timeout condition occurs. Cleared by software by writing a one. Writing a zero has no effect. Never cleared by the TSIF.
22	RESERVED_2	Writes have no effect but by convention, always write zero. Reads zero.
21	TSIF_INV_SYNC	Invert the external indicator tsif_sync.
20	TSIF_INV_NULL	Invert the external discrimination flag tsif_null.
19	TSIF_INV_ERROR	Invert the external error flag input tsif_error.
18	TSIF_INV_ENABLE	Invert the external enable input tsif_en.
17	TSIF_INV_DATA	Invert the external data input tsif_data.
16	TSIF_INV_CLOCK	Invert the external clock input tsif_clock.
15	SPARE_SW_BIT	programmable read/write spare SW bit
14:12	RESERVED_3	Writes have no effect but by convention, always write zero. Reads zero.
11	TSIF_EN_NULL	Enable the sample and reporting of the value of the tsif_null input.
10	TSIF_EN_ERROR	Enable the sample and reporting of the value of the tsif_error input.
9	TSIF_LAST_BIT	If high, sample tsif_null and tsif_error on the last bit of the packet.
8	TSIF_EN_TIME_LIMIT	Enables the use of the Time Limit if set.
7	TSIF_EN_TCR	Enables the TSIF Clock Reference (TCR) to run at TSIF_START.
6:5	TSIF_MODE	Set 00 - TSIF Mode 1 is used at TSIF_START. Set 01 - TSIF Mode 2 is used at TSIF_START. Set 10 - TSIF Loop-back Mode is used at TSIF_START. Set 11 - Reserved but implemented as Loop-back.

TSIF_STATUS_AND_CONTROL (cont.)

Bits	Name	Description
4	TSIF_EN_DM	Enables use of the Data Mover request acknowledge interface when set. When clear, the availability of a 188 byte HTS packet plus status is signaled via the assertion of TSIF_PACK_AVAIL.
3	TSIF_STOP	Stops the TSIF operation when written to a one. Writing a zero has no effect. Always reads zero.
2:1	RESERVED_4	Writes have no effect but by convention, always write zero. Reads zero.
0	TSIF_START	Write Operations: Set 0 - Has no effect. Set 1 - Starts the TSIF operation and begins the input of HTS packets After this field is written to a one, all bits in the range [23:0] are write-protected except bit 3. Read Operations return the current bit value.

2.5.2 TSIF time limit

0x18200004 TSIF_TIME_LIMIT

Type: Read/Write
Clock: CRIF_WR_CLK
Reset State: 0x0

The time unit of this register is the period of tsif_ref_clk. tsif_ref_clk equals 27MHz/256. This yields a 9.48 micro second period.

The LIMIT may be read or written at anytime regardless of the state of TSIF_START.

TSIF_TIME_LIMIT

Bits	Name	Description
31:29	RESERVED_1	Writes have no effect but by convention, always write zero. Reads zero.
28	TSIF_TIME_LIMIT_IMM_LOAD	When this bit is set with a write to this register, the new TSIF_TIME_LIMIT value is loaded immediately into the Time Limit Counter. Otherwise it is loaded only when TSIF_START is set, or when last bit of 'Valid Packet' is received. Setting this bit is allowed only when no packets are currently arriving. ' Write only bit.
27:24	RESERVED_2	Writes have no effect but by convention, always write zero. Reads zero.

TSIF_TIME_LIMIT (cont.)

Bits	Name	Description
23:0	TSIF_TIME_LIMIT	The time-limit indicates the amount of time which is allowed to pass between each valid-packet written to system memory (time between the END of one packet to the END of next one). If this timer expires, then a timeout-status is reported.

2.5.3 TSIF clock reference (TCR) counter

0x18200008 TSIF_CLOCK_REF_COUNTER

Type: Read/Write
Clock: CRIF_CLK
Reset State: 0x0

This counter runs off the crif_clk and may be written or read at anytime. It increments relative to a tsif_ref_clk. tsif_ref_clk is equal to 27 MHz/256. Therefore the TCR increments at a rate equal to 27 MHz/256 = 105.47 kHz. This yields a 9.48 micro second period, which is faster than the equivalent H.222.0 reference clock of 27 MHz/300 = 90 kHz with a 11.11 micro second period. Specifically, 105 kHz provides the required clock resolution but in different time units.

Bits [23:0] of the TCR are used to form the TTS provided as part of the packet status loaded into memory with each H.222.0 packet. The TTS rolls over every 159.07 seconds or approximately every 2.65 minutes. The TCR rolls over every 678.71 minutes or approximately every 11.31 hours.

- Note: Read or Write to the register should be performed at least one tsif_ref_clk cycle after the previous write to the register has been performed.

TSIF_CLOCK_REF_COUNTER

Bits	Name	Description
31:24	TSIF_TCR_HIGH	The high bits of the TCR Counter.
23:0	TSIF_TTS	The TTS provided in each packet status.

2.5.4 TSIF loop back flags

0x1820000C TSIF_LOOP_BACK_FLAGS

Type: Read/Write
Clock: CRIF_WR_CLK
Reset State: 0x0

This register is used for loop back operations.

TSIF_LOOP_BACK_FLAGS

Bits	Name	Description
31	RESERVED_1	Writes have no effect but by convention, always write zero. Reads zero.
30	TSIF_LPBK_PT_FLAG	Loop back Post tsif_en Flag.
29	TSIF_LPBK_NULL_FLAG	Loop back Null Flag.
28	TSIF_LPBK_ERROR_FLAG	Loop back Error Flag.
27:26	RESERVED_2	Writes have no effect but by convention, always write zero. Reads zero.
25	TSIF_LPBK_PKT_LAST	Loop back last packet word indicator.
24	TSIF_LPBK_PKT_START	Loop back starting packet word indicator.
23:0	RESERVED	Writes have no effect but by convention, always write zero. Reads zero.

2.5.5 TSIF loop back data

0x18200010 TSIF_LOOP_BACK_DATA

Type: Read/Write
Clock: CRIF_WR_CLK
Reset State: 0x0

This register is used for loop back operations.

TSIF_LOOP_BACK_DATA

Bits	Name	Description
31:0	TSIF_LPBK_DATA	Loop back packet data.

2.5.6 Test bus control

0x18200014 TSIF_TEST_CTRL

Type: Read/Write
Clock: CRIF_CLK
Reset State: 0x0

This register is used for test bus enable and selection.

TSIF_TEST_CTRL

Bits	Name	Description
31:5	RESERVED_1	unused.
4	TEST_BUS_EN	Test bus enable bit, if zero the test bus output is driven to zero.
3	RESERVED_2	unused.
2:0	TEST_BUS_SEL	Test bus selection: '000': control_test_bus0 '001': control_test_bus1 '010': protocol_test_bus0 '011': protocol_test_bus1 '100': testbus_out (MISR) else: test bus output is driven to zero

2.5.7 TSIF MISR test mode

0x18200018 TSIF_TEST_MODE

Type: Read/Write
Clock: CRIF_WR_CLK
Reset State: 0x0

MISR test mode register

TSIF_TEST_MODE

Bits	Name	Description
31:2	RESERVED	unused.
1:0	MODE	Set 00: Disabled Set 01: Enabled, Test Mode 1 - the input to the MISR is the data written toward the RAM Set 10: Enabled, Test Mode 2 - the input to the MISR is the data read from the RAM

2.5.8 MISR TEST MISR reset

0x1820001C TSIF_TEST_MISR_RESET

Type: Write
Clock: CRIF_WR_CLK
Reset State: Undefined

A write to this register will reset the MISR state. This need to be done after setting the test mode register to a non-zero value.

TSIF_TEST_MISR_RESET

Bits	Name	Description
31:1	RESERVED	unused.
0	RESET	

2.5.9 TSIF test export MISR

0x18200020 TSIF_TEST_EXPORT_MISR

Type: Read/Write
Clock: WR_CLK
Reset State: 0x0

This register controls what is sent on testbus. A value of '0' (reset value) will send the data that is going into the MISR on the testbus. A value of '1' will send the current MISR state onto the testbus. The latter option is typically used for debug purposes. For example, if your final MISR signature failed, you might want to know where it failed (i.e., right in the beginning or somewhere else).

TSIF_TEST_EXPORT_MISR

Bits	Name	Description
31:1	RESERVED	unused.
0	EXPORT	When clear (0), testbus is driven by what is sent into the MISR. (i.e., what is the result of the muxing of all the input data streams with <BLOCK>_TEST_MODE) When set (1), testbus is driven by the current state of the MISR. (debug typically)

2.5.10 TSIF test MISR CURR VAL

0x18200024 TSIF_TEST_MISR_CURR_VAL

Type: Read
Clock: WR_CLK
Reset State: Undefined

A read from this address will return the current MISR state for this block. Keep in mind that this could change every cycle depending on how it is used.

TSIF_TEST_MISR_CURR_VAL

Bits	Name	Description
31:0	VAL	Current MISR state

2.5.11 TSIF data port

0x18200100 TSIF_DATA_PORT

Type: Read Only
Clock: CRIF_CLK
Reset State: Undefined

At the core level, this register has a separate select so it can be located in an address space separate from the other registers. The product specific wrapper establishes the address.

When a packet is available, 48 reads are expected to this register or data port. This provides the 188 byte Transport Stream packet followed by a four-byte status word. If additional reads are made, then the crif_error signal is asserted. Once a packet is available, it must be completely read in order for an additional packet to be made available. If too few words are read and a new packet is available, then the new packet is discarded with a resulting TSIF_OVERFLOW status condition. Writing this register also causes the crif_error signal to be asserted.

TSIF_DATA_PORT

Bits	Name	Description
31:0	TSIF_DATA	HTS packet data plus a status word.

2.6 TSPP registers (0x18202000 TSPP_BASE)

This section contains TSPP registers.

2.6.1 TSPP control, configuration and status registers (register based)

0x18202000 TSPP_RST

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

This is the SW reset register.

TSPP_RST

Bits	Name	Description
0	TSPP_SW_RESET	When set(1), all functional modules of TSPP block are reset. SW is responsible to clear(0) TSPP_SW_RESET to get TSPP block out of reset. ¨ TSPP RAM is not reset. To reset TSPP RAM SW should explicitly write the values into the RAM. ¨ All SW registers configured by SW are not reset. ¨ All SW registers including RAM may be configured when TSPP_SW_RESET is set(1).

0x18202004 TSPP_CLK_CONTROL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

This is TSPP block clock control register. It is used to disable/enable different TSPP block clocks.

TSPP_CLK_CONTROL

Bits	Name	Description
9	FORCE_CRYPTO_CLK_OPEN	When set(1), crypto_clk CGC forced open.
8	FORCE_PES_PL_CTRL_CLK_OPEN	When set(1), pes_asmb_clk CGC forced open.
7	FORCE_PES_AF_CTRL_CLK_OPEN	When set(1), pes_pre_proc_clk CGC forced open.
6	FORCE_RAW_CTRL_CLK_OPEN	When set(1), raw_ctrl_clk CGC forced open.

TSPP_CLK_CONTROL (cont.)

Bits	Name	Description
5	FORCE_PERF_CNT_CLK_OPEN	When set(1), perf_cnt_clk CGC forced open.
4	FORCE_CTX_SEARCH_CLK_OPEN	When set(1), ctx_search_clk CGC forced open.
3	FORCE_TSP_PROC_CLK_OPEN	When set(1), tsp_proc_clk CGC forced open.
2	FORCE_CONS_AHB2MEM_CLK_OPEN	When set(1), cons_ahb2mem_clk CGC forced open.
1	FORCE_TS_AHB2MEM_CLK_OPEN	When set(1), ts_ahb2mem_clk CGC forced open.
0	SET_CLKON	When set(1), tspp_clkon signal is constantly set to '1'. When clear(0), tspp_clkon signal is dynamically controlled by TSPP HW.

0x18202008 TSPP_CONFIG

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x7F

This is TSPP block configuration register. The register configures TSPP block functionality. This register value may be updated only when TSPP is not active (no TS PKTs are currently processed).

TSPP_CONFIG

Bits	Name	Description
15:8	PKT_LENGTH	Length of received packet. PKT_LENGTH = 188 + SUFFIX_LENGTH. In case of packet from consumer pipe: ¨ The packet is read from consumer pipe and only 188 bytes with 4 bytes if zero padding are written to TSPP RAM. Those 192 bytes will be parsed by TSPP. Rest of bytes are discarded. In case of packet coming from TSIF: ¨ TSIF removes the unneeded suffix, and adds its suffix. In this case PKT_LENGTH value is not used. PKT length is always multiple of 4 bytes, so the two LSB bits of PKT_LENGTH are ignored.

TSPP_CONFIG (cont.)

Bits	Name	Description
7	DUP_WITH_DISC_EN	Duplicate with discontinuity enabled bit. When this bit is clear(0): ¨ It is assumed that duplicate packets don't arrive with discontinuity_indicator set. This means that when discontinuity_indicator is set, continuity_counter is not tested, and the PKT is not considered duplicate. When this bit is set(1): ¨ It is assumed that duplicate packets may arrive with discontinuity_indicator set. This means that when discontinuity_indicator is set, and continuity_counter is the same as in the previous TS PKT, the packet is considered duplicate and discarded. ¨ In case of a duplicate TS PKT with payload_unit_start_indicator = '1', discontinuity_indicator = '1' and unspecified_pes_length = '1', In this case the duplicated PKT will be passed as a complete PES. The PKT will not be considered duplicate.
6	PES_SYNC_ERROR_MASK	When this bit is clear(0), packet_start_code_prefix (0x000001) is not tested. This means that if packet with payload_unit_start_indicator is received with wrong packet_start_code_prefix: ¨ TSP packet is not discarded. ¨ PES construction starts. ¨ PS_BROKEN interrupt is not set.
5	PS_LENGTH_ERR_AT_UNSP_MASK	This bit is related to the following error condition: ¨ payload_unit_start_indicator == 1 ¨ PS_STATE = PS_CONSTRUCTING. ¨ unsp_pes_length = '0' This error condition tells that new PES starts, before the previous PES terminated, and the previous PES is not of unspecified length. When this bit is clear(0), error condition described above is not tested. This means that: ¨ TSP packets is not discarded. ¨ Construction of the unspecified length PES completes (if there is no continuity_error). ¨ PS_BROKEN interrupt is not set.
4	PS_CONT_ERR_AT_UNSP_MASK	This bit is related to continuity_error between last TSP of unspecified length PES to the first TSP of next PES. When this bit is clear(0), continuity error described above is not tested. This means that: ¨ TSP packets is not discarded. ¨ Construction of the unspecified length PES completes. ¨ PS_BROKEN interrupt is not set.

TSPP_CONFIG (cont.)

Bits	Name	Description
3	PS_CONTINUITY_ERROR_MASK	This bit is related to continuity_error between TSPs in the same PES. When this bit is clear(0), continuity error described above is not tested. This means that: ¨ TSP packets is not discarded. ¨ Constructed PES is not discarded. ¨ PS_BROKEN interrupt is not set.
2	PS_DUPLICATE_TSP_MASK	When this bit is clear(0), while PES processing, duplicate TSP packets are not discarded.
1	TSP_ERROR_INDICATOR_MASK	When this bit is clear(0), transport_error_indicator bit is not tested.
0	TSP_SYNC_ERROR_MASK	When this bit is clear(0), sync_byte (0x47) is not tested.

0x1820200C TSPP_CONTROL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

This is TSPP block control register. The register controls TSPP block functionality. This register value may be updated while TSPP block operation.

TSPP_CONTROL

Bits	Name	Description
5	PID_FILTER_LOCK	When this bit is set(1), TSPP doesn't access PID filter table. This bit is only for test purposes, and should be always cear(0). Otherwise TS PKTs will be lost due to overflow.
4	FORCE_KEY_CALC	When this bit is clear(0): TSPP performs data key fetch only if decryption is required and data_key was changed. And as a result multi2 performs key calculation only in this case. When this bit is set(1): TSPP performs data key fetch each time decryption is required, even if the key hasn't changed.
3	TSP_CONS_SRC_DISABLE	When this bit is set(1), TS PKTs located in BAM consumer pipe are not processed, till this bit is clear(0).
2	TSP_TSIF1_SRC_DISABLE	When this bit is set(1), TS PKTs received by TSIF 1 are not processed, till this bit is clear(0).
1	TSP_TSIF0_SRC_DISABLE	When this bit is set(1), TS PKTs received by TSIF 0 are not processed, till this bit is clear(0).

TSPP_CONTROL (cont.)

Bits	Name	Description
0	PERF_COUNT_INIT	Only when this bit is asserted SW is allowed to update performance counters values. The bit insures that the HW doesn't read or write any performance counter while SW is updating their values. The SW is responsible to de assert this bit when SW finished updating performance counters values. To reset any performance counter, SW should write zero value to the corresponding performance counter register.

0x18202010 TSPP_PS_DISABLE

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

This is TSPP block PS disable register. The register is used to allow SW to reconfigure PID filter table while TSPP is active. More details exist in the following table.

TSPP_PS_DISABLE

Bits	Name	Description
15	PS_DISABLE15	PS_DISABLE for pipe number 15. Same as PS_DISABLE0.
14	PS_DISABLE14	PS_DISABLE for pipe number 14. Same as PS_DISABLE0.
13	PS_DISABLE13	PS_DISABLE for pipe number 13. Same as PS_DISABLE0.
12	PS_DISABLE12	PS_DISABLE for pipe number 12. Same as PS_DISABLE0.
11	PS_DISABLE11	PS_DISABLE for pipe number 11. Same as PS_DISABLE0.
10	PS_DISABLE10	PS_DISABLE for pipe number 10. Same as PS_DISABLE0.
9	PS_DISABLE9	PS_DISABLE for pipe number 9. Same as PS_DISABLE0.
8	PS_DISABLE8	PS_DISABLE for pipe number 8. Same as PS_DISABLE0.
7	PS_DISABLE7	PS_DISABLE for pipe number 7. Same as PS_DISABLE0.
6	PS_DISABLE6	PS_DISABLE for pipe number 6. Same as PS_DISABLE0.
5	PS_DISABLE5	PS_DISABLE for pipe number 5. Same as PS_DISABLE0.
4	PS_DISABLE4	PS_DISABLE for pipe number 4. Same as PS_DISABLE0.
3	PS_DISABLE3	PS_DISABLE for pipe number 3. Same as PS_DISABLE0.
2	PS_DISABLE2	PS_DISABLE for pipe number 2. Same as PS_DISABLE0.
1	PS_DISABLE1	PS_DISABLE for pipe number 1. Same as PS_DISABLE0.

TSPP_PS_DISABLE (cont.)

Bits	Name	Description
0	PS_DISABLE0	SW should set(1) this bit when updating PID filter entries that point to pipe number 0. In case of RAW processing, PID filter entries may be updated without setting this bit. When this bit is set(1), all TS PKTs that PID points to PID filter entry that points to pipe number 0, are ignored. When this bit is cleared(0) after it was set, the next TS PKT that is routed to pipe number 0, is retransmitted (pushed to the beginning of pipe number 0). The details regarding PID filter reconfiguration while TSPP is active, are described in SW procedures.

2.6.2 TSPP messaging interrupt registers (register based)

0x18202014 TSPP_MSG_IRQ_STATUS

Type: Read
Clock: AHB_CLK
Reset State: 0x0

This is the TSPP messaging interrupt status register.

TSPP_MSG_IRQ_STATUS

Bits	Name	Description
2	TSPP_IRQ	TSPP interrupt line value. To clear TSPP_IRQ, TSPP interrupt line should be cleared by writing to TSPP_IRQ_CLEAR register.
1	TSIF_1_IRQ	TSIF 1 interrupt line value. To clear TSIF_1_IRQ, TSIF 1 interrupt line should be cleared by writing to TSIF 1 registers.
0	TSIF_0_IRQ	TSIF 0 interrupt line value. To clear TSIF_0_IRQ, TSIF 0 interrupt line should be cleared by writing to TSIF 0 registers.

0x18202018 TSPP_MSG_IRQ_MASK

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

This is the TSPP messaging interrupt mask register.

TSPP_MSG_IRQ_MASK

Bits	Name	Description
2	TSPP_IRQ	Mask bit of TSPP_IRQ.

TSPP_MSG_IRQ_MASK (cont.)

Bits	Name	Description
1	TSIF_1_IRQ	Mask bit of TSIF_1_IRQ.
0	TSIF_0_IRQ	Mask bit of TSIF_0_IRQ.

2.6.3 TSPP interrupt registers (register based)

TSPP block interrupts are generated using only one level structure. All interrupt sources per all pipes are locate in the TSPP_IRQ_STATUS register.

0x1820201C TSPP_IRQ_STATUS

Type: Read
Clock: AHB_CLK
Reset State: 0x0

This is the TSPP interrupt status register. The bits in this register are sticky. In order to clear some bit in this register, corresponding bit should be set in the TSPP_IRQ_CLEAR register.

TSPP_IRQ_STATUS

Bits	Name	Description
19	TSP_RD_CMPL_IRQ	TS PKT read complete interrupt. The interrupt is set when TSPP has completed to fetch TS PKT from TSIF. The interrupt is only for test purposes, and it is used with TSIF loopback mode. SW sequence is as follows: ’ SW writes one TS PKT to TSIF in loopback mode. ’ TSPP fetches the PKT and sets the IRQ. ’ SW clears the IRQ and writes another TS PKT to TSIF, in parallel TSPP parses the previous TS PKT.
18	KEY_ERROR_IRQ	Key error interrupt. This interrupt is set when the required key for TS PKT decryption was not valid. In this case the TSP is discarded. TSPP_KEY_ERROR register contains the information regarding the key errors.
17	KEY_SWITCHED_ILLEGAL_IRQ	Key switched illegal interrupt is set each time when transport_scrambling_control in the TSP header is changed to non scrambled(’00’), or not defined(’01’), and the TSP contains payload. This means that adaptation_field_control is ’01’ or ’11’. When this interrupt is set, both key types, odd and even, for the selected key number, become non valid. SW should update the data key that became non valid. TSPP_KEY_VALID register contains the information regarding the valid keys.

TSPP_IRQ_STATUS (cont.)

Bits	Name	Description
16	KEY_SWITCHED_IRQ	Key switched interrupt is set each time when transport_scrambling_control in the TSP header is changed to scrambled with odd key or even key. When this interrupt is set, same key number with opposite key_type (delving) becomes non valid. SW should update the data key that became non valid. TSPP_KEY_VALID register contains the information regarding the valid keys.
15	PS_BROKEN15	PS_BROKEN interrupt for pipe number 15. Same as PS_BROKEN0.lobal interrupt.
14	PS_BROKEN14	PS_BROKEN interrupt for pipe number 14. Same as PS_BROKEN0.
13	PS_BROKEN13	PS_BROKEN interrupt for pipe number 13. Same as PS_BROKEN0.
12	PS_BROKEN12	PS_BROKEN interrupt for pipe number 12. Same as PS_BROKEN0.
11	PS_BROKEN11	PS_BROKEN interrupt for pipe number 11. Same as PS_BROKEN0.
10	PS_BROKEN10	PS_BROKEN interrupt for pipe number 10. Same as PS_BROKEN0.
9	PS_BROKEN9	PS_BROKEN interrupt for pipe number 9. Same as PS_BROKEN0.
8	PS_BROKEN8	PS_BROKEN interrupt for pipe number 8. Same as PS_BROKEN0.
7	PS_BROKEN7	PS_BROKEN interrupt for pipe number 7. Same as PS_BROKEN0.
6	PS_BROKEN6	PS_BROKEN interrupt for pipe number 6. Same as PS_BROKEN0.
5	PS_BROKEN5	PS_BROKEN interrupt for pipe number 5. Same as PS_BROKEN0.
4	PS_BROKEN4	PS_BROKEN interrupt for pipe number 4. Same as PS_BROKEN0.
3	PS_BROKEN3	PS_BROKEN interrupt for pipe number 3. Same as PS_BROKEN0.
2	PS_BROKEN2	PS_BROKEN interrupt for pipe number 2. Same as PS_BROKEN0.
1	PS_BROKEN1	PS_BROKEN interrupt for pipe number 1. Same as PS_BROKEN0.
0	PS_BROKEN0	PS_BROKEN interrupt per pipe number 0. The interrupt is set when one of the statuses in TSPP_PIPE_ERROR_STATUS0 register is set.

0x18202020 TSPP_IRQ_MASK

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

This is the TSPP interrupt mask register. This register is used to enable the corresponding functions in the TSPP_IRQ_STATUS register. Setting (1) a bit in the TSPP_IRQ_MASK register causes an interrupt to be generated, if the corresponding bit in the TSPP_IRQ_STATUS register is set. Clearing (0) a bit in the TSPP_IRQ_MASK register causes the setting of the corresponding bit in the TSPP_IRQ_STATUS register to have no effect on the interrupt.

TSPP_IRQ_MASK

Bits	Name	Description
19	TSP_RD_CMPL_IRQ	Mask bit if TSP_RD_CMPL_IRQ interrupt.
18	KEY_ERROR_IRQ	Mask bit of KEY_ERROR_IRQ interrupt.
17	KEY_SWITCHED_ILLEGAL_IRQ	Mask bit of KEY_SWITCHED_ILLEGAL_IRQ interrupt.
16	KEY_SWITCHED_IRQ	Mask bit of KEY_SWITCHED_IRQ interrupt.
15	PS_BROKEN15	Mask bit of PS_BROKEN interrupt for pipe number 15.
14	PS_BROKEN14	Mask bit of PS_BROKEN interrupt for pipe number 14.
13	PS_BROKEN13	Mask bit of PS_BROKEN interrupt for pipe number 13.
12	PS_BROKEN12	Mask bit of PS_BROKEN interrupt for pipe number 12.
11	PS_BROKEN11	Mask bit of PS_BROKEN interrupt for pipe number 11.
10	PS_BROKEN10	Mask bit of PS_BROKEN interrupt for pipe number 10.
9	PS_BROKEN9	Mask bit of PS_BROKEN interrupt for pipe number 9.
8	PS_BROKEN8	Mask bit of PS_BROKEN interrupt for pipe number 8.
7	PS_BROKEN7	Mask bit of PS_BROKEN interrupt for pipe number 7.
6	PS_BROKEN6	Mask bit of PS_BROKEN interrupt for pipe number 6.
5	PS_BROKEN5	Mask bit of PS_BROKEN interrupt for pipe number 5.
4	PS_BROKEN4	Mask bit of PS_BROKEN interrupt for pipe number 4.
3	PS_BROKEN3	Mask bit of PS_BROKEN interrupt for pipe number 3.
2	PS_BROKEN2	Mask bit of PS_BROKEN interrupt for pipe number 2.
1	PS_BROKEN1	Mask bit of PS_BROKEN interrupt for pipe number 1.
0	PS_BROKEN0	Mask bit of PS_BROKEN interrupt per pipe number 0.

0x18202024 TSPP_IRQ_CLEAR

Type: Write
Clock: AHB_CLK
Reset State: 0x0

This is the TSPP interrupt clear register. Setting one of this register bits generates a pulse that clears corresponding bit in TSPP_IRQ_STATUS. If one of the PS_BROKEN interrupt bits is cleared, then also all the status bits in the corresponding TSPP_PIPEn_ERROR_STATUS, n = [0..15] register are cleared.

TSPP_IRQ_CLEAR

Bits	Name	Description
19	TSP_RD_CMPL_IRQ	Clear bit of TSP_RD_CMPL_IRQ interrupt.
18	KEY_ERROR_IRQ	Clear bit of KEY_ERROR_IRQ interrupt.
17	KEY_SWITCHED_ILLEGAL_IRQ	Clear bit of KEY_SWITCHED_ILLEGAL_IRQ interrupt.
16	KEY_SWITCHED_IRQ	Clear bit of KEY_SWITCHED_IRQ interrupt.
15	PS_BROKEN15	Clear bit of PS_BROKEN interrupt for pipe number 15.
14	PS_BROKEN14	Clear bit of PS_BROKEN interrupt for pipe number 14.
13	PS_BROKEN13	Clear bit of PS_BROKEN interrupt for pipe number 13.
12	PS_BROKEN12	Clear bit of PS_BROKEN interrupt for pipe number 12.
11	PS_BROKEN11	Clear bit of PS_BROKEN interrupt for pipe number 11.
10	PS_BROKEN10	Clear bit of PS_BROKEN interrupt for pipe number 10.
9	PS_BROKEN9	Clear bit of PS_BROKEN interrupt for pipe number 9.
8	PS_BROKEN8	Clear bit of PS_BROKEN interrupt for pipe number 8.
7	PS_BROKEN7	Clear bit of PS_BROKEN interrupt for pipe number 7.
6	PS_BROKEN6	Clear bit of PS_BROKEN interrupt for pipe number 6.
5	PS_BROKEN5	Clear bit of PS_BROKEN interrupt for pipe number 5.
4	PS_BROKEN4	Clear bit of PS_BROKEN interrupt for pipe number 4.
3	PS_BROKEN3	Clear bit of PS_BROKEN interrupt for pipe number 3.
2	PS_BROKEN2	Clear bit of PS_BROKEN interrupt for pipe number 2.
1	PS_BROKEN1	Clear bit of PS_BROKEN interrupt for pipe number 1.
0	PS_BROKEN0	Clear bit of PS_BROKEN interrupt per pipe number 0.

0x18202028+4*n TSPP_PIPEn_ERROR_STATUS, n=[0..15]

Type: Read
Clock: AHB_CLK
Reset State: 0x0

Those registers hold the error statuses per each pipe. Assertion of one of the error status bits of some pipe causes PS_BROKEN interrupt, which corresponds to that pipe to be set. Clearing PS_BROKEN interrupt of some pipe also clears all the status bits of the register that corresponds to that pipe.

TSPP_PIPEn_ERROR_STATUS

Bits	Name	Description
3	PES_SYNC_ERROR	PES packet didn't start with 0x000001.
2	PS_LENGTH_ERROR	PES packet discarded due to length consistency error.
1	PS_CONTINUITY_ERROR	PES packet discarded due to continuity error.
0	PS_LOST_START	PES packet discarded since the first TSP of the PES was lost.

0x18202068 TSPP_STATUS

Type: Read
Clock: AHB_CLK
Reset State: 0x0

This is a status register that is used for test purposes.

TSPP_STATUS

Bits	Name	Description
13:10	TSP_PKT_AVAIL_STATUS	When one of the bits is set, this means that pipe_number that equals to 8 subtracted from this bit number, contains at least one TS PKT.
9:6	TSIF1_DM_REQ_NUM	Number of TSIF1 DM requests that haven't been served yet.
5:2	TSIF0_DM_REQ_NUM	Number of TSIF0 DM requests that haven't been served yet.
1:0	CURR_FLTR_TABLE_NUM	The currently active PID filter table: 0b00 - Filter table0 0b01 - Filter table1 0b10 - Filter table2 0b11 - Illegal.

0x1820206C TSPP_CURR_TSP_HEADER

Type: Read
Clock: AHB_CLK
Reset State: 0x0

This is a status register that is used for test purposes.

TSPP_CURR_TSP_HEADER

Bits	Name	Description
31:0	CURR_TSP_HEADER	The TSP header of the TSP packet that is currently being processed.

0x18202070 TSPP_CURR_PID_FILTER

Type: Read
Clock: AHB_CLK
Reset State: 0x0

This is a status register that is used for test purposes.

TSPP_CURR_PID_FILTER

Bits	Name	Description
31:0	CURR_PID_FILTER	The PID_FILTER that filtered the TSP packet which is currently being processed.

2.6.4 TSPP scrambling registers

0x18202074+4*n TSPP_SYSTEM_KEY_WORDn, n=[0..7]

Type: Write
Clock: AHB_CLK
Reset State: 0x0

System key words 0 to 7.

WORD0: bits 31 down to 0

WORD1: bits 63 down to 32

WORD2: bits 95 down to 64

WORD3: bits 127 down to 96

WORD4: bits 159 down to 128

WORD5: bits 191 down to 160

WORD6: bits 223 down to 192

WORD7: bits 255 down to 224

TSPP_SYSTEM_KEY_WORDn

Bits	Name	Description
31:0	SYSTEM_KEY_BITS	System key bits.

0x18202094+4*n TSPP_CBC_INIT_VAL_WORDn, n=[0..1]

Type: Write
Clock: AHB_CLK
Reset State: 0x0

CBC initial value words 0 to 1.

WORD0: bits 31 down to 0

WORD1: bits 63 down to 32

TSPP_CBC_INIT_VAL_WORDn

Bits	Name	Description
31:0	CBC_INIT_VAL_BITS	CBC initial value bits.

0x1820209C TSPP_DATA_KEY_RESET

Type: Write
Clock: AHB_CLK
Reset State: 0x0

This is TSPP data key reset register. The reset is a pulse. SW should write to this register only during PID Filters reconfiguration. If after reconfiguration, same data key is going to be used to descramble different TS PKTs stream, SW should reset this data key by writing value of ’1’ to the corresponding bit of the TSPP_KEY_RESET register.

Writing ’1’ to a bit corresponding to specified data key does the following:

- Clears the corresponding bits in TSPP_KEY_VALID resister (both even and odd).
- Clears the corresponding bits in TSPP_KEY_ERROR register.
- Resets some other internal logic in TSPP related to data keys. This will disable KEY_SWITCHED_IRQ due to first received scrambled TS PKT.

TSPP_DATA_KEY_RESET

Bits	Name	Description
7	DATA_KEY7_RESET	Reset pulse for data key number 7.
6	DATA_KEY6_RESET	Reset pulse for data key number 6.
5	DATA_KEY5_RESET	Reset pulse for data key number 5.
4	DATA_KEY4_RESET	Reset pulse for data key number 4.
3	DATA_KEY3_RESET	Reset pulse for data key number 3.
2	DATA_KEY2_RESET	Reset pulse for data key number 2.
1	DATA_KEY1_RESET	Reset pulse for data key number 1.
0	DATA_KEY0_RESET	Reset pulse for data key number 0.

0x182020A0 TSPP_KEY_VALID

Type: Read
Clock: AHB_CLK
Reset State: 0x0

This register holds the valid bits for the data keys.

Valid bit is set(1) when SW updates the corresponding data key in the data keys table.

Valid bit is cleared(0) when the key type in the transport scrambling control is switched from even to odd or from odd to even.

TSPP_KEY_VALID

Bits	Name	Description
15	DATA_ODD_KEY7_VALID	Valid bit for data odd key number 7.
14	DATA_ODD_KEY6_VALID	Valid bit for data odd key number 6.
13	DATA_ODD_KEY5_VALID	Valid bit for data odd key number 5.
12	DATA_ODD_KEY4_VALID	Valid bit for data odd key number 4.
11	DATA_ODD_KEY3_VALID	Valid bit for data odd key number 3.
10	DATA_ODD_KEY2_VALID	Valid bit for data odd key number 2.
9	DATA_ODD_KEY1_VALID	Valid bit for data odd key number 1.
8	DATA_ODD_KEY0_VALID	Valid bit for data odd key number 0.
7	DATA_EVEN_KEY7_VALID	Valid bit for data even key number 7.
6	DATA_EVEN_KEY6_VALID	Valid bit for data even key number 6.
5	DATA_EVEN_KEY5_VALID	Valid bit for data even key number 5.

TSPP_KEY_VALID (cont.)

Bits	Name	Description
4	DATA_EVEN_KEY4_VALID	Valid bit for data even key number 4.
3	DATA_EVEN_KEY3_VALID	Valid bit for data even key number 3.
2	DATA_EVEN_KEY2_VALID	Valid bit for data even key number 2.
1	DATA_EVEN_KEY1_VALID	Valid bit for data even key number 1.
0	DATA_EVEN_KEY0_VALID	Valid bit for data even key number 0.

0x182020A4 TSPP_KEY_ERROR

Type: Read
Clock: AHB_CLK
Reset State: 0x0

This register holds the error bits for the data keys.

Error bit is set(1) when decryption is required, and the data key is not valid. This means that SW didn't update the appropriate data key in time.

Error bit is cleared(0) by SW when clearing the key_error_irq.

TSPP_KEY_ERROR

Bits	Name	Description
7	DATA_KEY7_ERROR	Error bit for data key number 7.
6	DATA_KEY6_ERROR	Error bit for data key number 6.
5	DATA_KEY5_ERROR	Error bit for data key number 5.
4	DATA_KEY4_ERROR	Error bit for data key number 4.
3	DATA_KEY3_ERROR	Error bit for data key number 3.
2	DATA_KEY2_ERROR	Error bit for data key number 2.
1	DATA_KEY1_ERROR	Error bit for data key number 1.
0	DATA_KEY0_ERROR	Error bit for data key number 0.

2.6.5 TEST bus control register

0x182020A8 TSPP_TEST_CTRL

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

TSPP test bus control register.

TSPP_TEST_CTRL

Bits	Name	Description
7	TEST_BUS_EN	Test bus enable. When clear(0), tspp_test_bus is all zero.
6:0	TEST_BUS_SEL	Test bus selector: ¨ Parser test buses 0b1110010: dout_test_bus (multi2) 0b1110001: control_test_bus (multi2) 0b1110000: iif_test_bus (multi2) 0b1100111: parser_config_test_bus 0b1100110: ctx_test_bus 0b1100101: tsp2es_test_bus 0b1100100: pl_dec_test_bus 0b1100011: af_proc_test_bus 0b1100010: proc_ctrl_test_bus 0b1100001: main_ctrl_test_bus2 0b1100000: main_ctrl_test_bus1 ¨ TS ifc. test buses 0b0100101: mem2tsp_test_bus 0b0100100: cons_ahb2mem_test_bus 0b0100011:ts_ahb2mem_test_bus 0b0100010: ts_cons_arb_test_bus 0b0100001: ts_ifc_arb_test_bus 0b0100000: ts_fsms_test_bus ¨ Prod test buses 0b0010001: fifo2ahb_test_bus 0b0010000: es2fifo_test_bus ¨ Other test buses 0b0000001: mem_ctrl_test_bus 0b0000000: regs_test_bus

2.6.6 TSPP other registers

0x182020AC TSPP_VERSION

Type: Read
Clock: AHB_CLK
Reset State: 0x1

TSPP version register. The register holds current TSPP version.

TSPP_VERSION

Bits	Name	Description
7:0	TSPP_VERSION	Current TSPP version.

0x182020B0 TSPP_GENERICS

Type: Read
Clock: AHB_CLK
Reset State: Undefined

The register holds TSPP generics values. It is used to identify which generic values are used at TSPP instantiation.

TSPP_GENERICS

Bits	Name	Description
12	CRYPTO_GEN	CRYPTO_GEN generic parameter value.
11:7	MAX_CONS_PIPES	MAX_CONS_PIPES generic parameter value. Typical value 4.
6:2	MAX_PIPES	MAX_PIPES generic parameter value. Typical value 16.
1	TSIF_1_GEN	TSIF_1_GEN generic parameter value.
0	TSIF_0_GEN	TSIF_0_GEN generic parameter value.

0x182020B4 TSPP_NOP

Type: Read/Write
Clock: AHB_CLK
Reset State: 0x0

The register has four no operational bits. It is reserved for future use.

TSPP_NOP

Bits	Name	Description
3:0	TSPP_NOP	TSPP nop register bits.

2.6.7 TSPP PID FILTER and CONFIG registers (RAM based)

There are sixteen PID filters in each PID filter table. This allows up to sixteen different pipes to which PIDs may be routed.

Each TSP may be processed twice by the same filter. This depends on PIPE_PROCESS0, PIPE_PROCESS1 and rest of filter parameters.

After SW configured PID filter and config registers, HW operates as follows:

- New TS PKT is received, and PID is retrieved from PKT header.
- PID filter registers are registers are read from lower to higher address.
- For each filter PIPE_PROCESS0 is checked:
- When DISABLED:
- The register is skipped.
- When TSP_RAW_PROCESSING | TSP_RAW_NO_SUFFIX:
- If (PID & PID_MASK = PIPE_PID & PID_MASK):
- PID config register is read.
- The TSP packet is routed to pipe with PIPE_NUMBER0.
- RAW Processing is performed on the TSP.
- If PIPE_PROCESS1 /= DISABLED:
- The TSP is processed again based on PIPE_PROCESS1, PIPE_NUMBER1, and other filter parameters.
- ELSE
- The register is skipped.
- When PES_PROCESSING
- If (PID = PIPE_PID):
- PID config register is read.
- The TSP packet is routed to pipe with PIPE_NUMBER.
- PES Processing is performed on the TSP.
- If PIPE_PROCESS1 /= DISABLED:
- The TSP is processed again based on PIPE_PROCESS1, PIPE_NUMBER1, and other filter parameters.
- ELSE
- The register is skipped.
- If all registers were skipped, the TSP packet is ignored. Corresponding interrupt is generated, and corresponding performance counter is updated.

Notes for SW configuration.

- PID filter registers are searched till the first match. This means that PID filter registers with higher addresses have lower priority.
- All PID filter registers of PES Processing should be located at lower addresses than PID filter registers of Raw Processing, in order not to mask them mistakenly. The reason specified in the previous bullet.
- PIPE_MASK filed is used only in TSP RAW processing.
- SW may set PIPE_MASK to 0x1FFF and PIPE_PROCESS to Raw in order to rout all unmatched PIDs to some pipe and not to ignore them. PID filter search will be completed if PIPE_MASK = 0x1FFF and PIPE_PROCESS = Raw is encountered.
- If PS_DISABLE bit of the corresponding PIPE in the TSPP_PS_DISABLE register is set(1), the TS PKT is ignored.

0x18202800+ 8*n TSPP_PID_FILTERn_TABLE0, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

This is TSPP PID filter register set of PID filter table1 interface.

There are sixteen PID filters for PID filter table1. This allows up to sixteen different pipes to which PIDs may be routed.

TSPP_PID_FILTERn_TABLE0

Bits	Name	Description
31:30	PIPE_PROCESS0	Process level for the filtered PID, when TSP is processed for the first time. 0x3: TSP_RAW_NO_SUFFIX 0x2: TSP_RAW_PROCESSING 0x1: PES_PROCESSING 0x0: DISABLED
29:26	NOT_USED	Not used bits.
25:13	PIPE_PID	Collect that PID.
12:0	PID_MASK	Define don't care bits of the PIPE_PID. Note that PIPE_MASK is used only if PIPE_PROCESS = TSP_RAW_PROCESSING.

0x18202804+ 8*n TSPP_PID_CONFIGn_TABLE0, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

This is TSPP PID config register set for Filter table1.

TSPP_PID_CONFIGn_TABLE0

Bits	Name	Description
31:30	PIPE_PROCESS1	Same as PIPE_PROCESS0, only for the second time processing of the same TSP. When PIPE_PROCESS0 = DISABLED. PIPE_PROCESS1 is irrelevant.
29:24	NOT_USED1	Not used bits.
23	TSP_HEADER_ERR_MASK 1	Same as TSP_HEADER_ERR_MASK0, only for the second time processing of the TSP.
22	TRANS_END_DISABLE1	Same as TRANS_END_DISABLE0, only for the second time processing of the TSP. Relevant for PIPE_NUMBER1.
21	DEC_ON_ERR_EN1	Same as DEC_ON_ERR_EN0, only for the second time processing of the TSP.
20	SCRAMB_EN1	Same as SCRAMB_EN0, only for the second time processing of the TSP.
19:16	PIPE_NUMBER1	Same as PIPE_NUMBER0, only for the second time processing of the TSP.
15:11	NOT_USED0	Not used bits.
10:8	KEY_NUMBER	Data key number that should be used when TSP payload decryption is required.
7	TSP_HEADER_ERR_MASK 0	This bit is used when the TSP is processed for the first time. When this bit is set(1), TSP header errors are tested as usual, depending on TSP_SYNC_ERROR_MASK, and TSP_ERROR_INDICATOR_MASK. When this bit is clear(0), TSP header errors are not tested. TSP is written into the pipe if there are no other errors.
6	TRANS_END_DISABLE0	This bit controls the behavior of transaction_end output port for PIPE_NUMBER0. This control bit should be set only per pipes that were configured for Raw processing. When this bit is clear(0), each TSP, transaction_end signal is asserted. When this bit is set(1), transaction_end signal is never asserted. This control bit allows SW to allocate pipe descriptors per several TSPs, and not per each TSP. When this bit is set(1), the sizes of pipe descriptors, should be exact multiples of TSIF packet size (192 bytes).
5	DEC_ON_ERR_EN0	Decryption enabled on error. When this bit is set(1), TSPP performs TSP payload decryption when required also if there is an error in TSP header and the error is not masked (if the error is masked the packet is discarded). When this bit is clear(0), TSPP doesn’t perform TSP payload decryption when there is and error in TSP header.

TSPP_PID_CONFIGn_TABLE0 (cont.)

Bits	Name	Description
4	SCRAMB_EN0	Scrambling enable bit for the TSP when it is processed for the first time. When this bit is set(1), TSPP performs TSP payload decryption as defined by transport_scrambling_control bits in the TSP header. When this bit is clear(0), TSPP ignores the transport_scrambling_control bits in the TSP header. TS PKTs payload sent as is, without decryption.
3:0	PIPE_NUMBER0	The filtered PID will be routed to this pipe number when the TSP is processed for the first time.

0x18202880+ 8*n TSPP_PID_FILTERn_TABLE1, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

This is TSPP PID filter register set of PID filter table1 interface.

There are sixteen PID filters for PID filter table1. This allows up to sixteen different pipes to which PIDs may be routed.

TSPP_PID_FILTERn_TABLE1

Bits	Name	Description
31:30	PIPE_PROCESS0	Process level for the filtered PID, when TSP is processed for the first time. 0x3: TSP_RAW_NO_SUFFIX 0x2: TSP_RAW_PROCESSING 0x1: PES_PROCESSING 0x0: DISABLED
29:26	NOT_USED	Not used bits.
25:13	PIPE_PID	Collect that PID.
12:0	PID_MASK	Define don’t care bits of the PIPE_PID. Note that PIPE_MASK is used only if PIPE_PROCESS = TSP_RAW_PROCESSING.

0x18202884+ 8*n TSPP_PID_CONFIGn_TABLE1, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

This is TSPP PID config register set for Filter table1.

TSPP_PID_CONFIGn_TABLE1

Bits	Name	Description
31:30	PIPE_PROCESS1	Same as PIPE_PROCESS0, only for the second time processing of the same TSP. When PIPE_PROCESS0 = DISABLED. PIPE_PROCESS1 is irrelevant.
29:24	NOT_USED1	Not used bits.
23	TSP_HEADER_ERR_MASK 1	Same as TSP_HEADER_ERR_MASK0, only for the second time processing of the TSP.
22	TRANS_END_DISABLE1	Same as TRANS_END_DISABLE0, only for the second time processing of the TSP. Relevant for PIPE_NUMBER1.
21	DEC_ON_ERR_EN1	Same as DEC_ON_ERR_EN0, only for the second time processing of the TSP.
20	SCRAMB_EN1	Same as SCRAMB_EN0, only for the second time processing of the TSP.
19:16	PIPE_NUMBER1	Same as PIPE_NUMBER0, only for the second time processing of the TSP.
15:11	NOT_USED0	Not used bits.
10:8	KEY_NUMBER	Data key number that should be used when TSP payload decryption is required.
7	TSP_HEADER_ERR_MASK 0	This bit is used when the TSP is processed for the first time. When this bit is set(1), TSP header errors are tested as usual, depending on TSP_SYNC_ERROR_MASK, and TSP_ERROR_INDICATOR_MASK. When this bit is clear(0), TSP header errors are not tested. TSP is written into the pipe if there are no other errors.
6	TRANS_END_DISABLE0	This bit controls the behavior of transaction_end output port for PIPE_NUMBER0. This control bit should be set only per pipes that were configured for Raw processing. When this bit is clear(0), each TSP, transaction_end signal is asserted. When this bit is set(1), transaction_end signal is never asserted. This control bit allows SW to allocate pipe descriptors per several TSPs, and not per each TSP. When this bit is set(1), the sizes of pipe descriptors, should be exact multiples of TSIF packet size (192 bytes).
5	DEC_ON_ERR_EN0	Decryption enabled on error. When this bit is set(1), TSPP performs TSP payload decryption when required also if there is an error in TSP header and the error is not masked (if the error is masked the packet is discarded). When this bit is clear(0), TSPP doesn't perform TSP payload decryption when there is and error in TSP header.
4	SCRAMB_EN0	Scrambling enable bit for the TSP when it is processed for the first time. When this bit is set(1), TSPP performs TSP payload decryption as defined by transport_scrambling_control bits in the TSP header. When this bit is clear(0), TSPP ignores the transport_scrambling_control bits in the TSP header. TS PKTs payload sent as is, without decryption.

TSPP_PID_CONFIGn_TABLE1 (cont.)

Bits	Name	Description
3:0	PIPE_NUMBER0	The filtered PID will be routed to this pipe number when the TSP is processed for the first time.

0x18202900+ 8*n TSPP_PID_FILTERn_TABLE2, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

This is TSPP PID filter register set of PID filter table1 interface.

There are sixteen PID filters for PID filter table1. This allows up to sixteen different pipes to which PIDs may be routed.

TSPP_PID_FILTERn_TABLE2

Bits	Name	Description
31:30	PIPE_PROCESS0	Process level for the filtered PID, when TSP is processed for the first time. 0x3: TSP_RAW_NO_SUFFIX 0x2: TSP_RAW_PROCESSING 0x1: PES_PROCESSING 0x0: DISABLED
29:26	NOT_USED	Not used bits.
25:13	PIPE_PID	Collect that PID.
12:0	PID_MASK	Define don’t care bits of the PIPE_PID. Note that PIPE_MASK is used only if PIPE_PROCESS = TSP_RAW_PROCESSING.

0x18202904+ 8*n TSPP_PID_CONFIGn_TABLE2, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

This is TSPP PID config register set for Filter table1.

TSPP_PID_CONFIGn_TABLE2

Bits	Name	Description
31:30	PIPE_PROCESS1	Same as PIPE_PROCESS0, only for the second time processing of the same TSP. When PIPE_PROCESS0 = DISABLED. PIPE_PROCESS1 is irrelevant.
29:24	NOT_USED1	Not used bits.
23	TSP_HEADER_ERR_MASK 1	Same as TSP_HEADER_ERR_MASK0, only for the second time processing of the TSP.
22	TRANS_END_DISABLE1	Same as TRANS_END_DISABLE0, only for the second time processing of the TSP. Relevant for PIPE_NUMBER1.
21	DEC_ON_ERR_EN1	Same as DEC_ON_ERR_EN0, only for the second time processing of the TSP.
20	SCRAMB_EN1	Same as SCRAMB_EN0, only for the second time processing of the TSP.
19:16	PIPE_NUMBER1	Same as PIPE_NUMBER0, only for the second time processing of the TSP.
15:11	NOT_USED0	Not used bits.
10:8	KEY_NUMBER	Data key number that should be used when TSP payload decryption is required.
7	TSP_HEADER_ERR_MASK 0	This bit is used when the TSP is processed for the first time. When this bit is set(1), TSP header errors are tested as usual, depending on TSP_SYNC_ERROR_MASK, and TSP_ERROR_INDICATOR_MASK. When this bit is clear(0), TSP header errors are not tested. TSP is written into the pipe if there are no other errors.
6	TRANS_END_DISABLE0	This bit controls the behavior of transaction_end output port for PIPE_NUMBER0. This control bit should be set only per pipes that were configured for Raw processing. When this bit is clear(0), each TSP, transaction_end signal is asserted. When this bit is set(1), transaction_end signal is never asserted. This control bit allows SW to allocate pipe descriptors per several TSPs, and not per each TSP. When this bit is clear(0), TSPP doesn’t perform TSP payload decryption when there is and error in TSP header.
4	SCRAMB_EN0	Scrambling enable bit for the TSP when it is processed for the first time. When this bit is set(1), TSPP performs TSP payload decryption as defined by transport_scrambling_control bits in the TSP header. When this bit is clear(0), TSPP ignores the transport_scrambling_control bits in the TSP header. TS PKTs payload sent as is, without decryption.

TSPP_PID_CONFIGn_TABLE2 (cont.)

Bits	Name	Description
3:0	PIPE_NUMBER0	The filtered PID will be routed to this pipe number when the TSP is processed for the first time.

2.6.8 TSPP GLOBAL PERFORMANCE COUNTERS registers (RAM based)

TSPP performance counters are used to collect statistics of different events that occurred while TSP packets were received and processed.

TSPP global performance counters collect statistics of TSP packets before they were routed to a pipe.

Performance counters should be initialized by SW by writing values of 0x0 before TSPP block operation is started.

The counters are incremented by TSPP HW, and never reset.

Resetting performance counters should be performed by SW by writing value of 0x0 to each counter.

0x18202980 TSPP_TSP_TOTAL_NUM

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_TSP_TOTAL_NUM

Bits	Name	Description
31:0	TSP_TOTAL_NUM	Number of all packets from HW.

0x18202984 TSPP_TSP_IGNORED_NUM

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_TSP_IGNORED_NUM

Bits	Name	Description
31:0	TSP_IGNORED_NUM	Number of TSPs not routed to any pipe.

0x18202988 TSPP_TSP_ERROR_INDICATOR_NUM

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_TSP_ERROR_INDICATOR_NUM

Bits	Name	Description
31:0	TSP_ERROR_INDICATOR_NUM	Number of TSPs with Reed Solomon failure.

0x1820298C TSPP_TSP_SYNC_ERROR_NUM

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_TSP_SYNC_ERROR_NUM

Bits	Name	Description
31:0	TSP_SYNC_ERROR_NUM	Number of TSPs did not start with 0x47

2.6.9 TSPP PIPE CONTEXT registers (RAM based)

0x18202990+40*n TSPP_PIPEn_CONTEXT0, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

This is TSPP pipe context register set. Together with TSPP_PIPEn_CONTEXT1, n = [0..15] register, those registers contain pipe context information.

There are sixteen pipe context registers sets, each register per one pipe.

Notes for SW configuration:

- Most of context registers bit fields are only for test purposes.
- SW may read context registers to see context information of a pipe.
- SW should initialize PS_STATE of each context to PS_EMPTY (PS_LOST_START interrupt will be generated if in the first received TSP payload_unit_start_indicator is not set) or to PS_BROKEN_NO_RETRANS (will not generate PS_LOST_START interrupt before first PES is assembled), before activating TSPP module.

- SW may write values to context registers. SW writes to those registers while TSPP module is active, will bring to undefined results.

TSPP_PIPEn_CONTEXT0

Bits	Name	Description
31:16	PES_BYTES_LEFT	Down counter. Number of bytes that are still expected to complete PES PKT assembly. In case of UNSP_PES_LENGTH = '1', PES_BYTES_LEFT = 0x0.
15:12	CONTINUITY_COUNTER	Continuity counter of the last packet received for the PES being constructed.
11	UNSP_PES_LENGTH	Unspecified PES packet length. Asserted when PES_packet_length field in the PES header.
10:2	NOT_USED	currently not used bits.
1:0	PS_STATE	PS_STATE of the constructed PES: 0b11 - PS_BROKEN_NO_RETRANS 0b10 - PS_BROKEN_RETRANS 0b01 - PS_CONSTRUCTING 0b00 - PS_EMPTY

0x18202994+ 40*n TSPP_PIPEn_CONTEXT1, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

See description of TSPP_PIPEn_CONTEXT0, n = [0..15].

TSPP_PIPEn_CONTEXT1

Bits	Name	Description
31:0	TSIF_SUFFIX	TSIF suffix of the first TSP of the PES.

2.6.10 TSPP PIPE PERFORMANCE COUNTERS registers (RAM based)

TSPP pipe performance counters collect statistics of TSP packets after they were routed to some pipe. Pipe performance counters collect statistics per pipe.

0x18202998+ 40*n TSPP_PIPE_TSP_TOTAL_NUMn, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_PIPE_TSP_TOTAL_NUMn

Bits	Name	Description
31:0	PIPE_TSP_TOTAL_NUM	Number of TSP routed to this pipe. Relevant to RAW and PES precessing.

0x1820299C+ 40*n TSPP_PS_DUPLICATE_TSP_NUMn, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_PS_DUPLICATE_TSP_NUMn

Bits	Name	Description
31:0	PS_DUPLICATE_TSP_NUM	Number of duplicate TSPs. Relevant only to PES precessing.

0x182029A0+ 40*n TSPP_TSP_NO_PAYLOAD_NUMn, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_TSP_NO_PAYLOAD_NUMn

Bits	Name	Description
31:0	TSP_NO_PAYLOAD_NUM	Number of TSPs without payload. Relevant only to PES precessing.

0x182029A4+ 40*n TSPP_TSP_BROKEN_PS_NUMn, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_TSP_BROKEN_PS_NUMn

Bits	Name	Description
31:0	TSP_BROKEN_PS_NUM	Number of TSPs thrown since PES is broken. Relevant only to PES precessing.

0x182029A8+40*n TSPP_PS_TOTAL_NUMn, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_PS_TOTAL_NUMn

Bits	Name	Description
31:0	PS_TOTAL_NUM	Total number of PES constructed.

0x182029AC+40*n TSPP_PS_CONTINUITY_ERROR_NUMn, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_PS_CONTINUITY_ERROR_NUMn

Bits	Name	Description
31:0	PS_CONTINUITY_ERROR_NUM	Number of PES packets discarded due to continuity error. Relevant only to PES precessing.

0x182029B0+40*n TSPP_PS_LENGTH_ERROR_NUMn, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_PS_LENGTH_ERROR_NUMn

Bits	Name	Description
31:0	PS_LENGTH_ERROR_NUM	Number of PES packets discarded due to length consistency error. Relevant only to PES precessing.

0x182029B4+40*n TSPP_PES_SYNC_ERROR_NUMn, n=[0..15]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

TSPP_PES_SYNC_ERROR_NUMn

Bits	Name	Description
31:0	PES_SYNC_ERROR_NUM	Number of PES packets that didn't start with 0x000001. Relevant only to PES precessing.

2.6.11 TSPP TS PKT buffer

0x18202C10+4*n TSPP_TSP_BUFF_WORDn, n=[0..47]

Type: Read/Write
Clock: AHB_CLK
Reset State: Undefined

This register set points to the TS PKT that was received from BAM consumer PIPE. Those registers may be accessed by SW only for test purposes. Writing to those registers while TSPP operation will lead to undefined TSPP behavior.

TSPP_TSP_BUFF_WORDn

Bits	Name	Description
31:0	TSPP_TSP_BUFF_WORD	The register points to the TS PKT that was received from BAM consumer pipe.

2.6.12 TSPP DATA KEYS registers (RAM based)

0x18202CD0+16*n TSPP_DATA_EVEN_KEYn_LSB, n=[0..7]

Type: Write
Clock: AHB_CLK
Reset State: Undefined

Those registers hold the LSB bits of even data keys.

TSPP_DATA_EVEN_KEYn_LSB

Bits	Name	Description
31:0	DATA_EVEN_KEY_LSB	LSB bits of data even key.

0x18202CD4+16*n TSPP_DATA_EVEN_KEYn_MSB, n=[0..7]

Type: Write
Clock: AHB_CLK
Reset State: Undefined

Those registers hold the MSB bits of even data keys.

TSPP_DATA_EVEN_KEYn_MSB

Bits	Name	Description
31:0	DATA_EVEN_KEY_MSB	MSB bits of data even key.

0x18202CD8+16*n TSPP_DATA_ODD_KEYn_LSB, n=[0..7]

Type: Write
Clock: AHB_CLK
Reset State: Undefined

Those registers hold the LSB bits of odd data keys.

TSPP_DATA_ODD_KEYn_LSB

Bits	Name	Description
31:0	DATA_ODD_KEY_LSB	LSB bits of data even key.

0x18202CDC +16*n TSPP_DATA_ODD_KEYn_MSB, n=[0..7]

Type: Write
Clock: AHB_CLK
Reset State: Undefined

Those registers hold the MSB bits of odd data keys.

TSPP_DATA_ODD_KEYn_MSB

Bits	Name	Description
31:0	DATA_ODD_KEY_MSB	MSB bits of data even key.

2.7 CFPB SPLT Config (System FPB) Registers (0x17F00000 CSYSFPB_SPL_BASE)

This section contains Chip System FPB registers.

0x17F00000 CSYSFPB_SPL_CFPB_SPLT_CTRL_STATUS

Type: Read/Write
Clock: CC_CFPB_SPLT_CLK
Reset State: 0x00000000

This register is a general configuration register.

CSYSFPB_SPL_CFPB_SPLT_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0)
11	RPM_PROC_IRQ_EN	SW: RW, HW: R RPMProcessorInterruptEnable When set, the RPM processor receives an interrupt whenever ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	APPS_PROC_IRQ_EN	SW: RW, HW: R Apps_ProcInterruptEnable When set, the Application Processor receives an interrupt whenever ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

CSYSFPB_SPL_CFPB_SPLT_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x5: Select the S0_M0 ahb2ahb bridge test bus. 0x6: Select the S1_M1 ahb2ahb bridge test bus. 0x7: Select the M0 ahb2ahb bridge test bus. 0x8: Select the M1 ahb2ahb bridge test bus. 0x9: Select the M2 ahb2ahb bridge test bus. 0xA: Select the M3 ahb2ahb bridge test bus. 0xB: Select the M4 ahb2ahb bridge test bus. 0xC: Select the M5 ahb2ahb bridge test bus. 0xD: Select the M6 ahb2ahb bridge test bus. 0xE: Select the M7 ahb2ahb bridge test bus. 0xF: Select the M8 ahb2ahb bridge test bus. 0x10: Select the M9 ahb2ahb bridge test bus. 0x11: Select the M10 ahb2ahb bridge test bus. 0x12: Select the M11 ahb2ahb bridge test bus. 0x13: Select the M12 ahb2ahb bridge test bus. 0x14: Select the M13 ahb2ahb bridge test bus. 0x15: Select the M14 ahb2ahb bridge test bus. 0x16: Select the M15 ahb2ahb bridge test bus.

0x17F00044 CSYSFPB_SPL_CFPB_SPLT_PORT_EN

Type: Read/Write
Clock: CC_CFPB_SPLT_CLK
Reset State: 0xFFFFFFFF

This register is the CFPB_SPLT master port enable register.

CSYSFPB_SPL_CFPB_SPLT_PORT_EN

Bits	Name	Description
31:1	RESERVED_BIT31_1	Only one master port is used.

CSYSFPB_SPL_CFPB_SPLT_PORT_EN (cont.)

Bits	Name	Description
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

0x17F00050 CSYSFPB_SPL_CFPB_SPLT_ERROR_STAT

Type: Read/Write
Clock: CC_CFPB_SPLT_CLK
Reset State: 0x00000000

This register is the bus error status register.

CSYSFPB_SPL_CFPB_SPLT_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the channel ID that caused the detected error when CID is valid for the master of the access. If not, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	

CSYSFPB_SPL_CFPB_SPLT_ERROR_STAT (cont.)

Bits	Name	Description
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Master0 0x1: Master1 0x2: Master2 0x3: Master3 0x4: Master4 0x5: Master5 0x6: Master6 0x7: Master7 0x8: Master8 0x9: Master9 0xA: Master10 0xB: Master11 0xC: Master12 0xD: Master13 0xE: Master14 0xF: Master15
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit

CSYSFPB_SPL_CFPB_SPLT_ERROR_STAT (cont.)

Bits	Name	Description
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x17F00054 CSYSFPB_SPL_CFPB_SPLT_ERROR_ADDR

Type: Read
Clock: CC_CFPB_SPLT_CLK
Reset State: 0x00000000

This register contains the bus error address.

CSYSFPB_SPL_CFPB_SPLT_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x17F0005C CSYSFPB_SPL_CFPB_SPLT_XPU_ACR

Type: Read/Write
Clock: CC_CFPB_SPLT_CLK
Reset State: 0xFFFFFFFF

The CFPB_SPLT_XPU_ACR register is the CFPB_SPLT Access Control Register for configuring register protection.

CSYSFPB_SPL_CFPB_SPLT_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R CFPB_SPLT XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the CFPB_SPLT configure space, including this register itself. Power up value is set (1)

0x17F00060 CSYSFPB_SPL_CFPB_SPLT_HW_CLK_GATING_CFG

Type: Read/Write
Clock: CC_CFPB_SPLT_CLK
Reset State: 0x00000000

The CFPB_SPLT_HW_CLK_GATING_CFG register is for hardware clock gating configuration.

CSYSFPB_SPL_CFPB_SPLT_HW_CLK_GATING_CFG

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	HYSTERESIS_CNT_SW	SW: RW, HW: R Hysteresis Counter Value This field is used by SW to set the hysteresis counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)
3:0	WAKE_CNT_SW	SW: RW, HW: R Wakeup Counter Value This field is used by SW to set the wakeup counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)

2.8 BAM registers (0x18204000 TSIF_BAM_BASE)

This section contains TSIF BAM registers.

BAM supports only Word (4 byte) aligned writes and reads on the Configuration Bus interface.

BAM has MAX_PIPES hardware generic parameter defining the number of pipes it supports. Each BAM can have up to 31 pipes supported.

BAM has BAM_CONF_AHBS_ADDR_WIDTH hardware generic parameter defining the Bit Number for selecting BAM access or Peripheral access. Legal Ranges are 14 to 20. Count starts from 1, meaning a value of 17 will set BAM Base address as 0x0001_0000.

The following data applies to these registers:

- bam_addr addr range = 11:2 - At maximum (31 pipes) BAM addresses demand 11:2 bits address space. Additional BAM_CONF_AHBS_ADDR_WIDTH bit (12 or higher) selects BAM/Peripheral.

2.8.1 BAM control registers

BAM Control registers configure the BAM operational state, SW reset, interrupts and others.

0x18204F80 TSIF_BAM_CTRL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

BAM Control register allows global controls for the BAM.

TSIF_BAM_CTRL

Bits	Name	Description
31:17	RESERVED_BITS31_17	Set to Zero (0)
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 0’b1 - Enable Power Saving Mode 0’b0 - Disable Power Saving Mode

TSIF_BAM_CTRL (cont.)

Bits	Name	Description
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1’b1 - Enabled 0x0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 0x00 - Cache when current descriptor has less than 64 bytes left. 0x01 - Cache when current descriptor has less than 128 bytes left. 0x10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 0x11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
12	RESERVED_BITS12	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_SIC_SEL
11:5	BAM_TESTBUS_SEL	Set to Zero (0) Obsolete field
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 0x1 - Enabled 0x0 - Disabled Available in BAM only
3	RESERVED_BITS3	Set to Zero (0)
2	RESERVED_BITS2	Set to Zero (0)

TSIF_BAM_CTRL (cont.)

Bits	Name	Description
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 0x1 - Enabled 0x0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 0x1 - Reset state 0x0 - Normal state

0x18204F84 TSIF_BAM_REVISION

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

TSIF_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 0x1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 0x0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 0x1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 0x0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)

TSIF_BAM_REVISION (cont.)

Bits	Name	Description
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 0x1 - Ack On Success double sampled 0x0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 0x1 - No Bypass 0x0 - Bypass Exists
16	SECURED	This field indicates BAM/BAM-Lite has security support (APU inside) 0x1 - Secured 0x0 - Not Secured
15:12	RESERVED_BITS15_12	Set to Zero (0)
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRCS*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRCS*_EEn registers exist for n=[0..3].
7:0	REVISION	This field contains the revision number of the core, Hard Coded.

0x18204FBC TSIF_BAM_NUM_PIPES

Type: Read
Clock: BAM_CLK
Reset State: 0XUUUUUUUU

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

TSIF_BAM_NUM_PIPES

Bits	Name	Description
31:24	BAM_NON_PIPE_GRP	This field contains the number of BAM Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
23:16	PERIPH_NON_PIPE_GRP	This field contains the number of Peripheral's Non Pipe security groups (APU Entries). Zeroes when Non-Secured BAM
15:8	RESERVED_BITS15_8	Set to Zero (0)

TSIF_BAM_NUM_PIPES (cont.)

Bits	Name	Description
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x18204FC0 TSIF_BAM_TIMER

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

TSIF_BAM_TIMER

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x18204FC4 TSIF_BAM_TIMER_CTRL

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

The resolution of the BAM inactivity timer are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the TIMER_THRSHLD is 10 will indicate the 2^3*1us*10, which is 80us of inactivity in a

pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * TIMER_TRSHLD.

TSIF_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 0x1 - Active 0x0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x18204F88 TSIF_BAM_DESC_CNT_TRSHLD

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

TSIF_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0).
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. Available in BAM only

0x18204F8C TSIF_BAM_IRQ_SRCS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

TSIF_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x18204F90 TSIF_BAM_IRQ_SRCS_MSK

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

TSIF_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x18204FB0 TSIF_BAM_IRQ_SRCS_UNMASKED

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

TSIF_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x18204F94 TSIF_BAM_IRQ_STTS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

TSIF_BAM_IRQ_STTS

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x18204F98 TSIF_BAM_IRQ_CLR

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

TSIF_BAM_IRQ_CLR

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 0x1 - Clear 0x0 - Unchanged
3	BAM_EMPTY_CLR	0x1 - Clear 0x0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	0x1 - Clear 0x0 - Unchanged
1	BAM_HRESP_ERR_CLR	0x1 - Clear 0x0 - Unchanged Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x18204F9C TSIF_BAM_IRQ_EN

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

TSIF_BAM_IRQ_EN

Bits	Name	Description
31:5	RESERVED_BITS31_5	Set to Zero (0)
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 0x1 - Enable 0x0 - Disable
3	BAM_EMPTY_EN	0x1 - Enable 0x0 - Disable Available in BAM-Lite only

TSIF_BAM_IRQ_EN (cont.)

Bits	Name	Description
2	BAM_ERROR_EN	0x1 - Enable 0x0 - Disable
1	BAM_HRESP_ERR_EN	0x1 - Enable 0x0 - Disable Available in BAM only
0	RESERVED_BITS0	Set to Zero (0)

0x18204FA0 TSIF_BAM_RESERVED_1

Type: Read
Clock: BAM_CLK
Reset State: 0x00000000

TSIF_BAM_RESERVED_1

Bits	Name	Description
31	RESERVED_BITS31	Set to Zero (0) Obsolete field: BAM_IRQ_SIC_SEL
30:0	RESERVED_BITS30_0	Set to Zero (0) Obsolete field: P_IRQ_SIC_SEL

0x18204FA4 TSIF_BAM_AHB_MASTER_ERR_CTRLS

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

TSIF_BAM_AHB_MASTER_ERR_CTRLS

Bits	Name	Description
31:23	RESERVED_BITS31_16	Set to Zero (0)
22:18	BAM_ERR_HVMID	HVMID

TSIF_BAM_AHB_MASTER_ERR_CTRLS (cont.)

Bits	Name	Description
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x18204FA8 TSIF_BAM_AHB_MASTER_ERR_ADDR

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

TSIF_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x18204FAC TSIF_BAM_AHB_MASTER_ERR_DATA

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

TSIF_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x18204FB4 TSIF_BAM_RESERVED_2

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

TSIF_BAM_RESERVED_2

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_IRQ_DEST_ADDR

0x18204FB8 TSIF_BAM_RESERVED_3

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

.

TSIF_BAM_RESERVED_3

Bits	Name	Description
31:0	RESERVED_BITS31_0	Set to Zero (0) Obsolete field: BAM_PERIPH_IRQ_DEST_ADDR

0x18204FF0 TSIF_BAM_TRUST_REG

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside - SECURED field in the BAM_REVISION register) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

TSIF_BAM_TRUST_REG

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_VMID	Those bits indicate the VMID value to be used when performing BAM type accesses to the bus. BAM Type accesses include BAM MTI (or Direct Mode accesses, not applicable for BAM Lite)
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 0x1 - Enable 0x0 - Disable
6:2	RESERVED_BITS6_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_EE	This field indicates the EE (0,1,2,3) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 0x00 - EE0 0x01 - EE1 0x10 - EE2 0x11 - EE3

0x18204FF4 TSIF_BAM_TEST_BUS_SEL

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is the testbus selector register.

Supported in releases after bam_p3q3r29 (BlackBird).

TSIF_BAM_TEST_BUS_SEL

Bits	Name	Description
31:19	RESERVED_BITS31_19	Set to Zero (0)
18	BAM_DATA_ERASE	When enabled, BAM will be instructed to erase all the data it currently has inside. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 0x1 - Enable Erase 0x0 - Disabled
17	BAM_DATA_FLUSH	When enabled, BAM will be instructed to flush all the data it currently has inside. BAM will only flush the data once it has enough data and a valid destination for it. This is a DEBUG feature and should not be used in normal SW flows. Use with extreme care after consulting with HW representative. BAM_IRQ_STTS register has an interrupt bit indicating the BAM has no data buffered inside. 0x1 - Enable Flush 0x0 - Disabled
16	BAM_CLK_ALWAYS_ON	This bit controls the BAM to issue 'always on' clock request. 0x1 - Enable Always On clock request. 0x0 - Disabled
15:7	RESERVED_BITS15_7	Set to Zero (0)
6:0	BAM_TESTBUS_SEL	Test Bus selector. Values with bit[11] set high are reserved for the BAM Lite integrator to provide testbus from outside of the BAM Lite. For example, eDML testbus may reside at X'100_0000' to X'111_1111' selector values. eDML has no registers thus has no test bus selector, so its test bus is combined with the BAM lite's. BAM provides zeroes on its testbus when external values selected. X'000_0000' - Zeros X'000_0001' - Slave test bus X'000_0010' - Pipe state machine test bus X'000_0011' - Buffer test bus X'000_0100' - Sideband test bus X'000_1101' - Bus Manager test bus X'001_0000' - Reg file test bus X'1''_''''' - BAM Lite sets zeroes on the test bus, leaving it for external use

0x18204FF8 TSIF_BAM_TEST_BUS_REG

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the value being output to the testbus of the chip. It is not intended for SW usage but for lab debugging of the BAM. Values here can change every cycle.

TSIF_BAM_TEST_BUS_REG

Bits	Name	Description
31:0	BAM_TESTBUS_REG	32 bit Testbus value. To select the Block in BAM to show here, use the BAM_TESTBUS_SEL field in BAM_CTRL register.

0x18204FFC TSIF_BAM_CNFG_BITS

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

TSIF_BAM_CNFG_BITS

Bits	Name	Description
31:27	RESERVED_BITS31_27	Set to Zero (0)
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 0x1 - Enable Fix 0x0 - Disable Available in BAM only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit is disabled, BAM could fetch descriptors for a pipe that was reset and no descriptors were added yet, if a retransmission request followed after the reset. 0x1 - Enable Fix 0x0 - Disable Available in BAM only

TSIF_BAM_CNFG_BITS (cont.)

Bits	Name	Description
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 0x1 - Enable 0x0 - Disable Available in BAM only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there are available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided. 0x1 - Enable 0x0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe that was reset, still stored its retransmission savepoint, but into the illegal's pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 0x1 - Enabled 0x0 - Disable Available in BAM only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 0x1 - Enable 0x0 - Disable Available in BAM only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there's no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 0x1 - Enable 0x0 - Disable Available in BAM only

TSIF_BAM_CNFG_BITS (cont.)

Bits	Name	Description
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 0x1 - 0x0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 0x1 - Enable 0x0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 0x1 - Enable 0x0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset. 0x1 - Enable 0x0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix) 0x1 - Enable 0x0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM's common clock request. 0x1 - Propagate Sideband Clock Request 0x0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. 0x1 - Enable Power Saving 0x0 - Disable Power Saving

TSIF_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reset pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 0x1 - Enable external block pipe reset 0x0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer that insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. This functionality has been found to be buggy and was removed from APQ8064. Bit is currently unused. 0x1 - Enable 0x0 - Disable Available in BAM only
10:4	RESERVED_BITS10_4	Set to Zero (0)
3	BAM_ADML_SYNC_BRIDGE	0x1: Use a Synchronous Configuration bridge in aDML. 0x0: Use a Asynchronous Configuration bridge in aDML.
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It's invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 0x1 - Enable 0x0 - Disable Available in BAM only
1	BAM_ADML_DEEP_CONS_FIFO	0x1: Use a deep Consumer FIFO in aDML (16 dwords) 0x0: Use a shallow Consumer FIFO in aDML (8 dwords)
0	BAM_ADML_INCR4_EN_N	0x1: Don't allow INCR4 aDML-BAM accesses. 0x0: Allow INCR 4 aDML-BAM accesses.

0x18205800+ 128*n TSIF_BAM_IRQ_SRCS_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

TSIF_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x18205804+ 128*n TSIF_BAM_IRQ_SRCS_MSK_EEn, n=[0..3]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

TSIF_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: Enable BAM interrupt 0x0: Disable BAM interrupt
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: Enable Pipe interrupt 0x0: Disable Pipe interrupt

0x18205808+ 128*n TSIF_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..3]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..3] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

TSIF_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

2.8.2 BAM PIPE management registers

BAM Pipe management registers control each pipe's parameters. Those reside in physical registers.

0x18204000+ 128*n TSIF_BAM_P_CTRLn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Control register provides various controls for the pipe.

TSIF_BAM_P_CTRLn

Bits	Name	Description
31:11	RESERVED_BITS31_11	Set to Zero (0)
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be prefetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 0x00 - 32 bytes at most (INCR8) 0x01 - 16 bytes at most (INCR4) 0x10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

TSIF_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 0x00 - 512 Bytes 0x01 - 256 Bytes 0x10 - 128 Bytes 0x11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals that are not able to produce End Of Block indications. 0x1 - Enable 0x0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 0x1 - System mode. 0x0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only.When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 0x1 - Enable Streaming Mode 0x0 - None-Streaming Mode
3	P_DIRECTION	This bit denotes pipe direction. 0x1 - The pipe can be written (producer mode) 0x0 - The pipe can be read (consumer mode)
2	RESERVED_BITS2	Set to Zero (0)
1	P_EN	0x1 - Enable Pipe 0x0 - Disable Pipe
0	RESERVED_BITS0	Set to Zero (0)

0x18204004+ 128*n TSIF_BAM_P_RSTn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

TSIF_BAM_P_RSTn

Bits	Name	Description
31:1	RESERVED_BITS31_1	Set to Zero (0)
0	P_SW_RST	This resets the pipe and its' registers, (Both Flip-Flops and RAM). 0x1 - Reset 0x0 - Do Nothing

0x18204008+ 128*n TSIF_BAM_P_HALTn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This is a self-modifying register.

TSIF_BAM_P_HALTn

Bits	Name	Description
31:2	RESERVED_BITS31_2	Set to Zero (0)
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. 0x1 - Sets this bit to 1 0x0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 0x1 - Enable Halt 0x0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it.

0x18204030+ 128*n TSIF_BAM_P_TRUST_REGn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register holds the BAM Trusted configurations. The BAM APU needs to protect this register at the highest security level.

This register cannot be reset by any SW reset. Only HW reset applies. When using a secured BAM (APU integrated inside) it is reset by the XPU HW Reset. When using a non-secured BAM, it is reset by the BAM HW Reset.

Supported in releases after bam_p3q3r29 (BlackBird).

TSIF_BAM_P_TRUST_REGn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:13	RESERVED_BITS15_13	Set to Zero (0) Reserved for possible BAM_VMID field expansion
12:8	BAM_P_VMID	Those bits indicate the VMID value to be used when performing Pipe type accesses to the bus. BAM Type accesses include Pipe MTI, Data and Descriptors.
7:2	RESERVED_BITS7_2	Set to Zero (0). Reserved for BAM_EE field expansion
1:0	BAM_P_EE	This field indicates the EE (0,1,2,3) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 0x00 - EE0 0x01 - EE1 0x10 - EE2 0x11 - EE3

0x18204010+ 128*n TSIF_BAM_P_IRQ_STTSn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits that are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

TSIF_BAM_P_IRQ_STTSn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector that has INT bit selected

0x18204014+128*n TSIF_BAM_P_IRQ_CLRn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

Writing to this register causes the interrupt to clear.

TSIF_BAM_P_IRQ_CLRn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_CLR	0x1 - Clear 0x0 - Unchanged
4	P_ERR_CLR	0x1 - Clear 0x0 - Unchanged
3	P_OUT_OF_DESC_CLR	0x1 - Clear 0x0 - Unchanged

TSIF_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 0x1 - Clear 0x0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 0x1 - Clear 0x0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 0x1 - Clear 0x0 - Unchanged

0x18204018+ 128*n TSIF_BAM_P_IRQ_ENn, n=[0..30]

Type: Read/Write
Clock: BAM_CLK
Reset State: 0X00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

TSIF_BAM_P_IRQ_ENn

Bits	Name	Description
31:6	RESERVED_BITS31_5	Set to Zero (0)
5	P_TRNSFR_END_EN	0x1 - Enable 0x0 - Disable
4	P_ERR_EN	0x1 - Enable 0x0 - Disable
3	P_OUT_OF_DESC_EN	0x1 - Enable 0x0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 0x1 - Enable 0x0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 0x1 - Enable 0x0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 0x1 - Enable 0x0 - Disable

0x1820401C+ 128*n TSIF_BAM_P_TIMERn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This register counts the idle time of the pipe.

TSIF_BAM_P_TIMERn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms

0x18204020+ 128*n TSIF_BAM_P_TIMER_CTRLn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by GENERIC values to the BAM, and uses a separate clock, the nactivity_timers_clk.This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32 KHz clock. This allows the bam_clk to be turned off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM GENERIC inputs. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH generic constant. These parameters should be taken into account when setting this register. For example for inactivity_timer_clk period is 1us and the generic is 3 and the P_TIMER_THRSHLD is 10 will indicate the 2^3*1us*10, which is 80us of inactivity in a pipe before sending an interrupt. The general formula is 2^INACTIVITY_TIMER_WIDTH * clock period * P_TIMER_TRSHLD.

TSIF_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESOLD value 0x1 - Active 0x0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
28:16	RESERVED_BITS28_16	Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x18204024+ 128*n TSIF_BAM_P_PRDCR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

TSIF_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer
23:21	RESERVED_BITS23_21	Set to Zero (0)
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value

0x18204028+ 128*n TSIF_BAM_P_CNSMR_SDBNDn, n=[0..30]

Type: Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

TSIF_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
31:25	RESERVED_BITS31_25	Set to Zero (0)
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value

2.8.3 BAM PIPE configuration registers (RAM)

BAM Pipe management registers configure each pipes' parameters.

Pipe Address span: currently defining each pipe to have 32 addresses, therefore inter pipe offset is 32*4=128=0x80 bytes.

0x1820502C+ 64*n TSIF_BAM_P_EVNT_DEST_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Event Destination Address, which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

TSIF_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x18205018+ 64*n TSIF_BAM_P_EVNT_REGn, n=[0..30]

Type: Write
Clock: BAM_CLK
Reset State: 0X00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

TSIF_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software that creates descriptors). For example, when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x18205000+ 64*n TSIF_BAM_P_SW_OFSTSn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

TSIF_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode.
15:0	SW_DESC_OFST	Descriptor FIFO offset.

0x18205024+ 64*n TSIF_BAM_P_DATA_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

TSIF_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x1820501C+ 64*n TSIF_BAM_P_DESC_FIFO_ADDRn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

TSIF_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x18205028+64*n TSIF_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When a BAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

TSIF_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x18205020+64*n TSIF_BAM_P_FIFO_SIZESn, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

TSIF_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors.

2.8.4 BAM PIPE internal state registers (RAM)

BAM Pipe debug registers allow a software look inside on the internal parameters of the BAM State Machines stored in RAM.

Those shouldn't be normally used or altered by the software.

0x18205034+64*n TSIF_BAM_P_RETR_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context stored for retransmission.

This is being stored by Ack Update state machine in consumer mode or by the Writeback state machine in producer mode.

This is being loaded by the Writeback state machine when retransmission happens.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

TSIF_BAM_P_RETR_CNTXT_n

Bits	Name	Description
31:16	RETR_DESC_OFST	Descriptor Fifo Offset for retransmission.
15:0	RETR_OFST_IN_DESC	The Offset inside the Descriptor for retransmission.

0x18205038+64*n TSIF_BAM_P_SI_CNTXT_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Sideband Inform state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

TSIF_BAM_P_SI_CNTXT_n

Bits	Name	Description
31:16	RESERVED_BITS31_16	Set to Zero (0)
15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

0x18205004+ 64*n TSIF_BAM_P_AU_PSM_CNTXT_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Ack Update state machine.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

TSIF_BAM_P_AU_PSM_CNTXT_1_n

Bits	Name	Description
31:16	AU_PSM_ACCUMED	PSM: The acknowledged (EOB/T) number of bytes since last Write Event. AU: The accumulation of the descriptor sizes for the present ack_on_success event. This is never bigger than the ACKED field. Once the ACCUMED values are bigger than Event Threshold, an Event will be issued, the ACKED value will decrease by the ACCUMED size and this value will be zeroed. This also serves as the Bytes Consumed value in the Event.
15:0	AU_ACKED	AU: The left over of the number of bytes that were received via the ack_on_success, that did not cause a descriptor closure. This value is down counting upon issuing Read Event. PSM:

0x18205008+ 64*n TSIF_BAM_P_PSM_CNTXT_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

TSIF_BAM_P_PSM_CNTXT_2_n

Bits	Name	Description
31	PSM_DESC_VALID	The Descriptor Valid bit provided by the Writeback state machine to Pipe state machine.
30	PSM_DESC_IRQ	The Descriptor Interrupt bit provided by the Writeback state machine to pipe state machine.
29	PSM_DESC_IRQ_DONE	The Descriptor Interrupt needed selection bit.
28:25	PSM_GENERAL_BITS	General Context Switch Bits
24:22	PSM_CONS_STATE	State of the Pipe Consumer state machine.
21:19	PSM_PROD_SYS_STATE	State of the Pipe Producer System state machine.
18:16	PSM_PROD_B2B_STATE	State of the Pipe Producer BAM to BAM state machine.
15:0	PSM_DESC_SIZE	The Descriptor Size provided by the Writeback state machine to pipe state machine.

0x1820500C+ 64*n TSIF_BAM_P_PSM_CNTXT_3_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

TSIF_BAM_P_PSM_CNTXT_3_n

Bits	Name	Description
31:0	PSM_DESC_ADDR	The Data Address provided in the current descriptor from the Writeback state machine.

0x18205010+ 64*n TSIF_BAM_P_PSM_CNTXT_4_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

TSIF_BAM_P_PSM_CNTXT_4_n

Bits	Name	Description
31:16	PSM_DESC_OFST	The running Descriptor Fifo Offset of the Writeback state machine
15:0	PSM_SAVED_ACCUMED_SIZE	The Saved Accumulated Size from the Pipe state machine.

0x18205014+64*n TSIF_BAM_P_PSM_CNTXT_5_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

Internal Context of Pipe & Writeback state machines.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

TSIF_BAM_P_PSM_CNTXT_5_n

Bits	Name	Description
31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

0x18205030+64*n TSIF_BAM_P_RESERVED_1_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

TSIF_BAM_P_RESERVED_1_n

Bits	Name	Description
31:0	BAM_P_RES_1	Set to zero (0) Reserved

0x1820503C+64*n TSIF_BAM_P_RESERVED_2_n, n=[0..30]

Type: Write/Read
Clock: BAM_CLK
Reset State: 0X00000000

This Register indicates reserved space.

TSIF_BAM_P_RESERVED_2_n

Bits	Name	Description
31:0	BAM_P_RES_2	Set to zero (0) Obsolete Register: BAM_P_IRQ_DEST_ADDRn, n=[0..30]

2.9 ADM3_0 registers (0x18300000 ADM3_0_BASE)

This section contains ADM3 registers.

Table 2-2 Support for posting writes on bus

Host interface 0 (HI0)	32-bit AHB	Master on the fast peripheral bus to allow the ARM to program the DM3

Table 2-3 Client rate control interfaces (ADM3_0)

Interface	CRCI assignment	Type	Outstanding request allowed*	Purpose/properties
NULL_CRCI	0	NA	NA	NULL CRCI: choosing it indicates no throttling
CRCI1	1	Block-type	4/4	
CRCI2	2	Block-type	4/4	
CRCI3	3	Command-type	NA	
CRCI4	4	Block-type	8/4	
CRCI5	5	Block-type	8/4	
CRCI6	6	Block-type	48/4	
CRCI7	7	Block-type	4/4	
CRCI8	8	Block-type	4/4	
CRCI9	9	Block-type	4/4	
CRCI10	10	Block-type	4/4	
CRCI11	11	Block-type	4/4	
CRCI12	12	Block-type	4/4	
CRCI13	13	Block-type	4/4	
CRCI14	14	Block-type	4/4	
CRCi15	15	Command-type	NA	

Table 2-4 Client rate control interfaces (ADM3_1)

Interface	CRCI assignment	Type	Outstanding request allowed*	Purpose/properties
NULL_CRCI	0	NA	NA	NULL CRCI: choosing it indicates no throttling
CRCI1	1	Block-type	4/4	
CRCI2	2	Block-type	4/4	
CRCI3	3	Command-type	NA	
CRCI4	4	Block-type	8/4	
CRCI5	5	Block-type	8/4	
CRCI6	6	Block-type	4/4	
CRCI7	7	Block-type	4/4	
CRCI8	8	Block-type	4/4	
CRCI9	9	Block-type	4/4	
CRCI10	10	Block-type	4/4	
CRCI11	11	Block-type	4/4	
CRCI12	12	Block-type	4/4	
CRCI13	13	Block-type	4/4	
CRCI14	14	Block-type	8/4	
CRCi15	15	Command-type	NA	

In order to throttle data with the CRCI, the reset bit of corresponding CRCI control register must be cleared. All CRCIs come up in the reset state after power-up and must be enabled by software clearing these bits.

*Outstanding Request Allowed: The maximum number of the CRCI's "REQ" recognized by ADM3 at any give moment. If CRCI attempts at any given time with consecutive “REQ” the ADM3 will cease to "ACK" until the current channel "block transfer" is complete.

This section describes the various registers within the ADM3. These registers are visible from peripheral bus by the peripheral bus masters. Table 1-13 provides a summary of register accessing with respect with the security domain.

Note that the ARM and ADSP register space point to the same set of physical registers. Reserved bits must be written to as 0, and cannot be counted on to return a specific value.

For each register address, "n" denotes either the channel number (0-15) or client interface number (0-2), and ‘s’ denotes the security domain (0-7). Each security domain is 128KB+2KB apart.

Table 2-5 Host interface register accessing by the security domain summary

Address	Register name	SD Accessing Privilege
0x000+4n+0x20800s	HI_CHn_CMD_PTR	SD specific accessing

2.9.1 Channel programming registers

0x18300000+4*n+0x20800*s **ADM3_0_HI_CHn_CMD_PTR_SDs, n=[0..15], s=[0..7]**

Type: Read/Write
Clock: DM_CORE
Reset State: 0xXXXXXXXX

The HI_CHn_CMD_PTR_SDs register is used to supply the top-level programming structure pointer to the N'th DM3 channel. This register is implemented as a FIFO that can accept two top-level pointers in addition to a third that is executing.

ADM3_0_HI_CHn_CMD_PTR_SDs

Bits	Name	Description
31:29	RESERVED_BITS31_29	
28:0	ADDR	Address (in double words) of the command structure

0x18300040+4*n+0x20800*s **ADM3_0_HI_CHn_RSLT_SDs, n=[0..15], s=[0..7]**

Type: Read
Clock: DM_CORE
Reset State: V(alid) bit=0, all other bits X

The HI_CHn_RSLT_SDs register is used to read the results produced by N'th DM3 channel.

NOTE Reading this register pops one item from the 3-deep result FIFO. The combined depth of the result FIFO and the top-level pointer FIFO is only allowed to be two deep unless there isn't already a top-level pointer executing, in which case the combined depth can be three.

There almost always is a one-to-one correspondence between the top-level pointers and the results. The only exception is when an error occurs (as indicated by ERR). In this case, all queued top-level pointers will be discarded, but only one result will be created.

ADM3_0_HI_CHn_RSLT_SDs

Bits	Name	Description
31	V	Valid - the result is valid If this bit is cleared (0), it indicates that the host has emptied the result FIFO.
3	ERR	Error - The result was generated because of an error
2	F	Flush - The result was generated because of a flush operation
1	TPD	Top pointer done - The result was generated because of the completion of the last command in the top-level programming structure
0	RESERVED_BIT0	

0x18300080+4*n+0x20800*s **ADM3_0_HI_CHn_FLUSH_STATE0_SDs, n=[0..15], s=[0..7]**

Type: Read/Write
Clock: DM_CORE
Reset State: V(alid) bit=1, FLUSH_TYPE=0, CMD_ERR=0, all other bits X

Writing to the HI_CHn_FLUSH_STATE0_SDs register clears (0) the V bit, which then causes the channel to begin a flush operation. When writing to this register, bit 31 should be set to the desired flush type (discard or graceful). Upon completion of the flush state assembly (as indicated by a set V flag), this and the other five FLUSH_STATE registers will contain the state of the channel at the time of the flush. The DM3 may also initiate a channel flush operation internally when the channel encounters an error.

NOTE If a flush is already underway for a given channel and a result from this flush has not yet been generated, then a subsequent flush to the same channel will have no impact and will not generate a second result. This can be determined by the CH_STATE after a flush request. If set to FLUSH_WAIT then this indicates that a flush is already in progress and the subsequent flush was ignored.

Also, if the NO_DATA_XFER field is set, then the flush occurred prior any data transfers occurring for the top-level pointer, and thus all other flush state registers will not contain valid data.

If the LAST_CPLE_MPU field is set then the last command list entry processed was an MPU command. As such, all other flush state registers will not contain valid data, except for the PTR_NUM field in the FLUSH_STATE5 register. In this case, PTR_NUM will point to the next CLE entry AFTER the MPU command.

If the NO_INB_INSTR field is set, then the flush occurred at a point where no INB instruction was loaded or being processed. In this case the DPH_CMD_TYPE field of FLUSH_STATE0, the SRC_REM_LEN field of FLUSH_STATE3, and the SRC_DSCR_NUM field of the FLUSH_STATE4 register provide information on the last INB operation to fully complete. This can happen between commands, between scatter/gather indices, or between scatter/gather descriptors.

If the NO_OTB_INSTR field is set, then the flush occurred at a point where no OTB instruction was loaded or being processed. In this case the DST_REM_LEN field of FLUSH_STATE3 and the DST_DSCR_NUM field of the FLUSH_STATE4 register provide information on the last OTB operation to fully complete. This can happen between commands, between scatter/gather indices, or between scatter/gather descriptors.

Also, if both the NO_INB_INSTR and NO_OTB_INSTR fields are set then the flush occurred at a time when no instructions (INB or OTB) were loaded for the channel. This can happen between commands, between scatter/gather indices, or between scatter/gather descriptors. In this case all flush state registers provide information on what just completed rather than what was next to be processed.

When following the requirement that only the FLUSH_STATE1 register, and the PTR_NUM and DSCR_INDX_NUM fields of the FLUSH_STATE5 register are used in conjunction with NO_DATA_XFER, CH_STATE, and LAST_CPLE_MPU to resubmit flushed commands, the

NO_INB_INSTR and NO_OTB_INSTR fields can be ignored and are provided for debug purposes only.

Host initiated flush operations only terminate the top-level pointer that is currently being executed. If a second top-level pointer is valid, it will not be affected by the flush. On the other hand, a flush due to an error condition will flush all top-level pointers.

ADM3_0_HI_CHn_FLUSH_STATE0_SDs

Bits	Name	Description
31	FLUSH_TYPE	Notes: 1. FLUSH_TYPE=1 is only supported for single and box mode commands. It currently is not supported for commands that are zero length, and should not be attempted on commands of zero length or unpredictable results may occur. 2. On reads, this bit indicates the type of flush that occurred based on the command type being processed at the time that the flush was requested. 3. If a graceful flush is requested just as one command is completing and another is about to start, the FLUSH_TYPE may not agree with the DPH_CMD_TYPE. This is because the FLUSH_TYPE is based on the command that is completing, while the DPH_CMD_TYPE will be based on the command that is about to start (assuming another command is loaded). This only occurs under the condition that the flush had no impact on the command completing. For example FLUSH_TYPE = 1 and DPH_CMD_TYPE = SG indicates that a single or box mode command was finishing at the time that a graceful flush was requested, but the next command is of type SG and thus only the SG command was affected by the flush. In this case graceful flush and discard flush are equivalent, since no data is buffered. 0x0: Flush should discard any data already read into data buffer 0x1: Flush should write all INB data received or requested prior to terminating the top-level command
30:21	RESERVED_BITS30_21	
20	CMD_ERR	Indicates that an error occurred when parsing a command. For example if ADDR_MODE=2 (reserved) in the first word of the command. This type of error is imprecise in that the DPH_CMD_TYPE field as well as the FLUSH_STATE1-5 registers provide details of the command that is currently in the data phase (or the last command to complete data phase processing if no commands are in the data phase) at the time that the error occurs. This is because the discard flush is applied as soon as the error is detected. The command that is in the data phase may or may not be the command to cause this type of error since up to two commands are processed at a time (one in data phase and one in command phase).
19	LAST_CPLE_MPU	The last command pointer list entry to be processed was an MPU command. As such, the DPH_CMD_TYPE field, as well as all of the other flush state registers will not contain valid data. The one exception is the PTR_NUM field in FLUSH_STATE5 which is valid.

ADM3_0_HI_CHn_FLUSH_STATE0_SDs (cont.)

Bits	Name	Description
18	NO_OTB_INSTR	Flush occurred at a time when no OTB instructions were loaded. See above for details.
17	NO_INB_INSTR	Flush occurred at a time when no INB instructions were loaded. See above for details.
16	NO_DATA_XFER	The channel had begun to process the top-level pointer for this channel, but no data transfers for the top-level pointer had yet begun. As such, all other flush state registers will not be valid. A result will be generated for this top-level pointer.
15:14	DPH_CMD_TYPE	Specifies the type of command that has been flushed (only valid if CH_STATE is not idle, NO_DATA_XFER is not set (1), and LAST_CPLE_MPU is not set (1)): 0x0: Single 0x1: Scatter/gather 0x2: Reserved_programming 0x3: Box
13	PTR_NUM_OVRFLW	Indicates that the PTR_NUM field in FLUSH_STATE5 has overflowed and is not valid (this is only a status indication, it is not a cause for a flush)
12	DSCR_INDX_OVRFLW	Indicates that the DSCR_INDX_NUM field in FLUSH_STATE5 has overflowed and is not valid (this is only a status indication, it is not a cause for a flush)
11	LEN_ERROR	A flush was triggered internally because a box mode or scatter/gather command encountered a length error.
10	MPU_ERROR	A flush was triggered internally because a command encountered an internal MPU error.
9	DPH_BUS_ERROR	A flush was triggered internally because a command encountered a bus error from one of the data transfer requests.
8	CPH_BUS_ERROR	A flush was triggered internally because a command encountered a bus error from one of the command fetch requests. This type of error is imprecise in that the DPH_CMD_TYPE field as well as the FLUSH_STATE1-5 registers provide details of the command that is currently in the data phase (or the last command to complete data phase processing if no commands are in the data phase) at the time that the error occurs. This is because the discard flush is applied as soon as the error is detected. The command that is in the data phase may or may not be the command to cause this type of error since up to two commands are processed at a time (one in data phase and one in command phase).
7:3	RESERVED_BITS7_3	

ADM3_0_HI_CHn_FLUSH_STATE0_SDs (cont.)

Bits	Name	Description
2:1	CH_STATE	Specifies the processing state of the channel at the time that the flush was requested The channel was completely idle at the time of a flush and thus the flush has been ignored and has no impact. In this case a result will not be generated for this flush request. In this case all of the other flush state registers will not update. They will continue to provide the state of the last flush (if any). The channel was processing a command at the time of the flush. A result will be generated if the flush is due to an error condition, or if flush results are enabled. The channel was already processing a flush (either host initiated or due to an error) at the time that the latest flush was requested. As such, the latest flush request will be ignored. Other flush state registers do not update and continue to correspond to the initial flush. No result will be generated for the latest flush. 0x0: IDLE 0x1: PROCESS 0x3: FLUSH_WAIT
0	V	Indicates that the flush state is now valid. If an error occurs on a top-pointer after the previous top-pointer was flushed, this bit will go low while the DM3 core gathers the flush state for the error. In this case the flush state from the previous top-pointer will be lost if it has not already been read by the host.

0x183000C0+4*n+0x20800*s ADM3_0_HI_CHn_FLUSH_STATE1_SDs, n=[0..15], s=[0..7]

Type: Read
Clock: DM_CORE
Reset State: 0xXXXXXXXX

The HI_CHn_FLUSH_STATE1_SDs register is only meaningful if CH_STATE is not idle (00), NO_DATA_XFER is not set (1), and LAST_CPLE_MPU is not set (1).

ADM3_0_HI_CHn_FLUSH_STATE1_SDs

Bits	Name	Description
31:0	CMD_ADDR	Address of the command being processed by the data phase at the time of flush operation.

0x18300100+4*n+0x20800*s ADM3_0_HI_CHn_FLUSH_STATE2_SDs, n=[0..15], s=[0..7]

Type: Read
Clock: DM_CORE
Reset State: 0xXXXXXXXX

The HI_CHn_FLUSH_STATE2_SDs register is reserved. Software should not access this register.

ADM3_0_HI_CHn_FLUSH_STATE2_SDs

Bits	Name	Description
31:0	RESERVED_BITS31_0	

0x18300140+4*n+0x20800*s ADM3_0_HI_CHn_FLUSH_STATE3_SDs, n=[0..15], s=[0..7]

Type: Read
Clock: DM_CORE
Reset State: 0xXXXXXXXX

The HI_CHn_FLUSH_STATE3_SDs register is only meaningful if CH_STATE is not idle (00), NO_DATA_XFER is not set (1), and LAST_CPLE_MPU is not set (1). This register is intended for debug purposes and should not be relied upon by software.

ADM3_0_HI_CHn_FLUSH_STATE3_SDs

Bits	Name	Description
31:16	DST_REM_LEN	Specifies the number of bytes yet to be written to the command's current destination buffer (assuming all outstanding bus requests have completed). In the case of box mode commands, this is the number of bytes remaining for the current line.
15:0	SRC_REM_LEN	Specifies the number of bytes yet to be read from the command's current source buffer (assuming all outstanding bus requests have completed). In the case of box mode commands, this is the number of bytes remaining for the current line.

0x18300180+4*n+0x20800*s ADM3_0_HI_CHn_FLUSH_STATE4_SDs, n=[0..15], s=[0..7]

Type: Read
Clock: DM_CORE
Reset State: 0xXXXXXXXX

The HI_CHn_FLUSH_STATE4_SDs register is only meaningful if CH_STATE is not idle (00), NO_DATA_XFER is not set (1), and LAST_CPLE_MPU is not set (1). This register is intended only for debug purposes and should not be relied upon for software.

ADM3_0_HI_CHn_FLUSH_STATE4_SDs

Bits	Name	Description
31:16	DST_DSCR_NUM	Box mode commands: · Specifies the number of remaining destination lines for the command, including the current line (assuming all outstanding requests completed) Scatter/gather commands: · Specifies the scatter/gather command's current destination descriptor position in the descriptor list (assuming all outstanding requests completed)
15:0	SRC_DSCR_NUM	Box mode commands: · Specifies the number of remaining source lines for the command, including the current line (assuming all outstanding requests completed) Scatter/gather commands: · Specifies the scatter/gather command's current source descriptor position in the descriptor list (assuming all outstanding requests completed)

0x183001C0+4*n+0x20800*s **ADM3_0_HI_CHn_FLUSH_STATE5_SDs, n=[0..15], s=[0..7]**

Type: Read
Clock: DM_CORE
Reset State: 0xXXXXXXXX

The HI_CHn_FLUSH_STATE5_SDs register is only meaningful if CH_STATE is not idle (00), and NO_DATA_XFER is not set (1). If LAST_CPLE_MPU is set (1), then only the PTR_NUM field in this register is valid. In this case PTR_NUM points to the command list entry AFTER the MPU command.

ADM3_0_HI_CHn_FLUSH_STATE5_SDs

Bits	Name	Description
31:24	PTR_NUM	Specifies the current command's list pointer position in the pointer list (assuming all outstanding requests completed).
23:16	DSCR_INDX_NUM	Specifies the indirect scatter/gather command's current descriptor index position in the descriptor index list (assuming all outstanding requests completed).
15:8	BUFFERED_LEN	Specifies the number of data bytes read from the source but not written to the destination (assuming all outstanding requests complete). This field is intended for debug purposes only and should not be relied upon by software.
2:0	RESERVED_BITS2_0

Clock: DM_CORE
Reset State: 0x00000000

The HI_SEC_DOMAIN_IRQ_STATUS_SDs register is the N'th security domain's interrupt status register, which reflects the state of only those channels that belong to the N'th security domain. The other IRQ bits are always cleared (0). Reading the N'th security domain's interrupt status register clears (0) all of the interrupt requests from the channels belonging to the N'th security domain. The other channel interrupt requests are not affected.

ADM3_0_HI_SEC_DOMAIN_IRQ_STATUS_SDs

Bits	Name	Description
15	CH_15_IRQ	Indicates a pending interrupt request from channel 15
14	CH_14_IRQ	Indicates a pending interrupt request from channel 14
13	CH_13_IRQ	Indicates a pending interrupt request from channel 13
12	CH_12_IRQ	Indicates a pending interrupt request from channel 12
11	CH_11_IRQ	Indicates a pending interrupt request from channel 11
10	CH_10_IRQ	Indicates a pending interrupt request from channel 10
9	CH_9_IRQ	Indicates a pending interrupt request from channel 9
8	CH_8_IRQ	Indicates a pending interrupt request from channel 8
7	CH_7_IRQ	Indicates a pending interrupt request from channel 7
6	CH_6_IRQ	Indicates a pending interrupt request from channel 6
5	CH_5_IRQ	Indicates a pending interrupt request from channel 5
4	CH_4_IRQ	Indicates a pending interrupt request from channel 4
3	CH_3_IRQ	Indicates a pending interrupt request from channel 3
2	CH_2_IRQ	Indicates a pending interrupt request from channel 2
1	CH_1_IRQ	Indicates a pending interrupt request from channel 1
0	CH_0_IRQ	Indicates a pending interrupt request from channel 0

2.9.3 Channel status, configuration registers accessible to security domains

0x18300300+4*n+0x20800*s **ADM3_0_HI_CHn_RSLT_CONF_SDs, n=[0..15], s=[0..7]**

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000002

The HI_CHn_RSLT_CONF_SDs register provides the interrupt configuration status of the indicated channel.

ADM3_0_HI_CHn_RSLT_CONF_SDs

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	FLUSH_RSLT_EN	When set (1), a result will be generated for each top-level pointer that is flushed due to a host initiated flush. Note that all top-level pointers that either fully complete or that generate an error always produce a result. This bit should be set for normal operation, since it results in a one-to-one correspondence between top-pointers and results (with the only exception being that if a top-pointer causes an error, any top pointers that are queued are discarded without a result)
0	IRQ_EN	Indicates that an interrupt should be generated when the result FIFO becomes not empty, i.e., transition from 0 valid entry to 1 valid entry.

0x18300200+4*n+0x20800*s **ADM3_0_HI_CHn_STATUS_SDs, n=[0..15], s=[0..7]**

Type: Read
Clock: DM_CORE
Reset State: 0x00000001

The HI_CHn_STATUS_SDs register provides the channel status of the indicated channel.

ADM3_0_HI_CHn_STATUS_SDs

Bits	Name	Description
31:29	RSLT_FIFO_CNTR	Number of valid entries in the result FIFO. 0-3 are supported.
28:27	CMD_PTR_FIFO_CNTR	Number of valid entries in the command pointer FIFO. Note that there may also be a command pointer already being processed.
26	CMD_IN_PROGRESS	Indicates that a top-level pointer is currently being processed.
1	RSLT_VLD	At least one valid result may be dequeued from the result FIFO

ADM3_0_HI_CHn_STATUS_SDs (cont.)

Bits	Name	Description
0	CMD_PTR_RDY	At least one command pointer may be enqueued to the command pointer FIFO. This will only assert if all of the following are true: 1. CMD_PTR_FIFO_CNTR < 2 2. (CMD_PTR_FIFO_CNTR + RSLT_FIFO_CNTR < 2) OR ((CMD_PTR_FIFO_CNTR + RSLT_FIFO_CNTR < 3) AND CMD_IN_PROGRESS = 0)

0x18300400+0x20800*s ADM3_0_HI_CRCI0_CTL_SDs, s=[0..7]

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00030000

The HI_CRCI0_CTL_SDs register provides the ready status, reset of CRCI0.

ADM3_0_HI_CRCI0_CTL_SDs

Bits	Name	Description
31:18	RESERVED_BITS31_18	
17	CRCI0_RST	When set (1), this bit resets the indicated CRCI and keeps it in the reset state. When clear(0), this bit re-enables the indicated CRCI, and it becomes `1' after reset.
16	CRCI0_RDY	This is read only bit. When (1), this bit indicates that the indicated CRCI has at least one token for sending data or a command.
15:0	RESERVED_BITS15_0	

0x18300400+4*n+0x20800*s ADM3_0_HI_CRCIn_CTL_SDs, n=[1..15], s=[0..7]

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00020000

The HI_CRCIn_CTL_SDs register provides the ready status, reset, mux select and block size of the indicated CRCI.

ADM3_0_HI_CRCIn_CTL_SDs

Bits	Name	Description
31:19	RESERVED_BITS31_19	
18	CRCIN_MUX_SEL	The mux select for indicated CRCI.

ADM3_0_HI_CRCIn_CTL_SDs (cont.)

Bits	Name	Description
17	CRCIN_RST	When set (1), this bit resets the indicated CRCI and keeps it in the reset state. When clear(0), this bit re-enables the indicated CRCI, and it becomes `1' after reset.
16	CRCIN_RDY	This is read only bit. When (1), this bit indicates that indicated CRCI has at least one token for sending data or a command.
15:3	RESERVED_BITS15_3	
2:0	CRCIN_BLOCK_SIZE	Defines the block size if indicated CRCI is Data CRCI. 0x0: 16 bytes 0x1: 32 bytes 0x2: 64 bytes 0x3: 128 bytes 0x4: 192 bytes 0x5: 256 bytes

2.9.4 Security domain 0 channel configuration and debug registers

0x18300240+4*n ADM3_0_HI_CHn_CONF, n=[0..15]

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000081

The HI_CHn_CONF register provides the configuration status of the indicated channel and accessible through the security domain 0 only.

ADM3_0_HI_CHn_CONF

Bits	Name	Description
31:16	OTHER_CH_BLK_MASK	Each set (1) bit specifies that the corresponding channel is controlled by this channel via the OCU and OCB control field.
13	SEC_DOMAIN_2	Specifies the channel security domain (controls channel programming and status register aliasing, and selects which of the four interrupts should be used by the channel)
12	RSLT_CONF_SHADOW_EN	If set (1), the CH_CONF field IRQ_EN and FLUSH_RSLT_EN fields are set through register CHn_RSLT_CONF_SDs. During subsequent writes to CHn_CONF, writes to those fields are ignored. If clear, access to CHn_RSLT_CONF_SDs is ignored.
11	MPU_DISABLE	Disables MPU error detection
10	RESERVED_BIT10	

ADM3_0_HI_CHn_CONF (cont.)

Bits	Name	Description
9	PERM_MPU_CONF	Indicates that the MPU configuration structure pointed to by the top-level pointer will be executed. If this bit is cleared (0), all MPU structures will be silently ignored.
8	RESERVED_BIT8	
7	FLUSH_RSLT_EN	When set (1), a result will be generated for each top-level pointer that is flushed due to a host initiated flush. Note that all top-level pointers that either fully complete or that generate an error always produce a result. This bit should be set for normal operation, since it results in a one-to-one correspondence between top-pointers and results (with the only exception being that if a top-pointer causes an error, any top pointers that are queued are discarded without a result)
6	IRQ_EN	Indicates that an interrupt should be generated when the result FIFO becomes not empty, i.e., transition from 0 valid entry to 1 valid entry. if RSLT_CONF_SHADOW_EN is set (1), writes to this field will be ignored.
5:4	SEC_DOMAIN1_0	Specifies the channel security domain (controls channel programming and status register aliasing, and selects which of the four interrupts should be used by the channel)
3:0	PRIORITY	Specifies channel priority, in which 0 is the highest priority. This is the weight to the arbitration scheme. Note that assigning a channel's priority value to 0 causes the channel to stay at the highest priority, i.e., the channel will always be granted whenever there's a command to be executed, as the accumulator value is never incremented (incremented with 0). The priority can be viewed as the period between service intervals, such that a weight of 1 will be serviced twice as often as a weight of 2. Though arbitration occurs for each client interface separately, a channel's priority is common to all client interfaces. If multiple channels are configured for the same priority and are ready for access to the same client interface, round-robin servicing will be provided between these channels. The only exception to this is if more than one channel is configured as priority 0. In this case the zero-priority channel with the lowest number is always given preference.

0x18300280+4*n ADM3_0_HI_CHn_DBG_0, n=[0..15]

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000000

The HI_CHn_DBG_0 register is used for debugging purposes for the indicated channel and accessible through the security domain 0 only.

ADM3_0_HI_CHn_DBG_0

Bits	Name	Description
3	REQ_ENG_HALT	When set (1), prevents the channel from being chosen by the arbiter for data transfers. The current operation on the channel (if already selected) will complete.
2	CMD_ENG_HALT	When set (1), prevents the channel from being chosen by the arbiter for command transfers. The current operation on the channel (if already selected) will complete.
1	CMD_PTR_FIFO_HALT	When set (1), prevents the command pointer FIFO from accepting any new command pointers from hosts. The writes to the command pointer register will be ignored.
0	ERROR	When set (1), indicates that the channel has encountered an error and is now in the stalled state. Specific error information may be obtained by reading the channel flush state registers (see Error handling section). The software must clear (0) this bit before the channel may be used again. This bit can only be cleared by S/W; it cannot be set to 1 by S/W.

0x183002C0+4*n ADM3_0_HI_CHn_DBG_1, n=[0..15]

Type: Read
Clock: DM_CORE
Reset State: 0x00000000

The HI_CHn_DBG_1 register is used for additional debugging purposes for the indicated channel and accessible through the security domain 0 only.

NOTE This register always returns "0". Writing to this register has no affect.

ADM3_0_HI_CHn_DBG_1

Bits	Name	Description
31:0	DBG_STATE	TBD

2.9.5 Global configuration, and debug registers

0x18300390+4*n ADM3_0_HI_CIn_CONF, n=[0..3]

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00010001

The HI_CIn_CONF register is the CI configuration register for the indicated client interface.

It is possible to configure two or more client interfaces to have overlapping address regions. In this case accesses to the overlapping region will be sent to the highest numbered client interface. CI0 is the default client interface, and receives accesses to addresses that have not been assigned to any client interface. Setting RANGE_END < RANGE_START will disable the client interface, with the exception of CI0. On reset only CI0 is enabled. While the CI0 RANGE_START and RANGE_END parameters can be written and read, they do not have an impact on the address decode.

ADM3_0_HI_CIn_CONF

Bits	Name	Description
31:24	RANGE_END	Specifies the end of the N'th CI address range in 16-MB blocks. Note that this is the last block within the client interface region. For example setting RANGE_START=0x00 and RANGE_END=0x00 specifies that the client interface supports the address range 0x00000000-0x00FFFFFF. APQ 7200/7500: For CI 1 (SMI), the upper bit of this field must not be set. Any addresses in the range 0x80000000-0xFFFFFFFF must go to CI 0 if unused.
23:16	RANGE_START	Specifies the start of the N'th CI address range in 16-MB blocks

ADM3_0_HI_CIn_CONF (cont.)

Bits	Name	Description
5:4	CI_WEIGHT	Specifies the relative weight that the client interface receives when arbitrating for access to the channel buffer memory. Normally this can be left at 0 for all client interfaces, which means that each CI gets 25% of the channel buffer memory BW when all client interfaces are requesting (more BW is available if not all of the client interfaces are busy). At 133MHz the channel buffer memory has a half-duplex capacity of 500MB/sec. Assuming that each client interface is performing 32-byte bursts, a weight of 0 guarantees at least 125MB/sec of half duplex channel buffer memory BW to each CI. If the CI is doing 16 byte bursts while all other client interfaces are doing 32-byte bursts, then that CI is guaranteed at least 83.3 MB/sec of half duplex BW. If more than this amount of half-duplex BW is required on a single client interface, the CI weight parameter allows for a redistribution of the channel buffer memory BW. The minimum BW that the channel buffer memory will supply to a given CIn is determined by multiplying the following ratio by the BW capacity of the channel buffer memory (500MB/sec at 133MHz) (CI_WEIGHT(CIn)+1)*MAX_BURST_LEN(CIn) --- Sum for i=0 to 3 of ((CI_WEIGHT(CIi)+1)*MAX_BURST_LEN(CIi) Assuming that all bursts are 32-bytes long, then CI_WEIGHT does not need to be set to more than 1. Setting CI_WEIGHT to 1 for a high BW CI and to 0 for the remaining three CIs will result in the channel buffer memory supporting a minimum of 200MB/sec of half-duplex BW to the high BW CI, and 100 MB/sec to each of the remaining 3 low-BW CIs. With a maximum requirement of 100MB/sec full-duplex (200MB/sec half-duplex) across all 4 CIs, this is more than sufficient. Note that this parameter only distributes the BW of the channel buffer memory. It does not ensure that the client interfaces or the command processing can keep up with these rates.
3:0	MAX_BURST_LEN	Specifies the maximum burst length in 32-bit words. Only values of 1, 4, and 8 are currently supported, which specify 1, 4, or 8 word bursts. The following are the limitations of each client interface: AHB client interfaces (CI2, CI3, CI4): 1, 4, 8 AXI client interfaces (CI0, CI1): 4, 8 The AXI client interfaces will also work with a setting of 1, but not all bursts are limited to 1 word. It is recommended that AXI client interfaces be set to 8 word bursts and AHB client interfaces be set to at least 4 word bursts for optimal system performance.

0x183003B0+ 4*n ADM3_0_HI_CIn_DBG_ERR, n=[0..3]

Type: Read
Clock: DM_CORE
Reset State: 0x00000000

The HI_CIn_DBG_ERR register is the CI debug register for the indicated client interface.

ADM3_0_HI_CIn_DBG_ERR

Bits	Name	Description
31:16	DATA_BUS_ERR	The N'th bit in the mask becomes set (1) when the N'th channel data transfer traffic causes a bus error on this interface. By clearing the ERROR bit in the HI0_CHn_DBG_0 register, the bit corresponding to the channel will be cleared in this register.
15:0	CMD_BUS_ERR	The N'th bit in the mask becomes set (1) when the N'th channel command fetch traffic causes a bus error on this interface. By clearing the ERROR bit in the HI0_CHn_DBG_0 register, the bit corresponding to the channel will be cleared in this register.

0x183003D0 ADM3_0_HI_CRCI_CONF0

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000000

The HI_CRCI_CONF0 register is the CRCI configuration register.

ADM3_0_HI_CRCI_CONF0

Bits	Name	Description
31:30	RESERVED_BITS31_30	
29:27	CRCI9_SEC_DOMAIN	Specifies the security domain of HI_CRCI9_CTL register
26:24	CRCI8_SEC_DOMAIN	Specifies the security domain of HI_CRCI8_CTL register
23:21	CRCI7_SEC_DOMAIN	Specifies the security domain of HI_CRCI7_CTL register
20:18	CRCI6_SEC_DOMAIN	Specifies the security domain of HI_CRCI6_CTL register
17:15	CRCI5_SEC_DOMAIN	Specifies the security domain of HI_CRCI5_CTL register
14:12	CRCI4_SEC_DOMAIN	Specifies the security domain of HI_CRCI4_CTL register
11:9	CRCI3_SEC_DOMAIN	Specifies the security domain of HI_CRCI3_CTL register
8:6	CRCI2_SEC_DOMAIN	Specifies the security domain of HI_CRCI2_CTL register
5:3	CRCI1_SEC_DOMAIN	Specifies the security domain of HI_CRCI1_CTL register
2:0	CRCI0_SEC_DOMAIN	Specifies the security domain of HI_CRCI0_CTL register

0x183003D4 ADM3_0_HI_CRCI_CONF1

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000000

The HI_CRCI_CONF1 register is the CRCI control register.

ADM3_0_HI_CRCI_CONF1

Bits	Name	Description
31:18	RESERVED_BITS31_18	
17:15	CRCI15_SEC_DOMAIN	Specifies the security domain of HI_CRCI15_CTL register
14:12	CRCI14_SEC_DOMAIN	Specifies the security domain of HI_CRCI14_CTL register
11:9	CRCI13_SEC_DOMAIN	Specifies the security domain of HI_CRCI13_CTL register
8:6	CRCI12_SEC_DOMAIN	Specifies the security domain of HI_CRCI12_CTL register
5:3	CRCI11_SEC_DOMAIN	Specifies the security domain of HI_CRCI11_CTL register

0x183003D8 ADM3_0_HI_GP_CTL

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000000

.The HI_GP_CTL is a general purpose register that can be tailored for chip specific uses

ADM3_0_HI_GP_CTL

Bits	Name	Description
31:12	RESERVED_BITS31_12	
11:8	LP_CNT	The programmable counter is used to add more delay between AHB CI CLKON and HTRANS.
7	CI3_CLK_LP_EN	When set (1) this bit enables the corresponding CI low power feature. (CI clock gated when CI is idle). When clear (0) this bits disables the corresponding CI low power feature. (CI clock no gated).
6	CI2_CLK_LP_EN	When set (1) this bit enables the corresponding CI low power feature. (CI clock gated when CI is idle). When clear (0) this bits disables the corresponding CI low power feature. (CI clock no gated).

ADM3_0_HI_GP_CTL (cont.)

Bits	Name	Description
5	CI1_CLK_LP_EN	When set (1) this bit enables the corresponding CI low power feature. (CI clock gated when CI is idle). When clear (0) this bits disables the corresponding CI low power feature. (CI clock no gated).
4	CI0_CLK_LP_EN	When set (1) this bit enables the corresponding CI low power feature. (CI clock gated when CI is idle). When clear (0) this bits disables the corresponding CI low power feature. (CI clock no gated).
3	RESERVED_BITS3	
2	CI2_ISYNC_MODE_SEL_N	When set (1), this bit places the CI2 ISYNC AXI fifos in asynchronous operation mode. When cleared (0), this bit places the CI2 ISYNC AXI fifos in iso-synchronous operation mode. This field becomes `0' after reset.
1	CI1_ISYNC_MODE_SEL_N	When set (1), this bit places the CI1 ISYNC AXI fifos in asynchronous operation mode. When cleared (0), this bit places the CI1 ISYNC AXI fifos in iso-synchronous operation mode. This field becomes `0' after reset.
0	CI0_ISYNC_MODE_SEL_N	When set (1), this bit places the CI0 ISYNC AXI fifos in asynchronous operation mode. When cleared (0), this bit places the CI0 ISYNC AXI fifos in iso-synchronous operation mode. This field becomes `0' after reset.

0x183003E0 ADM3_0_HI_GLBL_DBG_CMD_ENG

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000000

NOTE This register always returns "0". Writing to this register has no affect.

ADM3_0_HI_GLBL_DBG_CMD_ENG

Bits	Name	Description
31:0	DBG_STATE	TBD

0x183003E4 ADM3_0_HI_GLBL_DBG_REQ_ENG

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000000

NOTE This register always returns "0". Writing to this register has no affect.

ADM3_0_HI_GLBL_DBG_REQ_ENG

Bits	Name	Description
31:0	DBG_STATE	TBD

0x183003E8 ADM3_0_HI_GLBL_DBG_XFR_ENG

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000000

NOTE This register always returns "0". Writing to this register has no affect.

ADM3_0_HI_GLBL_DBG_XFR_ENG

Bits	Name	Description
31:0	DBG_STATE	TBD

0x183003EC ADM3_0_HI_GLBL_DBG_CHAN_BLK

Type: Read
Clock: DM_CORE
Reset State: 0x00000000

ADM3_0_HI_GLBL_DBG_CHAN_BLK

Bits	Name	Description
15:0	CHAN_BLK_MASK	Indicates which channel(s) are currently blocked (see other channel block or this channel block command arguments)

0x183003F0 ADM3_0_HI_GLBL_DBG_CHAN_BLK_CLR

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000000

ADM3_0_HI_GLBL_DBG_CHAN_BLK_CLR

Bits	Name	Description
3:0	CHAN_BLK_CLR_CHAN_NNUM	Writing to this register causes the bit, corresponding to the channel number written, in GLBL_DBG_CHAN_BLK register to clear. This allows hosts to selectively clear channel block bits without relying on read-modify-write of GLBL_DBG_CHAN_BLK that would cause race-condition.

0x183003F4 ADM3_0_HI_GLBL_DBG_TEST_SEL

Type: Read/Write
Clock: DM_CORE
Reset State: 0x00000000

NOTE For the Client Interface test buses to work properly, all Client Interfaces must not be in the low power mode.

ADM3_0_HI_GLBL_DBG_TEST_SEL

Bits	Name	Description
5:0	TEST_BUS_SEL	This signal selects the signals to show on the DM3 testbus. The encoding for each set of test signal is as follows: 0x0: None (output is all zeros) 0x1: Reserved_programming_1 0x2: Reserved_programming_2 0x3: Reserved_programming_3 0x4: Command engine 0x8: Request engine 0xC: Transfer engine 0x10: Reserved_programming_4 0x20: CI0 0x24: CI1 0x28: CI2 0x2C: CI3 0x30: HI AHB2AHB BRIDGE

2.10 TSSC Registers (0x18600000 TSSC_BASE)

This section contains TSSC registers.

0x18600100 TSSC_CTL

Type: Read/Write
Clock: CC_TSSC_CLK
Reset State: 0x0000

The TSSC_CTL register is the master control register for the TSSC. Note, the ENABLE need not be reset to 0 between two TS operation unless the software wants to disable the TSSC and take over its functionality.

TSSC_CTL

Bits	Name	Description
31:13	RESERVED31_13	Reserved31_13
13	TOTAL_SSBI_CTRL_EN	If enables, blocks SSBI Master for entire duration of programmed operation(s) in Master/Slave mode 0x0: selectively reserve SSBI 0x1: reserve SSBI for all operations
12	INTR_FLAG2	This is set `1' along with PENUP_IRQ assertion.
11	DATA_FLAG	If set, indicates a valid data is present. This flag needs to be explicitly cleared by the Software (upon sample read). Collection of subsequent samples in master mode WILL NOT start unless a set DataFlag is cleared.
10	INTR_FLAG1	Set to 1 by TSSC along with SAMPLE_IRQ assertion.
9:7	DEBOUNCE_TIME	Decides the debounce time 0x0: 400 us 0x1: 800 us 0x2: 1.2 ms 0x3: 1.6 ms 0x4: 2 ms 0x5: 3 ms 0x6: 4 ms 0x7: 6 ms
6	DEBOUNCE_EN	Enables the Debounce Logic inside TSSC. 0x0: Disables TSSC Debounce Logic 0x1: Enables TSSC Debounce Logic
5	EN_AVERAGE	Enables Averaging function. In this case, the collected samples are averaged and the average value is stored in a separate register TSSC_AVG

TSSC_CTL (cont.)

Bits	Name	Description
4:3	MODE	0x0: TSSC disabled 0x1: BYPASS mode 0x2: Slave Mode 0x3: Master Mode
2	TSSC_SW_RESET	Writing a `1' to this bit resets the TSSC. The TSSC has to be enabled for this reset to take effect. This bit need not be cleared to de-assert. This is similar to a command_wr.
1	COMMAND_WR	Writing a `1' to this bit, triggers an operation in Slave/Master mode. This is optional for master (non-intr initiated) and must for slave mode.
0	ENABLE	Enables TSSC. Propagates Clock to the registers inside

0x18600104 TSSC_OPN

Type: Read/Write
Clock: CC_TSSC_CLK
Reset State: 0x0000

The TSSC_OPN holds details on the 4 different operations that the TSSC is supposed to do when in Master mode and also it tells the sequence in which the four operations are to be done.This register has four such 4-bit fields. The fields NUM_SAMPLE and RESOLUTION respectively set the number of samples and resolution for OPERATION.

TSSC_OPN

Bits	Name	Description
31:28	OPERATION4	Place Holder for Fourth Operation in Master Mode
27:24	OPERATION3	Place holder for Third operation in Master mode
23:20	OPERATION2	Place holder for second operation in Master Mode
19:16	OPERATION1	.Place holder for Slave Mode operation and first operation in Master Mode.
15:14	NUM_SAMPLE4	Number of Samples for Operation 4 0x0: One Sample 0x1: Four Samples 0x2: Eight Samples 0x3: Sixteen Samples
13:12	NUM_SAMPLE3	Number of Sample for Operation 3. Options same as above
11:10	NUM_SAMPLE2	Number of Sample for Operation 2.Options same as above
9:8	NUM_SAMPLE1	Number of Sample for Operation 1 and for slave Mode.Options same as above

TSSC_OPN (cont.)

Bits	Name	Description
7:6	RESOLUTION4	Resolution for Operation 4. 0x0: 8-bit resolution 0x1: 10-bit resolution 0x2: 12-bit resolution 0x3: reserved (if set, interpreted as 10 inside)
5:4	RESOLUTION3	Resolution setting for Operation 3
3:2	RESOLUTION2	Resolution setting for Operation 2
1:0	RESOLUTION1	Resolution setting for Operation1 and for Slave Mode.

0x18600108 TSSC_SAMPLING_INT

Type: Read/Write
Clock: CC_TSSC_CLK
Reset State: 0x0000

The TSSC_SAMPLING_INT register holds the Sampling Interval details. The SAMPLING_INT field gives the sampling interval in milliseconds. This has to be specified in unsigned binary. Hence the possible settings are 1 to 31. Note: zero is an invalid setting for this field.

TSSC_SAMPLING_INT

Bits	Name	Description
31:5	RESERVED31_5	Reserved31_5
4:0	SAMPLING_INT	Specifies (in unsigned binary) the sampling interval in millisecond units

0x1860010C TSSC_STATUS

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0b00000UU000000000

The TSSC_STATUS is a read-only register. This is updated by the TSSC and is read by software in case of interrupt from TSSC.

TSSC_STATUS

Bits	Name	Description
31:21	RESERVED31_21	Reserved31_21
20:18	TSSC_SSBI_FSM_STATE	Dynamically reflects the state of the SSBI read/write state machine inside TSSC. Used for Debugging.

TSSC_STATUS (cont.)

Bits	Name	Description
17:14	TSSC_FSM_STATE	Dynamically reflects the state of the main TSSC FSM. Used for Debugging.
13	BUSY	This bit is set to `1' when the TSSC is in the middle of a sampling operation in Slave modes. In Master mode, this bit is `1' throughout the period that SI timer is running.
12:11	ERROR_CODE	Indicates the Error details. Valid only if ERROR flag is set. 0x0: No Error 0x1: Watch Dog timed out waiting for ADC_EOC 0x2: Reserved. 0x3: Reserved
10	ADC_EOC_STATUS	The raw ADC_EOC signal synchronized to the TSSC's clock domain.
9	PENIRQ_STATUS	This is the raw PEN_IRQ_N interrupt synchronized to the TSSC's clock domain.
8:6	OPERATION	Indicates the current operation in progress. This field and the following field can become handy during error conditions. 0x0: None 0x1: First operation 0x2: Second operation 0x3: Third operation 0x4: Fourth operation
5:1	SAMPLES_COLLECTED	This field dynamically indicates the current sample number that is being collected (The sample number is in unsigned binary).
0	ERROR	If set, an ERROR has occurred. The ERROR_CODE field indicates the details.

0x18600110 TSSC_AVG_12

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "average sample" values of Operation 1 and Operation 2 as detailed in TSSC_OPN register. In slave mode, the LS field has the average value of the operation programmed in TSSC_OPN[OPERATION1] field. The number of bits valid in each of these fields depends upon the RESOLUTION setting of the concerned operation in the TSSC_OPN register.

TSSC_AVG_12

Bits	Name	Description
31:16	SAMPLES_AVG_2	Average value of samples for Operation 2 (Master mode)

TSSC_AVG_12 (cont.)

Bits	Name	Description
15:0	SAMPLES_AVG_1	Average value of samples for Operation 1 in Master mode and Average value of samples for slave mode operation

0x18600114 TSSC_AVG_34

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "average sample" values of Operation 3 and Operation 4 as detailed in TSSC_OPN register. In slave mode, this register is unused. The number of bits valid in each of these fields depends upon the RESOLUTION setting of the concerned operation in the TSSC_OPN register.

TSSC_AVG_34

Bits	Name	Description
31:16	SAMPLES_AVG_4	Average value of samples for Operation 4 (Master mode)
15:0	SAMPLES_AVG_3	Average value of samples for Operation 3(Master mode)

0x18600118 TSSC_SAMPLE_1_1

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 1 and 2 of Master Mode Operation 1 and Slave mode operation as the case may be.

TSSC_SAMPLE_1_1

Bits	Name	Description
31:16	RAW_SAMPLE_2	Raw Sample 2 of Master Mode Opn.1 and Slave Mode
15:0	RAW_SAMPLE_1	Raw Sample 1 of Master mode Opn 1 and Slave Mode

0x1860011C TSSC_SAMPLE_1_2

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 3 and 4 of Master Mode Operation 1 and Slave mode operation as the case may be.

TSSC_SAMPLE_1_2

Bits	Name	Description
31:16	RAW_SAMPLE_4	Raw Sample 4of Master Mode Opn.1 and Slave Mode
15:0	RAW_SAMPLE_3	Raw Sample 3 of Master mode Opn 1 and Slave Mode

0x18600120 TSSC_SAMPLE_1_3

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 5 and 6 of Master Mode Operation 1 and Slave mode operation as the case may be.

TSSC_SAMPLE_1_3

Bits	Name	Description
31:16	RAW_SAMPLE_6	Raw Sample 6 of Master Mode Opn.1 and Slave Mode
15:0	RAW_SAMPLE_5	Raw Sample 5 of Master mode Opn 1 and Slave Mode

0x18600124 TSSC_SAMPLE_1_4

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample7 and 8 of Master Mode Operation 1 and Slave mode operation as the case may be.

TSSC_SAMPLE_1_4

Bits	Name	Description
31:16	RAW_SAMPLE_8	Raw Sample8 of Master Mode Opn.1 and Slave Mode
15:0	RAW_SAMPLE_7	Raw Sample 7 of Master mode Opn 1 and Slave Mode

0x18600128 TSSC_SAMPLE_1_5

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 9 and 10 of Master Mode Operation 1 and Slave mode operation as the case may be.

TSSC_SAMPLE_1_5

Bits	Name	Description
31:16	RAW_SAMPLE_10	Raw Sample 10 of Master Mode Opn.1 and Slave Mode
15:0	RAW_SAMPLE_9	Raw Sample 9 of Master mode Opn 1 and Slave Mode

0x1860012C TSSC_SAMPLE_1_6

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 11 and 12 of Master Mode Operation 1 and Slave mode operation as the case may be.

TSSC_SAMPLE_1_6

Bits	Name	Description
31:16	RAW_SAMPLE_12	Raw Sample 12 of Master Mode Opn.1 and Slave Mode
15:0	RAW_SAMPLE_11	Raw Sample 11 of Master mode Opn 1 and Slave Mode

0x18600130 TSSC_SAMPLE_1_7

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 13 and 14 of Master Mode Operation 1 and Slave mode operation as the case may be.

TSSC_SAMPLE_1_7

Bits	Name	Description
31:16	RAW_SAMPLE_14	Raw Sample 14 of Master Mode Opn.1 and Slave Mode
15:0	RAW_SAMPLE_13	Raw Sample 13 of Master mode Opn 1 and Slave Mode

0x18600134 TSSC_SAMPLE_1_8

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 15 and 16 of Master Mode Operation 1 and Slave mode operation as the case may be.

TSSC_SAMPLE_1_8

Bits	Name	Description
31:16	RAW_SAMPLE_16	Raw Sample 16 of Master Mode Opn.1 and Slave Mode
15:0	RAW_SAMPLE_15	Raw Sample 15 of Master mode Opn 1 and Slave Mode

0x18600138 TSSC_SAMPLE_2_1

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 1 and 2 of Master Mode Operation 2

TSSC_SAMPLE_2_1

Bits	Name	Description
31:16	RAW_SAMPLE_2	Raw Sample 2 of Master Mode Opn.2
15:0	RAW_SAMPLE_1	Raw Sample 1 of Master mode Opn 2

0x1860013C TSSC_SAMPLE_2_2

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 3 and 4 of Master Mode Operation 2.

TSSC_SAMPLE_2_2

Bits	Name	Description
31:16	RAW_SAMPLE_4	Raw Sample 4of Master Mode Opn.2
15:0	RAW_SAMPLE_3	Raw Sample 3 of Master mode Opn 2

0x18600140 TSSC_SAMPLE_2_3

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 5 and 6 of Master Mode Operation 2

TSSC_SAMPLE_2_3

Bits	Name	Description
31:16	RAW_SAMPLE_6	Raw Sample 6 of Master Mode Opn.2
15:0	RAW_SAMPLE_5	Raw Sample 5 of Master mode Opn 2

0x18600144 TSSC_SAMPLE_2_4

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample7 and 8 of Master Mode Operation 2

TSSC_SAMPLE_2_4

Bits	Name	Description
31:16	RAW_SAMPLE_8	Raw Sample8 of Master Mode Opn.2
15:0	RAW_SAMPLE_7	Raw Sample 7 of Master mode Opn 2

0x18600148 TSSC_SAMPLE_2_5

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 9 and 10 of Master Mode Operation 2

TSSC_SAMPLE_2_5

Bits	Name	Description
31:16	RAW_SAMPLE_10	Raw Sample 10 of Master Mode Opn.2
15:0	RAW_SAMPLE_9	Raw Sample 9 of Master mode Opn 2

0x1860014C TSSC_SAMPLE_2_6

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 11 and 12 of Master Mode Operation 2.

TSSC_SAMPLE_2_6

Bits	Name	Description
31:16	RAW_SAMPLE_12	Raw Sample 12 of Master Mode Opn.2
15:0	RAW_SAMPLE_11	Raw Sample 11 of Master mode Opn 2

0x18600150 TSSC_SAMPLE_2_7

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 13 and 14 of Master Mode Operation 2.

TSSC_SAMPLE_2_7

Bits	Name	Description
31:16	RAW_SAMPLE_14	Raw Sample 14 of Master Mode Opn.2
15:0	RAW_SAMPLE_13	Raw Sample 13 of Master mode Opn 2

0x18600154 TSSC_SAMPLE_2_8

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 15 and 16 of Master Mode Operation 2

TSSC_SAMPLE_2_8

Bits	Name	Description
31:16	RAW_SAMPLE_16	Raw Sample 16 of Master Mode Opn.2
15:0	RAW_SAMPLE_15	Raw Sample 15 of Master mode Opn 2

0x18600158 TSSC_SAMPLE_3_1

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 1 and 2 of Master Mode Operation 3

TSSC_SAMPLE_3_1

Bits	Name	Description
31:16	RAW_SAMPLE_2	Raw Sample 2 of Master Mode Opn.3
15:0	RAW_SAMPLE_1	Raw Sample 1 of Master mode Opn3

0x1860015C TSSC_SAMPLE_3_2

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 3 and 4 of Master Mode Operation 3.

TSSC_SAMPLE_3_2

Bits	Name	Description
31:16	RAW_SAMPLE_4	Raw Sample 4of Master Mode Opn.3
15:0	RAW_SAMPLE_3	Raw Sample 3 of Master mode Opn 3

0x18600160 TSSC_SAMPLE_3_3

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 5 and 6 of Master Mode Operation 3

TSSC_SAMPLE_3_3

Bits	Name	Description
31:16	RAW_SAMPLE_6	Raw Sample 6 of Master Mode Opn.3
15:0	RAW_SAMPLE_5	Raw Sample 5 of Master mode Opn 3

0x18600164 TSSC_SAMPLE_3_4

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample7 and 8 of Master Mode Operation 3

TSSC_SAMPLE_3_4

Bits	Name	Description
31:16	RAW_SAMPLE_8	Raw Sample8 of Master Mode Opn.3
15:0	RAW_SAMPLE_7	Raw Sample 7 of Master mode Opn 3

0x18600168 TSSC_SAMPLE_3_5

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 9 and 10 of Master Mode Operation 3

TSSC_SAMPLE_3_5

Bits	Name	Description
31:16	RAW_SAMPLE_10	Raw Sample 10 of Master Mode Opn.3
15:0	RAW_SAMPLE_9	Raw Sample 9 of Master mode Opn 3

0x1860016C TSSC_SAMPLE_3_6

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 11 and 12 of Master Mode Operation 3.

TSSC_SAMPLE_3_6

Bits	Name	Description
31:16	RAW_SAMPLE_12	Raw Sample 12 of Master Mode Opn.3
15:0	RAW_SAMPLE_11	Raw Sample 11 of Master mode Opn 3

0x18600170 TSSC_SAMPLE_3_7

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 13 and 14 of Master Mode Operation 3.

TSSC_SAMPLE_3_7

Bits	Name	Description
31:16	RAW_SAMPLE_14	Raw Sample 14 of Master Mode Opn.3
15:0	RAW_SAMPLE_13	Raw Sample 13 of Master mode Opn 3

0x18600174 TSSC_SAMPLE_3_8

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 15 and 16 of Master Mode Operation 3

TSSC_SAMPLE_3_8

Bits	Name	Description
31:16	RAW_SAMPLE_16	Raw Sample 16 of Master Mode Opn. 3
15:0	RAW_SAMPLE_15	Raw Sample 15 of Master mode Opn 3

0x18600178 TSSC_SAMPLE_4_1

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 1 and 2 of Master Mode Operation 4

TSSC_SAMPLE_4_1

Bits	Name	Description
31:16	RAW_SAMPLE_2	Raw Sample 2 of Master Mode Opn.4
15:0	RAW_SAMPLE_1	Raw Sample 1 of Master mode Opn4

0x1860017C TSSC_SAMPLE_4_2

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 3 and 4 of Master Mode Operation 4.

TSSC_SAMPLE_4_2

Bits	Name	Description
31:16	RAW_SAMPLE_4	Raw Sample 4of Master Mode Opn.4
15:0	RAW_SAMPLE_3	Raw Sample 3 of Master mode Opn 4

0x18600180 TSSC_SAMPLE_4_3

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 5 and 6 of Master Mode Operation 4

TSSC_SAMPLE_4_3

Bits	Name	Description
31:16	RAW_SAMPLE_6	Raw Sample 6 of Master Mode Opn.4
15:0	RAW_SAMPLE_5	Raw Sample 5 of Master mode Opn 4

0x18600184 TSSC_SAMPLE_4_4

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample7 and 8 of Master Mode Operation 4

TSSC_SAMPLE_4_4

Bits	Name	Description
31:16	RAW_SAMPLE_8	Raw Sample8 of Master Mode Opn.4
15:0	RAW_SAMPLE_7	Raw Sample 7 of Master mode Opn 4

0x18600188 TSSC_SAMPLE_4_5

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 9 and 10 of Master Mode Operation 4

TSSC_SAMPLE_4_5

Bits	Name	Description
31:16	RAW_SAMPLE_10	Raw Sample 10 of Master Mode Opn.4
15:0	RAW_SAMPLE_9	Raw Sample 9 of Master mode Opn 4

0x1860018C TSSC_SAMPLE_4_6

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 11 and 12 of Master Mode Operation 4.

TSSC_SAMPLE_4_6

Bits	Name	Description
31:16	RAW_SAMPLE_12	Raw Sample 12 of Master Mode Opn.4
15:0	RAW_SAMPLE_11	Raw Sample 11 of Master mode Opn 4

0x18600190 TSSC_SAMPLE_4_7

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 13 and 14 of Master Mode Operation 4.

TSSC_SAMPLE_4_7

Bits	Name	Description
31:16	RAW_SAMPLE_14	Raw Sample 14 of Master Mode Opn.4
15:0	RAW_SAMPLE_13	Raw Sample 13 of Master mode Opn 4

0x18600194 TSSC_SAMPLE_4_8

Type: Read
Clock: CC_TSSC_CLK
Reset State: 0x0000

This register holds the "raw values" of sample 15 and 16 of Master Mode Operation 4

TSSC_SAMPLE_4_8

Bits	Name	Description
31:16	RAW_SAMPLE_16	Raw Sample 16 of Master Mode Opn. 4
15:0	RAW_SAMPLE_15	Raw Sample 15 of Master mode Opn 4

0x18600198 TSSC_TEST_1

Type: Read/Write
Clock: CC_TSSC_CLK
Reset State: 0x0001

The TSSC_TEST_1 register holds the value of ssbi_rd_data and the penirq_n signals that will be muxed into the TSSC state machine during functional test mode. Also the mode bit that controls the muxing (TEST_MODE) is also present in this register.

TSSC_TEST_1

Bits	Name	Description
31:24	TEST_SSBI_RD_DATA	The value in these bits will be muxed in as SSBI Read data when ever TEST_MODE bit is set.
23:3	RESERVED23_3	Reserved23_3
2	GATE_DEBOUNCE_EN	Selects or deselects the Gating logic in the path of penirqn signal to the debounce block. A `0' means gating logic not selected. Penirqn directly goes to debounce block. A `1' in this bit includes Gating logic in penirqn path to debounce logic.
1	TEST_MODE	This bit controls muxing of eoc, penirqn and ssbi_rd_data signals into the TSSC state machine. If 0, the functional mode inputs are muxed in. If 1, these inputs will be controlled based on description provided in the TSSC_TEST registers 1 and 2.
0	TEST_PENIRQ_N	This bit is directly muxed into penirqn debounce logic as the pen down interrupt input if TEST_MODE bit is set.

0x1860019C TSSC_TEST_2

Type: Write/Command
Clock: CC_TSSC_CLK
Reset State: 0x0000

The TSSC_TEST_2 register is a Write-only command register. A write to this register generates a pulse whose width is CC_TSSC_CLK period. If TEST_MODE bit in TSSC_TEST_1 register is set, then this pulse will be muxed into the TSSC state machine as ADC_EOC pulse.

TSSC_TEST_2

Bits	Name	Description
31:0	RESERVED31_0	Reserved31_0

2.11 TSSC Codec SSBI Registers (0x18600000 TSSC_SSBI_BASE)

This section contains TSSC Codec SSBI registers.

0x18600000 TSSC_CODEC_SSBI_CTL

Type: Read/Write
Clock: CC_TSSC_CLK
Reset State: 0x18001

Specifies various generic control information. Bits 14:7 are needed only for master interface with FTM support

TSSC_CODEC_SSBI_CTL

Bits	Name	Description
16	SSBI_DATA_PDEN	Pull down enable for SSBI_DATA pad.
15	ACTIVATE_RESERVE	Reset this bit to disable RESERVE feature in arbiter.
14	DISABLE_TERM_SYM	In FTM mode, set this bit to disable the termination symbol.
13:8	SLAVE_ID	In FTM mode, specifies the Slave ID.
7	FTM_MODE	Set this bit to force all the transfers to be in FTM mode.
6:5	SEL_RD_DATA	Specifies which RD_DATA value to select.
4	ENABLE_SSBI_INT	SSBI_INT is generated only when this bit is set.
3:2	SSBI_DATA_DEL	Specifies the number of 1/2 clock periods, SSBI_DATA will be delayed before sampling.
1:0	IDLE_SYMS	The master will ensure there are at least this number of Idle symbol periods in between the accesses. For successive writes, this value can be `0'. However if the following access is a read operation, then this value has to be greater then `0'.

0x18600004 TSSC_CODEC_SSBI_RESET

Type: Write
Clock: CC_TSSC_CLK

A write to this register resets the SSBI blocks.

TSSC_CODEC_SSBI_RESET

Bits	Name	Description
31:0	RESERVED31_0	Reserved31_0

0x18600008 TSSC_CODEC_SSBI_CMD

Type: Write
Clock: CC_TSSC_CLK

Specifies the information to use for the transfer. For both reads and writes, SW must write to this register to initiate the transfer. The REG_DATA field is ignored for reads. For a read, once it has completed, read the data through SSBI_RD. Note that, if SW initiates a read, it is expected that no subsequent access will be done until that data has been read from SSBI_RD

TSSC_CODEC_SSBI_CMD

Bits	Name	Description
27	SEND_TERM_SYM	In FTM mode, writing `1' to this bit will generate just the termination symbol without requesting for an access.
26	WAKEUP_SLAVE	When set (1), a single pulse will be send to Slave, followed by 10 idle clocks, followed by a read or write transaction.
25	USE_ENABLE	When set (1), this transaction will be stalled until the ENABLE input is set. Normally this feature is not used, hence this bit will be 0.
24	RDWRN	Denotes whether the command to perform is a register write (0) or read (1).
23:16	REG_ADD	Slave register address.
7:0	REG_DATA	Write data for a slave register. SSBI_DATA_WD can be in range 16 - 1.

0x1860000C TSSC_CODEC_SSBI_BYPASS

Type: Read/Write
Clock: CC_TSSC_CLK
Reset State: 0x0000

Allows SW to override SSBI_DATA value.

TSSC_CODEC_SSBI_BYPASS

Bits	Name	Description
1	OVR_VALUE	When OVR_MODE is 1, this bit is driven onto SSBI_DATA. This is NOT intended to enable SW to bit-bang SSBI commands. Rather, this is a safety option in case a need arises to program this bit differently in idle mode.
0	OVR_MODE	Override mode bit. When set (1), the value driven onto SSBI_DATA is given by OVR_VALUE.

0x18600010 TSSC_CODEC_SSBI_RD

Type: Read
Clock: CC_TSSC_CLK

When reading a slave register, write to SSBI_CMD (REG_DATA will be ignored). Once data is ready, read this register and it will return the returned data from the slave and the other fields filled in correctly to match. Reading from this register may clear some bits in SSBI_STATUS. Note if SW writes to SSBI_CMD before reading the contents of this register, all fields except REG_DATA may be invalid, and depending on the second access, REG_DATA may reflect the first read data or second read data

TSSC_CODEC_SSBI_RD

Bits	Name	Description
25	USE_ENABLE	Reflects how SSBI_CMD was written to initiate this read.
24	RDWRN	Reflects how SSBI_CMD was written to initiate this read.
23:16	REG_ADD	Reflects how SSBI_CMD was written to initiate this read.
7:0	REG_DATA	Returned read register data. SSBI_DATA_WD can be in range 16 - 1.

0x18600014 TSSC_CODEC_SSBI_STATUS

Type: Read
Clock: CC_TSSC_CLK

Returns information about the internal status of the SSBI master. If SW wants to perform an access, it should first ensure READY is 1. If SW wants to wait until the transfer has completed, it can poll MCHN_BUSY. If SW wants to know when read data has returned, it can poll RD_READY

TSSC_CODEC_SSBI_STATUS

Bits	Name	Description
4	SSBI_DATA_IN	Returns the instantaneous value of SSBI_DATA input. This is not affected by SSBI_DATA_DEL. This is intended as a test feature.
3	RD_CLOBBERED	This bit gets set (1) if SW initiates another access (read or write) while a SSBI read is being performed. The result of this action is that all the fields except RD_DATA in SSBI_RD will be invalid. Reads from SSBI_RD clear this bit.
2	RD_READY	Normally clear (0). If a SSBI read is performed, this bit will be set upon read completion (DONE assertion). Reads from SSBI_RD clear this bit.

TSSC_CODEC_SSBI_STATUS (cont.)

Bits	Name	Description
1	READY	Indicates that the master can accept a new transfer request. When clear (0), further writes to SSBI_CMD should not be done since the previous access may be lost. This signal will be clear for the duration from REQ assertion until ACK assertion. It also remains clear following reset, until the time SW writes to SSBI_CTL register and resets SSBI_DATA_PDEN bit.
0	MCHN_BUSY	When set (1), indicates the SSBI master is actively performing a transfer. This signal will be set for the duration from REQ assertion until DONE assertion.

0x18600018 TSSC_CODEC_SSBI_PRIORITIES

Type: Read/Write
Clock: CC_TSSC_CLK
Reset State: 0x0000

Specifies the priorities for SSBI ports. The SSBI block supports up to max. 8 ports for arbitration. Each port has 3 bits to specify its priority. Only three ports are shown here, for additional ports assume 3bits/port with priority 1 less then the port below it.

TSSC_CODEC_SSBI_PRIORITIES

Bits	Name	Description
8:6	PRIORITY2	Specifies the port of host, whose priority is 1 less then PRIORITY1
5:3	PRIORITY1	Specifies the port of host, whose priority is 1 less then PRIORITY0
2:0	PRIORITY0	Specifies the port of the highest priority host

2.12 WEB TCXO4 registers (0x18700000 MSM_PDM_BASE)

This section contains WEB TCX registers.

0x18700040 TCXO_PDM_CTL

Type: Read/Write
Clock: CC_PBUS_CLK
Reset State: 0x00

The TCXO_PDM_CTL register is used to enable/disable the PDM0 and PDM1 pins, and to configure the mode of operation for the PDM output.

TCXO_PDM_CTL

Bits	Name	Description
31:6	RESERVED_BITS31_6	Reserved bits
5	PDM2_POLARITY	This bit defines the polarity of PDM2. Set (1) this bit to invert the sense of the PDM output.
4	PDM1_POLARITY	This bit defines the polarity of PDM1. Set (1) this bit to invert the sense of the PDM output.
3	PDM0_POLARITY	This bit defines the polarity of PDM0. Set (1) this bit to invert the sense of the PDM output.
2	PDM2_EN	· Setting (1) this bit enables the PDM2 pin. · Clearing (0) this bit disables PDM2 and places it in a high impedance state. This bit is cleared on RESOUT.
1	PDM1_EN	· Setting (1) this bit enables the PDM1 pin. · Clearing (0) this bit disables PDM1 and places it in a high impedance state. This bit is cleared on RESOUT.
0	PDM0_EN	· Setting (1) this bit enables the PDM0 pin. · Clearing (0) this bit disables PDM0 and places it in a high impedance state. This bit is cleared on RESOUT. This bit is WRITE ONLY in perph_web_p3q3r15

0x18700044 PDM0_CTL

Type: Read/Write
Clock: CC_PBUS_CLK
Reset State: 0x8000

The PDM0_CTL register is the pulse density modulation register number 0. This register determines the density of pulses on the PDM0 pin.

PDM0_CTL

Bits	Name	Description
15:0	PDM0_DAT	When the PDM0_POLARITY is set, the output sense is inverted and the clock source is GENERAL_CLK/4.

0x18700048 PDM1_CTL

Type: Read/Write
Clock: CC_PBUS_CLK
Reset State: 0x80

The PDM1_CTL register is the pulse density modulation register number 1. This register determines the density of pulses on the PDM1 pin.

PDM1_CTL

Bits	Name	Description
7:0	PDM1_DAT	When the PDM1_POLARITY is set, the output sense is inverted and the clock source is GENERAL_CLK/4.

0x1870004C GP_MN_CLK_MDIV

Type: Read/Write
Clock: CC_PBUS_CLK
Reset State: Undefined

The GP_MN_CLK_MDIV register is the MDIV specification register for the GP M/N clock. For all GP_MN registers, this signal is generated by dividing the frequency of the TCXO signal by an M/N counter. M and N have the following specifications:

- The maximum value of M is 511.
- The maximum value of N is 8191.
- The value of M cannot exceed the value of N.

GP_MN_CLK_MDIV

Bits	Name	Description
8:0	GP_M_VALUE	This register defines the value of M for the M/N counter, which generates the GP_MN signal.

0x18700050 GP_MN_CLK_NDIV

Type: Read/Write
Clock: CC_PBUS_CLK
Reset State: Undefined

The GP_MN_CLK_NDIV register is the NDIV specification register for the GP M/N clock.

GP_MN_CLK_NDIV

Bits	Name	Description
12:0	GP_N_VALUE	This register defines the 1'Bits complement value of N minus M for the M/N counter, which generates the GP_MN signal. Write 0x1F to this register for APQ 2.2 compatibility.

0x18700054 GP_MN_CLK_DUTY

Type: Read/Write
Clock: CC_PBUS_CLK
Reset State: Undefined

The GP_MN_CLK_DUTY register is the duty cycle specification register for the GP M/N clock.

GP_MN_CLK_DUTY

Bits	Name	Description
12:0	GP_D_VALUE	This register defines the value of D, which determines the duty cycle of the GP M/N signal. The useful value of D must be in the range of M to N minus M.

0x18700058 WEB_TCXO4_TEST

Type: Read Only
Clock: CC_PBUS_CLK
Reset State: Undefined

The WEB_TCXO4_TEST register allows the current state of the web_tcxo4 output pads to be observed for test purposes.

WEB_TCXO4_TEST

Bits	Name	Description
15:14	RESERVED15_14	
13	PDM2_EDGE	Low to high edge on tlmm_gp_pdm2 input from pad. Read to clear.

WEB_TCXO4_TEST (cont.)

Bits	Name	Description
12	PDM2	Read tlmm_gp_pdm2 input from pad.
11:10	RESERVED11_10	
9	GP_MN_EDGE	Low to high edge on tlmm_gp_mn input from pad. Read to clear.
8	GP_MN	Read tlmm_gp_mn input from pad.
7:6	RESERVED7_6	
5	PDM1_EDGE	Low to high edge on tlmm_gp_pdm1 input from pad. Read to clear.
4	PDM1	Read tlmm_gp_pdm1 input from pad.
3:2	RESERVED3_2	
1	PDM0_EDGE	Low to high edge on tlmm_gp_pdm0 input from pad. Read to clear.
0	PDM0	Read tlmm_gp_pdm0 input from pad.

0x1870005C PDM2_CTL

Type: Read/Write
Clock: CC_PBUS_CLK
Reset State: 0x8000

The PDM2_CTL register is the pulse density modulation register number 2. This register determines the density of pulses on the PDM2 pin.

PDM2_CTL

Bits	Name	Description
15:0	PDM2_DAT	When the PDM2_POLARITY is set, the output sense is inverted and the clock source is GENERAL_CLK.

2.13 Chip System FPB1 Master Registers (0x18D00000 CSYSFPB_MST_BASE)

This section contains Chip System FPB registers.

0x18D00000 CSYSFPB_MST_CFPB_MASTER_CTRL_STATUS

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: 0x00000000

This register is a general configuration register.

CSYSFPB_MST_CFPB_MASTER_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0)
11	RPM_PROC_IRQ_EN	SW: RW, HW: R RPMProcessorInterruptEnable When set, the RPM processor receives an interrupt whenever ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	APPS_PROC_IRQ_EN	SW: RW, HW: R Apps_ProcInterruptEnable When set, the Application Processor receives an interrupt whenever ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

CSYSFPB_MST_CFPB_MASTER_CTRL_STATUS (cont.)

Bits	Name	Description

0x18D00004+0x4*a CSYSFPB_MST_CFPB_MASTER_AHB2AHB_CFG_Ma, a=[0..3]

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: 0x00000009

The CFPB_MASTER_AHB2AHB_CFG_Ma register is to configure the AHB2AHB bridge of master Ma. The AHB2AHB bridge is instantiated if the AHB interface is async (Generic: MASTER_ASYNC_IF(a) = ’1’). Otherwise this register is reserved.

CSYSFPB_MST_CFPB_MASTER_AHB2AHB_CFG_Ma

Bits	Name	Description
30:6	RESERVED_BITS30_6	

CSYSFPB_MST_CFPB_MASTER_AHB2AHB_CFG_Ma (cont.)

Bits	Name	Description
5:4	M_AHB2AHB_TEST_EN	SW: RW, HW: R Test enable for the Sa lite_bridge. Power up value is 00 0x0: DISABLED 0x1: Select slave side test signals 0x2: Select master side test signals 0x3: RESERVED_PROGRAMMING
3	M_WPOST_EN	SW: RW, HW: R MaWritePostEnable When set (1), the ahb2ahb bridge will support posting of write data. When cleared (0), each write request must complete across the bus before the next is accepted. Power up value is set (1)
2	M_HALT_ACK	SW:R, HW:W Indicates the Ma acknowledgement of halt_req asserted by software. Power up value is clear (0).
1	M_HALT_REQ	SW:RW, HW:R Software should write to this register to request the Ma lite_bridge master to cleanly halt. Power up value is clear (0).
0	M_IDLE	SW:R, HW:W Indicates that the Ma lite bridge master FSM is in IDLE state. Power up value is set (1).

0x18D00044 CSYSFPB_MST_CFPB_MASTER_PORT_EN

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: 0x0000000F

This register is the CFPB_MASTER master port enable register.

CSYSFPB_MST_CFPB_MASTER_PORT_EN

Bits	Name	Description
31:4	RESERVED_BIT31_4	Not used as only 4 Master ports are used.
3	M3_PORT_EN	SW: RW, HW: R M3PortEnable When cleared (0), M3 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

CSYSFPB_MST_CFPB_MASTER_PORT_EN (cont.)

Bits	Name	Description
2	M2_PORT_EN	SW: RW, HW: R M2PortEnable When cleared (0), M2 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)
1	M1_PORT_EN	SW: RW, HW: R M1PortEnable When cleared (0), M1 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

0x18D00050 CSYSFPB_MST_CFPB_MASTER_ERROR_STAT

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: 0x00000000

This register is the bus error status register.

CSYSFPB_MST_CFPB_MASTER_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the channel ID that caused the detected error when CID is valid for the master of the access. If not, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	

CSYSFPB_MST_CFPB_MASTER_ERROR_STAT (cont.)

Bits	Name	Description
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Master0 0x1: Master1 0x2: Master2 0x3: Master3 0x4: Master4 0x5: Master5 0x6: Master6 0x7: Master7 0x8: Master8 0x9: Master9 0xA: Master10 0xB: Master11 0xC: Master12 0xD: Master13 0xE: Master14 0xF: Master15
11:10	RESERVED_BITS11_10	
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit

CSYSFPB_MST_CFPB_MASTER_ERROR_STAT (cont.)

Bits	Name	Description
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x18D00054 CSYSFPB_MST_CFPB_MASTER_ERROR_ADDR

Type: Read
Clock: CC_CFPB_MASTER_CLK
Reset State: 0x00000000

This register contains the bus error address.

CSYSFPB_MST_CFPB_MASTER_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x18D0005C CSYSFPB_MST_CFPB_MASTER_XPU_ACR

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: 0xFFFFFFFF

The CFPB_MASTER_XPU_ACR register is the CFPB_MASTER Access Control Register for configuring register protection.

CSYSFPB_MST_CFPB_MASTER_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R CFPB_MASTER XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the CFPB_MASTER configure space, including this register itself. Power up value is set (1)

0x18D00060 CSYSFPB_MST_CFPB_MASTER_HW_CLK_GATING_CFG

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: 0x00000000

The CFPB_MASTER_HW_CLK_GATING_CFG register is for hardware clock gating configuration.

CSYSFPB_MST_CFPB_MASTER_HW_CLK_GATING_CFG

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	HYSTERESIS_CNT_SW	SW: RW, HW: R Hysteresis Counter Value This field is used by SW to set the hysteresis counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)
3:0	WAKE_CNT_SW	SW: RW, HW: R Wakeup Counter Value This field is used by SW to set the wakeup counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)

0x18D00064 CSYSFPB_MST_CFPB_MASTER_XPU_ACR_ERR_STATUS

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: 0x00000000

The CFPB_MASTER_XPU_ACR_ERR_STATUS register is for capturing the status when there is an XPU (ACR) access error.

M2VMT (hmaster index) registers (existing when VMIDMAPPER=1)

CSYSFPB_MST_CFPB_MASTER_XPU_ACR_ERR_STATUS

Bits	Name	Description
31:27	RESERVED_BITS31_27	
26:22	HVMID	SW: RW, HW: W HVMID of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
21	HWRITE	SW: RW, HW: W HVMID of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
20:9	HADDR	SW: RW, HW: W HADDR of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
8:6	HSIZE	SW: RW, HW: W HSIZE of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
5	HPROTNS	SW: RW, HW: W HPROTNS of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
4:1	HPROT	SW: RW, HW: W HPROT of the CSR access that caused an Error. Only valid when ERROR_DETECT_CSR is set (1). ERROR_DETECT_CSR must be cleared (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT_CSR has been cleared (0).
0	ERROR_DETECT_CSR	SW: RW, HW: RW ErrorDetect during CSR accesses. When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables this register to capture the next error detected. Power up value is clear (0)

0x18D01000+ 0x4*n CSYSFPB_MST_CFPB_MASTER_M2VMT_M2VMRn, n=[0..3]

Type: Read/Write
Clock: CC_CFPB_MASTER_CLKCC_CFPB_MASTER_CLK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where n = NUM_M2VMT_ENTRIES from the design generics and we map NUM_M2VMT_ENTRIES to NUM_MASTERS.

Since n=2 is TSIF DM master (uses CID), the set of registers starting at addr_offset 0x1000 can be ignored for the index=2. Instead, the set of registers starting at address_offset 0x2000 are to be used.

CSYSFPB_MST_CFPB_MASTER_M2VMT_M2VMRn

Bits	Name	Description
31:5	RESERVED	
4:0	VMID	Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRn address associations. n = NUM_M2VMT_ENTRIES from the design generic/parameter.

0x18D01F80 CSYSFPB_MST_CFPB_MASTER_M2VMT_CR

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: xxx0

Global configuration register.

Note: When REMOVE_M2VMT_RPU = ‘1’, this register is not available. Also, bit [2], is not valid or has no effect when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT =‘1’.

CSYSFPB_MST_CFPB_MASTER_M2VMT_CR

Bits	Name	Description
31:4	RESERVED	

CSYSFPB_MST_CFPB_MASTER_M2VMT_CR (cont.)

Bits	Name	Description
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., in valid addresses) are recorded as such. Decode error is asserted when config access to un-implemented and/or unmapped register/address are done. Also, note that decode error is never asserted for client port accesses. When value is set to ’0’, i.e., ’do not record’, decode errors do not set the M2VMT_ESR[CFG], and M2VMT_EAR & M2VMT_SYNRn is not updated. When value is set to ’1’, i.e., ’record’, decode errors set M2VMT_ESR[CFG] and M2VMT_EAR & M2VMT_SYNRn is updated with the address and the syndrome of the error. Reset State: x
2	RPUEIE	RPU error interrupt Enable: When set, configuration port errors are reported directly to the interrupt controller via the M2VMT_intr, interrupt output signal. Interrupt output is asserted if M2VMT_CR[RPUIE_EN] is ’1’ and ANY bit is set in the M2VMT_ESR register. Special Note: Not valid or has no effect on the interrupt when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=’1’. Reset State: x
1	RPUERE	RPU error report enable: When set, M2VMT reports configuration port errors to the requesting bus master, according to the respective port’s bus protocol. All error types reported via CRIF port will use a decode error, rather than a slave error. Regardless of the value of this field, both configuration port errors are terminated by the M2VMT as RAZ/WI, and are recorded in M2VMT_ESR register. Reset State: X
0	RPUE	RPU Enable: Governs whether M2VMT_RPU_ACR is enabled to check the VMID of the configuration request. When set, all configuration port accesses are checked against M2VMT_RPU_ACR register for access permissions. It’s cleared by reset. Set once SROT configures MID->VMID mapping tables Reset State: 0

0x18D01F84 CSYSFPB_MST_CFPB_MASTER_M2VMT_EAR

Type: Read
Clock: CC_CFPB_MASTER_CLK
Reset State: unknown

When there is an error, this register holds the physical address of the errant transaction.

CSYSFPB_MST_CFPB_MASTER_M2VMT_EAR

Bits	Name	Description
31:0	PA	M2VMT Error Address Register: Physical address[31:0]. Contains the physical address of the errant request. Based on implementation, it may not contain the full 32 bits of the address. Captures the address on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. Special Note: When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT = '1', this register is not available and therefore access to this register are treated as RAZ/WI.

0x18D01F88 CSYSFPB_MST_CFPB_MASTER_M2VMT_ESR

Type: Read/Write to clear
Clock: CC_CFPB_MASTER_CLK
Reset State: Undefined

M2VMT Error Status Register:

Captures the status upon M2VMT configuration errors, as determined by the M2VMT_RPU_ACR.

This register has read/write-clear access, meaning that reads simply provide a value in the register, while writes are performed by clearing those bits corresponding to '1's in the value written data, and leaving unchanged those bits corresponding to 0s n the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old error. A write with a '1' set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

The presence of an asserted value on any bit in this register is what prompts the assertion when enabled by M2VMT_CR[RPUEIE] of the M2MVT's interrupt output. Therefore these bits must be cleared by the interrupt handler. This is contrasted with the fields in the M2VMT_ESYNRn register, which are merely the 'syndrome' of an error indicated by the M2VMT_ESR.

For M2VMT, there is only one defined error status bit in the M2VMT_SER (actually two counting multi-error).

CSYSFPB_MST_CFPB_MASTER_M2VMT_ESR

Bits	Name	Description
31	MULTI	Multi-Error: When set to '1', indicates that an additional error occurred while M2VMT_ESR is non-zero. The M2VMT_EAR,M2VMT_ESYNRn and M2VMT_ESR registers (with the exception of this bit) lock on the first error, and must be cleared to unlock. Therefore, the status and the syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., syndrome register and status register stores details of only the first error.
30:1	RESERVED	
0	CFG	Configuration Port Error: When set to '1', indicates an error associated with a configuration port request. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this register is treated as RAZ/WI.

0x18D01F8C CSYSFPB_MST_CFPB_MASTER_M2VMT_ESRRESTORE

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: unknown

CSYSFPB_MST_CFPB_MASTER_M2VMT_ESRRESTORE

Bits	Name	Description
31:0	M2VMT_ESRRTORE	M2VMT Error Status Register Restore This is just an aliased address for M2VMT_ESR, which provides direct write access (rather than write-clear) for restoration purpose **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this register is treated as RAZ/WI.

0x18D01F90 CSYSFPB_MST_CFPB_MASTER_M2VMT_ESYNR0

Type: Read
Clock: CC_CFPB_MASTER_CLK
Reset State: undefined

Error Syndrome Register 0:

Captures the syndrome on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) 'lock' upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., the syndrome register and the status register stores details of only the first error.

CSYSFPB_MST_CFPB_MASTER_M2VMT_ESYNR0

Bits	Name	Description
31:24	ATID	ATID[7:0] field of errant request.
23:21	RESERVED	
20:16	AVMID	AVMID[4:0] field of errant request.
15:0	AMID	AMID[15:0] field of errant request. Special Note: When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT="1", this register is not available and therefore access to this register is treated as RAZ/WI.

0x18D01F94 CSYSFPB_MST_CFPB_MASTER_M2VMT_ESYNR1

Reset State: Undefined

Error Syndrome Register 1:

Captures syndrome upon M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) 'lock' upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., the syndrome register and the status register stores details of only the first error.

CSYSFPB_MST_CFPB_MASTER_M2VMT_ESYNR1

Bits	Name	Description
31	DCD	Decode: Indicates configuration port error due to invalid/ unrecognized/ unmapped/ un-implemented address (e.g., a reserved register address). Includes decode errors within the global address space. Also, note that decode error is never asserted for client port accesses.
30	AC	Access control: Indicates configuration port error due to lack of permission, as specified by the access control registers
29:25	RESERVED_1	

CSYSFPB_MST_CFPB_MASTER_M2VMT_ESYNR1 (cont.)

Bits	Name	Description

Using the incoming VMID, this register controls access to the global register space.

M2VMT (hcid index) registers (existing when VMIDMAPPER=1 and MASTER_IS_DM /= x"0000")

CSYSFPB_MST_CFPB_MASTER_M2VMT_RPU_ACR

Bits	Name	Description
31:0	RWE	M2VMT local RPU Access control Register. Each bit position corresponds to a VMID. When set to '1', that VMID is granted VMID read/write access to the entire block of registers within the M2VMT's 4KB global address space, including this register itself. In practice, this register designates the VMID(s) that can act as SROT (e.g., scorpion-secure) or pseudo SROT (e.g. RPM ARM11). Special Note: When REMOVE_M2VMT_RPU='1', this register is not available and therefore access to this register is treated as RAZ/WI.

0x18D02000+ 0x4*n CSYSFPB_MST_CFPB_MASTER_DM_M2VMT_M2VMRn, n=[0..15]

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where n = NUM_M2VMT_ENTRIES from the design generics

CSYSFPB_MST_CFPB_MASTER_DM_M2VMT_M2VMRn

Bits	Name	Description
31:5	RESERVED	
4:0	VMID	Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRn address associations. n = NUM_M2VMT_ENTRIES from the design generic/parameter.

0x18D02F80 CSYSFPB_MST_CFPB_MASTER_DM_M2VMT_CR

Type: Read/Write
Clock: CC_CFPB_MASTER_CLK
Reset State: xxx0

Global configuration register.

Note: When REMOVE_M2VMT_RPU = ’1’, this register is not available. Also, bit [2], is not valid or has no effect when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT =’1’.

CSYSFPB_MST_CFPB_MASTER_DM_M2VMT_CR

Bits	Name	Description
31:4	RESERVED	
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., in valid addresses) are recorded as such. Decode error is asserted when config access to un-implemented and/or unmapped register/address are done. Also, note that decode error is never asserted for client port accesses. When value is set to ’0’ i.e., ’do not record’, decode errors do not set the M2VMT_ESR[CFG], and M2VMT_EAR & M2VMT_SYNRn is not updated. When value is set to ’1’, i.e., ’record’, decode errors set M2VMT_ESR[CFG] and M2VMT_EAR & M2VMT_SYNRn is updated with the address and the syndrome of the error. Reset State: x
2	RPUEIE	RPU error interrupt Enable: When set, configuration port errors are reported directly to the interrupt controller via the M2VMT_intr, interrupt output signal. Interrupt output is asserted if M2VMT_CR[RPUIE_EN] is ’1’ and ANY bit is set in the M2VMT_ESR register. Special Note: Not valid or has no effect on the interrupt when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=’1’. Reset State: x
1	RPUERE	RPU error report enable: When set, M2VMT reports configuration port errors to the requesting bus master, according to the respective port’s bus protocol. All error types reported via CRIF port will use a decode error, rather than a slave error. Regardless of the value of this field, both configuration port errors are terminated by the M2VMT as RAZ/WI, and are recorded in M2VMT_ESR register. Reset State: X
0	RPUE	RPU Enable: Governs whether M2VMT_RPU_ACR is enabled to check the VMID of the configuration request. When set, all configuration port accesses are checked against M2VMT_RPU_ACR register for access permissions. It’s cleared by reset. Set once SROT configures MID->VMID mapping tables Reset State: 0

When there is an error, this register holds the physical address of the errant transaction.

CSYSFPB_MST_CFPB_MASTER_DM_M2VMT_EAR

Bits	Name	Description
31:0	PA	M2VMT Error Address Register: Physical address[31:0]. Contains the physical address of the errant request. Based on implementation, it may not contain the full 32 bits of the address. Captures the address on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. Special Note: When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT = '1', this register is not available and therefore access to this register are treated as RAZ/WI.

0x18D02F88 CSYSFPB_MST_CFPB_MASTER_DM_M2VMT_ESR

Type: Read/Write to clear
Clock: CC_CFPB_MASTER_CLK
Reset State: Undefined

M2VMT Error Status Register:

Captures the status upon M2VMT configuration errors, as determined by the M2VMT_RPU_ACR.

This register has read/write-clear access, meaning that reads simply provide a value in the register, while writes are performed by clearing those bits corresponding to '1's in the value written data, and leaving unchanged those bits corresponding to 0s n the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old error. A write with a '1' set in a bit field will result in clearing that bit. Writes with a 0 have no effect.

The presence of an asserted value on any bit in this register is what prompts the assertion when enabled by M2VMT_CR[RPUEIE] of the M2MVT's interrupt output. Therefore these bits must be cleared by the interrupt handler. This is contrasted with the fields in the M2VMT_ESYNRn register, which are merely the 'syndrome' of an error indicated by the M2VMT_ESR.

For M2VMT, there is only one defined error status bit in the M2VMT_SER (actually two counting multi-error).

CSYSFPB_MST_CFPB_MASTER_DM_M2VMT_ESR

Bits	Name	Description
31	MULTI	Multi-Error: When set to '1', indicates that an additional error occurred while M2VMT_ESR is non-zero. The M2VMT_EAR,M2VMT_ESYNRn and M2VMT_ESR registers (with the exception of this bit) lock on the first error, and must be cleared to unlock. Therefore, the status and the syndrome of errors that occurred while M2VMT_ESR[CFG] is '1' are lost, i.e., syndrome register and status register stores details of only the first error.
30:1	RESERVED	
0	CFG	Configuration Port Error: When set to '1', indicates an error associated with a configuration port request. **NOTE** When REMOVE_M2VMT_RPU='1' OR REMOVE_ M2VMT_SYND_REG_IF_RPU_PRESENT='1', this register is not available and therefore access to this register is treated as RAZ/WI.

13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.

CFPB1_XPU_APU_IDR (cont.)

Bits	Name	Description
9	RESERVED9	Reserved
8:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x18E00FFC CFPB1_XPU_APU_APU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

CFPB1_XPU_APU_APU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APUs (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

2.15 Chip System FPB1 Config Registers (0x18F00000 CSYSFPB1_BASE)

This section contains Chip System FPB 1 registers.

0x18F00000 CSYSFPB1_CFPB1_CTRL_STATUS

Type: Read/Write
Clock: CC_CFPB1_CLK
Reset State: 0x00000000

This register is a general configuration register.

CSYSFPB1_CFPB1_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0)
11	RPM_PROC_IRQ_EN	SW: RW, HW: R PRMProcInterruptEnable When set, the RPM Processor receives an interrupt whenever ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	APPS_PROC_IRQ_EN	SW: RW, HW: R AppsProcInterruptEnable When set, the Application Processor receives an interrupt whenever ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

CSYSFPB1_CFPB1_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x5: Select the S0_M0 ahb2ahb bridge test bus. 0x6: Select the S1_M1 ahb2ahb bridge test bus. 0x7: Select the M0 ahb2ahb bridge test bus. 0x8: Select the M1 ahb2ahb bridge test bus. 0x9: Select the M2 ahb2ahb bridge test bus. 0xA: Select the M3 ahb2ahb bridge test bus. 0xB: Select the M4 ahb2ahb bridge test bus. 0xC: Select the M5 ahb2ahb bridge test bus. 0xD: Select the M6 ahb2ahb bridge test bus. 0xE: Select the M7 ahb2ahb bridge test bus. 0xF: Select the M8 ahb2ahb bridge test bus. 0x10: Select the M9 ahb2ahb bridge test bus. 0x11: Select the M10 ahb2ahb bridge test bus. 0x12: Select the M11 ahb2ahb bridge test bus. 0x13: Select the M12 ahb2ahb bridge test bus. 0x14: Select the M13 ahb2ahb bridge test bus. 0x15: Select the M14 ahb2ahb bridge test bus. 0x16: Select the M15 ahb2ahb bridge test bus.

0x18F00004+0x4*a CSYSFPB1_CFPB1_AHB2AHB_CFG_Ma, a=[0..0]

Type: Read/Write
Clock: CC_CFPB1_CLK
Reset State: 0x00000009

The CFPB1_AHB2AHB_CFG_Ma register is to configure the AHB2AHB bridge of master Ma. The AHB2AHB bridge is instantiated if the AHB interface is async (Generic: MASTER_ASYNC_IF(a) = ’1’). Otherwise this register is reserved.

CSYSFPB1_CFPB1_AHB2AHB_CFG_Ma

Bits	Name	Description
30:6	RESERVED_BITS30_6	

CSYSFPB1_CFPB1_AHB2AHB_CFG_Ma (cont.)

Bits	Name	Description
5:4	M_AHB2AHB_TEST_EN	SW: RW, HW: R Test enable for the Sa lite_bridge. Power up value is 00 0x0: DISABLED 0x1: Select slave side test signals 0x2: Select master side test signals 0x3: RESERVED_PROGRAMMING
3	M_WPOST_EN	SW: RW, HW: R MaWritePostEnable When set (1), the ahb2ahb bridge will support posting of write data. When cleared (0), each write request must complete across the bus before the next is accepted. Power up value is set (1)
2	M_HALT_ACK	SW:R, HW:W Indicates the Ma acknowledgement of halt_req asserted by software. Power up value is clear (0).
1	M_HALT_REQ	SW:RW, HW:R Software should write to this register to request the Ma lite_bridge master to cleanly halt. Power up value is clear (0).
0	M_IDLE	SW:R, HW:W Indicates that the Ma lite bridge master FSM is in IDLE state. Power up value is set (1).

0x18F00044 CSYSFPB1_CFPB1_PORT_EN

Type: Read/Write
Clock: CC_CFPB1_CLK
Reset State: 0xFFFFFFFF

This register is the CFPB1 master port enable register.

CSYSFPB1_CFPB1_PORT_EN

Bits	Name	Description
31:1	RESERVED_BIT31_1	Only one master port is used.
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

0x18F00050 CSYSFPB1_CFPB1_ERROR_STAT

Type: Read/Write
Clock: CC_CFPB1_CLK
Reset State: 0x00000000

This register is the bus error status register.

CSYSFPB1_CFPB1_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the channel ID that caused the detected error when CID is valid for the master of the access. If not, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Master0 0x1: Master1 0x2: Master2 0x3: Master3 0x4: Master4 0x5: Master5 0x6: Master6 0x7: Master7 0x8: Master8 0x9: Master9 0xA: Master10 0xB: Master11 0xC: Master12 0xD: Master13 0xE: Master14 0xF: Master15
11:10	RESERVED_BITS11_10	

CSYSFPB1_CFPB1_ERROR_STAT (cont.)

Bits	Name	Description
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x18F00054 CSYSFPB1_CFPB1_ERROR_ADDR

Type: Read
Clock: CC_CFPB1_CLK
Reset State: 0x00000000

This register contains the bus error address.

CSYSFPB1_CFPB1_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x18F00058 CSYSFPB1_CFPB1_GPREG

Type: Read/Write
Clock: CC_CFPB1_CLK
Reset State: 0x00000000

This register is a configurable general purpose register. This is 9-bit register. The size of this register is defined by the generic-SFPB_GPREG_SIZE (1 - 32 bits). It is set to 9.

CSYSFPB1_CFPB1_GPREG

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8:1	MSM_TIMEOUT_VAL	SW: RW, HW: W APQ will wait for time out value for ACK to receive from the Slave if MSM_TIMEOUT_VAL is programmed and if timeout is enabled. If ACK is not received within the timeout value, APQ will respond with Error. Power up value is clear (0)
0	MSM_TIMEOUT_EN	SW: RW, HW: W Enables the time out value if set to ’1’ Power up value is clear (0)

0x18F0005C CSYSFPB1_CFPB1_XPU_ACR

Type: Read/Write
Clock: CC_CFPB1_CLK
Reset State: 0xFFFFFFFF

The CFPB1_XPU_ACR register is a SFPB Access Control Register for configuring register protection.

CSYSFPB1_CFPB1_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R CFPB1 XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the CFPB1 configure space, including this register itself. Power up value is set (1)

0x18F00060 CSYSFPB1_CFPB1_HW_CLK_GATING_CFG

Type: Read/Write
Clock: CC_CFPB1_CLK
Reset State: 0x00000000

The CFPB1_HW_CLK_GATING_CFG register is for hardware clock gating configuration.

CSYSFPB1_CFPB1_HW_CLK_GATING_CFG

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	HYSTERESIS_CNT_SW	SW: RW, HW: R Hysteresis Counter Value This field is used by SW to set the hysteresis counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)
3:0	WAKE_CNT_SW	SW: RW, HW: R Wakeup Counter Value This field is used by SW to set the wakeup counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)

2.16 IMEM Configuration Registers (0x1A300000 PMEM_BASE)

The following subsections describe the IMEM registers.

0x1A300000 PMEM_IMEM_CONFIG

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000001

General configuration register for IMEM. This register sets the IMEM accessibility for Graphics and AXI.

Power up value is based on parameters provided

NOTE

a. All banks are 2k x 64 in size.

b. GRP and AXI memory configurations are 64 bits wide.

c. If Graphics interface is not required, set the IMEM_CONFIG_POR parameter to all AXI setting (2'b01). The sharing scheme will then not apply.

PMEM_IMEM_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	IMEM_CONFIG	(Graphics Interface = 256kbytes) (AXI Interface (and trace) = 256kbytes) (Graphics Interface = 128kbytes) (AXI Interface (and trace) = 128kbytes) Banks 0 and 1 are allocated to Graphics. Banks 2 and 3 are allocated to AXI. (Graphics Interface = 128kbytes) (AXI Interface (and trace) = 128kbytes) Banks 0 and 1 are allocated to AXI. Banks 2 and 3 are allocated to Graphics. SW : RW, HW: R 0x0: All graphics (Dedicated all to Graphics) 0x1: All axi (Dedicated all to AXI) 0x2: 0_1_Graphics_2_3_AXI 0x3: 0_1_AXI_2_3_Graphics

2.16.1 IMEM AXI Trace Configuration registers

0x1A300004 PMEM_IMEM_AXI_TRACE_CONFIG

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to enable and control the AXI trace to IMEM.

PMEM_IMEM_AXI_TRACE_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	AXI_TRACE_ADDR_WRAP_EN	1-Enables AXI trace address to wrap
0	AXI_TRACE_EN	1-Enables AXI trace to IMEM

0x1A300008 PMEM_IMEM_AXI_TRACE_ADDR_CNTR

Type: Read
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to read the AXI Trace Address counter value.

PMEM_IMEM_AXI_TRACE_ADDR_CNTR

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:0	AXI_TRACE_ADDR_CNTR	Current AXI Trace address

0x1A30000C PMEM_IMEM_AXI_TRACE_WRAP_STATUS

Type: Read
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to read the AXI Trace Address wrap status bit.

PMEM_IMEM_AXI_TRACE_WRAP_STATUS

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	AXI_TRACE_WRAP_STATUS	0x1: AXI trace address wrapped 0x0: AXI trace address not wrapped

0x1A300010 PMEM_IMEM_AXI_BASE_ADDR_OFFSET

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00001280

This register is used to set the AXI Base Address offset value in order to relocate the IMEM AXI memory within the space allowed by the interconnect. The POR value of this register is based on the parameter - IMEM_BASE_ADDRESS. In case of MPSS, this is set to 0x5800. This should be set to the upper 16 bits of the Imem base address. Based on the size of the Imem, the relevant bits of this register are used for decoding the address.

PMEM_IMEM_AXI_BASE_ADDR_OFFSET

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:0	IMEM_AXI_BASE_ADDRESS_OFFSET	IMEM AXI base address offset for decode

2.16.2 IMEM Syndrome registers

0x1A300020 PMEM_IMEM_ERR_ADDRESS_MS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x000000000000

The IMEM_ERR_ADDRESS_MS register contains the upper bits of the address of the request that caused the bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, it will be locked until bit 8 of the ERR_CODE register is written to clear the error.

PMEM_IMEM_ERR_ADDRESS_MS

Bits	Name	Description
31:16	RESERVED_BITS31_16	

PMEM_IMEM_ERR_ADDRESS_MS (cont.)

Bits	Name	Description
15:0	ERROR_ADDRESS_31_16	Bits 31:16 of the address of the request that caused the bus error.

0x1A300024 PMEM_IMEM_ERR_ADDRESS_LS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_ADDRESS_LS register contains the lower bits of the address of the request that caused the AXI GE bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, the register will be locked until bit 8 of the ERR_CODE register is written to clear the error.

PMEM_IMEM_ERR_ADDRESS_LS

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:3	ERROR_ADDRESS_15_3	Bits 15:3 of the address of the request that caused the bus error
2:0	RESERVED_BITS2_0	Reserved if not implemented otherwise include with error address.

0x1A300028 PMEM_IMEM_ERR_APACKET_MS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_APACKET_MS register provides various data about the request that caused the AXI GE bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, it will be locked until bit 8 of the ERR_CODE register is written to clear the error.

PMEM_IMEM_ERR_APACKET_MS

Bits	Name	Description
31:20	RESERVED_BITS31_20	
19:18	ERROR_ALOCK_1_0	The ALOCK of the request that caused the bus error
17	ERROR_ABURST	The ABURST of the request that caused the bus error
16:12	ERROR_PORTID_4_0	The Port ID of the request that caused the bus error.
11:5	ERROR_ATID_6_0	The Transfer ID of the request that caused the bus error.

PMEM_IMEM_ERR_APACKET_MS (cont.)

Bits	Name	Description
4	ERROR_AWRITE	The awrite of the request that caused bus error
3:0	ERROR_ALEN	The burst length of the request that caused bus error

0x1A30002C PMEM_IMEM_ERR_APACKET_LS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_APACKET_LS register provides various data about the request that caused the AXI GE bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, the register will be locked until bit 8 of the ERR_CODE register is written to clear the error.

PMEM_IMEM_ERR_APACKET_LS

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:9	ERROR_AMID_15_0	The master ID of the request that caused the bus error (The higher order bits will be set to 0 for MID width < 7)
8:5	ERROR_ATYPE_3_0	The ATYPE of the request that caused the bus error
4	ERROR_APROTNS	The APROTNS of the request that caused the bus error
3:0	RESERVED_BITS_3_0	

0x1A300030 PMEM_IMEM_ERR_CODE

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_CODE register provides additional data about the bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, the register will be locked until bit 8 of the ERR_CODE register is written to clear the error.

Additionally, each slave or AXI interconnect that is capable of detecting an error is also required to have a single programmable register that can be used to optionally interrupt the ARM9 or Scorpion Processor core. This interrupt mechanism is required since write transfers may be posted on the bus and the AXI transfer may complete prior to the occurrence of the error in the AXI interconnect or slave device. The interrupt from the AXI interconnect and the AXI slave devices will be directed to both the modem and application processor's interrupt controllers. The interrupt output of the slave device shall be driven from bit 3 of the ERR_CODE register above. To clear the interrupt, it will be necessary to clear the ERR_CODE register by writing to bit 8

(ERROR_CLEAR) of the ERR_CODE register. This will clear the ERROR field (bit 3) and also unlock the ERR_ADDRESS, ERR_APACKET, and ERR_CODE registers so that a subsequent error can be recoded in these registers.

PMEM_IMEM_ERR_CODE

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8	ERROR_CLEAR	Writing a ’1’ to this bit will clear the bus error status bit.
7:4	RESERVED_BIT7_4	
3	ERROR	Error Status bit to indicate that an error has occurred.
2	RESERVED_BIT2	
1	MPU_ERROR	0x1: memory protection error
0	ADDRESS_DECODE_ERRO R	0x1: slave address decode error

0x1A300034 PMEM_IMEM_ERR_IRQ_MSK

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000001

This register is used to block interrupt to ARM9 or Scorpion.

PMEM_IMEM_ERR_IRQ_MSK

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	PROCESSOR_IRQ_MASK	1 disables bus error interrupt to Processor

0x1A300040 PMEM_IMEM_CLK_ON_EN

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x00000000

This register is used to enable/disable the clock_on circuitry. If disabled, clock on is always high.

PMEM_IMEM_CLK_ON_EN

Bits	Name	Description
31:1	RESERVED_BITS31_1	

PMEM_IMEM_CLK_ON_EN (cont.)

Bits	Name	Description
0	CLK_ON_TIME	1 will enable the timer countdown

0x1A300044 PMEM_IMEM_CLK_ON_TIME

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x000003FF

This register sets the starting time for a binary countdown in clock cycles.

PMEM_IMEM_CLK_ON_TIME

Bits	Name	Description
31:10	RESERVED_BITS31_1	
9:0	CLK_ON_TIME_9_0	10 bits to count down from, for a max of 1024

0x1A300048 PMEM_IMEM_FSCGC_TIMERS

Type: Read Only
Clock: BUS_CLOCK
Reset State: 0x00000000

This register sets the starting time for a binary countdown in clock cycles.

PMEM_IMEM_FSCGC_TIMERS

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:4	WAKEUP_COUNTER_3_0	4 bit count down, must be 20ns
3:0	TO_SLEEP_COUNTER_3_0	4 bit count down, must be 20ns

0x1A30004C PMEM_IMEM_FSCGC_CONTROL

Type: Read Only
Clock: BUS_CLOCK
Reset State: 0x00000000

Controls for head switch and perifery within IMEM.

PMEM_IMEM_FSCGC_CONTROL

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:16	HALT_CLOCK_23_16	Gates the clock to individual RAMS
15:8	CORE_ON_15_8	RAM Core will remain on if this is 1 (for individual rams)
7:0	PERIF_ON_7_0	RAM Perifery will remain on if this is 1 (for individual rams)

0x1A300050 PMEM_IMEM_EX_FSCGC_CONTROL

Type: Read Only
Clock: BUS_CLOCK
Reset State: 0x00000000

Controls for head switch and perifery outside of IMEM.

PMEM_IMEM_EX_FSCGC_CONTROL

Bits	Name	Description
31:22	RESERVED_BITS31_24	
23:16	HALT_CLOCK_7_0	Gates the clock to individual RAMS
15:8	CORE_ON_7_0	RAM Core will remain on if this is 1 (for individual rams)
7:0	PERIF_ON_7_0	RAM Perifery will remain on if this is 1 (for individual rams)

0x1A300054 PMEM_IMEM_RAM_CONFIG

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x00000000

This register configures the access to the external ram interface.

PMEM_IMEM_RAM_CONFIG

Bits	Name	Description
31:3	RESERVED_BITS31_3	
1:0	EX_RAM_CONFIG_1_0	External ram access configuration: 11; NO external ram allocated to AXI 0x0: No External ram allocated to AXI 0x1: 256K of external ram allocated to AXI 0x2: All external ram allocated to AXI

2.16.3 Internal Memory misc. registers

0x1A300038 PMEM_IMEM_MEM_ACC_CFG

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to configure the acc pins of the RAM for programming the sense amp. This is not supported for APQ8064.

PMEM_IMEM_MEM_ACC_CFG

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	ACC_CFG	

2.16.4 XPU Registers

0x1A301000+ 4*n PMEM_MPU_PRTn_ACR, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when MPU_IDR[MV, PT] = 10, i.e, a multi-VMID full access vs. no access permission type MPU. These registers include a single bit per VMID granting full access.

PMEM_MPU_PRTn_ACR

Bits	Name	Description
31:0	RWE	Read/Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the registers in the associated resource group.

0x1A301800+ 4*n PMEM_MPU_PRTn_START, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition Start Address Register. This register contains the start address of the partition. Only the bit numbers indicated by MPU_IDR[MSb] through MPU_IDR[LSb] are valid and physically exist.

PMEM_MPU_PRTn_START

Bits	Name	Description
31:16	RESERVED_31_16	Reserved
15:7	ADDR	MPU Partition Start Address
6:0	RESERVED_6_0	Reserved

0x1A301C00+4*n PMEM_MPU_PRTn_END, n=[0..15]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition End Address Register. This register contains the start address of the partition.Only the bit numbers indicated by MPU_IDR[MSB] through MPU_IDR[LSB] are valid and physically exist.

PMEM_MPU_PRTn_END

Bits	Name	Description
31:16	RESERVED_311629	Reserved
15:7	ADDR	MPU Partition End Address
6:0	RESERVED_6_0	Reserved

0x1A301F80 PMEM_MPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Configuration Register: This register includes fields governing various MPU behaviors.

PMEM_MPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved

PMEM_MPU_CR (cont.)

Bits	Name	Description
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set MPU_ESR. MPU_EAR and MPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set MPU_ESR. MPU_EAR and MPU_ESYNR0 updated with address and syndrome of error.
2	MPUEIE	MPU Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the MPU. Interrupt output is asserted if MPU_CR[MPUEIE] = 1 and any bit is set in MPU_ESR.
1	MPUERE	MPU Error Report Enable. MPUERE = 0 causes the MPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. MPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective MPU port. Errors from either port are terminated by the MPU as RAZ/WI Both client and configuration port errors are recorded in MPU_ESR, independent of the value of MPU_CR[MPUERE]
0	MPUE	MPU Enable. Governs whether MPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures MPU and the MID to VMID mapping tables.

0x1A301F84 PMEM_MPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the MPU, for both the client port and the configuration port.

PMEM_MPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x1A301F88 PMEM_MPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the MPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the MPU's interrupt output (when enabled by MPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the MPU_ESYNRn registers, which are merely the 'syndrome' of an error indicated by MPU_ESR.

PMEM_MPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) 'lock' upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x1A301F8C PMEM_MPU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Restore Register. This register is an aliased address for the MPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

PMEM_MPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) 'lock' upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved

PMEM_MPU_ESRRESTORE (cont.)

Bits	Name	Description
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x1A301F90 PMEM_MPU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

PMEM_MPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x1A301F94 PMEM_MPU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

PMEM_MPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.

PMEM_MPU_ESYNR1 (cont.)

Bits	Name	Description
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x1A301FF4 PMEM_MPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

MPU Revision Register: This register provides major/minor revision codes for the implementation.

PMEM_MPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x1A301FF8 PMEM_MPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x0F07240F

MPU ID Register: Read-only register that defines various configuration attributes of the MPU instance.

PMEM_MPU_IDR

Bits	Name	Description
31:29	RESERVED31_29	Reserved
28:24	MSB	Indicates most significant address bit number used in START/END address comparisons.
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used in START/END address comparisons.
15:14	RESERVED15_12	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only MPU_PRTn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate MPU_PRTn_RACR and MPU_PRTn_WACR registers govern read vs. write access. For single VMID, MPU_PRTn_ACR registers include separate 5-bit read/write vs. read-only 'owner' VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. MPU_PRTn_ACR registers indicate single 5 bit 'owner' VMID field for governing access. MV=1 : indicates multi-VMD type access control. MPU_PRTn_xACR registers include separate bit per VMID (32 bits) for governing access.
9:8	RESERVED9_8	Reserved
7:0	NPRT	Number of partitions. Indicates the number of partitions (minus 1) supported by the MPU. Values range from 0-223 (1-224 partitions)

0x1A301FFC PMEM_MPU_MPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

MPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the MPU (including the MPU_MPU_ACR itself).

PMEM_MPU_MPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the MPU's 4KB address region (including the MPU_MPU_ACR itself). For single VMID type MPUs (MPU_IDR[MV] = 0) the MPU_MPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

2.17 TCSR Registers (0x1A400000 MSM_TCSR_BASE)

This section contains the TCSR registers.

The registers in this section exist in the core_top_csr, which is instantiated in the core_top.

0x1A400000 TCSR_PRNG_RING_OSC_DSBL

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

No longer in use as functionality removed due to security risks.

Can be used as a 4-bit spare register, if needed.

TCSR_PRNG_RING_OSC_DSBL

Bits	Name	Description
31:4	RESERVED_31_4	
3	PRNG_RING_OSC_3_DSBL_CFG	Was controls PRNG input prng_ring_osc_3_dsbl
2	PRNG_RING_OSC_2_DSBL_CFG	Was controls PRNG input prng_ring_osc_2_dsbl
1	PRNG_RING_OSC_1_DSBL_CFG	Was controls PRNG input prng_ring_osc_1_dsbl
0	PRNG_RING_OSC_0_DSBL_CFG	Was controls PRNG input prng_ring_osc_0_dsbl

0x1A400004 TCSR_SPDM_DIAG_SW_MON_0

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is a SW programmable bit used as inputs to either the sample or filter counters in SPDM.

TCSR_SPDM_DIAG_SW_MON_0

Bits	Name	Description
31:1	RESERVED_31_1	

TCSR_SPDM_DIAG_SW_MON_0 (cont.)

Bits	Name	Description
0	SW_BIT	SW programmable bit for off-line event counting 0x0: clear 0x1: set

0x1A400008 TCSR_SPDM_DIAG_SW_MON_1

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is a SW programmable bit used as inputs to either the sample or filter counters in SPDM.

TCSR_SPDM_DIAG_SW_MON_1

Bits	Name	Description
31:1	RESERVED_31_1	
0	SW_BIT	SW programmable bit for off-line event counting 0x0: clear 0x1: set

0x1A40000C TCSR_SPDM_DIAG_SW_MON_2

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is a SW programmable bit used as inputs to either the sample or filter counters in SPDM.

TCSR_SPDM_DIAG_SW_MON_2

Bits	Name	Description
31:1	RESERVED_31_1	
0	SW_BIT	SW programmable bit for off-line event counting 0x0: clear 0x1: set

0x1A400010 TCSR_SPDM_DIAG_SW_MON_3

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register was a SW programmable bit used as inputs to either the sample or filter counters in SPDM.

Not in use for APQ8064 since the SPDM port connected is connected to the 2nd LPDDR controller.

Can be used as a 1-bit spare register, if needed.

TCSR_SPDM_DIAG_SW_MON_3

Bits	Name	Description
31:1	RESERVED_31_1	
0	SW_BIT	SW programmable bit for off-line event counting 0x0: clear 0x1: set

0x1A400014 TCSR_SPDM_DLY_FIFO_EN

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

Enables delay FIFO for each offline 4bit port input. Delay FIFOs are used to transfer offline data between the source and the SPDM core pseudo-synchronously.

TCSR_SPDM_DLY_FIFO_EN

Bits	Name	Description
31:0	SPDM_DLY_FIFO_EN	Bit[0] corresponds to delay for FIFO used for offline port 0 0x0: Disable 0x1: Enable

0x1A400018 TCSR_SPDM_STG1_MUX_SEL

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

Mux selects for stage 1 MUXes to select 8 primary ports to monitor 32 offline ports. Each stage 1 MUX is 2-bits wide and selects 1 of 4 offline ports.

TCSR_SPDM_STG1_MUX_SEL

Bits	Name	Description
31:16	RESERVED_31_16	
15:14	SPDM_STG1_MUX_SEL7	Selects between Port 19, Port 23, Port 27, Port 31 to create Primary Port 7
13:12	SPDM_STG1_MUX_SEL6	Selects between Port 18, Port 22, Port 26, Port 30 to create Primary Port 6
11:10	SPDM_STG1_MUX_SEL5	Selects between Port 17, Port 21, Port 25, Port 29 to create Primary Port 5
9:8	SPDM_STG1_MUX_SEL4	Selects between Port 16, Port 20, Port 24, Port 28 to create Primary Port 4
7:6	SPDM_STG1_MUX_SEL3	Selects between Port 3, Port 7, Port 11, Port 15 to create Primary Port 3
5:4	SPDM_STG1_MUX_SEL2	Selects between Port 2, Port 6, Port 10, Port 14 to create Primary Port 2
3:2	SPDM_STG1_MUX_SEL1	Selects between Port 1, Port 5, Port 9, Port 13 to create Primary Port 1
1:0	SPDM_STG1_MUX_SEL0	Selects between Port 0, Port 4, Port 8, Port 12 to create Primary Port 0

0x1A40001C TCSR_SPDM_STG2_A_MUX_SEL

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

Mux selects for stage 2 MUXes to select one of 4 primary ports (selected in stage 1 MUX) for monitoring in an offline monitor. There is one MUX per offline monitor and each stage 2 MUX select is 2-bits wide.

TCSR_SPDM_STG2_A_MUX_SEL

Bits	Name	Description
31:30	SPDM_STG2_A_MUX_SEL15	Selects between Primary Ports 0- 3 for monitoring in offline monitor 15
29:28	SPDM_STG2_A_MUX_SEL14	Selects between Primary Ports 0- 3 for monitoring in offline monitor 14
27:26	SPDM_STG2_A_MUX_SEL13	Selects between Primary Ports 0- 3 for monitoring in offline monitor 13
25:24	SPDM_STG2_A_MUX_SEL12	Selects between Primary Ports 0- 3 for monitoring in offline monitor 12

TCSR_SPDM_STG2_A_MUX_SEL (cont.)

Bits	Name	Description

3:2	SPDM_STG3_B_MUX_SEL17	Selects one of 4-bits from Stage 2 Mux 17 for monitoring in offline monitor 17
1:0	SPDM_STG3_B_MUX_SEL16	Selects one of 4-bits from Stage 2 Mux 16 for monitoring in offline monitor 16

0x1A400030 TCSR_SMPSS_WDOG_CFG

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register was used to enable or disable the KPSS watch-dog timer output.

In APQ8064, it is no longer in use due to security concerns.

Can be used as a spare register, if needed.

TCSR_SMPSS_WDOG_CFG

Bits	Name	Description
31:8	RESERVED_31_8	
7	SCSS_WDT1CPU3BITEEXPIRED	Used to enable/disable the SMPSS watch dog timer output. 0x0: Disable 0x1: Enable
6	SCSS_WDT1CPU2BITEEXPIRED	Used to enable/disable the SMPSS watch dog timer output. 0x0: Disable 0x1: Enable
5	SCSS_WDT0CPU3BITEEXPIRED	Used to enable/disable the SMPSS watch dog timer output. 0x0: Disable 0x1: Enable
4	SCSS_WDT0CPU2BITEEXPIRED	Used to enable/disable the SMPSS watch dog timer output. 0x0: Disable 0x1: Enable
3	SCSS_WDT1CPU1BITEEXPIRED	Used to enable/disable the SMPSS watch dog timer output. 0x0: Disable 0x1: Enable
2	SCSS_WDT1CPU0BITEEXPIRED	Used to enable/disable the SMPSS watch dog timer output. 0x0: Disable 0x1: Enable
1	SCSS_WDT0CPU1BITEEXPIRED	Used to enable/disable the SMPSS watch dog timer output. 0x0: Disable 0x1: Enable
0	SCSS_WDT0CPU0BITEEXPIRED	Used to enable/disable the SMPSS watch dog timer output. 0x0: Disable 0x1: Enable

0x1A400034 TCSR_VTG_SENSOR_STATUS

Type: Read
Clock: AXI_CLOCK
Reset State: 0x00000000

No longer in use as there is no Voltage Sensor on this device.

Can be used as a spare register, if needed.

TCSR_VTG_SENSOR_STATUS

Bits	Name	Description
31:16	STATUS_DATA	Status data from voltage sensor.
17	STATUS_MIN_MAX_ALARM	MIN-MAX alarm bit (exported to the I/O)
16	STATUS_MIN_ALARM	Minimum threshold exceeded
15	STATUS_MAX_ALARM	Maximum threshold exceeded
14:8	STATUS_MIN_VALUE	Minimum value reached
7:1	STATUS_MAX_VALUE	Maximum value reached
0	STATUS_DATA_VALID	When set as 1 by voltage sensor core, the core_top_csr latches the status data from voltage sensor in this register,

0x1A40003C TCSR_VTG_SENSOR_CONFIG

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

No longer in use as there is no Voltage Sensor on this device.

Can be used as a spare register, if needed.

TCSR_VTG_SENSOR_CONFIG

Bits	Name	Description
31:29	CONFIG_DATA	Config data for voltage sensor.
28	CONFIG_DBG_BUS_EN	Debug bus enable - gates on/off debug bus outputs (off to 0)
27	CONFIG_MODE_OPERATION	Mode of operation: serial or parallel (priority encoded 3-bit)
26:20	CONFIG_MIN_MONITOR_THRESH	Minimum monitor threshold
19:13	CONFIG_MAX_MONITOR_THRESH	Maximum monitor threshold

TCSR_VTG_SENSOR_CONFIG (cont.)

Bits	Name	Description
12:10	CONFIG_PRI_ENC_MUX_SELECT	Priority encoder MUX select (for serial mode coarse delay select)
9:6	CONFIG_FINE_DLY_LINE_SEL	Fine delay line select
5	CONFIG_DLY_LINE_DLY_DEL	Range Adjustment: Delay line delay select
4	CONFIG_PROBE_DLY_SEL	Range Adjustment: Probe delay select
3:2	CONFIG_FREQ_DIV_CTL	Frequency divider Control Register
1	DATA_REQUEST	When set as 1 by system CPU in the core_top_csr, it indicates to the voltage sensor core that valid value for config register is available from system CPU.
0	MACRO_ENABLE	When set as 1 by system CPU in the core_top_csr, it activates the voltage sensor core.

0x1A400040 TCSR_RPM_VMID_NS_CTL

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

This register is disabled by default via a FUSE - so any write to this register will not take effect. when the FUSE is blown, the functionality described below will be in effect.

For all requests presented to AHB slave port input to SMPSS, if the incoming fabric VMID matches TCSR_RPM_VMID_NS_CTL[VMID], then drive HPROTNS into SMPSS according to NSCFG as below. If the VMID does NOT match, then drive HPROTNS into SMPSS using the value supplied by the fabric AHB slave port

TCSR_RPM_VMID_NS_CTL

Bits	Name	Description
31:24	RESERVED_31_24	
23:22	NSCFG	Encoding: 0x0: pass-through HPROTNS 0x1: reserved 0x2: HPROTNS forced to 0 0x3: HPROTNS forced to 1
21:5	RESERVED_21_5	
4:0	VMID	Used to compare with incoming fabric VMID.

0x1A400044 TCSR_GSBI_IRQ_MUX_SEL_0

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is used to select between the GSBI IRQs to output o_top_gsbi_irq_0.

TCSR_GSBI_IRQ_MUX_SEL_0

Bits	Name	Description
31:3	RESERVED_31_3	
2:0	GSBI_IRQ_MUX_SEL	Selects the GSBI IRQ corresponding to value in register

0x1A400050 TCSR_FAB_ATYPE0

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000004

This register is not being used for this device.

TCSR_FAB_ATYPE0

Bits	Name	Description
31:4	RESERVED_31_4	
3:0	FAB_ATYPE0_CFG	FABRIC ATYPE[3:0]

0x1A400054 TCSR_FAB_ATYPE1

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000004

This register is not being used in this device.

TCSR_FAB_ATYPE1

Bits	Name	Description
31:4	RESERVED_31_4	
3:0	FAB_ATYPE1_CFG	FABRIC ATYPE[3:0]

0x1A400058 TCSR_FAB_ATYPE2

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000004

This register is used to drive atype of M2 of system fabric in this device. ADM is connected to M2 AXI interface of system fabric.

TCSR_FAB_ATYPE2

Bits	Name	Description
31:4	RESERVED_31_4	
3:0	FAB_ATYPE2_CFG	0x0: reserved_1 0x1: strongly ordered (non-cacheable, shared) 0x2: device, non-shared (non-cacheable) 0x3: device, shared (non-cacheable) 0x4: normal, non-cacheable, non-shared 0x5: normal, non-cacheable, shared 0x6: normal, cacheable, write-back, write-allocate. non-shared 0x7: normal, cacheable, write-back, write-allocate. shared 0x8: reserved_2 0xC: normal, cacheable, write-through, no write-allocate. non-shared 0xD: normal, cacheable, write-through, no write-allocate. shared 0xE: normal, cacheable, write-back, no write-allocate. non-shared 0xF: normal, cacheable, write-back, no write-allocate. shared

0x1A40005C TCSR_FAB_ATYPE3

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000004

This register is used to drive atype of M3 of system fabric. ADM is connected to M3 AXI interface of system fabric.

TCSR_FAB_ATYPE3

Bits	Name	Description
31:4	RESERVED_31_4	

TCSR_FAB_ATYPE3 (cont.)

Bits	Name	Description
3:0	FAB_ATYPE3_CFG	0x0: reserved_1 0x1: strongly ordered (non-cacheable, shared) 0x2: device, non-shared (non-cacheable) 0x3: device, shared (non-cacheable) 0x4: normal, non-cacheable, non-shared 0x5: normal, non-cacheable, shared 0x6: normal, cacheable, write-back, write-allocate. non-shared 0x7: normal, cacheable, write-back, write-allocate. shared 0x8: reserved_2 0xC: normal, cacheable, write-through, no write-allocate. non-shared 0xD: normal, cacheable, write-through, no write-allocate. shared 0xE: normal, cacheable, write-back, no write-allocate. non-shared 0xF: normal, cacheable, write-back, no write-allocate. shared

0x1A400060 TCSR_FAB_ATYPE4

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000004

This register is used to drive atype of M4 of system fabric. ADM is connected to M4 AXI interface of system fabric.

TCSR_FAB_ATYPE4

Bits	Name	Description
31:4	RESERVED_31_4	
3:0	FAB_ATYPE4_CFG	0x0: reserved_1 0x1: strongly ordered (non-cacheable, shared) 0x2: device, non-shared (non-cacheable) 0x3: device, shared (non-cacheable) 0x4: normal, non-cacheable, non-shared 0x5: normal, non-cacheable, shared 0x6: normal, cacheable, write-back, write-allocate. non-shared 0x7: normal, cacheable, write-back, write-allocate. shared 0x8: reserved_2 0xC: normal, cacheable, write-through, no write-allocate. non-shared 0xD: normal, cacheable, write-through, no write-allocate. shared 0xE: normal, cacheable, write-back, no write-allocate. non-shared 0xF: normal, cacheable, write-back, no write-allocate. shared

0x1A400064 TCSR_FAB_ATYPE5

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000004

This register is used to drive atype of M5 of system fabric. ADM is connected to M5 AXI interface of system fabric.

TCSR_FAB_ATYPE5

Bits	Name	Description
31:4	RESERVED_31_4	
3:0	FAB_ATYPE5_CFG	0x0: reserved_1 0x1: strongly ordered (non-cacheable, shared) 0x2: device, non-shared (non-cacheable) 0x3: device, shared (non-cacheable) 0x4: normal, non-cacheable, non-shared 0x5: normal, non-cacheable, shared 0x6: normal, cacheable, write-back, write-allocate. non-shared 0x7: normal, cacheable, write-back, write-allocate. shared 0x8: reserved_2 0xC: normal, cacheable, write-through, no write-allocate. non-shared 0xD: normal, cacheable, write-through, no write-allocate. shared 0xE: normal, cacheable, write-back, no write-allocate. non-shared 0xF: normal, cacheable, write-back, no write-allocate. shared

0x1A400070 TCSR_ADM_0_A_CRCI_MUX_SEL

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is used for CRCI MUXing by ADM3.

TCSR_ADM_0_A_CRCI_MUX_SEL

Bits	Name	Description
31	ADM0_CRCI_TSIF_SEL	Select CRCI Request from TSIF 0 and 1. 0x0: TSIF 0 Req, 1 = TSIF 1 Req
30:8	RESERVED_30_8	Used by ADM
7	ADM0_CRCI_GSBI4_RX_SEL	Select CRCI req from GSBI4 UART/QUP RX req. 0 = QUP RX Req, 1 = UART RX Req

TCSR_ADM_0_A_CRCI_MUX_SEL (cont.)

Bits	Name	Description
6	ADM0_CRCI_GSBI4_TX_SEL	Select CRCI req from GSBI4 UART/QUP TX req. 0x0: QUP TX Req, 1 = UART TX Req
5	ADM0_CRCI_GSBI3_RX_SEL	Select CRCI req from GSBI3 UART/QUP RX req. 0x0: QUP RX Req, 1 = UART RX Req
4	ADM0_CRCI_GSBI3_TX_SEL	Select CRCI req from GSBI3 UART/QUP TX req. 0x0: QUP TX Req, 1 = UART TX Req
3	ADM0_CRCI_GSBI2_RX_SEL	Select CRCI req from GSBI2 UART/QUP RX req. 0x0: QUP RX Req, 1 = UART RX Req
2	ADM0_CRCI_GSBI2_TX_SEL	Select CRCI req from GSBI2 UART/QUP TX req. 0x0: QUP TX Req, 1 = UART TX Req
1	ADM0_CRCI_GSBI1_RX_SEL	Select CRCI req from GSBI1 UART/QUP RX req. 0x0: QUP RX Req, 1 = UART RX Req
0	ADM0_CRCI_GSBI1_TX_SEL	Select CRCI req from GSBI1 UART/QUP TX req. 0x0: QUP TX Req, 1 = UART TX Req

0x1A400074 TCSR_ADM_0_B_CRCI_MUX_SEL

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is used for CRCI MUXing by ADM3.

TCSR_ADM_0_B_CRCI_MUX_SEL

Bits	Name	Description
31:11	RESERVED_31_11	
10	ADM0_CRCI_TSIF_SEL	Select CRCI Request from TSIF 0 and 1. 0x0: TSIF 0 Req, 1 = TSIF 1 Req
9:8	RESERVED_9_8	
7	ADM0_CRCI_GSBI7_TX_SEL	Select CRCI req from GSBI7 UART/QUP TX req. 0x0: QUP TX Req, 1 = UART TX Req
6	ADM0_CRCI_GSBI7_RX_SEL	Select CRCI req from GSBI7 UART/QUP RX req. 0x0: QUP RX Req, 1 = UART RX Req
5	ADM0_CRCI_GSBI6_TX_SEL	Select CRCI req from GSBI6 UART/QUP TX req. 0x0: QUP TX Req, 1 = UART TX Req
4:0	RESERVED_4_0	

0x1A400080 TCSR_CPSS_DEBUG_BUS_SEL

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is used to select the CPSS test bus.

TCSR_CPSS_DEBUG_BUS_SEL

Bits	Name	Description
31:2	RESERVED_31_2	
1:0	CPSS_DBG_BUS_SEL	Used to select CPSS test bus. 0x0: Selects all X'00000000' on the CPSS test bus 0x1: Selects all X'55555555' on the CPSS test bus 0x2: Selects all X'AAAAAAAA' on the CPSS test bus 0x3: Selects the internal test bus

0x1A40008C TCSR_SPARE1

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

This is a 16 bit spare read/write register for possible ECO use. The bottom 3 bits are used as control inputs to the USB XO Shutdown ECO.

TCSR_SPARE1

Bits	Name	Description
31:16	RESERVED_31_16	
15:3	SPARES_15_3	Spare Reg
2	USB_XO_SD_RESET	USB XO Shutdown edge detect reset 0x1: reset 0x0: no reset
1	USB_XO_SD_FS_B_EN	USB XO Shutdown Full Speed USB B data interrupt enable 0x1: enable 0x0: disable
0	USB_XO_SD_FS_A_EN	USB XO Shutdown Full Speed USB A data interrupt enable 0x1: enable 0x0: disable

0x1A400090 TCSR_SPARE2

Type: Read/Write and Read Only
Clock: AXI_CLOCK
Reset State: 0x00000000

This is a 16 bit spare partial read/write and read only register for possible ECO use. The bottom 6 bits are used for a USB XO Shutdown ECO. The are used to read the current state of the High Speed USB DP/DM lines.

TCSR_SPARE2

Bits	Name	Description
31:16	RESERVED_31_16	
15:0	SPARES	Spare Reg

0x1A400094 TCSR_GSBI_IRQ_MUX_SEL_1

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is used to select between the GSBI IRQs to output o_top_gsbi_irq_1.

TCSR_GSBI_IRQ_MUX_SEL_1

Bits	Name	Description
31:3	RESERVED_31_3	
2:0	GSBI_IRQ_MUX_SEL	Selects the GSBI IRQ corresponding to value in register

0x1A400098 TCSR_GSBI_IRQ_MUX_SEL_2

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is used to select between the GSBI IRQs to output o_top_gsbi_irq_2.

TCSR_GSBI_IRQ_MUX_SEL_2

Bits	Name	Description
31:3	RESERVED_31_3	
2:0	GSBI_IRQ_MUX_SEL	Selects the GSBI IRQ corresponding to value in register

0x1A40009C TCSR_GSBI_IRQ_MUX_SEL_3

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is used to select between the GSBI IRQs to output o_top_gsbi_irq_3.

TCSR_GSBI_IRQ_MUX_SEL_3

Bits	Name	Description
31:3	RESERVED_31_3	
2:0	GSBI_IRQ_MUX_SEL	Selects the GSBI IRQ corresponding to value in register

0x1A4000A0 TCSR_GSBI_IRQ_MUX_SEL_4

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register was used to select between the GSBI IRQs to output o_top_gsbi_irq_4.

Not in use for APQ8064 since the output of the mux selected by this register is not connected.

Due to the SPS changes from previous chips to APQ8064, there are not enough IRQ inputs available in the SPS. As such, a decision was made not to use this IRQ at all.

Can be used as a 3-bit spare register, if needed.

TCSR_GSBI_IRQ_MUX_SEL_4

Bits	Name	Description
31:3	RESERVED_31_3	
2:0	GSBI_IRQ_MUX_SEL	Selects the GSBI IRQ corresponding to value in register

0x1A4000A4 TCSR_SATA_BRIC_DEBUG_BUS_SEL

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is used to select the SATA test bus.

TCSR_SATA_BRIC_DEBUG_BUS_SEL

Bits	Name	Description
31:3	RESERVED_31_3	
2:0	SATA_DBG_BUS_SEL	Used to select SATA test bus.

0x1A4000A8 TCSR_PCIE_BRIC_DEBUG_BUS_SEL

Type: Read/Write
Clock: AXI_CLOCK
Reset State: 0x00000000

The register is used to select the PCIE test bus.

TCSR_PCIE_BRIC_DEBUG_BUS_SEL

Bits	Name	Description
31:3	RESERVED_31_3	
2:0	PCIE_DBG_BUS_SEL	Used to select PCIE test bus.

2.18 PRNG Registers (0x1A500000 PRNG_BASE)

This section lists the registers associated with the PRNG block.

0x1A500000 PRNG_DATA_OUT

Type: Read
Reset State: 0x00000000

PRNG_DATA_OUT

Bits	Name	Description
31:0	PRNG_DATA_OUT	Pseudo Random Number output. If the FIFO is empty, reading this register will return 0.

0x1A500004 PRNG_STATUS

Type: Read
Reset State: 0x00000000

PRNG_STATUS

Bits	Name	Description
31:10	RESERVED_31_8	RESERVED
9:8	CURRENT_OPERATION	0x0: IDLE 0x1: GENERATE 0x2: INSTANTIATE 0x3: RESEED
7	GENERATE_REQUIRED	Indicates that a generate is, or soon will be occurring. This occurs when the generate counter != 0. This is only valid when the PRNG is enabled (PRNG_EN = 1)
6	RESEED_REQUIRED	Indicates that a reseed operation is, or soon will be occurring. This occurs when the reseed counter = reseed freq. This is only valid when the PRNG is enabled (PRNG_EN = 1)
5	INSTANTIATE_REQUIRED	Indicates that an instantiate operation or soon will be occurring. This occurs when the instantiate counter = 0. This is only valid when the PRNG is enabled (PRNG_EN = 1)
4	RING_OSC3_HEALTHY	Indicates that ring oscillator 3 is healthy. Only valid when RING_OSC3_CFG is set to one of the feedback settings (not valid when set to one of the FORCE inputs). When set to one of the FORCE inputs, this is reset to 0.
3	RING_OSC2_HEALTHY	Indicates that ring oscillator 2 is healthy. Only valid when RING_OSC2_CFG is set to one of the feedback settings (not valid when set to one of the FORCE inputs). When set to one of the FORCE inputs, this is reset to 0.

PRNG_STATUS (cont.)

Bits	Name	Description
2	RING_OSC1_HEALTHY	Indicates that ring oscillator 1 is healthy. Only valid when RING_OSC1_CFG is set to one of the feedback settings (not valid when set to one of the FORCE inputs).When set to one of the FORCE inputs, this is reset to 0.
1	RING_OSC0_HEALTHY	Indicates that ring oscillator 0 is healthy. Only valid when RING_OSC0_CFG is set to one of the feedback settings (not valid when set to one of the FORCE inputs). When set to one of the FORCE inputs, this is reset to 0.
0	DATA_AVAIL	Indicates that data is available on the PRNG_DATA_OUT FIFO.

0x1A500010 PRNG_ENTROPY_CNTR

Type: Read
Reset State: 0x00000000

PRNG_ENTROPY_CNTR

Bits	Name	Description
31:0	ENTROPY_CNTR	The current value of the entropy counter. Counts DOWN. Usually this is 0 except when actually doing an instantiate or reseed operation.

0x1A500014 PRNG_SAMPLE_CNTR

Type: Read
Reset State: 0x00000000

PRNG_SAMPLE_CNTR

Bits	Name	Description
31:0	SAMPLE_CNTR	The number of clocks since the last sample of the LFSRs. Counts DOWN. Usually this is 0 except when actually doing an instantiate or reseed operation.

0x1A500018 PRNG_GEN_CNTR

Type: Read
Reset State: 0x00000000

PRNG_GEN_CNTR

Bits	Name	Description
31:0	PRNG_GEN_CNTR	Current value of the generate counter

0x1A50001C PRNG_RESEED_CNTR

Type: Read
Reset State: 0x00000000

PRNG_RESEED_CNTR

Bits	Name	Description
31:0	RESEED_CNTR	Current value of the reseed counter

0x1A500020 PRNG_INSTANTIATE_CNTR

Type: Read
Reset State: 0x00000000

PRNG_INSTANTIATE_CNTR

Bits	Name	Description
31:0	INSTANTIATE_CNTR	The current number of reseed operations since the last reseed.

0x1A500024 PRNG_DEBUG

Type: Read
Reset State: 0x00000000

This register is provided to aid in debugging.

PRNG_DEBUG

Bits	Name	Description
31:14	RESERVED_31_14	RESERVED_31_14
13:10	RNG_STATE	RNG state machine state 0x0: IDLE 0x1: ENABLE_HASHGEN 0x2: ENABLE HASH DF H 0x3: UPDATE V 0x4: ENABLE HASH DF V 0x5: POP STATE COLLECTOR V 0x6: ENABLE HASH DF C 0x7: POP STATE COLLECTOR C
9:7	HASHGEN_STATE	Hash_gen states 0x0: IDLE 0x1: INITIALIZE 0x2: WAIT SHA DONE 0x3: UPDATE LOCAL V

PRNG_DEBUG (cont.)

Bits	Name	Description
6:4	HASH_DF_STATE	Hash DF states 0x0: IDLE 0x1: INITIALIZE 0x2: WAIT IDLE
3:0	PAD_STATE	Padding engine state machine 0x0: IDLE 0x1: PERSONALIZATION STRING 0x2: LOAD ENTROPY 0x3: INSERT V 0x4: LOAD STEP ID 0x5: LOAD NUM BITS 0x6: LOAD CNTR VAL 0x7: UPDATE HASHCNT 0x8: PAD FIRST 0x9: PAD ZEROES 0xA: PAD LENGTH 1 0xB: PAD LENGTH 0 0xC: WAIT SHA DONE

0x1A500100 PRNG_LFSR_CFG

Type: Read/Write
Reset State: 0x00000000

PRNG_LFSR_CFG

Bits	Name	Description
31:16	RESERVED_31_16	RESERVED
15	LFSR3_EN	Enables the output of LFSR3. When disabled, the LFSR is reset to 0 and disables the clock to the LFSR.
14:12	RING_OSC3_CFG	Configuration for Ring Oscillator 3 0x0: FORCE0. This is used for testability 0x2: FORCE1. This is used for testability. 0x4: feedback point 0 (slowest) 0x5: feedback point 1 0x6: feedback point 2 0x7: feedback point 3 (fastest)
11	LFSR2_EN	Enables the output of LFSR2. When disabled, the LFSR is reset to 0 and disables the clock to the LFSR.

PRNG_LFSR_CFG (cont.)

Bits	Name	Description
10:8	RING_OSC2_CFG	Configuration for Ring Oscillator 2 0x0: FORCE0. This is used for testability 0x2: FORCE1. This is used for testability. 0x4: feedback point 0 (slowest) 0x5: feedback point 1 0x6: feedback point 2 0x7: feedback point 3 (fastest)
7	LFSR1_EN	Enables the output of LFSR1. When disabled, the LFSR is reset to 0 and disables the clock to the LFSR.
6:4	RING_OSC1_CFG	Configuration for Ring Oscillator 1 0x0: FORCE0. This is used for testability 0x2: FORCE1. This is used for testability. 0x4: feedback point 0 (slowest) 0x5: feedback point 1 0x6: feedback point 2 0x7: feedback point 3 (fastest)
3	LFSR0_EN	Enables the output of LFSR0. When disabled, the LFSR is reset to 0 and disables the clock to the LFSR.
2:0	RING_OSC0_CFG	Configuration for Ring Oscillator 0 0x0: FORCE0. This is used for testability 0x2: FORCE1. This is used for testability. 0x4: feedback point 0 (slowest) 0x5: feedback point 1 0x6: feedback point 2 0x7: feedback point 3 (fastest)

0x1A500104 PRNG_CONFIG

Type: Read/Write
Reset State: 0x00000000

PRNG_CONFIG

Bits	Name	Description
31:6	RESERVED_31_6	RESERVED_31_6

PRNG_CONFIG (cont.)

Bits	Name	Description
5:2	TEST_OUT_SEL	Selects the appropriate test output to be put out on prng_rosc_test_out signal: 0x0: Output 0 0x8: rosc0_div_32 0x9: rosc1_div_32 0xA: rosc2_div_32 0xB: rosc3_div_32 0xC: rosc0_samp 0xD: rosc1_samp 0xE: rosc2_samp 0xF: rosc3_samp
1	PRNG_EN	Enable signal for the PRNG indicating that all setup is complete. Ring oscillators and the LFSR will still operate as per PRNG_LFSR_CFG, however when this is 0, the PRNG when the PRNG is disabled it will return to the IDLE state once its current operation has been completed, with the current operation possibly requiring space to be created in the output fifo for data that must be generated in the completion of the current operation. This space can be created by reading from the PRNG_DATA_OUT register. 0x0: disabled 0x1: enabled
0	SW_RESET	Software initiated reset. Automatically cleared when the write operation is complete. Reset is internally held for 2 clock cycles after this register is written and so no operations/accesses should be attempted until after this recovery time.

0x1A500108 PRNG_PERSONALIZATION_STRING

Type: Read/Write
Reset State: 0x00000000

PRNG_PERSONALIZATION_STRING

Bits	Name	Description
31:0	PERSONALIZATION_STRING	The personalization string. This may be all 0, but also may be obtained from other non-regular processes such as time between key presses, searcher noise (if present), or other system events.

0x1A500110 PRNG_NUM_ENTROPY

Type: Read/Write
Reset State: 0x00000400

PRNG_NUM_ENTROPY

Bits	Name	Description
31:0	NUM_ENTROPY_BYTES	Indicates the number of entropy bytes to be used during instantiate and reseed processes. Note that the minimum value of this field should be 16 for this design, although no enforcement is done in HW. Larger values provide more randomness. NIST SP800-90 specifies the maximum value to be 235 BITS.

0x1A500114 PRNG_SAMPLE_FREQ

Type: Read/Write
Reset State: 0x00000400

PRNG_SAMPLE_FREQ

Bits	Name	Description
31:0	SAMPLE_FREQ	The number of clocks between samples of the LFSR.

0x1A500118 PRNG_GEN_WORDS

Type: Read/Write
Reset State: 0x00000008

PRNG_GEN_WORDS

Bits	Name	Description
31:0	REQUESTED_WORDS	The number of words per generate operation

0x1A50011C PRNG_RESEED_FREQ

Type: Read/Write
Reset State: 0x00010000

PRNG_RESEED_FREQ

Bits	Name	Description
31:0	RESEED_FREQ	The number of generate operations before a reseed is initiated. The minimum number of generate operations before a reseed is initiated is 2.

0x1A500120 PRNG_INSTANTIATE_FREQ

Type: Read/Write
Reset State: 0x00010000

PRNG_INSTANTIATE_FREQ

Bits	Name	Description
31:0	INSTANTIATE_FREQ	The number of reseed operations before an instantiate is initiated.

2.19 Chip System FPB 0 Registers (0x1B100000 CFPB0_XPU_CFG_BASE)

This section contains the Chip FPB 0 XPU registers.

0x1B100000+ 4*n CFPB0_XPU_APU_RGn_ACR, n=[0..16]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 01, i.e., a single VMID, read/write access vs. read-only access permission type APU. These registers include 2 separate 5 bit "owner" VMID fields

CFPB0_XPU_APU_RGn_ACR

Bits	Name	Description
31:26	RESERVED31_26	Reserved.
25	ROGE	Read-only global enable: Opens up read-only access for this resource group to all VMIDs if: ROGE | (ROE & (VMID = ROVMID)) | APU_APU_ACR[VMID] = 1
24	ROE	Read-only enable. This is a "valid" bit for the ROVMID field.
23:21	RESERVED23_21	Reserved
20:16	ROVMID	Read-only VMID. Specifies "owner" VMID with read-only access to the registers in the associated resource group.
15:10	RESERVED15_10	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | APU_APU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a "valid" bit for the RWVMID field
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies "owner" VMID with full read/write access to the registers in the associated resource group.

0x1B100F80 CFPB0_XPU_APU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

APU Configuration Register: This register includes fields governing various APU behaviors.

CFPB0_XPU_APU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set APU_ESR. APU_EAR and APU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set APU_ESR. APU_EAR and APU_ESYNR0 updated with address and syndrome of error.
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x1B100F84 CFPB0_XPU_APU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

CFPB0_XPU_APU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x1B100F88 CFPB0_XPU_APU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the APU_ESYNRn registers, which are merely the "syndrome" of an error indicated by APU_ESR.

CFPB0_XPU_APU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x1B100F8C CFPB0_XPU_APU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

CFPB0_XPU_APU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x1B100F90 CFPB0_XPU_APU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

CFPB0_XPU_APU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x1B100F94 CFPB0_XPU_APU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

CFPB0_XPU_APU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x1B100FF4 CFPB0_XPU_APU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

CFPB0_XPU_APU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved

CFPB0_XPU_APU_REV (cont.)

Bits	Name	Description
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x1B100FF8 CFPB0_XPU_APU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x00001810

APU ID Register: Read-only register that defines various configuration attributes of the APU instance.

CFPB0_XPU_APU_IDR

Bits	Name	Description
31:29	RESERVED31_21	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMIDs have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.

CFPB0_XPU_APU_IDR (cont.)

Bits	Name	Description
9	RESERVED9	Reserved
8:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x1B100FFC CFPB0_XPU_APU_APU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

CFPB0_XPU_APU_APU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APUs (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

2.20 Chip System FPB0 Registers (0x1B200000 CSYSFPB0_BASE)

This section contains the Chip System FPB 0 registers.

0x1B200000 CSYSFPB0_CFPB0_CTRL_STATUS

Type: Read/Write
Clock: CC_CFPB0_CLK
Reset State: 0x00000000

This register is a general configuration register.

CSYSFPB0_CFPB0_CTRL_STATUS

Bits	Name	Description
31:13	RESERVED_BIT31_13	
12	XPU_EN	SW: RW, HW: R Default slave xpu enable bit When set, default slave xpu ACR register enables Power up value is clear (0)
11	RPM_PROC_IRQ_EN	SW: RW, HW: R PRMProcInterruptEnable When set, the RPM Processor receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
10	APPS_PROC_IRQ_EN	SW: RW, HW: R AppsProcInterruptEnable When set, the Application Processor receives an interrupt whenever SFPB_ERROR_STAT:ERROR_DETECT is set (1). Power up value is clear (0).
9	SFPB_ADDR_DEC_HALT_EN	SW:RW, HW:R This bit enables the gating of FPB slaves' hsel with clk halt signals from the clock control block. Power up value is clear (0) (disabled).
8:5	DEFAULT_MASTER	SW: RW, HW: R Power up value is 0000

CSYSFPB0_CFPB0_CTRL_STATUS (cont.)

Bits	Name	Description
4:0	SFPB_TEST_EN	SW: RW, HW: R Test enable for the system_fpb bus. Others: RESERVED_PROGRAMMING Power up value is 00000 0x0: DISABLED 0x1: Select the test_bus_sfpb (AHB BUS.) 0x2: Select the test_bus_sfpb1 (AHB BUS.) 0x3: Select the test_bus_sfpb2 (AHB BUS.) 0x4: Select the test_bus_sfpb3 (AHB BUS.) 0x5: Select the S0_M0 ahb2ahb bridge test bus. 0x6: Select the S1_M1 ahb2ahb bridge test bus. 0x7: Select the M0 ahb2ahb bridge test bus. 0x8: Select the M1 ahb2ahb bridge test bus. 0x9: Select the M2 ahb2ahb bridge test bus. 0xA: Select the M3 ahb2ahb bridge test bus. 0xB: Select the M4 ahb2ahb bridge test bus. 0xC: Select the M5 ahb2ahb bridge test bus. 0xD: Select the M6 ahb2ahb bridge test bus. 0xE: Select the M7 ahb2ahb bridge test bus. 0xF: Select the M8 ahb2ahb bridge test bus. 0x10: Select the M9 ahb2ahb bridge test bus. 0x11: Select the M10 ahb2ahb bridge test bus. 0x12: Select the M11 ahb2ahb bridge test bus. 0x13: Select the M12 ahb2ahb bridge test bus. 0x14: Select the M13 ahb2ahb bridge test bus. 0x15: Select the M14 ahb2ahb bridge test bus. 0x16: Select the M15 ahb2ahb bridge test bus.

0x1B200004+ 0x4*a CSYSFPB0_CFPB0_AHB2AHB_CFG_Ma, a=[0..0]

Type: Read/Write
Clock: CC_CFPB0_CLK
Reset State: 0x00000009

The CFPB0_AHB2AHB_CFG_Ma register is to configure the AHB2AHB bridge of master Ma. The AHB2AHB bridge is instantiated if the AHB interface is async (Generic: MASTER_ASYNC_IF(a) = ’1’). Otherwise this register is reserved.

CSYSFPB0_CFPB0_AHB2AHB_CFG_Ma

Bits	Name	Description
30:6	RESERVED_BITS30_6	

CSYSFPB0_CFPB0_AHB2AHB_CFG_Ma (cont.)

Bits	Name	Description
5:4	M_AHB2AHB_TEST_EN	SW: RW, HW: R Test enable for the Sa lite_bridge. Power up value is 00 0x0: DISABLED 0x1: Select slave side test signals 0x2: Select master side test signals 0x3: RESERVED_PROGRAMMING
3	M_WPOST_EN	SW: RW, HW: R MaWritePostEnable When set (1), the ahb2ahb bridge will support posting of write data. When cleared (0), each write request must complete across the bus before the next is accepted. Power up value is set (1)
2	M_HALT_ACK	SW:R, HW:W Indicates the Ma acknowledgement of halt_req asserted by software. Power up value is clear (0).
1	M_HALT_REQ	SW:RW, HW:R Software should write to this register to request the Ma lite_bridge master to cleanly halt. Power up value is clear (0).
0	M_IDLE	SW:R, HW:W Indicates that the Ma lite bridge master FSM is in IDLE state. Power up value is set (1).

0x1B200044 CSYSFPB0_CFPB0_PORT_EN

Type: Read/Write
Clock: CC_CFPB0_CLK
Reset State: 0xFFFFFFFF

This register is the CFPB0 master port enable register.

CSYSFPB0_CFPB0_PORT_EN

Bits	Name	Description
31:1	RESERVED_BIT31_1	Only one master port is used.
0	M0_PORT_EN	SW: RW, HW: R M0PortEnable When cleared (0), M0 bridge is prevented from arbitrating on the system_fpb bus. Power up value is set (1)

0x1B200050 CSYSFPB0_CFPB0_ERROR_STAT

Type: Read/Write
Clock: CC_CFPB0_CLK
Reset State: 0x00000000

This register is the bus error status register.

CSYSFPB0_CFPB0_ERROR_STAT

Bits	Name	Description
31:22	RESERVED_BITS31_22	
21:18	ERROR_CID	SW: R, HW: W ErrorDMChannelIDStatus Indicates the channel ID that caused the detected error when CID is valid for the master of the access. If not, this field is reserved. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
17:16	RESERVED_BITS17_16	
15:12	ERROR_PID	SW: R, HW: W ErrorPortIDStatus Indicates the port ID of the master that generated the detected error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: Master0 0x1: Master1 0x2: Master2 0x3: Master3 0x4: Master4 0x5: Master5 0x6: Master6 0x7: Master7 0x8: Master8 0x9: Master9 0xA: Master10 0xB: Master11 0xC: Master12 0xD: Master13 0xE: Master14 0xF: Master15
11:10	RESERVED_BITS11_10	

CSYSFPB0_CFPB0_ERROR_STAT (cont.)

Bits	Name	Description
9:8	ERROR_TYPE	SW: R, HW: W ErrorTypeStatus Indicates the type of error detected. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: System FPB xPU security violation 0x1: Invalid FPB address 0x2: Slave asserted error (also includes invalid SPB addresses and SPB bus timeouts) 0x3: RESERVED
7	RESERVED_BIT7_6	
6:4	ERROR_HSIZE	SW: R, HW: W ErrorHSizeStatus Indicates the width of the transfer to cause a bus error. Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0). 0x0: 8-bit 0x1: 16-bit 0x2: 32-bit
3:2	RESERVED_BIT3_2	
1	ERROR_HWRITE	SW: R, HW: W ErrorHWriteStatus Only valid when ERROR_DETECT is set (1). ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).
0	ERROR_DETECT	SW: RW, HW: RW ErrorDetect When set (1), a bus error has been detected and interrupts will be asserted. Clearing (0) this bit clears any interrupts asserted as well as enables the ERROR_ STAT register to capture the next error detected. Power up value is clear (0)

0x1B200054 CSYSFPB0_CFPB0_ERROR_ADDR

Type: Read
Clock: CC_CFPB0_CLK
Reset State: 0x00000000

This register contains the bus error address.

CSYSFPB0_CFPB0_ERROR_ADDR

Bits	Name	Description
31:0	ERROR_ADDR	SW: R, HW: W ErrorAddress Indicates the bus address that caused the captured bus error. Only valid when ERROR_STAT:ERROR_DETECT = 1. ERROR_DETECT must be clear (0) for this field to load - that is, it only loads the first detected error after ERROR_DETECT has been cleared (0).

0x1B200058 CSYSFPB0_CFPB0_GPREG

Type: Read/Write
Clock: CC_CFPB0_CLK
Reset State: 0x00000000

This register is a configurable general purpose register. This is 9-bit register. The size of this register is defined by the generic-SFPB_GPREG_SIZE (1 - 32 bits). It is set to 9.

CSYSFPB0_CFPB0_GPREG

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8:1	MSM_TIMEOUT_VAL	SW: RW, HW: W APQ will wait for time out value for ACK to receive from the Slave if MSM_TIMEOUT_VAL is programmed and if timeout is enabled. If ACK is not received within the timeout value, APQ will respond with Error. Power up value is clear (0)
0	MSM_TIMEOUT_EN	SW: RW, HW: W Enables the time out value if set to ’1’ Power up value is clear (0)

0x1B20005C CSYSFPB0_CFPB0_XPU_ACR

Type: Read/Write
Clock: CC_CFPB0_CLK
Reset State: 0xFFFFFFFF

The CFPB0_XPU_ACR register is the CFPB0 Access Control Register for configuring register protection.

CSYSFPB0_CFPB0_XPU_ACR

Bits	Name	Description
31:0	RWE	SW: RW, HW: R CFPB0 XPU Access control Register. Each bit position corresponds to a VMID. When set to 1, that VMID is granted VMID read/write access to the CFPB0 configure space, including this register itself. Power up value is set (1)

0x1B200060 CSYSFPB0_CFPB0_HW_CLK_GATING_CFG

Type: Read/Write
Clock: CC_CFPB0_CLK
Reset State: 0x00000000

The CFPB0_HW_CLK_GATING_CFG register is for hardware clock gating configuration.

CSYSFPB0_CFPB0_HW_CLK_GATING_CFG

Bits	Name	Description
31:11	RESERVED_BITS31_11	
10:4	HYSTERESIS_CNT_SW	SW: RW, HW: R Hysteresis Counter Value This field is used by SW to set the hysteresis counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)
3:0	WAKE_CNT_SW	SW: RW, HW: R Wakeup Counter Value This field is used by SW to set the wakeup counter for hardware clock gating scheme. This field is used when ENABLE_HW_CLK_GATING is set to 1. Power up value is clear (0)

3 Chip Core Top Registers

3.1 Overview

Table 3-1 chip_core_top Bases

Base Name	Parent	Address
TLMM_RPU_RGn_ACR	TLMM_BASE	0x00800000
SYS_IMEM_IMEM_CONFIG	SYS_IMEM_BASE	0x00B00000
SPDM_SREG_CFG0	SPDM_SECURE_BASE	0x01100000
SPDM_CREG_CFG0	SPDM_BASE	0x01000000
SPDM_OLEM_CFG0	SPDM_BASE	0x01000000
SPDM_RT_LOW_THRESH_STATUS	SPDM_BASE	0x01000000

3.2 TLMM Registers (0x00800000 TLMM_BASE)

This section contains the TLMM registers.

3.2.1 GPIO registers

3.2.1.1 Super User Only registers

The following security registers are access control registers (ACRs) that control permissions for the other registers in the TLMM. Any VMID defined as a Super User (SU) has access to all registers in the TLMM.

0x00800000+ 0x4*n TLMM_RPU_RGn_ACR, n=[0..89]

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

One per GPIO. The TLMM_RPU_RGn_ACR registers control access to a standard grouping of registers deemed to be a 'GPIO Resource.' The following registers make up a GPIO Resource: GPIO_CFGn, GPIO_IN_OUTn, GPIO_INTR_CFGn, GPIO_INTR_STATUSn. Only a single VMID can be an owner for a given GPIO Resource. Permissions are Access/No Access.

TLMM_RPU_RGn_ACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x00800300 TLMM_SPARE_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The TLMM_SPARE_WACR register controls the read/write access permissions for the TLMM_SPARE register. Only a single VMID can be given read/write control of this register.

TLMM_SPARE_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x00800304 TLMM_SPARE_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The TLMM_SPARE_RACR register controls the read-only access for the TLMM_SPARE register. Only a single VMID can be given read/write control of this register.

TLMM_SPARE_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x008002F0 RIVA_COEXIST_GPIO_PORT_SEL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The RIVA_COEXIST_GPIO_PORT_SEL_WACR register controls the read/write access permissions for the RIVA_COEXIST_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

RIVA_COEXIST_GPIO_PORT_SEL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008002F4 RIVA_COEXIST_GPIO_PORT_SEL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The RIVA_COEXIST_GPIO_PORT_SEL_RACR register controls the read-only access for the RIVA_COEXIST_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

RIVA_COEXIST_GPIO_PORT_SEL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800310 GP_PDM0_GPIO_PORT_SEL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GP_PDM0_GPIO_PORT_SEL_WACR register controls the read/write access permissions for the GP_PDM0_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

GP_PDM0_GPIO_PORT_SEL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x00800314 GP_PDM0_GPIO_PORT_SEL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GP_PDM0_GPIO_PORT_SEL_RACR register controls the read-only access for the GP_PDM0_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

GP_PDM0_GPIO_PORT_SEL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800318 GP_PDM1_GPIO_PORT_SEL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GP_PDM1_GPIO_PORT_SEL_WACR register controls the read/write access permissions for the GP_PDM1_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

GP_PDM1_GPIO_PORT_SEL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x0080031C GP_PDM1_GPIO_PORT_SEL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GP_PDM1_GPIO_PORT_SEL_RACR register controls the read-only access for the GP_PDM1_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

GP_PDM1_GPIO_PORT_SEL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800320 GP_PDM2_GPIO_PORT_SEL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GP_PDM2_GPIO_PORT_SEL_WACR register controls the read/write access permissions for the GP_PDM2_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

GP_PDM2_GPIO_PORT_SEL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x00800324 GP_PDM2_GPIO_PORT_SEL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GP_PDM2_GPIO_PORT_SEL_RACR register controls the read-only access for the GP_PDM2_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

GP_PDM2_GPIO_PORT_SEL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800328 SLIMBUS1_GPIO_PORT_SEL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The SLIMBUS1_GPIO_PORT_SEL_WACR register controls the read/write access permissions for the SLIMBUS1_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

SLIMBUS1_GPIO_PORT_SEL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x0080032C SLIMBUS1_GPIO_PORT_SEL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The SLIMBUS1_GPIO_PORT_SEL_RACR register controls the read-only access for the SLIMBUS1_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

SLIMBUS1_GPIO_PORT_SEL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800330 SLIMBUS1_A_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The SLIMBUS1_A_CTL_WACR register controls the read/write access permissions for the SLIMBUS1_A_CTL register. Only a single VMID can be given read/write control of this register.

SLIMBUS1_A_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x00800334 SLIMBUS1_A_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The SLIMBUS1_A_CTL_RACR register controls the read-only access for the SLIMBUS1_A_CTL register. Only a single VMID can be given read/write control of this register.

SLIMBUS1_A_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800338 SLIMBUS1_B_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The SLIMBUS1_B_CTL_WACR register controls the read/write access permissions for the SLIMBUS1_B_CTL register. Only a single VMID can be given read/write control of this register.

SLIMBUS1_B_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x0080033C SLIMBUS1_B_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The SLIMBUS1_B_CTL_RACR register controls the read-only access for the SLIMBUS1_B_CTL register. Only a single VMID can be given read/write control of this register.

SLIMBUS1_B_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800308 USB_FS1_GPIO_PORT_SEL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The USB_FS1_GPIO_PORT_SEL_WACR register controls the read/write access permissions for the USB_FS1_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

USB_FS1_GPIO_PORT_SEL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x0080030C USB_FS1_GPIO_PORT_SEL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The USB_FS1_GPIO_PORT_SEL_RACR register controls the read-only access for the USB_FS1_GPIO_PORT_SEL register. Only a single VMID can be given read/write control of this register.

USB_FS1_GPIO_PORT_SEL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800350+0x4*n DIR_CONN_INTRn_POLARITY_ACR, n=[0..21]

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

One per Direct Connect Interrupt. The DIR_CONN_INTRn_POLARITY_ACR registers control access to the DIR_CONN_INTRn_POLARITY registers used to configure the Direct Connect Interrupt Polarity. Each Interrupt is protected separately allowing either a SU or the owner of a particular interrupt to configure the polarity. Only a single VMID can be an owner for a given Direct Connect Interrupt.

DIR_CONN_INTRn_POLARITY_ACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003AC RESOUT_HDRV_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The RESOUT_HDRV_CTL_WACR register controls the read/write access permissions for the RESOUT_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

RESOUT_HDRV_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003B0 RESOUT_HDRV_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The RESOUT_HDRV_CTL_RACR register controls the read-only access for the RESOUT_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

RESOUT_HDRV_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x008003B4 JTAG_HDRV_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The JTAG_HDRV_CTL_WACR register controls the read/write access permissions for the JTAG_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

JTAG_HDRV_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003B8 JTAG_HDRV_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The JTAG_HDRV_CTL_RACR register controls the read-only access for the JTAG_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

JTAG_HDRV_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x008003BC PMIC_HDRV_PULL_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The PMIC_HDRV_CTL_WACR register controls the read/write access permissions for the PMIC_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

PMIC_HDRV_PULL_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003C0 PMIC_HDRV_PULL_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The PMIC_HDRV_CTL_RACR register controls the read-only access for the PMIC_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

PMIC_HDRV_PULL_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x008003C4 SDC1_HDRV_PULL_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The SDC1_HDRV_CTL_WACR register controls the read/write access permissions for the SDC1_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

SDC1_HDRV_PULL_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003C8 SDC1_HDRV_PULL_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The SDC1_HDRV_CTL_RACR register controls the read-only access for the SDC1_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

SDC1_HDRV_PULL_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x008003CC SDC3_HDRV_PULL_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The SDC3_HDRV_CTL_WACR register controls the read/write access permissions for the SDC3_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

SDC3_HDRV_PULL_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003D0 SDC3_HDRV_PULL_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The SDC3_HDRV_CTL_RACR register controls the read-only access for the SDC3_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

SDC3_HDRV_PULL_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x008003D8 MODE_PULL_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The MODE_HDRV_CTL_WACR register controls the read/write access permissions for the MODE_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

MODE_PULL_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003DC MODE_PULL_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The MODE_HDRV_CTL_RACR register controls the read-only access for the MODE_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

MODE_PULL_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x008003E0 GSBI4_3D_CAM_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI4_3D_CAM_CTL_WACR register controls the read/write access permissions for the GSBI4_3D_CAM_CTL register. Only a single VMID can be given read/write control of this register.

GSBI4_3D_CAM_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003E4 GSBI4_3D_CAM_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI4_3D_CAM_CTL_RACR register controls the read-only access for the GSBI4_3D_CAM_CTL register. Only a single VMID can be given read/write control of this register.

GSBI4_3D_CAM_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x008003E8 GSBI7_3D_CAM_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI7_3D_CAM_CTL_WACR register controls the read/write access permissions for the GSBI7_3D_CAM_CTL register. Only a single VMID can be given read/write control of this register.

GSBI7_3D_CAM_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003EC GSBI7_3D_CAM_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI7_3D_CAM_CTL_RACR register controls the read-only access for the GSBI7_3D_CAM_CTL register. Only a single VMID can be given read/write control of this register.

GSBI7_3D_CAM_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x008003F0 HSIC_STROBE_GPIO_PAD_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The HSIC_STROBE_GPIO_PAD_CTL_WACR register controls the read/write access permissions for the HSIC_STROBE_GPIO_PAD_CTL register. Only a single VMID can be given read/write control of this register.

HSIC_STROBE_GPIO_PAD_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003F4 HSIC_STROBE_GPIO_PAD_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The HSIC_STROBE_GPIO_PAD_CTL_RACR register controls the read-only access for the HSIC_STROBE_GPIO_PAD_CTL register. Only a single VMID can be given read/write control of this register.

HSIC_STROBE_GPIO_PAD_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x008003F8 HSIC_DATA_GPIO_PAD_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The HSIC_DATA_GPIO_PAD_CTL_WACR register controls the read/write access permissions for the HSIC_DATA_GPIO_PAD_CTL register. Only a single VMID can be given read/write control of this register.

HSIC_DATA_GPIO_PAD_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008003FC HSIC_DATA_GPIO_PAD_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The HSIC_DATA_GPIO_PAD_CTL_RACR register controls the read-only access for the HSIC_DATA_GPIO_PAD_CTL register. Only a single VMID can be given read/write control of this register.

HSIC_DATA_GPIO_PAD_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800348 HSIC_CAL_PAD_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The HSIC_CAL_PAD_CTL_WACR register controls the read/write access permissions for the HSIC_CAL_PAD_CTL register. Only a single VMID can be given read/write control of this register.

HSIC_CAL_PAD_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x0080034C HSIC_CAL_PAD_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The HSIC_CAL_PAD_CTL_RACR register controls the read-only access for the HSIC_CAL_PAD_CTL register. Only a single VMID can be given read/write control of this register.

HSIC_CAL_PAD_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800340 RGB_PAD_EN_WACR

Type: Read/Write
Clock: CC_TLMM_CLK
Reset State: 0x00000000

The RGB_PAD_EN_WACR register controls the read-only access for the RGB_PAD_EN register. Only a single VMID can be given read/write control of this register.

RGB_PAD_EN_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x00800344 RGB_PAD_EN_RACR

Type: Read/Write
Clock: CC_TLMM_CLK
Reset State: 0x00000000

The RGB_PAD_EN_RACR register controls the read-only access for the RGB_PAD_EN register. Only a single VMID can be given read/write control of this register.

RGB_PAD_EN_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with full read access to the registers in the associated resource group.

0x008002F8 RGB_HDRV_CTL_WACR

Type: Read/Write
Clock: CC_TLMM_CLK
Reset State: 0x00000000

The RGB_HDRV_CTL_WACR register controls the read/write access permissions for the RGB_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

RGB_HDRV_CTL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x008002FC RGB_HDRV_CTL_RACR

Type: Read/Write
Clock: CC_TLMM_CLK
Reset State: 0x00000000

The RGB_HDRV_CTL_RACR register controls the read-only access for the RGB_HDRV_CTL register. Only a single VMID can be given read/write control of this register.

RGB_HDRV_CTL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with full read access to the registers in the associated resource group.

0x00800400+ 0x4*n GPIO_INTR_CFG_SUn, n=[0..89]

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00000007

The summary interrupt control registers configure which processor the summary interrupt should be routed to. In addition, they control whether the GPIO is enabled as a direct connect interrupt.

GPIO_INTR_CFG_SUn

Bits	Name	Description
31:4	RESERVED	Reserved field.
3	DIR_CONN_EN	This bit tells the TLMM that GPIO[n] is being used as a Direct Connect Interrupt. 0x1: Enable 0x0: Disable

GPIO_INTR_CFG_SUn (cont.)

Bits	Name	Description
2:0	TARGET_PROC	This a 3-bit field that determines which processor a summary interrupt from GPIO[n] should get routed to. 0x0: RIVA_PROC 0x1: SPS_PROC 0x2: LPA_DSP 0x3: RPM_PROC 0x4: APCC_PROC 0x5: GSS_PROC 0x6: Reserved 0x7: NONE

0x00800600 GSBI1_UART_I2C_SEL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI1_UART_I2C_SEL_WACR register controls the read/write access permissions for the GSBI1_UART_I2C_SEL register. Only a single VMID can be given read/write control of this register.

GSBI1_UART_I2C_SEL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x00800604 GSBI1_UART_I2C_SEL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI1_UART_I2C_SEL_RACR register controls the read-only access for the GSBI1_UART_I2C_SEL register. Only a single VMID can be given read/write control of this register.

GSBI1_UART_I2C_SEL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800608 GSBI2_UART_SEL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI2_UART_SEL_WACR register controls the read/write access permissions for the GSBI2_UART_SEL register. Only a single VMID can be given read/write control of this register.

GSBI2_UART_SEL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x0080060C GSBI2_UART_SEL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI2_UART_SEL_RACR register controls the read-only access for the GSBI2_UART_SEL register. Only a single VMID can be given read/write control of this register.

GSBI2_UART_SEL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800610 GSBI3_UART_SEL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI3_UART_SEL_WACR register controls the read/write access permissions for the GSBI3_UART_SEL register. Only a single VMID can be given read/write control of this register.

GSBI3_UART_SEL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x00800614 GSBI3_UART_SEL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI3_UART_SEL_RACR register controls the read-only access for the GSBI3_UART_SEL register. Only a single VMID can be given read/write control of this register.

GSBI3_UART_SEL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800618 GSBI4_UART_I2C_SEL_WACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI4_UART_I2C_SEL_WACR register controls the read/write access permissions for the GSBI4_UART_I2C_SEL register. Only a single VMID can be given read/write control of this register.

GSBI4_UART_I2C_SEL_WACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field
7:5	RESERVED_2	Reserved
4:0	RWVMID_4_0	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x0080061C GSBI4_UART_I2C_SEL_RACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI4_UART_I2C_SEL_RACR register controls the read-only access for the GSBI4_UART_I2C_SEL register. Only a single VMID can be given read/write control of this register.

GSBI4_UART_I2C_SEL_RACR

Bits	Name	Description
31:10	RESERVED_1	Reserved
9	RGE	Read global enable. Opens up read access for this resource group to all VMIDs if: RGE | (RE & (VMID = RVMID)) | TLMM_RPU_ACR[VMID] = 1
8	RE	Read enable. This is a 'valid' bit for the RVMID field
7:5	RESERVED_2	Reserved
4:0	RVMID_4_0	Read VMID. Specifies 'owner' VMID with read access to the registers in the associated resource group.

0x00800700+ 0x4*n DIR_CONN_INTR_CFG_SUn, n=[0..21]

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00000007

The direct connect interrupt config registers configure which GPIO will be used as a direct connect interrupt. They also configure which processor a direct connect interrupt should get routed to.

NOTE In addition to selecting which GPIO will be used as a direct connect interrupt with the GPIO_SEL bit field, the DIR_CONN_EN must be set in the GPIO_INTR_CFG_SUn register.

DIR_CONN_INTR_CFG_SUn

Bits	Name	Description
31:10	RESERVED	Reserved field
9:3	GPIO_SEL	This field selects which GPIO will be used on Direct Connect Interrupt n.
2:0	TARGET_PROC	This a 3-bit field that determines which processor a Direct Connect n should get routed to. 0x0: RIVA_PROC 0x1: SPS_PROC 0x2: LPA_DSP 0x3: RPM_PROC 0x4: APCC_PROC 0x5: GSS_PROC 0x6: Reserved 0x7: NONE

0x00800800 TLMM_CLK_GATE_EN_SU

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

This register can enable the clock gating in the TLMM. By default the clock gating is disabled.

NOTE

NOTE .

TLMM_CLK_GATE_EN_SU

Bits	Name	Description
31:5	RESERVED	Reserved field
4	AHB_HCLK_EN	Enables the Clock Gating on the AHB Clock. 0x1: ENABLE 0x0: DISABLE
3	DBG_STATUS_EN	Enables the Clock Gating on the Debug Status Demets. 0x1: ENABLE 0x0: DISABLE
2	JTAG_XTRIG_EN	Enables the Clock Gating on the Debug Cross Triggering Demets. 0x1: ENABLE 0x0: DISABLE
1	SUMMARY_INTR_EN	Enables the Clock Gating on the Summary Interrupt Demets. 0x1: ENABLE 0x0: DISABLE
0	CRIF_READ_EN	Enables the Clock Gating on the Read Data Register on the CRIF interface. 0x1: ENABLE 0x0: DISABLE

0x00800810 TLMM_IE_CTRL_DISABLE_SU

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0001

This register can enable/disable control of the pad input enable within the TLMM. By default the IE control is disabled. When disabled, the IE for all GPIOs is always high and the input path is always enabled. When IE_CTRL is enabled, the input path can enabled/disabled based on the direction of the function that is configured for the GPIO. This register only affects GPIOs.

Some loopback tests require the IE to always be high. As such, this bit is required functionality for certain test modes.

TLMM_IE_CTRL_DISABLE_SU

Bits	Name	Description
31:1	RESERVED	Reserved field
0	IE_CTRL_DISABLE	Enables control of the pad IE within TLMM. When disabled, the IE is tied high. 0x1: DISABLE 0x0: ENABLE

0x00800820 PSHOLD_CTL_SU

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

This register controls the PSHOLD value when the alternate function is selected on GPIO.

NOTE In addition to SW control and the tlmm reset, this register can be reset via HW by the temperature sensor.

PSHOLD_CTL_SU

Bits	Name	Description
31:1	RESERVED	Reserved.
0	PSHOLD_VALUE	Controls the value of the PSHOLD output. 0x1: Asserted 0x0: De-asserted

0x00800840 TLMM_MPM_WAKEUP_INT_EN_0_SU

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

This register controls the input enable for the HV input path from the pad.

NOTE Interrupt enables are present within the MPM. This register is specifically used to gate the HV path from the pad to the MPM for power savings.

TLMM_MPM_WAKEUP_INT_EN_0_SU

Bits	Name	Description
31	GPIO_75	This is used to enable the HV interrupt path to the MPM: 0x0: Disable 0x1: Enable
30	GPIO_72	This is used to enable the HV interrupt path to the MPM: 0x0: Disable 0x1: Enable
29	GPIO_45	This is used to enable the HV interrupt path to the MPM: 0x0: Disable 0x1: Enable

0x00800844 TLMM_MPM_WAKEUP_INT_EN_1_SU

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

This register controls the input enable for the HV input path from the pad.

NOTE Interrupt enables are present within the MPM. This register is specifically used to gate the HV path from the pad to the MPM for power savings.

Bits	Name	Description
0	SRST_N	This is used to enable the HV interrupt path to the MPM: 0x0: Disable 0x1: Enable

0x00800F80 TLMM_RPU_CR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

RPU Configuration Register: This register includes fields governing various RPU behaviors

NOTE The RPUE bit field of this register is what enables VMID checking. When this bit is ’0’, all accesses are allowed. Once the SROT defines the Super User permissions in the TLMM_RPU_ACR register, this bit should be set to ’1’ to enable the TLMM security features.

The Client Port refers to valid VMID checking. Invalid VMIDs can result in CLIENT ERRORs when this error reporting is enabled.

The Configuration Port refers to valid address checking. Invalid addresses can result in DECODE ERRORs when this error reporting is enabled.

Table 3-2 shows when CLIENT ERRORs, DECODE ERRORs, and the XPU INTR are enabled based on the register configuration values.

Table 3-2 Enablements based on register configuration values

RPUERE	DCDEE	RPUEIE	CLIENT ERROR	DECODE ERROR	XPU INTR
0	X	X	0	0	0
1	0	0	1	0	0
1	0	1	1	0	1
1	1	0	1	1	0
1	1	1	1	1	1

Table 3-3 shows the types of transactions that will result in CLIENT or DECODE ERRORs.

It should be noted that bitwise register accesses will not trigger a CLIENT ERROR if any of the bits have the correct permissions that match the accessing VMID.

Table 3-3 Types of transactions resulting in CLIENT or DECODE ERRORs

VALID ADDRESS	SU VMID	Correct owner VMID	CLIENT ERROR	DECODE ERROR
0	X	X	0	1
1	0	0	1	0
1	0	1	0	0
1	1	0	0	0

.

TLMM_RPU_CR

Bits	Name	Description
31:4	RESERVED	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e.invalid address) are recorded as such. Do Not Record Decode errors do not set RPU_ESR[CFG]. RPU_EAR and RPU_ESYNR0 not updated. Record Decode errors set RPU_ESR[CFG]. RPU_EAR and RPU_ESYNR0 updated with address and syndrome of error. 0x0: DCDEE_DISABLE 0x1: DCDEE_ENABLE
2	RPUEIE	Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the RPU.
1	RPUERE	Error Report Enable. Causes the RPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective RPU port. Both client and configuration port errors are recorded in RPU_EAR, RPU_ESR and RPU_ESYNRn, independent of the value of RPU_CR[ERE] 0x0: ERE_DISABLE 0x1: ERE_ENABLE
0	RPUE	RPU Enable. Governs whether RPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures RPU and the MID to VMID mapping tables.

0x00800F84 TLMM_RPU_EAR

Type: Read
Clock: CC_TLMM_HCLK
Reset State: 0x0000

Error Address Register. This register captures the address upon errors detected by the RPU, for both the client port and the configuration port.

The first error is captured and held. Subsequent errors are not captured until the TLMM_RPU_ESR register is cleared.

NOTE We are capturing address bits up to 1MB of space (19:0). This is all the TLMM decodes.

.

TLMM_RPU_EAR

Bits	Name	Description
19:0	PA_19_0	The physical address of the errant request.

0x00800F88 TLMM_RPU_ESR

Type: Read/Write-Clear
Clock: CC_TLMM_HCLK
Reset State: 0x0000

Error Status Register. This register captures the status upon errors detected by the RPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old. The presence of an asserted value on any bit in this register is what prompts the assertion of the RPU's interrupt output (when enabled by RPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the RPU_ESYNRn registers, which are merely the 'syndrome' of an error indicated by RPU_ESR.

TLMM_RPU_ESR

Bits	Name	Description
31	MULTIERROR	Multi-error: Indicates additional error occurred while TLMM_RPU_ESR[CFG, CLIENT] still nonzero. TLMM_RPU_EAR and TLMM_RPU_ESYNRn registers (and TLMM_RPU_ESR itself, except for the MULTI bit) 'lock' upon first error, TLMM_RPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while TLMM_RPU_ESR is non-zero are lost.
30:2	RESERVED	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x00800F8C TLMM_RPU_ESRRESTORE

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

Error Restore Register. This register is an optional address for the TLMM_RPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes

.

TLMM_RPU_ESRRESTORE

Bits	Name	Description
31	MULTIERROR	Multi-error: Indicates additional error occurred while TLMM_RPU_ESR[CFG, CLIENT] still nonzero. TLMM_RPU_EAR and TLMM_RPU_ESYNRn registers (and TLMM_RPU_ESR itself, except for the MULTI bit) 'lock' upon first error, TLMM_RPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while TLMM_RPU_ESR is non-zero are lost.
30:2	RESERVED	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x00800F90 TLMM_RPU_ESYNR0

Type: Read
Clock: CC_TLMM_HCLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the RPU, for both the client port and the configuration port.

The first error is captured and held. Subsequent errors are not captured until the TLMM_RPU_ESR register is cleared.

TLMM_RPU_ESYNR0

Bits	Name	Description
31:24	RESERVED_1	ATID field of errant request. (Not supported in the TLMM)
23:21	RESERVED_2	Reserved
20:16	AVMID_4_0	AVMID field of errant request.
15:13	RESERVED_3	ABID field of errant request. (Not supported in the TLMM)
12:8	RESERVED_4	APID field of errant request. (Not supported in the TLMM)
7:0	RESERVED	AMID field of errant request. (Not supported in the TLMM)

0x00800F94 TLMM_RPU_ESYNR1

Type: Read
Clock: CC_TLMM_HCLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the RPU, for both the client port and the configuration port.

The first error is captured and held. Subsequent errors are not captured until the TLMM_RPU_ESR register is cleared.

TLMM_RPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED_1	Reserved
24	RESERVED_2	APULL field of the errant request. (Not supported in the TLMM)
23	RESERVED_3	Reserved

TLMM_RPU_ESYNR1 (cont.)

Bits	Name	Description
22	RESERVED_4	AOOO field of the errant request. (Not supported in the TLMM)
21:20	RESERVED_5	ALOCK field of the errant request. (Not supported in the TLMM)
19	RESERVED_6	Reserved
18:16	RESERVED_7	ASIZE field of errant request. (Not supported in the TLMM)
15:12	RESERVED_8	ALEN field of the errant request. (Not supported in the TLMM)
11	RESERVED_9	Reserved
10	RESERVED_10	ABURST field of errant request. (Not supported in the TLMM)
9	RESERVED_11	Reserved
8	AWRITE	AWRITE field of errant request.
7	RESERVED_12	AINST field of the errant request. (Not supported in the TLMM)
6	RESERVED_13	APROTNS field of errant request. (Not supported in the TLMM)
5	RESERVED_14	APRIV field of the errant request. (Not supported in the TLMM)
4	RESERVED_15	AINNERSHARED field of the errant request. (Not supported in the TLMM)
3	RESERVED_16	ASHARED field of the errant request. (Not supported in the TLMM)
2:0	RESERVED	AMEMTYPE field of the errant request. (Not supported in the TLMM)

0x00800FF4 TLMM_RPU_REV

Type: Read
Clock: CC_TLMM_HCLK
Reset State: 0x00000014

RPU Revision Register: This register provides major/minor revision codes for the implementation.

TLMM_RPU_REV

Bits	Name	Description
31:8	RESERVED	Reserved
7:4	MAJOR_3_0	Major variant field
3:0	MINOR_3_0	Minor variant

0x00800FF8 TLMM_RPU_IDR

Type: Read
Clock: CC_TLMM_HCLK
Reset State: 0x000208CC

RPU ID Register: Read-only register that defines various configuration attributes of the RPU instance.

TLMM_RPU_IDR

Bits	Name	Description
31:21	RESERVED_1	Reserved
20:16	LSB_4_0	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED_2	Reserved
13:12	XPUT_1_0	Indicates type of xPU (hard wired to 0b00 for RPU) 0x0: RPU 0x1: APU 0x2: MPU 0x3: Reserved
11	PT	Permission type Indicates full access vs. no access type. Only RPU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) Indicates read/write access type vs. read-only access type. For multi-VMID, separate RPU_RGn_RACR and RPU_RGn_WACR registers govern read vs. write access. For single VMID, RPU_RGn_ACR registers include separate 5-bit read/write vs. read-only 'owner' VMID fields 0x0: PT_FULL 0x1: PT_READ_WRITE
10	MV	Multi-VMID Indicates single VMID type access control. RPU_RGn_xACR registers indicate single 5 bit 'owner' VMID field for governing access. Indicates multi-VMD type access control. RPU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access. 0x0: SINGLE_MV 0x1: MULTI_MV
9:8	RESERVED	Reserved
7:0	NRG_7_0	Number of resource groups: Indicates number of resource groups (minus 1) supported by the RPU. Value can range between 0 and 255 (1-256 resource groups).

0x00800FFC TLMM_RPU_ACR

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0xFFFFFFFF

RPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the RPU (including the TLMM_RPU_ACR itself). In other words, any VMID set to ’1’ in this register has Super User access permissions.

TLMM_RPU_ACR

Bits	Name	Description
31:0	RWE_31_0	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the RPU’s 4KB address region (including the RPU_RPU_ACR itself). For single VMID type RPUs (RPU_IDR[MV] = 0) the RPU_RPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

0x00801000+0x10*n GPIO_CFGn, n=[0..89]

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_CFG[n] controls the GPIO Output Enable, HDrive, Pull and Alternate Functions. The default pull can vary for different GPIOs and can be found in the pinout spreadsheet/chapter. The default drive setting for all GPIOs is ’000’ (2 mA).

Depending on the GPIO selected, the FUNC_SEL value determines the function output. Table 3-4 summarizes the functions and the value to set to select them.

NOTE The default drive strength for all GPIO is 2 mA (DRV_STRENGTH = 000)

For all GPIO, the default GPIO_CFG[5:2] is 0, that is, the GPIO function is selected.

Table 3-4 Functions and values set to select them

GPIO	Function	Output Enable (gnd_tie=input) (vdd_tie=output)	GPIO_CFG[5:2] (FUNC_SEL)	GPIO_CFG[1:0] (GPIO_PULL)

GPIO_CFGn

Bits	Name	Description
31:10	RESERVED	Reserved field
9	GPIO_OE	1 bit that controls the OE for GPIO[n] when in GPIO mode.
8:6	DRV_STRENGTH	Controls the GPIO pad drive strength. This applies regardless of the FUNC_SEL field selection. 0x0: 2 mA 0x1: 4 mA 0x2: 6 mA 0x3: 8 mA 0x4: 10 mA 0x5: 12 mA 0x6: 14 mA 0x7: 16 mA
5:2	FUNC_SEL	Many of the GPIO pads have one or more functional hardware interfaces behind them. This field controls how the pad is used. Set this to the appropriate value for the function desired.
1:0	GPIO_PULL	The pad can be configured to employ an internal weak pull up, pull down, or keeper function. This applies regardless of the FUNC_SEL field selection. 0x0: No pull 0x1: Pull down (PD) 0x2: Keeper 0x3: Pull up (PU)

0x00801004+ 0x10*n GPIO_IN_OUTn, n=[0..89]

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_IN_OUT[n] controls the Out and In on the GPIO. The GPIO_IN bit is read-only.

GPIO_IN_OUTn

Bits	Name	Description
31:2	RESERVED	Reserved field.
1	GPIO_OUT	Controls the value of the GPIO Output
0	GPIO_IN	Allows you to read the Input value of the GPIO

0x00801008+0x10*n GPIO_INTR_CFGn, n=[0..89]

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00000002

The GPIO_INTR_CFG[n] controls the summary interrupt controller for GPIO n.

GPIO_INTR_CFGn

Bits	Name	Description
31:4	RESERVED	Reserved field.
3	INTR_RAW_STATUS_EN	This enables the RAW status for the summary interrupt on this GPIO. This is a power saving mechanism. Leave this disabled unless it is needed. 0x1: Enable 0x0: Disable
2	INTR_DECT_CTL	Controls the Edge or Level Detection of the Interrupt Controller 0x1: Edge 0x0: Level
1	INTR_POL_CTL	Controls the Polarity Detection of the Interrupt Controller. Polarity 1 corresponds to active high Polarity 0 corresponds to active low. 0x1: Polarity 1 0x0: Polarity 0
0	INTR_ENABLE	Controls if this GPIO will generate a summary interrupt. 0x1: Enable 0x0: Disable

0x0080100C+0x10*n GPIO_INTR_STATUSn, n=[0..89]

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00000

The GPIO_INTR_STATUS[n] controls the summary interrupt controller for GPIO n.

GPIO_INTR_STATUSn

Bits	Name	Description
31:1	RESERVED	Reserved field.
0	INTR_STATUS	When read, it returns the status for the interrupt on GPIO[n]. When written with a 1 in this position it clears the interrupt for GPIO[n].

3.2.1.2 Miscellaneous control and configuration registers

These registers control the mode MUXing outside of the GPIO. This includes the MUXing for GPIO pads used for ETM, debug, and JTAG options.

Access to these registers is determined based on the ACR registers in the previous section.

NOTE Analog test MUXing is controlled through primary pin decodes and is not covered here.

0x00802000 TLMM_INT_JTAG_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x1005

.

TLMM_INT_JTAG_CTL

Bits	Name	Description
31:13	RESERVED_1	Reserved field
12	TOTAL_RTCK_ENABLE_SOFT	Enables auto RTCK generation (Default set to 1)
11:10	RTCK_SEL_SOFT	Enables manual RTCK select: 0x0: NO_RTCK_SEL 0x1: RPM_RTCK_SEL 0x2: RIVA_ARM9_RTCK_SEL 0x3: PPSS_RTCK_SEL
9	PPSS_TAP_ENA_SOFT	Enables PPSS ARM7 JTAG (RTCK dependent)
8	A9_TAP_ENA_SOFT	Enables Riva ARM9 JTAG (RTCK dependent)
7	RPM_TAP_ENA_SOFT	Enables RPM ARM7 JTAG (RTCK dependent)
6	RESERVED_2	RESERVED
5	PCIE_TAP_ENA_SOFT	Enables PCIe JTAG
4	ADSP6_TAP_ENA_SOFT	Enables LPASS QDSP6 JTAG
3	APCC_TAP_ENA_SOFT	Enables APCC JTAG
2	QDSS_TAP_ENA_SOFT	Enables QDSS JTAG
1	ACC_TAP_ENA_SOFT	Enables ACC JTAG
0	MSM_TAP_ENA_SOFT	Enables APQ JTAG (Default set to 1)

0x00802004 TLMM_AUX_JTAG

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The TLMM_AUX_JTAG register controls the enables for which processors are allowed to trigger other processors.

TLMM_AUX_JTAG

Bits	Name	Description
31:4	RESERVED	Reserved Bits
3:0	AUX_JTAG_SEL	Selects which TAP controller is connected to the auxiliary JTAG TDO pad. 0xF: Reserved_1 0xE: Reserved_2 0xD: Reserved_3 0xC: Reserved_4 0xB: Reserved_5 0xA: Reserved_6 0x9: PPSS 0x8: RIVA 0x7: RPM 0x6: Reserved_7 0x5: PCIE 0x4: AD6 0x3: APCC 0x2: Reserved_8 0x1: ACC 0x0: None

0x00802008 TLMM_ETM_XTRIG_0

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00000000

The TLMM_ETM_XTRIG register controls the enables for which processors are allowed to trigger other processors.

TLMM_ETM_XTRIG_0

Bits	Name	Description
31	GSS1_TO_APC1	Permits the GSS bit 1 to trigger the APC1
30	GSS0_TO_APC1	Permits the GSS bit 0 to trigger the APC1

TLMM_ETM_XTRIG_0 (cont.)

Bits	Name	Description
29	GSS1_TO_APC0	Permits the GSS bit 1 to trigger the APC0
28	GSS0_TO_APC0	Permits the GSS bit 0 to trigger the APC0
27	QDSS_CH3_TO_APC1	Permits the QDSS CH3 to trigger the APC1
26	QDSS_CH2_TO_APC1	Permits the QDSS CH2 to trigger the APC1
25	QDSS_CH1_TO_APC1	Permits the QDSS CH1 to trigger the APC1
24	QDSS_CH0_TO_APC1	Permits the QDSSCH0 to trigger the APC1
23	APC0_TO_APC1	Permits the APC0 to trigger the APC1
22	LA_TO_APC1	Permits the Logic Analyzer to trigger the APC1
21	DAYTONA_FAB_TO_APC1	Permits the Smart Peripheral Subsystem Fabric to trigger the APC1
20	APPS_FAB_TO_APC1	Permits the Apps Fabric to trigger the APC1
19	MMSS_FAB_TO_APC1	Permits the MMSS Fabric to trigger the APC1
18	SYS_FAB_TO_APC1	Permits the System Fabric to trigger the APC1
17	APC3_TO_APC1	Permits the APC3 to trigger the APC1
16	APC2_TO_APC1	Permits the APC2 to trigger the APC1
15	AD6_TO_APC1	Permits the AD6 to trigger the APC1
14	A9_TO_APC1	Permits the ARM9RIVA to trigger the APC1
13	QDSS_CH3_TO_APC0	Permits the QDSS CH3 to trigger the APC0
12	QDSS_CH2_TO_APC0	Permits the QDSS CH2 to trigger the APC0
11	QDSS_CH1_TO_APC0	Permits the QDSS CH1 to trigger the APC0
10	QDSS_CH0_TO_APC0	Permits the QDSSCH0 to trigger the APC0
9	APC1_TO_APC0	Permits the APC1 to trigger the APC0
8	LA_TO_APC0	Permits the Logic Analyzer to trigger the APC0
7	DAYTONA_FAB_TO_APC0	Permits the Smart Peripheral Subsystem Fabric to trigger the APC0
6	APPS_FAB_TO_APC0	Permits the Apps Fabric to trigger the APC0
5	MMSS_FAB_TO_APC0	Permits the MMSS Fabric to trigger the APC0
4	SYS_FAB_TO_APC0	Permits the System Fabric to trigger the APC0
3	APC3_TO_APC0	Permits the APC3 to trigger the APC0
2	APC2_TO_APC0	Permits the APC2 to trigger the APC0
1	AD6_TO_APC0	Permits the AD6 to trigger the APC0
0	A9_TO_APC0	Permits the ARM9 RIVA to trigger the APC0

0x0080200C TLMM_ETM_XTRIG_1

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00

The TLMM_ETM_XTRIG register controls the enables for which processors are allowed to trigger other processors.

TLMM_ETM_XTRIG_1

Bits	Name	Description
31:28	RESERVED	RESERVED
27	GSS1_TO_A9	Permits the GSS bit 1 to trigger the ARM9 RIVA
26	GSS0_TO_A9	Permits the GSS bit 0 to trigger the ARM9 RIVA
25	GSS1_TO_AD6	Permits the GSS bit 1 to trigger the AD6
24	GSS0_TO_AD6	Permits the GSS bit 0 to trigger the AD6
23	QDSS_CH1_TO_A9	Permits the QDSS CH1 to trigger the ARM9 RIVA
22	QDSS_CH0_TO_A9	Permits the QDSSCH0 to trigger the ARM9 RIVA
21	LA_TO_A9	Permits the Logic Analyzer to trigger the ARM9 RIVA
20	DAYTONA_FAB_TO_A9	Permits the Smart Peripheral Subsystem Fabric to trigger the ARM9 RIVA
19	APPS_FAB_TO_A9	Permits the Apps Fabric to trigger the ARM9 RIVA
18	MMSS_FAB_TO_A9	Permits the MMSS Fabric to trigger the ARM9 RIVA
17	SYS_FAB_TO_A9	Permits the System Fabric to trigger the ARM9 RIVA
16	APC3_TO_A9	Permits the APC3 to trigger the ARM9 RIVA
15	APC2_TO_A9	Permits the APC2 to trigger the ARM9 RIVA
14	AD6_TO_A9	Permits the AD6 to trigger the ARM9 RIVA
13	APC1_TO_A9	Permits the APC1 to trigger the ARM9 RIVA
12	APC0_TO_A9	Permits the APC0 to trigger the ARM9 RIVA
11	QDSS_CH1_TO_AD6	Permits the QDSS CH1 to trigger the AD6
10	QDSS_CH0_TO_AD6	Permits the QDSSCH0 to trigger the AD6
9	LA_TO_AD6	Permits the Logic Analyzer to trigger the AD6
8	DAYTONA_FAB_TO_AD6	Permits the Smart Peripheral Subsystem Fabric to trigger the AD6
7	APPS_FAB_TO_AD6	Permits the Apps Fabric to trigger the AD6
6	MMSS_FAB_TO_AD6	Permits the MMSS Fabric to trigger the AD6
5	SYS_FAB_TO_AD6	Permits the System Fabric to trigger the AD6
4	APC3_TO_AD6	Permits the APC3 to trigger the AD6

TLMM_ETM_XTRIG_1 (cont.)

Bits	Name	Description
3	APC2_TO_AD6	Permits the APC2 to trigger the AD6
2	A9_TO_AD6	Permits the ARM9RIVA to trigger the AD6
1	APC1_TO_AD6	Permits the APC1 to trigger the AD6
0	APC0_TO_AD6	Permits the APC0 to trigger the AD6

0x00802010 TLMM_ETM_XTRIG_2

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00000000

The TLMM_ETM_XTRIG register controls the enables for which processors are allowed to trigger other processors.

TLMM_ETM_XTRIG_2

Bits	Name	Description
31:28	RESERVED	RESERVED
27	GSS1_TO_MMSS_FAB_STOP	Permits the GSS bit 1 to trigger the MMSS Fabric Stop
26	GSS0_TO_MMSS_FAB_STOP	Permits the GSS bit 0 to trigger the MMSS Fabric Stop
25	GSS1_TO_MMSS_FAB_START	Permits the GSS bit 1 to trigger the MMSS Fabric Start
24	GSS0_TO_MMSS_FAB_START	Permits the GSS bit 0 to trigger the MMSS Fabric Start
23	QDSS_CH1_TO_MMSS_FAB_STOP	Permits the QDSS CH1 to trigger the MMSS_FAB_STOP
22	QDSS_CH0_TO_MMSS_FAB_STOP	Permits the QDSSCH0 to trigger the MMSS_FAB_STOP
21	LA_TO_MMSS_FAB_STOP	Permits the Logic Analyzer to trigger the MMSS Fabric Stop
20	DAYTONA_FAB_TO_MMSS_FAB_STOP	Permits the Smart Peripheral Subsystem Fabric to trigger the MMSS Fabric Stop
19	APPS_FAB_TO_MMSS_FAB_STOP	Permits the Apps Fabric to trigger the MMSS Fabric Stop
18	SYS_FAB_TO_MMSS_FAB_STOP	Permits the SYS Fabric to trigger the MMSS Fabric Stop
17	APC3_TO_MMSS_FAB_STOP	Permits the APC3 to trigger the MMSS Fabric Stop

TLMM_ETM_XTRIG_2 (cont.)

Bits	Name	Description
16	APC2_TO_MMSS_FAB_STOP	Permits the APC2 to trigger the MMSS Fabric Stop
15	AD6_TO_MMSS_FAB_STOP	Permits the AD6 to trigger the MMSS Fabric Stop
14	A9_TO_MMSS_FAB_STOP	Permits the ARM9 RIVA to trigger the MMSS Fabric Stop
13	APC1_TO_MMSS_FAB_STOP	Permits the APC1 to trigger the MMSS Fabric Stop
12	APC0_TO_MMSS_FAB_STOP	Permits the APC0 to trigger the MMSS Fabric Stop
11	QDSS_CH1_TO_MMSS_FAB_START	Permits the QDSS CH1 to trigger the MMSS_FAB_START
10	QDSS_CH0_TO_MMSS_FAB_START	Permits the QDSSCH0 to trigger the MMSS_FAB_START
9	LA_TO_MMSS_FAB_START	Permits the Logic Analyzer to trigger the MMSS Fabric Start
8	DAYTONA_FAB_TO_MMSS_FAB_START	Permits the Smart Peripheral Subsystem Fabric to trigger the MMSS Fabric Start
7	APPS_FAB_TO_MMSS_FAB_START	Permits the Apps Fabric to trigger the MMSS Fabric Start
6	SYS_FAB_TO_MMSS_FAB_START	Permits the SYS Fabric to trigger the MMSS Fabric Start
5	APC3_TO_MMSS_FAB_START	Permits the APC3 to trigger the MMSS Fabric Start
4	APC2_TO_MMSS_FAB_START	Permits the APC2 to trigger the MMSS Fabric Start
3	AD6_TO_MMSS_FAB_START	Permits the AD6 to trigger the MMSS Fabric Start
2	A9_TO_MMSS_FAB_START	Permits the ARM9 RIVA to trigger the MMSS Fabric Start
1	APC1_TO_MMSS_FAB_START	Permits the APC1 to trigger the MMSS Fabric Start
0	APC0_TO_MMSS_FAB_START	Permits the APC0 to trigger the MMSS Fabric Start

0x00802014 TLMM_ETM_XTRIG_3

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00000000

The TLMM_ETM_XTRIG register controls the enables for which processors are allowed to trigger other processors.

TLMM_ETM_XTRIG_3

Bits	Name	Description
31:28	RESERVED	RESERVED
27	GSS1_TO_DAYTONA_FAB_STOP	Permits the GSS bit 1 to trigger the Smart Peripheral Subsystem Fabric Stop
26	GSS0_TO_DAYTONA_FAB_STOP	Permits the GSS bit 0 to trigger the Smart Peripheral Subsystem Fabric Stop
25	GSS1_TO_DAYTONA_FAB_START	Permits the GSS bit 1 to trigger the Smart Peripheral Subsystem Fabric Start
24	GSS0_TO_DAYTONA_FAB_START	Permits the GSS bit 0 to trigger the Smart Peripheral Subsystem Fabric Start
23	QDSS_CH1_TO_DAYTONA_FAB_STOP	Permits the QDSS CH1 to trigger the DAYTONA_FAB_STOP
22	QDSS_CH0_TO_DAYTONA_FAB_STOP	Permits the QDSSCH0 to trigger the DAYTONA_FAB_STOP
21	LA_TO_DAYTONA_FAB_STOP	Permits the Logic Analyzer to trigger the Smart Peripheral Subsystem Fabric Stop
20	APPS_FAB_TO_DAYTONA_FAB_STOP	Permits the Apps Fabric to trigger the Smart Peripheral Subsystem Fabric Stop
19	MMSS_FAB_TO_DAYTONA_FAB_STOP	Permits the MMSS Fabric to trigger the Smart Peripheral Subsystem Fabric Stop

10	QDSS_CH0_TO_APPS_FAB_START	Permits the QDSSCH0 to trigger the APPS_FAB_START
9	LA_TO_APPS_FAB_START	Permits the Logic Analyzer to trigger the Apps Fabric Start
8	DAYTONA_FAB_TO_APPS_FAB_START	Permits the Smart Peripheral Subsystem Fabric to trigger the Apps Fabric Start
7	MMSS_FAB_TO_APPS_FAB_START	Permits the MMSS Fabric to trigger the Apps Fabric Start
6	SYS_FAB_TO_APPS_FAB_START	Permits the SYS Fabric to trigger the Apps Fabric Start
5	APC3_TO_APPS_FAB_START	Permits the APC3 to trigger the Apps Fabric Start
4	APC2_TO_APPS_FAB_START	Permits the APC2 to trigger the Apps Fabric Start
3	AD6_TO_APPS_FAB_START	Permits the AD6 to trigger the Apps Fabric Start
2	A9_TO_APPS_FAB_START	Permits the ARM9 RIVA to trigger the Apps Fabric Start
1	APC1_TO_APPS_FAB_START	Permits the APC1 to trigger the Apps Fabric Start
0	APC0_TO_APPS_FAB_START	Permits the APC0 to trigger the Apps Fabric Start

0x00802024 TLMM_ETM_XTRIG_7

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00000000

The TLMM_ETM_XTRIG register controls the enables for which processors are allowed to trigger other processors.

TLMM_ETM_XTRIG_7

Bits	Name	Description
31:28	RESERVED	RESERVED
27	GSS1_TO_QDSS_CH3	Permits the GSS bit 1 to trigger the QDSS CH3
26	GSS0_TO_QDSS_CH3	Permits the GSS bit 0 to trigger the QDSS CH3
25	APC3_TO_QDSS_CH3	Permits the APC3 to trigger the QDSS CH3
24	APC2_TO_QDSS_CH3	Permits the APC2 to trigger the QDSS CH3
23	GSS1_TO_QDSS_CH2	Permits the GSS bit 1 to trigger the QDSS CH2
22	GSS0_TO_QDSS_CH2	Permits the GSS bit 0 to trigger the QDSS CH2
21	APC3_TO_QDSS_CH2	Permits the APC3 to trigger the QDSS CH2
20	APC2_TO_QDSS_CH2	Permits the APC2 to trigger the QDSS CH2
19	GSS1_TO_QDSS_CH1	Permits the GSS bit 1 to trigger the QDSS CH1
18	GSS0_TO_QDSS_CH1	Permits the GSS bit 0 to trigger the QDSS CH1
17	APC3_TO_QDSS_CH1	Permits the APC3 to trigger the QDSS CH1
16	APC2_TO_QDSS_CH1	Permits the APC2 to trigger the QDSS CH1
15	GSS1_TO_QDSS_CH0	Permits the GSS bit 1 to trigger the QDSS CH0
14	GSS0_TO_QDSS_CH0	Permits the GSS bit 0 to trigger the QDSS CH0
13	APC3_TO_QDSS_CH0	Permits the APC3 to trigger the QDSS CH0
12	APC2_TO_QDSS_CH0	Permits the APC2 to trigger the QDSS CH0
11	LA_TO_QDSS_CH3	Permits the Logic Analyzer to trigger the QDSS CH3
10	APC1_TO_QDSS_CH3	Permits the APC1 to trigger the QDSS CH3
9	APC0_TO_QDSS_CH3	Permits the APC0 to trigger the QDSS CH3
8	LA_TO_QDSS_CH2	Permits the Logic Analyzer to trigger the QDSS CH2
7	APC1_TO_QDSS_CH2	Permits the APC1 to trigger the QDSS CH2
6	APC0_TO_QDSS_CH2	Permits the APC0 to trigger the QDSS CH2
5	LA_TO_QDSS_CH1	Permits the Logic Analyzer to trigger the QDSS CH1
4	APC1_TO_QDSS_CH1	Permits the APC1 to trigger the QDSS CH1

TLMM_ETM_XTRIG_7 (cont.)

Bits	Name	Description
3	APC0_TO_QDSS_CH1	Permits the APC0 to trigger the QDSS CH1
2	LA_TO_QDSS_CH0	Permits the Logic Analyzer to trigger the QDSS CH0
1	APC1_TO_QDSS_CH0	Permits the APC1 to trigger the QDSS CH0
0	APC0_TO_QDSS_CH0	Permits the APC0 to trigger the QDSS CH0

0x00802044 TLMM_ETM_XTRIG_8

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00000000

The TLMM_ETM_XTRIG register controls the enables for which processors are allowed to trigger other processors.

TLMM_ETM_XTRIG_8

Bits	Name	Description
31:30	RESERVED	RESERVED
29	QDSS_CH3_TO_GSS1	Permits the QDSS CH3 to trigger the GSS bit 1
28	QDSS_CH2_TO_GSS1	Permits the QDSS CH2 to trigger the GSS bit 1
27	QDSS_CH1_TO_GSS1	Permits the QDSS CH1 to trigger the GSS bit 1
26	QDSS_CH0_TO_GSS1	Permits the QDSSCH0 to trigger the GSS bit 1
25	LA_TO_GSS1	Permits the Logic Analyzer to trigger the GSS bit 1
24	DAYTONA_FAB_TO_GSS1	Permits the Smart Peripheral Subsystem Fabric to trigger the GSS bit 1
23	APPS_FAB_TO_GSS1	Permits the Apps Fabric to trigger the GSS bit 1
22	MMSS_FAB_TO_GSS1	Permits the MMSS Fabric to trigger the GSS bit 1
21	SYS_FAB_TO_GSS1	Permits the SYS Fabric to trigger the GSS bit 1
20	APC3_TO_GSS1	Permits the APC3 to trigger the GSS bit 1
19	APC2_TO_GSS1	Permits the APC2 to trigger the GSS bit 1
18	AD6_TO_GSS1	Permits the AD6 to trigger the GSS bit 1
17	A9_TO_GSS1	Permits the ARM9 RIVA to trigger the GSS bit 1
16	APC1_TO_GSS1	Permits the APC1 to trigger the GSS bit 1
15	APC0_TO_GSS1	Permits the APC0 to trigger the GSS bit 1
14	QDSS_CH3_TO_GSS0	Permits the QDSS CH3 to trigger the GSS bit 0

TLMM_ETM_XTRIG_8 (cont.)

Bits	Name	Description
13	QDSS_CH2_TO_GSS0	Permits the QDSS CH2 to trigger the GSS bit 0
12	QDSS_CH1_TO_GSS0	Permits the QDSS CH1 to trigger the GSS bit 0
11	QDSS_CH0_TO_GSS0	Permits the QDSSCH0 to trigger the GSS bit 0
10	LA_TO_GSS0	Permits the Logic Analyzer to trigger the GSS bit 0

8	APPS_FAB_TO_GSS0	Permits the Apps Fabric to trigger the GSS bit 0
7	MMSS_FAB_TO_GSS0	Permits the MMSS Fabric to trigger the GSS bit 0
6	SYS_FAB_TO_GSS0	Permits the SYS Fabric to trigger the GSS bit 0
5	APC3_TO_GSS0	Permits the APC3 to trigger the GSS bit 0
4	APC2_TO_GSS0	Permits the APC2 to trigger the GSS bit 0
3	AD6_TO_GSS0	Permits the AD6 to trigger the GSS bit 0
2	A9_TO_GSS0	Permits the ARM9 RIVA to trigger the GSS bit 0
1	APC1_TO_GSS0	Permits the APC1 to trigger the GSS bit 0
0	APC0_TO_GSS0	Permits the APC0 to trigger the GSS bit 0

0x00802028 TLMM_DBG_HALT_XTRIG_PERM_0

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00

The TLMM_DBG_HALT_XTRIG_PERM register controls the enables for which processors are allowed to trigger other processors.

TLMM_DBG_HALT_XTRIG_PERM_0

Bits	Name	Description
31	QDMAP_TO_A9	Permits the QDMAP to trigger the ARM9 RIVA
30	APC3_TO_A9	Permits the APC3 to trigger the ARM9 RIVA
29	APC2_TO_A9	Permits the APC2 to trigger the ARM9 RIVA
28	AD6_TO_A9	Permits the AD6 to trigger the ARM9 RIVA
27	PPSS_TO_A9	Permits the PPSS to trigger the ARM9 RIVA
26	RPM_TO_A9	Permits the RPM to trigger the ARM9 RIVA
25	APC1_TO_A9	Permits the APC1 to trigger the ARM9 RIVA

TLMM_DBG_HALT_XTRIG_PERM_0 (cont.)

Bits	Name	Description
24	APC0_TO_A9	Permits the APC0 to trigger the ARM9 RIVA
23	QDMAP_TO_RPM	Permits the QDMAP to trigger the RPM
22	APC3_TO_RPM	Permits the APC3 to trigger the RPM
21	APC2_TO_RPM	Permits the APC2 to trigger the RPM
20	AD6_TO_RPM	Permits the AD6 to trigger the RPM
19	PPSS_TO_RPM	Permits the PPSS to trigger the RPM
18	A9_TO_RPM	Permits the ARM9 RIVA to trigger the RPM
17	APC1_TO_RPM	Permits the APC1 to trigger the RPM
16	APC0_TO_RPM	Permits the APC0 to trigger the RPM
15	QDMAP_TO_APC1	Permits the QDMAP to trigger the APC1
14	APC3_TO_APC1	Permits the APC3 to trigger the APC1
13	APC2_TO_APC1	Permits the APC2 to trigger the APC1
12	AD6_TO_APC1	Permits the AD6 to trigger the APC1
11	PPSS_TO_APC1	Permits the PPSS to trigger the APC1
10	A9_TO_APC1	Permits the ARM9 RIVA to trigger the APC1
9	RPM_TO_APC1	Permits the RPM to trigger the APC1
8	APC0_TO_APC1	Permits the APC0 to trigger the APC1
7	QDMAP_TO_APC0	Permits the QDMAP to trigger the APC0
6	APC3_TO_APC0	Permits the APC3 to trigger the APC0
5	APC2_TO_APC0	Permits the APC2 to trigger the APC0
4	AD6_TO_APC0	Permits the AD6 to trigger the APC0
3	PPSS_TO_APC0	Permits the PPSS to trigger the APC0
2	A9_TO_APC0	Permits the ARM9 RIVA to trigger the APC0
1	RPM_TO_APC0	Permits the RPM to trigger the APC0
0	APC1_TO_APC0	Permits the APC1 to trigger the APC0

0x0080202C TLMM_DBG_HALT_XTRIG_PERM_1

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00

Table 3-4 The TLMM_DBG_HALT_XTRIG_PERM register controls the enables for which processors are allowed to trigger other processors.

TLMM_DBG_HALT_XTRIG_PERM_1

Bits	Name	Description
31	QDMAP_TO_APC3	Permits the QDMAP to trigger the APC3
30	APC2_TO_APC3	Permits the APC2 to trigger the APC3
29	AD6_TO_APC3	Permits the AD6 to trigger the APC3
28	PPSS_TO_APC3	Permits the PPSS to trigger the APC3
27	A9_TO_APC3	Permits the ARM9 RIVA to trigger the APC3
26	RPM_TO_APC3	Permits the RPM to trigger the APC3
25	APC1_TO_APC3	Permits the APC1 to trigger the APC3
24	APC0_TO_APC3	Permits the APC0 to trigger the APC3
23	QDMAP_TO_APC2	Permits the QDMAP to trigger the APC2
22	APC3_TO_APC2	Permits the APC3 to trigger the APC2
21	AD6_TO_APC2	Permits the AD6 to trigger the APC2
20	PPSS_TO_APC2	Permits the PPSS to trigger the APC2
19	A9_TO_APC2	Permits the ARM9 RIVA to trigger the APC2
18	RPM_TO_APC2	Permits the RPM to trigger the APC2
17	APC1_TO_APC2	Permits the APC1 to trigger the APC2
16	APC0_TO_APC2	Permits the APC0 to trigger the APC2
15	QDMAP_TO_PPSS	Permits the QDMAP to trigger the PPSS
14	APC3_TO_PPSS	Permits the APC3 to trigger the PPSS
13	APC2_TO_PPSS	Permits the APC2 to trigger the PPSS
12	AD6_TO_PPSS	Permits the AD6 to trigger the PPSS
11	A9_TO_PPSS	Permits the ARM9 RIVA to trigger the PPSS
10	RPM_TO_PPSS	Permits the RPM to trigger the PPSS
9	APC1_TO_PPSS	Permits the APC1 to trigger the PPSS
8	APC0_TO_PPSS	Permits the APC0 to trigger the PPSS
7	APC3_TO_AD6	Permits the APC3 to trigger the AD6
6	APC2_TO_AD6	Permits the APC2 to trigger the AD6
5	QDMAP_TO_AD6	Permits the QDMAP to trigger the AD6
4	A9_TO_AD6	Permits the ARM9 RIVA to trigger the AD6
3	PPSS_TO_AD6	Permits the PPSS to trigger the AD6
2	RPM_TO_AD6	Permits the RPM to trigger the AD6
1	APC1_TO_AD6	Permits the APC1 to trigger the AD6

TLMM_DBG_HALT_XTRIG_PERM_1 (cont.)

Bits	Name	Description
0	APC0_TO_AD6	Permits the APC0 to trigger the AD6

0x00802050 TLMM_DBG_HALT_XTRIG_PERM_2

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000000

The TLMM_DBG_HALT_XTRIG_PERM register controls the enables for which processors are allowed to trigger other processors.

TLMM_DBG_HALT_XTRIG_PERM_2

Bits	Name	Description
31:17	RESERVED	RESERVED
16	GSS_TO_APC3	Permits the GSS to trigger the APC3
15	GSS_TO_APC2	Permits the GSS to trigger the APC2
14	GSS_TO_AD6	Permits the GSS to trigger the AD6
13	GSS_TO_A9	Permits the GSS to trigger the ARM9 RIVA
12	GSS_TO_PPSS	Permits the GSS to trigger the PPSS
11	GSS_TO_RPM	Permits the GSS to trigger the RPM
10	GSS_TO_APC1	Permits the GSS to trigger the APC1
9	GSS_TO_APC0	Permits the GSS to trigger the APC0
8	APC3_TO_GSS	Permits the APC3 to trigger the GSS
7	APC2_TO_GSS	Permits the APC2 to trigger the GSS
6	QDMAP_TO_GSS	Permits the QDMAP to trigger the GSS
5	AD6_TO_GSS	Permits the AD6 to trigger the GSS
4	A9_TO_GSS	Permits the ARM9 RIVA to trigger the GSS
3	PPSS_TO_GSS	Permits the PPSS to trigger the GSS
2	RPM_TO_GSS	Permits the RPM to trigger the GSS
1	APC1_TO_GSS	Permits the APC1 to trigger the GSS
0	APC0_TO_GSS	Permits the APC0 to trigger the GSS

0x00802030 TLMM_DBG_RESUME_XTRIG_PERM_0

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00

The TLMM_DBG_RESUME_XTRIG_PERM register controls the enables for which processors are allowed to trigger other processors.

TLMM_DBG_RESUME_XTRIG_PERM_0

Bits	Name	Description
31:27	RESERVED	Reserved Bits
26	GSS_TO_AD6	Permits the GSS to trigger the AD6
25	GSS_TO_APC1	Permits the GSS to trigger the APC1
24	GSS_TO_APC0	Permits the ARM9 RIVA to trigger the APC0
23	APC3_TO_AD6	Permits the APC3 to trigger the AD6
22	APC2_TO_AD6	Permits the APC2 to trigger the AD6
21	QDMAP_TO_AD6	Permits the QDMAP to trigger the AD6
20	A9_TO_AD6	Permits the ARM9 RIVA to trigger the AD6
19	PPSS_TO_AD6	Permits the PPSS to trigger the AD6
18	RPM_TO_AD6	Permits the RPM to trigger the AD6
17	APC1_TO_AD6	Permits the APC1 to trigger the AD6
16	APC0_TO_AD6	Permits the APC0 to trigger the AD6
15	QDMAP_TO_APC1	Permits the QDMAP to trigger the APC1
14	APC3_TO_APC1	Permits the APC3 to trigger the APC1
13	APC2_TO_APC1	Permits the APC2 to trigger the APC1
12	AD6_TO_APC1	Permits the AD6 to trigger the APC1
11	PPSS_TO_APC1	Permits the PPSS to trigger the APC1
10	A9_TO_APC1	Permits the ARM9 RIVA to trigger the APC1
9	RPM_TO_APC1	Permits the RPM to trigger the APC1
8	APC0_TO_APC1	Permits the APC0 to trigger the APC1
7	QDMAP_TO_APC0	Permits the QDMAP to trigger the APC0
6	APC3_TO_APC0	Permits the APC3 to trigger the APC0
5	APC2_TO_APC0	Permits the APC2 to trigger the APC0
4	AD6_TO_APC0	Permits the AD6 to trigger the APC0
3	PPSS_TO_APC0	Permits the PPSS to trigger the APC0

TLMM_DBG_RESUME_XTRIG_PERM_0 (cont.)

Bits	Name	Description
2	A9_TO_APC0	Permits the ARM9 RIVA to trigger the APC0
1	RPM_TO_APC0	Permits the RPM to trigger the APC0
0	APC1_TO_APC0	Permits the APC1 to trigger the APC0

0x00802034 TLMM_DBG_RESUME_XTRIG_PERM_1

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00

The TLMM_DBG_RESUME_XTRIG_PERM register controls the enables for which processors are allowed to trigger other processors.

TLMM_DBG_RESUME_XTRIG_PERM_1

Bits	Name	Description
31:27	RESERVED	Reserved Bits
26	GSS_TO_APC3	Permits the GSS to trigger the APC3
25	GSS_TO_APC2	Permits the GSS to trigger the APC2
24	QDMAP_TO_GSS	Permits the QDMAP to trigger the GSS
23	APC3_TO_GSS	Permits the APC3 to trigger the GSS
22	APC2_TO_GSS	Permits the APC2 to trigger the GSS
21	AD6_TO_GSS	Permits the AD6 to trigger the GSS
20	PPSS_TO_GSS	Permits the PPSS to trigger the GSS
19	A9_TO_GSS	Permits the ARM9 RIVA to trigger the GSS
18	RPM_TO_GSS	Permits the RPM to trigger the GSS
17	APC1_TO_GSS	Permits the APC1 to trigger the GSS
16	APC0_TO_GSS	Permits the APC0 to trigger the GSS
15	QDMAP_TO_APC3	Permits the QDMAP to trigger the APC3
14	APC2_TO_APC3	Permits the APC3 to trigger the APC3
13	AD6_TO_APC3	Permits the AD6 to trigger the APC3
12	PPSS_TO_APC3	Permits the PPSS to trigger the APC3
11	A9_TO_APC3	Permits the ARM9 RIVA to trigger the APC3
10	RPM_TO_APC3	Permits the RPM to trigger the APC3
9	APC1_TO_APC3	Permits the APC1 to trigger the APC3

TLMM_DBG_RESUME_XTRIG_PERM_1 (cont.)

Bits	Name	Description
8	APC0_TO_APC3	Permits the APC0 to trigger the APC3
7	QDMAP_TO_APC2	Permits the QDMAP to trigger the APC2
6	APC3_TO_APC2	Permits the APC3 to trigger the APC2
5	AD6_TO_APC2	Permits the AD6 to trigger the APC2
4	PPSS_TO_APC2	Permits the PPSS to trigger the APC2
3	A9_TO_APC2	Permits the ARM9 RIVA to trigger the APC2
2	RPM_TO_APC2	Permits the RPM to trigger the APC2
1	APC1_TO_APC2	Permits the APC1 to trigger the APC2
0	APC0_TO_APC2	Permits the APC0 to trigger the APC2

0x00802038 TLMM_DBG_STATUS

Type: Read
Clock: CC_TLMM_HCLK
Reset State: 0x0

The TLMM_DBG_STATUS register reflects the debug state of the RPM ARM7, PPSS ARM7, Audio QDSP6, Riva ARM9 and the APCC.

TLMM_DBG_STATUS

Bits	Name	Description
31:18	RESERVED	Reserved Bits
17	GSS_DBG_ACK	GSS debug trigger signal gss_dbg_ack
16	GSS_DBG_TRIGGER	GSS debug trigger signal gss_dbg_trigger
15	APC3_DBG_ACK	APC3 debug trigger signal apc3_dbg_ack
14	APC3_DBG_DONE	APC3 debug trigger signal apc3_dbg_done
13	APC3_DBG_TRIGGER	APC3 debug trigger signal apc3_dbg_trigger
12	APC2_DBG_ACK	APC2 debug trigger signal apc2_dbg_ack
11	APC2_DBG_DONE	APC2 debug trigger signal apc2_dbg_done
10	APC2_DBG_TRIGGER	APC2 debug trigger signal apc2_dbg_trigger
9	AD6_MCD_BREAKEVENT	Audio DSP Debug Ack signal ad6_mcd_breakevent
8	A9_DBGACK	ARM9 Debug Ack signal a9_dbgack
7	PPSS_JTAG_DBGACK	PPSS Debug Ack signal ppss_jtag_dbgack
6	RPM_DBG_ACK	RPM Debug Ack signal rpm_dbg_ack

TLMM_DBG_STATUS (cont.)

Bits	Name	Description
5	APC1_DBG_ACK	APC1 debug trigger signal apc1_dbg_ack
4	APC1_DBG_DONE	APC1 debug trigger signal apc1_dbg_done
3	APC1_DBG_TRIGGER	APC1 debug trigger signal apc1_dbg_trigger
2	APC0_DBG_ACK	APC0 debug trigger signal apc0_dbg_ack
1	APC0_DBG_DONE	APC0 debug trigger signal apc0_dbg_done
0	APC0_DBG_TRIGGER	APC0 debug trigger signal apc0_dbg_trigger

0x0080203C TLMM_ETM_MODE

Type: Read/Write
Clock: CC_TLMM_CLK
Reset State: 0x0000

The TLMM_ETM_MODE register controls the enables for which processors are allowed to trigger other processors.

TLMM_ETM_MODE

Bits	Name	Description
31:2	RESERVED	Reserved Bits
1	APC_OVER_JTAG	Configures APC ETM Mode over JTAG pins. This muxes three tracedata onto the TDI, TDO, and RTCK pins. 0x1: Enable 0x0: Disable
0	APC_OVER_SDC3	Configures 6-pin (4-bit) APC ETM Mode over SDC3 pins. 0x1: Enable 0x0: Disable

0x00802040 TLMM_DBG_BUS_OUT_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

The TLMM_DBG_BUS_OUT_SEL register selects between 4 different byte shifted versions of the dbg_bus_out. This allows critical bits to be moved to different GPIOs if concurrency issues occur. The output of this mux feeds the GPIO muxing where each bit can be enabled as an alternate function.

.

TLMM_DBG_BUS_OUT_SEL

Bits	Name	Description
31:2	RESERVED	Reserved Bits
1:0	COPY_SEL	Select which byte shifted copy to output to the GPIO muxing: 0x0: COPY_A 0x1: COPY_B 0x2: COPY_C 0x3: COPY_D

0x00802048 CHIP_MODE

Type: Read
Clock: CC_TLMM_HCLK
Reset State: pin value

The APQ MODE input pad values are reflected in this register.

CHIP_MODE

Bits	Name	Description
31:2	RESERVED	Reserved field.
1	MODE1_PIN	Returns the current value of MODE[1] pin
0	MODE0_PIN	Returns the current value of MODE[0] pin

0x0080204C TLMM_SPARE

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00

The TLMM_SPARE register is a miscellaneous register for spare register bits.

TLMM_SPARE

Bits	Name	Description
31:8	RESERVED	By convention, always write zero. Reads always return zero.
7:0	MISC	

0x00802054 HW_REVISION_NUMBER

Type: Read
Clock: CC_TLMM_HCLK
Reset State: Hardcoded and PINs

The HW_REVISION_NUMBER register contains the hardware revision number for the APQ. This information is identical to that stored in JTAG ID, which contains chip revision chip ID (including 'variant'), manufacturing ID, and a start bit.

HW_REVISION_NUMBER

Bits	Name	Description
31:28	VERSION_ID	0x0: first tape-out
27:12	PARTNUM	Future variants can be created through EFUSE blowing.
11:1	QUALCOMM_MFG_ID	00001110000
0	START_BIT	Always set (1)

0x00802064 RIVA_COEXIST_GPIO_PORT_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

The GPIO_PORT_SEL register is used to control the Muxing for multiple copies of an interface on the pins.

RIVA_COEXIST_GPIO_PORT_SEL

Bits	Name	Description
31:2	RESERVED	Reserved field.
1:0	RIVA_COEXIST_SEL	Select between copy A and copy B and copy C of the interface: The signals that are part of the RIVA Coexistence Interface are: WNC_PRIORITY LTE_FRAME_SYNC LTE_ACTIVE 0x0: RIVA_COEXIST_A 0x1: RIVA_COEXIST_B 0x2: RIVA_COEXIST_C 0x3: RESERVED

0x00802068 GP_PDM0_GPIO_PORT_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

The GPIO_PORT_SEL register is used to control the Muxing for multiple copies of an interface on the pins.

GP_PDM0_GPIO_PORT_SEL

Bits	Name	Description
31:1	RESERVED	Reserved field.
0	GP_PDM0_SEL	Select between copy A and copy B of the interface: 0x0: GP_PDM0_A 0x1: GP_PDM0_B

0x0080206C GP_PDM1_GPIO_PORT_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

The GPIO_PORT_SEL register is used to control the Muxing for multiple copies of an interface on the pins.

GP_PDM1_GPIO_PORT_SEL

Bits	Name	Description
31:1	RESERVED	Reserved field.
0	GP_PDM1_SEL	Select between copy A and copy B of the interface: 0x0: GP_PDM1_A 0x1: GP_PDM1_B

0x00802070 GP_PDM2_GPIO_PORT_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

The GPIO_PORT_SEL register is used to control the Muxing for multiple copies of an interface on the pins.

GP_PDM2_GPIO_PORT_SEL

Bits	Name	Description
31:1	RESERVED	Reserved field.
0	GP_PDM2_SEL	Select between copy A and copy B of the interface: 0x0: GP_PDM2_A 0x1: GP_PDM2_B

0x00802074 SLIMBUS1_GPIO_PORT_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

The GPIO_PORT_SEL register is used to control the Muxing for multiple copies of an interface on the pins.

For slimbus1, this register serves two functions.

The first is the combining of the multiple copies of the slimbus1_clk and slimbus1_data input paths. Specifically, this register determines whether slimbus1_clk_a_in or slimbus1_clk_b_in is muxed to slimbus1_clk_in. Similarly, slimbus1_data_a_in and slimbus1_data_b_in are muxed to slimbus1_data_in.

The second function of this register is to select which copy of the early slimbus feedback clock is used. As such, the register value also determines whether slimbus1_early_fb_clk_a or slimbus1_early_fb_clk_b is muxed to slimbus1_early_fb_clk. slimbus1_early_fb_clk_a is sourced from slimbus1_clk_out when slimbus1_clk_a is selected as the alternate function for the respective GPIO. Similarly, slimbus1_early_fb_clk_b is sourced from slimbus1_clk_out when slimbus1_clk_b is selected as the alternate function for the respective GPIO. This early tapping of the output clock provides a version of the feedback clock that does not go through the pad.

SLIMBUS1_GPIO_PORT_SEL

Bits	Name	Description
31:1	RESERVED	Reserved field.
0	SLIMBUS1_SEL	Select between copy A and copy B of the interface: 0x0: SLIMBUS1_A 0x1: SLIMBUS1_B

0x0080207C SLIMBUS1_A_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

This register controls the slimbus1_a_sr_ctl_en TLMM output.

Its purpose is to control the clock and data pads for copy A of slimbus1 on GPIO. It is used to enable/disable slew rate control for the slimbus pad. When used for slimbus, slew rate control must be enabled. When used for other purposes, slew rate control should be disabled. When disabled, the pad behaves in a similar manner to a regular GPIO pad. The default value is slew rate control disabled.

SLIMBUS1_A_CTL

Bits	Name	Description
31:1	RESERVED	Reserved field.
0	SR_CTL_EN	Select whether slew rate control is enabled/disabled: 0x0: Disable 0x1: Enable

0x00802080 SLIMBUS1_B_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

This register controls the slimbus1_b_sr_ctl_en TLMM output.

Its purpose is to control the clock and data pads for copy B of slimbus1 on GPIO. It is used to enable/disable slew rate control for the slimbus pad. When used for slimbus, slew rate control must be enabled. When used for other purposes, slew rate control should be disabled. When disabled, the pad behaves in a similar manner to a regular GPIO pad. The default value is slew rate control disabled.

SLIMBUS1_B_CTL

Bits	Name	Description
31:1	RESERVED	Reserved field.
0	SR_CTL_EN	Select whether slew rate control is enabled/disabled: 0x0: Disable 0x1: Enable

0x00802084 RGB_PAD_EN

Type: Read/Write
Clock: CC_TLMM_CLK
Reset State: 0x00000000

This register provides an enable to the LVDS and RGB pads.

RGB_PAD_EN

Bits	Name	Description
31:1	RESERVED	Reserved
0	RGB_PAD_EN	This bit is used to provide a RGB enable to the LVDS and RGB pads. 0x1: ENABLE 0x0: DISABLE

0x00802088 USB_FS1_GPIO_PORT_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0

The GPIO_PORT_SEL register is used to control the Muxing for multiple copies of an interface on the pins.

USB_FS1_GPIO_PORT_SEL

Bits	Name	Description
31:1	RESERVED	Reserved field.
0	USB_FS1_SEL	Select between copy A and copy B of the interface: 0x0: USB_FS1_A 0x1: USB_FS1_B

Table 3-5 Pull values

Value	Configuration
00	No pull (up or down)
01	Pull down
10	Keep
11	Pull up

Table 3-6 HDrive values

Value	Configuration
000	2 mA
001	4 mA
010	6 mA
011	8 mA
100	10 mA

Table 3-6 HDrive values

Value	Configuration
101	12 mA
110	14 mA
111	16 mA

0x00802090 RESOUT_HDRV_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0001

This registers controls the HDrive value for the resout pin.

RESOUT_HDRV_CTL

Bits	Name	Description
31:3	RESERVED	Reserved.
2:0	RESOUT_N_HDRV	RESOUT_N HDrive Value

0x00802094 JTAG_HDRV_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0xF0DB

This register controls the HDrive value for the JTAG pins.

JTAG_HDRV_CTL

Bits	Name	Description
31:16	RESERVED	RESERVED Bits
15:14	TDI_PULL	TDI Pull Value
13:12	TMS_PULL	TMS Pull Value
11:9	TDI_HDRV	TDI HDrive Value
8:6	TMS_HDRV	TMS HDrive Value
5:3	TDO_HDRV	TDO HDrive Value
2:0	RTCK_HDRV	RTCK HDrive Value

0x0080209C PMIC_HDRV_PULL_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x200

This register controls the HDrive and Pull values for the PMIC interfaces pins.

PMIC_HDRV_PULL_CTL

Bits	Name	Description
31:11	RESERVED	RESERVED Bits
10:9	SSBI_PMIC1_PULL	SSBI PMIC 1 Pull Value
8:6	CXO_EN_HDRV	CXO ENABLE HDrive Value
5:3	SSBI_PMIC_FWD_CLK_HDRV	SSBI PMIC FORWARD CLOCK HDrive Value
2:0	SSBI_PMIC1_HDRV	SSBI PMIC 1 HDrive Value

0x008020A0 SDC1_HDRV_PULL_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0BDB

This register controls the HDrive and Pull values for the SDC1 interface pins.

SDC1_HDRV_PULL_CTL

Bits	Name	Description
31:15	RESERVED	Reserved.
14:13	SDC1_CLK_PULL	SDC1 CLK Pull Value
12:11	SDC1_CMD_PULL	SDC1 CMD Pull Value
10:9	SDC1_DATA_PULL	SDC1 DATA Pull Value
8:6	SDC1_CLK_HDRV	SDC1 CLOCK HDrive Value
5:3	SDC1_CMD_HDRV	SDC1 CMD HDrive Value
2:0	SDC1_DATA_HDRV	SDC1 DATA HDrive Value

0x008020A4 SDC3_HDRV_PULL_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0BDB

This register controls the HDrive and Pull values for the SDC3 interface pins.

SDC3_HDRV_PULL_CTL

Bits	Name	Description
31:16	RESERVED	Reserved.
15:14	SDC3_CLK_PULL	SDC3 CLK Pull Value
13	SDC3_HYS_CTL	Enable/Disable for additional pad hysteresis. 0x0: Disable 0x1: Enable
12:11	SDC3_CMD_PULL	SDC3 CMD Pull Value
10:9	SDC3_DATA_PULL	SDC3 DATA Pull Value
8:6	SDC3_CLK_HDRV	SDC3 CLOCK HDrive Value
5:3	SDC3_CMD_HDRV	SDC3 CMD HDrive Value
2:0	SDC3_DATA_HDRV	SDC3 DATA HDrive Value

0x008020B4 MODE_PULL_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0005

This register controls the Pull values for the Mode Interface pins.

MODE_PULL_CTL

Bits	Name	Description
31:4	RESERVED	Reserved.
3:2	MODE_1_PULL	MODE 1 Pull Value
1:0	MODE_0_PULL	MODE 0 Pull Value

0x008020B8 GSBI4_3D_CAM_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

This register controls the I2C for the GSBI in 3D Camera mode.

GSBI4_3D_CAM_CTL

Bits	Name	Description
31:2	RESERVED	Reserved.
1	ENABLE_LEFT_I2C	Enable/Disable Instructions going to the Left I2C: 0x0: Disable 0x1: Enable
0	ENABLE_RIGHT_I2C	Enable/Disable Instructions going to the Right I2C: 0x0: Disable 0x1: Enable

0x008020BC GSBI7_3D_CAM_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

This register controls the I2C for the GSBI in 3D Camera mode.

GSBI7_3D_CAM_CTL

Bits	Name	Description
31:2	RESERVED	Reserved.
1	ENABLE_LEFT_I2C	Enable/Disable Instructions going to the Left I2C: 0x0: Disable 0x1: Enable
0	ENABLE_RIGHT_I2C	Enable/Disable Instructions going to the Right I2C: 0x0: Disable 0x1: Enable

0x008020C0 HSIC_STROBE_GPIO_PAD_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0002AA10

This register controls the configuration for the GPIO 81 HSIC STROBE pad, which can be configured for either HSIC or GPIO usage.

HSIC_STROBE_GPIO_PAD_CTL

Bits	Name	Description
31:28	RESERVED	Reserved.
27	CORE_CTL_EN	Control muxing between TLMM and HSIC core register control. NCNT, PCNT, and PULL control is muxed. The HSIC core controls are usb2_hsic_dat_keep_en, usb2_hsic_stb_keep_en, usb2_hsic_stb_dat_ncnt, usb2_hsic_stb_dat_pcnt. The resulting post mux pad controls are core_pull_gpio_88, gpio_88_ncnt, gpio_88_pcnt.
26	DDR_MODE	Control gpio_88_ddr_mode TLMM port.
25	LV_MODE	Control gpio_88_lv_mode TLMM port.
24	VM_SHIFT_EN	Control gpio_88_vm_shift_en TLMM port.
23	ODT_EN	Control gpio_88_odt_en TLMM port.
22:21	ODT	Control gpio_88_odt TLMM port.
20:18	DCC	Control gpio_88_dcc TLMM port.
17:16	NRXDEL	Control gpio_88_nrxdel TLMM port.
15:14	PRXDEL	Control gpio_88_prxdel TLMM port.
13:12	NSLEW	Control gpio_88_nslew TLMM port.
11:10	PSLEW	Control gpio_88_pslew TLMM port.
9:5	NCNT	Control gpio_88_ncnt TLMM port.
4:0	PCNT	Control gpio_88_pcnt TLMM port.

0x008020C4 HSIC_DATA_GPIO_PAD_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0002AA10

This register controls the configuration for the GPIO 89 HSIC DATA pad, which can be configured for either HSIC or GPIO usage.

HSIC_DATA_GPIO_PAD_CTL

Bits	Name	Description
31:28	RESERVED	Reserved.

HSIC_DATA_GPIO_PAD_CTL (cont.)

Bits	Name	Description
27	CORE_CTL_EN	Control muxing between TLMM and HSIC core register control. NCNT, PCNT, and PULL control is muxed. The HSIC core controls are usb2_hsic_dat_keep_en, usb2_hsic_stb_keep_en, usb2_hsic_stb_dat_ncnt, usb2_hsic_stb_dat_pcnt. The resulting post mux pad controls are core_pull_gpio_89, gpio_89_ncnt, gpio_89_pcnt.
26	DDR_MODE	Control gpio_89_ddr_mode TLMM port.
25	LV_MODE	Control gpio_89_lv_mode TLMM port.
24	VM_SHIFT_EN	Control gpio_89_vm_shift_en TLMM port.
23	ODT_EN	Control gpio_89_odt_en TLMM port.
22:21	ODT	Control gpio_89_odt TLMM port.
20:18	DCC	Control gpio_89_dcc TLMM port.
17:16	NRXDEL	Control gpio_89_nrxdel TLMM port.
15:14	PRXDEL	Control gpio_89_prxdel TLMM port.
13:12	NSLEW	Control gpio_89_nslew TLMM port.
11:10	PSLEW	Control gpio_89_pslew TLMM port.
9:5	NCNT	Control gpio_89_ncnt TLMM port.
4:0	PCNT	Control gpio_89_pcnt TLMM port.

0x008020C8 HSIC_CAL_PAD_CTL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x00000000

This register controls the configuration for the HSIC CAL pad.

HSIC_CAL_PAD_CTL

Bits	Name	Description
31:4	RESERVED	Reserved.
3	DDR_MODE	Control hsic_cal_ddr_mode TLMM port.
2	LV_MODE	Control hsic_cal_lv_mode TLMM port.
1:0	IMP_SEL	Control hsic_cal_imp_sel TLMM port.

0x008020CC RGB_HDRV_CTL

Type: Read/Write
Clock: CC_TLMM_CLK
Reset State: 0x00000000

This register controls the HDrive values for the LCD Interface pins.

RGB_HDRV_CTL

Bits	Name	Description
31:15	RESERVED	Reserved
14:12	RGB_CLK_HDRV	RGB CLK HDrive Value
11:9	RGB_DEN_HDRV	RGB DEN HDrive Value
8:6	RGB_VSYNC_HDRV	RGB VSYNC HDrive Value
5:3	RGB_HSYNC_HDRV	RGB HSYNC HDrive Value
2:0	RGB_DATA_HDRV	RGB Data HDrive Value

0x008020D0 GSBI1_UART_I2C_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI1_UART_I2C_SEL register selects which GPIO the GSBI1 UART RX and I2C interfaces are on.

GSBI1_UART_I2C_SEL

Bits	Name	Description
31:2	RESERVED	Reserved
1	GSBI1_I2C_SEL	Select between standard GSBI1 and copy GSBI1 I2C interface on GPIO: 0x0: GSBI1 0x1: GSB1_I2C_RX
0	GSBI1_UART_SEL	Select between standard GSBI1 and copy GSBI1 UART RX interface on GPIO: 0x0: GSBI1 0x1: GSBI1_UART_RX

0x008020D4 GSBI2_UART_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI2_UART_SEL register selects which GPIO the GSBI2 UART RX interface is on.

GSBI2_UART_SEL

Bits	Name	Description
31:1	RESERVED	Reserved
0	GSBI2_UART_SEL	Select between standard GSBI2 and copy GSBI2 UART RX interface on GPIO: 0x0: GSBI2 0x1: GSBI2_UART_RX

0x008020D8 GSBI3_UART_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI3_UART_SEL register selects which GPIO the GSBI3 4 Wire UART interface is on.

GSBI3_UART_SEL

Bits	Name	Description
31:1	RESERVED	Reserved
0	GSBI3_UART_SEL	Select between standard GSBI3 and copy GSBI3 UART interface on GPIO: 0x0: GSBI3 0x1: GSBI3_UART

0x008020DC GSBI4_UART_I2C_SEL

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GSBI4_UART_I2C_SEL register selects which GPIO the GSBI4 2 Wire UART and I2C interfaces are on.

GSBI4_UART_I2C_SEL

Bits	Name	Description
31:2	RESERVED	Reserved
1	GSBI4_I2C_SEL	Select between standard GSBI4 and copy GSBI4 I2C interface on GPIO: 0x0: GSBI4 0x1: GSBI4_I2C
0	GSBI4_UART_SEL	Select between standard GSBI4 and copy GSBI4 UART interface on GPIO: 0x0: GSBI4 0x1: GSBI4_UART

0x00802100+ 0x4*n DIR_CONN_INTRn_POLARITY, n=[0..21]

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0001

The Direct Connect Interrupt Polarity registers control the polarity for each Direct Connect Interrupt. The polarity resets to active to high.

DIR_CONN_INTRn_POLARITY

Bits	Name	Description
31:1	RESERVED	Reserved.
0	POLARITY	Controls the Polarity Detection for the Direct Connect Interrupt. Polarity 1 corresponds to active high Polarity 0 corresponds to active low. 0x1: Polarity 1 0x0: Polarity 0

3.2.1.3 GPIO Banked registers

0x00803000 GPIO_OUT_0

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OUT_0 register controls the output values of GPIO[31:0]. This register is designed for BIT BANG or fast configuration of multiple output bits.

GPIO_OUT_0

Bits	Name	Description
31:0	GPIO_OUT_31_0	Output values for GPIO[31:0].

0x00803004 GPIO_OUT_1

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OUT_1 register controls the output values of GPIO[63:32]. This register is designed for BIT BANG or fast configuration of multiple output bits.

GPIO_OUT_1

Bits	Name	Description
31:0	GPIO_OUT_63_32	Output values for GPIO[63:32].

0x00803008 GPIO_OUT_2

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OUT_2 register controls the output values of GPIO[89:64]. This register is designed for BIT BANG or fast configuration of multiple output bits.

GPIO_OUT_2

Bits	Name	Description
25:0	GPIO_OUT_89_64	Output values for GPIO[89:64].

0x00803020 GPIO_OUT_CLR_0

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OUT_CLR_0 register bits can be used to clear (0) the output values of GPIO[31:0]. Once a CLR bit is written to ’1’, the corresponding GPIO output will be cleared to ’0’. The CLR bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple output bits and alleviates the need for a read-modify-write operation.

GPIO_OUT_CLR_0

Bits	Name	Description
31:0	GPIO_OUT_CLR_31_0	Clear bits for GPIO[31:0] output values.

0x00803024 GPIO_OUT_CLR_1

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OUT_CLR_1 register bits can be used to clear (0) the output values of GPIO[63:32]. Once a CLR bit is written to ’1’, the corresponding GPIO output will be cleared to ’0’. The CLR bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple output bits and alleviates the need for a read-modify-write operation.

GPIO_OUT_CLR_1

Bits	Name	Description
31:0	GPIO_OUT_CLR_63_32	Clear bits for GPIO[63:32] output values.

0x00803028 GPIO_OUT_CLR_2

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OUT_CLR_2 register bits can be used to clear (0) the output values of GPIO[89:64]. Once a CLR bit is written to ’1’, the corresponding GPIO output will be cleared to ’0’. The CLR bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple output bits and alleviates the need for a read-modify-write operation.

GPIO_OUT_CLR_2

Bits	Name	Description
25:0	GPIO_OUT_CLR_89_64	Clear bits for GPIO[89:64] output values.

0x00803040 GPIO_OUT_SET_0

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OUT_SET_0 register bits can be used to set (1) the output values of GPIO[31:0]. Once a SET bit is written to ’1’, the corresponding GPIO output will be set to ’1’. The SET bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple output bits and alleviates the need for a read-modify-write operation.

GPIO_OUT_SET_0

Bits	Name	Description
31:0	GPIO_OUT_SET_31_0	Set bits for GPIO[31:0] output values.

0x00803044 GPIO_OUT_SET_1

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OUT_SET_1 register bits can be used to set (1) the output values of GPIO[63:32]. Once a SET bit is written to ’1’, the corresponding GPIO output will be set to ’1’. The SET bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple output bits and alleviates the need for a read-modify-write operation.

GPIO_OUT_SET_1

Bits	Name	Description
31:0	GPIO_OUT_SET_63_32	Set bits for GPIO[63:32] output values.

0x00803048 GPIO_OUT_SET_2

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OUT_SET_2 register bits can be used to set (1) the output values of GPIO[89:64]. Once a SET bit is written to ’1’, the corresponding GPIO output will be set to ’1’. The SET bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple output bits and alleviates the need for a read-modify-write operation.

GPIO_OUT_SET_2

Bits	Name	Description
25:0	GPIO_OUT_SET_89_64	Set bits for GPIO[89:64] output values.

0x00803060 GPIO_IN_0

Type: Read
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_IN_0 register allows the input values for GPIO[31:0] to be read. This register is designed for reading multiple input bits.

GPIO_IN_0

Bits	Name	Description
31:0	GPIO_IN_31_0	GPIO[31:0] input values.

0x00803064 GPIO_IN_1

Type: Read
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_IN_1 register allows the input values for GPIO[63:32] to be read. This register is designed for reading multiple input bits.

GPIO_IN_1

Bits	Name	Description
31:0	GPIO_IN_63_32	GPIO[63:32] input values.

0x00803068 GPIO_IN_2

Type: Read
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_IN_2 register allows the input values for GPIO[89:64] to be read. This register is designed for reading multiple input bits.

GPIO_IN_2

Bits	Name	Description
25:0	GPIO_IN_89_64	GPIO[89:64] input values.

0x00803080 GPIO_OE_0

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OE_0 register controls the output enables of GPIO[31:0]. This register is designed for BIT BANG or fast configuration of multiple output bits.

GPIO_OE_0

Bits	Name	Description
31:0	GPIO_OE_31_0	GPIO[31:0] output enables.

0x00803084 GPIO_OE_1

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OE_1 register controls the output enables of GPIO[63:32]. This register is designed for BIT BANG or fast configuration of multiple output bits.

GPIO_OE_1

Bits	Name	Description
31:0	GPIO_OE_63_32	GPIO[63:32] output enables.

0x00803088 GPIO_OE_2

Type: Read/Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OE_2 register controls the output enables of GPIO[89:64]. This register is designed for BIT BANG or fast configuration of multiple output bits.

GPIO_OE_2

Bits	Name	Description
25:0	GPIO_OE_89_64	GPIO[89:64] output enables.

0x00803100 GPIO_OE_CLR_0

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OE_CLR_0 register bits can be used to clear (0) the output enables of GPIO[31:0]. Once a CLR bit is written to ’1’, the corresponding GPIO OE will be cleared to ’0’. The CLR bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple OE bits and alleviates the need for a read-modify-write operation.

GPIO_OE_CLR_0

Bits	Name	Description
31:0	GPIO_OE_CLR_31_0	Clear bits for GPIO[31:0] output enables.

0x00803104 GPIO_OE_CLR_1

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OE_CLR_1 register bits can be used to clear (0) the output enables of GPIO[63:32]. Once a CLR bit is written to ’1’, the corresponding GPIO OE will be cleared to ’0’. The CLR bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple OE bits and alleviates the need for a read-modify-write operation.

GPIO_OE_CLR_1

Bits	Name	Description
31:0	GPIO_OE_CLR_63_32	Clear bits for GPIO[63:32] output enables.

0x00803108 GPIO_OE_CLR_2

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OE_CLR_2 register bits can be used to clear (0) the output enables of GPIO[89:64]. Once a CLR bit is written to ’1’, the corresponding GPIO OE will be cleared to ’0’. The CLR bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple OE bits and alleviates the need for a read-modify-write operation.

GPIO_OE_CLR_2

Bits	Name	Description
25:0	GPIO_OE_CLR_89_64	Clear bits for GPIO[89:64] output enables.

0x00803120 GPIO_OE_SET_0

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OE_SET_0 register bits can be used to set (1) the output enables of GPIO[31:0]. Once a SET bit is written to ’1’, the corresponding GPIO OE will be set to ’1’. The SET bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple OE bits and alleviates the need for a read-modify-write operation.

GPIO_OE_SET_0

Bits	Name	Description
31:0	GPIO_OE_SET_31_0	Set bits for GPIO[31:0] output enables.

0x00803124 GPIO_OE_SET_1

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OE_SET_1 register bits can be used to set (1) the output enables of GPIO[63:32]. Once a SET bit is written to ’1’, the corresponding GPIO OE will be set to ’1’. The SET bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple OE bits and alleviates the need for a read-modify-write operation.

GPIO_OE_SET_1

Bits	Name	Description
31:0	GPIO_OE_SET_63_32	Set bits for GPIO[63:32] output enables.

0x00803128 GPIO_OE_SET_2

Type: Write
Clock: CC_TLMM_HCLK
Reset State: 0x0000

The GPIO_OE_SET_2 register bits can be used to set (1) the output enables of GPIO[89:64]. Once a SET bit is written to ’1’, the corresponding GPIO OE will be set to ’1’. The SET bit will then automatically return to ’0’ so that it can be used again. This register is designed for BIT BANG or fast configuration of multiple OE bits and alleviates the need for a read-modify-write operation.

GPIO_OE_SET_2

Bits	Name	Description
25:0	GPIO_OE_SET_89_64	Set bits for GPIO[89:64] output enables.

3.3 IMEM Configuration Registers (0x00B00000 SYS_IMEM_BASE)

The following subsections describe the IMEM configuration registers.

0x00B00000 SYS_IMEM_IMEM_CONFIG

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000001

General configuration register for IMEM. This register sets the IMEM accessibility for Graphics and AXI.

Power up value is based on parameters provided

NOTE

a. All banks are 8k x 64 in size.

b. GRP and AXI memory configurations are 64 bits wide.

c. If Graphics interface is not required, set the IMEM_CONFIG_POR parameter to all AXI setting (2'b01). The sharing scheme will then not apply.

SYS_IMEM_IMEM_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1:0	IMEM_CONFIG	(Graphics Interface = 256kbytes) (AXI Interface (and trace) = 256kbytes) (Graphics Interface = 128kbytes) (AXI Interface (and trace) = 128kbytes) Banks 0 and 1 are allocated to Graphics. Banks 2 and 3 are allocated to AXI. (Graphics Interface = 128kbytes) (AXI Interface (and trace) = 128kbytes) Banks 0 and 1 are allocated to AXI. Banks 2 and 3 are allocated to Graphics. SW : RW, HW: R 0x0: All graphics (Dedicated all to Graphics) 0x1: All axi (Dedicated all to AXI) 0x2: 0_1_Graphics_2_3_AXI 0x3: 0_1_AXI_2_3_Graphics

3.3.1 IMEM AXI Trace Configuration registers

0x00B00004 SYS_IMEM_IMEM_AXI_TRACE_CONFIG

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to enable and control the AXI trace to IMEM.

SYS_IMEM_IMEM_AXI_TRACE_CONFIG

Bits	Name	Description
31:2	RESERVED_BITS31_2	
1	AXI_TRACE_ADDR_WRAP_EN	1-Enables AXI trace address to wrap
0	AXI_TRACE_EN	1-Enables AXI trace to IMEM

0x00B00008 SYS_IMEM_IMEM_AXI_TRACE_ADDR_CNTR

Type: Read
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to read the AXI Trace Address counter value.

SYS_IMEM_IMEM_AXI_TRACE_ADDR_CNTR

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:0	AXI_TRACE_ADDR_CNTR	Current AXI Trace address

0x00B0000C SYS_IMEM_IMEM_AXI_TRACE_WRAP_STATUS

Type: Read
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to read the AXI Trace Address wrap status bit.

SYS_IMEM_IMEM_AXI_TRACE_WRAP_STATUS

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	AXI_TRACE_WRAP_STATUS	0x1: AXI trace address wrapped 0x0: AXI trace address not wrapped

0x00B00010 SYS_IMEM_IMEM_AXI_BASE_ADDR_OFFSET

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00002A00

This register is used to set the AXI Base Address offset value in order to relocate the IMEM AXI memory within the space allowed by the interconnect. The POR value of this register is based on the parameter - IMEM_BASE_ADDRESS. In case of MPSS, this is set to 0x5800. This should be set to the upper 16 bits of the Imem base address. Based on the size of the Imem, the relevant bits of this register are used for decoding the address.

SYS_IMEM_IMEM_AXI_BASE_ADDR_OFFSET

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:0	IMEM_AXI_BASE_ADDRESS_OFFSET	IMEM AXI base address offset for decode

3.3.1.1 IMEM Syndrome registers

0x00B00020 SYS_IMEM_IMEM_ERR_ADDRESS_MS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x000000000000

The IMEM_ERR_ADDRESS_MS register contains the upper bits of the address of the request that caused the bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, it will be locked until bit 8 of the ERR_CODE register is written to clear the error.

SYS_IMEM_IMEM_ERR_ADDRESS_MS

Bits	Name	Description
31:16	RESERVED_BITS31_16	

SYS_IMEM_IMEM_ERR_ADDRESS_MS (cont.)

Bits	Name	Description
15:0	ERROR_ADDRESS_31_16	Bits 31:16 of the address of the request that caused the bus error.

0x00B00024 SYS_IMEM_IMEM_ERR_ADDRESS_LS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_ADDRESS_LS register contains the lower bits of the address of the request that caused the AXI GE bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, the register will be locked until bit 8 of the ERR_CODE register is written to clear the error.

SYS_IMEM_IMEM_ERR_ADDRESS_LS

Bits	Name	Description
31:16	RESERVED_BITS31_16	
15:3	ERROR_ADDRESS_15_3	Bits 15:3 of the address of the request that caused the bus error
2:0	RESERVED_BITS2_0	Reserved if not implemented otherwise include with error address.

0x00B00028 SYS_IMEM_IMEM_ERR_APACKET_MS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_APACKET_MS register provides various data about the request that caused the AXI GE bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, it will be locked until bit 8 of the ERR_CODE register is written to clear the error.

SYS_IMEM_IMEM_ERR_APACKET_MS

Bits	Name	Description
31:20	RESERVED_BITS31_20	
19:18	ERROR_ALOCK_1_0	The ALOCK of the request that caused the bus error
17	ERROR_ABURST	The ABURST of the request that caused the bus error
16:12	ERROR_PORTID_4_0	The Port ID of the request that caused the bus error.
11:5	ERROR_ATID_6_0	The Transfer ID of the request that caused the bus error.

SYS_IMEM_IMEM_ERR_APACKET_MS (cont.)

Bits	Name	Description
4	ERROR_AWRITE	The awrite of the request that caused bus error
3:0	ERROR_ALEN	The burst length of the request that caused bus error

0x00B0002C SYS_IMEM_IMEM_ERR_APACKET_LS

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_APACKET_LS register provides various data about the request that caused the AXI GE bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, the register will be locked until bit 8 of the ERR_CODE register is written to clear the error.

SYS_IMEM_IMEM_ERR_APACKET_LS

Bits	Name	Description
31:24	RESERVED_BITS31_24	
23:9	ERROR_AMID_15_0	The master ID of the request that caused the bus error (The higher order bits will be set to 0 for MID width < 7)
8:5	ERROR_ATYPE_3_0	The ATYPE of the request that caused the bus error
4	ERROR_APROTNS	The APROTNS of the request that caused the bus error
3:0	RESERVED_BITS_3_0	

0x00B00030 SYS_IMEM_IMEM_ERR_CODE

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000000

The IMEM_ERR_CODE register provides additional data about the bus error. This register will be updated by hardware upon the detection of an MPU error or address decode error. Once set, the register will be locked until bit 8 of the ERR_CODE register is written to clear the error.

Additionally, each slave or AXI interconnect which is capable of detecting an error is also required to have a single programmable register that can be used to optionally interrupt the ARM9 or Scorpion Processor core. This interrupt mechanism is required since write transfers may be posted on the bus and the AXI transfer may complete prior to the occurrence of the error in the AXI interconnect or slave device. The interrupt from the AXI interconnect and the AXI slave devices will be directed to both the ARM9 and application processor's interrupt controllers. The interrupt output of the slave device shall be driven from bit 3 of the ERR_CODE register above. To clear the interrupt, it will be necessary to clear the ERR_CODE register by writing to bit 8

(ERROR_CLEAR) of the ERR_CODE register. This will clear the ERROR field (bit 3) and also unlock the ERR_ADDRESS, ERR_APACKET, and ERR_CODE registers so that a subsequent error can be recoded in these registers.

SYS_IMEM_IMEM_ERR_CODE

Bits	Name	Description
31:9	RESERVED_BITS31_9	
8	ERROR_CLEAR	Writing a ‘1’ to this bit will clear the bus error status bit.
7:4	RESERVED_BIT7_4	
3	ERROR	Error Status bit to indicate that an error has occurred.
2	RESERVED_BIT2	
1	MPU_ERROR	0x1: memory protection error
0	ADDRESS_DECODE_ERROR	0x1: slave address decode error

0x00B00034 SYS_IMEM_IMEM_ERR_IRQ_MSK

Type: Read/Write
Clock: CORE_CLOCK
Reset State: 0x00000001

This register is used to block interrupt to ARM9 or Scorpion.

SYS_IMEM_IMEM_ERR_IRQ_MSK

Bits	Name	Description
31:1	RESERVED_BITS31_1	
0	PROCESSOR_IRQ_MASK	1 disables bus error interrupt to Processor

0x00B00040 SYS_IMEM_IMEM_CLK_ON_EN

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x00000000

This register is used to enable/disable the clock_on circuitry. If disabled, clock on is always high.

SYS_IMEM_IMEM_CLK_ON_EN

Bits	Name	Description
31:2	RESERVED_BITS31_2	

SYS_IMEM_IMEM_CLK_ON_EN (cont.)

Bits	Name	Description
1	AHB_CLK_ON_EN	1 will enable AHB clock on
0	CLK_ON_EN	1 will enable the timer countdown

0x00B00044 SYS_IMEM_IMEM_CLK_ON_TIME

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x000003FF

This register sets the starting time for a binary countdown in clock cycles.

SYS_IMEM_IMEM_CLK_ON_TIME

Bits	Name	Description
31:10	RESERVED_BITS31_1	
9:0	CLK_ON_TIME_9_0	10 bits to count down from, for a max of 1024

0x00B00048 SYS_IMEM_IMEM_FSCGC_TIMERS

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x000000FF

This register sets the starting time for a binary countdown in clock cycles.

SYS_IMEM_IMEM_FSCGC_TIMERS

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:4	WAKEUP_COUNTER_3_0	4 bit count down, must be 20ns
3:0	TO_SLEEP_COUNTER_3_0	4 bit count down, must be 20ns

0x00B0004C SYS_IMEM_IMEM_FSCGC_CONTROL

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x000000FF

Controls for head switch and periphery within IMEM.

SYS_IMEM_IMEM_FSCGC_CONTROL

Bits	Name	Description
31:12	RESERVED_BITS31_12	
11:8	HALT_CLOCK_11_8	Gates the clock to individual RAMS
7:4	CORE_ON_7_4	RAM Core will remain on if this is 1 (for individual rams)
3:0	PERIF_ON_3_0	RAM Periphery will remain on if this is 1 (for individual rams)

0x00B00050 SYS_IMEM_IMEM_EX_FSCGC_CONTROL

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x0000FFFF

Controls for head switch and perfory outside of IMEM.

SYS_IMEM_IMEM_EX_FSCGC_CONTROL

Bits	Name	Description
31:22	RESERVED_BITS31_24	
23:16	HALT_CLOCK_7_0	Gates the clock to individual RAMS
15:8	CORE_ON_7_0	RAM Core will remain on if this is 1 (for individual rams)
7:0	PERIF_ON_7_0	RAM Periphery will remain on if this is 1 (for individual rams)

0x00B00054 SYS_IMEM_IMEM_RAM_CONFIG

Type: Read/Write
Clock: BUS_CLOCK
Reset State: 0x00000000

This register configures the access to the external RAM interface.

SYS_IMEM_IMEM_RAM_CONFIG

Bits	Name	Description
31:3	RESERVED_BITS31_3	
1:0	EX_RAM_CONFIG_1_0	External ram access configuration: 11: NO external RAM allocated to AXI 0x0: No External RAM allocated to AXI 0x1: 256K of external RAM allocated to AXI 0x2: All external RAM allocated to AXI

3.3.1.2 Internal Memory Misc

0x00B00038 SYS_IMEM_IMEM_MEM_ACC_CFG

Type: Read Only
Clock: CORE_CLOCK
Reset State: 0x00000000

This register is used to configure the acc pins of the RAM for programming the sense amp.

SYS_IMEM_IMEM_MEM_ACC_CFG

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:0	ACC_CFG	

3.3.2 XPU Registers

0x00B01000+ 4*n SYS_IMEM_MPU_PRTn_RACR, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU. These registers include a single bit per VMID granting read access

SYS_IMEM_MPU_PRTn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x00B01400+ 4*n SYS_IMEM_MPU_PRTn_WACR, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU.

SYS_IMEM_MPU_PRTn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x00B01800+4*n SYS_IMEM_MPU_PRTn_START, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition Start Address Register. This register contains the start address of the partition. Only the bit numbers indicated by MPU_IDR[MSb] through MPU_IDR[LSb] are valid and physically exist.

SYS_IMEM_MPU_PRTn_START

Bits	Name	Description
31:25	RESERVED_31_25	Reserved
24:12	ADDR	MPU Partition Start Address
11:0	RESERVED_11_0	Reserved

0x00B01C00+4*n SYS_IMEM_MPU_PRTn_END, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition End Address Register. This register contains the start address of the partition.Only the bit numbers indicated by MPU_IDR[MSB] through MPU_IDR[LSB] are valid and physically exist.

SYS_IMEM_MPU_PRTn_END

Bits	Name	Description
31:25	RESERVED_31_25	Reserved
24:12	ADDR	MPU Partition End Address
11:0	RESERVED_11_0	Reserved

0x00B01F80 SYS_IMEM_MPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Configuration Register: This register includes fields governing various MPU behaviors.

SYS_IMEM_MPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set MPU_ESR. MPU_EAR and MPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set MPU_ESR. MPU_EAR and MPU_ESYNR0 updated with address and syndrome of error.
2	MPUEIE	MPU Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the MPU. Interrupt output is asserted if MPU_CR[MPUEIE] = 1 and any bit is set in MPU_ESR.
1	MPUERE	MPU Error Report Enable. MPUERE = 0 causes the MPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. MPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective MPU port. Errors from either port are terminated by the MPU as RAZ/WI Both client and configuration port errors are recorded in MPU_ESR, independent of the value of MPU_CR[MPUERE]
0	MPUE	MPU Enable. Governs whether MPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures MPU and the MID to VMID mapping tables.

0x00B01F84 SYS_IMEM_MPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the MPU, for both the client port and the configuration port.

SYS_IMEM_MPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x00B01F88 SYS_IMEM_MPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the MPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the MPU's interrupt output (when enabled by MPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the MPU_ESYNRn registers, which are merely the 'syndrome' of an error indicated by MPU_ESR.

SYS_IMEM_MPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) 'lock' upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x00B01F8C SYS_IMEM_MPU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Restore Register. This register is an aliased address for the MPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

SYS_IMEM_MPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) 'lock' upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x00B01F90 SYS_IMEM_MPU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

SYS_IMEM_MPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x00B01F94 SYS_IMEM_MPU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

SYS_IMEM_MPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x00B01FF4 SYS_IMEM_MPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

MPU Revision Register: This register provides major/minor revision codes for the implementation.

SYS_IMEM_MPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x00B01FF8 SYS_IMEM_MPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x180C2C07

MPU ID Register: Read-only register that defines various configuration attributes of the MPU instance.

SYS_IMEM_MPU_IDR

Bits	Name	Description
31:29	RESERVED31_29	Reserved
28:24	MSB	Indicates most significant address bit number used in START/END address comparisons.
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used in START/END address comparisons.
15:14	RESERVED15_12	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only MPU_PRTn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate MPU_PRTn_RACR and MPU_PRTn_WACR registers govern read vs. write access. For single VMID, MPU_PRTn_ACR registers include separate 5-bit read/write vs. read-only ‘owner’ VMID fields

SYS_IMEM_MPU_IDR (cont.)

Bits	Name	Description
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. MPU_PRTn_ACR registers indicate single 5 bit 'owner' VMID field for governing access. MV=1 : indicates multi-VMD type access control. MPU_PRTn_xACR registers include separate bit per VMID (32 bits) for governing access.
9:8	RESERVED9_8	Reserved
7:0	NPRT	Number of partitions. Indicates the number of partitions (minus 1) supported by the MPU. Values range from 0-223 (1-224 partitions)

0x00B01FFC SYS_IMEM_MPU_MPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

MPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the MPU (including the MPU_MPU_ACR itself).

SYS_IMEM_MPU_MPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the MPU's 4KB address region (including the MPU_MPU_ACR itself). For single VMID type MPUs (MPU_IDR[MV] = 0) the MPU_MPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

4 Chip Core Top XPU Registers

4.1 Overview

Table 4-1 chip_core_top_XPUs Bases

Base Name	Parent	Address
LPASS_XPU_MPU_PRTn_RACR	LPASS_XPU_BASE	0x17000000
KPSS_XPU_MPU_PRTn_RACR	KPSS_XPU_BASE	0x17100000
GSS_XPU_MPU_PRTn_RACR	GSS_XPU_BASE	0x17200000
SATA_APU_RGn_ACR	SATA_XPU_CFG_BASE	0x1B300000
CE3_APU_RGn_ACR	CE3_XPU_CFG_BASE	0x17500000

4.2 LPASS XPU Registers (0x17000000 LPASS_XPU_BASE)

This section contains the LPASS XPU registers.

0x17000000+ 4*n LPASS_XPU_MPU_PRTn_RACR, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU. These registers include a single bit per VMID granting read access

LPASS_XPU_MPU_PRTn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x17000400+ 4*n LPASS_XPU_MPU_PRTn_WACR, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU.

LPASS_XPU_MPU_PRTn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x17000800+ 4*n LPASS_XPU_MPU_PRTn_START, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition Start Address Register. This register contains the start address of the partition. Only the bit numbers indicated by MPU_IDR[MSb] through MPU_IDR[LSb] are valid and physically exist.

LPASS_XPU_MPU_PRTn_START

Bits	Name	Description
31:24	RESERVED_31_24	Reserved
23:12	ADDR	MPU Partition Start Address
11:0	RESERVED_11_0	Reserved

0x17000C00+4*n LPASS_XPU_MPU_PRTn_END, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition End Address Register. This register contains the start address of the partition.Only the bit numbers indicated by MPU_IDR[MSB] through MPU_IDR[LSB] are valid and physically exist.

LPASS_XPU_MPU_PRTn_END

Bits	Name	Description
31:24	RESERVED_31_24	Reserved
23:12	ADDR	MPU Partition End Address
11:0	RESERVED_11_0	Reserved

0x17000F80 LPASS_XPU_MPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Configuration Register: This register includes fields governing various MPU behaviors.

LPASS_XPU_MPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved

LPASS_XPU_MPU_CR (cont.)

Bits	Name	Description
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set MPU_ESR. MPU_EAR and MPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set MPU_ESR. MPU_EAR and MPU_ESYNR0 updated with address and syndrome of error.
2	MPUEIE	MPU Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the MPU. Interrupt output is asserted if MPU_CR[MPUEIE] = 1 and any bit is set in MPU_ESR.
1	MPUERE	MPU Error Report Enable. MPUERE = 0 causes the MPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. MPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective MPU port. Errors from either port are terminated by the MPU as RAZ/WI Both client and configuration port errors are recorded in MPU_ESR, independent of the value of MPU_CR[MPUERE]
0	MPUE	MPU Enable. Governs whether MPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures MPU and the MID to VMID mapping tables.

0x17000F84 LPASS_XPU_MPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the MPU, for both the client port and the configuration port. Client port addresses are 32 bits width and configuration port addresses are 12 bits wide (the width of the configuration address port).

LPASS_XPU_MPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x17000F88 LPASS_XPU_MPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the MPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the MPU's interrupt output (when enabled by MPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the MPU_ESYNRn registers, which are merely the "syndrome" of an error indicated by MPU_ESR.

LPASS_XPU_MPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x17000F8C LPASS_XPU_MPU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Restore Register. This register is an aliased address for the MPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

LPASS_XPU_MPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x17000F90 LPASS_XPU_MPU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

LPASS_XPU_MPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x17000F94 LPASS_XPU_MPU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

LPASS_XPU_MPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x17000FF4 LPASS_XPU_MPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

MPU Revision Register: This register provides major/minor revision codes for the implementation.

LPASS_XPU_MPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x17000FF8 LPASS_XPU_MPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x170C2C07

MPU ID Register: Read-only register that defines various configuration attributes of the MPU instance.

LPASS_XPU_MPU_IDR

Bits	Name	Description
31:29	RESERVED31_29	Reserved
28:24	MSB	Indicates most significant address bit number used in START/END address comparisons.
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used in START/END address comparisons.
15:14	RESERVED15_12	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only MPU_PRTn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate MPU_PRTn_RACR and MPU_PRTn_WACR registers govern read vs. write access. For single VMID, MPU_PRTn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields

LPASS_XPU_MPU_IDR (cont.)

Bits	Name	Description
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. MPU_PRTn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMD type access control. MPU_PRTn_xACR registers include separate bit per VMID (32 bits) for governing access.
9	RESERVED9	Reserved
8:0	NPRT	Number of partitions. Indicates the number of partitions (minus 1) supported by the MPU. Values range from 0-223 (1-224 partitions)

0x17000FFC LPASS_XPU_MPU_MPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

MPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the MPU (including the MPU_MPU_ACR itself).

LPASS_XPU_MPU_MPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the MPU's 4KB address region (including the MPU_MPU_ACR itself). For single VMID type MPUs (MPU_IDR[MV] = 0) the MPU_MPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

4.3 KPSS XPU Registers (0x17100000 KPSS_XPU_BASE)

This section contains the KPSS XPU registers.

0x17100000+ 4*n KPSS_XPU_MPU_PRTn_RACR, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU. These registers include a single bit per VMID granting read access

KPSS_XPU_MPU_PRTn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x17100400+ 4*n KPSS_XPU_MPU_PRTn_WACR, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU.

KPSS_XPU_MPU_PRTn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x17100800+ 4*n KPSS_XPU_MPU_PRTn_START, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition Start Address Register. This register contains the start address of the partition. Only the bit numbers indicated by MPU_IDR[MSb] through MPU_IDR[LSb] are valid and physically exist.

KPSS_XPU_MPU_PRTn_START

Bits	Name	Description
31:24	RESERVED_31_24	Reserved
23:12	ADDR	MPU Partition Start Address
11:0	RESERVED_11_0	Reserved

0x17100C00+4*n KPSS_XPU_MPU_PRTn_END, n=[0..7]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition End Address Register. This register contains the start address of the partition.Only the bit numbers indicated by MPU_IDR[MSB] through MPU_IDR[LSB] are valid and physically exist.

KPSS_XPU_MPU_PRTn_END

Bits	Name	Description
31:24	RESERVED_31_24	Reserved
23:12	ADDR	MPU Partition End Address
11:0	RESERVED_11_0	Reserved

0x17100F80 KPSS_XPU_MPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Configuration Register: This register includes fields governing various MPU behaviors.

KPSS_XPU_MPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved

KPSS_XPU_MPU_CR (cont.)

Bits	Name	Description
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresse) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set MPU_ESR. MPU_EAR and MPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set MPU_ESR. MPU_EAR and MPU_ESYNR0 updated with address and syndrome of error.
2	MPUEIE	MPU Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the MPU. Interrupt output is asserted if MPU_CR[MPUEIE] = 1 and any bit is set in MPU_ESR.
1	MPUERE	MPU Error Report Enable. MPUERE = 0 causes the MPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. MPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective MPU port. Errors from either port are terminated by the MPU as RAZ/WI Both client and configuration port errors are recorded in MPU_ESR, independent of the value of MPU_CR[MPUERE]
0	MPUE	MPU Enable. Governs whether MPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures MPU and the MID to VMID mapping tables.

0x17100F84 KPSS_XPU_MPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the MPU, for both the client port and the configuration port. Client port addresses are 32 bits width and configuration port addresses are 12 bits wide (the width of the configuration address port).

KPSS_XPU_MPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x17100F88 KPSS_XPU_MPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the MPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the MPU's interrupt output (when enabled by MPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the MPU_ESYNRn registers, which are merely the "syndrome" of an error indicated by MPU_ESR.

KPSS_XPU_MPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.

0x17100FFC KPSS_XPU_MPU_MPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

MPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the MPU (including the MPU_MPU_ACR itself).

KPSS_XPU_MPU_MPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the MPU's 4KB address region (including the MPU_MPU_ACR itself). For single VMID type MPUs (MPU_IDR[MV] = 0) the MPU_MPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

4.4 GSS XPU Registers (0x17200000 GSS_XPU_BASE)

This section contains the GSS XPU registers.

0x17200000+ 4*n GSS_XPU_MPU_PRTn_RACR, n=[0..19]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU. These registers include a single bit per VMID granting read access

GSS_XPU_MPU_PRTn_RACR

Bits	Name	Description
31:0	RE	Read enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read access to the registers in the associated resource group.

0x17200400+ 4*n GSS_XPU_MPU_PRTn_WACR, n=[0..19]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

These registers exist only for the case when MPU_IDR[MV, PT] = 11, i.e., a multi-VMID, read/write access vs. read-only access permission type MPU.

GSS_XPU_MPU_PRTn_WACR

Bits	Name	Description
31:0	WE	Write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID write access to the registers in the associated resource group.

0x17200800+ 4*n GSS_XPU_MPU_PRTn_START, n=[0..19]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition Start Address Register. This register contains the start address of the partition. Only the bit numbers indicated by MPU_IDR[MSb] through MPU_IDR[LSb] are valid and physically exist.

GSS_XPU_MPU_PRTn_START

Bits	Name	Description
31:29	RESERVED_31_29	Reserved
28:10	ADDR	MPU Partition Start Address
9:0	RESERVED_9_0	Reserved

0x17200C00+4*n GSS_XPU_MPU_PRTn_END, n=[0..19]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Partition End Address Register. This register contains the start address of the partition.Only the bit numbers indicated by MPU_IDR[MSB] through MPU_IDR[LSB] are valid and physically exist.

GSS_XPU_MPU_PRTn_END

Bits	Name	Description
31:29	RESERVED_31_29	Reserved
28:10	ADDR	MPU Partition End Address
9:0	RESERVED_9_0	Reserved

0x17200F80 GSS_XPU_MPU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

MPU Configuration Register: This register includes fields governing various MPU behaviors.

GSS_XPU_MPU_CR

Bits	Name	Description
31:2	RESERVED31_2	Reserved

GSS_XPU_MPU_CR (cont.)

Bits	Name	Description
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set MPU_ESR. MPU_EAR and MPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set MPU_ESR. MPU_EAR and MPU_ESYNR0 updated with address and syndrome of error.
2	MPUEIE	MPU Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the MPU. Interrupt output is asserted if MPU_CR[MPUEIE] = 1 and any bit is set in MPU_ESR.
1	MPUERE	MPU Error Report Enable. MPUERE = 0 causes the MPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master. MPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective MPU port. Errors from either port are terminated by the MPU as RAZ/WI Both client and configuration port errors are recorded in MPU_ESR, independent of the value of MPU_CR[MPUERE]
0	MPUE	MPU Enable. Governs whether MPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures MPU and the MID to VMID mapping tables.

0x17200F84 GSS_XPU_MPU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the MPU, for both the client port and the configuration port. Client port addresses are 32 bits width and configuration port addresses are 12 bits wide (the width of the configuration address port).

GSS_XPU_MPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x17200F88 GSS_XPU_MPU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the MPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the MPU's interrupt output (when enabled by MPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the MPU_ESYNRn registers, which are merely the "syndrome" of an error indicated by MPU_ESR.

GSS_XPU_MPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x17200F8C GSS_XPU_MPU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Restore Register. This register is an aliased address for the MPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

GSS_XPU_MPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while MPU_ESR[CFG, CLIENT] still non-zero. MPU_EAR and MPU_ESYNRn registers (and MPU_ESR itself, except for the MULTI bit) "lock" upon first error, MPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while MPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error associated with a client port request.
0	CFG	Configuration Port Error. Indicates error associated with a configuration port request.

0x17200F90 GSS_XPU_MPU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

GSS_XPU_MPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x17200F94 GSS_XPU_MPU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the MPU, for both the client port and the configuration port.

GSS_XPU_MPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x17200FF4 GSS_XPU_MPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

MPU Revision Register: This register provides major/minor revision codes for the implementation.

GSS_XPU_MPU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x17200FF8 GSS_XPU_MPU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x1C0A2C13

MPU ID Register: Read-only register that defines various configuration attributes of the MPU instance.

GSS_XPU_MPU_IDR

Bits	Name	Description
31:29	RESERVED31_29	Reserved
28:24	MSB	Indicates most significant address bit number used in START/END address comparisons.
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used in START/END address comparisons.
15:14	RESERVED15_12	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only MPU_PRTn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate MPU_PRTn_RACR and MPU_PRTn_WACR registers govern read vs. write access. For single VMID, MPU_PRTn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields

GSS_XPU_MPU_IDR (cont.)

Bits	Name	Description
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. MPU_PRTn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMD type access control. MPU_PRTn_xACR registers include separate bit per VMID (32 bits) for governing access.
9	RESERVED9	Reserved
8:0	NPRT	Number of partitions. Indicates the number of partitions (minus 1) supported by the MPU. Values range from 0-223 (1-224 partitions)

0x17200FFC GSS_XPU_MPU_MPU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

MPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the MPU (including the MPU_MPU_ACR itself).

GSS_XPU_MPU_MPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the MPU's 4KB address region (including the MPU_MPU_ACR itself). For single VMID type MPUs (MPU_IDR[MV] = 0) the MPU_MPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

4.5 SATA XPU Registers (0x1B300000 SATA_XPU_CFG_BASE)

This section contains the SATA XPU registers.

0x1B300000+4*n SATA_APU_RGn_ACR, n=[0..0]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 01, i.e., a single VMID, read/write access vs. read-only access permission type APU. These registers include 2 separate 5 bit "owner" VMID fields

SATA_APU_RGn_ACR

Bits	Name	Description
31:26	RESERVED31_26	Reserved.
25	ROGE	Read-only global enable: Opens up read-only access for this resource group to all VMIDs if: ROGE | (ROE & (VMID = ROVMID)) | APU_APU_ACR[VMID] = 1
24	ROE	Read-only enable. This is a "valid" bit for the ROVMID field.
23:21	RESERVED23_21	Reserved
20:16	ROVMID	Read-only VMID. Specifies "owner" VMID with read-only access to the registers in the associated resource group.
15:10	RESERVED15_10	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | APU_APU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a "valid" bit for the RWVMID field
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies "owner" VMID with full read/write access to the registers in the associated resource group.

0x1B300F80 SATA_APU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

APU Configuration Register: This register includes fields governing various APU behaviors.

SATA_APU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set APU_ESR. APU_EAR and APU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set APU_ESR. APU_EAR and APU_ESYNR0 updated with address and syndrome of error.
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x1B300F84 SATA_APU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

SATA_APU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x1B300F88 SATA_APU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the APU_ESYNRn registers, which are merely the "syndrome" of an error indicated by APU_ESR.

SATA_APU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x1B300F8C SATA_APU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

SATA_APU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x1B300F90 SATA_APU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

SATA_APU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x1B300F94 SATA_APU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

SATA_APU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x1B300FF4 SATA_APU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

SATA_APU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved

SATA_APU_REV (cont.)

Bits	Name	Description
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x1B300FF8 SATA_APU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x00001800

APU ID Register: Read-only register that defines various configuration attributes of the APU instance.

SATA_APU_IDR

Bits	Name	Description
31:29	RESERVED31_21	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.

SATA_APU_IDR (cont.)

Bits	Name	Description
9:8	RESERVED9_8	Reserved
7:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x1B300FFC SATA_APU_APU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

SATA_APU_APU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APU (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

4.6 CE3 XPU Registers (0x17500000 CE3_XPU_CFG_BASE)

This section contains the CE3 XPU registers.

0x17500000+4*n CE3_APU_RGn_ACR, n=[0..0]

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

(Read) Access Control Registers: This description is for the case when APU_IDR[MV, PT] = 01, i.e., a single VMID, read/write access vs. read-only access permission type APU. These registers include 2 separate 5 bit "owner" VMID fields

CE3_APU_RGn_ACR

Bits	Name	Description
31:26	RESERVED31_26	Reserved.
25	ROGE	Read-only global enable: Opens up read-only access for this resource group to all VMIDs if: ROGE | (ROE & (VMID = ROVMID)) | APU_APU_ACR[VMID] = 1
24	ROE	Read-only enable. This is a "valid" bit for the ROVMID field.
23:21	RESERVED23_21	Reserved
20:16	ROVMID	Read-only VMID. Specifies "owner" VMID with read-only access to the registers in the associated resource group.
15:10	RESERVED15_10	Reserved
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | APU_APU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a "valid" bit for the RWVMID field
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies "owner" VMID with full read/write access to the registers in the associated resource group.

0x17500F80 CE3_APU_CR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

APU Configuration Register: This register includes fields governing various APU behaviors.

CE3_APU_CR

Bits	Name	Description
31:4	RESERVED31_4	Reserved
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set APU_ESR. APU_EAR and APU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set APU_ESR. APU_EAR and APU_ESYNR0 updated with address and syndrome of error.
2	APUEIE	APU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the APU. Interrupt output is asserted if APU_CR[APUEIE] = 1 and any bit is set in APU_ESR
1	APUERE	APU Error Report Enable. APUERE = 0 causes the APU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master APUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective APU port. Errors from either port are terminated by the APU as RAZ/WI Both client and configuration port errors are recorded in APU_ESR, independent of the value of APU_CR[APUERE]
0	APUE	APU Enable. Governs whether APU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures APU and the MID to VMID mapping tables.

0x17500F84 CE3_APU_EAR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the APU, for both the client port and the configuration port.

CE3_APU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x17500F88 CE3_APU_ESR

Type: Read/Write-clear
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the APU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the APU's interrupt output (when enabled by APU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the APU_ESYNRn registers, which are merely the "syndrome" of an error indicated by APU_ESR.

CE3_APU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x17500F8C CE3_APU_ESRRESTORE

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error RestoreRegister: This is just an aliased address for APU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

CE3_APU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while APU_ESR[CFG, CLIENT] still non-zero. APU_EAR and APU_ESYNRn registers (and APU_ESR itself, except for the MULTI bit) "lock" upon first error, APU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while APU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x17500F90 CE3_APU_ESYNR0

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

CE3_APU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x17500F94 CE3_APU_ESYNR1

Type: Read/Write
Clock: XPU_CLK
Reset State: 0x00000000

Error Syndrome Register. Captures the syndrome upon errors detected by the APU, for both the client port and the configuration port.

CE3_APU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved.
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved.
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x17500FF4 CE3_APU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

CE3_APU_REV

Bits	Name	Description
31:8	RESERVED31_8	Reserved

CE3_APU_REV (cont.)

Bits	Name	Description
7:4	MAJOR	Major variant field
3:0	MINOR	Minor variant field

0x17500FF8 CE3_APU_IDR

Type: Read
Clock: XPU_CLK
Reset State: 0x00001800

APU ID Register: Read-only register that defines various configuration attributes of the APU instance.

CE3_APU_IDR

Bits	Name	Description
31:29	RESERVED31_21	Reserved
28:24	MSB	Indicates most significant address bit number used to select a resource group
23:21	RESERVED23_21	Reserved
20:16	LSB	Indicates least significant address bit number used to select a resource group.
15:14	RESERVED15_14	Reserved
13:12	XPUT	Indicates type of xPU (hardwired to 0b00 for RPU 0x0: RPU 0x1: APU 0x2: MPU 0x3: reserved
11	PT	Permission type PT=0 : indicates full access vs. no access type. Only APU_RGn_ACR registers needed, and they specify which VMID(s) have full access (other VMIDs have no access) PT=1 : indicates read/write access type vs. read-only access type. For multi-VMID, separate APU_RGn_RACR and APU_RGn_WACR registers govern read vs. write access. For single VMID, APU_RGn_ACR registers include separate 5-bit read/write vs. read-only "owner" VMID fields
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. APU_RGn_ACR registers indicate single 5 bit "owner" VMID field for governing access. MV=1 : indicates multi-VMID type access control. APU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.

CE3_APU_IDR (cont.)

Bits	Name	Description
9:8	RESERVED9_8	Reserved
7:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the APU. Value can range between 0 and 255 (1-256 resource groups).

0x17500FFC CE3_APU_APU_ACR

Type: Read/Write
Clock: XPU_CLK
Reset State: 0xFFFFFFFF

APU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the APU (including the APU_APU_ACR itself).

CE3_APU_APU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the APU's 4KB address region (including the APU_APU_ACR itself). For single VMID type APUs (APU_IDR[MV] = 0) the APU_APU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

5 Clock Controller Registers

5.1 Overview

Table 5-1 Clock_Controller Bases

Base Name	Parent	Address
GCC_RPU_CR	CLK_CTL_BASE	0x00900000

5.2 GCC RPU Registers (0x00900000 CLK_CTL_BASE)

This section contains the GCC RPU registers.

0x00900F80 GCC_RPU_CR

Type: Write/Read
Clock: XPU_CLK
Reset State: 0x00000000

RPU Configuration Register: This register includes fields governing various RPU behaviors.

GCC_RPU_CR

Bits	Name	Description
31:4	RESERVED_BITS31_4	
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., invalid addresses) are recorded as such. 0xDCDEE: 0 - do not record. Decode errors do not set RPU_ESR. RPU_EAR and RPU_ESYNR0 not updated. 0xDCDEE: 1 - record. Decode errors set RPU_ESR. RPU_EAR and RPU_ESYNR0 updated with address and syndrome of error.
2	RPUEIE	RPU Error Interrupt Enable. Governs whether the client port and the configuration port errors are reported directly to the interrupt controller via the interrupt output of the RPU. Interrupt output is asserted if RPU_CR[RPUEIE] = 1 and any bit is set in RPU_ESR
1	RPUERE	RPU Error Report Enable. RPUERE = 0 causes the RPU to treat configuration port errors as RAZ/WI, and to simply pass client port errors through to the slave device. Errors are not reported to the requesting master RPUERE = 1 enables client port and configuration port errors to be reported to the requesting master according to the particular bus protocol of the respective RPU port. Errors from either port are terminated by the RPU as RAZ/WI Both client and configuration port errors are recorded in RPU_ESR, independent of the value of RPU_CR[RPUERE]
0	RPUE	RPU Enable. Governs whether RPU checking occurs for both the client port and the configuration port. This bit is cleared (0) by reset. It is set (1) once SROT configures RPU and the MID to VMID mapping tables.

0x00900F84 GCC_RPU_EAR

Type: Write/Read
Clock: XPU_CLK
Reset State: 0x00000000

Error Address Register. This register captures the address upon errors detected by the RPU, for both the client port and the configuration port.

GCC_RPU_EAR

Bits	Name	Description
31:0	PA	The physical address of the errant request.

0x00900F88 GCC_RPU_ESR

Type: Write/Read
Clock: XPU_CLK
Reset State: 0x00000000

Error Status Register. This register captures the status upon errors detected by the RPU, for both the client port and the configuration port.

This register has read/write-clear access, meaning that reads simply read the value in the register, while writes are performed by clearing those bits corresponding to 1s in the written data, and leaving unchanged those bits corresponding to 0s in the written data. This prevents inadvertent clearing of new errors when writing the register to clear an old The presence of an asserted value on any bit in this register is what prompts the assertion of the RPU's interrupt output (when enabled by RPU_CR[IE]). Therefore, these bits must be cleared by the interrupt handler. This is contrasted with the fields in the RPU_ESYNRn registers, which are merely the 'syndrome' of an error indicated by RPU_ESR.

GCC_RPU_ESR

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while RPU_ESR[CFG, CLIENT] still non-zero. RPU_EAR and RPU_ESYNRn registers (and RPU_ESR itself, except for the MULTI bit) 'lock' upon first error, RPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while RPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x00900F8C GCC_RPU_ESRRESTORE

Type: Write/Read
Clock: XPU_CLK
Reset State: 0x00000000

.Error RestoreRegister: This is just an aliased address for RPU_ESR, which provides direct write access (rather than write-clear) for restoration purposes.

GCC_RPU_ESRRESTORE

Bits	Name	Description
31	MULTI	Multi-error: Indicates additional error occurred while RPU_ESR[CFG, CLIENT] still non-zero. RPU_EAR and RPU_ESYNRn registers (and RPU_ESR itself, except for the MULTI bit) 'lock' upon first error, RPU_ESR must be cleared to unlock.Status, address and syndrome of errors that occur while RPU_ESR is non-zero are lost.
30:2	RESERVED30_2	Reserved
1	CLIENT	Client Port Error. Indicates error (access control is the only type) associated with a client port request.
0	CFG	Configuration Port Error. Indicates error (access control or decode) associated with a configuration port request.

0x00900F90 GCC_RPU_ESYNR0

Type: Write/Read
Clock: XPU_CLK
Reset State: 0x00000000

.Error Syndrome Register. Captures the syndrome upon errors detected by the RPU, for both the client port and the configuration port.

GCC_RPU_ESYNR0

Bits	Name	Description
31:24	ATID	ATID field of errant request.
23:21	RESERVED23_21	Reserved
20:16	AVMID	AVMID field of errant request.
15:13	ABID	ABID field of errant request.
12:8	APID	APID field of errant request.
7:0	AMID	AMID field of errant request.

0x00900F94 GCC_RPU_ESYNR1

Type: Write/Read
Clock: XPU_CLK
Reset State: 0x00000000

.Error Syndrome Register. Captures the syndrome upon errors detected by the RPU, for both the client port and the configuration port.

GCC_RPU_ESYNR1

Bits	Name	Description
31	DCD	Decode. Indicates error due to invalid/unrecognized address (e.g., a reserved register address).
30	AC	Access Control. Indicates error due to lack of permission, as specified by the access control registers.
29:25	RESERVED29_25	Reserved
24	AFULL	AFULL field of errant request
23	RESERVED23	Reserved.
22	AOOO	AOOO field of errant request
21:20	ALOCK	ALOCK field of errant request
19	RESERVED19	Reserved
18:16	ASIZE	ASIZE field of errant request.
15:12	ALEN	ALEN field of errant request.
11	RESERVED11	Reserved
10	ABURST	ABURST field of errant request.
9	RESERVED9	Reserved
8	AWRITE	AWRITE field of errant request.
7	AINST	AINST field of errant request.
6	APROTNS	APROTNS field of errant request.
5	APRIV	APRIV field of errant request.
4	AINNERSHARED	AINNERSHARED field of errant request.
3	ASHARED	ASHARED field of errant request.
2:0	AMEMTYPE	AMEMTYPE field of errant request.

0x00900FF4 GCC_RPU_REV

Type: Read
Clock: XPU_CLK
Reset State: 0x00000011

Revision Register. This register provides major/minor revision codes for the implementation.

For single VMID, RPU_RGn_ACR registers include separate 5-bit read/write vs. read-only ‘owner’ VMID fields

GCC_RPU_IDR (cont.)

Bits	Name	Description
10	MV	Multi-VMID MV=0 : indicates single VMID type access control. RPU_RGn_ACR registers indicate single 5-bit 'owner' VMID field for governing access. MV=1 : indicates multi-VMD type access control. RPU_RGn_xACR registers include separate bit per VMID (32 bits) for governing access.
9:8	RESERVED9_8	Reserved
7:0	NRG	Number of resource groups: Indicates number of resource groups (minus 1) supported by the RPU. Value can range between 0 and 255 (1-256 resource groups).

0x00900FFC GCC_RPU_RPU_ACR

Type: Write/Read
Clock: XPU_CLK
Reset State: 0x00000000

.RPU Access Control Register: This register includes a bit per VMID governing configuration port access to the registers of the RPU (including the RPU_RPU_ACR itself).

GCC_RPU_RPU_ACR

Bits	Name	Description
31:0	RWE	Read/write enable. Each bit corresponds to a VMID, which when set to 1 grants that VMID read/write access to the entire block of registers within the RPU's 4KB address region (including the RPU_RPU_ACR itself). For single VMID type RPUs (RPU_IDR[MV] = 0) the RPU_RPU_ACR is also used to identify the VMIDs. In practice, this register designates the ASID(s) that can act as SROT.

0x00901000 AFAB_CLK_SRC_ACR

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0000

(Read) Access Control Registers: This description is for the case when GCC_RPU_IDR[MV, PT] = 00, i.e., a single VMID, full access vs. no access permission type RPU. Access Control Register that contains the VMID permitted to Read and Write the AFAB_CLK_SRC0_NS, AFAB_CLK_SRC1_NS and AFAB_CLK_SRC_CTL registers.

AFAB_CLK_SRC_ACR

Bits	Name	Description
31:10	RESERVED31_10	Reserved.
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | RPU_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field.
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x0090100C QDSS_STM_CLK_ACR

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0000

(Read) Access Control Registers: This description is for the case when GCC_RPU_IDR[MV, PT] = 00, i.e., a single VMID, full access vs. no access permission type RPU. Access Control Register that contains the VMID permitted to READ and WRITE the QDSS_STM_CLK_CTL register.

QDSS_STM_CLK_ACR

Bits	Name	Description
31:10	RESERVED31_10	Reserved.
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | RPU_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a 'valid' bit for the RWVMID field.
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies 'owner' VMID with full read/write access to the registers in the associated resource group.

0x00901010 AFAB_CORE_CLK_ACR

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0000

(Read) Access Control Registers: This description is for the case when GCC_RPU_IDR[MV, PT] = 00, i.e., a single VMID, full access vs. no access permission type RPU. Access Control Register that contains the VMID permitted to READ and WRITE the AFAB_CORE_CLK_CTL registers.

AFAB_CORE_CLK_ACR

Bits	Name	Description
31:10	RESERVED31_10	Reserved.
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | RPU_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a ‘valid’ bit for the RWVMID field.
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies ‘owner’ VMID with full read/write access to the registers in the associated resource group.

0x00901014 SCSS_ACR

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

(Read) Access Control Registers: This description is for the case when GCC_RPU_IDR[MV, PT] = 00, i.e., a single VMID, full access vs. no access permission type RPU. Access Control Register that contains the VMID permitted to READ and WRITE the SCCS_ACLK_CTL, SCSS_HCLK_CTL, SCCS_DBG_CLK_CTL, SCSS_XO_SRC_CLK_CTL, SCSS_RESET, SCSS_AFAB_PORT_RESET registers.

SCSS_ACR

Bits	Name	Description
31:10	RESERVED31_10	Reserved.
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | RPU_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a ‘valid’ bit for the RWVMID field
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies ‘owner’ VMID with full read/write access to the registers in the associated resource group.

0x00901018 AFAB_EBI1_S_ACLK_ACR

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

(Read) Access Control Registers: This description is for the case when GCC_RPU_IDR[MV, PT] = 00, i.e., a single VMID, full access vs. no access permission type RPU. Access Control Register that contains the VMID permitted to READ and WRITE the AFAB_EBI1_CH0_ACLK_CTL and AFAB_EBI1_CH1_ACLK_CTL

AFAB_EBI1_S_ACLK_ACR

Bits	Name	Description
31:10	RESERVED31_10	Reserved.
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | RPU_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a ‘valid’ bit for the RWVMID field.
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies ‘owner’ VMID with full read/write access to the registers in the associated resource group.

0x00901020 AFAB_AXI_S_FCLK_ACR

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

(Read) Access Control Registers: This description is for the case when GCC_RPU_IDR[MV, PT] = 00, i.e., a single VMID, full access vs. no access permission type RPU. Access Control Register that contains the VMID permitted to READ and WRITE the AFAB_AXI_S0_FCLK_CTL, AFAB_AXI_S1_FCLK_CTL, AFAB_AXI_S2_FCLK_CTL, AFAB_AXI_S3_FCLK_CTL, AFAB_AXI_S4_FCLK_CTL registers.

AFAB_AXI_S_FCLK_ACR

Bits	Name	Description
31:10	RESERVED31_10	Reserved.
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | RPU_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a ‘valid’ bit for the RWVMID field.
7:5	RESERVED7_5	Reserved
4:0	RWVMID	Read/Write VMID. Specifies ‘owner’ VMID with full read/write access to the registers in the associated resource group.

0x00901024 SFAB_CORE_CLK_ACR

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

(Read) Access Control Registers: This description is for the case when GCC_RPU_IDR[MV, PT] = 00, i.e., a single VMID, full access vs. no access permission type RPU. Access Control Register that contains the VMID permitted to READ and WRITE the SFAB_CORE_CLK_CTL register.

SFAB_CORE_CLK_ACR

Bits	Name	Description
31:10	RESERVED31_10	Reserved.
9	RWGE	Read/Write global enable. Opens up read/write access for this resource group to all VMIDs if: RWGE | (RWE & (VMID = RWVMID)) | RPU_RPU_ACR[VMID] = 1
8	RWE	Read/Write enable. This is a ‘valid’ bit for the RWVMID field.

0x00902008 AFAB_CLK_SRC_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0002

The AFAB_CLK_SRC_CTL register provides control to select which asfab_only_src0/1 supplied to the arm clock. Internal to the 'u_afab_sfab_clk_src' Hard-macro cell (hm_arm_clk_ctl) are two integer divider/clock selection Hard-macro cells (hm_nbid_clk_ctl). Each nbid can select from 8 sources and divide 1-16 (see descriptions above). This register also provides controls for clock root within this clock generator and provides enable to put this generator in low power state by selecting ALT_SRC which will be grounded.

NOTE The combined enable vote for the sc_hclk, sc_aclk, adm0_clk and adm1_clk branches will also enable the clock root. Therefore, the software root clock enable in this register does not have sole control for the enabling of the clock root.

AFAB_CLK_SRC_CTL

Bits	Name	Description
31:3	RESERVED_BITS31_3	RESERVED
2	CLK_GENERATOR_LOW_PWR_ENA	This bit put the generator in low power state by selecting the alt_src that is grounded. 0x1: Enable 0x0: Disable
1	CLK_ROOT_ENA	Enable clock source for system and application fabric. NOTE This bit does not have sole control of the disabling of the clock root. The voting of the clock branch enable for sc_hclk, sc_aclk, adm0_clk and adm1_clk also affect the enabling of the clock root. 0x1: Enable 0x0: Disable
0	NBID_SEL	This bit selects which internal divider provides the source to the global tree. 0x0: nbid0 0x1: nbid1

0x00902060 QDSS_STM_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x10

This register is used to control the QDSS_STM_CLK. It provides fabric clock gating, branch enable and clock inversion to the branch.

QDSS_STM_CLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	ASYNC_RESET	Async reset for clock domain. 0x1: Active 0x0: Not Active
5	CLK_INV	This bit is used to invert qdss_stm_clk. 0x1: invert 0x0: Not invert

3:0	RESERVED_BITS3_0	RESERVED

0x009020A0 SCSS_ACLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The SCSS_ACLK_CTL register provides controls to the branch cell used to generate Scorpion multi-processors sub-system (SMPSS) AXI clock and the AXI clocks for the application fabric ports communicating with SMPSS. The controls include enable to fabric dynamic clock gating and inversion of these clocks. The branch enable is votable by multiple master. Therefore, this branch enable control will be located in the individual master's clock voting registers.

SCSS_ACLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FABRIC_CLK_GATE_EN	Enable for dynamic clock gating. NOTE Should not be enable for both chips. 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert scss_aclk. 0x1: invert 0x0: Not invert
4:0	RESERVED_BITS4_0	RESERVED

0x009020A4 SCSS_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The SCSS_HCLK_CTL register provides controls to the branch cell used to generate SMPSS AHB clock (CC_SC_HCLK). The controls include enable to fabric dynamic clock gating and inversion of CC_SC_HCLK. The branch enable of CC_SC_HCLK is votable for multiple master. Therefore, this branch enable control will be located in the individual master's clock voting registers.

SCSS_HCLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FABRIC_CLK_GATE_ENA	Enable for dynamic clock gating. 0x0: Disable 0x1: Enable

SCSS_HCLK_CTL (cont.)

Bits	Name	Description

0x00902100 AFAB_AXI_S0_FCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the branch cell used to generate the fabric clock for the application AXI slave port 0 (cc_afab_axi_s0_fclk). It provides enable and clock inversion to the branch, and

also contains enable for the fabric dynamic clock gating mode. When fabric dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

Clock: SFPB_HCLK
Reset State: 0x0000

The PCIE_AUX_CLK_CTL register provides controls to the cell used to generate cc_pcie_aux_clk.

PCIE_AUX_CLK_CTL

Bits	Name	Description
31:6	RESERVED_BITS31_6	RESERVED
5	CLK_INV	This bit is used to invert pcie_aux_clk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for pcie_aux_clk clock branch. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x009022CC PCIE_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch forPCIE AHB clock. It provides enable and clock inversion to the branch, software control to the reset of logic clocked by this clock domain and also contains enable for the fabric dynamic clock gating mode. When fabric dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

PCIE_HCLK_CTL

31:7	RESERVED_BITS31_7	RESERVED

PCIE_HCLK_CTL (cont.)

Bits	Name	Description
6	BUS_CLK_GATE_ENA	Enable for dynamic clock gating. (This feature is for future usage only. Setting this bit will have the same effect of enabling the clock.) 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert pcie_hclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for pcie_hclk clock branch. This clock is votable. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x009022D0 PCIE_PCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of PCLK (PCIE PHY REF CLK) clock for PCIE. It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When fabric dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

Bits	Name	Description
31:6	RESERVED_BITS31_6	RESERVED
5	CLK_INV	This bit is used to invert pcie_aclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for pcie_aclk clock branch. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x009022D4 PCIE_PCLK_FS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x4F

This register is used for the sleep and wake-up values of the footswitch controller CXC of the PCIE PCLK (aka PCIE PHY REF CLK) clock for PCIE.

PCIE_PCLK_FS

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FORCE_C_ON	Force core on.
5	FORCE_P_ON	Force peripheral on.
4	FORCE_P_OFF	Force peripheral off.
3:0	S_W_VAL	Sleep/Wake-up value.

0x009022D8 PCIE_SFAB_PORT_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides software control to the system fabric ports connecting to PCIE.

PCIE_SFAB_PORT_RESET

Bits	Name	Description
31:2	RESERVED_BITS31_2	RESERVED
1	SFAB_PCIE_M_RESET	Async reset for System fabric master port connecting to PCIE. 0x1: Active 0x0: Not Active
0	SFAB_PCIE_S_RESET	Software reset for System fabric slave port connecting to PCIE. 0x1: Active

0x009022DC PCIE_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x78

This register provides centralized software resets for various PCIE clock domains and functions.

PCIE_RESET

0x009022E8 SFAB_CLK_SRC_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0002

The SFAB_CLK_SRC_CTL register provides control to select which asfab_only_src0/1 supplied to the arm clock. Internal to the 'u_afab_sfab_clk_src' Hard-macro cell (hm_arm_clk_ctl) are two integer divider/clock selection Hard-macro cells (hm_nbid_clk_ctl). Each nbid can select from 8 sources and divide 1-16 (see descriptions above). This register also provides controls for clock root within this clock generator and provides enable to put this generator in low power state by selecting ALT_SRC which will be grounded.

NOTE The combined enable vote for the sc_hclk, sc_aclk, adm0_clk and adm1_clk branches will also enable the clock root. Therefore, the software root clock enable in this register does not have sole control for the enabling of the clock root.

SFAB_CLK_SRC_CTL

Bits	Name	Description
31:3	RESERVED_BITS31_3	RESERVED
2	CLK_GENERATOR_LOW_PWR_ENA	This bit put the generator in low power state by selecting the alt_src which is grounded. 0x1: Enable 0x0: Disable
1	CLK_ROOT_ENA	Enable clock source for system and application fabric. NOTE This bit does not have sole control of the disabling of the clock root. The voting of the clock branch enable for sc_hclk, sc_aclk, adm0_clk and adm1_clk also affect the enabling of the clock root. 0x1: Enable 0x0: Disable
0	NBID_SEL	This bit selects which internal divider provides the source to the global tree. 0x0: nbid0 0x1: nbid1

0x009023A0 SFAB_LPASS_Q6_ACLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of Low Power Audio Subsystem (LPASS) Q6 AXI clock and the AXI clock for system fabric ports connecting to LPASS Q6. It provides enable and clock inversion to the branch, software control to the reset of logic clocked by this clock domain and also contains enable for the fabric dynamic clock gating mode. When fabric dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

0x00902564 DFAB_ARB1_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of AHB clock for Smart Peripheral Subsystem fabric arbitor 1. It provides enable and clock inversion to the branch, software control to the reset of logic clocked by this clock domain and also contains enable for the fabric dynamic clock gating mode. When fabric dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

0x00902648 CFPB_2X_CLK_SRC_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0002

The CFPB_2X_CLK_SRC_CTL register provides control to select which cfpb_2x_clk_src0/1 supplied to the arm clock. Internal to the {u_cfpb_2x_clk_src} Hard-macro cell (hm_arm_clk_ctl) are two integer divider/clock selection Hard-macro cells (hm_nbid_clk_ctl). Each nbid can select from 8 sources and divide 1-16 (see descriptions above). This register also provides controls for clock root within this clock generator and provides enable to put this generator in low power state by selecting ALT_SRC which will be grounded.

NOTE The combined enable vote for the adm0 and adm1 pbus clock branches will also enable the clock root. Therefore, the software root clock enable in this register does not have sole control for the enabling of the clock root.

CFPB_2X_CLK_SRC_CTL

Bits	Name	Description
31:3	RESERVED_BITS31_3	RESERVED
2	CLK_GENERATOR_LOW_PWR_ENA	This bit put the generator in low power state by selecting the alt_src which is grounded. 0x1: Enable 0x0: Disable
1	CLK_ROOT_ENA	Enable clock source for cfpb_2x. NOTE This bit does not have sole control of the disabling of the clock root. The voting of the clock branch enable for adm0 and adm1 pbus clocks also affect the enabling of the clock root. 0x1: Enable 0x0: Disable
0	NBID_SEL	This bit selects which internal divider provides the source to the cfpb_2x clock tree. 0x0: nbid0 0x1: nbid1

0x0090264C CFPB_CLK_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

0x009026E0 CFPB_SPLITTER_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of cc_cfpb_splitter_hclk. It provides enable and clock inversion to the clock branches, software control to the reset of logic clocked by these clocks and also contains enable for the dynamic clock gating for cc_cfpb_splitter_hclk. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of cc_cfpb_splitter_hclk. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

CFPB_SPLITTER_HCLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FABRIC_CLK_GATE_ENA	NOTE:This bit should be used as a static configuration. To toggle hardware clock gating for CPSS/CFPB, SW should disable the corresponding CPSS/CFPB AHB clock befor updating this bit. Enable for dynamic clock gating. 0x0: Disable 0x1: Enable

0x00902768 SFPB_HCLK_SRC_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0002

The SFPB_HCLK_SRC_CTL register provides control to select which sfpb_hclk_clk_src0/1 supplied to the arm clock. Internal to the {u_sfpb_hclk_src} Hard-macro cell (hm_arm_clk_ctl) are two integer divider/clock selection Hard-macro cells (hm_nbid_clk_ctl). Each nbid can select from 8 sources and divide 1-16 (see descriptions above). This register also provides controls for clock root within this clock generator.

NOTE In normal case, software should never turn off the root of sfpb clock because it will lock up the chip and can't ever turn back on this clock since clk_ctl uses sfpb_hclk. Due to requirement of the HFPLL that the system FPB AHB clock must always be 3X the speed of the HFPLL reference XO divided by 4, system FPB AHB clock must not be running at XO speed and can't be sourced by CXO (19.2 Mhz) when any of the

HFPLL reference XO is MXO (27 Mhz).

0x009027C0 RPM_PROC_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x10

The RPM_PROC_CLK_CTL register provides controls to the branch cell used to generate CC_RPM_PROC_CLK . The controls include branch enable and inversion of CC_RPM_PROC_CLK. This register also control software assertion of the asynchronous reset for the PRM processor. The branch enable control in this register is one of two software enable control for the RPM ARM7 processor clock. The other control comes from RPM in the form of rpm_proc_clkon signal which is also programmable by software. In addition, the enabling of rpm_proc_clk is also conditioned by the rpm_bus_hclk on/off status. Even though software

enables the rpm_proc_clk by toggling the enable bit, the rpm_proc_clk will remain off until the rpm_bus_hclk is running.

RPM_PROC_CLK_CTL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7	ASYNC_RESET	Async reset for RPM_PROC clock domain. 0x1: Active 0x0: Not Active
6	RESERVED_BIT6	RESERVED
5	CLK_INV	This bit is used to invert rpm_proc_clk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for rpm_proc_clk clock branch. NOTE: This is one of two software controllable branch enable bits. The other branch enable control comes from a software programable register in RPM. This control comes from RPM in the form of rpm_proc_clkon which will be combined with rpm_proc_clk_sleep_ena bit (see RPM_CLK_SLEEP_ENA_VOTE register). When rpm_proc_clk_sleep_ena bit is set, this clk_branch_ena bit does not have any affect on enabling the rpm_proc_clk. In addition, enabling of the rpm_proc_clk also conditions on first turning on the rpm_bus_hclk first. Without rpm_bus_hclk being enabled, rpm_proc_clk will not turn on even though it is programmed to be enabled by setting 1 to this bit or the enable bit from RPM. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x009027C4 RPM_BUS_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x10

The RPM_BUS_HCLK_CTL register provides controls to the branch cell used to generate CC_RPM_BUS_HCLK . The controls include branch enable and inversion of CC_RPM_BUS_HCLK. This register also control software assertion of the asynchronous reset for the RPM HCLK logic. The branch enable control in the register is one of two enable control for the CC_RPM_BUS_HCLK. The other control comes from RPM in the form of rpm_cc_bus_hclkon signal. This signal is conbined with the clock branch enable control from this register and if either one is asserted, the clock to the processor will be on.

0x009027E0 RPM_MSG_RAM_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The RPM_MSG_RAM_HCLK_CTL register provides controls to the branch cell used to generate CC_RPM_MSG_RAM_HCLK. The controls include enable to dynamic bus clock gating and inversion of CC_RPM_MSG_RAM_HCLK. This register also control software assertion of the asynchronous reset for CC_RPM_MSG_RAM_HCLK clock domain. The branch enable of CC_RPM_MSG_RAM_HCLK is votable for multiple master. Therefore, this branch enable control will be located in the individual master's clock voting registers.

Clock: SFPB_HCLK
Reset State: 0x4F

This register is used for the sleep and wake-up values of the footswitch controller CXC for cc_usb_hsic_system_clk.

USB_HSIC_SYSTEM_CLK_FS

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FORCE_C_ON	Force core on.
5	FORCE_P_ON	Force peripheral on.
4	FORCE_P_OFF	Force peripheral off.
3:0	S_W_VAL	Sleep/Wake-up value.

0x00902934 USB_HSIC_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the reset to usb hsic core.

USB_HSIC_RESET

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	USB_HSIC_RESET	Common USB_HSIC reset for HCLK and SYSTEM clock.

0x00902938 VDD_USB_HSIC_GFS_CTL

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x100

USB HSIC Power Rail control

VDD_USB_HSIC_GFS_CTL

Bits	Name	Description
9	RESERVED_BIT9	RESERVED INTERNAL only: Footswitch Retention bit for the VDD_USB_HSIC power rail. GFS_RET = 1 and GFS_EN = 0 put Macro into VDD_MIN stage (Leakage saved but logic state retained) (NOTE: This is not a supported feature in 45nm).

VDD_USB_HSIC_GFS_CTL (cont.)

Bits	Name	Description
8	VDD_USB_HSIC_GFS_EN	Footswitch enable bit for the VDD_USB_HSIC power rail.
7:6	RESERVED_BITS7_6	UNUSED
5	USB_HSIC_CLAMP	Clamp I/O bit for the Audio VDD_USB_HSIC power rail. 0x0: unclamp 0x1: clamp
4:0	VDD_USB_HSIC_GFS_CNT	This is the number of SFPB_HCLK cycles to delay the assertion of gfs_en_all after the assertion of gfs_en1 when enabling the global distributed footswitch.

0x0090293C VDD_USB_HSIC_GFS_CTL_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0x1

The VDD_USB_HSIC_GFS_CTL_STATUS register hold the status of the USB HSIC global distributed footswitch control signals

VDD_USB_HSIC_GFS_CTL_STATUS

Bits	Name	Description
0	USB_HSIC_GFS_EN_ALL	Footswitch enable bit for the VDD_USB_HSIC power rail. 0x0: Disabled 0x1: Enabled

0x00902940 CFPB0_C0_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of AHB clock (cc_cfpb0_c0_hclk) for the Dim Wrapper. It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic

NOTE This is a spare register for any ECO purpose.

CFPB0_C0_HCLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	BUS_CLK_GATE_ENA	Enable for dynamic clock gating. (This feature is for future usage only. Setting this bit will have the same effect of enabling the clock.) 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert usb_fs1_hclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for usb_fs1_hclk clock branch. This clock is votable. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902944 CFPB0_D0_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of AHB clock (cc_cfpb0_d0_hclk) for the Dim Wrapper. It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic

NOTE This is a spare register for any ECO purpose.

CFPB0_D0_HCLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	BUS_CLK_GATE_ENA	Enable for dynamic clock gating. (This feature is for future usage only. Setting this bit will have the same effect of enabling the clock.) 0x0: Disable 0x1: Enable

CFPB0_D0_HCLK_CTL (cont.)

Bits	Name	Description
5	CLK_INV	This bit is used to invert usb_fs1_hclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for usb_fs1_hclk clock branch. This clock is votable. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902948 CFPB0_C1_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of AHB clock (cc_cfpb0_c1_hclk) for the Dim Wrapper. It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic

NOTE This is a spare register for any ECO purpose.

CFPB0_C1_HCLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	BUS_CLK_GATE_ENA	Enable for dynamic clock gating. (This feature is for future usage only. Setting this bit will have the same effect of enabling the clock.) 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert usb_fs1_hclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for usb_fs1_hclk clock branch. This clock is votable. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x0090294C CFPB0_D1_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of AHB clock (cc_cfpb0_d1_hclk) for the Dim Wrapper. It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

NOTE This is a spare register for any ECO purpose.

CFPB0_D1_HCLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	BUS_CLK_GATE_ENA	Enable for dynamic clock gating. (This feature is for future usage only. Setting this bit will have the same effect of enabling the clock.) 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert usb_fs1_hclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for usb_fs1_hclk clock branch. This clock is votable. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902960 USB_FS1_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of AHB clock (cc_usb_fs1_hclk) for the USB_FS1 core. It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

3:0	RESERVED_BITS3_0	RESERVED

0x00902964 USB_FS1_XCVR_FS_CLK_MD

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register contains the M and D values used for the M/N:D counter of cc_usb_fs1_xcvr_fs_clk generator.

USB_FS1_XCVR_FS_CLK_MD

Bits	Name	Description
31:24	RESERVED_BITS31_24	RESERVED
23:16	M_VAL	This is the M value for the clock branchs M/N:D counter.
15:8	RESERVED_BITS15_8	RESERVED
7:0	D_VAL	This is the NOT(2*D) value for the clock branchs M/N:D counter.

0x00902968 USB_FS1_XCVR_FS_CLK_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0000

This register contains the N values used for the M/N:D counter of cc_usb_fs1_xcvr_fs_clk generator. It also contains the branch enable, root enables, clock inversion, MN counter enable and

reset, MN counter mode selection, and pre divider control of the cc_usb_fs1_xcvr_fs_clk generator.

USB_FS1_XCVR_FS_CLK_NS

Bits	Name	Description
31:24	RESERVED_BITS31_24	RESERVED
23:16	N_VAL	This is the NOT(N-M) value of the clock branchs M/N:D counter when it is used as either modulo-N counter or as full M/N:D counter.
15:12	RESERVED_BITS15_12	RESERVED
11	CLK_ROOT_ENA	Enable for usb_fs1_xcvr_fs_clk clock source NOTE The root cannot be disable by setting this bit to 0 if the downstream CXCs are still running. 0x1: Enable 0x0: Disable
10	CLK_INV	This bit is used to invert usb_fs1_xcvr_fs_clk. 0x1: invert 0x0: Not invert
9	CLK_BRANCH_ENA	Enable for usb_fs1_xcvr_fs_clk clock branch. 0x1: Enable 0x0: Disable
8	MNCNTR_EN	Enable for the M/N counter. 0x1: Enable 0x0: Disable
7	MNCNTR_RST	Activate the reset for the M/N counter. 0x1: Active 0x0: Not Active
6:5	MNCNTR_MODE	Define M/N counter mode. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
4:3	PRE_DIV_SEL	Select to activate or bypass the modulo divider before the M/N counter. 0x0: Bypass 0x1: Div-2 0x2: Div-3 0x3: Div-4

USB_FS1_XCVR_FS_CLK_NS (cont.)

Bits	Name	Description
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mxo 0x2: pll0 0x3: pll8 0x4: gnd_tie 0x5: GND 0x6: core_bi_clk_test_se 0x7: core_bi_pll_test_se

0x0090296C USB_FS1_SYSTEM_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of cc_usb_fs1_system_clk. It provides enable and clock inversion to the branch.

USB_FS1_SYSTEM_CLK_CTL

Bits	Name	Description
31:6	RESERVED_BITS31_6	RESERVED
5	CLK_INV	This bit is used to invert usb_fs1_system_hclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for usb_fs1_system_hclk clock branch. This clock is votable 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902970 USB_FS1_SYSTEM_CLK_FS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x4F

This register is used for the sleep and wake-up values of the footswitch controller CXC for USB FS1 core system clock.

USB_FS1_SYSTEM_CLK_FS

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FORCE_C_ON	Force core on.
5	FORCE_P_ON	Force peripheral on.
4	FORCE_P_OFF	Force peripheral off.
3:0	S_W_VAL	Sleep/Wake-up value.

0x00902974 USB_FS1_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

This register is used to control the reset to usb fs1 core.

USB_FS1_RESET

Bits	Name	Description
31:2	RESERVED_BITS31_2	RESERVED
1	USB_FS1_XCVR_RESET	Async reset for usb fs1 xcvr clock domain. 0x1: Active 0x0: Inactive
0	USB_FS1_RESET	Common USB_FS1 async reset. 0x1: Active 0x0: Inactive

0x009029A0 GSBI_COMMON_SIM_CLK_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0000

This register is used to control the generation of the GSBI SIM clock source.

GSBI_COMMON_SIM_CLK_NS

Bits	Name	Description
31:12	RESERVED_BITS31_12	RESERVED

GSBI_COMMON_SIM_CLK_NS (cont.)

Bits	Name	Description
11	CLK_ROOT_ENA	This bit is used to enable the GSBI SIM clock root. NOTE The root cannot be disable by setting this bit to 0 if the downstream CXCs are still running. 0x1: Enable 0x0: Diable

0x00902B88 SEC_CTRL_ACC_CLK_SRC0_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The SEC_CTRL_ACC_CLK_SRC0_NS register is 1/2 of the Security Control ACC clock selection register. This register is used to select the cc_sec_ctrl_acc_clk source clock divisor and clock source for SRC0. Internal to the {u_sec_ctrl_acc_src} Hard-macro cell (hm_arm_clk_ctl) are two integer divider/clock selection Hard-macro cells (hm_nbid_clk_ctl). Each nbid can select from 8 sources and divide 1-16.

0x00902B90 SEC_CTRL_ACC_CLK_SRC_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0002

This register provides control to select which sec_ctrl_acc_clk_src0/1 supplied to the arm clock. Internal to the {u_sec_ctrl_acc_src} Hard-macro cell (hm_arm_clk_ctl) are two integer divider/clock selection Hard-macro cells (hm_nbid_clk_ctl). Each nbid can select from 8 sources and divide 1-16 (see descriptions above). This register also provides controls for clock root within this clock generator. In addition, this register contains a control bit which would like jtag to control the nbid select during production vector. By default, the control of the nbid select is under JDR register control. In production vector, jtag can select NBID1 as the source of the ACC clock which by default will get its clock from PLL_TEST_SE (see sec_ctrl_acc_clk_src1_ns register). During boot, software can switch the nbid select control back to this register by programmig the JTAG_NBID_SEL_CTRL bit.

.

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of cc_sata_rxoob_clk. It provides enable and clock inversion to the branch, software control to the reset of logic clocked by this clock domain and also contains enable for the dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

SATA_RXOOB_CLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	CLK_GATE_ENA	Enable for dynamic clock gating. 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert sata_rxoob_clk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for sata_rxoob_clk clock branch. This clock is votable 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902C10 SATA_PMALIVE_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of cc_sata_pmalive_clk. It provides enable and clock inversion to the branch, software control to the reset of logic clocked by this clock domain and also contains enable for the dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

SATA_PMALIVE_CLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	CLK_GATE_ENA	Enable for dynamic clock gating. 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert sata_pmalive_clk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for sata_pmalive_clk clock branch. This clock votable 0x1: Enable 0x0: Disable
3:2	RESERVED_BITS3_2	RESERVED
1:0	CLK_DIV	Select divide ratio (1-4) for sata_pmalive_clk clock. 0x0: DIv-1 0x1: Div-2 0x2: Div-3 0x3: Div-4

0x00902C14 SATA_PHY_REF_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of cc_sata_phy_ref_clk. It provides source selection, enable and clock inversion to the branch.

SATA_PHY_REF_CLK_CTL

Bits	Name	Description
31:6	RESERVED_BITS31_6	RESERVED
5	CLK_INV	This bit is used to invert sata_phy_ref_clk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for sata_phy_ref_clk clock branch. This clock is votable 0x1: Enable 0x0: Disable
3:1	RESERVED_BITS3_1	RESERVED

SATA_PHY_REF_CLK_CTL (cont.)

Bits	Name	Description
0	SRC_SEL	Selects which XO will supply the 27MHz reference for the SATA PHY PLL: 0x0: PXO (default) 0x1: MXO

0x00902C18 SATA_SFAB_M_PORT_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the reset to the system fabric master port connecting to SATA.

SATA_SFAB_M_PORT_RESET

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	SFAB_SATA_M_RESET	Async reset for System fabric sata master port. 0x1: Active 0x0: Inactive

0x00902C1C SATA_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the reset to the system fabric master port connecting to SATA.

SATA_RESET

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	ASYNC_RESET	Async reset for sata. (Resets multiple clock domains inside SATA core). 0x1: Active 0x0: Inactive

0x00902C20 SATA_ACLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of AXI clock for SATA core and system fabric ports connecting to SATA. It provides enable and clock inversion to the branch, software control to the reset of logic clocked by this clock domain and also contains enable for the fabric dynamic clock gating mode. When fabric dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

SATA_ACLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FABRIC_CLK_GATE_ENA	Enable for dynamic clock gating. 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert sata_aclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for sata_aclk clock branch. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902C24 SATA_ACLK_FS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x4F

This register is used for the sleep and wake-up values of the footswitch controller CXC of the AXI clock for SATA and system fabric port connecting to SATA.

SATA_ACLK_FS

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FORCE_C_ON	Force core on.
5	FORCE_P_ON	Force peripheral on.
4	FORCE_P_OFF	Force peripheral off

SATA_ACLK_FS (cont.)

Bits	Name	Description
3:0	S_W_VAL	Sleep/Wake-up value.

0x00902C40 SATA_PHY_CFG_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of cc_sata_phy_cfg_clk. It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	BUS_GATE_ENA	Enable for dynamic clock gating. 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert sata_phy_cfg_clk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for sata_phy_cfg_clk clock branch. This clock is votable. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902C60 GSS_SLP_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

This register is used to control the clock branch for the generation of cc_gss_slp_clk. It provides enable and clock inversion to the branch, and software control to the reset of logic clocked by this clock domain.

GSS_SLP_CLK_CTL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7	ASYNC_RESET	Async reset for GSS sleep clock domain. 0x1: Active 0x0: Not Active
6	RESERVED_BIT6	RESERVED
5	CLK_INV	This bit is used to invert gss_slp_clk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for gss_slp_clk clock branch. This clock is votable. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902C64 GSS_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

This register is used to control the GSS reset.

GSS_RESET

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	ASYNC_RESET	Async reset for GSS. 0x1: Active 0x0: Inactive

0x00902C68 GSS_CLAMP_ENA

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x1

This register is used to enable the GSS clamps.

GSS_CLAMP_ENA

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	GSS_CLAMP_ENA	Clamp enable for GSS. 0x1: GSS outputs Clamped 0x0: GSS output NOT Clamped

0x00902C74 GSS_CXO_SRC_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x1

This register is used to control the clock branch for the generation of cc_gss_cxo_src. It provides enable and clock inversion.

GSS_CXO_SRC_CTL

Bits	Name	Description
31:2	RESERVED_BITS31_2	RESERVED
1	CLK_INV	This bit is used to invert cc_gss_cxo_src. 0x1: invert 0x0: Not invert
0	CLK_BRANCH_ENA	Enable for cc_gss_cxo_src clock branch. 0x1: Enable 0x0: Disable

0x00902CA0 TSSC_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

This register is used to control the generation of cc_tssc_clk. There are 3 possible sources for this clock and each source can be halted independently. This register provides controls for them as well. This register also provides control for async reset to TSSC.

TSSC_CLK_CTL

Bits	Name	Description
31:15	RESERVED_BITS31_15	RESERVED

TSSC_CLK_CTL (cont.)

Bits	Name	Description
14	MXO_SRC_CLK_INV	This bit is used to invert the MXO source. NOTE: MXO is not used in APQ8064. 0x1: Inverted 0x0: Not inverted
13	MXO_SRC_BRANCH_ENA	This bit is used to enable the MXO source for generating tssc clock. NOTE: MXO is not used in APQ8064. 0x1: Enable 0x0: Diable
12	PXO_SRC_CLK_INV	This bit is used to invert the PXO source. 0x1: Inverted 0x0: Not inverted
11	PXO_SRC_BRANCH_ENA	This bit is used to enable the PXO source for generating tssc clock. 0x1: Enable 0x0: Diable
10	CXO_SRC_CLK_INV	This bit is used to invert the CXO source. 0x1: Inverted 0x0: Not inverted
9	CXO_SRC_BRANCH_ENA	This bit is used to enable the CXO source for generating tssc clock. 0x1: Enable 0x0: Diable

0x00902D00+ 32*n GPn_MD, n=[0..2]

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register contains the M and D values used for the M/N:D counter of GP clock generators

GPn_MD

Bits	Name	Description
31:24	RESERVED_BITS31_24	RESERVED
23:16	M_VAL	This is the M value for the clock branchs M/N:D counter.
15:8	RESERVED_BITS15_8	RESERVED
7:0	D_VAL	This is the NOT(2*D) value for the clock branchs M/N:D counter.

0x00902D24+32*n GPn_NS, n=[0..2]

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0000

This register contains the N values used for the M/N:D counter of GP clock generators. It also contains the branch enable, root enables, clock inversion, MN counter enable and reset, MN counter mode selection, and pre divider control of the GP clock generators.

GPn_NS

Bits	Name	Description
31:24	RESERVED_BITS31_24	RESERVED
23:16	N_VAL	This is the NOT(N-M) value of the clock branchs M/N:D counter when it is used as either modulo-N counter or as full M/N:D counter.
15:12	RESERVED_BITS15_12	RESERVED
11	CLK_ROOT_ENA	Enable for gpn_clk clock source. NOTE :The root cannot be disable by setting this bit to 0 if the downstream CXC (controlled by clk_branch_ena at bit 9) is still running. 0x1: Enable 0x0: Disable
10	CLK_INV	This bit is used to invert gpn_clk 0x1: invert 0x0: Not invert
9	CLK_BRANCH_ENA	Enable for gpn_clk clock branch 0x1: Enable 0x0: Disable
8	MNCNTR_EN	Enable for the M/N counter. 0x1: Enable 0x0: Disable

GPn_NS (cont.)

Bits	Name	Description
7	MNCNTR_RST	Activate the reset for the M/N counter. 0x1: Active 0x0: Not Active
6:5	MNCNTR_MODE	Define M/N counter mode. 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
4:3	PRE_DIV_SEL	Select to activate or bypass the modulo divider before the M/N counter. 0x0: Bypass 0x1: Div-2 0x2: Div-3 0x3: Div-4
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: core_pi_sleep_clk 0x2: pll0 0x3: pll8 0x4: gnd_tie 0x5: cxo 0x6: mmcc_pll1 0x7: lcc_pri_pll

0x00902DA0 MPM_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x110

This register is used to control the clock branch for the generation of cc_mpm_clk. It provides enable and clock inversion to the branch, software control to the reset of logic clocked by this clock domain and also contains enable for the dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic. This register also contains control to enable the MPM reference clock.

MPM_CLK_CTL

Bits	Name	Description
31:9	RESERVED_BITS31_9	RESERVED

MPM_CLK_CTL (cont.)

Bits	Name	Description
8	MPM_REF_CLK_ENA	Enable for mpm ref clock (in rpm block). 0x1: Enable 0x0: Disable
7	MPM_HCLK_RESET	Software reset for the MPM HCLK branch. 0x1: Active
6	BUS_CLK_GATE_ENA	Enable for dynamic clock gating. (This feature is for future usage only. Setting this bit will have the same effect of enabling the clock.) 0x0: Disable 0x1: Enable
5	MPM_HCLK_INV	This bit is used to invert mpm_clk. 0x1: invert 0x0: Not invert
4	MPM_HCLK_BRANCH_ENA	Enable for mpm_clk clock branch. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902DA4 MPM_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the reset to MPM

MPM_RESET

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	MPM_RESET	Software reset for the MPM. 0x1: Active

0x00902DC0 RINGOSC_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The RINGOSC_NS register contains control signals for the process monitors blocks and the control for the ring oscillator clock generation.

RINGOSC_NS

Bits	Name	Description
23:20	RING_MODE	This field selects the ring mode of the selected process monitor.
19:18	GROUP_ADDRESS	This field selects the group address of the selected process monitor.
17:16	RING_ADDRESS	This field selects the ring address of the selected process monitor.
15	PMBLK_LR_EN	This field enables the process monitor block (lower right). 0x1: Enabled 0x0: Not enabled
14	PMBLK_UR_EN	This field enables the process monitor block (upper right). 0x1: Enabled 0x0: Not enabled
13	PMBLK_UL_EN	This field enables the process monitor block (upper left). 0x1: Enabled 0x0: Not enabled
12	PMBLK_CN_EN	This field enables the process monitor block (central). 0x1: Enabled 0x0: Not enabled
11	RO_ROOT_ENA	This field enables the clk root signal. 0x1: Enabled 0x0: Not enabled
10	RO_CLK_INV	This field inverts the clk signal. 0x1: Inverted 0x0: Not inverted
9	RO_CLK_BRANCH_ENA	This field enables the clk branch signal. 0x1: Enabled 0x0: Not enabled
8	PMBLK_LL_EN	This field enables the process monitor block (lower left). 0x1: Enabled 0x0: Not enabled

RINGOSC_NS (cont.)

Bits	Name	Description
7:4	RING_OSC_DIV_SEL	These bits define the division ratio for the divider on the process monitor source. RING_OSC_DIV_SEL 0x0: Div1 0x1: Div2 0x2: Div3 0x3: Div4 0x4: Div5 0x5: Div6 0x6: Div7 0x7: Div8 0x8: Div9 0x9: Div10 0xA: Div11 0xB: Div12 0xC: Div13 0xD: Div14 0xE: Div15 0xF: Div16
3	UNUSED_BIT_3	UNUSED
2:0	RING_OSC_SEL	Selects the desired internal core to use as the ring_osc_clk. RING_OSC_SEL 0x0: pmblk_cn 0x1: pmblk_ul 0x2: pmblk_ur 0x3: pmblk_lr 0x4: pmblk_ll 0x5: sc_ringosc 0x6: gnd_tie_1 0x7: gnd_tie_2

0x00902DC4 RINGOSC_TCXO_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The TCXO_CNT register holds the value used to load the TCXO counter. It also contains the enable to turn on both up and down counters for DVS_CNTL circuit.

NOTE The TCXO counter uses the XO4 clock from PDM. Although the name implies the counters and logic might have a directly dependency on CXO clock but it does not. One must program the PDM_CLK_NS register to generate the corresponding XO/4

clock. See PDM_CLK_NS register for the programming need. and all the possible XO source selection available.

RINGOSC_TCXO_CTL

Bits	Name	Description
31:21	RESERVED_BITS31_21	RESERVED
20	CNT_EN	DVS_CTRL Up and down counters enable. 0x1: Enabled 0x0: Disable
19:0	TCXO_TERM_CNT	After being loaded this value is decremented and used to compare the ring oscillator frequency to the TCXO frequency and thereby estimating its frequency.

0x00902DCC RINGOSC_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0xXXXXXXXX

The RINGOSC_STATUS register is a read-only register, which contains the status of the ring oscillator counter value and the status of the tcxo counter.

RINGOSC_STATUS

Bits	Name	Description
25	TCXO_CNT_DONE	This bit is automatically set (1) when the TCXO CNT terminates. It can be polled by the microprocessor to determine when the value of RINGOSC_CNT is valid.
24:0	RINGOSC_CNT	These read only register bits hold the value stored in the ring oscillator counter, which is used to compare the ring oscillator frequency to the TCXO frequency and, thereby, estimate its frequency. This register is reset automatically by the rising edge of the ringosc_cnt_en signal.

0x00902DE0 EBI1_CLK_SRC0_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The EBI1_CLK_SRC0_NS register is 1/2 of the EBI1 clocks selection register. This register is used to select the EBI1 source clock divisor and clock source for SRC0. Internal to the {u_ebi1_async_2x_src} Hard-macro cell (hm_arm_clk_ctl) are two integer divider/clock selection Hard-macro cells (hm_nbid_clk_ctl). Each nbid can select from 8 sources and divide 1-16.

EBI1_CLK_SRC0_NS

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6:3	SRC_DIV	This field selects to activate or bypass the modulo divider. 0x0: Bypass 0x1: Div-2 0x2: Div-3 0x3: Div-4 0x4: Div-5 0x5: Div-6 0x6: Div-7 0x7: Div-8 0x8: Div-9 0x9: Div-10 0xA: Div-11 0xB: Div-12 0xC: Div-13 0xD: Div-14 0xE: Div-15 0xF: Div-16
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: pll14_out_aux 0x2: pll0_out_early 0x3: pll8 0x4: gnd_tie 0x5: pll11_out_early 0x6: core_bi_clk_test_se 0x7: core_bi_pll_test_se

0x00902DE4 EBI1_CLK_SRC1_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The EBI1_CLK_SRC1_NS register is 1/2 of the EBI1 clocks selection register. This register is used to select the EBI1 source clock divisor and clock source for SRC1. Internal to the {u_ebi1_async_2x_src} Hard-macro cell (hm_arm_clk_ctl) are two integer divider/clock selection Hard-macro cells (hm_nbid_clk_ctl). Each nbid can select from 8 sources and divide 1-16.

EBI1_CLK_SRC1_NS

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED

EBI1_CLK_SRC1_NS (cont.)

Bits	Name	Description
6:3	SRC_DIV	This field selects to activate or bypass the modulo divider. 0x0: Bypass 0x1: Div-2 0x2: Div-3 0x3: Div-4 0x4: Div-5 0x5: Div-6 0x6: Div-7 0x7: Div-8 0x8: Div-9 0x9: Div-10 0xA: Div-11 0xB: Div-12 0xC: Div-13 0xD: Div-14 0xE: Div-15 0xF: Div-16
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: pll14_out_aux 0x2: pll0_out_early 0x3: pll8 0x4: gnd_tie 0x5: pll11_out_early 0x6: core_bi_clk_test_se 0x7: core_bi_pll_test_se

0x00902DE8 EBI1_CLK_SRC_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x2

The EBI1_CLK_SRC_CTL register provides control to select which EBI1_CLK_SRC0/1 supplied to the arm clock. Internal to the {u_ebi1_async_2x_src} Hard-macro cell (hm_arm_clk_ctl) are two integer divider/clock selection Hard-macro cells (hm_nbid_clk_ctl). Each nbid can select from 8 sources and divide 1-16 (see descriptions above). This register also provides controls for clock root within this clock generator and provides enable to put this generator in low power state by selecting ALT_SRC which will be grounded. In addition, this register also contains control to select between asfab_only generator and ebi1_asfab generator for the source of the fabric clocks. When EBI1 frequency swtich state machine is enable (setting of the FSM_ENA bit of EBI1_FRQSW_CTl register), toggling NBID_SEL bit will trigger the state

machine to perform the EBI1 frequency switch sequence. The actual switching will not occur right away. Software must wait for the switching to complete by polling the FRQSW_CMPLT bit.

NOTE The combined enable vote for the sc_hclk, sc_aclk, adm0_clk and adm1_clk branches will also enable the clock root. Therefore, the software root clock enable in this register does not have sole control for the enabling of the clock root.

EBI1_CLK_SRC_CTL

Bits	Name	Description
31:3	RESERVED_BITS31_3	RESERVED
2	CLK_GENERATOR_LOW_PWR_ENA	This bit put the generator in low power state by selecting the alt_src which is grounded. 0x1: Enable 0x0: Disable
1	CLK_ROOT_ENA	Enable clock source for ebi1_clk. NOTE: This bit does not have sole control of the disabling of the clock root. The voting of the clock branch enable for sc_hclk, sc_aclk, adm0_clk and adm1_clk also affect the enabling of the clock root. 0x1: Enable 0x0: Disable
0	NBID_SEL	This bit selects which internal divider provides the source to the ebi1_clk clock tree. 0x0: nbid0 0x1: nbid1

0x00902DEC EBI1_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0xA00

The EBI1_CLK_CTL register provides controls to the branch cells used to generate all the EBI 1X clocks. The controls include enables to the branch enable(s) for the ebi1 2X clock for the EBI1 channel(s), the inversion control for the branch enable(s) and the software assertion of the asynchronous reset for the EBI1 clock domain. This register also provides control to reset all the 2X to 1X divider. In order to phase align all the 2X to 1X EBI clock dividers, assertion of the reset and deassertion of the reset should be done when the EBI1 2X clock(s) are halted. By default after chip wide reset, the branch enable(s) for the EBI 2X clock are desserted and the 2X to 1X dividers are in reset state. Prior to enabling the 2X clock branches, software should first write to this register to deassert the 2X to 1X divider reset.

The EBI1_CLK_CTL register also contains the branch enable and the inversion control for the ebi1 frequency switch FSM clock. When the branch enable for any one of the ebi1 2X clocks is set, it will enable the FSM clock as well. For this reason, in order to use the EBI1 frequency switch FSM, the ebi1 2x clock(s) must be enabled as well.

EBI1_CLK_CTL

Bits	Name	Description
31:14	RESERVED_BITS31_14	RESERVED
13	CH1_FABRIC_CLK_GATE_ENA	Enable for dynamic clock gating for CH1 EBI1 2x clk. 0x0: Disable 0x1: Enable
12	CH0_FABRIC_CLK_GATE_ENA	Enable for dynamic clock gating for CH0 EBI1 2x clk. 0x0: Disable 0x1: Enable
11	CH1_EBI1_1X_DIV_RESET	Async reset for reseting all the CH1 EBI1 2X to 1X dividers in the system. NOTE: The reset should be asserted when the EBI1 2X clock is not running in order to properly align all the EBI1 1X clock from each other. By default, this reset is asserted. Software needs to deassert this reset before enabling the EBI1 2X clock branches. 0x1: Active 0x0: Not Active
10	FRQSW_FSM_CLK_INV	This bit is used to invert the EBI1 frequency switch FSM clock. 0x1: invert 0x0: Not invert
9	CH0_EBI1_1X_DIV_RESET	Async reset for reseting all the CH0 EBI1 2X to 1X dividers in the system. NOTE:The reset should be asserted when the EBI1 2X clock is not running in order to properly align all the EBI1 1X clock from each other. By default, this reset is asserted. Software needs to deassert this reset before enabling the EBI1 2X clock branches. 0x1: Active 0x0: Not Active
8	CH1_CLK_BRANCH_ENA	Enable for ebi1 2X clock branch for channel 1 ebi1. Also will enable the EBI1 frequency switch FSM clock. 0x1: Enable 0x0: Disable
7	CH1_ASYNC_RESET	Async reset for EBI1 CH1 clock domain. 0x1: Active 0x0: Not Active
6	CH0_ASYNC_RESET	Async reset for EBI1 CH0 clock domain. 0x1: Active 0x0: Not Active
5	EBI1_2X_CLK_INV	This bit is used to invert ebi1 2x clock for all channels. 0x1: invert 0x0: Not invert

EBI1_CLK_CTL (cont.)

Bits	Name	Description
4	CH0_CLK_BRANCH_ENA	Enable for ebi1 2X clock branch for channel 0 ebi1. Also will enable the EBI1 frequency switch FSM clock. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902DF0 EBI1_FRQSW_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x100

This register contains controls which are specified to EBI1 frequency switching state machine and switching logic. It contains the reset and enable of the state machine and addition delay setting for the wait counter that times the actual switching of the hm_arm_clk_ctl block.

EBI1_FRQSW_CTL

Bits	Name	Description
31:10	RESERVED_BITS31_10	RESERVED
9	CH1_ENA	When this bit is set (1) the FSM will complete the frequency switch handshake with EBI1 CH1. 0x0: Disable EBI1 CH1 FRQSW 0x1: Enable EBI1 CH1 FRQSW
8	CH0_ENA	When this bit is set (1) the FSM will complete the frequency switch handshake with EBI1 CH0. 0x0: Disable EBI1 CH0 FRQSW 0x1: Enable EBI1 CH0 FRQSW
7:6	RESERVED_BITS7_6	RESERVED
5:2	ADDITION_FRQSW_WAIT_DELAY	This is an additional delay value that is added to the default delay value of 2 for the hm_arm_clk_ctl clock switching delay wait counter. A zero value means the only clock switch delay is 2 DDR 1X clock cycles.
1	FSM_RESET	EBI1 frequency switch state machine reset
0	FSM_ENA	EBI1 frequency switch state machine enable

0x00902DF4 EBI1_FRQSW_STATUS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

This register contains some status for the EBI1 frequency switching logic. A switch completion status and a report of the final NBID select going to hm_arm_clk_ctl can be obtained from reading this register.

NOTE Prior to issuing the next frequency switch command by toggling the NBID_SEL bit in EBI1_CLK_SRC_CTL register, Software must first write to this register to clear the FRQSW_CMPLT bit.

EBI1_FRQSW_STATUS

Bits	Name	Description
31:2	RESERVED_BITS31_2	RESERVED
1	FSM_NBID_SEL	Internal FSM nbid_sel value (Read ONLY). 0x0: nbid0 0x1: nbid1
0	FRQSW_CMPLT	Frequency switch complete frq. (Software can write this bit)

0x00902DF8 EBI1_FRQSW_REQ_ACK_TIMER

Type: Read
Clock: SFPB_HCLK
Reset State: 0x0

This register is read only and contains the timer value for the duration betwen the rising of the REQ from the frequency switching state machine to the completion of the switching cycle via a deassertion of the ACK from the HSDDRX controller for the last switching command.

EBI1_FRQSW_REQ_ACK_TIMER

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7:0	REQ_ACK_TIMER	Timer for REQ to ACK duration.

0x00902DFC EBI1_XO_SRC_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the generation of cc_ebi1_ch0_ca_xo_src, cc_ebi1_ch0_dq_xo_src, cc_ebi1_ch1_ca_xo_src and cc_ebi1_ch1_dq_xo_src. It provides enable and clock inversion to the branch, and also contains controls to the selection of the XO sources.

EBI1_XO_SRC_CTL

Bits	Name	Description
31:15	RESERVED_BITS31_15	RESERVED
14	CH1_CA_CLK_GATE_ENA	Enable for dynamic clock gating for EBI1 XO clock for CH1 CA. 0x0: Disable 0x1: Enable
13	CH1_CA_CLK_INV	This bit is used to invert the EBI1 XO clock for CH1 CA. 0x1: Inverted 0x0: Not inverted
12	CH1_CA_CLK_BRANCH_ENA	This bit is used to enable the EBI1 XO clock branch for CH1 CA. 0x1: Enable 0x0: Diable
11	CH1_DQ_CLK_GATE_ENA	Enable for dynamic clock gating for EBI1 XO clock for CH1 DQ. 0x0: Disable 0x1: Enable
10	CH1_DQ_CLK_INV	This bit is used to invert the EBI1 XO clock for CH1 DQ. 0x1: Inverted 0x0: Not inverted
9	CH1_DQ_CLK_BRANCH_ENA	This bit is used to enable the EBI1 XO clock branch for CH1 DQ. 0x1: Enable 0x0: Diable
8	CH0_CA_CLK_GATE_ENA	Enable for dynamic clock gating for EBI1 XO clock for CH0 CA. 0x0: Disable 0x1: Enable
7	CH0_CA_CLK_INV	This bit is used to invert the EBI1 XO clock for CH0 CA. 0x1: Inverted 0x0: Not inverted
6	CH0_CA_CLK_BRANCH_ENA	This bit is used to enable the EBI1 XO clock branch for CH0 CA. 0x1: Enable 0x0: Diable
5	CH0_DQ_CLK_GATE_ENA	Enable for dynamic clock gating for EBI1 XO clock for CH0 DQ. 0x0: Disable 0x1: Enable

EBI1_XO_SRC_CTL (cont.)

Bits	Name	Description
4	CH0_DQ_CLK_INV	This bit is used to invert the EBI1 XO clock for CH0 DQ. 0x1: Inverted 0x0: Not inverted
3	CH0_DQ_CLK_BRANCH_ENA	This bit is used to enable the EBI1 XO clock branch for CH0 DQ. 0x1: Enable 0x0: Diable
2	CLK_INV	This bit is used to invert the EBI1 XO clock. 0x1: Inverted 0x0: Not inverted
1	CLK_BRANCH_ENA	This bit is used to enable the EBI1 XO clock branch. 0x1: Enable 0x0: Diable
0	SRC_SEL	This field selects which XO to drive EBI1 XO src clock. 0x0: PXO 0x1: MXO

0x00902E00 SFAB_SMPSS_S_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of cc_sfab_smpss_s_hclk. It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

SFAB_SMPSS_S_HCLK_CTL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7	ASYNC_RESET	Async reset for SMPSS System fabric slave AHB port clock. domain 0x1: Active 0x0: Not Active
6	FABRIC_CLK_GATE_ENA	Enable for dynamic clock gating. 0x0: Disable 0x1: Enable

SFAB_SMPSS_S_HCLK_CTL (cont.)

Bits	Name	Description
5	CLK_INV	This bit is used to invert sfab_smpss_s_hclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for sfab_smpss_s_hclk clock branch. This clock is votable. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00902E60 SCSS_DBG_STATUS_REQ

Type: Read
Clock: SFPB_HCLK
Reset State: 0x0000_0000

This register constains Scorpion core debug status.

.

SCSS_DBG_STATUS_REQ

Bits	Name	Description
2	SC_DBG_CPU1_CORE_PWR_UP_REQ	Request to keep Scorpion Core1 power domain up and associated clocks running. 0x1: Enable
1	SC_DBG_CPU0_CORE_PWR_UP_REQ	Request to keep Scorpion Core0 power domain up and associated clocks running. 0x1: Enable
0	SC_DBG_SYS_PWR_UP_REQ	Request to keep Scorpion system power domain up and associated clocks running. 0x1: Enable

0x00902E64 SCSS_DBG_STATUS_CORE_PWRDUP

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

This register contains power state of the Scorpion cores and should only be reset duirng true power on condition.

.

SCSS_DBG_STATUS_CORE_PWRDUP

Bits	Name	Description
31:2	RESERVED_BITS31_2	RESERVED
1	SC_CORE1_POWER_RAIL_UP	Status which indicates the power status of Scorpion core1 power regime. 0x1: power_up (Scorpion core power rail is up.) 0x0: power_down (Scorpion core power rail is down.)
0	SC_CORE0_POWER_RAIL_UP	Status which indicates the power status of Scorpion core0 power regime. 0x1: power_up (Scorpion core power rail is up.) 0x0: power_down (Scorpion core power rail is down.)

0x00902E80 PRNG_CLK_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0000

The PRNG_CLK_NS register provides controls to the branch cell used to generate CC_PRNG_CLK. The controls include source select, source divide, root clock enable and inversion of CC_PRNG_CLK. This register also control software assertion of the asynchronous reset for the PRNG clock domain. The branch enable of PRNG clock is votable for multiple master. Therefore, this branch enable control will be located in the individual master's clock voting registers.

NOTE The combined enable vote for the clock branch will also enable the clock root. Therefore, the software root clock enable in this register does not have sole control for the enabling of the clock root.

PRNG_CLK_NS

Bits	Name	Description
31:13	RESERVED_BITS31_13	RESERVED
12	ASYNC_RESET	Async reset for PRNG clock domain. 0x1: Active 0x0: Not Active
11	CLK_ROOT_ENA	Enable for prng_clk clock root. NOTE: This bit does not have sole control of the disabling of the clock root. The voting of the clock branch enable also affect the enabling of the clock root. In addition, the root cannot be disabled if the downstream CXC is still running. 0x1: Enable 0x0: Disable

PRNG_CLK_NS (cont.)

0x00902EE0 GLOBAL_BUS_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to globally enable/disable SFAB, AFAB, CFPB and SPS clock branches and hardware clock gating.

NOTE This register only controls clock branches that are generated within the Global Clock Controller. A number of clocks that connect to the fabrics are generated from other clock controllers and are not manipulated by this register. Additionally, some clock branches generated within the Global Clock Controller may be asynchronous to the buses and have been intentionally omitted from this feature.

NOTE The following clock branches are affected:

NOTE Apps FABRIC: afab_core_clk, cc_afab_axi_s0_fclk, cc_afab_axi_s1_fclk, cc_afab_axi_s2_fclk, cc_afab_axi_s3_fclk, cc_afab_axi_s4_fclk, afab_ebi1_ch0_aclk, afab_ebi1_ch1_aclk, spdm_cy_port0_clk_src, cc_sc_aclk

NOTE System FABRIC: sfab_core_clk, cc_sfab_axi_s0_fclk, cc_sfab_axi_s1_fclk, cc_sfab_axi_s2_fclk, cc_sfab_axi_s3_fclk, cc_sfab_axi_s4_fclk, cc_sfab_ahb_s0_fclk, cc_sfab_ahb_s1_fclk, cc_sfab_ahb_s2_fclk, cc_sfab_ahb_s3_fclk, cc_sfab_ahb_s4_fclk, cc_sfab_ahb_s5_fclk, cc_sfab_ahb_s6_fclk, cc_sfab_ahb_s7_fclk, cc_sfab_ahb_s8_fclk, afab_sfab_m0_aclk, afab_sfab_m1_aclk, sfab_afab_m_aclk, cc_sfab_adm0_m0_aclk, cc_sfab_adm0_m1_aclk, cc_sfab_adm0_m2_hclk, cc_sfab_lpass_q6_aclk, cc_sfab_mss_m_aclk, cc_sfab_mss_s_hclk, cc_mss_s_hclk, cc_sfab_mss_q6_sw_aclk, cc_sfab_mss_q6_fw_aclk, cc_sfab_usb3_m_aclk, cc_qdss_stm_clk, cc_mss_xpu_clk, spdm_cy_port1_clk_src, cc_sfab_smpss_s_hclk, cc_sc_hclk, cc_sfab_cfpb_m_hclk, cc_cfpb_master_hclk,

0x00902F20 PLL11_DIV_SRC_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x04

PLL11 (EBI1 DDR PLL) aux output will be used as a possible source for many of the clock generation. Before sending this source to all the generators, it first goes through a divider in order to divider down the frequency of this clock. This register provides the controls for this divider. This register also provides a reset to reset the divider. The proper usage of this is that the divider should be held in reset state when PLL11 aux output are being enable. Once PLL11 aux output is enabled, the reset to the divider can be removed.

Clock: SFPB_HCLK
Reset State: 0x00

This register provides the control for enabling and inverting the SPDM CY port6 clock. SPDM CY port 6 clock is a divided version of SCPLL1 aux output clock. We must enable the AUX source output of SCPLL1 as well in order to see this clock properly.

SPDM_CY_PORT6_CLK_CTL

Bits	Name	Description
31:6	RESERVED_BITS31_6	RESERVED
5	CLK_INV	This bit is used to invert the clock. 0x1: Inverted 0x0: Not inverted

SPDM_CY_PORT6_CLK_CTL (cont.)

Bits	Name	Description
4	CLK_BRANCH_ENA	This bit is used to enable the clock branch. 0x1: Enable 0x0: Diable
3:1	RESERVED_BITS3_1	RESERVED
0	SRC_SEL	This bit selects between SCPLL1 aux output or PXO clock. 0x1: SCPLL1_aux 0x0: PXO (default)

0x00902F7C SPDM_CY_PORT7_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides the control for enabling and inverting the SPDM CY port7 clock. SPDM CY port 7 clock is a divided version of SCPLL2 aux output clock. We must enable the AUX source output of SCPLL2 as well in order to see this clock properly.

SPDM_CY_PORT7_CLK_CTL

Bits	Name	Description
31:6	RESERVED_BITS31_6	RESERVED
5	CLK_INV	This bit is used to invert the clock. 0x1: Inverted 0x0: Not inverted
4	CLK_BRANCH_ENA	This bit is used to enable the clock branch. 0x1: Enable 0x0: Diable
3:1	RESERVED_BITS3_1	RESERVED
0	SRC_SEL	This bit selects between SCPLL2 aux output or PXO clock. 0x1: SCPLL2_aux 0x0: PXO (default)

0x00902F80 RESET_ALL

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0

This register controls the sw_ares_all. "sw_ares_all" is a means for SW to assert all "reset" bits for various blocks/bridges/cores which are under SW control in one-shot WITHOUT impacting the clock control's internal reset. With this bit, we can maintain mission mode speeds while reseting.

RESET_ALL

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	RESET_ALL	Setting this bit will trigger software reset to everything on chip 0x1: Active

0x00902F84 RESET_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: X

The RESET_STATUS register indicates the source of the last reset.

NOTE Since this register reflects the source of the last reset, its Reset State cannot be defined since the source of the reset can not be known before it occurs. Typically, the RESET_STATUS value will be 0x4 indicating that the Security Control module was the last element to trigger a Power On Reset.

RESET_STATUS

Bits	Name	Description
31:4	RESERVED_BITS31_4	RESERVED
3:0	STATUS	The source fo the last reset. 0x0: RESIN_N 0x1: WDOG_EXPIRED 0x2: MPM_PU_RESET 0x3: SRST (pi_srst_n NAND qdss_srst_n) 0x4: Security control power on reset 0x8: QDSS_SRST_N

0x00902FA0 CLK_TEST

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x00

The CLK_TEST register is used for conrotrolling the clock debug bus and generation of the debug clocks.

CLK_TEST

Bits	Name	Description
31:29	RESERVED_BITS31_29	RESERVED
28:27	HS_DBG_OUTPUT_DIV	Select Divide ratio for high speed debug clock output divide. 0x0: Divide-1 0x1: Divide-2 0x2: Divide-3 0x3: Divide-4
26	RING_OSC_DBG_SEL	Select between ring_osc_clk or dbg_hs_clk Set (1) to this bit to enable the test TCXO counter and test clock counter to check the function of the high speed debug clock. Clear (0) to this bit to select the ring oscillator clock source instead. 0x1: cc_dbg_hs_clk 0x0: cc_ringosc_clk
25	SC_LEAF_CLK_INV	Set (1) this bit to invert the Scorpion high-speed leaf debug clock. 0x1: Inverted 0x0: Not inverted
24	SC_LEAF_CLK_ENA	This bit is used to enable the SMPSS debug clocks. Set (1) this bit to enable the Scorpion high-speed leaf debug cloc. 0x1: Enable 0x0: Diable
23	TEST_BUS_ENA	This bit is used to enable the debug bus. When disable, the debug bus coming out of clock control will be zero. 0x1: Enable 0x0: Diable

0x00902FA4 PLLTEST_PAD_CFG

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x058016

The PLLTEST_PAD_CFG register is used to configure the PLLTEST DE pad. By default, CORE_IE_N is set as enabled so that a test clock can be driven into the chip for sourcing the ACC clock in production vector.

PLLTEST_PAD_CFG

Bits	Name	Description

PLLTEST_PAD_CFG (cont.)

Bits	Name	Description
2:0	OUT_SEL1	NOTE: The signals below are selected when OUT_SEL2 and OUT_SEL are '000' PLLTEST output muxing 0x0: This selects all the signals given under OUT_SEL 0x1: GND_TIE_1 0x2: pll13_out_test 0x3: pxo_clk_src 0x4: GND_TIE_2 0x5: scpll_droop_test_se (selected by DROOP_SEL) 0x6: pll14_out_test 0x7: mmcc_pll3_out_test

0x00902FA8 CLKTEST_PAD_CFG

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x08000

The CLKTEST_PAD_CFG register is used to configure the CLKTEST pad.

CLKTEST_PAD_CFG

Bits	Name	Description
31:17	RESERVED_BITS31_17	RESERVED
16:15	PULL_SE	These bits are used to set the single-ended pad pull-state. 0x0: None 0x1: Pulldown 0x2: Keep 0x3: Pull Up
14	CORE_IE	This bit is used to enable the single-ended input path. 0x1: Enabled 0x0: Disable
13	SE_OE	This bit is used to enable the single-ended output pad. 0x1: Enabled 0x0: Disable
12	RESERVED_BIT12	RESERVED
11:9	OUT_SEL_SINGLE	These bits are used to select the single-ended output signal.
8:5	RESERVED_BITS8_5	RESERVED
4:2	CORE_HDRIVE	These bits are used to configure the output drive strength. This is hard-wired to 24 mA drive strength.
1:0	RESERVED_BITS1_0	RESERVED

0x00902FAC JITTER_PROBE

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0xFF

Jitter probe enable and init counter value. See PLLTEST_PAD_CFG for Jitter probe reference clock selection.

JITTER_PROBE

Bits	Name	Description
31:9	RESERVED_BITS31_9	RESERVED
8	EN	Enable of the jitter probe macro. 0x1: Enabled 0x0: Disabled
7:0	INIT_COUNTER	Initial value of bit 8 counter.

0x00902FB0 JITTER_PROBE_VAL

Type: Read
Clock: SFPB_HCLK
Reset State: 0x0

Jitter probe read value

JITTER_PROBE_VAL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7:0	COUNT_VALUE	8 bit value represents the reference clock period in terms of half FO 1.3 inv delay under the operating PVT condition.

0x00902FC0 CLK_HALT_AFAB_SFAB_STATEA

Type: Read
Clock: SFPB_HCLK
Reset State: 0x00

The CLK_HALT_AFAB_SFAB_STATEA is used to indicate the halt state of the Application and system clocks. There are 2 parts, A and B. Each bit indicates the halt state of the corresponding clock branch. A set (1) bit indicates that the clock branch is halted (disabled or *_clk_off=1).

CLK_HALT_AFAB_SFAB_STATEA

0x00902FE0 RPM_CLK_BRANCH_ENA_VOTE

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0380

The RPM_CLK_BRANCH_ENA_VOTE register is the clock enable votes dedicated to RPM ARM7 for clocks that are votable. The vote for clock branch enables is only a vote for ON scheme (The clock will be disabled only if all Masters vote for OFF). RPM ARM7 votes are considered to be the main vote for all the votable clocks.

The votable clocks include:

- Scorpion AXI and AHB clocks -- Voting only with RPM, and Scorpion Core 0 and 1
- ADM0 and ADM1 core clocks and pbus clocks
- RPM message ram clock
- PMIC SSBI2, arbitor 0 and 1 hclk
- PRNG clock

Some bits in this register are set (1) on RESOUT to allow the chip to function only at a basic start-up level. All clock branches are enabled (active) and operating at the CXO frequency during RESOUT. The enable signals do not take effect until the RESOUT is de-asserted.

Set (1) enables the corresponding clock branch.

Clear (0) disables the corresponding clock branch.

RPM_CLK_BRANCH_ENA_VOTE

Bits	Name	Description
31:13	RESERVED_BITS31_13	RESERVED
12	SC_HCLK_ENA	Enable SMPSS AHB clock. 0x1: Enabled

RPM_CLK_BRANCH_ENA_VOTE (cont.)

Bits	Name	Description
11	SC_ACLK_ENA	Enable SMPSS AXI clock. This also enables the clocks for the 3 fabric axi ports interfacing with SMPSS. 0x1: Enabled
10	PRNG_CLK_ENA	Enable for PRNG clock. 0x1: Enable
9	PMIC_ARB1_HCLK_ENA	Enable PMIC Arbiter 1 clock. 0x1: Enabled
8	PMIC_ARB0_HCLK_ENA	Enable PMIC Arbiter 0 clock. 0x1: Enabled
7	PMIC_SSBI2_CLK_ENA	Enable for PMIC SSBI2 clock. 0x1: Enable
6	RPM_MSG_RAM_HCLK_ENA	Enable for RPM message ram clock. 0x1: Enable
5:4	RESERVED_BITS5_4	RESERVED
3	ADM0_PBUS_CLK_ENA	Enable for ADM0 PBUS clock 0x1: Enable
2	ADM0_CLK_ENA	Enable ADM0 clock 0x1: Enabled
1:0	RESERVED_BITS1_0	RESERVED

0x00902FE4 RPM_CLK_SLEEP_ENA_VOTE

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0

The RPM_CLK_SLEEP_ENA_VOTE register is used to halt the corresponding clock signals when the RPM ARM7 processor goes to standby by deasserting rpm_proc_clkon signal. The value of each bit is correspondingly combined with the bit in RPM_CLK_BRANCH_ENA_VOTE register. If clock is not enabled in RPM_CLK_BRANCH_ENA register, it will NOT enable upon interrupt.

- Set (1) allows the clock to halt when RPM ARM7 goes to standby mode.
- Clear (0) does not allow the clock to halt when RPM ARM7 goes to standby mode.

RPM_CLK_SLEEP_ENA_VOTE

Bits	Name	Description
31	RPM_PROC_CLK_PRE	This field selects if RPM ARM7 clock is halted before halting others. 0x1: Enabled
30	RPM_PROC_CLK_SLEEP_ENA	Halt RPM ARM7 processor clock upon standby. When this bit is set, the clk_branch_ena bit in rpm_proc_clk_ctl register will have no affect in turning on the rpm_proc_clk. With this bit set, the rpm_proc_clk can only be turned on by programming the appropiate register in RPM to enable its processor clock. Please note that rpm_proc_clk is also conditioned on the enabling of rpm_bus_hclk first. 0x1: Enabled
29:13	RESERVED_BITS29_13	RESERVED
12	SC_HCLK_SLEEP_ENA	Halt SMPSS AHB clock upon standby. 0x1: Enabled
11	SC_ACLK_SLEEP_ENA	Halt SMPSS AXI clock upon standby. This also halts the clocks for the 3 fabric axi ports interfacing with SMPSS. 0x1: Enabled
10	PRNG_CLK_SLEEP_ENA	Haltr PRNG clock upon standby. 0x1: Enable
9	PMIC_ARB1_HCLK_SLEEP_ENA	Halt PMIC Arbiter 1 clock upon standby. 0x1: Enabled
8	PMIC_ARB0_HCLK_SLEEP_ENA	Halt PMIC Arbiter 0 clock upon standby. 0x1: Enabled
7	PMIC_SSBI2_CLK_SLEEP_ENA	Halt PMIC SSBI2 clock upon standby. 0x1: Enable

0x009030C0 PLL0_MODE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The PLL0_MODE register configures and controls PLL0 (SVS. Global Bus PLL - SR) . All register bits are cleared (0) on RESOUT.

PLL0_MODE

Bits	Name	Description
31:22	RESERVED_BITS31_22	RESERVED

PLL0_MODE (cont.)

Bits	Name	Description
21	PLL_VOTE_FSM_RESET	Resets PLL voting FSM. 0x0: De-asserts Reset to PLL voting FSM 0x1: Resets PLL voting FSM
20	PLL_VOTE_FSM_ENA	Enables PLL voting FSM. 0x0: Disabled 0x1: Enabled
19:14	PLL_BIAS_COUNT	Sets PLL bias count of PLL voting FSM.
13:8	PLL_LOCK_COUNT	Sets PLL lock time of PLL voting FSM.
7:5	RESERVED_BITS_7_5	RESERVED
4	PLL_REF_XO_SEL	Specify the reference XO to be used. 0x0: PXO (27MHz) 0x1: GND
3	PLL_PLLTEST	Set (1) this bit to enter the PLL test mode. Clear (0) this bit for the normal mode.
2	PLL_RESET_N	Low asserted reset for the digital logic in the PLL. This includes the MND counters and integer divider.
1	PLL_BYPASSNL	Clear (0) to bypass the PLL (PLLOUT is then identical to the input reference). Set (1) to use the PLL. Default is clear (0) at RESOUT (different from previous APQs).
0	PLL_OUTCTRL	Set (1) to activate the PLL's outputs (the analog circuitry is active but the output is not). Set (1) will enable the following PLL's outputs: PLLOUT_LV_MAIN (if MAIN output enabled PLL0_CONFIG[23]) PLLOUT_LV_BIST (If BIST output enabled PLL0_TEST_CTL[13]) PLLOUT_LV_AUX (If AUX output enabled PLL0_TEST_CTL[12]) Clear (0) to disable the PLL's output and save power. Clears (0) at RESOUT.

0x009030C4 PLL0_L_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The following equation (fractional division ratio) is used to calculate the PLL0 (NT PLL) output frequency:

VCO = REF * [L+(M/N)] / (R * P)

Where:

- R represents the predivider of 2
- P represents the post divider

The value of the PLL0_L_VAL register is the given value of L for that equation.

PLL0_L_VAL

Bits	Name	Description
31:10	RESERVED_BITS31_10	UNUSED (This is the original assignment before CR154463.)

12	PLLOUT_AUX_ENABLE	0x0: Disable PLLOUT_LV_AUX output. 0x1: Enable PLLOUT_LV_AUX output (if outctrl=1)
11:0	INTERNAL_BIT11_0	Bits used for PLL testing.

0x009030D4 PLL0_CONFIG

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0084248B

The PLL0_CONFIG register is used for the PLL0 (NT PLL) for:

- Enable the main output
- Set up integer or fractional mode
- Set up the Post divider ratio
- Set up the Pre-divider ratio
- Select the appropriate VCO depending on the generated frequency

PLL0_CONFIG

Bits	Name	Description
31:28	RESERVED_BITS31_28	PLL0_CONFIG(31:30) : Not Used See PLL0_L_VAL(27:26) that maps to PLL_CONFIG_CTL(27:26) PLL0_CONFIG(29) : Not Used See PLL0_L_VAL(23) that maps to PLL_CONFIG_CTL(23) PLL0_CONFIG(28) : Not Used See PLL0_L_VAL(15) that maps to PLL_CONFIG_CTL(15)
27	EARLY_OUT_ENA	PLL0_CONFIG(27) maps to PLL_CONFIG_CTL(3) PLLOUT_LV_EARLY enable 0x0: Disable 0x1: Enable
26	CLK33_OUT_SEL	Not Used
25	CLK33_OUT_ENA	Not Used
24	OUT_SEL	Not Used
23	MAIN_OUT_ENA	PLL0_CONFIG(23) maps to PLL_CONFIG_CTL(0) PLLOUT_LV_MAIN enable 0x0: Disable 0x1: Enable
22	MN_ACCUM_ENA	PLL0_CONFIG(22) maps to PLL_CONFIG_CTL(14) PLL fractional mode control 0x0: Disable 0x1: Enable
21:20	PLLOUT_DIVIDE	PLL0_CONFIG(21:20) maps to PLL_CONFIG_CTL(8:7) PLL Post-divider control 0x0: Divide by 1 (use this setting when sending reference clock to output) 0x1: Divide by 2 0x2: Divide by 4 0x3: Invalid
19	PRE_DIVIDE	PLL0_CONFIG(19) maps to PLL_CONFIG_CTL(6) PLL pre-divider control 0x0: Divide by 1 0x1: Divide by 2
18	INTERNAL_BIT18	Not Used
17:16	VCO	PLL0_CONFIG(17) maps to PLL_CONFIG_CTL(9) VCO Selection PLL0_CONFIG(16) : Not Used 0x0: Select 100 - 500 MHz VCO 0x1: Select 400 - 1400 MHz VCO

PLL0_CONFIG (cont.)

Bits	Name	Description
15	INTERNAL_BIT15	Not Used
14:0	INTERNAL_BITS14_0	Not Used

0x009030D8 PLL0_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0x00

The PLL0_STATUS register is used for reporting PLL state.

NOTE PLLs 1-2 are programmed by registers within MMSS. PLL4 is programmed by registers in LPASS.

PLL0_STATUS

Bits	Name	Description
31:17	RESERVED_BITS31_17	RESERVED
16	PLL_ACTIVE_FLAG	pll_active_flag from PLL voting FSM. It indicates when FSM has enabled the PLL and PLL should be locked.
15:0	PLL_D	PLL0_STATUS(15:1) : Unused and shorted to VSSD PLL0_STATUS(0) : Clock detect

0x009030E0 PLL5_MODE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x20

The PLL5_MODE register configures and controls PLL5 (Modem PLL0 - SR PLL). All register bits are cleared (0) on RESOUT.

PLL5_MODE

Bits	Name	Description
31:22	RESERVED_BITS31_22	RESERVED
21	PLL_VOTE_FSM_RESET	Resets PLL voting FSM 0x0: De-asserts Reset to PLL voting FSM 0x1: Resets PLL voting FSM

PLL5_MODE (cont.)

Bits	Name	Description
20	PLL_VOTE_FSM_ENA	Enables PLL voting FSM 0x0: Disabled 0x1: Enabled
19:14	PLL_BIAS_COUNT	Sets PLL bias count of PLL voting FSM
13:8	PLL_LOCK_COUNT	Sets PLL lock time of PLL voting FSM
7:6	RESERVED_BITS7_6	RESERVED
5:4	PLL_REF_XO_SEL	Specify the reference XO to be used. 0x0: PXO 0x1: GND 0x2: CXO 0x3: GND_TIE
3	PLL_PLLTEST	Set(1) this bit to enter the PLL test mode. Clear (0) this bit for the normal mode.
2	PLL_RESET_N	Low asserted reset for the digital logic in the PLL. This includes the MND counters and integer divider.
1	PLL_BYPASSNL	lear (0) at RESOUT (different from previous APQs).
0	PLL_OUTCTRL	Set (1) to activate the PLL's outputs (the analog circuitry is active but the output is not). Set (1) will enable the following PLL's outputs: PLLOUT_LV_MAIN (if MAIN output enabled PLL5_CONFIG[23]) PLLOUT_LV_BIST (If BIST output enabled PLL5_TEST_CTL[13]) PLLOUT_LV_AUX (If AUX output enabled PLL5_TEST_CTL[12]) Clear (0) to disable the PLL's output and save power. Clears (0) at RESOUT.

0x009030E4 PLL5_L_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The following equation (fractional division ratio) is used to calculate the PLL5 (NT PLL) output frequency:

VCO = REF * [L+(M/N)] / (R * P)

Where:

- R represents the predivider of 2
- P represents the post divider

The value of the PLL5_L_VAL register is the given value of L for that equation.

PLL5_L_VAL

Bits	Name	Description
31:10	RESERVED_BITS31_10	UNUSED (This is the original assignment before CR154463.)
31	ICP_TST_EN	PLL_TEST_CTL(9) Charge pump test current control. 0x0: Disable 0x1: Enable
27:26	NMOSC_FREQ_CTL	PLL_CONFIG_CTL(27:26) 0x0: Highest (2.8 GHz at TT / 1.05V /40C) 0x1: 1/2 highest 0x2: 1/3 highest 0x3: 1/4 highest
25:24	PFD_DZSEL	PLL_CONFIG_CTL(25:24) PFD reset pulse width adjustment. 0x0: 1x delay 0x1: 2x delay 0x2: 3x delay 0x3: 4x delay
23	NMOSC_EN	PLL_CONFIG_CTL(23) Noise measurement oscillator control. 0x0: Disable 0x1: Enable
21:20	ICP_DIV	PLL_CONFIG_CTL(21:20) Charge pump bias mirror multiplication factor. 0x0: 1 0x1: 3/2 0x2: 7/4 0x3: 9/4
19:18	IREG_DIV	PLL_CONFIG_CTL(19:18) Regulator bias mirror multiplication factor. 0x0: 1 0x1: 7/5 0x2: 9/5 0x3: 11/5
17:16	CUSEL	PLL_CONFIG_CTL(17:16) VCO decoupling cap unit size. 0x0: 125 fF 0x1: 250 fF 0x2: 375 fF 0x3: 500 fF

PLL5_L_VAL (cont.)

Bits	Name	Description
15	REF_MODE	PLL_CONFIG_CTL(15) Reference circuit mode 0x0: Bandgap mode (seed currents sourced from bandgap circuit and Nwell reference circuit active). 0x1: Supply independent mode (seed currents sourced from supply independent circuit amd Nwell reference pulled to VDDA)
14	PLLOUT_LV_TEST	PLL_TEST_CTL(14) PLLOUT_LV_TEST source selection 0x0: PLL output clock 0x1: Noise measurement oscillator
13:12	CFG_LOCKDET	PLL_CONFIG_CTL(13:12) Lock detector phase error threshold 0x0: 2 pi /7 0x1: 2 pi /15 0x2: 2 pi /23 0x3: 2 pi /31
11	FORCE_ISEED	PLL_CONFIG_CTL(11) Seed current control 0x0: Turn off seed currents when clock is detected 0x1: Keep seed currents on at all times
9:0	PLL_L	This register contains the 10-bit L value in the PLL0's fractional division ratio.

0x009030E8 PLL5_M_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The value of the PLL5_M_VAL register is the given value of M for the fractional division ratio.

PLL5_M_VAL

Bits	Name	Description
31:19	RESERVED_BITS31_19	UNUSED
18:0	PLL_M	This register contains the 19-bit M value of the PLLn's numerator value in the fractional division ratio.

0x009030EC PLL5_N_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x1

The value of the PLL5_N_VAL register is the given value of N for the fractional division ratio.

PLL5_N_VAL

Bits	Name	Description
31:19	RESERVED_BITS31_19	UNUSED
18:0	PLL_N	This register contains the 19-bit N value of the PLLn's denominator value in the fractional division ratio.

0x009030F0 PLL5_TEST_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The PLL5_TEST_CTL register is used to enable the TEST, BIST and AUX outputs of PLL5 (SR PLL). The field descriptions show the mapping from 45nm NT wrapper PLL5_TEST_CTL register to SR PLL inputs, PLL_TEST_CTL and PLL_CONFIG_CTL. Some bits of PLL_TEST_CTL and PLL_CONFIG_CTL come from PLL5_L_VAL (CR154463).

PLL5_TEST_CTL

0x009030F8 PLL5_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0x00

the PLL5_STATUS register is used for reporting PLL state.

PLL5_STATUS

Bits	Name	Description
31:17	RESERVED_BITS31_17	RESERVED
16	PLL_ACTIVE_FLAG	pll_active_flag from PLL voting FSM. It indicates when FSM has enabled the PLL and PLL should be locked.
15:0	PLL_D	PLL5_STATUS(15:1) : Unused and shorted to VSSD PLL5_STATUS(0) : Clock detect

0x00903140 PLL8_MODE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The PLL8_MODE register configures and controls PLL8 (SPS PLL - SR PLL). All register bits are cleared (0) on RESOUT.

PLL8_MODE

Bits	Name	Description
31:22	RESERVED_BITS31_22	RESERVED
21	PLL_VOTE_FSM_RESET	Resets PLL voting FSM. 0x0: De-asserts Reset to PLL voting FSM 0x1: Resets PLL voting FSM
20	PLL_VOTE_FSM_ENA	Enables PLL voting FSM. 0x0: Disabled 0x1: Enabled
19:14	PLL_BIAS_COUNT	Sets PLL bias count of PLL voting FSM.
13:8	PLL_LOCK_COUNT	Sets PLL lock time of PLL voting FSM.
7:5	RESERVED_BITS_7_5	RESERVED
4	PLL_REF_XO_SEL	Specify the reference XO to be used. 0x0: PXO (27MHz) 0x1: GND
3	PLL_PLLTEST	Set (1) this bit to enter the PLL test mode. Clear (0) this bit for the normal mode.
2	PLL_RESET_N	Low asserted reset for the digital logic in the PLL. This includes the MND counters and integer divider.
1	PLL_BYPASSNL	Clear (0) to bypass the PLL (PLLOUT is then identical to the input reference). Set (1) to use the PLL. Default is clear (0) at RESOUT (different from previous APQs)

PLL8_MODE (cont.)

Bits	Name	Description
0	PLL_OUTCTRL	Set (1) to activate the PLL's outputs (the analog circuitry is active - but the output is not). Set (1) will enable the following PLL's outputs: PLLOUT_LV_MAIN (if MAIN output enabled PLL8_CONFIG[23])PLLOUT_LV_BIST (If BIST output enabled PLL8_TEST_CTL[13]) PLLOUT_LV_AUX (If AUX output enabled PLL8_TEST_CTL[12]) Clear (0) to disable the PLL's output and save power. Clears (0) at RESOUT.

0x00903144 PLL8_L_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The following equation (fractional division ratio) is used to calculate the PLL8 (NT PLL) output frequency:

VCO = REF * [L+(M/N)] / (R * P)

Where:

- R represents the predivider of 2
- P represents the post divider

The value of the PLL8_L_VAL register is the given value of L for that equation.

0x00903154 PLL8_CONFIG

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0084248B

The PLL8_CONFIG register is used for the PLL8 (NT PLL) to:

- Enable the main output
- Setup integer or fractional mode
- Setup the Post divider ratio
- Setup the Pre-divider ratio
- Select the appropriate VCO depending on the generated frequency

The field descriptions show the mapping from 45nm NT wrapper PLL8_CONFIG register to SR PLL input, PLL_CONFIG_CTL. Some bits of PLL_CONFIG_CTL come from PLL8_TEST_CTL and PLL8_L_VAL (CR154463).

PLL8_CONFIG

Bits	Name	Description
31:28	RESERVED_BITS31_28	PLL8_CONFIG(31:30) : Not Used See PLL8_L_VAL(27:26) that maps to PLL_CONFIG_CTL(27:26) PLL8_CONFIG(29) : Not Used See PLL8_L_VAL(23) that maps to PLL_CONFIG_CTL(23) PLL8_CONFIG(28) : Not Used See PLL8_L_VAL(15) that maps to PLL_CONFIG_CTL(15)

PLL8_CONFIG (cont.)

Bits	Name	Description
27	EARLY_OUT_ENA	PLL8_CONFIG(27) maps to PLL_CONFIG_CTL(3) PLLOUT_LV_EARLY enable 0x0: Disable 0x1: Enable
26	CLK33_OUT_SEL	Not Used
25	CLK33_OUT_ENA	Not Used
24	OUT_SEL	Not Used
23	MAIN_OUT_ENA	PLL8_CONFIG(23) maps to PLL_CONFIG_CTL(0) PLLOUT_LV_MAIN enable 0x0: Disable 0x1: Enable
22	MN_ACCUM_ENA	PLL8_CONFIG(22) maps to PLL_CONFIG_CTL(14) PLL fractional mode control 0x0: Disable 0x1: Enable
21:20	PLLOUT_DIVIDE	PLL8_CONFIG(21:20) maps to PLL_CONFIG_CTL(8:7) PLL Post-divider control 0x0: Divide by 1 (use this setting when sending reference clock to output) 0x1: Divide by 2 0x2: Divide by 4 0x3: Invalid
19	PRE_DIVIDE	PLL8_CONFIG(19) maps to PLL_CONFIG_CTL(6) PLL pre-divider control 0x0: Divide by 1 0x1: Divide by 2
18	INTERNAL_BIT18	Not Used
17:16	VCO	PLL8_CONFIG(17) maps to PLL_CONFIG_CTL(9) VCO Selection PLL8_CONFIG(16) : Not Used 0x0: Select 100 - 500 MHz VCO 0x1: Select 400 - 1400 MHz VCO
15	INTERNAL_BIT15	Not Used
14:0	INTERNAL_BITS14_0	Not Used

0x00903158 PLL8_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0x00

The PLL8_STATUS register is used to report the PLL state.

PLL8_STATUS

Bits	Name	Description
31:17	RESERVED_BITS31_17	RESERVED
16	PLL_ACTIVE_FLAG	pll_active_flag from PLL voting FSM. It indicates when FSM has enabled the PLL and PLL should be locked.
15:0	PLL_D	PLL8_STATUS(15:1) : Unused and shorted to VSSD PLL8_STATUS(0) : Clock detect

0x00903160 GPLL1_MODE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The GPLL1_MODE register configures and controls GPLL1. All register bits are cleared (0) on RESOUT.

GPLL1_MODE

Bits	Name	Description
31:22	RESERVED_BITS31_22	RESERVED
21	PLL_VOTE_FSM_RESET	Resets PLL voting FSM. 0x0: De-asserts Reset to PLL voting FSM 0x1: Resets PLL voting FSM
20	PLL_VOTE_FSM_ENA	Enables PLL voting FSM. 0x0: Disabled 0x1: Enabled
19:14	PLL_BIAS_COUNT	Sets PLL bias count of PLL voting FSM.
13:8	PLL_LOCK_COUNT	Sets PLL lock time of PLL voting FSM.
7:5	RESERVED_BITS_7_5	RESERVED
4	PLL_REF_XO_SEL	Specify the reference XO to be used. 0x0: PXO 0x1: MXO

GPLL1_MODE (cont.)

Bits	Name	Description
3	PLL_PLLTEST	Set(1) this bit to enter the PLL test mode. Clear (0) this bit for the normal mode.
2	PLL_RESET_N	Low asserted reset for the digital logic in the PLL. This includes the MND counters and integer divider.
1	PLL_BYPASSNL	Clear (0) to bypass the PLL (PLLOUT is then identical to the input reference). Set (1) to use the PLL. Default is clear (0) at RESOUT (different from previous APQs)
0	PLL_OUTCTRL	Set (1) to activate the PLL's outputs (the analog circuitry is active but the output is not). Set (1) will enable the following PLL's outputs: PLLOUT_LV_MAIN (if MAIN output enabled GPLL1_CONFIG[24]) PLLOUT_LV_BIST (If BIST output enabled GPLL1_TEST_CTL[13]) PLLOUT_LV_AUX (If AUX output enabled GPLL1_TEST_CTL[12]) Clear (0) to disable the PLL's output and save power. Clears (0) at RESOUT.

0x00903164 GPLL1_L_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The following equation (fractional division ratio) is used to calculate the GPLL1 (SR2 PLL) output frequency:

VCO = REF * [L+(M/N)] / (R * P)

Where:

- R represents the predivider of 2
- P represents the post divider.

The value of the GPLL1_L_VAL register is the given value of L for that equation.

GPLL1_L_VAL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED (this is the original assignment before CR154463)

GPLL1_L_VAL (cont.)

Bits	Name	Description
31	LFSR_DITHER_EN	PLL_CONFIG_CTL(31) 0x0: LFSR dither disabled 0x1: LFSR dither enabled (use this in conjunction with MASH11fracN mode)
30:29	LOCK_DET_CFG	PLL_CONFIG_CTL(30:29) Lock detection circuit configuration 0x0: Threshold = 2 pi / 7 0x1: Threshold = 2 pi / 15 0x2: Threshold = 2 pi / 23 0x3: Threshold = 2 pi / 31
28	FRACN_MODE_CTL	PLL_CONFIG_CTL(24) Frac-N mode control 0x0: MN- Accumulator FracN mode (legacy) 0x1: Mash11 FracN mode (Use PLL_N_val = 19'hFFFF in this mode for lowest inband dither power. Use PLL_CONFIG_CTL3:2 = 2'b0 in this mode for best quantization noise filtering)
27:26	OVER_VOLTAGE_CFG	PLL_CONFIG_CTL(27:26) Over voltage detect counter configuration 0x0: Detect at count = 0 0x1: Detect at count = 4 0x2: Detect at count = 8 0x3: Detect at count = 32
25	OVER_VOLTAGE_EN	PLL_CONFIG_CTL(25) 0x0: Over voltage detect counter is enabled 0x1: Over voltage detect counter is disabled
16:14	RESERVED_16_14	PLL_TEST_CTL (31:29) RESERVED
13	VCO_DCAPS_EN	PLL_CONFIG_CTL(13) Disable internally programmed VCO decoupling caps 0x0: Automatically controlled programmable VCO dcaps 0x1: Disable programmable VCO dcaps
11	REG_BIAS_CFG_B1	PLL_CONFIG_CTL(11) Bit1 of regulator stage 2 bias current setting
10	ADZ_CFG_B0	PLL_CONFIG_CTL(6) Bit0 of anti dead zone programmable input /filter phase offset control
8	VREG_ATEST_CTL	PLL_TEST_CTL (0) 0x0: Disconnect VREG to test op amp input 0x1: Connect VREG to test op amp input - observed on ATEST0
7:0	PLL_L	This register contains the 10-bit L value in the PLL's fractional division ratio.

0x00903168 GPLL1_M_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The value of the GPLL1_M_VAL register is the given value of M for the fractional division ratio.

GPLL1_M_VAL

Bits	Name	Description
31:19	RESERVED_BITS31_19	UNUSED (This is the original assignment before CR154463.)
31:30	NMOSC_FREQ_CTL	PLL_CONFIG_CTL(27:26) for LPA PLL - Pll4 0x0: Highest (2.8 GHz at TT / 1.05V /40C) 0x1: 1/2 highest 0x2: 1/3 highest 0x3: 1/4 highest
29	NMOSC_EN	PLL_CONFIG_CTL(23) for LPA PLL - Pll4 Noise measurement oscillator control 0x0: Disable 0x1: Enable
28	REF_MODE	PLL_CONFIG_CTL(15) for LPA PLL - Pll4 Reference circuit mode 0x0: Bandgap mode (seed currents sourced from bandgap circuit and Nwell reference circuit active) 0x1: Supply independent mode (seed currents sourced from supply independent circuit amd Nwell reference pulled to VDDA)
27	LVEARLY_EN	PLL_CONFIG_CTL(3) for LPA PLL - Pll4 PLLOUT_LV_EARLY enable 0x0: Disable 0x1: Enable
26	PLLOUT_LV_TEST	PLL_TEST_CTL(14) for LPA PLL - Pll4 PLLOUT_LV_TEST source selection 0x0: PLL output clock 0x1: Noise measurement oscillator
25	DTEST_SEL	PLL_TEST_CTL(7) for LPA PLL - Pll4 DTEST signal select 0x0: Select clock detect signal 0x1: Select feedback divider output signal
24	BYP_TESTAMP	PLL_TEST_CTL(6) for LPA PLL - Pll4 ATEST amplifier bypass control 0x0: Do not bypass ATEST buffer amplifier 0x1: Bypass ATEST buffer amplifier

GPLL1_M_VAL (cont.)

Bits	Name	Description
18:0	PLL_M	This register contains the 19-bit M value of the PLLn's numerator value in the fractional division ratio.

0x0090316C GPLL1_N_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x01

The value of the GPLL1_N_VAL register is the given value of N for the fractional division ratio.

GPLL1_N_VAL

Bits	Name	Description
31:19	RESERVED_BITS31_19	UNUSED (This is the original assignment before CR154463.)
31:30	PFD_DZSEL	PLL_CONFIG_CTL(25:24) for LPA PLL - Pll4 PFD reset pulse width adjustment 0x0: 1x delay 0x1: 2x delay 0x2: 3x delay 0x3: 4x delay
29:28	ICP_DIV	PLL_CONFIG_CTL(21:20) for LPA PLL - Pll4 Charge pump bias mirror multiplication factor. 0x0: 1 0x1: 3/2 0x2: 7/4 0x3: 9/4
27:26	IREG_DIV	PLL_CONFIG_CTL(19:18) for LPA PLL - Pll4 Regulator bias mirror multiplication factor. 0x0: 1 0x1: 7/5 0x2: 9/5 0x3: 11/5
25:24	CUSEL	PLL_CONFIG_CTL(17:16) for LPA PLL - Pll4 VCO decoupling cap unit size. 0x0: 125 fF 0x1: 250 fF 0x2: 375 fF 0x3: 500 fF

GPLL1_N_VAL (cont.)

Bits	Name	Description
23:22	CFG_LOCKDET	PLL_CONFIG_CTL(13:12) for LPA PLL - Pll4 Lock detector phase error threshold. 0x0: 2 pi /7 0x1: 2 pi /15 0x2: 2 pi /23 0x3: 2 pi /31
21	FORCE_ISEED	PLL_CONFIG_CTL(11) for LPA PLL - Pll4 Seed current control 0x0: Turn off seed currents when clock is detected 0x1: Keep seed currents on at all times
20	ICP_TST_EN	PLL_TEST_CTL(9) for LPA PLL - Pll4 Charge pump test current control 0x0: Disable 0x1: Enable
18:0	PLL_N	This register contains the 19-bit N value of the PLLn's denominator value in the fractional division ratio.

0x00903170 GPLL1_TEST_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The GPLL1_TEST_CTL register is used to enable the TEST, BIST and AUX outputs of this PLL (SR2 PLL). The field descriptions show the mapping from 45nm NT wrapper GPLL1_TEST_CTL register to SR2 PLL inputs, PLL_TEST_CTL. Some bits of PLL_TEST_CTL and PLL_CONFIG_CTL come from GPLL1_L_VAL (CR154463).

GPLL1_TEST_CTL

Bits	Name	Description
31:29	RESERVED_BITS31_29	MMCC_PLL2_TEST_CTL(31:29) : Not Used See MMCC_PLL2_L_VAL(16:14) that maps to PLL_TEST_CTL(31:29)

GPLL1_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0x00

The GPLL1_STATUS register is used for test purposes to report PLL state.

GPLL1_STATUS

Bits	Name	Description
31:16	RESERVED_BITS31_16	RESERVED
15:0	PLL_AUTOCAL_VAL	MMCC_PLL2_STATUS(15:6) : Unused, driven low (vssd domain) MMCC_PLL2_STATUS(5:2) : Over voltage counter status MMCC_PLL2_STATUS(1) : Over voltage detect flag MMCC_PLL2_STATUS(0) : Negated of no_clock (if clock is detected, output is high)

0x00903180 EBI1_PLL_MODE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The EBI1_PLL_MODE register configures and controls EBI1_PLL (EBI1_PLL - GP3 PLL). All register bits are cleared (0) on RESOUT.

EBI1_PLL_MODE

Bits	Name	Description
31:5	RESERVED_BITS31_5	RESERVED
4	PLL_REF_XO_SEL	Specify the reference XO to be used 0x0: PXO (27MHz) 0x1: GND
3	PLL_PLLTEST	Set(1) this bit to enter the PLL test mode. Clear (0) this bit for the normal mode.
2	PLL_RESET_N	Low asserted reset for the digital logic in the PLL. This includes the MND counters and integer divider.
1	PLL_BYPASSNL	Clear (0) to bypass the PLL (PLLOUT is then identical to the input reference). Set (1) to use the PLL. Default is clear (0) at RESOUT (different from previous APQs)
0	PLL_OUTCTRL	Set (1) to activate the PLL's outputs (the analog circuitry is active but the output is not). Set (1) will enable the following PLL's outputs: PLLOUT_LV_MAIN (if MAIN output enabled EBI1_PLL_CONFIG[24]) PLLOUT_LV_BIST (If BIST output enabled EBI1_PLL_TEST_CTL[13]) PLLOUT_LV_AUX (If AUX output enabled EBI1_PLL_TEST_CTL[12]) Clear (0) to disable the PLL's output and save power. Clears (0) at RESOUT.

0x00903184 EBI1_PLL_L_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The following equation (fractional division ratio) is used to calculate the EBI1_PLL (GP3 PLL) output frequency:

VCO = REF * [L+(M/N)] / (R * P)

Where:

- R represents the predivider of 2
- P represents the post divider

The value of the EBI1_PLL_L_VAL register is the given value of L for that equation.

EBI1_PLL_L_VAL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED (This is the original assignment before CR154463.)
31	LFSR_DITHER_EN	PLL_CONFIG_CTL(31) 0x0: LFSR dither disabled 0x1: LFSR dither enabled (use this in conjunction with MASH11fracN mode)
30:29	LOCK_DET_CFG	PLL_CONFIG_CTL(30:29) Lock detection circuit configuration 0x0: Threshold = 2 pi / 7 0x1: Threshold = 2 pi / 15 0x2: Threshold = 2 pi / 23 0x3: Threshold = 2 pi / 31
28	FRACN_MODE_CTL	PLL_CONFIG_CTL(24) Frac-N mode control 0x0: MN- Accumulator FracN mode (legacy) 0x1: Mash11 FracN mode (Use PLL_N_val = 19'hFFFF in this mode for lowest inband dither power. Use PLL_CONFIG_CTL3:2 = 2'b0 in this mode for best quantization noise filtering)
27:26	OVER_VOLTAGE_CFG	PLL_CONFIG_CTL(27:26) Over voltage detect counter configuration 0x0: Detect at count = 0 0x1: Detect at count = 4 0x2: Detect at count = 8 0x3: Detect at count = 32

EBI1_PLL_L_VAL (cont.)

Bits	Name	Description
25	OVER_VOLTAGE_EN	PLL_CONFIG_CTL(25) 0x0: Over voltage detect counter is enabled 0x1: Over voltage detect counter is disabled
16:14	RESERVED_16_14	PLL_TEST_CTL (31:29) RESERVED
13	VCO_DCAPS_EN	PLL_CONFIG_CTL(13) Disable internally programmed VCO decoupling caps 0x0: Automatically controlled programmable VCO dcaps 0x1: Disable programmable VCO dcaps
11	REG_BIAS_CFG_B1	PLL_CONFIG_CTL(11) Bit1 of regulator stage 2 bias current setting
10	ADZ_CFG_B0	PLL_CONFIG_CTL(6) Bit0 of anti dead zone programmable input /filter phase offset control
8	VREG_ATEST_CTL	PLL_TEST_CTL (0) 0x0: Disconnect VREG to test op amp input 0x1: Connect VREG to test op amp input - observed on ATEST0
7:0	PLL_L	This register contains the 10-bit L value in the PLL's fractional division ratio.

0x00903188 EBI1_PLL_M_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The value of the EBI1_PLL_M_VAL register is the given value of M for the fractional division ratio.

EBI1_PLL_M_VAL

Bits	Name	Description
31:19	RESERVED_BITS31_19	UNUSED
18:0	PLL_M	This register contains the 19-bit M value of the PLLn's numerator value in the fractional division ratio.

0x0090318C EBI1_PLL_N_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x01

The value of the EBI1_PLL_N_VAL register is the given value of N for the fractional division ratio.

EBI1_PLL_N_VAL

Bits	Name	Description
31:19	RESERVED_BITS31_19	UNUSED
18:0	PLL_N	This register contains the 19-bit N value of the PLLn's denominator value in the fractional division ratio.

0x00903190 EBI1_PLL_TEST_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The EBI1_PLL_TEST_CTL register is used to enable the TEST, BIST and AUX outputs of PLL11 (SR2 PLL). The field descriptions show the mapping from 45nm NT wrapper EBI1_PLL_TEST_CTL register to SR2 PLL inputs, PLL_TEST_CTL. Some bits of PLL_TEST_CTL and PLL_CONFIG_CTL come from EBI1_PLL_L_VAL (CR154463).

EBI1_PLL_TEST_CTL

Bits	Name	Description
31:29	RESERVED_BITS31_29	EBI1_PLL_TEST_CTL(31:29) : Not Used See EBI1_PLL_L_VAL(16:14) that maps to PLL_TEST_CTL(31:29)

0x00903194 EBI1_PLL_CONFIG

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00010401

Some bits of the EBI1_PLL_CONFIG register are used for test purposes. The field descriptions show the mapping from 45nm GP3 wrapper EBI1_PLL_CONFIG register to SR2 PLL input, PLL_CONFIG_CTL. Some bits of PLL_CONFIG_CTL come from EBI1_PLL_L_VAL (CR154463).

EBI1_PLL_CONFIG

Bits	Name	Description
31:25	RESERVED_BITS31_25	EBI1_PLL_CONFIG(31:25) : Not Used See EBI1_PLL_L_VAL(31:25) that maps to PLL_CONFIG_CTL(31:25).
24	INTERNAL_BIT24	EBI1_PLL_CONFIG(24) maps to PLL_CONFIG_CTL(21) 0x0: Disable PLLOUT_LV_MAIN 0x1: Enable PLLOUT_LV_MAIN
23:22	INTERNALBITS23_22	EBI1_PLL_CONFIG(23) maps to PLL_CONFIG_CTL(18) Filter timing configuration EBI1_PLL_CONFIG(22) maps to PLL_CONFIG_CTL(22) 0x0: Filter timing driven by early reference clock 0x1: Filter timing driven by the edge that arrives first - reference / divider output 0x0: Disable PLLOUT_LV_EARLY 0x1: Enable PLLOUT_LV_EARLY
21:20	INTERNALBITS21_20	EBI1_PLL_CONFIG(21) maps to PLL_CONFIG_CTL(17) Filter timing configuration EBI1_PLL_CONFIG(20) maps to PLL_CONFIG_CTL(20) MSB (Bit1) for output clock post divide ratio. (EBI1_PLL_CONFIG(20) and EBI1_PLL_CONFIG(16) are used together) 0x0: Conventional sample reset filter - double sampling disabled 0x1: Enable double sampled filter on opposite reference clock edge, enable filter phase offset circuit. Phase offset magnitude is controlled using ADZ config bits
19:18	PLLOUT_HV_DIVIDE	EBI1_PLL_CONFIG(19:18) maps to PLL_CONFIG_CTL(16:15) Regulator stage-1 output voltage setting 0x0: Vfilt *_1 (1.4 / 1) 0x1: Vfilt *_2 (1.35 / 1) 0x2: Vfilt *_3 (1.3 / 1) 0x3: Vfilt *_4 (1.25 / 1)

EBI1_PLL_CONFIG (cont.)

Bits	Name	Description
17	INTERNAL_BIT17	EBI1_PLL_CONFIG(17) maps to PLL_CONFIG_CTL(28) MN accumulator 0x0: Disable 0x1: Enable
16	POST_DIVIDE	EBI1_PLL_CONFIG(16) maps to PLL_CONFIG_CTL(19) LSB (Bit0) for output clock post divide ratio EBI1_PLL_CONFIG(20) : EBI1_PLL_CONFIG(16) maps to PLL_CONFIG_CTL(20:19) 0x0: 1 (Use this setting when bypassing reference clock to PLL output) 0x1: 2 0x2: 4 0x3: Unused, Reserved
15	PRE_DIVIDE	EBI1_PLL_CONFIG(15) maps to PLL_CONFIG_CTL(23) CLK_REF pre-divide ratio 0x0: 1 0x1: 2
14	PLLOUT_HV_ENABLE	EBI1_PLL_CONFIG(14) maps to PLL_CONFIG_CTL(14) 0x0: Disable iseed gating 0x1: Enables no_clock signal to gate iseed current in the charge pump
13	RESERVED_BIT13	EBI1_PLL_CONFIG(13) : Not Used See EBI1_PLL_L_VAL(13) that maps to PLL_CONFIG_CTL(13).
12	INTERNAL_BIT12	EBI1_PLL_CONFIG(12) maps to PLL_CONFIG_CTL(12) Enable / Bypass for stage 1 regulator 0x0: Enable 0x1: Bypass
11	RESERVED_BIT11	EBI1_PLL_CONFIG(11) : Not Used See EBI1_PLL_L_VAL(11) that maps to PLL_CONFIG_CTL(11). (EBI1_PLL_L_VAL(11) and EBI1_PLL_CONFIG(10) are used together)
10:9	INTERNAL_BITS10_9	EBI1_PLL_CONFIG(10:9) maps to PLL_CONFIG_CTL(10:9) EBI1_PLL_CONFIG(10) is LSB (Bit0) of regulator stage 2 Bias current setting EBI1_PLL_L_VAL(11) : EBI1_PLL_CONFIG(10) maps to PLL_CONFIG_CTL(11:10) (EBI1_PLL_CONFIG(9:8) are used together) 0x0: 1x Ivco / L 0x1: 2x Ivco / L 0x2: 3x Ivco / L 0x3: 4x Ivco / L

EBI1_PLL_CONFIG (cont.)

Bits	Name	Description
8:7	VCO	EBI1_PLL_CONFIG(8:7) maps to PLL_CONFIG_CTL(8:7) EBI1_PLL_CONFIG(9:8) maps to PLL_CONFIG_CTL(9:8) Reference voltage setting for over voltage detection on stage 2 regulator output EBI1_PLL_CONFIG(7) EBI1_PLL_CONFIG(7) is MSB (bit1) of Anti dead zone programmable input / Filter phase offset control and LSB (bit0) is EBI1_PLL_L_VAL(10). EBI1_PLL_CONFIG(7) : EBI1_PLL_L_VAL(10) maps to PLL_CONFIG_CTL(7:6) 0x0: Power down over voltage detection 0x1: 1.15 / 1.8 0x2: 1.2 / 1.8 0x3: 1.25 / 1.8 0x0: 1 delay elements / Icpoffset = 0 (Tcpoffset = 0, Filter offset disabled) 0x1: 2 delay elements / Icpoffset = 0.6uA @ Fref = 20MHz, Fo = 1GHz (Tcpoffset = 250 ps) 0x2: 3 delay elements / Icpoffset = 1.2uA @ Fref = 20MHz, Fo = 1GHz (Tcpoffset = 500 ps) 0x3: 4 delay elements / Icpoffset = 4.2uA @ Fref = 20MHz, Fo = 1GHz (Tcpoffset = 1750 ps)
6	RESERVED_BIT6	EBI1_PLL_CONFIG(6) : Not Used See EBI1_PLL_L_VAL(10) that maps to PLL_CONFIG_CTL(6). (EBI1_PLL_CONFIG(7) and EBI1_PLL_L_VAL(10) are used together)
5:2	INTERNAL_BITS5_2	EBI1_PLL_CONFIG(5:4) maps to PLL_CONFIG_CTL(5:4) Iseed control for Charge pump EBI1_PLL_CONFIG(3:2) maps to PLL_CONFIG_CTL(1:0) Setting for delay in reference path. Delta t (nominal values) 0x0: 0.5x Iseed 0x1: 1x Iseed 0x2: 2x Iseed 0x3: 4x Iseed 0x0: 200 ps 0x1: 400 ps 0x2: 800 ps 0x3: 1200 ps

EBI1_PLL_CONFIG (cont.)

Bits	Name	Description
1:0	INTERNAL_BITS1_0	EBI1_PLL_CONFIG(1:0) maps to PLL_CONFIG_CTL(3:2) Current mirror for charge pump current fixed divider ratio Iout / Ivco 0x0: 1 / L (may need to use this setting at low end of VCO range) 0x1: 2 / L 0x2: 3 / L 0x3: 5 / L

0x00903198 EBI1_PLL_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0x00

The EBI1_PLL_STATUS register is used for test purposes to report PLL state.

EBI1_PLL_STATUS

Bits	Name	Description
31:16	RESERVED_BITS31_16	RESERVED
15:0	PLL_AUTOCAL_VAL	EBI1_PLL_STATUS(15:6) : Unused, driven low (vssd domain) EBI1_PLL_STATUS(5:2) : Over voltage counter status EBI1_PLL_STATUS(1) : Over voltage detect flag EBI1_PLL_STATUS(0) : Negated of no_clock (if clock is detected, output is high))

0x009031A0 RIVA_PLL_MODE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The RIVA_PLL_MODE register configures and controls RIVA_PLL (SR2 PLL). All register bits are cleared (0) on RESOUT.

RIVA_PLL_MODE

Bits	Name	Description
31:6	RESERVED_BITS31_5	RESERVED

RIVA_PLL_MODE (cont.)

Bits	Name	Description
5:4	PLL_REF_XO_SEL	Specify the reference XO to be used 0x0: PXO (27MHz) 0x1: GND 0x2: CXO 0x3: RF_24MHZ_XO_SRC
3	PLL_PLLTEST	Set (1) this bit to enter the PLL test mode. Clear (0) this bit for the normal mode.
2	PLL_RESET_N	Low asserted reset for the digital logic in the PLL. This includes the MND counters and integer divider.
1	PLL_BYPASSNL	Clear (0) to bypass the PLL (PLLOUT is then identical to the input reference). Set (1) to use the PLL. Default is clear (0) at RESOUT (different from previous APQs)
0	PLL_OUTCTRL	Set (1) to activate the PLL's outputs (the analog circuitry is active but the output is not). Set (1) will enable the following PLL's outputs: PLLOUT_LV_MAIN (if MAIN output enabled RIVA_PLL_CONFIG[24]) PLLOUT_LV_BIST (If BIST output enabled RIVA_PLL_TEST_CTL[13]) PLLOUT_LV_AUX (If AUX output enabled RIVA_PLL_TEST_CTL[12]) Clear (0) to disable the PLL's output and save power. Clears (0) at RESOUT.

0x009031A4 RIVA_PLL_L_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The following equation (fractional division ratio) is used to calculate the RIVA_PLL output frequency:

VCO = REF * [L+(M/N)] / (R * P)

Where:

- R represents the predivider of 2
- P represents the post divider

The value of the RIVA_PLL_L_VAL register is the given value of L for that equation.

RIVA_PLL_L_VAL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED (This is the original assignment before CR154463.)
31	LFSR_DITHER_EN	PLL_CONFIG_CTL(31) 0x0: LFSR dither disabled 0x1: LFSR dither enabled (use this in conjunction with MASH11fracN mode)
30:29	LOCK_DET_CFG	PLL_CONFIG_CTL(30:29) Lock detection circuit configuration 0x0: Threshold = 2 pi / 7 0x1: Threshold = 2 pi / 15 0x2: Threshold = 2 pi / 23 0x3: Threshold = 2 pi / 31

RIVA_PLL_TEST_CTL (cont.)

Bits	Name	Description
5	INTERNAL_BIT5	RIVA_PLL_TEST_CTL(5) maps to PLL_TEST_CTL(5) Current flows from AVDD (should terminate to AVSS on board). 0x0: Open test switch 0x1: Bypass ico current with external input from ATEST1 pin to bias the cp
4:1	INTERNAL_BITS4_1	RIVA_PLL_TEST_CTL(4:1) maps to PLL_TEST_CTL(4:1) RIVA_PLL_TEST_CTL(4) Current flows from VDDA (should terminate to VSSA on board). RIVA_PLL_TEST_CTL(3) RIVA_PLL_TEST_CTL(2) When set to â□□1â□□ enable switch to force external voltages from ATEST0 RIVA_PLL_TEST_CTL(1) When set to â□□1â□□ connect VINT to test op amp input - observed on ATEST0 RIVA_PLL_TEST_CTL(0) When set to â□□1â□□ connect VREG to test op amp input - observed on ATEST0 0x0: Open test switch 0x1: Enable bias circuit current to ATEST1 pin 0x0: Filter test op amp disabled 0x1: Enable the filter test opamp
0	INTERNAL_BIT0	RIVA_PLL_TEST_CTL(0) maps to PLL_TEST_CTL(12) Mux selectors for DTEST 0x0: Select C_MVAL (carry input for M-val: +1 dither) 0x1: Select NOCLKB

0x009031B4 RIVA_PLL_CONFIG

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00010401

Some bits of the RIVA_PLL_CONFIG register are used for test purposes. The field descriptions show the mapping from 45nm GP3 wrapper RIVA_PLL_CONFIG register to SR2 PLL input, PLL_CONFIG_CTL. Some bits of PLL_CONFIG_CTL come from RIVA_PLL_L_VAL (CR154463).

RIVA_PLL_CONFIG

Bits	Name	Description
31:25	RESERVED_BITS31_25	RIVA_PLL_CONFIG(31:25) : Not Used See RIVA_PLL_L_VAL(31:25) that maps to PLL_CONFIG_CTL(31:25).
24	INTERNAL_BIT24	RIVA_PLL_CONFIG(24) maps to PLL_CONFIG_CTL(21) 0x0: Disable PLLOUT_LV_MAIN 0x1: Enable PLLOUT_LV_MAIN
23:22	INTERNALBITS23_22	RIVA_PLL_CONFIG(23) maps to PLL_CONFIG_CTL(18) Filter timing configuration RIVA_PLL_CONFIG(22) maps to PLL_CONFIG_CTL(22) 0x0: Filter timing driven by early reference clock 0x1: Filter timing driven by the edge that arrives first - reference / divider output 0x0: Disable PLLOUT_LV_EARLY 0x1: Enable PLLOUT_LV_EARLY
21:20	INTERNALBITS21_20	RIVA_PLL_CONFIG(21) maps to PLL_CONFIG_CTL(17) Filter timing configuration RIVA_PLL_CONFIG(20) maps to PLL_CONFIG_CTL(20) MSB (Bit1) for output clock post divide ratio. (RIVA_PLL_CONFIG(20) and RIVA_PLL_CONFIG(16) are used together) 0x0: Conventional sample reset filter - double sampling disabled 0x1: Enable double sampled filter on opposite reference clock edge, enable filter phase offset circuit. Phase offset magnitude is controlled using ADZ config bits
19:18	PLLOUT_HV_DIVIDE	RIVA_PLL_CONFIG(19:18) maps to PLL_CONFIG_CTL(16:15) Regulator stage-1 output voltage setting 0x0: Vfilt *_1 (1.4 / 1) 0x1: Vfilt *_2 (1.35 / 1) 0x2: Vfilt *_3 (1.3 / 1) 0x3: Vfilt *_4 (1.25 / 1)
17	INTERNAL_BIT17	RIVA_PLL_CONFIG(17) maps to PLL_CONFIG_CTL(28) MN accumulator 0x0: Disable 0x1: Enable

RIVA_PLL_CONFIG (cont.)

Bits	Name	Description
16	POST_DIVIDE	RIVA_PLL_CONFIG(16) maps to PLL_CONFIG_CTL(19) LSB (Bit0) for output clock post divide ratio RIVA_PLL_CONFIG(20) : RIVA_PLL_CONFIG(16) maps to PLL_CONFIG_CTL(20:19) 0x0: 1 (Use this setting when bypassing reference clock to PLL output) 0x1: 2 0x2: 4 0x3: Unused, Reserved
15	PRE_DIVIDE	RIVA_PLL_CONFIG(15) maps to PLL_CONFIG_CTL(23) CLK_REF pre-divide ratio 0x0: 1 0x1: 2
14	PLLOUT_HV_ENABLE	RIVA_PLL_CONFIG(14) maps to PLL_CONFIG_CTL(14) 0x0: Disable iseed gating 0x1: Enables no_clock signal to gate iseed current in the charge pump

5:2	INTERNAL_BITS5_2	RIVA_PLL_CONFIG(5:4) maps to PLL_CONFIG_CTL(5:4) Iseed control for Charge pump RIVA_PLL_CONFIG(3:2) maps to PLL_CONFIG_CTL(1:0) Setting for delay in reference path. Delta t (nominal values) 0x0: 0.5x Iseed 0x1: 1x Iseed 0x2: 2x Iseed 0x3: 4x Iseed 0x0: 200 ps 0x1: 400 ps 0x2: 800 ps 0x3: 1200 ps

RIVA_PLL_CONFIG (cont.)

Bits	Name	Description
1:0	INTERNAL_BITS1_0	RIVA_PLL_CONFIG(1:0) maps to PLL_CONFIG_CTL(3:2) Current mirror for charge pump current fixed divider ratio Iout / Ivco 0x0: 1 / L (may need to use this setting at low end of VCO range) 0x1: 2 / L 0x2: 3 / L 0x3: 5 / L

0x009031B8 RIVA_PLL_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0x00

The RIVA_PLL_STATUS register is used for test purposes to report PLL state.

RIVA_PLL_STATUS

Bits	Name	Description
31:16	RESERVED_BITS31_16	RESERVED
15:0	PLL_AUTOCAL_VAL	RIVA_PLL_STATUS(15:6) : Unused, driven low (vssd domain) RIVA_PLL_STATUS(5:2) : Over voltage counter status RIVA_PLL_STATUS(1) : Over voltage detect flag RIVA_PLL_STATUS(0) : Negated of no_clock (if clock is detected, output is high)

0x009031C0 PLL14_MODE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The PLL14_MODE register configures and controls PLL14_ (SRPLL). All register bits are cleared (0) on RESOUT.

PLL14_MODE

Bits	Name	Description
31:22	RESERVED_BITS31_22	RESERVED
21	PLL_VOTE_FSM_RESET	Resets PLL voting FSM 0x0: De-asserts Reset to PLL voting FSM 0x1: Resets PLL voting FSM

PLL14_MODE (cont.)

Bits	Name	Description
20	PLL_VOTE_FSM_ENA	Enables PLL voting FSM 0x0: Disabled 0x1: Enabled
19:14	PLL_BIAS_COUNT	Sets PLL bias count of PLL voting FSM
13:8	PLL_LOCK_COUNT	Sets PLL lock time of PLL voting FSM
7:5	RESERVED_BITS_7_5	RESERVED
4	PLL_REF_XO_SEL	Specify the reference XO to be used. 0x0: PXO 0x1: CXO
3	PLL_PLLTEST	Set(1) this bit to enter the PLL test mode. Clear (0) this bit for the normal mode.
2	PLL_RESET_N	Low asserted reset for the digital logic in the PLL. This includes the MND counters and integer divider.
1	PLL_BYPASSNL	Clear (0) to bypass the PLL (PLLOUT is then identical to the input reference). Set (1) to use the PLL. Default is clear (0) at RESOUT (different from previous APQs)
0	PLL_OUTCTRL	Set (1) to activate the PLL's outputs (the analog circuitry is active but the output is not). Set (1) will enable the following PLL's outputs: PLLOUT_LV_MAIN (if MAIN output enabled PLL14_CONFIG[24]) PLLOUT_LV_BIST (If BIST output enabled PLL14_TEST_CTL[13]) PLLOUT_LV_AUX (If AUX output enabled PLL14_TEST_CTL[12]) Clear (0) to disable the PLL's output and save power. Clears (0) at RESOUT.

0x009031C4 PLL14_L_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The following equation (fractional division ratio) is used to calculate the PLL14 (SR PLL) output frequency:

VCO = REF * [L+(M/N)] / (R * P)

Where:

- R represents the predivider of 2
- P represents the post divider

The value of the PLL14_L_VAL register is the given value of L for that equation.

PLL14_L_VAL

Bits	Name	Description
31:10	RESERVED_BITS31_10	UNUSED (this is the original assignment before CR154463)
31	ICP_TST_EN	PLL_TEST_CTL(9) Charge pump test current control 0x0: Disable 0x1: Enable
27:26	NMOSC_FREQ_CTL	PLL_CONFIG_CTL(27:26) 0x0: Highest (2.8 GHz at TT / 1.05V /40C) 0x1: 1/2 highest 0x2: 1/3 highest 0x3: 1/4 highest
25:24	PFD_DZSEL	PLL_CONFIG_CTL(25:24) PFD reset pulse width adjustment 0x0: 1x delay 0x1: 2x delay 0x2: 3x delay 0x3: 4x delay
23	NMOSC_EN	PLL_CONFIG_CTL(23) Noise measurement oscillator control 0x0: Disable 0x1: Enable
21:20	ICP_DIV	PLL_CONFIG_CTL(21:20) Charge pump bias mirror multiplication factor 0x0: 1 0x1: 3/2 0x2: 7/4 0x3: 9/4
19:18	IREG_DIV	PLL_CONFIG_CTL(19:18) Regulator bias mirror multiplication factor 0x0: 1 0x1: 7/5 0x2: 9/5 0x3: 11/5
17:16	CUSEL	PLL_CONFIG_CTL(17:16) VCO decoupling cap unit size 0x0: 125 fF 0x1: 250 fF 0x2: 375 fF 0x3: 500 fF

PLL14_L_VAL (cont.)

Bits	Name	Description
15	REF_MODE	PLL_CONFIG_CTL(15) Reference circuit mode 0x0: Bandgap mode (seed currents sourced from bandgap circuit and Nwell reference circuit active) 0x1: Supply independent mode (seed currents sourced from supply independent circuit amd Nwell reference pulled to VDDA)
14	PLLOUT_LV_TEST	PLL_TEST_CTL(14) PLLOUT_LV_TEST source selection 0x0: PLL output clock 0x1: Noise measurement oscillator
13:12	CFG_LOCKDET	PLL_CONFIG_CTL(13:12) Lock detector phase error threshold 0x0: 2 pi /7 0x1: 2 pi /15 0x2: 2 pi /23 0x3: 2 pi /31
11	FORCE_ISEED	PLL_CONFIG_CTL(11) Seed current control 0x0: Turn off seed currents when clock is detected 0x1: Keep seed currents on at all times
9:0	PLL_L	This register contains the 10-bit L value in the PLL0's fractional division ratio.

0x009031C8 PLL14_M_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

The value of the PLL14_M_VAL register is the given value of M for the fractional division ratio.

PLL14_M_VAL

Bits	Name	Description
31:19	RESERVED_BITS31_19	UNUSED
18:0	PLL_M	This register contains the 19-bit M value of the PLLn's numerator value in the fractional division ratio.

0x009031CC PLL14_N_VAL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x01

The value of the PLL14_N_VAL register is the given value of N for the fractional division ratio.

PLL14_N_VAL

Bits	Name	Description
31:19	RESERVED_BITS31_19	UNUSED
18:0	PLL_N	This register contains the 19-bit N value of the PLLn's denominator value in the fractional division ratio.

0x009031D0 PLL14_TEST_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

The PLL14_TEST_CTL register is used to enable the TEST, BIST and AUX outputs of PLL14 (SR PLL). The field descriptions show the mapping from 45nm NT wrapper PLL14_TEST_CTL register to SR PLL inputs, PLL_TEST_CTL and PLL_CONFIG_CTL. Some bits of PLL_TEST_CTL and PLL_CONFIG_CTL come from PLL14_L_VAL (CR154463).

PLL14_TEST_CTL

0x0090320C SC_PLL0_M_VAL

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0000

PLL M Val register.

SC_PLL0_M_VAL

Bits	Name	Description
31:19	RESERVED_BITS_31_19	RESERVED
18:0	M_VAL	M value

0x00903210 SC_PLL0_N_VAL

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0000

PLL N Val register.

SC_PLL0_N_VAL

Bits	Name	Description
31:19	RESERVED_BITS_31_19	RESERVED
18:0	N_VAL	N value

0x00903214 SC_PLL0_DROOP_CTL

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0xc000

PLL Droop register.

SC_PLL0_DROOP_CTL

Bits	Name	Description
31	NOISE_PATTERN_SHIFT	Control pattern shifting operation in vddd_scorpion droop pattern generator 0x0: Disable 0x1: Enable
30:29	LOAD_ADDRESS	Load address for vddd_scorpion droop pattern generator 0x0: Address 3:0 bits for pattern LSB 0x1: Address 8:4 bits for pattern LSB 0x2: Address 3:0 bits for pattern MSB 0x3: Address 8:4 bits for pattern MSB
28:25	DROOP_PATTERN_DATA	4 bits of pattern data for vddd_scorpion droop pattern generator
24:23	RESET_CNT_TIMER_CFG	Reset counter timer configuration 0x0: Count 2049 cycles of input clock 0x1: Count 4097cycles of input clock 0x2: Count 8193 cycles of input clock 0x3: Count 16385 cycles of input clock
22	DROOP_DET_CLK_SEL	Clock select for droop detector 0x0: Use HF PLL clock 0x1: Use droop_clk_in
21:20	OUTPUT_SER_DATA_DIV	Clock divider control for output serialized data 0x0: Divide by 1 0x1: Divide by 2 0x2: Divide by 4 0x3: RESERVED
19:18	DROOP_DET_CLK_DIV	Clock divider control for droop detection clock 0x0: Divide by 1 0x1: Divide by 2 0x2: Divide by 4 0x3: RESERVED
17	ATEST_MODE	Atest mode for pulse generation circuit 0x0: Disable 0x1: Enable
16	BYPASS_MODE	Bypass mode for pulse generation circuit 0x0: Internally generated pulse control current 0x1: Bypass with external control current
15	PULSE_GENERATION	For controling pulse generation circuit 0x0: Disable 0x1: Enable

SC_PLL0_DROOP_CTL (cont.)

Bits	Name	Description
14:13	PULSE_WIDTH_CTL	Pulse width control 0x0: 140 ps 0x1: 270 ps 0x2: 390 ps 0x3: 470 ps
12:10	EXTERNAL_DROOP_CTL0	External droop control 0 0x0: No droop detected 0x7: Maximum droop detected
9:7	EXTERNAL_DROOP_CTL1	External droop control 1 0x0: No droop detected 0x7: Maximum droop detected
6	EXTERNAL_DROOP_DET0	External droop detect 0 0x0: No droop detected 0x1: Droop detected
5	EXTERNAL_DROOP_DET1	External droop detect 1 0x0: No droop detected 0x1: Droop detected
4	EXTERNAL_DROOP_CODE	Select external droop code, droop detect 0x0: Select external droop code 0 0x1: Select external droop code 1
3	DROOP_CODE_DETECT	Control external droop code, droop detect mode 0x0: Disable 0x1: Enable
2:1	DROOP_CONTROL_SE	Select output signal on droop_control_se lines For droop_test_se1, For droop_test_se2, 0x0: Pulse width control 0 0x1: Divided reference cloc_2 0x2: Inverter chain latching clock 0x3: Reference clock 0x0: Pulse width control 1 0x1: Pulse Generator output 0x2: Output from last stage in inverter chain 0x3: Serialized droop control output
0	OUTPUT_DRIVER	Output driver control on droop_control_se 0x0: Disable 0x1: Enable

0x00903218 SC_PLL0_TEST_CTL

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0000

PLL Test control register.

SC_PLL0_TEST_CTL

Bits	Name	Description
31:30	RESERVED_BITS_31_30	RESERVED
29	SLAVE_VCO_INJECTION	0x0: Slave VCO injection is disabled during droop 0x1: Slave VCO injection lock is always enabled
28	SYNC_MODE	0x0: Slave re-locking is synchronized 0x1: Slave re-locking is asynchronous
27:25	RESERVED_BITS_27_25	RESERVED
24:23	NOISE_OSC_CTL_VDDD_SCORPION	Control for noise measurement oscillator on VDDD_SCORPION supply 0x0: Highest frequency of oscillation 0x1: 1/2 Highest frequency 0x2: 1/3 Highest frequency 0x3: 1/4 Highest frequency
22:20	NOISE_GEN_CFG_VDDA	VDDA Noise Generator configuration. Current sink in noise generator resistor dac, 0x0: 0 0x1: Max 2 mA 0x2: Max 4 mA 0x3: Max 6 mA 0x4: Max 8 mA 0x5: Max 10 mA 0x6: Max 12 mA 0x7: Max 14 mA
19	SUPPLY_NOISE_GEN	To control the supply noise generator circuit 0x0: Disable 0x1: Enable
18:17	NOISE_OSC_CTL_VDDA	Control for noise measurement oscillator on VDDA supply 0x0: Disable analog supply measurement oscillator 0x1: Slowest frequency of oscillation 0x2: Mid frequency of oscillation 0x3: Highest frequency of oscillation

SC_PLL0_TEST_CTL (cont.)

Bits	Name	Description
16:15	CONNECT_PLL_LV_TEST	0x0: Connect PLL clock path to pllout_lv_test output 0x1: Connect vddd_scorpion supply noise measurement oscillator path to pllout_lv_test output 0x2: Connect analog supply noise measurement oscillator path to pllout_lv_test output 0x3: RESERVED
14	NOISE_OSC_EN	Used to control the noise measurement oscillator on VDDD_SCORPION supply 0x0: Disable 0x1: Enable
13	FILT_INT	0x0: Disconnect 0x1: Connect FILT_INT to test op amp input - observed on ATEST0
12	DTEST_MUX_SEL	Mux selectors for DTEST(note: set PLLTEST to enable DTEST) 0x0: Reserved 0x1: Select NOCLK
11	OUTPUT_INVERT	0x0: Disable 0x1: Enable
10	PLLOUT_LV_TEST	0x0: Disable 0x1: Enable
9	PLLOUT_LV_AUX	0x0: Disable 0x1: Enable
8	PLLOUT_LV_BIST	0x0: Disable 0x1: Enable
7	PLLOUT_HV	0x0: Disable 0x1: Enable
6	VCO_CURRENT_ATEST0	current flows from VDDA (should terminate to VSSA on board) 0x0: Open test switch 0x1: Enable VCO current div-16 output to ATEST0 pin
5	ICO_CURRENT_ATEST1	Current flows from AVDD (should terminate to AVSS on board) 0x0: Open test switch 0x1: Bypass ICO current with external input from ATEST1 pin to bias the cp
4	BIAS_CURRENT_ATEST1	Current flows from VDDA (should terminate to VSSA on Board) 0x0: Open test switch 0x1: Enable bias circuit current to ATEST1 pin
3	FILTER_TEST_OPAMP	0x0: Disable 0x1: Enable
2	SWITCH_ATEST0	0x0: Disabled 0x1: Enables switch to force external voltages from ATEST0

SC_PLL0_TEST_CTL (cont.)

Bits	Name	Description
1	VREG_SLAVE_ATEST0	0x0: Disconnect 0x1: Connect VREG_SLAVE to test op amp input -observed on ATEST0
0	VREG_MST_ATEST0	0x0: Disconnect 0x1: Connect VREG_MST to test op amp input -observed on ATEST0

0x0090321C SC_PLL0_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0x0000

PLL Status register.

SC_PLL0_STATUS

Bits	Name	Description
31:16	RESERVED_BITS_31_16	RESERVED
15:0	PLL_STATUS	SC_PLL0_STATUS(15:6) : Unused, driven low (vssd domain) SC_PLL0_STATUS(5:2) : Over voltage counter status SC_PLL0_STATUS(1) : Over voltage detect flag SC_PLL0_STATUS(0) : Negated of no_clock (if clock is detected, output is high)

0x00903240 SC_PLL1_MODE

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0000

PLL Mode register.

SC_PLL1_MODE

0x00903424 PLL_LOCK_DET_MASK

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000

PLL lock detect status register mask. This mask can be set to selectively export a combined PLL lock detection status. This combined PLL lock detection status is intended to be used during manufacturing testing. The combined status is not viewable through the software interface.

Setting a bit to 1'b1 will enable the real time monitoring of the corresponding PLL's lock detect status.

NOTE This register’s reset value of 0x0 must be adjusted before use. The reset value of 0x0 indicates the LOCK_DET status for ALL PLLs are ignored, and thus the combined PLL lock detect output will report that all PLLs are locked.

0x00903460 PLL_ENA_SPARE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register allows a spare entity to enable a limited set of shared PLLs without incurring any messaging overhead with the RPM. The PLLs are programmed to a static frequency and setting a bit in this register only enables or disables the PLL to run at that predetermined static frequency.

Enabling the PLL starts off the automated FSM which paces the PLL through the warmup routine. The FSM status bits, located in the PLLn_MODE registers, for each PLL featuring automatic enables should be consulted to determine if the PLL is locked and running.

1	SENS_SW_RST	Software reset bit 0x0: Reset de-asserted 0x1: Reset asserted
0	TSENS_EN	Temperature sensor monitoring enable 0x0: Disabled (default) 0x1: Enabled

0x00903624 TSENS_THRESHOLD

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0

TSENS Limit Value register.

TSENS_THRESHOLD

Bits	Name	Description
31:24	MAX_LIMIT_TH	The Max temperature limit threshold is calculated with the following equation: 0000 0000 = -57.17C 1110 1111 = +125.02C 1111 1111 = +137.22C
23:16	MIN_LIMIT_TH	The Min temperature limit threshold is calculated with the following equation: 0001 0111 = -39.64C 0x0: -57.17C 0xFF: +137.22C
15:8	UPPER_LIMIT_TH	The Upper temperature limit threshold is calculated with the following equation: 0000 0000 = -57.17C 1100 1110 = +99.86C 1111 1111 = +137.22C
7:0	LOWER_LIMIT_TH	The Lower temperature threshold is calculated with the following equation: 0000 0000 = -57.17C 0011 0000 = -20.58C 1111 1111 = +137.22C

0x00903628 TSENS_S0_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0x0

TSENS_S0_Status register.

TSENS_S0_STATUS

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7:0	LAST_TEMP0	The last temperature measured is calculated with the following equation: 0x0: -57.17C 0xFF: +137.22C

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7:0	LAST_TEMP4	The last temperature measured is calculated with the following equation: 0x0: -57.17C 0xFF: +137.22C

0x0090363C TSENS_INT_STATUS

Type: Read
Clock: SFPB_HCLK
Reset State: 0x0

TSENS_INT_Status register.

TSENS_INT_STATUS

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7	TRDY	Temperature measurement is complete and temperature values are stored in LAST_TEMP[4:0] 0x0: Temperature measurement is not valid (default) 0x1: Last temperature reading is stored in LAST_TEMP[4:0]
6:4	RESERVED_BITS6_4	RESERVED

TSENS_INT_STATUS (cont.)

Bits	Name	Description
3	MAX_INT	Temperature in higher than MAX_LIMIT_TH 0x0: Temperature is lower than MAX_LIMIT_TH (default) 0x1: Temperature is equal to or higher than MAX_LIMIT_TH
2	UPPER_INT	Temperature is higher than UPPER_LIMIT_TH 0x0: Temperature is lower than UPPER_LIMIT_TH (default) 0x1: Temperature is higher than UPPER_LIMIT_TH but lower than MAX_LIM_TH
1	LOWER_INT	Temperature is lower than LOWER_LIMIT_TH 0x0: Temperature is higher than LOWER_LIMIT_TH (default) 0x1: Temperature is lower than LOWER_LIMIT_TH but higher than MIN_LIMIT_TH
0	MIN_INT	Temperature in lower than MIN_LIMIT_TH 0x0: Temperature is higher than MIN_LIMIT_TH (default) 0x1: Temperature is equal to or lower than MIN_LIMIT_TH

0x00903640 TSENS_CONFIG

Type: Read
Clock: SFPB_HCLK
Reset State: 0x9B

TSENS_CONFIG is used for fine tuning central sensor current magnitude.

TSENS_CONFIG

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7:0	TSENS_CONFIG	Tsens config: [7:6] control internal clock frequency. [5:3] control Iref magnitude. [2:0] control Iin.

0x00903644 TSENS_TEST_CNTL

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0

TSENS control register for test related functions

TSENS_TEST_CNTL

Bits	Name	Description
31:8	RESERVED_BITS31_8	
7:4	TSENS_TEST_SEL	Used for muxing out appropriate current or voltage to tsens_test_out in test mode. When TSENS_TEST_EN is '1', tsens_test_out gets, When TSENS_TEST_EN = 0, TSENS_TEST_SEL(3:0) is don't care and tsens_test_out is in Hi-Z state 0x0: Vref of Sensor 0 0x1: Iptat of Sensor 0 0x2: Ictat of Sensor 0 0x3: Iin of Sensor 0 (controlled by TSENS_CONFIG to change slope) 0x4: Iin of Sensor 1 0x5: Iin of Sensor 2 0x6: Iin of Sensor 3 0x7: Iin of Sensor 4 0x8: Iin of Sensor 5 0x9: Iin of Sensor 6 0xA: Iin of Sensor 7 0xB: Iin of Sensor 8 0xC: Iin of Sensor 9 0xD: Iin of Sensor 10
3:2	RESERVED_BITS3_2	RESERVED
1	TSENS_TEST_EN	Test enable 0x0: Test disabled (default) 0x1: Test enabled
0	TSENS_ADC_TEST_SEL	ADC test select 0x0: ADC uses temperature sensor outputs (default) 0x1: ADC uses analog test input signals

0x00903660 TSENS_STATUS_CNTL

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0

TSENS control register.

TSENS_STATUS_CNTL

Bits	Name	Description
31:4	RESERVED_BITS31_4	

TSENS_STATUS_CNTL (cont.)

Bits	Name	Description
3	TSENS_MAX_STATUS_MASK	MASK MAX status to PSHOLD 0x0: Normal operation 0x1: Mask off Max interrupt operation to PSHOLD
2	TSENS_UPPER_STATUS_CLR	Clear UPPER_INT status bit 0x0: Normal operation 0x1: Clear (logic 0 UPPER_INT bit in the TSENS_INT_STATUS register)
1	TSENS_LOWER_STATUS_CLR	Clear LOWER_INT status bit 0x0: Normal operation 0x1: Clear (logic 0 LOWER_INT bit in the TSENS_INT_STATUS register)
0	TSENS_MIN_STATUS_MASK	MASK MIN status to PSHOLD 0x0: Normal operation 0x1: Mask off Min interrupt operation to PSHOLD

0x00903664 TSENS_S5_STATUS

Type: Read

0x009036C0 CE3_CLK_SRC_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the the generation of ce3_clk_src. It provides root enable, clock source divide control and clock source selection control.

CE3_CLK_SRC_NS

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7	CLK_ROOT_ENA	Enable ce3_clk clock source 0x1: Enable 0x0: Disable
6:3	SRC_DIV	This field selects to activate or bypass the modulo divider. 0x0: Bypass 0x1: Div-2 0x2: Div-3 0x3: Div-4 0x4: Div-5 0x5: Div-6 0x6: Div-7 0x7: Div-8 0x8: Div-9 0x9: Div-10 0xA: Div-11 0xB: Div-12 0xC: Div-13 0xD: Div-14 0xE: Div-15 0xF: Div-16
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: pll14 0x2: pll0 0x3: pll8 0x4: gnd 0x5: pll11 0x6: pll3 0x7: core_bi_pll_test_se

0x009036C4 CE3_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of AHB clock for the Crypto engine 3. It provides enable and clock inversion to the branch, software control to the reset of logic clocked by this clock domain and also contains enable for the dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

CE3_HCLK_CTL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7	ASYNC_RESET	Async reset for CE3 AHB clock domain. 0x1: Active 0x0: Not Active
6	BUS_CLK_GATE_ENA	Enable for dynamic clock gating. (This feature is for future usage only. Setting this bit will have the same effect of enabling the clock.) 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert ce2_hclk 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for ce2_hclk clock branch 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x009036C8 CE3_SFAB_PORT_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides software control to the system fabric ports connecting to CE3.

CE3_SFAB_PORT_RESET

Bits	Name	Description
31:2	RESERVED_BITS31_2	RESERVED
1	SFAB_CE3_M_RESET	Async reset for System fabric master port connecting to CE3. 0x1: Active 0x0: Not Active
0	SFAB_CE3_S_RESET	Software reset for System fabric slave port connecting to CE3. 0x1: Active

0x009036CC CE3_CORE_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of core clock for the Crypto engine 3 on the System FABRIC. It provides enable, clock inversion to the branch and software control to the reset of logic clocked by this clock domain.

CE3_CORE_CLK_CTL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7	ASYNC_RESET	Async reset for CE3 core clock domain 0x1: Active 0x0: Not Active
6	BUS_CLK_GATE_ENA	Enable for dynamic clock gating. 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert ce3_core_clk 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for ce3_core_clk clock branch 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x009036D0 CE3_SLEEP_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

This register is used to control the clock branch for the generation of cc_ce3_sleep_clk. It provides enable and clock inversion to the branch, and software control to the reset of logic clocked by this clock domain.

CE3_SLEEP_CLK_CTL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED

CE3_SLEEP_CLK_CTL (cont.)

Bits	Name	Description
7	ASYNC_RESET	Async reset for CE3 sleep clock domain. 0x1: Active 0x0: Not Active
6	RESERVED_BIT6	RESERVED
5	CLK_INV	This bit is used to invert ce3_sleep_clk 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for ce3_sleep_clk clock branch This clock is votable 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x009036E0 SFAB_AHB_S8_FCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the branch cell used to generate the fabric clock for the system fabric AHB slave port 8 (cc_sfab_ahb_s8_fclk). It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When fabric dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

SFAB_AHB_S8_FCLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FABRIC_CLK_GATE_ENA	Enable for dynamic clock gating 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert sfab_ahb_s7_fclk 0x1: invert 0x0: Not inver
4	CLK_BRANCH_ENA	Enable for sfab_ahb_s7_fclk clock branch This clock is votable 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00903700 USB_HS3_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of AHB clock (cc_USB_HS3_hclk) for the USB_HS3 core. It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

USB_HS3_HCLK_CTL

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FABRIC_CLK_GATE_ENA	Enable for dynamic clock gating. 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert usb_hs3_hclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for usb_hs3_hclk clock branch. This clock is votable. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00903704 USB_HS3_HCLK_FS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x4F

This register is used for the sleep and wake-up values of the footswitch controller CXC for USB high speed core AHB clock.

USB_HS3_HCLK_FS

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED

USB_HS3_HCLK_FS (cont.)

Bits	Name	Description
6	FORCE_C_ON	This bit force the core on signal to remain active during halt state of the clk 0x1: Force-on mode 0x0: Normal mode
5	FORCE_P_ON	This bit force the periph_on signal to remain active during halt state of the clock 0x1: Force-on mode 0x0: Normal mode
4	FORCE_P_OFF	This bit force the perif_off signal to remain active during halt state of the clock 0x1: Force-on mode 0x0: Normal mode
3:0	S_W_VAL	These bits will set the wake-up and sleep value of the clock. 0x0: Clocks-0 0x1: Clocks-1 0x2: Clocks-2 0x3: Clocks-3 0x4: Clocks-4 0x5: Clocks-5 0x6: Clocks-6 0x7: Clocks-7 0x8: Clocks-8 0x9: Clocks-9 0xA: Clocks-10 0xB: Clocks-11 0xC: Clocks-12 0xD: Clocks-13 0xE: Clocks-14 0xF: Clocks-15

0x00903708 USB_HS3_XCVR_FS_CLK_MD

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register contains the M and D values used for the M/N:D counter of cc_usb_hs3_xcvr_fs_clk generator.

USB_HS3_XCVR_FS_CLK_MD

Bits	Name	Description
31:24	RESERVED_BITS31_24	RESERVED

USB_HS3_XCVR_FS_CLK_MD (cont.)

Bits	Name	Description
23:16	M_VAL	This is the M value for the clock branchs M/N:D counter.
15:8	RESERVED_BITS15_8	RESERVED
7:0	D_VAL	This is the NOT(2*D) value for the clock branchs M/N:D counter.

0x0090370C USB_HS3_XCVR_FS_CLK_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0000

This register contains the N values used for the M/N:D counter of cc_usb_hs3_xcvr_fs_clk generator. It also contains the branch enable, root enables, clock inversion, MN counter enable and reset, MN counter mode selection, and pre divider control of the cc_usb_hs3_xcvr_fs_clk generator.

USB_HS3_XCVR_FS_CLK_NS

Bits	Name	Description
31:24	RESERVED_BITS31_24	RESERVED
23:16	N_VAL	This is the NOT(N-M) value of the clock branchs M/N:D counter when it is used as either modulo-N counter or as full M/N:D counter.
15:12	RESERVED_BITS15_12	RESERVED
11	CLK_ROOT_ENA	Enable for usb_hs3_xcvr_fs_clk clock source. NOTE The root cannot be disable by setting this bit to 0 if the downstream CXC (controlled by bit 9 CLK_BRANCH_ENA) is still running. 0x1: Enable 0x0: Disable
10	CLK_INV	This bit is used to invert usb_hs3_xcvr_fs_clk. 0x1: invert 0x0: Not invert
9	CLK_BRANCH_ENA	Enable for usb_hs3_xcvr_fs_clk clock branch. 0x1: Enable 0x0: Disable
8	MNCNTR_EN	Enable for the M/N counter. 0x1: Enable 0x0: Disable
7	MNCNTR_RST	Activate the reset for the M/N counter. 0x1: Active 0x0: Not Active

USB_HS3_XCVR_FS_CLK_NS (cont.)

Bits	Name	Description
6:5	MNCNTR_MODE	Define M/N counter mode 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode
4:3	PRE_DIV_SEL	Select to activate or bypass the modulo divider before the M/N counter. 0x0: Bypass 0x1: Div-2 0x2: Div-3 0x3: Div-4
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mxo 0x2: pll0 0x3: pll8 0x4: gnd_tie 0x5: GND 0x6: core_bi_clk_test_se 0x7: core_bi_pll_test_se

0x00903710 USB_HS3_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

This register is used to control reset to USB HS1 core..

USB_HS3_RESET

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	USB_HS3_RESET	Common USB_HS3 core reset

0x00903720 USB_HS4_HCLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is used to control the clock branch for the generation of AHB clock (cc_USB_HS4_hclk) for the USB_HS4 core. It provides enable and clock inversion to the branch, and also contains enable for the fabric dynamic clock gating mode. When dynamic clock gating mode is enabled, the software clock branch enable bit will not have direct control over the enabling of this clock. The enabling of this clock will be done dynamically by internal hardware based on bus traffic.

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FABRIC_CLK_GATE_ENA	Enable for dynamic clock gating. 0x0: Disable 0x1: Enable
5	CLK_INV	This bit is used to invert usb_hs4_hclk. 0x1: invert 0x0: Not invert
4	CLK_BRANCH_ENA	Enable for usb_hs4_hclk clock branch. This clock is votable. 0x1: Enable 0x0: Disable
3:0	RESERVED_BITS3_0	RESERVED

0x00903724 USB_HS4_HCLK_FS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x4F

This register is used for the sleep and wake-up values of the footswitch controller CXC for USB high speed core AHB clock.

USB_HS4_HCLK_FS

Bits	Name	Description
31:7	RESERVED_BITS31_7	RESERVED
6	FORCE_C_ON	This bit force the core on signal to remain active during halt state of the clk. 0x1: Force-on mode 0x0: Normal mode
5	FORCE_P_ON	This bit force the periph_on signal to remain active during halt state of the clock 0x1: Force-on mode 0x0: Normal mode

USB_HS4_HCLK_FS (cont.)

Bits	Name	Description
4	FORCE_P_OFF	This bit force the perif_off signal to remain active during halt state of the clock. 0x1: Force-on mode 0x0: Normal mode
3:0	S_W_VAL	These bits will set the wake-up and sleep value of the clock. 0x0: Clocks-0 0x1: Clocks-1 0x2: Clocks-2 0x3: Clocks-3 0x4: Clocks-4 0x5: Clocks-5 0x6: Clocks-6 0x7: Clocks-7 0x8: Clocks-8 0x9: Clocks-9 0xA: Clocks-10 0xB: Clocks-11 0xC: Clocks-12 0xD: Clocks-13 0xE: Clocks-14 0xF: Clocks-15

0x00903728 USB_HS4_XCVR_FS_CLK_MD

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register contains the M and D values used for the M/N:D counter of cc_usb_hs4_xcvr_fs_clk generator.

USB_HS4_XCVR_FS_CLK_MD

Bits	Name	Description
31:24	RESERVED_BITS31_24	RESERVED
23:16	M_VAL	This is the M value for the clock branchs M/N:D counter.
15:8	RESERVED_BITS15_8	RESERVED
7:0	D_VAL	This is the NOT(2*D) value for the clock branchs M/N:D counter.

0x0090372C USB_HS4_XCVR_FS_CLK_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000_0000

This register contains the N values used for the M/N:D counter of cc_usb_hs4_xcvr_fs_clk generator. It also contains the branch enable, root enables, clock inversion, MN counter enable and reset, MN counter mode selection, and pre divider control of the cc_usb_hs4_xcvr_fs_clk generator.

USB_HS4_XCVR_FS_CLK_NS

Bits	Name	Description
31:24	RESERVED_BITS31_24	RESERVED
23:16	N_VAL	This is the NOT(N-M) value of the clock branchs M/N:D counter when it is used as either modulo-N counter or as full M/N:D counter.
15:12	RESERVED_BITS15_12	RESERVED
11	CLK_ROOT_ENA	Enable for usb_hs4_xcvr_fs_clk clock source. NOTE: The root cannot be disable by setting this bit to 0 if the downstream CXC (controlled by bit 9 CLK_BRANCH_ENA) is still running. 0x1: Enable 0x0: Disable
10	CLK_INV	This bit is used to invert usb_hs4_xcvr_fs_clk. 0x1: invert 0x0: Not invert
9	CLK_BRANCH_ENA	Enable for usb_hs4_xcvr_fs_clk clock branch. 0x1: Enable 0x0: Disable
8	MNCNTR_EN	Enable for the M/N counter. 0x1: Enable 0x0: Disable
7	MNCNTR_RST	Activate the reset for the M/N counter. 0x1: Active 0x0: Not Active
6:5	MNCNTR_MODE	Define M/N counter mode 0x0: Bypass 0x1: Clock swallow mode 0x2: Dual-edge mode 0x3: Single-edge mode

USB_HS4_XCVR_FS_CLK_NS (cont.)

Bits	Name	Description
4:3	PRE_DIV_SEL	Select to activate or bypass the modulo divider before the M/N counter. 0x0: Bypass 0x1: Div-2 0x2: Div-3 0x3: Div-4
2:0	SRC_SEL	This field selects the output of the clock source MUX. 0x0: pxo 0x1: mxo 0x2: pll0 0x3: pll8 0x4: gnd_tie 0x5: GND 0x6: core_bi_clk_test_se 0x7: core_bi_pll_test_se

0x00903730 USB_HS4_RESET

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0

This register is used to control reset to USB HS1 core.

USB_HS4_RESET

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	USB_HS4_RESET	Common USB_HS4 core reset

0x00903740 GSS_CLK_BRANCH_ENA_VOTE

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0

The GSS_CLK_BRANCH_ENA_VOTE register is the clock enable votes dedicated to LPASS Q6 for clocks that are votable. The vote for clock branch enables is only a vote for ON scheme (The clock will be disabled only if all Masters vote for OFF).

The votable clocks include:

- Scorpion AXI and AHB clocks -- Voting only with RPM, and Scorpion Core 0 and 1

- ADM0 and ADM1 core clocks and pbus clocks
- RPM message ram clock
- PMIC SSBI2, arbitor 0 and 1 hclk
- PRNG clock

Some bits in this register are set (1) on RESOUT to allow the chip to function only at a basic start-up level. All clock branches are enabled (active) and operating at the CXO frequency during RESOUT. The enable signals do not take effect until the RESOUT is de-asserted.

Set (1) enables the corresponding clock branch.

Clear (0) disables the corresponding clock branch.

GSS_CLK_BRANCH_ENA_VOTE

Bits	Name	Description
31:13	RESERVED_BITS31_13	RESERVED
12:11	RESERVED_BITS12_11	RESERVED
10	PRNG_CLK_ENA	Enable for PRNG clock 0x1: Enable
9	PMIC_ARB1_HCLK_ENA	Enable PMIC Arbiter 1 clock 0x1: Enabled
8	PMIC_ARB0_HCLK_ENA	Enable PMIC Arbiter 0 clock 0x1: Enabled
7	PMIC_SSBI2_CLK_ENA	Enable for PMIC SSBI2 clock 0x1: Enable
6	RPM_MSG_RAM_HCLK_ENA	Enable for RPM message ram clock 0x1: Enable
5:4	RESERVED_BITS5_4	RESERVED
3	ADM0_PBUS_CLK_ENA	Enable for ADM0 PBUS clock 0x1: Enable
2	ADM0_CLK_ENA	Enable ADM0 clock 0x1: Enabled
1:0	RESERVED_BITS1_0	RESERVED

0x00903744 GSS_CLK_SLEEP_ENA_VOTE

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0

The GSS_CLK_SLEEP_ENA_VOTE register is used to halt the corresponding clock signals when the LPA_Q6 processor goes to standby by asserting lpass_cc_qdsp6_core_idle signal. The value of each bit is correspondingly combined with the bit in GSS_CLK_BRANCH_ENA_VOTE register. If clock is not enabled in GSS_CLK_BRANCH_ENA register, it will NOT enable upon interrupt.

- Set (1) allows the clock to halt when LPASS Q6 goes to standby mode.
- Clear (0) does not allow the clock to halt when LPASS Q6 goes to standby mode.

GSS_CLK_SLEEP_ENA_VOTE

Bits	Name	Description
31:13	RESERVED_BITS31_13	RESERVED
12:11	RESERVED_BITS12_11	RESERVED
10	PRNG_CLK_SLEEP_ENA	Halt PRNG clock upon standby 0x1: Enable
9	PMIC_ARB1_HCLK_SLEEP_ENA	Halt PMIC Arbiter 1 clock upon standby 0x1: Enabled
8	PMIC_ARB0_HCLK_SLEEP_ENA	Halt PMIC Arbiter 0 clock upon standby 0x1: Enabled
7	PMIC_SSBI2_CLK_SLEEP_ENA	Halt PMIC SSBI2 clock upon standby 0x1: Enable
6	RPM_MSG_RAM_HCLK_SLEEP_ENA	Halt RPM message ram clock upon standby 0x1: Enable
5:4	RESERVED_BITS5_4	RESERVED
3	ADM0_PBUS_CLK_SLEEP_ENA	Halt ADM0 PBUS clock upon standby 0x1: Enable
2	ADM0_CLK_SLEEP_ENA	halt ADM0 clock upon standby. 0x1: Enabled
1:0	RESERVED_BITS1_0	RESERVED

0x009037E4 RIVA_CLK_BRANCH_ENA_VOTE

Type: Read/Write
Clock: SFPB_HCLK
Reset State: 0x0

The RIVA_CLK_BRANCH_ENA_VOTE register is the clock enable votes dedicated to untrusted side of Scorpion core1 for clocks that are votable. The vote for clock branch enables is only a vote for ON scheme (The clock will be disabled only if all Masters vote for OFF).

The votable clocks include:

- Scorpion AXI and AHB clocks -- Voting only with RPM, and Scorpion Core 0 and 1
- ADM0 and ADM1 core clocks and pbus clocks
- RPM message ram clock
- PMIC SSBI2, arbitor 0 and 1 hclk
- PRNG clock

Some bits in this register are set (1) on RESOUT to allow the chip to function only at a basic start-up level. All clock branches are enabled (active) and operating at the CXO frequency during RESOUT. The enable signals do not take effect until the RESOUT is de-asserted.

Set (1) enables the corresponding clock branch.

Clear (0) disables the corresponding clock branch.

RIVA_CLK_BRANCH_ENA_VOTE

Bits	Name	Description
31:13	RESERVED_BITS31_13	RESERVED
12:11	RESERVED_BITS12_11	RESERVED
10	PRNG_CLK_ENA	Enable for PRNG clock 0x1: Enable
9	PMIC_ARB1_HCLK_ENA	Enable PMIC Arbiter 1 clock 0x1: Enabled
8	PMIC_ARB0_HCLK_ENA	Enable PMIC Arbiter 0 clock 0x1: Enabled
7	PMIC_SSBI2_CLK_ENA	Enable for PMIC SSBI2 clock 0x1: Enable
6	RPM_MSG_RAM_HCLK_ENA	Enable for RPM message ram clock 0x1: Enable
5:4	RESERVED_BITS5_4	RESERVED
3	ADM0_PBUS_CLK_ENA	Enable for ADM0 PBUS clock 0x1: Enable
2	ADM0_CLK_ENA	Enable ADM0 clock 0x1: Enabled
1:0	RESERVED_BITS1_0	RESERVED

0x00903800 SPDM_CY_PORT8_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides the control for enabling and inverting the SPDM CY port8 clock. SPDM CY port 8 clock is a divided version of SCPLL3 aux output clock. We must enable the AUX source output of SCPLL3 as well in order to see this clock properly.

SPDM_CY_PORT8_CLK_CTL

Bits	Name	Description
31:6	RESERVED_BITS31_6	RESERVED
5	CLK_INV	This bit is used to invert the clock. 0x1: Inverted 0x0: Not inverted
4	CLK_BRANCH_ENA	This bit is used to enable the clock branch. 0x1: Enable 0x0: Diable
3:1	RESERVED_BITS3_1	RESERVED
0	SRC_SEL	This bit selects between SCPLL3 aux output or PXO clock. 0x1: SCPLL3_aux 0x0: PXO (default)

0x00903820 APCS_WDT0_CPU0_WDOG_EXPIRED_ENABLE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides the enable for allowing the APCS CPU0's WDOG timer0's expiration to trigger a reset.

APCS_WDT0_CPU0_WDOG_EXPIRED_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	WDOG_ENA	This bit enables the WDOG timer's expiration to trigger a reset: 0x0: not enabled 0x1: enabled

0x00903824 APCS_WDT1_CPU0_WDOG_EXPIRED_ENABLE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides the enable for allowing the APCS CPU0's WDOG timer1's expiration to trigger a reset.

APCS_WDT1_CPU0_WDOG_EXPIRED_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	WDOG_ENA	This bit enables the WDOG timer's expiration to trigger a reset: 0x0: not enabled 0x1: enabled

0x00903828 APCS_WDT0_CPU1_WDOG_EXPIRED_ENABLE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides the enable for allowing the APCS CPU1's WDOG timer0's expiration to trigger a reset.

APCS_WDT0_CPU1_WDOG_EXPIRED_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	WDOG_ENA	This bit enables the WDOG timer's expiration to trigger a reset: 0x0: not enabled 0x1: enabled

0x0090382C APCS_WDT1_CPU1_WDOG_EXPIRED_ENABLE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides the enable for allowing the APCS CPU1's WDOG timer1's expiration to trigger a reset.

APCS_WDT1_CPU1_WDOG_EXPIRED_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	WDOG_ENA	This bit enables the WDOG timer's expiration to trigger a reset: 0x0: not enabled 0x1: enabled

0x00903830 APCS_WDT0_CPU2_WDOG_EXPIRED_ENABLE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides the enable for allowing the APCS CPU2's WDOG timer0's expiration to trigger a reset.

APCS_WDT0_CPU2_WDOG_EXPIRED_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	WDOG_ENA	This bit enables the WDOG timer's expiration to trigger a reset: 0x0: not enabled 0x1: enabled

0x00903834 APCS_WDT1_CPU2_WDOG_EXPIRED_ENABLE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides the enable for allowing the APCS CPU2's WDOG timer1's expiration to trigger a reset.

APCS_WDT1_CPU2_WDOG_EXPIRED_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	WDOG_ENA	This bit enables the WDOG timer's expiration to trigger a reset: 0x0: not enabled 0x1: enabled

0x00903838 APCS_WDT0_CPU3_WDOG_EXPIRED_ENABLE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides the enable for allowing the APCS CPU3's WDOG timer0's expiration to trigger a reset.

APCS_WDT0_CPU3_WDOG_EXPIRED_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED

0x0090383C APCS_WDT1_CPU3_WDOG_EXPIRED_ENABLE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register provides the enable for allowing the APCS CPU3's WDOG timer1's expiration to trigger a reset.

APCS_WDT1_CPU3_WDOG_EXPIRED_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	WDOG_ENA	This bit enables the WDOG timer's expiration to trigger a reset: 0x0: not enabled 0x1: enabled

0x00903840 RPM_WDOG_EXPIRED_ENABLE

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x01

This register provides the enable for allowing the RPM's WDOG timer's expiration to trigger a reset.

RPM_WDOG_EXPIRED_ENABLE

Bits	Name	Description
31:1	RESERVED_BITS31_1	RESERVED
0	WDOG_ENA	This bit enables the WDOG timer's expiration to trigger a reset: 0x0: not enabled 0x1: enabled

0x00903860 PCIE_ALT_REF_CLK_NS

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x0000

The PCIE_ALT_REF_CLK_NS register provides controls to the cell used to generate cc_pcie_alt_ref_clk. The controls include root clock enable, source select, source divider value and inversion of cc_pcie_alt_ref_clk.

PCIE_ALT_REF_CLK_NS

Bits	Name	Description
31:12	RESERVED_BITS31_12	RESERVED
11	CLK_ROOT_ENA	Enable for pcie_alt_ref_clk clock source. 0x1: Enable 0x0: Disable
10	CLK_INV	This bit is used to invert pcie_alt_ref_clk 0x1: Invert 0x0: Not Invert
9	CLK_BRANCH_ENA	Enable for pcie_alt_ref_clk clock branch 0x1: Enable 0x0: Disable
8:7	RESERVED_BITS8_7	RESERVED

PCIE_ALT_REF_CLK_NS (cont.)

Bits	Name	Description
6:3	CLK_DIV	This field is used to control the divider for generating the pcie_alt_ref_clk. 0x0: Div-1 0x1: Div-2 0x2: Div-3 0x3: Div-4 0x4: Div-5 0x5: Div-6 0x6: Div-7 0x7: Div-8 0x8: Div-9 0x9: Div-10 0xA: Div-11 0xB: Div-12 0xC: Div-13 0xD: Div-14 0xE: Div-15 0xF: Div-16
2:1	RESERVED_BITS2_1	RESERVED
0	SRC_SEL	This field selects which source to drive pcie_alt_ref_clk. 0x0: PXO 0x1: PLL3

0x00903880 RIVA_XO_SRC_CLK_CTL

Type: Write/Read
Clock: SFPB_HCLK
Reset State: 0x00

This register is a spare.

RIVA_XO_SRC_CLK_CTL

Bits	Name	Description
31:8	RESERVED_BITS31_8	RESERVED
7:4	NOT_USED_BITS7_4	NOT USED
3	RIVA_XO_INV	This bit is used to invert riva_clk_pxo_src 0x1: invert 0x0: Not invert
2	RIVA_XO_SELECT	Select between CXO and PXO sources 0x1: Select PXO 0x0: Select CXO

RIVA_XO_SRC_CLK_CTL (cont.)

Bits	Name	Description
1	RIVA_XO_SWITCH_DISABLE	Disables the CXC switch 0x1: XOOFF 0x0: XO ON
0	NOT_USED_BIT0	NOT USED

0x00903884 SPARE1

Type: Write/Read
Clock: SFPB_HCLK

6.2 QDSS DAPROM Registers (0x01A00000 QDSS_DAPROM_BASE)

This section contains the QDSS DAPROM registers.

The DAPROM contains the base address location information for all the CoreSight compliant components as well as the CoreSight management registers of the debug system implemented in APQ8064. Address range 0x000 - 0xFFC follows the entry format shown in the DDIO314H ARM specification. This format contains the APB address offset of one CoreSight component such as the ETB. All of the registers in DAPROM are READ-ONLY.

NOTE For more detailed information about these registers, see ARM documentation at http://infocenter.arm.com/help/index.jsp.

0x01A00000 QDSS_ETB_ROM_WORD

Type: Read
Clock: PCLKDBG
Reset State: 0x00001003

QDSS_ETB_ROM_WORD

Bits	Name	Description
31:12	ADDR_OFFSET	0x01000 Address offset relative to the base address of this ROM Table
11:2	RESERVED	0x0000
1	FORMAT	0b1 The '1' value signifies a 32-bit ROM word
0	PRESENT	0b1 The '1' value signifies a non-empty ROM word

6.3 QDSS ETB Registers (0x01A01000 QDSS_ETB_BASE)

This section contains the QDSS ETB registers.

6.3.1 CoreSight Component Registers

This section describes the CS component registers. This includes device specific registers, CS management registers, peripheral ID registers, and component ID registers. It is provided below for QCSR and FLAT file generation. However, the details of the registers can be found in the ARM documents, which provide more detailed information about these registers, such as their usage and descriptive register bits information. See: http://infocenter.arm.com/help/index.jsp.

6.3.1.1 CoreSight ETB Registers Summary

Table 6-2 contains a summary of ETB registers.

Table 6-2 Summary of ETB registers

Offset	Type	Width	Reset value	Name	Reference Section
0x004	Read	32	0x1000	RAM Depth Register, RDP	ETB RAM Depth Register, RDP, 0x004
0x00C	Read	32	0x1000	Status Register, STS	ETB Status Register, STS, 0x00C
0x010	Read	32	0x00000000	RAM Read Data Register, RRD	ETB RAM Read Data Register, RRD, 0x010
0x014	Read/Write	32	0x00000000	RAM Read Pointer Register, RRP	ETB RAM Read Pointer Register, RRP, 0x014
0x018	Read/Write	32	0x00000000	RAM Write Pointer Register, RWP	ETB RAM Write Pointer Register, RWP, 0x018
0x01C	Read/Write	32	0x00000000	Trigger Counter Register, TRG	ETB Trigger Counter Register, TRG, 0x01C
0x020	Read/Write	32	0x00000000	Control Register, CTL	ETB Control Register, CTL, 0x020
0x024	Write	32	0x00000000	RAM Write Data Register, RWD	ETB RAM Write Data Register, RWD, 0x024
0x300	Read	2	0x02	Formatter and Flush Status Register, FFSR	ETB Formatter and Flush Status Register, FFSR, 0x300
0x304	Read/Write	13	0x0200	Formatter and Flush Control Register, FFCR	ETB Formatter and Flush Control Register, FFCR, 0x304
0xEE0	Write	2	-	Integration Register, ITMISCOP0	ETB Integration Test Registers
0xEE4	Write	2	-	Integration Register, ITTRFLINACK	Integration Test Trigger In and Flush In Acknowledge Register, ITTRFLINACK, 0xEE4
0xEE8	Read	2	Undefined	Integration Register, ITTRFLIN	Integration Test Trigger In and Flush In Register, ITTRFLIN, 0xEE8

Table 6-2 Summary of ETB registers

Offset	Type	Width	Reset value	Name	Reference Section
0xEEC	Read	5	Undefined	Integration Register, ITATBDATA0	Integration Test ATB Data Register 0, ITATBDATA0, 0xEEC
0xEF0	Write	2	-	Integration Register, ITATBCTR2	Integration Test ATB Control Register 2, ITATBCTR2, 0xEF0
0xEF4	Read	7	Undefined	Integration Register, ITATBCTR1	Integration Test ATB Control Register 1, ITATBCTR1, 0xEF4
0xEF8	Read	10	Undefined	Integration Register, ITATBCTR0	Integration Test ATB Control Register 0, ITATBCTR0, 0xEF8
0xF00	Read/Write	1	0x0	Integration Mode Control Register	ETB CoreSight management registers
0xFA0	Read/Write	4	0xF	Claim Tag Set Register	
0xFA4	Read/Write	4	0x0	Claim Tag Clear Register	
0xFB0	Write	32	-	Lock Access Register	
0xFB4	Read	3	0x0/0x3	Lock Status Register

0xFF8	Read	8	0x05	Component ID2	
0xFFC	Read	8	0xB1	Component ID3	

6.3.1.2 ETB Registers

0x01A01004 QDSS_ETB_RAM_DEPTH_REG

Type: Read
Reset State: 0x1000

ETB RAM Depth Register, RDP, 0x004

QDSS_ETB_RAM_DEPTH_REG

Bits	Name	Description
31:0	RAM_DEPTH_REGISTER	Defines the depth, in words, of the trace RAM. This value is configurable in the RTL, but fixed at synthesis. Supported depth in powers of 2 only. Reset value = Ram Depth that is given by a Verilog tick define. = 0x1000 = 16KB ETB

0x01A0100C QDSS_ETB_STATUS_REG

Type: Read
Reset State: 0x0008

ETB Status Register, STS, 0x00C

QDSS_ETB_STATUS_REG

Bits	Name	Description
31:4	RESERVED	Reserved.
3	FTEMPTY	Formatter pipeline empty. All data stored to RAM.
2	ACQCOMP	Acquisition complete. The acquisition complete flag indicates that capture has been completed when the formatter stops because of any of the methods defined in the Formatter and Flush Control Register, or TraceCaptEn = 0. This also results in FtStopped in the Formatter and Flush Status Register going HIGH.
1	TRIGGERED	The Triggered bit is set when a trigger has been observed. This does not indicate that a trigger has been embedded in the trace data by the formatter, but is determined by the programming of the Formatter and Flush Control Register.
0	FULL	RAM Full. The flag indicates when the RAM write pointer has wrapped around.

0x01A01010 QDSS_ETB_RAM_READ_DATA_REG

Type: Read
Reset State: 0x00000000

ETB RAM Read Data Register, RRD, 0x010

0x01A01014 QDSS_ETB_RAM_READ_POINTER

Type: Read/Write
Reset State: 0x00000000

ETB RAM Read Pointer Register, RRP, 0x014

QDSS_ETB_RAM_READ_POINTER

Bits	Name	Description
1:0	CSETB_ADDR_WIDTH	Sets the read pointer used to read entries from the Trace RAM over the APB interface.

0x01A01018 QDSS_ETB_RAM_WRITE_POINTER

Type: Read/Write
Reset State: 0x00000000

ETB RAM Write Pointer Register, RWP, 0x018

QDSS_ETB_RAM_WRITE_POINTER

Bits	Name	Description
1:0	CSETB_ADDR_WIDTH	Sets the write pointer used to write entries from the CoreSight bus into the Trace RAM

0x01A0101C QDSS_ETB_TRG

Type: Read/Write
Reset State: 0x00000000

ETB Trigger Counter Register, TRG, 0x01C

0x01A01020 QDSS_ETB_CTL_REG

Type: Read/Write
Reset State: 0x00000000

ETB Control Register, CTL, 0x020

QDSS_ETB_CTL_REG

Bits	Name	Description
31:1	RESERVED	Reserved
0	TRACECAPTEN	ETB Trace Capture Enable. This is the master enable bit forcing FtStopped HIGH when TraceCaptEn is LOW. When capture is disabled, any remaining data in the ATB formatter is stored to RAM. When all data is stored the formatter outputs FtStopped. Capture is fully disabled, or complete, when FtStopped goes HIGH. See ETB Formatter and Flush Status Register, FFSR, 0x300. 0x1: enable trace capture 0x0: disable trace capture.

0x01A01024 QDSS_ETB_RWD_REG

Type: Write
Reset State: 0x00000000

ETB RAM Write Data Register, RWD, 0x024

QDSS_ETB_RWD_REG

Bits	Name	Description
31:0	RAM_WRITE_DATA_REGISTER	Data written to the ETB Trace RAM. When trace capture is disabled, the contents of this register are placed into the ETB Trace RAM when this register is written to. Writing to this register increments the RAM Write Pointer Register. If trace capture is enabled, and this register is accessed, then a read from this register outputs 0xFFFFFFFF. Reads of this register never increment the RAM Write Pointer Register. A constant stream of 1s being output corresponds to a synchronization output from the ETB. If a write access is attempted, the data is not written into Trace RAM.

0x01A01300 QDSS_ETB_FFSR

Type: Read
Reset State: 0x00000002

ETB Formatter and Flush Status Register, FFSR, 0x300

QDSS_ETB_FFSR

Bits	Name	Description
31:2	RESERVED	Reserved RAZ/SBZP.
1	FTSTOPPED	Formatter stopped. The formatter has received a stop request signal and all trace data and post-amble has been output. Any more trace data on the ATB interface is ignored and ATREADYS goes HIGH.
0	FLINPROG	Flush In Progress. This is an indication of the current state of AFVALIDS.

0x01A01304 QDSS_ETB_FFCR

Type: Read/Write
Reset State: 0x0000

ETB Formatter and Flush Control Register, FFCR, 0x304

QDSS_ETB_FFCR

Bits	Name	Description
31:14	RESERVED_1	Reserved RAZ/SBZP.
13	STOPTRIG	Stop the formatter when a Trigger Event has been observed. Reset to disabled (zero).
12	STOPFL	Stop the formatter when a flush has completed (return of AFREADYS). This forces the FIFO to drain off any part-completed packets. Setting this bit enables this function but this is clear on reset (disabled).
11	RESERVED_2	Reserved RAZ/SBZP.
10	TRIGFL	Indicate a trigger on Flush completion (AFREADYS being returned).
9	TRIGEVT	Indicate a trigger on a Trigger Event.
8	TRIGIN	Indicate a trigger on TRIGIN being asserted
7	RESERVED_3	Reserved RAZ/SBZP.
6	FONMAN	Manually generate a flush of the system. Setting this bit causes a flush to be generated. This is cleared when this flush has been serviced. This bit is clear on reset.
5	FONTRIG	Generate flush using Trigger event. Set this bit to cause a flush of data in the system when a Trigger Event occurs. This bit is clear on reset.
4	FONFLIN	Generate flush using the FLUSHIN interface. Set this bit to enable use of the FLUSHIN connection. This bit is clear on reset.
3:2	RESERVED_4	Reserved RAZ/SBZP.

QDSS_ETB_FFCR (cont.)

Bits	Name	Description
1	ENFCONT	Continuous Formatting. Continuous mode in the ETB corresponds to normal mode with the embedding of triggers. Can only be changed when FtStopped is HIGH. This bit is clear on reset.
0	ENFTC	Enable Formatting. Do not embed Triggers into the formatted stream. Trace disable cycles and triggers are indicated by TRACECTL, where fitted. Can only be changed when FtStopped is HIGH. This bit is clear on reset.

0x01A01EE0 QDSS_ETB_ITMISCOP0

Type: Write
Reset State: Not readable

ETB Integration Test Registers

QDSS_ETB_ITMISCOP0

Bits	Name	Description
31:2	RESERVED	Reserved
1	FULL	Set the value of FULL
0	ACQCOMP	Set the value of ACQCOMP

0x01A01EE4 QDSS_ETB_ITTRFLINACK

Type: Write
Reset State: Not readable

Integration Test Trigger In and Flush In Acknowledge Register, ITTRFLINACK, 0xEE4

QDSS_ETB_ITTRFLINACK

Bits	Name	Description
31:2	RESERVED	Reserved
1	FLUSHINACK	Set the value of FLUSHINACK
0	TRIGINACK	Set the value of TRIGINACK

0x01A01EE8 QDSS_ETB_ITTRFLIN

Type: Read
Reset State: Undefined

Integration Test Trigger In and Flush In Register, ITTRFLIN, 0xEE8

QDSS_ETB_ITTRFLIN

Bits	Name	Description
31:2	RESERVED	Reserved
1	FLUSHIN	Read the value of FLUSHIN
0	TRIGIN	Read the value of TRIGIN

0x01A01EEC QDSS_ETB_ITATBDATA0

Type: Read
Reset State: Undefined

Integration Test ATB Data Register 0, ITATBDATA0, 0xEEC

QDSS_ETB_ITATBDATA0

Bits	Name	Description
31:5	RESERVED	Reserved
4	ATDATA_31	Read the value of ATDATAS[31]
3	ATDATA_23	Read the value of ATDATAS[23]
2	ATDATA_15	Read the value of ATDATAS[15]
1	ATDATA_7	Read the value of ATDATAS[7]
0	ATDATA_0	Read the value of ATDATAS[0]

0x01A01EF0 QDSS_ETB_ITATBCTR2

Type: Write
Reset State: Not readable

Integration Test ATB Control Register 2, ITATBCTR2, 0xEF0

QDSS_ETB_ITATBCTR2

Bits	Name	Description
31:2	RESERVED	Reserved
1	AFVALIDS	Set the value of AFVALIDS
0	ATREADYS	Set the value of ATREADYS

0x01A01EF4 QDSS_ETB_ITATBCTR1

Type: Read
Reset State: Undefined

Integration Test ATB Control Register 1, ITATBCTR1, 0xEF4

QDSS_ETB_ITATBCTR1

Bits	Name	Description
31:7	RESERVED	Reserved
6:0	ATID	Read the value of ATIDS

0x01A01EF8 QDSS_ETB_ITATBCTR0

Type: Read
Reset State: Undefined

Integration Test ATB Control Register 0, ITATBCTR0, 0xEF8

QDSS_ETB_ITATBCTR0

Bits	Name	Description
31:10	RESERVED_1	Reserved
9:8	ATBYTES	Read the value of ATBYTESS
7:2	RESERVED_2	Reserved

6.4 QDSS CTI1 Registers (0x01A02000 QDSS_CTI1_BASE)

This section contains the QDSS CTI1 registers.

6.4.1 CoreSight Component Registers

This section describes the CS component registers. This includes device specific registers, CS management registers, peripheral ID registers, and component ID registers. It is provided below for QCSR and FLAT file generation. However, the details of the registers can be found in the ARM documents, which provide more detailed information about these registers, such as their usage and descriptive register bits information. See: http://infocenter.arm.com/help/index.jsp.

6.4.1.1 CoreSight CTI Registers Summary

Table 6-3 is the summary of CTI registers.

Table 6-3 Summary of CTI registers

Offset	Name	Type	Width	Reset value	Description
0x000	CTI1_CONTROL	Read/Write	1	0x0	See CTI Control Register, CTICONTROL, 0x000
0x010	CTI1_INTACK	Write	8	-	See CTI Interrupt Acknowledge Register, CTIINTACK, 0x010
0x014	CTI1_APPSET	Read/Write	4	0x0	See CTI Application Trigger Set Register, CTIAPPSET, 0x014
0x018	CTI1_APPCLEAR	Write	4	0x0	See CTI Application Trigger Clear Register, CTIAPPCLEAR, 0x018
0x01C	CTI1_APPPULSE	Write	4	0x0	See CTI Application Pulse Register, CTIAPPPULSE, 0x01C
0x020-0x03C	CTI1_INEN	Read/Write	4	0x00	See CTI Trigger to Channel Enable Registers, CTIINEN0-7, 0x020-0x03C
0x0A0-0x0BC	CTI1_OUTEN	Read/Write	4	0x00	See CTI Channel to Trigger Enable Registers, CTIOUTEN0-7, 0x0A0-0x0BC
0x130	CTI1_TRIGINSTATUS	Read	8	-	See CTI Trigger In Status Register, CTITRIGINSTATUS, 0x130
0x134	CTI1_TRIGOUTSTATUS	Read	8	0x00	See CTI Trigger Out Status Register, CTITRIGOUTSTATUS, 0x134
0x138	CTI1_CHINSTATUS	Read	4	-	See CTI Channel In Status Register, CTICHINSTATUS, 0x138
0x13C	CTI1_CHOUTSTATUS	Read	4	0x0	See CTI Channel Out Status Register, CTICHOUTSTATUS, 0x13C
0x140	CTI1_GATE	Read/Write	4	0xF	See Enable CTI Channel Gate Register, CTIGATE, 0x140
0x144	CTI1_ASICCTL	Read/Write	8	0x00	See External Multiplexor Control Register, ASICCTL, 0x144

Table 6-3 Summary of CTI registers

Offset	Name	Type	Width	Reset value	Description
0xEDC	CTI1_ITCHINACK	Write	4	0x0	See ITCHINACK Register, 0xEDC
0xEE0	CTI1_ITTRIGINACK	Write	8	0x00	See ITTRIGINACK Register, 0xEE0
0xEE4	CTI1_ITCHOUT	Write	4	0x0	See ITCHOUT Register, 0xEE4
0xEE8	CTI1_ITTRIGOUT	Write	8	0x00	See ITTRIGOUT Register, 0xEE8
0xEEC	CTI1_ITCHOUTACK	Read	4	0x0	See ITCHOUTACK Register, 0xEEC
0xEF0	CTI1_ITTRIGOUTACK	Read	8	0x00	See ITTRIGOUTACK Register, 0xEF0
0xEF4	CTI1_ITCHIN	Read	4	0x0	See ITCHIN Register, 0xEF4
0xEF8	CTI1_ITTRIGIN	Read	8	0x00	See ITTRIGIN Register, 0xEF8
0xEFC -0xF7C	-	-	-	-	Reserved
0xF00	CTI1_ITCTRL	Read/Write	1	0x0	See ECT CoreSight defined registers
0xFA0	CTI1_CLAIMSET	Read/Write	4	0xF	
0xFA4	CTI1_CLAIMCLR	Read/Write	4	0x0	
0xFB0	CTI1_LAR	Write	32	-	
0xFB4	CTI1_LSR	Read	2	0x0/0x3	
0xFB8	CTI1_AUTHSTATUS	Read	4	0x5	
0xFC0-0xFC4	-	-	-	-	Reserved
0xFC8	CTI1_DEVID	Read	20	0x40800	See ECT CoreSight defined registers
0xFCC	CTI1_DEVTYPE	Read	8	0x14	See ECT CoreSight defined registers
0xFD0	CTI1_PIDR4	Read	8	0x04	
0xFD4	PeripheralID5	-	-	-	Reserved
0xFD8	PeripheralID6	-	-	-	Reserved
0xFDC	PeripheralID7	-	-	-	Reserved
0xFE0	CTI1_PIDR0	Read	8	0x06	See ECT CoreSight defined registers
0xFE4	CTI1_PIDR1	Read	8	0xB9	
0xFE8	CTI1_PIDR2	Read	8	0x2B	
0xFEC	CTI1_PIDR3	Read	8	0x00	
0xFF0	CTI1_CIDR0	Read	8	0x0D	
0xFF4	CTI1_CIDR1	Read	8	0x90	
0xFF8	CTI1_CIDR2	Read	8	0x05	
0xFFC	CTI1_CIDR3	Read	8	0xB1	

6.4.1.2 CTI1 Registers

0x01A02000 QDSS_CTI1_CONTROL

Type: Read/Write
Reset State: 0x0

CTI control register enables the CTI

QDSS_CTI1_CONTROL

Bits	Name	Description
31:1	RESERVED_31_1	Reserved RAZ DNM.
0	GLBEN	Enables or disables the ECT: When disabled, all cross triggering mapping logic functionality is disabled for this processor. 0x0: disabled (reset) 0x1: enabled.

0x01A02010 QDSS_CTI1_INTACK

Type: Write
Reset State: Not readable

QDSS_CTI1_INTACK

Bits	Name	Description
31:8	RESERVED_31_8	Reserved RAZ DNM.
7:0	INTACK	Acknowledges the corresponding CTITRIGOUT output: There is one bit of the register for each CTITRIGOUT output. 0x1: CTITRIGOUT is acknowledged and is cleared when MAPTRIGOUT is LOW. 0x0: no effect.

0x01A02014 QDSS_CTI1_APPSET

Type: Read/Write
Reset State: 0x0

QDSS_CTI1_APPSET

Bits	Name	Description
31:4	RESERVED_31_4	Reserved RAZ DNM.

QDSS_CTI1_APPSET (cont.)

Bits	Name	Description
3:0	APPSET	Setting a bit HIGH generates a channel event for the selected channel. Read: Write: There is one bit of the register for each channel. 0x0: application trigger inactive (reset) 0x1: application trigger active. 0x0: no effect 0x1: generate channel event.

0x01A02018 QDSS_CTI1_APPCLEAR

Type: Write
Reset State: 0x0

QDSS_CTI1_APPCLEAR

Bits	Name	Description
31:4	RESERVED_31_4	Reserved RAZ DNM.
3:0	APPCLEAR	Clears corresponding bits in the CTIAPPSET register. There is one bit of the register for each channel. 0x1: application trigger disabled in the CTIAPPSET register 0x0: no effect.

0x01A0201C QDSS_CTI1_APPPULSE

Type: Write
Reset State: 0x0

QDSS_CTI1_APPPULSE

Bits	Name	Description
31:4	RESERVED	Reserved RAZ DNM.
3:0	APPULSE	Setting a bit HIGH generates a channel event pulse for the selected channel. Write: There is one bit of the register for each channel. 0x1: channel event pulse generated for one CTICLK period 0x0: no effect.

0x01A02020+ 0x4*n QDSS_CTI1_INENn, n=[0..7]

Type: Read/Write
Reset State: 0x00

NOTE 8 registers

QDSS_CTI1_INENn

Bits	Name	Description
31:4	RESERVED	Reserved RAZ DNM.
3:0	TRIGINEN	Enables a cross trigger event to the corresponding channel when an CTITRIGIN is activated. There is one bit of the register for each of the four channels. For example in register CTIINEN0, TRIGINEN0 set to 1 enables CTITRIGIN onto channel 0. 0x1: enables the CTITRIGIN signal to generate an event on the respective channel of the CTM. 0x0: disables the CTITRIGIN signal from generating an event on the respective channel of the CTM.

0x01A020A0+ 0x4*n QDSS_CTI1_OUTENn, n=[0..7]

Type: Read/Write
Reset State: 0x00

NOTE 8 registers

QDSS_CTI1_OUTENn

Bits	Name	Description
31:4	RESERVED	Reserved RAZ DNM.
3:0	TRIGOUTEN	Changing the value of this bit from a 0 to a 1 enables a channel event for the corresponding channel to generate an CTITRIGOUT output: There is one bit for each of the four channels. For example in register CTIOUTEN0, enabling bit 0 enables CTICHIN0 to cause a trigger event on the CTITRIGOUT0 output. 0x0: the channel input_1 (CTICHIN from the CTM is not routed to the CTITRIGOUT output) 0x1: the channel input_2 (CTICHIN from the CTM is routed to the CTITRIGOUT output.)

0x01A02130 QDSS_CTI1_TRIGINSTATUS

Type: Read
Reset State: Undefined

QDSS_CTI1_TRIGINSTATUS

Bits	Name	Description
31:8	RESERVED	Reserved RAZ DNM.
7:0	TRIGINSTATUS	Shows the status of the CTITRIGIN inputs: Because the register provides a view of the raw CTITRIGIN inputs, the reset value is unknown. There is one bit of the register for each trigger input. 0x1: CTITRIGIN is active 0x0: CTITRIGIN is inactive.

0x01A02134 QDSS_CTI1_TRIGOUTSTATUS

Type: Read
Reset State: 0x00

QDSS_CTI1_TRIGOUTSTATUS

Bits	Name	Description
31:8	RESERVED	Reserved RAZ DNM.
7:0	TRIGOUTSTATUS	Shows the status of the CTITRIGOUT outputs. There is one bit of the register for each trigger output. 0x1: CTITRIGOUT is active 0x0: CTITRIGOUT is inactive (reset.)

0x01A02138 QDSS_CTI1_CHINSTATUS

Type: Read
Reset State: Undefined

QDSS_CTI1_CHINSTATUS

Bits	Name	Description
31:4	RESERVED	Reserved RAZ DNM.
3:0	CTICHINSTATUS	Shows the status of the CTICHIN inputs: Because the register provides a view of the raw CTICHIN inputs from the CTM, the reset value is unknown. There is one bit of the register for each channel input. 0x1: CTICHIN is active 0x0: CTICHIN is inactive.

0x01A0213C QDSS_CTI1_CHOUTSTATUS

Type: Read
Reset State: 0x0

QDSS_CTI1_CHOUTSTATUS

Bits	Name	Description
31:4	RESERVED	Reserved RAZ DNM.
3:0	CTICHOUTSTATUS	Shows the status of the CTICHOUT outputs. There is one bit of the register for each channel output. 0x1: CTICHOUT is active 0x0: CTICHOUT is inactive (reset.)

0x01A02140 QDSS_CTI1_GATE

Type: Read/Write
Reset State: 0xF

QDSS_CTI1_GATE

Bits	Name	Description
31:4	RESERVED	Reserved RAZ DNM.
3	CTIGATEEN3	Enable CTICHOUT3. Set to 0 to disable channel propagation.
2	CTIGATEEN2	Enable CTICHOUT2. Set to 0 to disable channel propagation.
1	CTIGATEEN1	Enable CTICHOUT1. Set to 0 to disable channel propagation.
0	CTIGATEEN0	Enable CTICHOUT0. Set to 0 to disable channel propagation.

0x01A02144 QDSS_CTI1_ASICCTL

Type: Read/Write
Reset State: 0x00

QDSS_CTI1_ASICCTL

Bits	Name	Description
31:8	RESERVED	Reserved RAZ DNM.
7:0	ASICCTL	Implementation-defined ASIC control, value written to the register is output on ASICCTL7:0. If external multiplexing of trigger signals is implemented then the number of multiplexed signals on each trigger must be reflected within the Device ID Register. This is done within a Verilog define EXTMUXNUM.

0x01A02EDC QDSS_CTI1_ITCHINACK

Type: Write
Reset State: 0x0

QDSS_CTI1_ITCHINACK

Bits	Name	Description
31:4	RESERVED	Reserved
3:0	CTCHINACK	Set the value of the CTCHINACK outputs

0x01A02EE0 QDSS_CTI1_ITTRIGINACK

Type: Write
Reset State: 0x00

QDSS_CTI1_ITTRIGINACK

Bits	Name	Description
31:8	RESERVED	Reserved
7:0	CTTRIGINACK	Set the value of the CTTRIGINACK outputs

0x01A02EE4 QDSS_CTI1_ITCHOUT

Type: Write
Reset State: 0x0

QDSS_CTI1_ITCHOUT

Bits	Name	Description
31:4	RESERVED	Reserved
3:0	CTCHOUT	Set the value of the CTCHOUT outputs

0x01A02EE8 QDSS_CTI1_ITTRIGOUT

Type: Write
Reset State: 0x00

QDSS_CTI1_ITTRIGOUT

Bits	Name	Description
31:8	RESERVED	Reserved
7:0	CTTRIGOUT	Set the value of the CTTRIGOUT outputs

0x01A02EEC QDSS_CTI1_ITCHOUTACK

Type: Read
Reset State: 0x0

QDSS_CTI1_ITCHOUTACK

Bits	Name	Description
31:4	RESERVED	Reserved
3:0	CTCHOUTACK	Read the values of the CTCHOUTACK inputs

0x01A02EF0 QDSS_CTI1_ITTRIGOUTACK

Type: Read
Reset State: 0x00

QDSS_CTI1_ITTRIGOUTACK

Bits	Name	Description
31:8	RESERVED	Reserved
7:0	CTTRIGOUTACK	Read the values of the CTTRIGOUTACK inputs

0x01A02EF4 QDSS_CTI1_ITCHIN

Type: Read
Reset State: 0x0

QDSS_CTI1_ITCHIN

Bits	Name	Description
31:4	RESERVED	Reserved
3:0	CTCHIN	Read the values of the CTCHIN inputs

0x01A02EF8 QDSS_CTI1_ITTRIGIN

Type: Read
Reset State: 0x00

QDSS_CTI1_ITTRIGIN

Bits	Name	Description
31:8	RESERVED	Reserved
7:0	CTTRIGIN	Read the values of the CTTRIGIN inputs

0x01A02F00 QDSS_CTI1_ITCTRL

Type: Read/Write
Reset State: 0x0

Reset Mask: 0x00000001

Used to enable topology detection. This register enables the component to switch from a functional mode, the default behavior, to integration mode where the inputs and outputs of the component can be directly controlled for integration testing and topology solving. Refer to the CoreSight Architecture Specification for more information, at http://www.arm.com/products/system-ip/coresight/index.php.

NOTE When a device has been in integration mode, it might not function with the original behavior. After performing integration or topology detection, you must reset the system to ensure correct behavior of CoreSight and other connected system components that are affected by the integration or topology detection.

QDSS_CTI1_ITCTRL

Bits	Name	Description
31:1	RESERVED	Reserved
0	INTEGRATION_MODE	Enables the component to switch from functional mode to integration mode and back. If no integration functionality is implemented, this register must read as zero. 0x1: INTEGRATION_MODE (Enable integration mode.) 0x0: FUNCTIONAL_MODE (Disable integration mode.)

0x01A02FA0 QDSS_CTI1_CLAIMSET

Type: Read/Write
Reset State: 0xF

This is used in conjunction with Claim Tag Clear Register, CTICLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CTI1_CLAIMSET

Bits	Name	Description
3:0	CLAIMSET	On write: Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag. On Read: This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x01A02FA4 QDSS_CTI1_CLAIMCLR

Type: Read/Write
Reset State: 0x0

This register is used in conjunction with Claim Tag Set Register, CTICLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CTI1_CLAIMCLR

Bits	Name	Description
3:0	CLAIMCLR	On Write: Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag. On Read: The value present reflects the current setting of the Claim Tag.

0x01A02FB0 QDSS_CTI1_LAR

Type: Write
Reset State: Not readable

This register is used to enable write access to device registers.

QDSS_CTI1_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. An invalid write has the effect of removing write access. 0xC5ACCE55: UNLOCK (unlock the protection register to enable write access)

0x01A02FB4 QDSS_CTI1_LSR

Type: Read
Reset State: 0x0/0x3

This indicates the status of the lock control mechanism. This lock prevents accidental writes by code under debug. This register must always be present although there might not be any lock access control mechanism. The lock mechanism, where present and locked, must block write accesses to any control register, except the Lock Access Register. For most components this covers all registers except for the Lock Access Register, 0xFB0.

QDSS_CTI1_LSR

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register, 0xFB0, is implemented as 8-bit or 32-bit. 0x0: V_32_BIT (This component implements a 32-bit Lock Access Register.)
1	LOCKGRANT	Returns the current status of the Lock. 0x0: ACCESS_PERMITTED (Write access is allowed to this device.) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted.)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access Register, 0xFB0, are ignored.) 0x1: LOCK_PRESENT (Lock control mechanism is present.)

0x01A02FB8 QDSS_CTI1_AUTHSTATUS

Type: Read
Reset State: 0x5

Reports the required security level and current status of those enables. Where functionality changes on a given security level, this change in status must be reported in this register.

QDSS_CTI1_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug: 0x0: V_2_B10 (Functionality disabled) 0x3: V_2_B11 (Functionality enabled.)
5:4	SID	Indicates the security level for secure invasive debug: 0x0: V_2_B10 (Functionality disabled) 0x3: V_2_B11 (Functionality enabled.)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug: 0x0: V_2_B10 (Functionality disabled) 0x3: V_2_B11 (Functionality enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug: 0x0: V_2_B10 (Functionality disabled) 0x3: V_2_B11 (Functionality enabled.)

0x01A02FC8 QDSS_CTI1_DEVID

Type: Read
Reset State: 0x40800

QDSS_CTI1_DEVID

Bits	Name	Description
31:20	RESERVED_31_20	Reserved.
19:16	NUMECTCHN	Number of ECT channels available. Always reads 0x4
15:8	NUMECTTRIG	Number of ECT triggers available. Always reads 0x08
7:5	RESERVED_7_5	Reserved.
4:0	EXTMUXNUM	Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that you must alter accordingly.

0x01A02FCC QDSS_CTI1_DEVTYPE

Type: Read
Reset State: 0x14

Provides a debugger with information about the component when the Part Number field is not recognized. The debugger can then report this information.

QDSS_CTI1_DEVTYPE

Bits	Name	Description
7:4	SUB_TYPE	Sub-classification within the major category: 0x1: TRIGGER_MATRIX
3:0	MAJOR_TYPE	Major classification grouping for this debug or trace component: 0x4: DEBUG_CONTROL

0x01A02FD0 QDSS_CTI1_PIDR4

Type: Read
Reset State: 0x04

Part of the set of peripheral identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CTI1_PIDR4

Bits	Name	Description
7:4	FOURKB_COUNT	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB, this must read as 0x0, 4KB only. For 8KB set to 0x1, for 16KB set to 0x, for 32KB set to 0x3, and so on. 0x0: V_4KB (Indicates that the device only occupies 4KB of memory.)
3:0	JEP106_CONT	JEDEC continuation code indicating the designer of the component, together with the identity code. 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARMs JEDEC identity code is on the 5th bank.)

0x01A02FD4 QDSS_CTI1_PIDR5

Type: Read
Reset State: 0x00

Part of the set of peripheral identification registers.

QDSS_CTI1_PIDR5

Bits	Name	Description
7:0	RESERVED	Reserved RAZ/SBZP

0x01A02FD8 QDSS_CTI1_PIDR6

Type: Read
Reset State: 0x00

Part of the set of peripheral identification registers.

QDSS_CTI1_PIDR6

Bits	Name	Description
7:0	RESERVED	Reserved RAZ/SBZP

0x01A02FDC QDSS_CTI1_PIDR7

Type: Read
Reset State: 0x00

Part of the set of peripheral identification registers.

QDSS_CTI1_PIDR7

Bits	Name	Description
7:0	RESERVED	Reserved RAZ/SBZP

0x01A02FE0 QDSS_CTI1_PIDR0

Type: Read
Reset State: 0x06

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CTI1_PIDR0

Bits	Name	Description
7:0	PART_NUMBER_BITS7TO0	Bits [7:0] of the component part number. This is selected by the designer of the component. 0x62: CORESIGHT_STM_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number, 0x962.)

0x01A02FE4 QDSS_CTI1_PIDR1

Type: Read
Reset State: 0xB9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CTI1_PIDR1

Bits	Name	Description
7:4	JEP106_BITS3TO0	Bits [3:0] of the JEDEC identity code indicating the designer of the component, together with the continuation code. 0xB: ARM_JEP106_IDENTITY_CODE_7_0 (Lowest 4 bits of the JEP106 Identity Code.)
3:0	PART_NUMBER_BITS11TO8	Bits [11:8] of the component part number. This is selected by the designer of the component. 0x9: CORESIGHT_STM_PART_NUMBER_11_8 (Upper 4 bits of the Part Number, 0x907.)

0x01A02FE8 QDSS_CTI1_PIDR2

Type: Read
Reset State: 0x3B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CTI1_PIDR2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is used as a look-up to establish the exact major and minor revision. 0x0: R0P0 (This device is at r0p0.)
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used. 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC http://www.jedec.org.)
2:0	JEP106_BITS6TO4	Bits [6:4] of the JEDEC identity code indicating the designer of the component, together with the continuation code. 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code.)

0x01A02FEC QDSS_CTI1_PIDR3

Type: Read
Reset State: 0x00

Part of the set of Peripheral Identification registers. Contains the Rev and customer modified fields.

QDSS_CTI1_PIDR3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODS (Indicates that there have been no metal fixes to this component.)
3:0	CUSTOMER_MODIFIED	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODS (Indicates that there have been no modifications made.)

0x01A02FF0 QDSS_CTI1_CIDR0

Type: Read
Reset State: 0x0D

A component identification register, that indicates that the identification registers are present.

QDSS_CTI1_CIDR0

Bits	Name	Description
7:0	PREAMBLE	Contains bits [24:31] of the component identification. 0xD: V_0D (Identification value.)

0x01A02FF4 QDSS_CTI1_CIDR1

Type: Read
Reset State: 0x90

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_CTI1_CIDR1

Bits	Name	Description
7:4	CLASS	Class of the component, for example, ROM table or CoreSight component. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component.)
3:0	PREAMBLE	Contains bits [19:16] of the component identification. 0x0: V_0 (Identification value.)

0x01A02FF8 QDSS_CTI1_CIDR2

Type: Read
Reset State: 0x05

A component identification register that indicates the identification registers are present.

QDSS_CTI1_CIDR2

Bits	Name	Description
7:0	PREAMBLE	Contains bits [15:8] of the component identification. 0x5: V_05 (Identification value.)

0x01A02FFC QDSS_CTI1_CIDR3

Type: Read
Reset State: 0xB1

A component identification register, that indicates that the identification registers are present.

QDSS_CTI1_CIDR3

Bits	Name	Description
7:0	PREAMBLE	Contains bits [7:0] of the component identification. 0xB1: B1 (Identification value.)

6.5 QDSS TPIU Registers (0x01A03000 QDSS_TPIU_BASE)

This section contains the QDSS TPIU registers.

6.5.1 CoreSight Component Registers

This section describes the CS component registers. This includes device specific registers, CS management registers, peripheral ID registers, and component ID registers. It is provided below for QCSR and FLAT file generation. However, the details of the registers can be found in the ARM documents, which provide more detailed information about these registeres, such as their usage and descriptive register bits information. You can find ARM documentation at http://infocenter.arm.com/help/index.jsp.

6.5.1.1 TPIU Registers

0x01A03000 QDSS_TPIU_SUPPORTED_PORT_SIZE

Type: Read
Reset State: 0xFFFFFFF

See Supported Port Size Register, 0x000

QDSS_TPIU_SUPPORTED_PORT_SIZE

Bits	Name	Description
31:0	DATA	

0x01A03004 QDSS_TPIU_CURRENT_PORT_SIZE

Type: Read/Write
Reset State: 0x0000001

See Current Port Size Register, 0x004

QDSS_TPIU_CURRENT_PORT_SIZE

Bits	Name	Description
31:0	DATA	

0x01A03100 QDSS_TPIU_SUPPORTED_TRIGGER_MODES

Type: Read
Reset State: 0x11F

See Supported Trigger Modes Register, 0x100

QDSS_TPIU_SUPPORTED_TRIGGER_MODES

Bits	Name	Description
31:18	RESERVED_1	Reserved RAZ/SBZP
17	TRGRUN	Trigger Counter running. A trigger has occurred but the counter is not at zero.
16	TRIGGERED	Triggered. A trigger has occurred and the counter has reached zero.
15:9	RESERVED_2	Reserved RAZ/SBZP
8	TCOUNT8	8-bit wide counter register implemented.
7:5	RESERVED	Reserved RAZ/SBZP
4	MULT64K	Multiply the Trigger Counter by 65536 supported.
3	MULT256	Multiply the Trigger Counter by 256 supported.
2	MULT16	Multiply the Trigger Counter by 16 supported.
1	MULT4	Multiply the Trigger Counter by 4 supported.
0	MULT2	Multiply the Trigger Counter by 2 supported.

0x01A03104 QDSS_TPIU_TRIGGER_COUNTER_VALUE

Type: Read/Write
Reset State: 0x00

See Trigger Counter Register, 0x104

QDSS_TPIU_TRIGGER_COUNTER_VALUE

Bits	Name	Description
31:8	RESERVED	Reserved RAZ/SBZP
7:0	TRIGCOUNT	8-bit counter value for the number of words to be output from the formatter before a trigger is inserted. Reset value is 0x00.

0x01A03108 QDSS_TPIU_TRIGGER_MULTIPLIER

Type: Read/Write
Reset State: 0x00

See Trigger Multiplier Register, 0x108

QDSS_TPIU_TRIGGER_MULTIPLIER

Bits	Name	Description
31:5	RESERVED	Reserved RAZ/SBZP
4	MULT64K	Multiply the Trigger Counter by 65536 (216)
3	MULT256	Multiply the Trigger Counter by 256 (28)
2	MULT16	Multiply the Trigger Counter by 16 (24)
1	MULT4	Multiply the Trigger Counter by 4 (22)
0	MULT2	Multiply the Trigger Counter by 2 (21)

0x01A03200 QDSS_TPIU_SUPPORTED_TEST_PATTERNM

Type: Read
Reset State: 0x3000F

See Supported Test Patterns/Modes Register, 0x200

QDSS_TPIU_SUPPORTED_TEST_PATTERNM

Bits	Name	Description
31:18	RESERVED_1	Reserved RAZ/SBZP
17	PCONTEN	Continuous mode
16	PTIMEEN	Timed mode
15:4	RESERVED_2	Reserved RAZ/SBZP
3	PATF0	FF/00 Pattern
2	PATA5	AA/55 Pattern
1	PATW0	Walking 0s Pattern
0	PATW1	Walking 1s Pattern

0x01A03204 QDSS_TPIU_CURRENT_TEST_PATTERNM

Type: Read/Write
Reset State: 0x00000

See Current Test Patterns/Modes Register, 0x204

QDSS_TPIU_CURRENT_TEST_PATTERNM

Bits	Name	Description
31:0	DATA	

0x01A03208 QDSS_TPIU_TEST_PATTERN_REPEAT_COUNTER

Type: Read/Write
Reset State: 0x00

See TPIU Test Pattern Repeat Counter Register, 0x208

QDSS_TPIU_TEST_PATTERN_REPEAT_COUNTER

Bits	Name	Description
31:8	RESERVED	Reserved RAZ/SBZP
7:0	PATTCOUNT	8-bit counter value to indicate the number of TRACECLKIN cycles that a pattern runs for before switching to the next pattern. Default value is 0.

0x01A03300 QDSS_TPIU_FORMATTER_AND_FLUSH_STATUS

Type: Read
Reset State: 0x2 or 0x6

See Formatter and Flush Status Register, 0x300

QDSS_TPIU_FORMATTER_AND_FLUSH_STATUS

Bits	Name	Description
31:3	RESERVED	Reserved RAZ/SBZP.
2	TCPRESENT	If this bit is set then TRACECTL is present. If no TRACECTL pin is available, that is, this bit is zero, then the data formatter must be used and only in continuous mode. This is constrained by the CSTPIU_TRACECTL_VAL Verilog define, which is not user modifiable, and the external tie-off TPCTL. If either constraint reports zero/LOW then no TRACECTL is present and this inability to use the pin is reflected in this register. See TRACECTL removal for more information.
1	FTSTOPPED	Formatter stopped. The formatter has received a stop request signal and all trace data and post-amble has been output. Any more trace data on the ATB interface is ignored and ATREADYS goes HIGH.
0	FLINPROG	Flush In Progress. This is an indication of the current state of AFVALIDS.

0x01A03304 QDSS_TPIU_FORMATTER_AND_FLUSH_CONTROL

Type: Read/Write
Reset State: 0x0000

See Formatter and Flush Control Register, 0x304

QDSS_TPIU_FORMATTER_AND_FLUSH_CONTROL

Bits	Name	Description
31:14	RESERVED_1	Reserved RAZ/SBZP.
13	STOPTRIG	Stop the formatter after a Trigger Event is observed. Reset to disabled, or zero.
12	STOPFL	Stop the formatter after a flush completes (return of AFREADYS). This forces the FIFO to drain off any part-completed packets. Setting this bit enables this function but this is clear on reset, or disabled.
11	RESERVED_2	Reserved RAZ/SBZP.
10	TRIGFL	Indicates a trigger on Flush completion on AFREADYS being returned.
9	TRIGEVT	Indicate a trigger on a Trigger Eventa.
8	TRIGIN	Indicate a trigger on TRIGIN being asserted.
7	RESERVED_3	Reserved RAZ/SBZP.
6	FONMAN	Manually generate a flush of the system. Setting this bit causes a flush to be generated. This is cleared when this flush has been serviced. This bit is clear on reset.
5	FONTRIG	Generate flush using Trigger event. Set this bit to cause a flush of data in the system when a Trigger Eventa occurs. Reset value is this bit clear.
4	FONFLIN	Generate flush using the FLUSHIN interface. Set this bit to enable use of the FLUSHIN connection. This is clear on reset.
3:2	RESERVED_4	Reserved RAZ/SBZP.
1	ENFCONT	Continuous Formatting, no TRACECTL. Embed in trigger packets and indicate null cycles using Sync packets. Reset value is this bit clear. Can only be changed when FtStopped is HIGH.
0	ENFTC	Enable Formatting. Do not embed Triggers into the formatted stream. Trace disable cycles and triggers are indicated by TRACECTL, where fitted. Reset value is this bit clear. Can only be changed when FtStopped is HIGH.

0x01A03308 QDSS_TPIU_FORMATTER_SYNCHRONIZATION_COUNTER

Type: Read/Write
Reset State: 0x040

See Formatter Synchronization Counter Register, 0x308

QDSS_TPIU_FORMATTER_SYNCHRONIZATION_COUNTER

Bits	Name	Description
31:12	RESERVED	Reserved RAZ/SBZP.
11:0	CYCCOUNT	12-bit counter value to indicate the number of complete frames between full synchronization packets. Default value is 64 (0x40).

0x01A03400 QDSS_TPIU_EXTCTL_IN_PORT

Type: Read
Reset State: Undefined

See TPIU EXCTL Port Registers

0x01A03404 QDSS_TPIU_EXTCTL_OUT_PORT

Type: Read/Write
Reset State: 0x00

See TPIU EXCTL Port Registers

0x01A03EE4 QDSS_TPIU_ITTRFLINACK

Type: Write
Reset State: Not readable

See Integration Test Trigger In and Flush In Acknowledge Register, ITTRFLINACK, 0xEE4

0x01A03EE8 QDSS_TPIU_ITTRFLIN

Type: Read
Reset State: Undefined

See Integration Test Trigger In and Flush In Register, ITTRFLIN, 0xEE8.

QDSS_TPIU_ITTRFLIN

Bits	Name	Description
31:2	RESERVED	Reserved RAZ/SBZP.
1	FLUSHIN	Read the value of FLUSHIN
0	TRIGIN	Read the value of TRIGIN

0x01A03EEC QDSS_TPIU_ITATBDATA0

Type: Read
Reset State: Undefined

See Integration Test ATB Data Register 0, ITATBDATA0, 0xEEC.

QDSS_TPIU_ITATBDATA0

Bits	Name	Description
31:5	B_1	Reserved
4	ATDATA_31	Read the value of ATDATAS[31]
3	ATDATA_23	Read the value of ATDATAS[23]
2	ATDATA_15	Read the value of ATDATAS[15]
1	ATDATA_7	Read the value of ATDATAS[7]
0	ATDATA_0	Read the value of ATDATAS[0]

0x01A03EF0 QDSS_TPIU_ITATBCTR2

Type: Write
Reset State: Not readable

See Integration Test ATB Control Register 2, ITATBCTR2, 0xEF0

0x01A03EF4 QDSS_TPIU_ITATBCTR1

Type: Read
Reset State: Undefined

See Integration Test ATB Control Register 1, ITATBCTR1, 0xEF4

0x01A03EF8 QDSS_TPIU_ITATBCTR0

Type: Read
Reset State: Undefined

See Integration Test ATB Control Register 0, ITATBCTR0, 0xEF8

0x01A03F00 QDSS_TPIU_ITMR

6.6.1.2 CSTF Registers

This section describes the coresight trace funnel (CSTF) specific registers:

- CSTF control register
- CSTF priority control register

The CSTF control register and the CSTF priority control register can only be changed when the whole trace system is stopped.

0x01A04000 QDSS_CS_TFUNNEL_FUNCTL

Type: Read/Write
Clock: PCLKDBG
Reset State: 0x300

The coresight funnel control register enables the slave ports and defines the hold time of the slave ports. Hold time refers to the number of transactions that are output on the funnel master port from the same slave while that slave port ATVALIDSx is HIGH. Hold time does not refer to clock cycles in this context.

QDSS_CS_TFUNNEL_FUNCTL

Bits	Name	Description
31:12	RESERVED	

QDSS_CS_TFUNNEL_FUNCTL (cont.)

Bits	Name	Description
11:8	MINIMUM_HOLD_TIME	The formatting scheme can easily become inefficient if fast switching occurs, so, where possible, this must be minimized. If a source has nothing to transmit, then another source is selected irrespective of the minimum number of cycles. Reset is 0x3. The CSTF holds for the minimum hold time and one additional cycle.The maximum value that can be entered is 0xE and this equates to 15 cycles. 0xF is reserved.
7	ENABLE_SLAVE_PORT_7	Setting this bit enables slave, port 7. If the bit is not set, this has the effect of excluding the port from the priority selection scheme. The port is disabled on reset.
6	ENABLE_SLAVE_PORT_6	Setting this bit enables slave, port 6. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The port is disabled on reset.
5	ENABLE_SLAVE_PORT_5	Setting this bit enables slave, port 5. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The port is disabled on reset.
4	ENALBE_SLAVE_PORT_4	Setting this bit enables slave, port 4. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The port is disabled on reset.
3	ENABLE_SLAVE_PORT_3	Setting this bit enables slave, port 3. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The port is disabled on reset.
2	ENABLE_SLAVE_PORT_2	Setting this bit enables slave, port 2. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The port is disabled on reset.
1	ENABLE_SLAVE_PORT_1	Setting this bit enables slave, port 1. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The port is disabled on reset.
0	ENABLE_SLAVE_PORT_0	Setting this bit enables slave, port 0. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The port is disabled on reset.

0x01A04004 QDSS_CS_TFUNNEL_PRICTL

Type: Read/Write
Clock: PCLKDBG
Reset State: 0xFAC688

At reset the default configuration assigns priority 0 to port 0, and priority 1 to port 1. If the highest priority is given to a particular slave port, the corresponding port must be programmed with the lowest value. Typically this is likely to be a port that has more important data or that has a small FIFO and is, therefore, likely to overflow. If the lowest priority is given to a particular slave port, the corresponding slave port must be programmed with the highest value. Typically this is likely to be a device that has a large FIFO that is less likely to overflow, or a source that has information that is of lower importance. A port programmed with value 0 gets the highest priority. A port

programmed with value 7 gets the lowest priority. Priority must always go to the highest priority source that has valid data available, if enabled. If a priority value has been entered for multiple different slave ports, then the arbitration logic selects the lowest port number of them.

QDSS_CS_TFUNNEL_PRICTL

Bits	Name	Description
31:24	RESERVED	Reserved
23:21	PRIORITY_PORT7	Port7 priority value.
20:18	PRIORITY_PORT6	Port6 priority value.
17:15	PRIORITY_PORT5	Port5 priority value.
14:12	PRIORITY_PORT4	Port4 priority value.
11:9	PRIORITY_PORT3	Port3 priority value.
8:6	PRIORITY_PORT2	Port2 priority value.
5:3	PRIORITY_PORT1	Port1 priority value.
2:0	PRIORITY_PORT0	Priority value of the slave port 0. The value written into this location is the value that is assigned to the first slave port.

0x01A04EEC QDSS_CS_TFUNNEL_ITATBDATA0

Type: Read/Write
Clock: PDBGCLK
Reset State: 0x00

The integration test ATB Data 0 register performs different functions depending on whether the access is a read or a write.

- A write outputs data on ATDATAM
- A read returns the data from ATDATAS<n>, where <n> is defined by the status of the CSTF control register at 0x000. The read data is only valid when ATVALIDS<n> is HIGH

QDSS_CS_TFUNNEL_ITATBDATA0

Bits	Name	Description
31:5	RESERVED	Reserved
4	ATDATA_31	WRITE: When this bit is written, it sets the value of ATDATAM bit[31] READ : When this bit is read, it returns the value of ATDATAS<n> bit[31]
3	ATDATA_23	WRITE: When this bit is written, it sets the value of ATDATAM bit[23] READ : When this bit is read, it returns the value of ATDATAS<n> bit[23]
2	ATDATA_15	WRITE: When this bit is written, it sets the value of ATDATAM bit[15] READ : When this bit is read, it returns the value of ATDATAS<n> bit[15]

QDSS_CS_TFUNNEL_ITATBDATA0 (cont.)

Bits	Name	Description
1	ATDATA_7	WRITE: When this bit is written, it sets the value of ATDATAM bit[7] READ : When this bit is read, it returns the value of ATDATAS<n> bit[7]
0	ATDATA_0	WRITE: When this bit is written, it sets the value of ATDATAM bit[0] READ : When this bit is read, it returns the value of ATDATAS<n> bit[0] where <n> refers to the selected slave port that is achieved by programming the CSTF control register.

0x01A04EF0 QDSS_CS_TFUNNEL_ITATBCTR2

Type: Read/Write
Clock: PCLKDBG
Reset State: 0x0

The integration test ATB Control 2 register performs different functions depending on whether the access is a read or a write.

- A write outputs data on ATREADYS<n> and AFVALIDS<n>, where <n> is defined by the status of the CSTF Control Register at 0x00
- A read returns the data from ATREADYM and AFVALIDM

QDSS_CS_TFUNNEL_ITATBCTR2

Bits	Name	Description
31:2	RESERVED	Reserved
1	AFVALID	WRITE: When this bit is written, it sets the value of AFVALIDS<n> READ : When this bit is read, it returns the value of AFVALIDM
0	ATREADY	WRITE: When this bit is written, it sets the value of AFREADYS<n> READ : When this bit is read, it returns the value of ATREADYM where <n> refers to the selected slave port that is achieved by programming the CSTF control register.

0x01A04EF4 QDSS_CS_TFUNNEL_ITATBCTR1

Type: Read/Write
Clock: PDBGCLK
Reset State: 0x00

The integration test ATB Control 1 register performs different functions depending on whether the access is a read or a write.

- A write outputs data on ATIDM

- A read returns the data from ATIDS<n>, where <n> is defined by the status of the CSTF Control register at 0x000. The read data is only valid when ATVALIDS<n> is HIGH

QDSS_CS_TFUNNEL_ITATBCTR1

Bits	Name	Description
31:7	RESERVED	Reserved
6:0	ATID	WRITE: When this bit is written, it sets the value of ATIDM READ : When this bit is read, it returns the value of ATIDS<n> where <n> refers to the selected slave port that is achieved by programming the CSTF control register.

0x01A04EF8 QDSS_CS_TFUNNEL_ITATBCTR0

Type: Read/Write
Clock: PDBGCLK
Reset State: 0x000

The integration test ATB Control 0 register performs different functions depending on whether the access is a read or a write.

- Write sets the value of the ATVALIDM, AFREADYM, and ATBYTESM signals
- Read returns the value of the ATVALIDS<n>, AFREADYS<n>, and ATBYTESS<n> signals, where <n> is defined by the status of the CSTF Control register at 0x000. The read value of ATBYTESS<n> is only valid when ATVALIDS<n> is HIGH.

QDSS_CS_TFUNNEL_ITATBCTR0

Bits	Name	Description
31:10	RESERVED_1	
9:8	ATBYTES	WRITE: When this bit is written, it sets the value of ATBYTESM READ : When this bit is read, it returns the value of ATBYTESS<n>
7:2	RESERVED_2	
1	AFREADYS	WRITE: When this bit is written, it sets the value of AFREADYM READ : When this bit is read, it returns the value of AFREADYS<n>
0	ATVALID	WRITE: When this bit is written, it sets the value of ATVALIDM READ : When this bit is read, it returns the value of ATVALIDS<n> where <n> refers to the selected slave port that is achieved by programming the CSTF control register.

Clock: PDBGCLK
Reset State: 0xF

This is used in conjunction with Claim Tag Clear Register, CS_TFUNNEL_CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CS_TFUNNEL_CLAIMSET

Bits	Name	Description
3:0	CLAIMSET	

0x01A04FA4 QDSS_CS_TFUNNEL_CLAIMCLR

Type: Read/Write
Clock: PDBGCLK
Reset State: 0x0

This register is used in conjunction with Claim Tag Set Register. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CS_TFUNNEL_CLAIMCLR

Bits	Name	Description
3:0	CLAIMCLR	

6.6.1.4 Lock Registers

The Lock Registers prevent accidental access to the registers of CoreSight components. Software that is being debugged might accidentally write to memory used by CoreSight components. This might disable those components, making the software impossible to debug. The CoreSight programmer's model includes a Lock Status Register and a Lock Access Register to control software access to CoreSight components to ensure that the likelihood of accidental access to CoreSight components is extremely small.

0x01A04FB0 QDSS_CS_TFUNNEL_LOCKACCESS

Type: Write ONLY
Clock: PDBGCLK

QDSS_CS_TFUNNEL_LOCKACCESS

Bits	Name	Description
31:0	LOCKACCESS	

0x01A04FB4 QDSS_CS_TFUNNEL_LOCKSTATUS

Type: Read ONLY
Clock: PDBGCLK
Reset State: 0x3

QDSS_CS_TFUNNEL_LOCKSTATUS

Bits	Name	Description
31:3	RESERVED	
2	B_8_BIT_LOCK	
1	ACCESS	
0	LOCK_CONTROL	

6.6.1.5 Authentication Status Register

0x01A04FB8 QDSS_CS_TFUNNEL_AUTHSTATUS

Type: Read Only
Clock: PDBGCLK
Reset State: 0x00

QDSS_CS_TFUNNEL_AUTHSTATUS

Bits	Name	Description
31:0	RESERVED	

6.6.1.6 Identification Registers

0x01A04FC8 QDSS_CS_TFUNNEL_DEVICEID

Type: Read Only
Clock: PDBGCLK
Reset State: 0x28

QDSS_CS_TFUNNEL_DEVICEID

Bits	Name	Description
31:8	RESERVED	
7:4	PRIORITY_SCHEME	The CSTF implements a static priority scheme.
3:0	PORTCOUNT	This is the value of the Verilog define PORTCOUNT and represents the number of input ports connected. By default all 8 ports are connected. 0x0 and 0x1 are illegal values.

0x01A04FCC QDSS_CS_TFUNNEL_DEVICETYPE

Type: Read Only
Clock: PDBGCLK
Reset State: 0x12

QDSS_CS_TFUNNEL_DEVICETYPE

Bits	Name	Description
7:0	DEVICE_TYPE	

0x01A04FD0 QDSS_CS_TFUNNEL_PERIPHID4

Type: Read Only
Clock: PDBGCLK
Reset State: 0x04

QDSS_CS_TFUNNEL_PERIPHID4

Bits	Name	Description
7:4	B_4KB_COUNT	
3:0	JEP106_CONTINUATION	

0x01A04FD4 QDSS_CS_TFUNNEL_PERIPHID5

Type: Read Only

6.7 QDSS ITM Registers (0x01A05000 QDSS_ITM_BASE)

This section contains the QDSS ITM registers.

6.7.1 CoreSight Component Registers

This section describes the CS component registers. This includes device specific registers, CS management registers, peripheral ID registers, and component ID registers. It is provided below for QCSR and FLAT file generation. However, the details of the registers can be found in the ARM documents, which provide more detailed information about these registers, such as their usage and descriptive register bits information. You can find ARM documentation at http://infocenter.arm.com/help/index.jsp.

6.7.1.1 CoreSight ITM Registers Summary

Table 6-5 is the summary of ITM registers.

NOTE ITM is for integration testing only.

Table 6-5 ITM register summary

Offset	Type	Width	Reset value	Name	Description
0x000-0x07C	Read/Write	32	0x00000000	ITM_STIMULUS_PORT_REGn n=[0..31]	See Stimulus registers
0xE00	Read/Write	32	0x00000000	ITM_TER	See Trace registers
0xE20	Read/Write	32	0x00000000	ITM_TTR	
0xE80	Read/Write	32	0x00000004	ITM_CR	See Control registers
0xE90	Read/Write	12	0x00000400	ITM_SCR

7.7.1.2 ITM Registers

0x01A05000+ 0x04*n QDSS_ITM_STIMULUS_PORT_REGn, n=[0..31]

Type: Read/Write
Reset State: 0x00000000

See Stimulus registers

NOTE n=32

QDSS_ITM_STIMULUS_PORT_REGn

Bits	Name	Description
31:0	DATA	

0x01A05E00 QDSS_ITM_TER

Type: Read/Write
Reset State: 0x00000000

See Trace registers

QDSS_ITM_TER

Bits	Name	Description
31:0	TRACE_ENABLE_REG	Bit mask to enable tracing on ITM stimulus port

0x01A05E20 QDSS_ITM_TTR

Type: Read/Write
Reset State: 0x00000000

QDSS_ITM_TTR

Bits	Name	Description
31:0	TRIGGER_MASK	Bit mask to trigger generation, TRIGOUT, on selected writes to the stimulus registers

0x01A05E80 QDSS_ITM_CR

Type: Read/Write
Reset State: 0x00000004

See Control registers

QDSS_ITM_CR

Bits	Name	Description
31:24	RESERVED_1	Reserved RAZ/SBZP
23	ITMBUSY	ITM is transmitting trace and FIFO is not empty
22:16	TRACEID	ATIDM[6:0] value
15:10	RESERVED_2	Reserved RAZ/SBZP
9:8	TSPRESCALE	Timestamp Prescaler, 0b00=/1, 0b01=/4, 0b10=/16, 0b11=/64
7:4	RESERVED	Reserved RAZ/SBZP
3	DWTEN	Enable DWT input port
2	SYNCEN	Enable sync packets
1	TSSEN	Enable timestamps, delta
0	ITMEN	Enable ITM stimulus, also acts as a global enable

0x01A05E90 QDSS_ITM_SCR

Type: Read/Write
Reset State: 0x00000400

QDSS_ITM_SCR

Bits	Name	Description
31:12	RESERVED	Reserved RAZ/SBZP
11:0	SYNC_COUNT	Counter value for time between synchronization markers

0x01A05EE4 QDSS_ITM_ITTRIGOUTACK

Type: Read
Reset State: 0x00000000

See Integration test registers

QDSS_ITM_ITTRIGOUTACK

Bits	Name	Description
31:1	RESERVED	Reserved RAZ/SBZP
0	ITTRIGOUTACK	Read the value of TRIGOUTACK

0x01A05EE8 QDSS_ITM_ITTRIGOUT

Type: Write
Reset State: Not readable

Integration Test Trigger Out Register

QDSS_ITM_ITTRIGOUT

Bits	Name	Description
31:1	RESERVED	Reserved RAZ/SBZP
0	ITTRIGOUT	Set the value of TRIGOUT

0x01A05EEC QDSS_ITM_IITATDATA

Type: Write
Reset State: Not readable

Integration Test ATB Data Register 0

QDSS_ITM_IITATDATA

Bits	Name	Description
31:2	RESERVED	Reserved RAZ/SBZP
1	ITATDATAM7	Set the value of ATDATAM7
0	ITATDATAM0	Set the value of ATDATAM0

0x01A05EF0 QDSS_ITM_ITATCTL2

Type: Read
Reset State: 0x00000000

Integration Test ATB Control Register 2

QDSS_ITM_ITATCTL2

Bits	Name	Description
31:1	RESERVED	Reserved RAZ/SBZP
0	ITATREADYM	Read the value of ATREADYM

0x01A05EF4 QDSS_ITM_ITATCTL1

Type: Write
Reset State: Not readable

Integration Test ATB Control Register 1

QDSS_ITM_ITATCTL1

Bits	Name	Description
31:7	RESERVED	Reserved RAZ/SBZP
6:0	ITATIDM	Set the value of ATIDM6:0

0x01A05EF8 QDSS_ITM_ITATCTL0

Type: Write
Reset State: Not readable

Integration Test ATB Control Register 0

QDSS_ITM_ITATCTL0

Bits	Name	Description
31:2	RESERVED	Reserved RAZ/SBZP
1	ITAFREADYM	Set the value of AFREADYM
0	ITATVALIDM	Set the value of ATVALIDM

0x01A05F00 QDSS_ITM_ITMODE_CONTROL_REGISTER

Type: Read/Write
Reset State: 0x0

See CoreSight defined registers

QDSS_ITM_ITMODE_CONTROL_REGISTER

Bits	Name	Description
31:0	DATA	

0x01A05FA0 QDSS_ITM_CLAIM_TAG_SET

Type: Read/Write
Reset State: 0xFF

QDSS_ITM_CLAIM_TAG_SET

Bits	Name	Description
31:0	DATA	

0x01A05FA4 QDSS_ITM_CLAIM_TAG_CLEAR

Type: Read/Write
Reset State: 0x00

QDSS_ITM_CLAIM_TAG_CLEAR

Bits	Name	Description
31:0	DATA	

0x01A05FB0 QDSS_ITM_LOCK_ACCESS

Type: Write
Reset State: Not readable

QDSS_ITM_LOCK_ACCESS

Bits	Name	Description
31:0	DATA	

0x01A05FB4 QDSS_LOCK_STATUS

Type: Read
Reset State: 0x0/0x3

QDSS_LOCK_STATUS

Bits	Name	Description
31:0	DATA	

0x01A05FB8 QDSS_ITM_AUTHENTICATION_STATUS

Type: Read
Reset State: Not readable

QDSS_ITM_AUTHENTICATION_STATUS

Bits	Name	Description
31:0	DATA	

0x01A05FC8 QDSS_ITM_DEVICE_ID

Type: Read
Reset State: 0x20

QDSS_ITM_DEVICE_ID

Bits	Name	Description
31:0	DATA	

0x01A05FCC QDSS_ITM_DEVICE_TYPE_IDENTIFIER

Type: Read
Reset State: 0x43

QDSS_ITM_DEVICE_TYPE_IDENTIFIER

Bits	Name	Description
31:0	DATA	

0x01A05FD0 QDSS_ITM_PERIPHERAL_ID4

Type: Read
Reset State: 0x04

See CoreSight defined registers

QDSS_ITM_PERIPHERAL_ID4

Bits	Name	Description

Type: Read
Reset State: 0xB1

6.8 QDSS STM Registers (0x01A06000 QDSS_STM_BASE)

This section contains the QDSS STM registers.

6.8.1 CoreSight Component Registers

This section describes the CS component registers. This includes device specific registers, CS management registers, peripheral ID registers, and component ID registers. It is provided below for QCSR and FLAT file generation. However, the details of the registers can be found in the ARM documents, which provide more detailed information about these registers, such as their usage and descriptive register bits information. You can find ARM documentation at http://infocenter.arm.com/help/index.jsp.

6.8.1.1 CoreSight STM registers overview

System Trace Macrocell (STM) is a recently added CoreSight component from the ARM IP technology.

6.8.1.2 STM Registers

0x01A06C04 QDSS_STMDMASTARTR

Type: Write
Reset State: Not readable

This Write register is used to start a DMA transfer.

A write of one when the DMA peripheral request interface is idle starts a DMA transfer. A write of zero has no effect. A write of one when the DMA peripheral request interface is active has no effect.

QDSS_STMDMASTARTR

Bits	Name	Description
0	START	Start a DMA transfer 0x1: START (Start a DMA transfer)

0x01A06C08 QDSS_STMDMASTOPR

Type: Write
Reset State: Not readable

This Write register is used to stop a DMA transfer.

A write of one stops an active DMA transfer. A write of zero has no effect. A write of one when the DMA peripheral request interface is idle has no effect.

QDSS_STMDMASTOPR

Bits	Name	Description
0	STOP	Stop an active DMA transfer 0x1: STOP (Stop an active DMA transfer)

0x01A06C0C QDSS_STMDMASTATR

Type: Read
Reset State: Undefined

This Read register is used to determine the status of the DMA peripheral request interface.

QDSS_STMDMASTATR

Bits	Name	Description
0	STATUS	Stop an active DMA transfer 0x0: IDLE (interface is idle) 0x1: ACTIVE (interface is active)

0x01A06C10 QDSS_STMDMACTLR

Type: Read/Write
Reset State: 0x00000000

Controls the DMA transfer request mechanism.

QDSS_STMDMACTLR

Bits	Name	Description
3:2	SENS	Determines the sensitivity of the DMA request to the current buffer level in the STM: 0x0: EMPTY (FIFO is less than 25% full) 0x1: V_25 (FIFO is less than 50% full) 0x2: V_50 (FIFO is less than 75% full) 0x3: V_75 (FIFO is less than 100% full)

0x01A06CFC QDSS_STMDMAIDR

Type: Read
Reset State: Undefined

This Read register indicates the DMA features of the STM.

QDSS_STMDMAIDR

Bits	Name	Description
11:8	VENDSPEC	The VENDSPEC field identifies any vendor specific modifications or mappings. 0x0: VENDSPEC (Vendor specific information.)
7:4	CLASSREV	The CLASSREV field identifies the revision of the programmers model. 0x0: REVISION_CONTROL (Revision.)
3:0	CLASS	The CLASS field identifies the programmers model. 0x2: CONTROL (DMA Control.)

0x01A06E00 QDSS_STMSPER

Type: Read/Write
Reset State: Undefined

This read/write only register is used to enable the stimulus registers to generate trace.

The register defines one bit per stimulus register. Writing 1 enables the appropriate stimulus port, writing 0 disables the appropriate stimulus port. This register is used in conjunction with the Software Enable Bank Select Register.

QDSS_STMSPER

Bits	Name	Description
31:0	SPE	Stimulus port enable, with one bit per stimulus port 0x0: stimulus port disabled 0x1: stimulus port enabled

0x01A06E20 QDSS_STMSPTER

Type: Read/Write
Reset State: Undefined

This register is used to enable trigger generation on writes to enabled stimulus port registers.

QDSS_STMSPTER

Bits	Name	Description
31:0	SPTE	Bit mask to enable trigger generation from the stimulus port registers, with one bit per stimulus port register 0x0: disabled 0x1: enabled

0x01A06E60 QDSS_STMSPSCR

Type: Read/Write
Reset State: Undefined

This register allows a debugger to program which stimulus ports the STMSPER and STMSPTER apply to.

QDSS_STMSPSCR

Bits	Name	Description
31:20	PORTSEL	This field defines which stimulus ports the STMSPTER and/or STMSPER apply to
1:0	PORTCTL	This defines how the port selection is applied: 0x0: NOT_USED (Port selection not used) 0x1: STMSPTER_ONLY (Port selection applies only to the STMSPTER) 0x2: RESERVED (Reserved) 0x3: STMSPER_AND_STMSPTER (Port selection applies to both the STMSPER and STMSPTER)

0x01A06E64 QDSS_STMSPMSCR

Type: Read/Write
Reset State: Undefined

This register allows a debugger to program which masters the STMSPSCR applies to.

QDSS_STMSPMSCR

Bits	Name	Description
22:15	MASTSEL	This field defines which master the STMSPSCR applies to
0	MASTCTL	This defines how the master is applied: 0x0: NOT_USED (Master selection not used) 0x1: STMSPSCR (Port selection applies to the STMSPSCR)

0x01A06E68 QDSS_STMSPOVERRIDER

Type: Read/Write
Reset State: Undefined

This register allows a debugger to override various features of the STM.

QDSS_STMSPOVERRIDER

Bits	Name	Description
31:15	PORTSEL	This field defines which stimulus ports the override controls apply to. This size of this field is defined by the number of implemented stimulus ports
2	OVERTS	This override requests all stimulus port writes that cause trace to be traced with a timestamp (where possible). As with normal operation, this does not ensure all packets are generated with timestamps. This field is independent of OVERCTL and PORTSEL. 0x0: DISABLED (Override not enabled) 0x1: ENABLED (Override enabled)
1:0	OVERCTL	This defines how the port selection is applied: 0x0: DISABLED (Override controls disabled) 0x1: GUARANTEED (Ports selected by PORTSEL always behave as Guaranteed transactions) 0x2: INVARIANT_TIMING (Ports selected by PORTSEL always behave as Invariant Timing transactions) 0x3: RESERVED (Reserved)

0x01A06E6C QDSS_STMSPMOVERRIDER

Type: Read/Write
Reset State: Undefined

This register allows a debugger to choose which masters the STMSPOVERRIDERR applies to.

QDSS_STMSPMOVERRIDER

Bits	Name	Description
22:15	MASTSEL	This field defines which master ports the override controls apply to. This size of this field is defined by the number of implemented masters
0	MASTCTL	This defines how the master selection is applied: 0x0: DISABLED (Override controls disabled. STMSPOVERRIDERR applies equally to all masters) 0x1: ENABLED (Master selection enabled. STMSPOVERRIDERR applies to the masters selected by MASTSEL)

0x01A06E70 QDSS_STMSPTRIGCSR

Type: Read/Write
Reset State: Undefined

This register is used to control the STM triggers caused by STMSPTER.

QDSS_STMSPTRIGCSR

Bits	Name	Description
4	ATBTRIGEN_DIR	When set, this bit enables the STM to use the ATID value of 0x7D when a Trigger Event on writes to TRIG location occurs. 0x0: DISABLE (Do not output ATB trace triggers on write to TRIG location) 0x1: ENABLE (Output ATB trace trigger for trigger on write to TRIG location)
3	ATBTRIGEN_TE	When set, this bit enables the STM to use the ATID value of 0x7D when a Trigger Event on match using STMSPTER occurs. 0x0: DISABLE (Do not output ATB trace trigger for trigger on match using STMSPTER) 0x1: ENABLE (Output ATB trace trigger for trigger on match using STMSPTER)
2	TRIGCLEAR	When TRIGCTL indicates single-shot mode, this bit is used to clear TRIGSTATUS. Writing a b1 to this bit when in multi-shot mode is Unpredictable. 0x0: NO_EFFECT (No effect) 0x1: CLEAR (Clears TRIGSTATUS if TRIGSTATUS is b1)
1	TRIGSTATUS	When TRIGCTL indicates single-shot mode, this indicates whether the single trigger has occurred: 0x0: NOT_OCCURRED (Trigger has not occurred) 0x1: OCCURRED (Trigger has occurred)
0	TRIGCTL	Trigger Control. 0x0: MULTI_SHOT (Triggers are multi-shot) 0x1: SINGLE_SHOT (Triggers are single-shot)

0x01A06E80 QDSS_STMTCSR

Type: Read/Write
Reset State: 0x00000004

Controls the STM settings.

QDSS_STMTCSR

Bits	Name	Description
23	BUSY	STM is busy, for example the STM trace FIFO is not empty: 0x0: IDLE (STM is not busy.) 0x1: BUSY (STM is busy.)

QDSS_STMTCSR (cont.)

Bits	Name	Description
22:16	TRACEID	ATB Trace ID.
5	COMPEN	Compression Enable for Stimulus Ports: 0x0: DISABLED (Compression disabled, data transfers are transmitted at the size of the transaction.) 0x1: ENABLED (Compression enabled, data transfers are compressed to save bandwidth.)
2	SYNCEN	STMSYNCR is implemented so this value is RAO. 0x1: RAO (STMSYNCR implemented.)
1	TSEN	This bit controls if timestamp requests are ignored or not: 0x0: DISABLE (Timestamping disabled. Requests for timestamp generation are ignored, and stimulus port writes selecting timestamping are treated as if it were not selected.) 0x1: ENABLE (Timestamping enabled. If stimulus writes select timestamping, a timestamp is output according to STPv2.)
0	EN	Global STM enable: 0x0: DISABLE (STM disabled) 0x1: ENABLE (STM enabled)

0x01A06E84 QDSS_STMTSSTIMR

Type: Write
Reset State: Not readable

This Write register is used to force the next packet caused by a stimulus port write to have a timestamp output.

QDSS_STMTSSTIMR

Bits	Name	Description
0	FORCETS	Force Timestamp Stimulus. A write to this register with this bit as b1 requests the next stimulus port write which causes trace to be upgraded to have a timestamp. Writes with this bit b0 are ignored. 0x1: FORCETS (Force Timestamp Stimulus)

0x01A06E8C QDSS_STMTSFREQR

Type: Read/Write
Reset State: Undefined

This Read/Write register is used to indicate the frequency of the timestamp counter. The unit of measurement is increments per second. When the STPv2 protocol is used, this register contains the

value output in the FREQ and FREQ_TS packets. The timestamp frequency is output in the STPv2 protocol at every synchronization point when STMTCSR.TSEN is b1.

QDSS_STMTSFREQR

Bits	Name	Description
31:0	FREQ	The timestamp frequency in Hz

0x01A06E90 QDSS_STMSYNCR

Type: Read/Write
Reset State: Undefined

This register controls the interval between synchronization packets, in terms of the number of bytes of trace generated.

This register only provides a hint of the desired synchronization frequency; implementations are permitted to be inaccurate.

Writing a value of 0x00000000 to this register disables the synchronization counter. However, any other IMPLEMENTATION DEFINED synchronizations mechanism continue to operate independently.

QDSS_STMSYNCR

Bits	Name	Description
12	MODE	Mode control: 0x0: N_BYTES (COUNT[11:0] defines a value N. Synchronization period is N bytes) 0x1: V_2_N_BYTES (COUNT[11:7] defines a value N. Synchronization period is 2^N bytes. N must be in the range of 12 to 27 inclusive and other values are Unpredictable)
11:2	COUNT	Counter value for the number of bytes between synchronization packets. Reads return the value of this register.

0x01A06E94 QDSS_STMAUXCR

Type: Read/Write
Reset State: 0x00000000

Used for IMPLEMENTATION DEFINED STM controls.

QDSS_STMAUXCR

Bits	Name	Description
4	AFREADYHIGH	Provides override control for the AFREADY output: 0x0: NO_OVERRIDE (No override, AFREADY is controlled by the state of the STM.) 0x1: OVERRIDE (Override, AFREADY is driven HIGH.)
3	CLKON	Provides override control for architectural clock gate enable: 0x0: NO_OVERRIDE (No override, clock gate is controlled by the state of STM.) 0x1: OVERRIDE (Override, clock is enabled.)
2	PRIORINVDIS	Controls arbitration between AXI and HW during flush: 0x0: INVERSION_ENABLED (Priority inversion, when AXI flush is finished, HW gets priority until HW flush is done) 0x1: INVERSION_DISABLED (Priority inversion disabled, AXI always has priority over HW.)
1	ASYNCPE	ASYNC priority: 0x0: DISABLE (ASYNC priority is always lower than trace.) 0x1: ENABLE (ASYNC priority escalates on second synchronization request.)
0	FIFOAF	Auto-flush: 0x0: DISABLED (Auto-flush disabled.) 0x1: ENABLED (Auto-flush enabled.)

0x01A06EA0 QDSS_STMSPFEAT1R

Type: Read
Reset State: 0x006587D1

Indicates the features of the STM.

QDSS_STMSPFEAT1R

Bits	Name	Description
23:22	SWOEN	STMTCSR.SWOEN support. 0x1: NOT_IMPLEMENTED (STMTCSR.SWOEN not implemented.)
21:20	SYNCEN	STMTCSR.SYNCEN support. 0x2: RAO (STMTCSR.SYNCEN implemented but always reads as b1.)
19:18	HWTEN	STMTCSR.HWTEN support. 0x1: NOT_IMPLEMENTED (STMTCSR.HWTEN not implemented.)
17:16	TSPRESCALE	Timestamp prescale support. 0x1: NOT_IMPLEMENTED (Timestamp prescale not implemented.)

QDSS_STMSPFEAT1R (cont.)

Bits	Name	Description
15:14	TRIGCTL	Trigger control support. 0x2: MULTI_SHOT_AND_SINGLE_SHOT (Multi-shot and single-shot triggers supported. STMTRIGCSR implemented.)
13:10	TRACEBUS	Trace bus support. 0x1: ATB_WITH_TRIGGER (CoreSight ATB plus ATB trigger support implemented. STMTCSR.TRACEID and STMTRIGCSR.ATBTRIGEN implemented.)
9:8	SYNC	STMSYNCR support 0x3: MODE (STMSYNCR implemented with MODE control.)
7	FORCETS	STMTSSTIMR support. 0x1: IMPLEMENTED (STMTSSTIMR bit implemented.)
6	TSFREQ	Timestamp frequency indication configuration. 0x1: RW (STMTSFREQR is Read/Write.)
5:4	TS	Timestamp support. 0x1: ABSOLUT (Absolute timestamps implemented.)
3:0	PROT	Protocol 0x1: STPV2 (STPv2 protocol.)

0x01A06EA4 QDSS_STMSPFEAT2R

Type: Read
Reset State: 0x000104F2

Indicates the features of the STM.

QDSS_STMSPFEAT2R

Bits	Name	Description
17:16	SPTYPE	Stimulus port type support. 0x1: EXTENDED_ONLY (Only Extended Stimulus Ports implemented.)
15:12	DSIZE	Fundamental data size. 0x0: V_32_BIT (32-bit data.)
10:9	SPTRTYPE	Stimulus port transaction type support. 0x2: INVARIANT_TIMING_AND_GUARANTEED (Both invariant timing and guaranteed transactions are supported)
8:7	PRIVMASK	STMPRIVMASKR support. 0x1: NOT_IMPLEMENTED (STMPRIVMASKR not implemented.)
6	SPOVERRIDE	STMOVERRIDER support. 0x1: IMPLEMENTED (STMSPOVERRIDER and STMSPMOVERRIDER implemented.)

QDSS_STMSPFEAT2R (cont.)

Bits	Name	Description
5:4	SPCOMP	Data compression on stimulus ports support. 0x3: PROGRAMMABLE (Data compression support is programmable. STMTCSR.COMPEN is implemented.)
2	SPER	STMSPER presence. 0x0: IMPLEMENTED (STMSPER is implemented.)
1:0	SPTER	STMSPTER support. 0x2: IMPLEMENTED (STMSPTER is implemented.)

0x01A06EA8 QDSS_STMSPFEAT3R

Type: Read
Reset State: 0x0000007F

Indicates the features of the STM.

QDSS_STMSPFEAT3R

Bits	Name	Description
6:0	NUMMAST	The number of stimulus ports masters implemented, minus 1. 0x7F: NUMMAST (128 masters are implemented.)

0x01A06EE8 QDSS_STMITTRIGGER

Type: Write
Reset State: Not readable

Integration Test for Cross-Trigger Outputs Register.

QDSS_STMITTRIGGER

Bits	Name	Description
3	ASYNCOUT_W	Sets the value of the ASYNCOUT output in integration mode: 0x1: HIGH (Drive logic 1 on ASYNCOUT output.) 0x0: LOW (Drive logic 0 on ASYNCOUT output.)
2	TRIGOUTHETE_W	Sets the value of the TRIGOUTHETE output in integration mode: 0x1: HIGH (Drive logic 1 on TRIGOUTHETE output.) 0x0: LOW (Drive logic 0 on TRIGOUTHETE output.)
1	TRIGOUTSW_W	Sets the value of the TRIGOUTSW output in integration mode: 0x1: HIGH (Drive logic 1 on TRIGOUTSW output.) 0x0: LOW (Drive logic 0 on TRIGOUTSW output.)

QDSS_STMITTRIGGER (cont.)

Bits	Name	Description
0	TRIGOUTSPTE_W	Sets the value of the TRIGOUTSPTE output in integration mode: 0x1: HIGH (Drive logic 1 on TRIGOUTSPTE output.) 0x0: LOW (Drive logic 0 on TRIGOUTSPTE output.)

0x01A06EEC QDSS_STMITATBDATA0

Type: Write
Reset State: Not readable

Controls the value of the ATDATAM output in integration mode:

QDSS_STMITATBDATA0

Bits	Name	Description
4	ATDATAM31_W	Set the value of the ATDATAM[31] output: 0x1: HIGH (Drive logic 1 on ATDATAM output.) 0x0: LOW (Drive logic 0 on ATDATAM output.)
3	ATDATAM23_W	Set the value of the ATDATAM[23] output: 0x1: HIGH (Drive logic 1 on ATDATAM output.) 0x0: LOW (Drive logic 0 on ATDATAM output.)
2	ATDATAM15_W	Set the value of the ATDATAM[15] output: 0x1: HIGH (Drive logic 1 on ATDATAM output.) 0x0: LOW (Drive logic 0 on ATDATAM output.)
1	ATDATAM7_W	Set the value of the ATDATAM[7] output: 0x1: HIGH (Drive logic 1 on ATDATAM output.) 0x0: LOW (Drive logic 0 on ATDATAM output.)
0	ATDATAM0_W	Set the value of the ATDATAM[0] output: 0x1: HIGH (Drive logic 1 on ATDATAM output.) 0x0: LOW (Drive logic 0 on ATDATAM output.)

0x01A06EF0 QDSS_STMITATBCTR2

Type: Read
Reset State: Undefined

Returns the value of the ATREADYM and AFVALIDM inputs in integration mode.

QDSS_STMITATBCTR2

Bits	Name	Description
1	AFVALIDM_R	Reads the value of the AFVALIDM input: 0x1: HIGH (Pin is at logic 1.) 0x0: LOW (Pin is at logic 0.)
0	ATREADYM_R	Reads the value of the ATREADYM input: 0x1: HIGH (Pin is at logic 1.) 0x0: LOW (Pin is at logic 0.)

0x01A06EF4 QDSS_STMITATBID

Type: Write
Reset State: Not readable

Controls the value of the ATIDM output in integration mode.

QDSS_STMITATBID

Bits	Name	Description
6:0	ATIDM_W	Sets the value of the ATIDM output.

0x01A06EF8 QDSS_STMITATBCTR0

Type: Write
Reset State: Not readable

Controls the value of the ATVALIDM, AFREADYM, and ATBYTESM outputs in integration mode.

QDSS_STMITATBCTR0

Bits	Name	Description
9:8	ATBYTESM_W	Sets the value of the ATBYTESM output: 0x3: V_11 (Drive logic 2b11 on the ATBYTESM output.) 0x2: V_10 (Drive logic 2b10 on the ATBYTESM output.) 0x1: V_01 (Drive logic 2b01 on the ATBYTESM output.) 0x0: V_00 (Drive logic 2b00 on the ATBYTESM output.)
1	AFREADYM_W	Sets the value of the AFREADYM output: 0x1: HIGH (Drive logic 1 on the AFREADYM output.) 0x0: LOW (Drive logic 0 on the AFREADYM output.)

QDSS_STMITATBCTR0 (cont.)

Bits	Name	Description
0	ATVALIDM_W	Sets the value of the ATVALIDM output: 0x1: HIGH (Drive logic 1 on the ATVALIDM output.) 0x0: LOW (Drive logic 0 on the ATVALIDM output.)

0x01A06F00 QDSS_STMITCTRL

Type: Read/Write
Reset State: 0x00000000

Used to enable topology detection. See the CoreSight Architecture Specification for more information. This register enables the component to switch from a functional mode, the default behavior, to integration mode where the inputs and outputs of the component can be directly controlled for integration testing and topology solving.

NOTE When a device has been in integration mode, it might not function with the original behavior. After performing integration or topology detection, you must reset the system to ensure correct behavior of CoreSight and other connected system components that are affected by the integration or topology detection.

QDSS_STMITCTRL

Bits	Name	Description
0	INTEGRATION_MODE	Enables the component to switch from functional mode to integration mode and back. If no integration functionality is implemented, this register must read as zero. 0x1: INTEGRATION_MODE (Enable integration mode.) 0x0: FUNCTIONAL_MODE (Disable integration mode.)

0x01A06FA0 QDSS_STMCLAIMSET

Type: Read/Write
Reset State: Undefined

This is used in conjunction with Claim Tag Clear Register, STMCLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_STMCLAIMSET

Bits	Name	Description
3:0	CLAIMSET	On write: Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag. On Read: This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x01A06FA4 QDSS_STMCLAIMCLR

Type: Read/Write
Reset State: Undefined

This register is used in conjunction with Claim Tag Set Register, STMCLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_STMCLAIMCLR

Bits	Name	Description
3:0	CLAIMCLR	On Write: Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag. On Read: The value present reflects the current setting of the Claim Tag.

0x01A06FB0 QDSS_STMLAR

Type: Write
Reset State: Not readable

This is used to enable write access to device registers.

QDSS_STMLAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. An invalid write has the effect of removing write access. 0xC5ACCE55: UNLOCK (unlock the protection register to enable write access)

0x01A06FB4 QDSS_STMLSR

Type: Read
Reset State: Undefined (Value depends on PADDRDBG31)

This indicates the status of the lock control mechanism. This lock prevents accidental writes by code under debug. This register must always be present although there might not be any lock access control mechanism. The lock mechanism, where present and locked, must block write accesses to any control register, except the Lock Access Register. For most components this covers all registers except for the Lock Access Register, 0xFB0.

QDSS_STMLSR

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register, 0xFB0, is implemented as 8-bit or 32-bit. 0x0: V_32_BIT (This component implements a 32-bit Lock Access Register.)
1	LOCKGRANT	Returns the current status of the Lock. 0x0: ACCESS_PERMITTED (Write access is allowed to this device.) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted.)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access Register, 0xFB0, are ignored.) 0x1: LOCK_PRESENT (Lock control mechanism is present.)

0x01A06FB8 QDSS_STMAUTHSTATUS

Type: Read
Reset State: 0x000000AA

Reports the required security level and current status of those enables. Where functionality changes on a given security level, this change in status must be reported in this register.

QDSS_STMAUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug: 0x2: V_2_B10 (Functionality disabled) 0x3: V_2_B11 (Functionality enabled.)
5:4	SID	Indicates the security level for secure invasive debug: 0x2: V_2_B10 (Functionality disabled) 0x3: V_2_B11 (Functionality enabled.)

QDSS_STMAUTHSTATUS (cont.)

Bits	Name	Description
3:2	NSNID	Indicates the security level for non-secure non-invasive debug: 0x2: V_2_B10 (Functionality disabled) 0x3: V_2_B11 (Functionality enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug: 0x2: V_2_B10 (Functionality disabled) 0x3: V_2_B11 (Functionality enabled.)

0x01A06FC8 QDSS_STMDEVID

Type: Read
Reset State: 0x00010000

Indicates the capabilities of the CoreSight STM.

QDSS_STMDEVID

Bits	Name	Description
16:0	NUMSP	This value indicates the number of stimulus ports implemented. 0x10000: NUMBER_OF_PORTS (65536 stimulus ports implemented.)

0x01A06FCC QDSS_STMDEVTYPE

Type: Read
Reset State: 0x00000063

Provides a debugger with information about the component when the Part Number field is not recognized. The debugger can then report this information.

QDSS_STMDEVTYPE

Bits	Name	Description
7:4	SUB_TYPE	Sub-classification within the major category: 0x6: CORESIGHT_STM (This component generates trace based on software and hardware stimulus.)
3:0	MAJOR_TYPE	Major classification grouping for this debug or trace component: 0x3: TRACE_SOURCE (This component has ATB output.)

0x01A06FE0 QDSS_STMPIDR0

Type: Read
Reset State: 0x00000062

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_STMPIDR0

Bits	Name	Description
7:0	PART_NUMBER_BITS7TO0	Bits [7:0] of the component part number. This is selected by the designer of the component. 0x62: CORESIGHT_STM_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number, 0x962.)

0x01A06FE4 QDSS_STMPIDR1

Type: Read
Reset State: 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_STMPIDR1

Bits	Name	Description
7:4	JEP106_BITS3TO0	Bits [3:0] of the JEDEC identity code indicating the designer of the component, together with the continuation code. 0xB: ARM_JEP106_IDENTITY_CODE_7_0 (Lowest 4 bits of the JEP106 Identity Code.)
3:0	PART_NUMBER_BITS11TO8	Bits [11:8] of the component part number. This is selected by the designer of the component. 0x9: CORESIGHT_STM_PART_NUMBER_11_8 (Upper 4 bits of the Part Number, 0x907.)

0x01A06FE8 QDSS_STMPIDR2

Type: Read
Reset State: 0x0000000B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_STMPIDR2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is used as a look-up to establish the exact major and minor revision. 0x0: R0P0 (This device is at r0p0.)
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used. 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC http://www.jedec.org.)
2:0	JEP106_BITS6TO4	Bits [6:4] of the JEDEC identity code indicating the designer of the component, together with the continuation code. 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code.)

0x01A06FEC QDSS_STMPIDR3

Type: Read
Reset State: 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_STMPIDR3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODS (Indicates that there have been no metal fixes to this component.)
3:0	CUSTOMER_MODIFIED	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODS (Indicates that there have been no modifications made.)

0x01A06FD0 QDSS_STMPIDR4

Type: Read
Reset State: 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_STMPIDR4

Bits	Name	Description
7:4	FOURKB_COUNT	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB, this must read as 0x0, 4KB only. For 8KB set to 0x1, for 16KB set to 0x2, for 32KB set to 0x3, and so on. 0x0: V_4KB (Indicates that the device only occupies 4KB of memory.)
3:0	JEP106_CONT	JEDEC continuation code indicating the designer of the component, together with the identity code. 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARMs JEDEC identity code is on the 5th bank.)

0x01A06FF0 QDSS_STMCIDR0

Type: Read
Reset State: 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_STMCIDR0

Bits	Name	Description
7:0	PREAMBLE	Contains bits [24:31] of the component identification. 0xD: V_0D (Identification value.)

0x01A06FF4 QDSS_STMCIDR1

Type: Read
Reset State: 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_STMCIDR1

Bits	Name	Description
7:4	CLASS	Class of the component, for example, ROM table or CoreSight component. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component.)
3:0	PREAMBLE	Contains bits [19:16] of the component identification. 0x0: V_0 (Identification value.)

0x01A06FF8 QDSS_STMCIDR2

Type: Read
Reset State: 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_STMCIDR2

Bits	Name	Description
7:0	PREAMBLE	Contains bits [15:8] of the component identification. 0x5: V_05 (Identification value.)

0x01A06FFC QDSS_STMCIDR3

Type: Read
Reset State: 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_STMCIDR3

Bits	Name	Description
7:0	PREAMBLE	Contains bits [7:0] of the component identification. 0xB1: B1 (Identification value.)

6.9 QDSS M2VMT Registers (0x01A80000 QDSS_DAPM2VMT_BASE)

This section contains the QDSS M2VMT registers.

6.9.1 CoreSight Component Registers

This section describes the CS component registers. This includes device specific registers, CS management registers, peripheral ID registers, and component ID registers. It is provided below for QCSR and FLAT file generation. However, the details of the registers can be found in the ARM documents, which provide more detailed information about these registers, such as their usage and descriptive register bits information. You can find ARM documentation at http://infocenter.arm.com/help/index.jsp.

6.9.1.1 M2VMT Registers

NOTE These registers are independent of the DAP ROM Table.

0x01A80000+ 0x4*n QDSS_M2VMT_M2VMRn, n=[0..1]

Type: Read/Write
Clock: CC_QDSS_H_CLK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where n = NUM_M2VMT_ENTRIES from the design generics.

QDSS_M2VMT_M2VMRn

Bits	Name	Description
31:5	RESERVED	
4:0	VMID	Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRn address associations. n = NUM_M2VMT_ENTRIES from the design generic/parameter.

0x01A80F80 QDSS_M2VMT_CR

Type: Read/Write
Clock: CC_QDSS_H_CLK
Reset State: xxx0

Global configuration register.

Note: When REMOVE_M2VMT_RPU = ’1’, this register is not available. Also, bit [2], is not valid or has no effect when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT =’1’.

QDSS_M2VMT_CR

Bits	Name	Description
31:4	RESERVED	
3	DCDEE	Decode Error Enable: Governs whether or not configuration port decode errors (i.e., in valid addresses) are recorded as such. Decode error is asserted when config access to un-implemented and/or unmapped register/address are done. Also, note that decode error is never asserted for client port accesses. When value is set to ’0’, i.e., ’do not record’, decode errors do not set the M2VMT_ESR[CFG], and M2VMT_EAR & M2VMT_SYNRn is not updated. When value is set to ‘1’, i.e., ’record’, decode errors set M2VMT_ESR[CFG] and M2VMT_EAR & M2VMT_SYNRn is updated with the address and the syndrome of the error. Reset State: x
2	RPUEIE	RPU error interrupt Enable: When set, configuration port errors are reported directly to the interrupt controller via the M2VMT_intr, interrupt output signal. Interrupt output is asserted if M2VMT_CR[RPUIE_EN] is ’1’ and ANY bit is set in the M2VMT_ESR register. **NOTE** Not valid or has no effect on the interrupt when REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=’1’. Reset State: x
1	RPUERE	RPU error report enable: When set, M2VMT reports configuration port errors to the requesting bus master, according to the respective port bus protocol. All error types reported via CRIF port uses a decode error, rather than a slave error. Regardless of the value of this field, both configuration port errors are terminated by the M2VMT as RAZ/WI, and are recorded in M2VMT_ESR register. Reset State: X

QDSS_M2VMT_CR (cont.)

Bits	Name	Description
0	RPUE	RPU Enable: Governs whether M2VMT_RPU_ACR is enabled to check the VMID of the configuration request. When set, all configuration port accesses are checked against M2VMT_RPU_ACR register for access permissions. It is cleared by reset. Set once SROT configures MID->VMID mapping tables. Reset State: 0

0x01A80F84 QDSS_M2VMT_EAR

Type: Read/Write
Clock: CC_QDSS_H_CLK
Reset State: unknown

When there is an error, this register holds the physical address of the errant transaction.

QDSS_M2VMT_EAR

Bits	Name	Description
31:0	PA	M2VMT Error Address Register: Physical address[31:0]. Contains the physical address of the errant request. Based on implementation, it may not contain the full 32 bits of the address. Captures the address on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. NOTE When REMOVE_M2VMT_RPU='1' OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT = '1', this register is not available; and, therefore, access to this register are treated as RAZ/WI.

0x01A80F88 QDSS_M2VMT_ESR

Type: Read/Write to clear
Clock: CC_QDSS_H_CLK
Reset State: Undefined

M2VMT Error Status Register:

Captures the status upon M2VMT configuration errors, as determined by the M2VMT_RPU_ACR.

This register has read/write-clear access, meaning that reads simply provide a value in the register, while writes are performed by clearing those bits corresponding to '1's in the value written data, and leaving unchanged those bits corresponding to 0s n the written data. This prevents inadvertent

clearing of new errors when writing the register to clear an old error. A write with a ‘1’ set in a bit field results in clearing that bit. Writes with a 0 have no effect.

The presence of an asserted value on any bit in this register is what prompts the assertion when enabled by M2VMT_CR[RPUEIE] of the M2MVT’s interrupt output. Therefore these bits must be cleared by the interrupt handler. This is contrasted with the fields in the M2VMT_ESYNRn register, which are merely the ’syndrome’ of an error indicated by the M2VMT_ESR.

For M2VMT, there is only one defined error status bit in the M2VMT_SER (actually two counting multi-error).

QDSS_M2VMT_ESR

Bits	Name	Description
31	MULTI	Multi-Error: When set to ’1’, indicates that an additional error occurred while M2VMT_ESR is non-zero. The M2VMT_EAR,M2VMT_ESYNRn and M2VMT_ESR registers (with the exception of this bit) lock on the first error, and must be cleared to unlock. Therefore, the status and the syndrome of errors that occurred while M2VMT_ESR[CFG] is ’1’ are lost, i.e., syndrome register and status register only stores details of the first error.
30:1	RESERVED	
0	CFG	Configuration Port Error: When set to ’1’, indicates an error associated with a configuration port request. NOTE When REMOVE_M2VMT_RPU=’1’ OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=’1’, this register is not available; and, therefore, access to this register is treated as RAZ/WI.

0x01A80F8C QDSS_M2VMT_ESRRESTORE

Type: Write Only/reads ignored
Clock: CC_QDSS_H_CLK
Reset State: unknown

QDSS_M2VMT_ESRRESTORE

Bits	Name	Description
31:0	M2VMT_ESRRTORE	M2VMT Error Status Register Restore This is just an aliased address for M2VMT_ESR, which provides direct write access (rather than write-clear) for restoration purpose NOTE When REMOVE_M2VMT_RPU=’1’ OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=’1’, this register is not available; and, therefore, access to this register is treated as RAZ/WI.

0x01A80F90 QDSS_M2VMT_ESYNR0

Type: Read/Write
Clock: CC_QDSS_H_CLK
Reset State: undefined

Error Syndrome Register 0:

Captures the syndrome on M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) ‘lock’ upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is ‘1’ are lost, i.e., the syndrome register and the status register only stores details of the first error.

QDSS_M2VMT_ESYNR0

Bits	Name	Description
31:24	ATID	ATID[7:0] field of errant request.
23:21	RESERVED	
20:16	AVMID	AVMID[4:0] field of errant request.
15:0	AMID	AMID[15:0] field of errant request. NOTE When REMOVE_M2VMT_RPU=’1’ OR REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT=”1”, this register is not available; and, therefore, access to this register is treated as RAZ/WI.

0x01A80F94 QDSS_M2VMT_ESYNR1

Type: Read/Write
Clock: CC_QDSS_H_CLK
Reset State: Undefined

Error Syndrome Register 1:

Captures syndrome upon M2VMT configuration errors as determined by the M2VMT_RPU_ACR. M2VMT_ESYNRn registers and M2VMT_ESR itself (except for the MULTI bit) ‘lock’ upon first error. M2VMT_ESR must be cleared to unlock. Therefore, the status and syndrome of errors that occurred while M2VMT_ESR[CFG] is ‘1’ are lost., i.e., the syndrome register and the status register only stores details of the first error.

QDSS_M2VMT_ESYNR1

Bits	Name	Description
31	DCD	Decode: Indicates configuration port error due to invalid/ unrecognized/ unmapped/ unimplemented address (e.g., a reserved register address). Includes decode errors within the global address space. Also, note that decode error is never asserted for client port accesses.
30	AC	Access control: Indicates configuration port error due to lack of permission, as specified by the access control registers.
29:25	RESERVED_1	
24	AFULL	AFULL field of the errant request
23	AOOOWR	AOOOWR field of the errant request
22	AOOORD	AOOORD field of the errant request.
21:20	ALOCK	ALOCK[1:0] (ALOCK field of the errant request).
19	RESERVED_2	Reserved
18:16	ASIZE	ASIZE[2:0] field of the errant request).
15:12	ALEN	ALEN[3:0] field of the errant request.
11:10	ABURST	ABURST[1:0] field of the errant request.
9	RESERVED	Reserved
8	AWRITE	AWRITE field of the errant request.
7	AINST	AINST field of the errant request.
6	APROTNS	APROTNS field of the errant request.
5	APRIV	APRIV field of the errant request.
4	AINNERSHARED	AINNERSHARED field of the errant request.
3	ASHARED	ASHARED field of the errant request.
2:0	AMEMTYPE	AMEMTYPE[2:0] field of the errant request.

0x01A80FF4 QDSS_M2VMT_REV

Type: Read
Clock: CC_QDSS_H_CLK
Reset State: ’00010000’b

Reports the revision information for the M2VMT core and wrapper.

QDSS_M2VMT_REV

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	Major variant field. APQ8064: MAJOR = 0001.
3:0	MINOR	Minor variant field. MINOR = 0000.

0x01A80FF8 QDSS_M2VMT_IDR

Type: Read
Clock: CC_QDSS_H_CLK
Reset State: 0x2

Reports the size of the M2VMT table. It is a read-only register.

QDSS_M2VMT_IDR

Bits	Name	Description
31:9	RESERVED	
8:0	M2VMTSIZE	M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of Read/Write or other fields used to select mapping. M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.

0x01A80FFC QDSS_M2VMT_RPU_ACR

Type: Read/Write
Clock: CC_QDSS_H_CLK
Reset State: Undefined

Using the incoming VMID, this register controls access to the global register space.

QDSS_M2VMT_RPU_ACR

Bits	Name	Description
31:0	RWE	M2VMT local RPU Access control Register. Each bit position corresponds to a VMID. When set to ‘1’, that VMID is granted VMID read/write access to the entire block of registers within the M2VMT 4 Kb global address space, including this register itself. In practice, this register designates the VMID(s) that can act as SROT (e.g., scorpion-secure) or pseudo SROT (e.g., RPM ARM11). NOTE When REMOVE_M2VMT_RPU=’1’, this register is not available; and, therefore, access to this register is treated as RAZ/WI.

7 EBI1 DIM Registers

7.1 Overview

Table 7-1 EBI1_DIM Bases

Base Name	Parent	Address
DIM_BD0_DIM_DQ_TOP_CFG	DIM_BD0_REG_BASE	0x1A780000
DIM_BC0_DIM_CA_TOP_CFG	DIM_BC0_REG_BASE	0x1AB40000
DIM_C01_DIM_CA_TOP_CFG	DIM_C01_REG_BASE	0x1AB80000
DIM_BD1_DIM_DQ_TOP_CFG	DIM_BD1_REG_BASE	0x1AC80000
DIM_BC1_DIM_CA_TOP_CFG	DIM_BC1_REG_BASE	0x1B040000
DIM_C11_DIM_CA_TOP_CFG	DIM_C11_REG_BASE	0x1B080000

7.2 DIM BD0 DQ Top Configuration Registers (0x1A780000 DIM_BD0_REG_BASE)

This section describes the BD0 DIM DQ TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1A780000 DIM_BD0_DIM_DQ_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_BD0_DIM_DQ_TOP_CFG

Bits	Name	Description
26	CDC_LDO_EN	Enablement of CDC LDO 1’b1 : Enabled 1’b0 : Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1’b1 : Enabled 1’b0 : Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1’b1 : Disabled 1’b0 : Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1’b1 : Enable the RCW 1’b0 : Disabled (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1 : from Read CDCCAL 1’b0 : from Write CDCCAL (default)
12	DEBUG_BUS_EN	1’b1 : Enables the debug bus functionality 1’b0 : Disables the debug bus and drives all ’0’s on debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_dq[5:0] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend

DIM_BD0_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1A780004 DIM_BD0_DIM_DQ_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_DQ_HW_INFO register configures the following:

DIM_DQ_HW_INFO

DIM_BD0_DIM_DQ_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1A780008 DIM_BD0_DIM_DQ_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_DQ_HW_VERSION register configures the following:

DIM_DQ_HW_VERSION

DIM_BD0_DIM_DQ_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.

DIM_BD0_DIM_DQ_HW_VERSION (cont.)

Bits	Name	Description
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1A780010 DIM_BD0_DIM_DQ_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_BD0_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x1A780014 DIM_BD0_DIM_DQ_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_BD0_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x1A780018 DIM_BD0_DIM_DQ_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the DIM_DQ_PAD_CFG2.

DIM_BD0_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1A780020 DIM_BD0_DIM_DQ_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the DIM_DQ_PAD_CFG3.

DIM_BD0_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1'b1 : differential output (default) 1'b0 : single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)

DIM_BD0_DIM_DQ_PAD_CFG3 (cont.)

Bits	Name	Description
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x1A780024 DIM_BD0_DIM_DQ_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the DIM_DQ_PAD_CFG4.

DIM_BD0_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1’b1) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1’b0) 1’b1 :DDR2 modes (default) 1’b0 : DDR1 modes
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x1A780030 DIM_BD0_DIM_DQ_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the DIM_DQ_CDC_CTLR_CFG0.

DIM_BD0_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1A780034 DIM_BD0_DIM_DQ_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the DIM_DQ_CDC_CTLR_CFG1.

DIM_BD0_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used.
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1.
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1.
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1.
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1.

0x1A780038 DIM_BD0_DIM_DQ_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the DIM_DQ_CDC_CAL_TIMER_CFG0.

DIM_BD0_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1A78003C DIM_BD0_DIM_DQ_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_BD0_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1A780040 DIM_BD0_DIM_DQ_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures DIM_DQ_CDC_REFCOUNT_CFG.

DIM_BD0_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1A780044 DIM_BD0_DIM_DQ_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the DIM_DQ_CDC_COARSE_CAL_CFG

DIM_BD0_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1A780048 DIM_BD0_DIM_DQ_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the DIM_DQ_CDC_RSVD_CFG.

DIM_BD0_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1A78004C DIM_BD0_DIM_DQ_RD_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the DIM_DQ_RD_CDC_OFFSET_CFG

DIM_BD0_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1A780050 DIM_BD0_DIM_DQ_RD_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the DIM_DQ_RD_CDC_DELAY_CFG

DIM_BD0_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1A780054 DIM_BD0_DIM_DQ_RD_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the DIM_DQ_RD_CDC_SW_MODE_CFG.

DIM_BD0_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1’b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1A780058 DIM_BD0_DIM_DQ_RD_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_TEST_CFG register configures the following:

DIM_DQ_RD_CDC_TEST_CFG

DIM_BD0_DIM_DQ_RD_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1’b1: Test outputs from the main DDA are connected to the CDC test ports 1’b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1’b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1’b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.

DIM_BD0_DIM_DQ_RD_CDC_TEST_CFG (cont.)

Bits	Name	Description
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1A78005C DIM_BD0_DIM_DQ_RD_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_BD0_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1A780060 DIM_BD0_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_BD0_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x1A780070 DIM_BD0_DIM_DQ_RD_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the DIM_DQ_RD_CDC_STATUS0.

DIM_BD0_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. **NOTE** The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.

DIM_BD0_DIM_DQ_RD_CDC_STATUS0 (cont.)

Bits	Name	Description
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1A780074 DIM_BD0_DIM_DQ_RD_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_BD0_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1A780078 DIM_BD0_DIM_DQ_RD_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the DIM_DQ_RD_CDC_STATUS2.

DIM_BD0_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1A78007C DIM_BD0_DIM_DQ_RD_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the DIM_DQ_RD_CDC_STATUS3.

DIM_BD0_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1A780080 DIM_BD0_DIM_DQ_RD_CDC_STATUS4

Type: Read
Clock: HCLK
Reset State: 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the DIM_DQ_RD_CDC_STATUS4.

DIM_BD0_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x1A7800AC DIM_BD0_DIM_DQ_WR_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the DIM_DQ_WR_CDC_OFFSET_CFG.

DIM_BD0_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1A7800B0 DIM_BD0_DIM_DQ_WR_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the DIM_DQ_WR_CDC_DELAY_CFG.

DIM_BD0_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1A7800B4 DIM_BD0_DIM_DQ_WR_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the DIM_DQ_WR_CDC_SW_MODE_CFG.

DIM_BD0_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1’b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1A7800B8 DIM_BD0_DIM_DQ_WR_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_TEST_CFG register configures the DIM_DQ_WR_CDC_TEST_CFG.

DIM_BD0_DIM_DQ_WR_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1’b1: Test outputs from the main DDA are connected to the CDC test ports 1’b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1’b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1’b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1’b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1’b0 : CDC test ports disabled

DIM_BD0_DIM_DQ_WR_CDC_TEST_CFG (cont.)

Bits	Name	Description
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1A7800BC DIM_BD0_DIM_DQ_WR_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the DIM_DQ_WR_CDC_SW_OVRD_CFG.

DIM_BD0_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1A7800D0 DIM_BD0_DIM_DQ_WR_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the DIM_DQ_WR_CDC_STATUS0.

DIM_BD0_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. **NOTE** The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1A7800D4 DIM_BD0_DIM_DQ_WR_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the DIM_DQ_WR_CDC_STATUS1.

DIM_BD0_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1A7800D8 DIM_BD0_DIM_DQ_WR_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the DIM_DQ_WR_CDC_STATUS2.

DIM_BD0_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1A7800DC DIM_BD0_DIM_DQ_WR_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the DIM_DQ_WR_CDC_STATUS3.

DIM_BD0_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1A780100 DIM_BD0_DIM_DQ_DQ_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the DIM_DQ_DQ_IOC_SLV_CFG.

DIM_BD0_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1A780104 DIM_BD0_DIM_DQ_DQ_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the DIM_CA_CA_IOC_SLV_STATUS.

DIM_BD0_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x1A780110 DIM_BD0_DIM_DQ_DQS_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the DIM_DQ_DQS_IOC_SLV_CFG.

DIM_BD0_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1A780114 DIM_BD0_DIM_DQ_DQS_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the DIM_DQ_DQS_IOC_SLV_STATUS.

DIM_BD0_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

7.3 DIM BC0 CA Top Configuration Registers (0x1AB40000 DIM_BC0_REG_BASE)

This section describes the BC0 DIM CA TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1AB40000 DIM_BC0_DIM_CA_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_CA_TOP_CFG register configures the DIM_CA_TOP_CFG.

DIM_BC0_DIM_CA_TOP_CFG

Bits	Name	Description
20	IOCAL_CTLR_SEL	Select source of PCNT/NCNT/PNCNT_VALID 1’b1: external 1’b0: internal (default)
16	SDR_MODE_EN	1’b1 : Enables SDR mode on address bus 1’b0 : Enables DDR mode on address bus (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1: From IOCAL 1’b0: From CDCCAL (default)
12	DEBUG_BUS_EN	1’b1: Enables the debug bus functionality 1’b0: Disables the debug bus and drives all ’0’s on the debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_ca[7:5] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1’b0) 1’b1 : with pipe extend (default) 1’b0: without pipe extend
0	WR_CLK_SEL	Write clock select 1’b1 : With write CDC (default) 1’b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1AB40004 DIM_BC0_DIM_CA_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_CA_HW_INFO register configures the DIM_CA_HW_INFO.

DIM_BC0_DIM_CA_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1AB40008 DIM_BC0_DIM_CA_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_CA_HW_VERSION register configures the DIM_CA_HW_VERSION.

DIM_BC0_DIM_CA_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1AB40010 DIM_BC0_DIM_CA_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_CA_PAD_CFG0 register configures the DIM_CA_PAD_CFG0.

DIM_BC0_DIM_CA_PAD_CFG0

Bits	Name	Description
31	CA_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	CA_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	CA_LV_MODE	Mode pin for high/low voltage regime
28	CA_ODT_ENA	Enable bit for on-die termination
27:26	CA_ODT	Impedance control bit settings for on-die termination
25:24	CA_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	CA_NSLEW	Slew rate control bits for output path NMOS
17:16	CA_PSLEW	Slew rate control bits for output path PMOS
13:12	CA_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	CA_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	CA_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CA_ROUT	Impedance control bit settings for output driver
2:0	CA_DCC	Duty cycle correction bits for output path

0x1AB40014 DIM_BC0_DIM_CA_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0220440

The DIM_CA_PAD_CFG1 register configures the DIM_CA_PAD_CFG1.

DIM_BC0_DIM_CA_PAD_CFG1

Bits	Name	Description
31	CK_DDR_MODE1	Mode select for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes

DIM_BC0_DIM_CA_PAD_CFG1 (cont.)

Bits	Name	Description
30	CK_DDR_MODE0	Mode select for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	CK_LV_MODE	Mode select for high/low voltage regime
28	CK_CMFB_ENA	Common mode feedback loop enable
27	CK_ODT_ENA1	Enable bit for on-die termination (when hp_mode = 1'b1)
26	CK_ODT_ENA	Enable bit for on-die termination (when hp_mode = 1'b0) Bit field name missing '0' for APQ8064 SW compatibility.
25:24	CK_ODT	Impedance control bit settings for on-die termination
21:20	CK_NSLEW	Slew rate control bits for output path NMOS
17:16	CK_PSLEW	Slew rate control bits for output path PMOS
13	CK_CUR_MODE1	Current/Voltage mode selection (when hp_mode = 1'b1) 1'b1 : Current mode 1'b0 : Voltage mode (default)
12	CK_CUR_MODE0	Current/Voltage mode selection (when hp_mode = 1'b0) 1'b1 : Current mode 1'b0 : Voltage mode (default)
10:8	CK_I_DRV	Control bit settings for bias current
7	CK_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CK_ROUT	Impedance control bit settings for output driver
2:0	CK_DCC	Duty cycle correction bits for output path

0x1AB40018 DIM_BC0_DIM_CA_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_CA_PAD_CFG2 register configures the DIM_CA_PAD_CFG2.

DIM_BC0_DIM_CA_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused

DIM_BC0_DIM_CA_PAD_CFG2 (cont.)

Bits	Name	Description
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1AB4001C DIM_BC0_DIM_CA_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x00300000

The DIM_CA_PAD_CFG3 register configures the DIM_CA_PAD_CFG3.

DIM_BC0_DIM_CA_PAD_CFG3

Bits	Name	Description
31:30	CS_N_IE	
29:28	CS_N_OE	
25	CK_IE	
24	CK_OE	
23:22	CKE_IE	
21:20	CKE_OE	
19:10	CA_IE	
9:0	CA_OE	

0x1AB40020 DIM_BC0_DIM_CA_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_PAD_CFG4 register configures the DIM_CA_PAD_CFG4.

DIM_BC0_DIM_CA_PAD_CFG4

Bits	Name	Description
31:30	CS_N_OE_DYN_ENA	Enable dynamic control of CS_N OE 1'b1: Dynamic control enabled and CS_N_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CS_N OE gated by CA_PAD_CFG3 bits **NOTE** This register should not be set in external loopback mode since it will change the IE contol source.
29:28	CS_N_OE_DYN	Dynamic OE control for each of the CS_N outputs, OR-ed with common controller OE.
25	RESERVED_1	
24	RESERVED_2	
23:22	CKE_OE_DYN_ENA	Enable dynamic control of CKE OE 1'b1: Dynamic control enabled and CKE_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CKE OE gated by CA_PAD_CFG3 bits
21:20	CKE_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.
19:10	CA_OE_DYN_ENA	Enable dynamic control of CA OE 1'b1: Dynamic control enabled and CA_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CA OE gated by CA_PAD_CFG3 bits
9:0	CA_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.

0x1AB40030 DIM_BC0_DIM_CA_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG0 register configures the DIM_CA_CDC_CTLR_CFG0.

DIM_BC0_DIM_CA_CDC_CTLR_CFG0

Bits	Name	Description
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration

DIM_BC0_DIM_CA_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. Example: if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1AB40034 DIM_BC0_DIM_CA_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG1 register configures the DIM_CA_CDC_CTLR_CFG1.

DIM_BC0_DIM_CA_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.

DIM_BC0_DIM_CA_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used.
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1.
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1.
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1.
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1.

0x1AB40038 DIM_BC0_DIM_CA_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG0 register configures the DIM_CA_CDC_CAL_TIMER_CFG0.

DIM_BC0_DIM_CA_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.

DIM_BC0_DIM_CA_CDC_CAL_TIMER_CFG0 (cont.)

Bits	Name	Description
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1AB4003C DIM_BC0_DIM_CA_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG1 register configures the DIM_CA_CDC_CAL_TIMER_CFG1.

DIM_BC0_DIM_CA_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1AB40040 DIM_BC0_DIM_CA_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_REFCOUNT_CFG register configures the DIM_CA_CDC_REFCOUNT_CFG.

DIM_BC0_DIM_CA_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.

DIM_BC0_DIM_CA_CDC_REFCOUNT_CFG (cont.)

Bits	Name	Description
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1AB40044 DIM_BC0_DIM_CA_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_CA_CDC_COARSE_CAL_CFG configures the DIM_CA_CDC_COARSE_CAL_CFG.

DIM_BC0_DIM_CA_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1AB40048 DIM_BC0_DIM_CA_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_RSVD_CFG register configures the DIM_CA_CDC_RSVD_CFG.

DIM_BC0_DIM_CA_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1AB4004C DIM_BC0_DIM_CA_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_OFFSET_CFG register configures the DIM_CA_CDC_OFFSET_CFG.

DIM_BC0_DIM_CA_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AB40050 DIM_BC0_DIM_CA_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_DELAY_CFG register configures the DIM_CA_CDC_DELAY_CFG.

DIM_BC0_DIM_CA_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AB40054 DIM_BC0_DIM_CA_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_SW_MODE_CFG register configures the DIM_CA_CDC_SW_MODE_CFG.

DIM_BC0_DIM_CA_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AB40058 DIM_BC0_DIM_CA_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures the DIM_CA_CDC_TEST_CFG.

DIM_BC0_DIM_CA_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AB4005C DIM_BC0_DIM_CA_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures the DIM_CA_CDC_SW_OVRD_CFG.

DIM_BC0_DIM_CA_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AB40070 DIM_BC0_DIM_CA_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_CA_CDC_STATUS0 register configures the DIM_CA_CDC_STATUS0.

DIM_BC0_DIM_CA_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. **NOTE** The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy.
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AB40074 DIM_BC0_DIM_CA_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS1 register configures the DIM_CA_CDC_STATUS1.

DIM_BC0_DIM_CA_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.

DIM_BC0_DIM_CA_CDC_STATUS1 (cont.)

Bits	Name	Description
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AB40078 DIM_BC0_DIM_CA_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_CA_CDC_STATUS2 register configures the DIM_CA_CDC_STATUS2.

DIM_BC0_DIM_CA_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AB4007C DIM_BC0_DIM_CA_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS3 register configures the DIM_CA_CDC_STATUS3.

DIM_BC0_DIM_CA_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AB400E0 DIM_BC0_DIM_CA_IOC_CTLR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures the DIM_CA_IOC_CTLR_CFG.

DIM_BC0_DIM_CA_IOC_CTLR_CFG

Bits	Name	Description
31	CAL_NOW	SW : RW Set this bit to 1'b1 will cause the IO calibration starts immediately. This bit has to be cleared after the calibration has been done. 0x0: no-op 0x1: start IOCal immediately
30	IO_CAL_AUTO	Periodic auto calibration mode. Writing a '1' to this bit will trigger periodic auto calibration with the period specified in IOC_CTLR_TIMER_CFG register. If '0', it disables the timer based on sleep clock. Note that this does not impact the timer based on fixed frequency clock (ffclk).
29	IO_CAL_FF_TIMER_EN	Fixed Frequency Timer mode. Writing a '1' to this bit will set the timer running off tcxo clock. If '0', it disables the timer based on fixed frequency clock.
28	IO_CAL_BANDGAP_DYN_CTRL	Enable dynamic control of the bandgap element: This low-power feature is only available on x2 core. Bit reserved for x0/x1 cores. 1'b1: Enabled - bandgap element turned on only during IO calibration or when current mode is enabled. 1'b0: Disabled (default) - bandgap element turned on/off statically based on BANDHGAP_ENA0/1 bits.
25	SW_FFCLK_ON	Writing a '1' to this field will turn on the fixed frequency (xo) clock on signal
24	LV_MODE	SW: RW Enable/Disable low-voltage mode (MIF2 pad only) 0x0: 1.8V 0x1: non-1.8V
20:16	MARGIN_LOAD	SW: RW If the difference between the current IOCal result is greater than the last result by the number specified here, then the IOCal controller will request value update to DDR controller. 0x0: always update
13:12	IMP_SEL	SW : RW Select bits to choose which impedance to calibrate to

DIM_BC0_DIM_CA_IOC_CTLR_CFG (cont.)

Bits	Name	Description
10	PN_SEL_CA	SW: RW Enables loading of HW calibrated values for ca pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on ca pads when it is time to update the pads with the new value.
9	PN_SEL_DATA	SW: RW Enables loading of HW calibrated values for dq/dqs pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on data pads when it is time to update the pads with the new value.
8	CAL_USE_LAST	SW: RW Select the initial value to start IO calibration 0x0: start from a fixed values specified in IOC_CTLR_PNCNT_CFG (default) 0x1: start from previous IOCal PNCNT results
6:4	SAMPLE_POINT	SW: RW Specify number of samples per measure point 0x0: 1 0x1: 3 0x2: 5 0x3: 7 0x4: 9 0x5: 11 0x6: 13 0x7: 15
3	DDR_MODE1	
2	DDR_MODE0	
1	BANDGAP_ENA1	SW: RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable
0	BANDGAP_ENA0	SW: RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable

0x1AB400E4 DIM_BC0_DIM_CA_IOC_CTLR_PNCNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures the DIM_CA_IOC_CTLR_CFG.

This register contains the initial value for the next calibration to start from. Softwave can set the hardware to start calibration either from a fixed value or from previous results. If software chooses to use fixed value by setting CAN_USE_LAST in register IOC_CTLR_CFG to be 0, then the values in this register will be used.

DIM_BC0_DIM_CA_IOC_CTLR_PNCNT_CFG

Bits	Name	Description
12:8	NCNT_INIT_CSR	SW: RW Starting PCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted
4:0	PCNT_INIT_CSR	SW: RW Starting NCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted

0x1AB400E8 DIM_BC0_DIM_CA_IOC_CTLR_TIMER_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_CFG register configures the DIM_CA_IOC_CTLR_TIMER_CFG.

DIM_BC0_DIM_CA_IOC_CTLR_TIMER_CFG

Bits	Name	Description
31:16	TIMER_PERIOD	SW: RW Recalibration Period. The period is measured in timer clock cycles. Typically it's a 32kHz clock. The minimum period that can be programmed is 3. 0,1,2: Invalid values
15:0	FF_TIMER_PERIOD	SW: RW Recalibration Period for the timer running of xo clock. 0x0: Invalid

0x1AB400EC DIM_BC0_DIM_CA_IOC_CTLR_TIMER_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_STATUS register configures the DIM_CA_IOC_CTLR_TIMER_STATUS.

DIM_BC0_DIM_CA_IOC_CTLR_TIMER_STATUS

Bits	Name	Description
15:0	TIMER_STATUS	Current Auto Calibration Timer value. As this register is written in sleep clock domain and read in xo clock domain and no hardware synchronization in place, It is required by the software to read this register 4 times to get the correct value.

0x1AB400F0 DIM_BC0_DIM_CA_IOC_CTLR_CHAR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_ CHAR_CFG register configures the IDIM_CA_IOC_CTLR_CHAR_CFG.

This register is used by hardware verification software only. It provides a mechanism to allow software to bypass the internal calibration state machine and directly access the IOCAL pad inputs.

DIM_BC0_DIM_CA_IOC_CTLR_CHAR_CFG

Bits	Name	Description
16	SM_BYP_ENA	SW: RW Characterization Bypass Path Enable 0x0: Non-bypass: State Machine Controls IOCAL pad inputs (default) 0x1: bypass: This register controls IOCal pad inputs
15	SM_BYP_N_ENA	SW: RW IO CAL Characterization n_enable: 0x0: de-asserted (default) 0x1: asserted
12:8	SM_BYP_NCNT	SW: RW IO CAL Characterization ncnt value. 0x0: count 0 (default)
7	SM_BYP_P_ENA	SW: RW IO CAL Characterization p_enable: 0x0: de-asserted (default) 0x1: asserted
4:0	SM_BYP_PCNT	SW: RW IO CAL Characterization pcnt value. 0x0: count 0 (default)

0x1AB400F4 DIM_BC0_DIM_CA_IOC_CTLR_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00011010

The DIM_CA_IOC_CTLR_STATUS register configures the following:

DIM_CA_IOC_CTLR_STATUS

DIM_BC0_DIM_CA_IOC_CTLR_STATUS

Bits	Name	Description
31	INIT_IOCAL_DONE	SW : R The very first IO Calibration is finished This bit is stiky. once it becomes 1’b1 until software writes it back to 0. 0x0: Init-cal never done 0x1: Init-cal finished
18	IOCAL_DONE_D	SW : R IO Calibration is finished 0x0: in progress 0x1: finished
17	IOCAL_BUSY	SW : R Status of calibration State machine 0x0: idle 0x1: busy
16	SYNC_COMP	SW : R comp value from IOCal pad
12:8	NCNT_HOLD	SW : R Current NCNT value used
4:0	PCNT_HOLD	SW : R Current PCNT value used

0x1AB40100 DIM_BC0_DIM_CA_CA_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CA_IOC_SLV_CFG register configures the following:

This register specifies the overriding pcnt and ncnt values. Overriding mode is controlled by PNCNT_HW_LOAD_EN bit in this register.

DIM_CA_CA_IOC_SLV_CFG

DIM_BC0_DIM_CA_CA_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW: RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW: RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	Controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW: RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	Controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW: RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1AB40104 DIM_BC0_DIM_CA_CA_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CA_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_BC0_DIM_CA_CA_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

0x1AB40110 DIM_BC0_DIM_CA_CK_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CK_IOC_SLV_CFG register configures the following:

DIM_CA_CK_IOC_SLV_CFG

DIM_BC0_DIM_CA_CK_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW: RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW: RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	Controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW: RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	Controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW: RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1AB40114 DIM_BC0_DIM_CA_CK_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CK_IOC_SLV_STATUS register configures DIM_CA_CK_IOC_SLV_STATUS.

DIM_BC0_DIM_CA_CK_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

7.4 DIM C01 CA Top Configuration Registers (0x1AB80000 DIM_C01_REG_BASE)

This section describes the C01 DIM CA TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1AB80000 DIM_C01_DIM_CA_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_CA_TOP_CFG register configures DIM_CA_TOP_CFG.

DIM_C01_DIM_CA_TOP_CFG

Bits	Name	Description
20	IOCAL_CTLR_SEL	Select source of PCNT/NCNT/PNCNT_VALID 1’b1: external 1’b0: internal (default)
16	SDR_MODE_EN	1’b1 : Enables SDR mode on address bus 1’b0 : Enables DDR mode on address bus (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1: From IOCAL 1’b0: From CDCCAL (default)
12	DEBUG_BUS_EN	1’b1: Enables the debug bus functionality 1’b0: Disables the debug bus and drives all ’0’s on the debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_ca[7:5] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1’b0) 1’b1 : with pipe extend (default) 1’b0: without pipe extend
0	WR_CLK_SEL	Write clock select 1’b1 : With write CDC (default) 1’b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1AB80004 DIM_C01_DIM_CA_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_CA_HW_INFO register configures DIM_CA_HW_INFO.

DIM_C01_DIM_CA_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1AB80008 DIM_C01_DIM_CA_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_CA_HW_VERSION register configures DIM_CA_HW_VERSION.

DIM_C01_DIM_CA_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1AB80010 DIM_C01_DIM_CA_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_CA_PAD_CFG0 register configures DIM_CA_PAD_CFG0.

DIM_C01_DIM_CA_PAD_CFG0

Bits	Name	Description
31	CA_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	CA_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	CA_LV_MODE	Mode pin for high/low voltage regime
28	CA_ODT_ENA	Enable bit for on-die termination
27:26	CA_ODT	Impedance control bit settings for on-die termination
25:24	CA_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	CA_NSLEW	Slew rate control bits for output path NMOS
17:16	CA_PSLEW	Slew rate control bits for output path PMOS
13:12	CA_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	CA_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	CA_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CA_ROUT	Impedance control bit settings for output driver
2:0	CA_DCC	Duty cycle correction bits for output path

0x1AB80014 DIM_C01_DIM_CA_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0220440

The DIM_CA_PAD_CFG1 register configures DIM_CA_PAD_CFG1.

DIM_C01_DIM_CA_PAD_CFG1

Bits	Name	Description
31	CK_DDR_MODE1	Mode select for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes

DIM_C01_DIM_CA_PAD_CFG1 (cont.)

Bits	Name	Description
30	CK_DDR_MODE0	Mode select for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	CK_LV_MODE	Mode select for high/low voltage regime
28	CK_CMFB_ENA	Common mode feedback loop enable
27	CK_ODT_ENA1	Enable bit for on-die termination (when hp_mode = 1'b1)
26	CK_ODT_ENA	Enable bit for on-die termination (when hp_mode = 1'b0) Bit field name missing '0' for APQ8064 SW compatibility.
25:24	CK_ODT	Impedance control bit settings for on-die termination
21:20	CK_NSLEW	Slew rate control bits for output path NMOS
17:16	CK_PSLEW	Slew rate control bits for output path PMOS
13	CK_CUR_MODE1	Current/Voltage mode selection (when hp_mode = 1'b1) 1'b1 : Current mode 1'b0 : Voltage mode (default)
12	CK_CUR_MODE0	Current/Voltage mode selection (when hp_mode = 1'b0) 1'b1 : Current mode 1'b0 : Voltage mode (default)
10:8	CK_I_DRV	Control bit settings for bias current
7	CK_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CK_ROUT	Impedance control bit settings for output driver
2:0	CK_DCC	Duty cycle correction bits for output path

0x1AB80018 DIM_C01_DIM_CA_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_CA_PAD_CFG2 register configures DIM_CA_PAD_CFG2.

DIM_C01_DIM_CA_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused

DIM_C01_DIM_CA_PAD_CFG2 (cont.)

Bits	Name	Description
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1AB8001C DIM_C01_DIM_CA_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x00300000

The DIM_CA_PAD_CFG3 register configures DIM_CA_PAD_CFG3.

DIM_C01_DIM_CA_PAD_CFG3

Bits	Name	Description
31:30	CS_N_IE	
29:28	CS_N_OE	
25	CK_IE	
24	CK_OE	
23:22	CKE_IE	
21:20	CKE_OE	
19:10	CA_IE	
9:0	CA_OE	

0x1AB80020 DIM_C01_DIM_CA_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_PAD_CFG4 register configures DIM_CA_PAD_CFG4.

DIM_C01_DIM_CA_PAD_CFG4

Bits	Name	Description
31:30	CS_N_OE_DYN_ENA	Enable dynamic control of CS_N OE 1'b1: Dynamic control enabled and CS_N_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CS_N OE gated by CA_PAD_CFG3 bits **NOTE** This register should not be set in external loopback mode since it will change the IE contol source.
29:28	CS_N_OE_DYN	Dynamic OE control for each of the CS_N outputs, OR-ed with common controller OE.
25	RESERVED_1	
24	RESERVED_2	
23:22	CKE_OE_DYN_ENA	Enable dynamic control of CKE OE 1'b1: Dynamic control enabled and CKE_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CKE OE gated by CA_PAD_CFG3 bits
21:20	CKE_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.
19:10	CA_OE_DYN_ENA	Enable dynamic control of CA OE 1'b1: Dynamic control enabled and CA_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CA OE gated by CA_PAD_CFG3 bits
9:0	CA_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.

0x1AB80030 DIM_C01_DIM_CA_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG0 register configures DIM_CA_CDC_CTLR_CFG0.

DIM_C01_DIM_CA_CDC_CTLR_CFG0

Bits	Name	Description
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration

DIM_C01_DIM_CA_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1AB80034 DIM_C01_DIM_CA_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG1 register configures DIM_CA_CDC_CTLR_CFG1.

DIM_C01_DIM_CA_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.

DIM_C01_DIM_CA_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used.
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1.
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1.
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1.
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1.

0x1AB80038 DIM_C01_DIM_CA_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_CA_CDC_CAL_TIMER_CFG0

DIM_C01_DIM_CA_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.

DIM_C01_DIM_CA_CDC_CAL_TIMER_CFG0 (cont.)

Bits	Name	Description
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1AB8003C DIM_C01_DIM_CA_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG1 register configures DIM_CA_CDC_CAL_TIMER_CFG1.

DIM_C01_DIM_CA_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1AB80040 DIM_C01_DIM_CA_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_REFCOUNT_CFG register configures DIM_CA_CDC_REFCOUNT_CFG.

DIM_C01_DIM_CA_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.

DIM_C01_DIM_CA_CDC_REFCOUNT_CFG (cont.)

Bits	Name	Description
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1AB80044 DIM_C01_DIM_CA_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_CA_CDC_COARSE_CAL_CFG configures DIM_CA_CDC_COARSE_CAL_CFG.

DIM_C01_DIM_CA_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	Unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1AB80048 DIM_C01_DIM_CA_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_RSVD_CFG register configures DIM_CA_CDC_RSVD_CFG.

DIM_C01_DIM_CA_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1AB8004C DIM_C01_DIM_CA_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_OFFSET_CFG register configures DIM_CA_CDC_OFFSET_CFG.

DIM_C01_DIM_CA_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AB80050 DIM_C01_DIM_CA_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_DELAY_CFG register configures DIM_CA_CDC_DELAY_CFG.

DIM_C01_DIM_CA_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AB80054 DIM_C01_DIM_CA_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_SW_MODE_CFG register configures DIM_CA_CDC_SW_MODE_CFG.

DIM_C01_DIM_CA_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AB80058 DIM_C01_DIM_CA_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures DIM_CA_CDC_TEST_CFG.

DIM_C01_DIM_CA_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AB8005C DIM_C01_DIM_CA_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures DIM_CA_CDC_SW_OVRD_CFG.

DIM_C01_DIM_CA_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AB80070 DIM_C01_DIM_CA_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_CA_CDC_STATUS0 register configures DIM_CA_CDC_STATUS0.

DIM_C01_DIM_CA_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. **NOTE** The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AB80074 DIM_C01_DIM_CA_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS1 register configures DIM_CA_CDC_STATUS1.

DIM_C01_DIM_CA_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.

DIM_C01_DIM_CA_CDC_STATUS1 (cont.)

Bits	Name	Description
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AB80078 DIM_C01_DIM_CA_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_CA_CDC_STATUS2 register configures DIM_CA_CDC_STATUS2.

DIM_C01_DIM_CA_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AB8007C DIM_C01_DIM_CA_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS3 register configures DIM_CA_CDC_STATUS3.

DIM_C01_DIM_CA_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AB800E0 DIM_C01_DIM_CA_IOC_CTLR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures DIM_CA_IOC_CTLR_CFG.

DIM_C01_DIM_CA_IOC_CTLR_CFG

Bits	Name	Description
31	CAL_NOW	SW : RW Set this bit to 1'b1 will cause the IO calibration starts immediately. This bit has to be cleared after the calibration has been done. 0x0: no-op 0x1: start IOCal immediately
30	IO_CAL_AUTO	Periodic auto calibration mode. Writing a '1' to this bit will trigger periodic auto calibration with the period specified in IOC_CTLR_TIMER_CFG register. If '0', it disables the timer based on sleep clock. Note that this does not impact the timer based on fixed frequency clock (ffclk).
29	IO_CAL_FF_TIMER_EN	Fixed Frequency Timer mode. Writing a '1' to this bit will set the timer running off tcxo clock. If '0', it disables the timer based on fixed frequency clock.
28	IO_CAL_BANDGAP_DYN_CTRL	Enable dynamic control of the bandgap element: This low-power feature is only available on x2 core. Bit reserved for x0/x1 cores. 1'b1: Enabled - bandgap element turned on only during IO calibration or when current mode is enabled. 1'b0: Disabled (default) - bandgap element turned on/off statically based on BANDHGAP_ENA0/1 bits.
25	SW_FFCLK_ON	Writing a '1' to this field will turn on the fixed frequency (xo) clock on signal
24	LV_MODE	SW: RW Enable/Disable low-voltage mode (MIF2 pad only) 0x0: 1.8V 0x1: non-1.8V
20:16	MARGIN_LOAD	SW: RW If the difference between the current IOCal result is greater than the last result by the number specified here, then the IOCal controller will request value update to DDR controller. 0x0: always update
13:12	IMP_SEL	SW: RW Select bits to choose which impedance to calibrate to

DIM_C01_DIM_CA_IOC_CTLR_CFG (cont.)

Bits	Name	Description
10	PN_SEL_CA	SW: RW Enables loading of HW calibrated values for ca pads. Writing a ‘1’ to this bit would let the IOCAL to request traffic stall on ca pads when it is time to update the pads with the new value.
9	PN_SEL_DATA	SW: RW Enables loading of HW calibrated values for dq/dqs pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on data pads when it is time to update the pads with the new value.
8	CAL_USE_LAST	SW: RW Select the initial value to start IO calibration 0x0: start from a fixed values specified in IOC_CTLR_PNCNT_CFG (default) 0x1: start from previous IOCal PNCNT results
6:4	SAMPLE_POINT	SW: RW Specify number of samples per measure point 0x0: 1 0x1: 3 0x2: 5 0x3: 7 0x4: 9 0x5: 11 0x6: 13 0x7: 15
3	DDR_MODE1	
2	DDR_MODE0	
1	BANDGAP_ENA1	SW: RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable
0	BANDGAP_ENA0	SW: RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable

0x1AB800E4 DIM_C01_DIM_CA_IOC_CTLR_PNCNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures DIM_CA_IOC_CTLR_CFG.

This register contains the initial value for the next calibration to start from. Softwave can set the hardware to either start calibration from a fixed value or from previous results. If software chooses to use fixed value by setting CAN_USE_LAST in register IOC_CTLR_CFG to be 0, then the values in this register will be used.

DIM_C01_DIM_CA_IOC_CTLR_PNCNT_CFG

Bits	Name	Description
12:8	NCNT_INIT_CSR	SW : RW Starting PCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted
4:0	PCNT_INIT_CSR	SW : RW Starting NCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted

0x1AB800E8 DIM_C01_DIM_CA_IOC_CTLR_TIMER_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_CFG register configures DIM_CA_IOC_CTLR_TIMER_CFG.

DIM_C01_DIM_CA_IOC_CTLR_TIMER_CFG

Bits	Name	Description
31:16	TIMER_PERIOD	SW: RW Recalibration Period. The period is measured in timer clock cycles. Typically it's a 32kHz clock. The minimum period that can be programmed is 3. 0,1,2: Invalid values
15:0	FF_TIMER_PERIOD	SW: RW Recalibration Period for the timer running of xo clock. 0x0: Invalid

0x1AB800EC DIM_C01_DIM_CA_IOC_CTLR_TIMER_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_STATUS register configures DIM_CA_IOC_CTLR_TIMER_STATUS.

DIM_C01_DIM_CA_IOC_CTLR_TIMER_STATUS

Bits	Name	Description
15:0	TIMER_STATUS	Current Auto Calibration Timer value. As this register is written in sleep clock domain and read in xo clock domain and no hardware synchronization in place, It is required by the software to read this register 4 times to get the correct value.

0x1AB800F0 DIM_C01_DIM_CA_IOC_CTLR_CHAR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_ CHAR_CFGregister configures IDIM_CA_IOC_CTLR_CHAR_CFG.

This register is used by hardware verification software only. It provides a mechanism to allow software to bypass the internal calibration state machine and directly access the IOCAL pad inputs.

DIM_C01_DIM_CA_IOC_CTLR_CHAR_CFG

Bits	Name	Description
16	SM_BYP_ENA	SW: RW Characterization Bypass Path Enable 0x0: Non-bypass: State Machine Controls IOCAL pad inputs (default) 0x1: bypass: This register controls IOCal pad inputs
15	SM_BYP_N_ENA	SW: RW IO CAL Characterization n_enable: 0x0: de-asserted (default) 0x1: asserted
12:8	SM_BYP_NCNT	SW: RW IO CAL Characterization ncnt value. 0x0: count 0 (default)
7	SM_BYP_P_ENA	SW: RW IO CAL Characterization p_enable: 0x0: de-asserted (default) 0x1: asserted
4:0	SM_BYP_PCNT	SW: RW IO CAL Characterization pcnt value. 0x0: count 0 (default)

0x1AB800F4 DIM_C01_DIM_CA_IOC_CTLR_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00011010

The DIM_CA_IOC_CTLR_STATUS register configures DIM_CA_IOC_CTLR_STATUS.

DIM_C01_DIM_CA_IOC_CTLR_STATUS

Bits	Name	Description
31	INIT_IOCAL_DONE	SW: R The very first IO Calibration is finished This bit is stiky. once it becomes 1’b1 until software writes it back to 0. 0x0: Init-cal never done 0x1: Init-cal finished
18	IOCAL_DONE_D	SW: R IO Calibration is finished 0x0: in progress 0x1: finished
17	IOCAL_BUSY	SW: R Status of calibration State machine 0x0: idle 0x1: busy
16	SYNC_COMP	SW: R comp value from IOCal pad
12:8	NCNT_HOLD	SW: R Current NCNT value used
4:0	PCNT_HOLD	SW: R Current PCNT value used

0x1AB80100 DIM_C01_DIM_CA_CA_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CA_IOC_SLV_CFG register configures DIM_CA_CA_IOC_SLV_CFG.

This register specifies the overriding pcnt and ncnt values. Overriding mode is controlled by PNCNT_HW_LOAD_EN bit in this register.

DIM_C01_DIM_CA_CA_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW: RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW: RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	Controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW: RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	Controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW: RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1AB80104 DIM_C01_DIM_CA_CA_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CA_IOC_SLV_STATUS register configures DIM_CA_CA_IOC_SLV_STATUS.

DIM_C01_DIM_CA_CA_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

0x1AB80110 DIM_C01_DIM_CA_CK_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CK_IOC_SLV_CFG register configures DIM_CA_CK_IOC_SLV_CFG.

DIM_C01_DIM_CA_CK_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW: RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW : RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	Controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW: RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	Controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW: RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1AB80114 DIM_C01_DIM_CA_CK_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CK_IOC_SLV_STATUS register configures DIM_CA_CK_IOC_SLV_STATUS.

DIM_C01_DIM_CA_CK_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

7.5 DIM BD1 DQ Top Configuration Registers (0x1AC80000 DIM_BD1_REG_BASE)

This section describes the BD1 DIM DQ TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1AC80000 DIM_BD1_DIM_DQ_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures DIM_DQ_TOP_CFG.

DIM_BD1_DIM_DQ_TOP_CFG

Bits	Name	Description
26	CDC_LDO_EN	Enablement of CDC LDO 1’b1 : Enabled 1’b0 : Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1’b1 : Enabled 1’b0 : Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1’b1 : Disabled 1’b0 : Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1’b1 : Enable the RCW 1’b0 : Disabled (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1 : from Read CDCCAL 1’b0 : from Write CDCCAL (default)
12	DEBUG_BUS_EN	1’b1 : Enables the debug bus functionality 1’b0 : Disables the debug bus and drives all ’0’s on debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_dq[5:0] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend

DIM_BD1_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1 : with pipe extend (default) 1'b0 : without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1 : With write CDC (default) 1'b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1AC80004 DIM_BD1_DIM_DQ_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_DQ_HW_INFO register configures DIM_DQ_HW_INFO.

DIM_BD1_DIM_DQ_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1AC80008 DIM_BD1_DIM_DQ_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_DQ_HW_VERSION register configures DIM_DQ_HW_VERSION.

DIM_BD1_DIM_DQ_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.

DIM_BD1_DIM_DQ_HW_VERSION (cont.)

Bits	Name	Description
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1AC80010 DIM_BD1_DIM_DQ_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG0 register configures DIM_DQ_PAD_CFG0.

DIM_BD1_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x1AC80014 DIM_BD1_DIM_DQ_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG1 register configures DIM_DQ_PAD_CFG1.

DIM_BD1_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x1AC80018 DIM_BD1_DIM_DQ_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_DQ_PAD_CFG2 register configures DIM_DQ_PAD_CFG2.

DIM_BD1_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)

DIM_BD1_DIM_DQ_PAD_CFG2 (cont.)

Bits	Name	Description
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1AC80020 DIM_BD1_DIM_DQ_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures DIM_DQ_PAD_CFG3.

DIM_BD1_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1'b1 : differential output (default) 1'b0 : single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x1AC80024 DIM_BD1_DIM_DQ_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_DQ_PAD_CFG4 register configures DIM_DQ_PAD_CFG4.

DIM_BD1_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x1AC80030 DIM_BD1_DIM_DQ_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG0 register configures DIM_DQ_CDC_CTLR_CFG0.

DIM_BD1_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. Example: if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1AC80034 DIM_BD1_DIM_DQ_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures DIM_DQ_CDC_CTLR_CFG1.

DIM_BD1_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used.
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1.
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1.
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1.
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1.

0x1AC80038 DIM_BD1_DIM_DQ_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures DIM_DQ_CDC_CAL_TIMER_CFG0.

DIM_BD1_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.

DIM_BD1_DIM_DQ_CDC_CAL_TIMER_CFG0 (cont.)

Bits	Name	Description
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1AC8003C DIM_BD1_DIM_DQ_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures DIM_DQ_CDC_CAL_TIMER_CFG1.

DIM_BD1_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1AC80040 DIM_BD1_DIM_DQ_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures DIM_DQ_CDC_REFCOUNT_CFG.

DIM_BD1_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.

DIM_BD1_DIM_DQ_CDC_REFCOUNT_CFG (cont.)

Bits	Name	Description
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1AC80044 DIM_BD1_DIM_DQ_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures DIM_DQ_CDC_COARSE_CAL_CFG.

DIM_BD1_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	Unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1AC80048 DIM_BD1_DIM_DQ_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures DIM_DQ_CDC_RSVD_CFG.

DIM_BD1_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1AC8004C DIM_BD1_DIM_DQ_RD_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures DIM_DQ_RD_CDC_OFFSET_CFG.

DIM_BD1_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AC80050 DIM_BD1_DIM_DQ_RD_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures DIM_DQ_RD_CDC_DELAY_CFG.

DIM_BD1_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AC80054 DIM_BD1_DIM_DQ_RD_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures DIM_DQ_RD_CDC_SW_MODE_CFG.

DIM_BD1_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AC80058 DIM_BD1_DIM_DQ_RD_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_TEST_CFG register configures DIM_DQ_RD_CDC_TEST_CFG.

DIM_BD1_DIM_DQ_RD_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AC8005C DIM_BD1_DIM_DQ_RD_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures DIM_DQ_RD_CDC_SW_OVRD_CFG.

DIM_BD1_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AC80060 DIM_BD1_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures DIM_DQ_RD_CDC_SLAVE_DDA_CFG.

DIM_BD1_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x1AC80070 DIM_BD1_DIM_DQ_RD_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures DIM_DQ_RD_CDC_STATUS0.

DIM_BD1_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. **NOTE** The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected

DIM_BD1_DIM_DQ_RD_CDC_STATUS0 (cont.)

Bits	Name	Description
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AC80074 DIM_BD1_DIM_DQ_RD_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures DIM_DQ_RD_CDC_STATUS1.

DIM_BD1_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AC80078 DIM_BD1_DIM_DQ_RD_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures DIM_DQ_RD_CDC_STATUS2.

DIM_BD1_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AC8007C DIM_BD1_DIM_DQ_RD_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures DIM_DQ_RD_CDC_STATUS3.

DIM_BD1_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AC80080 DIM_BD1_DIM_DQ_RD_CDC_STATUS4

Type: Read
Clock: HCLK
Reset State: 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures DIM_DQ_RD_CDC_STATUS4.

DIM_BD1_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x1AC800AC DIM_BD1_DIM_DQ_WR_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures DIM_DQ_WR_CDC_OFFSET_CFG.

DIM_BD1_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1AC800B0 DIM_BD1_DIM_DQ_WR_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures DIM_DQ_WR_CDC_DELAY_CFG.

DIM_BD1_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1AC800B4 DIM_BD1_DIM_DQ_WR_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures DIM_DQ_WR_CDC_SW_MODE_CFG.

DIM_BD1_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1AC800B8 DIM_BD1_DIM_DQ_WR_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_TEST_CFG register configures DIM_DQ_WR_CDC_TEST_CFG.

DIM_BD1_DIM_DQ_WR_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1AC800BC DIM_BD1_DIM_DQ_WR_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures DIM_DQ_WR_CDC_SW_OVRD_CFG.

DIM_BD1_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1AC800D0 DIM_BD1_DIM_DQ_WR_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures DIM_DQ_WR_CDC_STATUS0.

DIM_BD1_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. **NOTE** The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1AC800D4 DIM_BD1_DIM_DQ_WR_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures DIM_DQ_WR_CDC_STATUS1.

DIM_BD1_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.

DIM_BD1_DIM_DQ_WR_CDC_STATUS1 (cont.)

Bits	Name	Description
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1AC800D8 DIM_BD1_DIM_DQ_WR_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures DIM_DQ_WR_CDC_STATUS2.

DIM_BD1_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1AC800DC DIM_BD1_DIM_DQ_WR_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures DIM_DQ_WR_CDC_STATUS3.

DIM_BD1_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1AC80100 DIM_BD1_DIM_DQ_DQ_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures DIM_DQ_DQ_IOC_SLV_CFG.

DIM_BD1_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AC80104 DIM_BD1_DIM_DQ_DQ_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures DIM_CA_CA_IOC_SLV_STATUS.

DIM_BD1_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x1AC80110 DIM_BD1_DIM_DQ_DQS_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures DIM_DQ_DQS_IOC_SLV_CFG.

DIM_BD1_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x1AC80114 DIM_BD1_DIM_DQ_DQS_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures DIM_DQ_DQS_IOC_SLV_STATUS.

DIM_BD1_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

7.6 DIM BC1 CA Top Configuration Registers (0x1B040000 DIM_BC1_REG_BASE)

This section describes the BC1 DIM CA TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1B040000 DIM_BC1_DIM_CA_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_CA_TOP_CFG register configures DIM_CA_TOP_CFG.

DIM_BC1_DIM_CA_TOP_CFG

Bits	Name	Description
20	IOCAL_CTLR_SEL	Select source of PCNT/NCNT/PNCNT_VALID 1’b1: external 1’b0: internal (default)
16	SDR_MODE_EN	1’b1 : Enables SDR mode on address bus 1’b0 : Enables DDR mode on address bus (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1: From IOCAL 1’b0: From CDCCAL (default)
12	DEBUG_BUS_EN	1’b1: Enables the debug bus functionality 1’b0: Disables the debug bus and drives all ’0’s on the debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_ca[7:5] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1’b0) 1’b1 : with pipe extend (default) 1’b0: without pipe extend
0	WR_CLK_SEL	Write clock select 1’b1 : With write CDC (default) 1’b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1B040004 DIM_BC1_DIM_CA_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_CA_HW_INFO register configures DIM_CA_HW_INFO.

DIM_BC1_DIM_CA_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1B040008 DIM_BC1_DIM_CA_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_CA_HW_VERSION register configures DIM_CA_HW_VERSION.

DIM_BC1_DIM_CA_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1B040010 DIM_BC1_DIM_CA_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_CA_PAD_CFG0 register configures DIM_CA_PAD_CFG0.

DIM_BC1_DIM_CA_PAD_CFG0

Bits	Name	Description
31	CA_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	CA_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	CA_LV_MODE	Mode pin for high/low voltage regime
28	CA_ODT_ENA	Enable bit for on-die termination
27:26	CA_ODT	Impedance control bit settings for on-die termination
25:24	CA_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	CA_NSLEW	Slew rate control bits for output path NMOS
17:16	CA_PSLEW	Slew rate control bits for output path PMOS
13:12	CA_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	CA_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	CA_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CA_ROUT	Impedance control bit settings for output driver
2:0	CA_DCC	Duty cycle correction bits for output path

0x1B040014 DIM_BC1_DIM_CA_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0220440

The DIM_CA_PAD_CFG1 register configures DIM_CA_PAD_CFG1.

DIM_BC1_DIM_CA_PAD_CFG1

Bits	Name	Description
31	CK_DDR_MODE1	Mode select for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes

DIM_BC1_DIM_CA_PAD_CFG1 (cont.)

Bits	Name	Description
30	CK_DDR_MODE0	Mode select for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	CK_LV_MODE	Mode select for high/low voltage regime
28	CK_CMFB_ENA	Common mode feedback loop enable
27	CK_ODT_ENA1	Enable bit for on-die termination (when hp_mode = 1'b1)
26	CK_ODT_ENA	Enable bit for on-die termination (when hp_mode = 1'b0) Bit field name missing '0' for APQ8064 SW compatibility.
25:24	CK_ODT	Impedance control bit settings for on-die termination
21:20	CK_NSLEW	Slew rate control bits for output path NMOS
17:16	CK_PSLEW	Slew rate control bits for output path PMOS
13	CK_CUR_MODE1	Current/Voltage mode selection (when hp_mode = 1'b1) 1'b1 : Current mode 1'b0 : Voltage mode (default)
12	CK_CUR_MODE0	Current/Voltage mode selection (when hp_mode = 1'b0) 1'b1 : Current mode 1'b0 : Voltage mode (default)
10:8	CK_I_DRV	Control bit settings for bias current
7	CK_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CK_ROUT	Impedance control bit settings for output driver
2:0	CK_DCC	Duty cycle correction bits for output path

0x1B040018 DIM_BC1_DIM_CA_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_CA_PAD_CFG2 register configures DIM_CA_PAD_CFG2.

DIM_BC1_DIM_CA_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused

DIM_BC1_DIM_CA_PAD_CFG2 (cont.)

Bits	Name	Description
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1B04001C DIM_BC1_DIM_CA_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x00300000

The DIM_CA_PAD_CFG3 register configures DIM_CA_PAD_CFG3.

DIM_BC1_DIM_CA_PAD_CFG3

Bits	Name	Description
31:30	CS_N_IE	
29:28	CS_N_OE	
25	CK_IE	
24	CK_OE	
23:22	CKE_IE	
21:20	CKE_OE	
19:10	CA_IE	
9:0	CA_OE	

0x1B040020 DIM_BC1_DIM_CA_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_PAD_CFG4 register configures DIM_CA_PAD_CFG4.

DIM_BC1_DIM_CA_PAD_CFG4

Bits	Name	Description
31:30	CS_N_OE_DYN_ENA	Enable dynamic control of CS_N OE 1'b1: Dynamic control enabled and CS_N_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CS_N OE gated by CA_PAD_CFG3 bits **NOTE** This register should not be set in external loopback mode since it will change the IE contol source.
29:28	CS_N_OE_DYN	Dynamic OE control for each of the CS_N outputs, OR-ed with common controller OE.
25	RESERVED_1	
24	RESERVED_2	
23:22	CKE_OE_DYN_ENA	Enable dynamic control of CKE OE 1'b1: Dynamic control enabled and CKE_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CKE OE gated by CA_PAD_CFG3 bits
21:20	CKE_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.
19:10	CA_OE_DYN_ENA	Enable dynamic control of CA OE 1'b1: Dynamic control enabled and CA_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CA OE gated by CA_PAD_CFG3 bits
9:0	CA_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.

0x1B040030 DIM_BC1_DIM_CA_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG0 register configures DIM_CA_CDC_CTLR_CFG0.

DIM_BC1_DIM_CA_CDC_CTLR_CFG0

Bits	Name	Description
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration

DIM_BC1_DIM_CA_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1B040034 DIM_BC1_DIM_CA_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG1 register configures DIM_CA_CDC_CTLR_CFG1.

DIM_BC1_DIM_CA_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.

DIM_BC1_DIM_CA_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used.
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1.
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1.
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1.
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1.

0x1B040038 DIM_BC1_DIM_CA_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG0 register configures DIM_CA_CDC_CAL_TIMER_CFG0.

DIM_BC1_DIM_CA_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.

DIM_BC1_DIM_CA_CDC_CAL_TIMER_CFG0 (cont.)

Bits	Name	Description
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1B04003C DIM_BC1_DIM_CA_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG1 register configures DIM_CA_CDC_CAL_TIMER_CFG1.

DIM_BC1_DIM_CA_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1B040040 DIM_BC1_DIM_CA_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_REFCOUNT_CFG register configures DIM_CA_CDC_REFCOUNT_CFG.

DIM_BC1_DIM_CA_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.

DIM_BC1_DIM_CA_CDC_REFCOUNT_CFG (cont.)

Bits	Name	Description
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1B040044 DIM_BC1_DIM_CA_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_CA_CDC_COARSE_CAL_CFG configures DIM_CA_CDC_COARSE_CAL_CFG.

DIM_BC1_DIM_CA_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	Unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1B040048 DIM_BC1_DIM_CA_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_RSVD_CFG register configures DIM_CA_CDC_RSVD_CFG.

DIM_BC1_DIM_CA_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1B04004C DIM_BC1_DIM_CA_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_OFFSET_CFG register configures DIM_CA_CDC_OFFSET_CFG.

DIM_BC1_DIM_CA_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1B040050 DIM_BC1_DIM_CA_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_DELAY_CFG register configures DIM_CA_CDC_DELAY_CFG.

DIM_BC1_DIM_CA_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1B040054 DIM_BC1_DIM_CA_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_SW_MODE_CFG register configures DIM_CA_CDC_SW_MODE_CFG.

DIM_BC1_DIM_CA_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1B040058 DIM_BC1_DIM_CA_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures DIM_CA_CDC_TEST_CFG.

DIM_BC1_DIM_CA_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1B04005C DIM_BC1_DIM_CA_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures DIM_CA_CDC_SW_OVRD_CFG.

DIM_BC1_DIM_CA_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1B040070 DIM_BC1_DIM_CA_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_CA_CDC_STATUS0 register configures DIM_CA_CDC_STATUS0.

DIM_BC1_DIM_CA_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. **NOTE** The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1B040074 DIM_BC1_DIM_CA_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS1 register configures DIM_CA_CDC_STATUS1.

DIM_BC1_DIM_CA_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.

DIM_BC1_DIM_CA_CDC_STATUS1 (cont.)

Bits	Name	Description
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1B040078 DIM_BC1_DIM_CA_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_CA_CDC_STATUS2 register configures DIM_CA_CDC_STATUS2.

DIM_BC1_DIM_CA_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1B04007C DIM_BC1_DIM_CA_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS3 register configures DIM_CA_CDC_STATUS3.

DIM_BC1_DIM_CA_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking.
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration.
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1B0400E0 DIM_BC1_DIM_CA_IOC_CTLR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures DIM_CA_IOC_CTLR_CFG.

DIM_BC1_DIM_CA_IOC_CTLR_CFG

Bits	Name	Description
31	CAL_NOW	SW: RW Set this bit to 1'b1 will cause the IO calibration starts immediately. This bit has to be cleared after the calibration has been done. 0x0: no-op 0x1: start IOCal immediately
30	IO_CAL_AUTO	Periodic auto calibration mode. Writing a '1' to this bit will trigger periodic auto calibration with the period specified in IOC_CTLR_TIMER_CFG register. If '0', it disables the timer based on sleep clock. Note that this does not impact the timer based on fixed frequency clock (ffclk).
29	IO_CAL_FF_TIMER_EN	Fixed Frequency Timer mode. Writing a '1' to this bit will set the timer running off tcxo clock. If '0', it disables the timer based on fixed frequency clock.
28	IO_CAL_BANDGAP_DYN_CTRL	Enable dynamic control of the bandgap element: This low-power feature is only available on x2 core. Bit reserved for x0/x1 cores. 1'b1: Enabled - bandgap element turned on only during IO calibration or when current mode is enabled. 1'b0: Disabled (default) - bandgap element turned on/off statically based on BANDHGAP_ENA0/1 bits.
25	SW_FFCLK_ON	Writing a '1' to this field will turn on the fixed frequency (xo) clock on signal
24	LV_MODE	SW: RW Enable/Disable low-voltage mode (MIF2 pad only) 0x0: 1.8V 0x1: non-1.8V
20:16	MARGIN_LOAD	SW: RW If the difference between the current IOCal result is greater than the last result by the number specified here, then the IOCal controller will request value update to DDR controller. 0x0: always update
13:12	IMP_SEL	SW: RW Select bits to choose which impedance to calibrate to.

DIM_BC1_DIM_CA_IOC_CTLR_CFG (cont.)

Bits	Name	Description
10	PN_SEL_CA	SW: RW Enables loading of HW calibrated values for ca pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on ca pads when it is time to update the pads with the new value.
9	PN_SEL_DATA	SW: RW Enables loading of HW calibrated values for dq/dqs pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on data pads when it is time to update the pads with the new value.
8	CAL_USE_LAST	SW: RW Select the initial value to start IO calibration 0x0: start from a fixed values specified in IOC_CTLR_PNCNT_CFG (default) 0x1: start from previous IOCal PNCNT results
6:4	SAMPLE_POINT	SW: RW Specify number of samples per measure point 0x0: 1 0x1: 3 0x2: 5 0x3: 7 0x4: 9 0x5: 11 0x6: 13 0x7: 15
3	DDR_MODE1	
2	DDR_MODE0	
1	BANDGAP_ENA1	SW : RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable
0	BANDGAP_ENA0	SW : RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable

0x1B0400E4 DIM_BC1_DIM_CA_IOC_CTLR_PNCNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures DIM_CA_IOC_CTLR_CFG.

This register contains the initial value for the next calibration to start from. Softwave can set the hardware to either start calibration from a fixed value or from previous results. If software chooses to use fixed value by setting CAN_USE_LAST in register IOC_CTLR_CFG to be 0, then the values in this register will be used.

DIM_BC1_DIM_CA_IOC_CTLR_PNCNT_CFG

Bits	Name	Description
12:8	NCNT_INIT_CSR	SW: RW Starting PCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted
4:0	PCNT_INIT_CSR	SW: RW Starting NCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted

0x1B0400E8 DIM_BC1_DIM_CA_IOC_CTLR_TIMER_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_CFG register configures DIM_CA_IOC_CTLR_TIMER_CFG.

DIM_BC1_DIM_CA_IOC_CTLR_TIMER_CFG

Bits	Name	Description
31:16	TIMER_PERIOD	SW: RW Recalibration Period. The period is measured in timer clock cycles. Typically it's a 32kHz clock. The minimum period that can be programmed is 3. 0,1,2: Invalid values
15:0	FF_TIMER_PERIOD	SW: RW Recalibration Period for the timer running of xo clock. 0x0: Invalid

0x1B0400EC DIM_BC1_DIM_CA_IOC_CTLR_TIMER_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_STATUS register configures DIM_CA_IOC_CTLR_TIMER_STATUS.

DIM_BC1_DIM_CA_IOC_CTLR_TIMER_STATUS

Bits	Name	Description
15:0	TIMER_STATUS	Current Auto Calibration Timer value. As this register is written in sleep clock domain and read in xo clock domain and no hardware synchronization in place, It is required by the software to read this register 4 times to get the correct value.

0x1B0400F0 DIM_BC1_DIM_CA_IOC_CTLR_CHAR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_ CHAR_CFG register configures IDIM_CA_IOC_CTLR_CHAR_CFG.

This register is used by hardware verification software only. It provides a mechanism to allow software to bypass the internal calibration state machine and directly access the IOCAL pad inputs.

DIM_BC1_DIM_CA_IOC_CTLR_CHAR_CFG

Bits	Name	Description
16	SM_BYP_ENA	SW : RW Characterization Bypass Path Enable 0x0: Non-bypass: State Machine Controls IOCAL pad inputs (default) 0x1: bypass: This register controls IOCal pad inputs
15	SM_BYP_N_ENA	SW: RW IO CAL Characterization n_enable: 0x0: de-asserted (default) 0x1: asserted
12:8	SM_BYP_NCNT	SW: RW IO CAL Characterization ncnt value. 0x0: count 0 (default)
7	SM_BYP_P_ENA	SW: RW IO CAL Characterization p_enable: 0x0: de-asserted (default) 0x1: asserted
4:0	SM_BYP_PCNT	SW: RW IO CAL Characterization pcnt value. 0x0: count 0 (default)

0x1B0400F4 DIM_BC1_DIM_CA_IOC_CTLR_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00011010

The DIM_CA_IOC_CTLR_STATUS register configures DIM_CA_IOC_CTLR_STATUS.

DIM_BC1_DIM_CA_IOC_CTLR_STATUS

Bits	Name	Description
31	INIT_IOCAL_DONE	SW: R The very first IO Calibration is finished This bit is stiky. once it becomes 1’b1 until software writes it back to 0. 0x0: Init-cal never done 0x1: Init-cal finished
18	IOCAL_DONE_D	SW: R IO Calibration is finished 0x0: in progress 0x1: finished
17	IOCAL_BUSY	SW: R Status of calibration State machine 0x0: idle 0x1: busy
16	SYNC_COMP	SW: R comp value from IOCal pad
12:8	NCNT_HOLD	SW: R Current NCNT value used
4:0	PCNT_HOLD	SW: R Current PCNT value used

0x1B040100 DIM_BC1_DIM_CA_CA_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CA_IOC_SLV_CFG register configures DIM_CA_CA_IOC_SLV_CFG.

This register specifies the overriding pcnt and ncnt values. Overriding mode is controlled by PNCNT_HW_LOAD_EN bit in this register.

DIM_BC1_DIM_CA_CA_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW: RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW: RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	Controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW: RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	Controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW: RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1B040104 DIM_BC1_DIM_CA_CA_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CA_IOC_SLV_STATUS register configures DIM_CA_CA_IOC_SLV_STATUS.

DIM_BC1_DIM_CA_CA_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

0x1B040110 DIM_BC1_DIM_CA_CK_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CK_IOC_SLV_CFG register configures DIM_CA_CK_IOC_SLV_CFG.

DIM_BC1_DIM_CA_CK_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW: RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW: RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	Controls if the NOFFSET is added for subtracted on top of calibration result. 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW: RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads. 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	Controls if the POFFSET is added for subtracted on top of calibration result. 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW: RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads. 0x0: count 0 (default)

0x1B040114 DIM_BC1_DIM_CA_CK_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CK_IOC_SLV_STATUS register configures DIM_CA_CK_IOC_SLV_STATUS.

DIM_BC1_DIM_CA_CK_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

7.7 DIM C11 CA Top Configuration Registers (0x1B080000 DIM_C11_REG_BASE)

This section describes the C11 DIM CA TOP configuration registers. These registers allow software to configure the core and obtain status information from it.

Only 32-bit word accesses are supported. Byte and half-word accesses are not supported.

0x1B080000 DIM_C11_DIM_CA_TOP_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000031

The DIM_CA_TOP_CFG register configures DIM_CA_TOP_CFG.

DIM_C11_DIM_CA_TOP_CFG

Bits	Name	Description
20	IOCAL_CTLR_SEL	Select source of PCNT/NCNT/PNCNT_VALID 1’b1: external 1’b0: internal (default)
16	SDR_MODE_EN	1’b1 : Enables SDR mode on address bus 1’b0 : Enables DDR mode on address bus (default)
13	DEBUG_BUS_SEL	Debug bus source select 1’b1: From IOCAL 1’b0: From CDCCAL (default)
12	DEBUG_BUS_EN	1’b1: Enables the debug bus functionality 1’b0: Disables the debug bus and drives all ’0’s on the debug bus (default)
8	CDC_TEST_EN	smt/cdc_test mux select for smt_ca[7:5] 1’b1 : from cdc test outputs 1’b0 : from smt inputs (default)
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1’b1) 1’b1 : with pipe extend (default) 1’b0 : without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1’b0) 1’b1 : with pipe extend (default) 1’b0: without pipe extend
0	WR_CLK_SEL	Write clock select 1’b1 : With write CDC (default) 1’b0 : Bypass write CDC, write clock from cdiv2 phi2 output

0x1B080004 DIM_C11_DIM_CA_HW_INFO

Type: Read
Clock: HCLK
Reset State: 0x00013007

The DIM_CA_HW_INFO register configures DIM_CA_HW_INFO.

DIM_C11_DIM_CA_HW_INFO

Bits	Name	Description
31:20	RESERVED	Read all zeros
19:16	CORE_ID	Core ID like LPDDR2, PCDDR3, etc.
15:12	MAJOR_REV	Major code revision
11:8	BRANCH_REV	Branch code revision
7:0	MINOR_REV	Minor code revision

0x1B080008 DIM_C11_DIM_CA_HW_VERSION

Type: Read
Clock: HCLK
Reset State: 0x10040001

The DIM_CA_HW_VERSION register configures DIM_CA_HW_VERSION.

DIM_C11_DIM_CA_HW_VERSION

Bits	Name	Description
31:28	MAJOR	Major version indicates different interface version, not backward compatible if changed.
27:16	MINOR	Minor version indicates expanded functionality, backward compatible.
15:0	STEP	Step indicates HW change which is not intented to impact SW compatibility.

0x1B080010 DIM_C11_DIM_CA_PAD_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0xE0222240

The DIM_CA_PAD_CFG0 register configures DIM_CA_PAD_CFG0.

DIM_C11_DIM_CA_PAD_CFG0

Bits	Name	Description
31	CA_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
30	CA_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1 :DDR2 modes (default) 1'b0 : DDR1 modes
29	CA_LV_MODE	Mode pin for high/low voltage regime
28	CA_ODT_ENA	Enable bit for on-die termination
27:26	CA_ODT	Impedance control bit settings for on-die termination
25:24	CA_PULL	Input pull control 2'b00 : no pull (default) 2'b01 : pull down 2'b10 : keeper 2'b11 : pull up
21:20	CA_NSLEW	Slew rate control bits for output path NMOS
17:16	CA_PSLEW	Slew rate control bits for output path PMOS
13:12	CA_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	CA_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	CA_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CA_ROUT	Impedance control bit settings for output driver
2:0	CA_DCC	Duty cycle correction bits for output path

0x1B080014 DIM_C11_DIM_CA_PAD_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0xE0220440

The DIM_CA_PAD_CFG1 register configures DIM_CA_PAD_CFG1.

DIM_C11_DIM_CA_PAD_CFG1

Bits	Name	Description
31	CK_DDR_MODE1	Mode select for DDR (when hp_mode = 1'b1) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes

DIM_C11_DIM_CA_PAD_CFG1 (cont.)

Bits	Name	Description
30	CK_DDR_MODE0	Mode select for DDR (when hp_mode = 1'b0) 1'b1 : DDR2 modes (default) 1'b0 : DDR1 modes
29	CK_LV_MODE	Mode select for high/low voltage regime
28	CK_CMFB_ENA	Common mode feedback loop enable
27	CK_ODT_ENA1	Enable bit for on-die termination (when hp_mode = 1'b1)
26	CK_ODT_ENA	Enable bit for on-die termination (when hp_mode = 1'b0) Bit field name missing '0' for APQ8064 SW compatibility.
25:24	CK_ODT	Impedance control bit settings for on-die termination
21:20	CK_NSLEW	Slew rate control bits for output path NMOS
17:16	CK_PSLEW	Slew rate control bits for output path PMOS
13	CK_CUR_MODE1	Current/Voltage mode selection (when hp_mode = 1'b1) 1'b1 : Current mode 1'b0 : Voltage mode (default)
12	CK_CUR_MODE0	Current/Voltage mode selection (when hp_mode = 1'b0) 1'b1 : Current mode 1'b0 : Voltage mode (default)
10:8	CK_I_DRV	Control bit settings for bias current
7	CK_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CK_ROUT	Impedance control bit settings for output driver
2:0	CK_DCC	Duty cycle correction bits for output path

0x1B080018 DIM_C11_DIM_CA_PAD_CFG2

Type: Read/Write
Clock: HCLK
Reset State: 0x1000000A

The DIM_CA_PAD_CFG2 register configures DIM_CA_PAD_CFG2.

DIM_C11_DIM_CA_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused

DIM_C11_DIM_CA_PAD_CFG2 (cont.)

Bits	Name	Description
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x1B08001C DIM_C11_DIM_CA_PAD_CFG3

Type: Read/Write
Clock: HCLK
Reset State: 0x00300000

The DIM_CA_PAD_CFG3 register configures DIM_CA_PAD_CFG3.

DIM_C11_DIM_CA_PAD_CFG3

Bits	Name	Description
31:30	CS_N_IE	
29:28	CS_N_OE	
25	CK_IE	
24	CK_OE	
23:22	CKE_IE	
21:20	CKE_OE	
19:10	CA_IE	
9:0	CA_OE	

0x1B080020 DIM_C11_DIM_CA_PAD_CFG4

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_PAD_CFG4 register configures DIM_CA_PAD_CFG4.

DIM_C11_DIM_CA_PAD_CFG4

Bits	Name	Description
31:30	CS_N_OE_DYN_ENA	Enable dynamic control of CS_N OE 1'b1: Dynamic control enabled and CS_N_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CS_N OE gated by CA_PAD_CFG3 bits **NOTE** This register should not be set in external loopback mode since it will change the IE contol source.
29:28	CS_N_OE_DYN	Dynamic OE control for each of the CS_N outputs, OR-ed with common controller OE.
25	RESERVED_1	
24	RESERVED_2	
23:22	CKE_OE_DYN_ENA	Enable dynamic control of CKE OE 1'b1: Dynamic control enabled and CKE_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CKE OE gated by CA_PAD_CFG3 bits
21:20	CKE_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.
19:10	CA_OE_DYN_ENA	Enable dynamic control of CA OE 1'b1: Dynamic control enabled and CA_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CA OE gated by CA_PAD_CFG3 bits
9:0	CA_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.

0x1B080030 DIM_C11_DIM_CA_CDC_CTLR_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG0 register configures DIM_CA_CDC_CTLR_CFG0.

DIM_C11_DIM_CA_CDC_CTLR_CFG0

Bits	Name	Description
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration

DIM_C11_DIM_CA_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration state machine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, RO(0.67 * 1024) = 686, hence program TMUX_CHAR = 11'h2AE

0x1B080034 DIM_C11_DIM_CA_CDC_CTLR_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CTLR_CFG1 register configuresDIM_CA_CDC_CTLR_CFG1.

DIM_C11_DIM_CA_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.

DIM_C11_DIM_CA_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
22:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 3'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used.
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1.
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1.
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1.
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1.

0x1B080038 DIM_C11_DIM_CA_CDC_CAL_TIMER_CFG0

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG0 register configures DIM_CA_CDC_CAL_TIMER_CFG0.

DIM_C11_DIM_CA_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1 : Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.

DIM_C11_DIM_CA_CDC_CAL_TIMER_CFG0 (cont.)

Bits	Name	Description
16	TIMER_ENA	1'b1 : Enables 32 KHz sleep clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x1B08003C DIM_C11_DIM_CA_CDC_CAL_TIMER_CFG1

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG1 register configures DIM_CA_CDC_CAL_TIMER_CFG1.

DIM_C11_DIM_CA_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1 : Enables reference clock based periodic autocalibration timer. 1'b0 : Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x1B080040 DIM_C11_DIM_CA_CDC_REFCOUNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_REFCOUNT_CFG register configures DIM_CA_CDC_REFCOUNT_CFG.

DIM_C11_DIM_CA_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.

DIM_C11_DIM_CA_CDC_REFCOUNT_CFG (cont.)

Bits	Name	Description
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x1B080044 DIM_C11_DIM_CA_CDC_COARSE_CAL_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The register DIM_CA_CDC_COARSE_CAL_CFG configures DIM_CA_CDC_COARSE_CAL_CFG.

DIM_C11_DIM_CA_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	Unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x1B080048 DIM_C11_DIM_CA_CDC_RSVD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_RSVD_CFG register configures DIM_CA_CDC_RSVD_CFG.

DIM_C11_DIM_CA_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x1B08004C DIM_C11_DIM_CA_CDC_OFFSET_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_OFFSET_CFG register configures DIM_CA_CDC_OFFSET_CFG.

DIM_C11_DIM_CA_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x1B080050 DIM_C11_DIM_CA_CDC_DELAY_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_DELAY_CFG register configures DIM_CA_CDC_DELAY_CFG.

DIM_C11_DIM_CA_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the state machine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x1B080054 DIM_C11_DIM_CA_CDC_SW_MODE_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_SW_MODE_CFG register configures DIM_CA_CDC_SW_MODE_CFG.

DIM_C11_DIM_CA_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x1B080058 DIM_C11_DIM_CA_CDC_TEST_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures DIM_CA_CDC_TEST_CFG.

DIM_C11_DIM_CA_CDC_TEST_CFG

Bits	Name	Description
3	CDC_SEL_DDA_TEST	1'b1: Test outputs from the main DDA are connected to the CDC test ports 1'b0: Test outputs from the slave DDA are connected to the CDC test ports
2	CDC_OSC_TEST_EN	1'b1: A divided version of the oscillator clock is made available on CDC test port OSC_TEST. 1'b0 : Raw oscillator clock frequency is made available on CDC test port OSC_TEST if CDC_TEST_EN register is set.
1	CDC_TEST_EN	1'b1: Enables CDC test outputs. Oscillator clock on OSC_TEST if CDC_OSC_TEST_EN = 0, CDC input on CDC_TEST_OUT1, CDC output on CDC_TEST_OUT2 if CDC_OUT_ONTEST2 = 1 1'b0 : CDC test ports disabled
0	CDC_OUT_ONTEST2	1'b1: CDC output is made available on CDC_TEST_OUT2 if CDC_TEST_EN = 1 1'b0: CDC input is available on CDC_TEST_OUT2 if CDC_TEST_EN = 1

0x1B08005C DIM_C11_DIM_CA_CDC_SW_OVRD_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_TEST_CFG register configures DIM_CA_CDC_SW_OVRD_CFG.

DIM_C11_DIM_CA_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x1B080070 DIM_C11_DIM_CA_CDC_STATUS0

Type: Read
Clock: HCLK
Reset State: 0x0000000C

The DIM_CA_CDC_STATUS0 register configures DIM_CA_CDC_STATUS0.

DIM_C11_DIM_CA_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. **NOTE** The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0 : DA0 is selected 1'b1 : DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x1B080074 DIM_C11_DIM_CA_CDC_STATUS1

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS1 register configures DIM_CA_CDC_STATUS1.

DIM_C11_DIM_CA_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid of CALIBRATION_DONE status bit is set.

DIM_C11_DIM_CA_CDC_STATUS1 (cont.)

Bits	Name	Description
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x1B080078 DIM_C11_DIM_CA_CDC_STATUS2

Type: Read
Clock: HCLK
Reset State: 0x10331033

The DIM_CA_CDC_STATUS2 register configures DIM_CA_CDC_STATUS2.

DIM_C11_DIM_CA_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x1B08007C DIM_C11_DIM_CA_CDC_STATUS3

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_CDC_STATUS3 register configures DIM_CA_CDC_STATUS3.

DIM_C11_DIM_CA_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x1B0800E0 DIM_C11_DIM_CA_IOC_CTLR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures DIM_CA_IOC_CTLR_CFG.

DIM_C11_DIM_CA_IOC_CTLR_CFG

Bits	Name	Description
31	CAL_NOW	SW: RW Set this bit to 1'b1 will cause the IO calibration starts immediately. This bit has to be cleared after the calibration has been done. 0x0: no-op 0x1: start IOCal immediately
30	IO_CAL_AUTO	Periodic auto calibration mode. Writing a '1' to this bit will trigger periodic auto calibration with the period specified in IOC_CTLR_TIMER_CFG register. If '0', it disables the timer based on sleep clock. Note that this does not impact the timer based on fixed frequency clock (ffclk).
29	IO_CAL_FF_TIMER_EN	Fixed Frequency Timer mode. Writing a '1' to this bit will set the timer running off tcxo clock. If '0', it disables the timer based on fixed frequency clock.
28	IO_CAL_BANDGAP_DYN_CTRL	Enable dynamic control of the bandgap element: This low-power feature is only available on x2 core. Bit reserved for x0/x1 cores. 1'b1: Enabled - bandgap element turned on only during IO calibration or when current mode is enabled. 1'b0: Disabled (default) - bandgap element turned on/off statically based on BANDHGAP_ENA0/1 bits.
25	SW_FFCLK_ON	Writing a '1' to this field will turn on the fixed frequency (xo) clock on signal
24	LV_MODE	SW: RW Enable/Disable low-voltage mode (MIF2 pad only) 0x0: 1.8V 0x1: non-1.8V
20:16	MARGIN_LOAD	SW: RW If the difference between the current IOCal result is greater than the last result by the number specified here, then the IOCal controller will request value update to DDR controller. 0x0: always update
13:12	IMP_SEL	SW: RW Select bits to choose which impedance to calibrate to

DIM_C11_DIM_CA_IOC_CTLR_CFG (cont.)

Bits	Name	Description
10	PN_SEL_CA	SW: RW Enables loading of HW calibrated values for ca pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on ca pads when it is time to update the pads with the new value.
9	PN_SEL_DATA	SW: RW Enables loading of HW calibrated values for dq/dqs pads. Writing a ’1’ to this bit would let the IOCAL to request traffic stall on data pads when it is time to update the pads with the new value.
8	CAL_USE_LAST	SW: RW Select the initial value to start IO calibration 0x0: start from a fixed values specified in IOC_CTLR_PNCNT_CFG (default) 0x1: start from previous IOCal PNCNT results
6:4	SAMPLE_POINT	SW: RW Specify number of samples per measure point 0x0: 1 0x1: 3 0x2: 5 0x3: 7 0x4: 9 0x5: 11 0x6: 13 0x7: 15
3	DDR_MODE1	
2	DDR_MODE0	
1	BANDGAP_ENA1	SW: RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable
0	BANDGAP_ENA0	SW: RW Pin to enable bandgap independent of diff_ctl 0x0: disable 0x1: enable

0x1B0800E4 DIM_C11_DIM_CA_IOC_CTLR_PNCNT_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures DIM_CA_IOC_CTLR_CFG.

This register contains the initial value for the next calibration to start from. Softwave can set the hardware to either start calibration from a fixed value or from previous results. If software chooses to use fixed value by setting CAN_USE_LAST in register IOC_CTLR_CFG to be 0, then the values in this register will be used.

DIM_C11_DIM_CA_IOC_CTLR_PNCNT_CFG

Bits	Name	Description
12:8	NCNT_INIT_CSR	SW : RW Starting PCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted
4:0	PCNT_INIT_CSR	SW : RW Starting NCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted

0x1B0800E8 DIM_C11_DIM_CA_IOC_CTLR_TIMER_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_CFG register configures DIM_CA_IOC_CTLR_TIMER_CFG.

DIM_C11_DIM_CA_IOC_CTLR_TIMER_CFG

Bits	Name	Description
31:16	TIMER_PERIOD	SW : RW Recalibration Period. The period is measured in timer clock cycles. Typically it's a 32kHz clock. The minimum period that can be programmed is 3. 0,1,2: Invalid values
15:0	FF_TIMER_PERIOD	SW : RW Recalibration Period for the timer running of xo clock. 0x0: Invalid

0x1B0800EC DIM_C11_DIM_CA_IOC_CTLR_TIMER_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_TIMER_STATUS register configures DIM_CA_IOC_CTLR_TIMER_STATUS.

DIM_C11_DIM_CA_IOC_CTLR_TIMER_STATUS

Bits	Name	Description
15:0	TIMER_STATUS	Current Auto Calibration Timer value. As this register is written in sleep clock domain and read in xo clock domain and no hardware synchronization in place, It is required by the software to read this register 4 times to get the correct value.

0x1B0800F0 DIM_C11_DIM_CA_IOC_CTLR_CHAR_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x00000000

The DIM_CA_IOC_CTLR_ CHAR_CFGregister configures IDIM_CA_IOC_CTLR_CHAR_CFG.

This register is used by hardware verification software only. It provides a mechanism to allow software to bypass the internal calibration state machine and directly access the IOCAL pad inputs.

DIM_C11_DIM_CA_IOC_CTLR_CHAR_CFG

Bits	Name	Description
16	SM_BYP_ENA	SW: RW Characterization Bypass Path Enable 0x0: Non-bypass: State Machine Controls IOCAL pad inputs (default) 0x1: bypass: This register controls IOCal pad inputs
15	SM_BYP_N_ENA	SW: RW IO CAL Characterization n_enable: 0x0: de-asserted (default) 0x1: asserted
12:8	SM_BYP_NCNT	SW: RW IO CAL Characterization ncnt value. 0x0: count 0 (default)
7	SM_BYP_P_ENA	SW: RW IO CAL Characterization p_enable: 0x0: de-asserted (default) 0x1: asserted
4:0	SM_BYP_PCNT	SW: RW IO CAL Characterization pcnt value. 0x0: count 0 (default)

0x1B0800F4 DIM_C11_DIM_CA_IOC_CTLR_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00011010

The DIM_CA_IOC_CTLR_STATUS register configures DIM_CA_IOC_CTLR_STATUS.

DIM_C11_DIM_CA_IOC_CTLR_STATUS

Bits	Name	Description
31	INIT_IOCAL_DONE	SW: R The very first IO Calibration is finished This bit is stiky. once it becomes 1'b1 until software writes it back to 0. 0x0: Init-cal never done 0x1: Init-cal finished
18	IOCAL_DONE_D	SW: R IO Calibration is finished 0x0: in progress 0x1: finished
17	IOCAL_BUSY	SW: R Status of calibration State machine 0x0: idle 0x1: busy
16	SYNC_COMP	SW: R comp value from IOCal pad
12:8	NCNT_HOLD	SW: R Current NCNT value used
4:0	PCNT_HOLD	SW: R Current PCNT value used

0x1B080100 DIM_C11_DIM_CA_CA_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CA_IOC_SLV_CFG register configures DIM_CA_CA_IOC_SLV_CFG.

This register specifies the overriding pcnt and ncnt values. Overriding mode is controlled by PNCNT_HW_LOAD_EN bit in this register.

DIM_C11_DIM_CA_CA_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW: RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW: RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	Controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW: RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	Controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW: RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1B080104 DIM_C11_DIM_CA_CA_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CA_IOC_SLV_STATUS register configures DIM_CA_CA_IOC_SLV_STATUS.

DIM_C11_DIM_CA_CA_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

0x1B080110 DIM_C11_DIM_CA_CK_IOC_SLV_CFG

Type: Read/Write
Clock: HCLK
Reset State: 0x10100000

The DIM_CA_CK_IOC_SLV_CFG register configures DIM_CA_CK_IOC_SLV_CFG.

DIM_C11_DIM_CA_CK_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: override (default) 0x1: auto cal
28:24	NCNT_SW_VAL	SW : RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW: RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	Controls if the NOFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
12:8	NCNT_SW_OFFSET	SW: RW The offiset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)
7	PCNT_OFFSET_SIGN	Controls if the POFFSET is added for subtracted on top of calibration result 0x0: Add 0x1: Subtract
4:0	PCNT_SW_OFFSET	SW: RW The offiset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: count 0 (default)

0x1B080114 DIM_C11_DIM_CA_CK_IOC_SLV_STATUS

Type: Read
Clock: HCLK
Reset State: 0x00001010

The DIM_CA_CK_IOC_SLV_STATUS register configures DIM_CA_CK_IOC_SLV_STATUS.

DIM_C11_DIM_CA_CK_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

8 Fabrics Registers

8.1 Overview

Table 8-1 Fabrics Bases

Base Name	Parent	Address
SFAB_FABRIC_ID_REVISION_REG0	SFAB_BASE	0x01300000
SFAB_M2VMT_M2VMRv_2	SFAB_BASE	0x01300000
AFAB_FABRIC_ID_REVISION_REG0	AFAB_BASE	0x01400000
AFAB_M2VMT_M2VMRv_0	AFAB_BASE	0x01400000
DAY_CFG_FABRIC_ID_REVISION_REG0	DAY_CFG_BASE	0x01500000
FABRIC_ID_REVISION_REG0	FABRIC_MMSS_BASE	0x05200000

8.2 System Fabric Registers (0x01300000 SFAB_BASE)

This section contains the System Fabric registers.

0x01300000 SFAB_FABRIC_ID_REVISION_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x2C40

This register contains the upper 16-bits of the core ID and revision number and contains the Major/Minor Revision information as well as the site ID where the core was developed.

SFAB_FABRIC_ID_REVISION_REG0

Bits	Name	Description
15:13	MAJ	SW: R Major Revision 0x1: Initial Release
12:10	MIN	SW: R Minor Revision 0x3: APQ8064
9:6	SITE	SW: R Site ID 0x1: RTP
5:0	RESERVED_BITS_5_0	

0x01300004 SFAB_FABRIC_ID_REVISION_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0001

This register contains the lower 16-bits of the core ID and revision number and contains the Core ID number.

SFAB_FABRIC_ID_REVISION_REG1

Bits	Name	Description
15:8	RESERVED_BITS_3_2	
7:0	ID	SW : R Core ID 0x1: FABRIC

0x01300008 SFAB_FABRIC_CONFIGURATION_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0002

This register defines the operating frequency, power down mode for the performance monitor, as well as the decode error and performance monitor cycle counter interrupts. It also has the control bit to globally disable redirection in Fabric.

The ISYND bits contain the interrupt syndrome. If more than one interrupt type occurs, more than one bit will be set. For example, if a decode error occurs and the performance monitor cycle-counter expires, the ISYND field will contain the value 3'b101. Performance monitor interrupts are only generated when the interrupt enable (PMIE) bit is set for the interrupt type.

If multiple decode errors occur, only the first error is recorded. If multiple decode errors occur at the same clock cycle, only a single error is considered, with Master 0 having the highest priority and Master 14 the lowest priority.

The determination of the time an error is recorded in the Fabric Error Status Register (FESR) is based on the following criteria:

For Reads: When Mn_RLAST is asserted.

For Writes: When Mn_BRESP is asserted.

Therefore, if two different masters make requests with invalid addresses to the FABRIC, the master which receives the RLAST or BRESP first for the invalid transaction, is recorded in the FESR. See FABRIC_ERROR_STATUS_REG_1 for information that is captured when a decode error occurs. The address of the request which caused a decode error is captured in the FABRIC_ERROR_UPPER_ADDR_REG and the FABRIC_ERROR_LOWER_ADDR_REG. If they happen simultaneously, the master priority is used to resolve which error is recorded in a fixed priority scheme. Master 0 has highest priority and Master 31 has the lowest priority.

NOTE If the master does not have RREADY or BREADY asserted by default (i.e., it is not able to receive all responses for outstanding requests and may throttle the FABRIC), the FABRIC_Interrupt generation may precede the return of the last read data beat or the write response.

To clear the interrupt, the ISYND bits are required to be written to 3'b000.

The performance monitor event/tenure overflow condition is indicated when the ISYND value is 010. An event overflow occurs when the event counter has reached its maximum value. A tenure overflow condition occurs:

When the tenure counter has reached its maximum value

OR

More than 16 tenures are outstanding, since the performance monitor implements only 16 counters for tenure tracking. Note that if the tenure overflows, values read from the performance monitors

for min/max/total/last tenure will no longer be valid as values recorded after the overflow will be incorrect.

SFAB_FABRIC_CONFIGURATION_REG

Bits	Name	Description
15:7	RESERVED_BITS_15_7	Reserved Bits
6:4	ISYND	SW : RW Interrupt syndrome* 0x0: No/Clear (interrupt) 0x1: Cycle counter expired (Perfmon) 0x2: Event/tenure overflow (Perfmon) 0x4: Decode error detected 0x5: MPU Error 0x6: Timeout Error (SPB)
3	RESERVED_BITS_3	
2	CSPDM	SW:RW CSR block power down mode 0x0: Disable Dynamic Clock Gating 0x1: Enable Dynamic Clock Gating
1	PPDM	SW : RW Performance monitor power down/disable mode 0x0: Monitor Enabled 0x1: Monitor Disabled (Gates clocks to performance monitor registers)
0	PMIE	SW : RW Perfmon interrupt enable

0x01300100+4*n SFAB_FABRIC_SEGMENT_UADDR_0_REG_n, n=[0..14]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Based on parameters passed

This register defines the upper and lower address ranges for a particular slave segment (n).If this slave segment (n) is a link then this register defines the first address range for the slave link.

NOTE A segmentation address register is required for each slave segment supported by the FABRIC.The reset values for each of these registers is set by top-level input ports which are strapped to a value determined from a configuration file

The address decode range is based on the value of the SEG_ADDR_DECODE_SHIFT & NUM_ADDR_DECODE_BITS parameters:

A request is generated to the slave segment if the address falls within the following range:

SLA[(NUM_ADDR_DEC_BITS-1):0]

<= ADDR[MSB-(SEG_ADDR_DECODE_SHIFT):MSB-((NUM_ADDR_DEC_BITS-1)+SEG_ADDR_DECODE_SHIFT)]

<= SUA[(NUM_ADDR_DEC_BITS-1):0]

and the slave segment enable (SSE) bit is set and the slave is present (Sn_NOTPRESENT = 0).

SFAB_FABRIC_SEGMENT_UADDR_0_REG_n

Bits	Name	Description
15:10	RESERVED_15_10	
9:0	SUA	SW: RW Segment 'n' upper address (based on parameter- up to 10-bits)

0x01300200+4*n SFAB_FABRIC_SEGMENT_LADDR_0_REG_n, n=[0..14]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Based on parameters passed

This register defines the upper and lower address ranges for a particular slave segment (n). If this slave segment (n) is a link then this register defines the first address range for the slave link.

NOTE A segmentation address register is required for each slave segment supported by the FABRIC.The reset values for each of these registers is set by top-level input ports which are strapped to a value determined from a configuration file

The address decode range is based on the value of the SEG_ADDR_DECODE_SHIFT & NUM_ADDR_DECODE_BITS parameters:

A request is generated to the slave segment if the address falls within the following range:

SLA[(NUM_ADDR_DEC_BITS-1):0]

<= ADDR[MSB-(SEG_ADDR_DECODE_SHIFT):MSB-((NUM_ADDR_DEC_BITS-1)+SEG_ADDR_DECODE_SHIFT)]

<= SUA[(NUM_ADDR_DEC_BITS-1):0]

and the slave segment enable (SSE) bit is set and the slave is present (Sn_NOTPRESENT = 0).

SFAB_FABRIC_SEGMENT_LADDR_0_REG_n

Bits	Name	Description
15	SSE	SW: RW Slave segment n enable

13:10	RESERVED_13_10	
9:0	SLA	SW: RW Segment n lower address (based on parameter- up to 10-bits)

0x01300300+4*n SFAB_FABRIC_SEGMENT_UADDR_1_REG_n, n=[0..14]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Based on parameters passed

This register defines the upper address for a particular slave link segment (n) if it's a link. A link segment can have up to two separate address ranges. This register defines the second address range for the slave link.

NOTE A link segmentation address register is required for each slave link segment supported by the FABRIC.The reset values for each of these registers is set by top-level input ports which are strapped to a value determined from a configuration file

The address decode range is based on the value of the SEG_ADDR_DECODE_SHIFT & NUM_ADDR_DECODE_BITS parameters:

A request is generated to the slave segment if the address falls within the following range:

SLA[(NUM_ADDR_DEC_BITS-1):0]

<= ADDR[MSB-(SEG_ADDR_DECODE_SHIFT):MSB-((NUM_ADDR_DEC_BITS-1)+SEG_ADDR_DECODE_SHIFT)]

<= SUA[(NUM_ADDR_DEC_BITS-1):0]

and the slave segment enable (SSE) bit is set and the slave is present (Sn_NOTPRESENT = 0).

0x01301000+0x0100*n+4*m SFAB_FABRIC_m_WEIGHTING_REG_n, m=[0..14], n=[0..14]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

The values programmed into this register determine the Tier 2 weight for each master under the Tier Based Arbitration Scheme.

NOTE This register is required for each master and each slave segment supported by the FABRIC .

SFAB_FABRIC_m_WEIGHTING_REG_n

Bits	Name	Description
15:8	RESERVED_BITS_15_8	
7:0	M_M_W	SW: RW Master 'm' Weight

0x01302000+0x0100*n+4*m SFAB_FABRIC_m_QOS_REG_n, m=[0..3], n=[0..14]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

The values programmed into this register determine the Tier 1 weight for each master under the Tier Based Arbitration Scheme. Only 4 master ports can be configured as Tier 1. The QMC bits are used to configure a master port as Tier 1.

NOTE If more than one of these QOS Control registers are set to the same master port, unpredictable behavior will occur.

Set-up procedure:

1. Set the QOS enable bit.
2. Set the arbitration mode to Scheduled Access Time in the FABRIC arbitration configuration register FACR (See FABRIC_ARBITRATION_CONTROL_REG_n, n=[0..14]).
3. Configure the master port that needs to be set to Tier1.
4. Set the appropriate number of tokens/weight.
5. Set the MLT value (default is zero clock cycles).

NOTE Four of these registers are required for each slave segment supported by the FABRIC .

0x01303300+4*n SFAB_FABRIC_MASTER_INTERFACE_REG_n, n=[0..14]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0084

This register controls the following master port attributes:

- whether the master request priority signals are used by the internal arbiter
- the redirection of cacheable coherent requests
- write gathering on AXI
- write packing on AHB

This register also controls a particular master's halt interface and for AHB master interfaces, it enables write packing functionality for posted writes.

When the MHR bit is set, the FABRIC_MnHALTREQ signal is asserted. The MHA and MHI fields capture the state of the FABRIC_MnHALTACK and FABRIC_MnIDLE signals at every clock cycle.

NOTE A register is implemented for each master interface supported by the FABRIC

SFAB_FABRIC_MASTER_INTERFACE_REG_n

Bits	Name	Description
15	RESERVED_BIT_15	
14	OWGM	SW : RW Enable optimized write gathering mode. SW should disable for AXI Ports
13	DBW	SW : RW Disable Bufferable writes. Treats Bufferable writes as Non Bufferable writes (AHB only)
12	PRIEN	SW : RW Enable Request Priority Lets the slave way arbiter consider the master request priority AREQPRIORITY[1:0] signal that is driven with each transaction
11	RCOSH	SW : RW Redirect Cacheable-outer-sharable Governs whether or not cacheable accesses that are outer-sharable are redirected to the Scorpion-MP L2 slave port
10	RCISH	SW : RW Redirect Cacheable-inner-sharable Governs whether or not cacheable accesses that are inner-sharable are redirected to the Scorpion-MP L2 slave port
9	RCNSH	SW : RW Redirect Cacheable-non-sharable Governs whether or not cacheable accesses that are non-sharable are redirected to the Scorpion-MP L2 slave port
8	CRE	SW : RW Enable redirection of cachable coherent requests

SFAB_FABRIC_MASTER_INTERFACE_REG_n (cont.)

Bits	Name	Description
7	WGE	SW : RW Write Gathering Enable (AXI only)
6	WPE	SW : RW Write Packing Enable (AHB Only) When enabled, the master port will pack indeterminate INCR burst writes, if disabled, the master port will break indeterminate INCR burst writes into SINGLES. 0x1: Enable 0x0: Disable
5:4	IIIW	SW : RW Bufferable Indeterminate INCR WR packing (AHB only): 0x0: break into INCR4 0x1: break into INCR8 0x3: break into INCR16
3	MID	SW : RW Master Interface Disable. SW diable of Master interface.
2	MI	SW : R Master Idle. Indicates that the Master does not have any pending bus transactions. For AHB busses, this bit is set internally by the FABRIC AHB Master port. For AXI masters, this value is driven by the master that is connected to the port.
1	MHA	SW : R Master halt acknowledge. Only valid for AXI masters. This bit is 0 on AHB master ports.
0	MHR	SW : RW Master halt request. Only valid for AXI masters. Writing this bit has no effect for AHB masters.

0x01303500 SFAB_FABRIC_TEST_INTERFACE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls:

- the grouping of signals that are driven out on the test bus (FABRIC_TESTBUS[31:0])
- Selection of MISR slave way and channel input

MEN: Selects which MISR output is driven onto the test-bus. For example, setting MEN to 00010 selects the MISR in slave segment 2. The MEN bits are only valid when the testmode (TMODE) is set to 000000 and test-enable is set (TEN)

TMODE: Selects the various test-bus modes

TEN: Test-enable. Must be set for values to be driven onto the test-bus OR for MISR to be enabled.

0x01303600+4*n SFAB_FABRIC_MASTER_CLOCK_HALT_REG_n, n=[0..14]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register is used to enable the low power mode clock halt & change functionality within the FABRIC master ports. To enable the clock halting functionality, the clock halt enable bit (CHTEN) needs to be set. The hysteresis timer value is a 10-bit timer (running on FCLK) value that is set using the CHTMR bits. The clock change and MODE bits are used to change the interface between sync/async/isosync modes.

NOTE A register is implemented for each master interface supported by the FABRIC .

SFAB_FABRIC_MASTER_CLOCK_HALT_REG_n

Bits	Name	Description
15	CHTEN	SW : RW Clock halt enable. Enables clock halt functionality for this port.
14	CCDONE	SW : RW Clock mode change completed/done
13	CCACK	SW : R Clock mode change acknowledge
12	CCREQ	SW : RW Clock mode change request
11:10	MODE	SW : RW Master clock interface mode 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC port clk slower. 0x3: ISOSYNC port clk faster.
9:0	CHTMR	SW : RW Master clock halt timer: # clock cycles of inactivity that should pass before clock is halted

0x01303800+4*n SFAB_FABRIC_SLAVE_CLOCK_HALT_REG_n, n=[0..14]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register is used to enable the low power mode clock halt & change functionality within the FABRIC slave ways. To enable the clock halting functionality, the clock halt enable bit (CHTEN) needs to be set. The hysteresis timer value is a 10-bit timer (running on FCLK) value that is set using the CHTMR bits. The clock change and MODE bits are used to change the interface between sync/async/isosync modes.

NOTE A register is implemented for each slave interface supported by the FABRIC .

0x013038F8 SFAB_FABRIC_MONITOR_ENABLE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the trigger selection and enabling of event and cycle counters.

NOTE When PTRIG is set to use any of the external trigger signals, the external triggers incur a 2 cycle delay from the positive edge assertion of the signal to when the actual counters are enabled in the performance monitor. This allows synchronization of the external signals into the FABRIC clock domain.

SFAB_FABRIC_MONITOR_ENABLE_REG

Bits	Name	Description

0x01303950 SFAB_FABRIC_MONITOR_CYCLE_COUNT_UPPER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the performance monitor cycle counter.

SFAB_FABRIC_MONITOR_CYCLE_COUNT_UPPER_REG

Bits	Name	Description
15:0	UCC	SW : RW MSB cycle count value The cycle count value is decremented once per FABRIC clock. The counter stops decrementing once the CC value equals 32:h0.

0x01303954 SFAB_FABRIC_MONITOR_CYCLE_COUNT_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the performance monitor cycle counter. If SW requires that the values when read do not change, when it reads this register, the value for all 32 bits of the cycle counter is stored. This allows for SW to read the lower reg and have the value match the exact cycle in which the upper reg was read.

SFAB_FABRIC_MONITOR_CYCLE_COUNT_LOWER_REG

Bits	Name	Description
15:0	LCC	SW : RW LSB cycle count value The cycle count value is decremented once per FABRIC clock. The counter stops decrementing once the CC value equals 32:h0.

0x01303958 SFAB_FABRIC_MONITOR_EVENT_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 0. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_LOWER_REG0

Bits	Name	Description
15:0	ECLT0	SW : RW Total # events (lower 16-bit value)

0x0130395C SFAB_FABRIC_MONITOR_EVENT_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 0. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_UPPER_REG0

Bits	Name	Description
15:0	ECUT0	SW : RW Total # events (upper 16-bit value)

0x01303960 SFAB_FABRIC_MONITOR_EVENT_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 1. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_LOWER_REG1

Bits	Name	Description
15:0	ECLT1	SW : RW Total # events (lower 16-bit value)

0x01303964 SFAB_FABRIC_MONITOR_EVENT_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 1. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_UPPER_REG1

Bits	Name	Description
15:0	ECUT1	SW : RW Total # events (upper 16-bit value)

0x01303968 SFAB_FABRIC_MONITOR_EVENT_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 2. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_LOWER_REG2

Bits	Name	Description
15:0	ECLT2	SW : RW Total # events (lower 16-bit value)

0x0130396C SFAB_FABRIC_MONITOR_EVENT_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 2. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_UPPER_REG2

Bits	Name	Description
15:0	ECUT2	SW : RW Total # events (upper 16-bit value)

0x01303970 SFAB_FABRIC_MONITOR_EVENT_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 3. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_LOWER_REG3

Bits	Name	Description
15:0	ECLT3	SW : RW Total # events (lower 16-bit value)

0x01303974 SFAB_FABRIC_MONITOR_EVENT_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 3. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_UPPER_REG3

Bits	Name	Description
15:0	ECUT3	SW : RW Total # events (upper 16-bit value)

0x01303978 SFAB_FABRIC_MONITOR_EVENT_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 4. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_LOWER_REG4

Bits	Name	Description
15:0	ECLT4	SW : RW Total # events (lower 16-bit value)

0x0130397C SFAB_FABRIC_MONITOR_EVENT_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 4. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_UPPER_REG4

Bits	Name	Description
15:0	ECUT4	SW : RW Total # events (upper 16-bit value)

0x01303980 SFAB_FABRIC_MONITOR_EVENT_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 5. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_LOWER_REG5

Bits	Name	Description
15:0	ECLT5	SW : RW Total # events (lower 16-bit value)

0x01303984 SFAB_FABRIC_MONITOR_EVENT_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 5. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_UPPER_REG5

Bits	Name	Description
15:0	ECUT5	SW : RW Total # events (upper 16-bit value)

0x01303988 SFAB_FABRIC_MONITOR_EVENT_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 6. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_LOWER_REG6

Bits	Name	Description
15:0	ECLT6	SW : RW Total # events (lower 16-bit value)

0x0130398C SFAB_FABRIC_MONITOR_EVENT_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 6. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_UPPER_REG6

Bits	Name	Description
15:0	ECUT6	SW : RW Total # events (upper 16-bit value)

0x01303990 SFAB_FABRIC_MONITOR_EVENT_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 7. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_LOWER_REG7

Bits	Name	Description
15:0	ECLT7	SW : RW Total # events (lower 16-bit value)

0x01303994 SFAB_FABRIC_MONITOR_EVENT_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 7. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_UPPER_REG7

Bits	Name	Description
15:0	ECUT7	SW : RW Total # events (upper 16-bit value)

0x013039A4 SFAB_FABRIC_TRIGGER_CONFIGURATION_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register configures the interface in which the trigger comparison is done on the address channel.

TAMS: Selects one of the 32 interfaces from which the address channel transfer qualifiers are used to enable trigger matching.

SFAB_FABRIC_TRIGGER_CONFIGURATION_REG

Bits	Name	Description
15:7	RESERVED_BITS15_6	

SFAB_FABRIC_TRIGGER_CONFIGURATION_REG (cont.)

Bits	Name	Description
6	TRGEN	SW : RW Trigger enable 1'b0 -disabled 0x1: enabled

SFAB_FABRIC_TRIGGER_CONFIGURATION_REG (cont.)

Bits	Name	Description

0x013039B8 SFAB_FABRIC_TRIGGER_REG_3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the address channel transfer qualifiers which are used as comparison for the trigger feature of the performance monitor function.

SFAB_FABRIC_TRIGGER_REG_3

Bits	Name	Description
15:12	RESERVED_BITS15_12	
11	AOOOWR	SW : RW Out-of-order write
10	AOOORD	SW : RW Out-of-order read
9:3	ATID	SW : RW Address TID (If ATID is less than 7 bits, the upper bits must be set to 0)
2	AFULL	SW : RW Full Transfer
1	RESERVED_BIT1	
0	APROTNS	SW : RW Protection level

0x013039BC SFAB_FABRIC_TRIGGER_REG_4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the address channel transfer qualifiers which are used as comparison for the trigger feature of the performance monitor function.

SFAB_FABRIC_TRIGGER_REG_4

Bits	Name	Description
15:12	ATYPE	SW : RW Memory type attributes
11:10	ALOCK	SW : RW Lock type
9	RESERVED_BITS9	
8	ABURST	SW : RW Burst type
7:5	ASIZE	Burst size
4:1	ALEN	Burst length
0	AWRITE	Burst direction

0x013039C0 SFAB_FABRIC_TRIGGER_MASK_REG_0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR0.

SFAB_FABRIC_TRIGGER_MASK_REG_0

Bits	Name	Description
15:0	FTTR0_MASK	SW : RW Bit mask field for FTTR0 Enable: 1 Disable: 0

0x013039C4 SFAB_FABRIC_TRIGGER_MASK_REG_1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR1.

SFAB_FABRIC_TRIGGER_MASK_REG_1

Bits	Name	Description
15:0	FTTR1_MASK	SW : RW Bit mask field for FTTR1 Enable: 1 Disable: 0

0x013039C8 SFAB_FABRIC_TRIGGER_MASK_REG_2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR2.

SFAB_FABRIC_TRIGGER_MASK_REG_2

Bits	Name	Description
15:0	FTTR2_MASK	SW : RW Bit mask field for FTTR2 Enable: 1 Disable: 0

0x013039CC SFAB_FABRIC_TRIGGER_MASK_REG_3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR3.

SFAB_FABRIC_TRIGGER_MASK_REG_3

Bits	Name	Description
15:0	FTTR3_MASK	SW : RW Bit mask field for FTTR3 Enable: 1 Disable: 0

0x013039D0 SFAB_FABRIC_TRIGGER_MASK_REG_4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR4.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR4.

SFAB_FABRIC_TRIGGER_MASK_REG_4

Bits	Name	Description
15:0	FTTR4_MASK	SW : RW Bit mask field for FTTR4 Enable: 1 Disable: 0

0x013039D4 SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter0.

SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG0

Bits	Name	Description
15:0	E0AL	SW : RW LSB address value Event counter 0 address selection (if address range filtering enabled)

0x013039D8 SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter0.

SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG0

Bits	Name	Description
15:0	E0AU	SW : RW MSB address value Event counter 0 address selection (if address range filtering enabled)

0x013039DC SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter1.

SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG1

Bits	Name	Description
15:0	E1AL	SW : RW LSB address value Event counter 1address selection (if address range filtering enabled)

0x013039E0 SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter1.

SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG1

Bits	Name	Description
15:0	E1AU	SW : RW MSB address value Event counter 1address selection (if address range filtering enabled)

0x013039E4 SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter2

SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG2

Bits	Name	Description
15:0	E2AL	SW : RW LSB address value Event counter 2 address selection (if address range filtering enabled)

0x013039E8 SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter2.

SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG2

Bits	Name	Description
15:0	E2AU	SW : RW MSB address value Event counter 2 address selection (if address range filtering enabled)

0x013039EC SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter3

SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG3

Bits	Name	Description
15:0	E3AL	SW : RW LSB address value Event counter 3 address selection (if address range filtering enabled)

0x013039F0 SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter3.

SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG3

Bits	Name	Description
15:0	E3AU	SW : RW MSB address value Event counter 3 address selection (if address range filtering enabled)

0x013039F4 SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter4.

SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG4

Bits	Name	Description
15:0	E4AL	SW : RW LSB address value Event counter 4 address selection (if address range filtering enabled)

0x013039F8 SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter4.

SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG4

Bits	Name	Description
15:0	E4AU	SW : RW MSB address value Event counter 4address selection (if address range filtering enabled)

0x013039FC SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter5.

SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG5

Bits	Name	Description
15:0	E5AL	SW : RW LSB address value Event counter 5 address selection (if address range filtering enabled)

0x01303A00 SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter4.

SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG5

Bits	Name	Description
15:0	E5AU	SW : RW MSB address value Event counter 5 address selection (if address range filtering enabled)

0x01303A04 SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter 6.

SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG6

Bits	Name	Description
15:0	E6AL	SW : RW LSB address value Event counter 6 address selection (if address range filtering enabled)

0x01303A08 SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 6.

SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG6

Bits	Name	Description
15:0	E6AU	SW : RW MSB address value Event counter 6 address selection (if address range filtering enabled)

0x01303A0C SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter 7.

SFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG7

Bits	Name	Description
15:0	E7AL	SW : RW LSB address value Event counter 7 address selection (if address range filtering enabled)

0x01303A10 SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 7.

SFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG7

Bits	Name	Description
15:0	E7AU	SW : RW MSB address value Event counter 7 address selection (if address range filtering enabled)

0x01303A14 SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR0.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG0

Bits	Name	Description
15:0	E0AML	SW : RW LSB address value Event counter 0 address mask

0x01303A18 SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR0.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG0

Bits	Name	Description
15:0	E0AMU	SW : RW MSB address value Event counter 0 address mask

0x01303A1C SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR1.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG1

Bits	Name	Description
15:0	E1AML	SW : RW LSB address value Event counter 1 address mask

0x01303A20 SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR1.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG1

Bits	Name	Description
15:0	E1AMU	SW : RW MSB address value Event counter address mask

0x01303A24 SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR2.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG2

Bits	Name	Description
15:0	E2AML	SW : RW LSB address value Event counter 2 address mask

0x01303A28 SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR2.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG2

Bits	Name	Description
15:0	E2AMU	SW : RW MSB address value Event counter 2 address mask

0x01303A2C SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR3.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG3

Bits	Name	Description
15:0	E3AML	SW : RW LSB address value Event counter 3 address mask

0x01303A30 SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR3.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG3

Bits	Name	Description
15:0	E3AMU	SW : RW MSB address value Event counter 3 address mask

0x01303A34 SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 4.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR4.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG4

Bits	Name	Description
15:0	E4AML	SW : RW LSB address value Event counter 4 address mask

0x01303A38 SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 4.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR4.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG4

Bits	Name	Description
15:0	E4AMU	SW : RW MSB address value Event counter 4 address mask

0x01303A3C SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 5.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR5.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG5

Bits	Name	Description
15:0	E5AML	SW : RW LSB address value Event counter 5 address mask

0x01303A40 SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 5.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR5.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG5

Bits	Name	Description
15:0	E5AMU	SW : RW MSB address value Event counter 5 address mask

0x01303A44 SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 6.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR6.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG6

Bits	Name	Description
15:0	E6AML	SW : RW LSB address value Event counter 6 address mask

0x01303A48 SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 6.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR6.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG6

Bits	Name	Description
15:0	E6AMU	SW : RW MSB address value Event counter 6 address mask

0x01303A4C SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for event counter 7.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPALR7.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_LOWER_REG7

Bits	Name	Description
15:0	E7AML	SW : RW LSB address value Event counter 7 address mask

0x01303A50 SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter 7.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPAUR7.

SFAB_FABRIC_MONITOR_ADDRESS_MASK_UPPER_REG7

Bits	Name	Description
15:0	E7AMU	SW : RW MSB address value Event counter 7 address mask

0x01303A70 SFAB_FABRIC_MONITOR_MID_MASK_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 0

SFAB_FABRIC_MONITOR_MID_MASK_REG0

Bits	Name	Description
15:0	E0MM	SW : RW MID Mask value for event counter 0

0x01303A74 SFAB_FABRIC_MONITOR_MID_MASK_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 1

SFAB_FABRIC_MONITOR_MID_MASK_REG1

Bits	Name	Description
15:0	E1MM	SW : RW MID Mask value for event counter 1

0x01303A78 SFAB_FABRIC_MONITOR_MID_MASK_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 2

SFAB_FABRIC_MONITOR_MID_MASK_REG2

Bits	Name	Description
15:0	E2MM	SW : RW MID Mask value for event counter 2

0x01303A7C SFAB_FABRIC_MONITOR_MID_MASK_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 3

SFAB_FABRIC_MONITOR_MID_MASK_REG3

Bits	Name	Description
15:0	E3MM	SW : RW MID Mask value for event counter 3

0x01303A80 SFAB_FABRIC_MONITOR_MID_MASK_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 4

SFAB_FABRIC_MONITOR_MID_MASK_REG4

Bits	Name	Description
15:0	E4MM	SW : RW MID Mask value for event counter 4

0x01303A84 SFAB_FABRIC_MONITOR_MID_MASK_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 15

SFAB_FABRIC_MONITOR_MID_MASK_REG5

Bits	Name	Description
15:0	E5MM	SW : RW MID Mask value for event counter 5

0x01303A88 SFAB_FABRIC_MONITOR_MID_MASK_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 6

SFAB_FABRIC_MONITOR_MID_MASK_REG6

Bits	Name	Description
15:0	E6MM	SW : RW MID Mask value for event counter 6

0x01303A8C SFAB_FABRIC_MONITOR_MID_MASK_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 7

SFAB_FABRIC_MONITOR_MID_MASK_REG7

Bits	Name	Description
15:0	E7MM	SW : RW MID Mask value for event counter 7

0x01303AA0 SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG0

Bits	Name	Description
15:0	EBTL0	SW : RW Total # beats (lower 16-bit value)

0x01303AA4 SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG0

Bits	Name	Description
15:0	EBTM0	SW : RW Total # beats (middle 16-bit value)

0x01303AA8 SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG0

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU0	SW : RW Total # beats (upper 4-bit value)

0x01303AAC SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG1

Bits	Name	Description
15:0	EBTL1	SW : RW Total # beats (lower 16-bit value)

0x01303AB0 SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG1

Bits	Name	Description
15:0	EBTM1	SW : RW Total # beats (middle 16-bit value)

0x01303AB4 SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG1

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU1	SW : RW Total # beats (upper 4-bit value)

0x01303AB8 SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG2

Bits	Name	Description
15:0	EBTL2	SW : RW Total # beats (lower 16-bit value)

0x01303ABC SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG2

Bits	Name	Description
15:0	EBTM2	SW : RW Total # beats (middle 16-bit value)

0x01303AC0 SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG2

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU2	SW : RW Total # beats (upper 4-bit value)

0x01303AC4 SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG3

Bits	Name	Description
15:0	EBTL3	SW : RW Total # beats (lower 16-bit value)

0x01303AC8 SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write

Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG3

Bits	Name	Description
15:0	EBTM3	SW : RW Total # beats (middle 16-bit value)

0x01303ACC SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG3

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU3	SW : RW Total # beats (upper 4-bit value)

0x01303AD0 SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG4

Bits	Name	Description
15:0	EBTL4	SW : RW Total # beats (lower 16-bit value)

0x01303AD4 SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG4

Bits	Name	Description
15:0	EBTM4	SW : RW Total # beats (middle 16-bit value)

0x01303AD8 SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG4

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU4	SW : RW Total # beats (upper 4-bit value)

0x01303ADC SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write

Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG5

Bits	Name	Description
15:0	EBTL5	SW : RW Total # beats (lower 16-bit value)

0x01303AE0 SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG5

Bits	Name	Description
15:0	EBTM5	SW : RW Total # beats (middle 16-bit value)

0x01303AE4 SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG5

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU5	SW : RW Total # beats (upper 4-bit value)

0x01303AE8 SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG6

Bits	Name	Description
15:0	EBTL6	SW : RW Total # beats (lower 16-bit value)

0x01303AEC SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG6

Bits	Name	Description
15:0	EBTM6	SW : RW Total # beats (middle 16-bit value)

0x01303AF0 SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 6. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG6

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU6	SW : RW Total # beats (upper 4-bit value)

0x01303AF4 SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG7

Bits	Name	Description
15:0	EBTL7	SW : RW Total # beats (lower 16-bit value)

0x01303AF8 SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG7

Bits	Name	Description
15:0	EBTM7	SW : RW Total # beats (middle 16-bit value)

0x01303AFC SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG7

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3:0	EBTU7	SW : RW Total # beats (upper 4-bit value)

0x01303B00 SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG0

Bits	Name	Description
15:0	EBYL0	SW : RW Total bytes (lower 16-bit value)

0x01303B04 SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG0

Bits	Name	Description
15:0	EBYM0	SW : RW Total bytes (middle 16-bit value)

0x01303B08 SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG0

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU0	SW : RW Total bytes (upper 11-bit value)

0x01303B0C SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG1

Bits	Name	Description
15:0	EBYL1	SW : RW Total bytes (lower 16-bit value)

0x01303B10 SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG1

Bits	Name	Description
15:0	EBYM1	SW : RW Total bytes (middle 16-bit value)

0x01303B14 SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 1. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG1

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU1	SW : RW Total bytes (upper 11-bit value)

0x01303B18 SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG2

Bits	Name	Description
15:0	EBYL2	SW : RW Total bytes (lower 16-bit value)

0x01303B1C SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG2

Bits	Name	Description
15:0	EBYM2	SW : RW Total bytes (middle 16-bit value)

0x01303B20 SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 2. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG2

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU2	SW : RW Total bytes (upper 11-bit value)

0x01303B24 SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG3

Bits	Name	Description
15:0	EBYL3	SW : RW Total bytes (lower 16-bit value)

0x01303B28 SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG3

Bits	Name	Description
15:0	EBYM3	SW : RW Total bytes (middle 16-bit value)

0x01303B2C SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 3. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG3

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU3	SW : RW Total bytes (upper 11-bit value)

0x01303B30 SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG4

Bits	Name	Description
15:0	EBYL4	SW : RW Total bytes (lower 16-bit value)

0x01303B34 SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG4

Bits	Name	Description
15:0	EBYM4	SW : RW Total bytes (middle 16-bit value)

0x01303B38 SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 4. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG4

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU4	SW : RW Total bytes (upper 11-bit value)

0x01303B3C SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (lower 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_LOWER_REG5

Bits	Name	Description
15:0	EBYL5	SW : RW Total bytes (lower 16-bit value)

0x01303B40 SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG5

Bits	Name	Description
15:0	EBYM5	SW : RW Total bytes (middle 16-bit value)

0x01303B44 SFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 5. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

SFAB_FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG0 (cont.)

Bits	Name	Description
3:0	T0SW	SW : RW Tenure slave way selection register for tenure counter 0 0x0: Selects Slave 0 0x1: Selects Slave 1 0x2: Selects Slave 2 0x3: Selects Slave 3 0x4: Selects Slave 4 0x5: Selects Slave 5 0x6: Selects Slave 6 0x7: Selects Slave 7 0x8: Selects Slave 8 0x9: Selects Slave 9 0xA: Selects Slave 10 0xB: Selects Slave 11 0xC: Selects Slave 12 0xD: Selects Slave 13 0xE: Selects Slave 14 0xF: Selects Slave 15

0x01303B64 SFAB_FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for tenure counter 0.

SFAB_FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG0

Bits	Name	Description
15:0	T0MID	SW : RW Tenure counter 0 MID selection (If MID filtering enabled)

0x01303B68 SFAB_FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the tenure selection, port selection and filtering criteria for the performance monitor tenure counter 1.

SFAB_FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG1

Bits	Name	Description
15:14	T1SR	SW : RW Tenure selection for tenure counter 1 0x0: Master addr hndshk interval 0x1: Slave addr hndshk interval 0x2: Bresp interval 0x3: Read data tenure
13:12	RESERVED_BITS_13_12	Reserved

0x01303B7C SFAB_FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for tenure counter 3.

SFAB_FABRIC_MONITOR_TENURE_SELECTION_UPPER_REG3

Bits	Name	Description
15:0	T3MID	SW : RW Tenure counter 3 MID selection (If MID filtering enabled)

0x01303B80 SFAB_FABRIC_MONITOR_MIN_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR0 and measured in tenure counter 0.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

SFAB_FABRIC_MONITOR_MIN_REG0

Bits	Name	Description
15:0	MIN0	SW : R Minimum value of tenure, in tenure counter 0

0x01303B84 SFAB_FABRIC_MONITOR_MIN_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR1 and measured in tenure counter 1.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

SFAB_FABRIC_MONITOR_MIN_REG1

Bits	Name	Description
15:0	MIN1	SW : R Minimum value of tenure, in tenure counter 1

0x01303B88 SFAB_FABRIC_MONITOR_MIN_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR2 and measured in tenure counter 2.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

SFAB_FABRIC_MONITOR_MIN_REG2

Bits	Name	Description
15:0	MIN2	SW : R Minimum value of tenure, in tenure counter 2

0x01303B8C SFAB_FABRIC_MONITOR_MIN_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR3 and measured in tenure counter 3.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

SFAB_FABRIC_MONITOR_MIN_REG3

Bits	Name	Description
15:0	MIN3	SW : R Minimum value of tenure, in tenure counter 3

0x01303B90 SFAB_FABRIC_MONITOR_MAX_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR0 and measured in tenure counter 0.

NOTE The reset value for this register is set to h'0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be 'hFFFF.

SFAB_FABRIC_MONITOR_MAX_REG0

Bits	Name	Description
15:0	MAX0	SW : R Maximum value of tenure, in tenure counter 0

0x01303B94 SFAB_FABRIC_MONITOR_MAX_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR1and measured in tenure counter 1

NOTE The reset value for this register is set to h'0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be 'hFFFF.

SFAB_FABRIC_MONITOR_MAX_REG1

Bits	Name	Description
15:0	MAX1	SW : R Maximum value of tenure, in tenure counter 1

0x01303B98 SFAB_FABRIC_MONITOR_MAX_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR2 and measured in tenure counter 2

NOTE The reset value for this register is set to h'0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be 'hFFFF.

SFAB_FABRIC_MONITOR_MAX_REG2

Bits	Name	Description
15:0	MAX2	SW : R Maximum value of tenure, in tenure counter 2

0x01303B9C SFAB_FABRIC_MONITOR_MAX_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the maximum value of the tenure that is selected using FPTSLR3 and measured in tenure counter 3

NOTE The reset value for this register is set to h'0000, equivalent to 0 clock cycles.The value is used as an initial comparison against the captured tenure. If the value of this register remains at h'0000 after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

If an overflow condition occurs, the tenure values cannot be relied on to be accurate.

The maximum tenure value can only be 'hFFFF.

SFAB_FABRIC_MONITOR_MAX_REG3

Bits	Name	Description
15:0	MAX3	SW : R Maximum value of tenure, in tenure counter 3

0x01303BA0 SFAB_FABRIC_MONITOR_TENURE_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure in tenure counter 0

SFAB_FABRIC_MONITOR_TENURE_LOWER_REG0

Bits	Name	Description
15:0	LTOT0	SW : RW LSB total value of tenure, in tenure counter 0

0x01303BA4 SFAB_FABRIC_MONITOR_TENURE_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure in tenure counter 0.

SFAB_FABRIC_MONITOR_TENURE_UPPER_REG0

Bits	Name	Description
15:0	UTOT0	SW : RW MSB total value of tenure, in tenure counter 0

0x01303BA8 SFAB_FABRIC_MONITOR_TENURE_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure in tenure counter 1

SFAB_FABRIC_MONITOR_TENURE_LOWER_REG1

Bits	Name	Description
15:0	LTOT1	SW : RW LSB total value of tenure, in tenure counter 1

0x01303BAC SFAB_FABRIC_MONITOR_TENURE_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure in tenure counter 1.

SFAB_FABRIC_MONITOR_TENURE_UPPER_REG1

Bits	Name	Description
15:0	UTOT1	SW : RW MSB total value of tenure, in tenure counter 1

0x01303BB0 SFAB_FABRIC_MONITOR_TENURE_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure in tenure counter 2

SFAB_FABRIC_MONITOR_TENURE_LOWER_REG2

Bits	Name	Description
15:0	LTOT2	SW : RW LSB total value of tenure, in tenure counter 2

0x01303BB4 SFAB_FABRIC_MONITOR_TENURE_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure in tenure counter 2.

SFAB_FABRIC_MONITOR_TENURE_UPPER_REG2

Bits	Name	Description
15:0	UTOT2	SW : RW MSB total value of tenure, in tenure counter 2

0x01303BB8 SFAB_FABRIC_MONITOR_TENURE_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure in tenure counter 3

SFAB_FABRIC_MONITOR_TENURE_LOWER_REG3

Bits	Name	Description
15:0	LTOT3	SW : RW LSB total value of tenure, in tenure counter 3

0x01303BBC SFAB_FABRIC_MONITOR_TENURE_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure in tenure counter 3.

SFAB_FABRIC_MONITOR_TENURE_UPPER_REG3

Bits	Name	Description
15:0	UTOT3	SW : RW MSB total value of tenure, in tenure counter 3

0x01303BC0 SFAB_FABRIC_MONITOR_LAST_TENURE_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the value of the last tenure in tenure counter 0

SFAB_FABRIC_MONITOR_LAST_TENURE_REG0

Bits	Name	Description
15:0	LASTT0	SW : R Last tenure value in tenure counter 0

0x01303BC4 SFAB_FABRIC_MONITOR_LAST_TENURE_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the value of the last tenure in tenure counter 1

SFAB_FABRIC_MONITOR_LAST_TENURE_REG1

Bits	Name	Description
15:0	LASTT1	SW : R Last tenure value in tenure counter 1

0x01303BC8 SFAB_FABRIC_MONITOR_LAST_TENURE_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the value of the last tenure in tenure counter 2

SFAB_FABRIC_MONITOR_LAST_TENURE_REG2

Bits	Name	Description
15:0	LASTT2	SW : R Last tenure value in tenure counter 2

0x01303BCC SFAB_FABRIC_MONITOR_LAST_TENURE_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the value of the last tenure in tenure counter 3

SFAB_FABRIC_MONITOR_LAST_TENURE_REG3

Bits	Name	Description
15:0	LASTT0	SW : R Last tenure value in tenure counter 3

0x01303BD0 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 0.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG0

Bits	Name	Description
15:0	T0AL	SW : RW LSB address value Tenure counter 0 address mask

0x01303BD4 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 0.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG0

Bits	Name	Description
15:0	T0AU	SW : RW MSB address value Tenure counter 0 address mask

0x01303BD8 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 1.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG1

Bits	Name	Description
15:0	T1AL	SW : RW LSB address value Tenure counter 1 address mask

0x01303BDC SFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 1.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG1

Bits	Name	Description
15:0	T1AU	SW : RW MSB address value Tenure counter 1 address mask

0x01303BE0 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 2.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG2

Bits	Name	Description
15:0	T2AL	SW : RW LSB address value Tenure counter 2 address mask

0x01303BE4 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 2.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG2

Bits	Name	Description
15:0	T2AU	SW : RW MSB address value Tenure counter 2 address mask

0x01303BE8 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 3.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG3

Bits	Name	Description
15:0	T3AL	SW : RW LSB address value Tenure counter 3 address mask

0x01303BEC SFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 3.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG3

Bits	Name	Description
15:0	T3AU	SW : RW MSB address value Tenure counter 3 address mask

0x01303BF0 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 0

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR0.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG0

Bits	Name	Description
15:0	T0AML	SW : RW LSB address value Tenure counter 0 address mask

0x01303BF4 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 0

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR0.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG0

Bits	Name	Description
15:0	T0AMU	SW : RW MSB address mask value Tenure counter 0 address mask

0x01303BF8 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 1

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR1.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG1

Bits	Name	Description
15:0	T1AML	SW : RW LSB address value Tenure counter 1 address mask

0x01303BFC SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 1

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR1.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG1

Bits	Name	Description
15:0	T1AMU	SW : RW MSB address mask value Tenure counter 1 address mask

0x01303C00 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 2

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR2.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG2

Bits	Name	Description
15:0	T2AML	SW : RW LSB address value Tenure counter 2 address mask

0x01303C04 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 2

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR2.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG2

Bits	Name	Description
15:0	T2AMU	SW : RW MSB address mask value Tenure counter 2 address mask

0x01303C08 SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 3

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR3.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG3

Bits	Name	Description
15:0	T3AML	SW : RW LSB address value Tenure counter 3 address mask

0x01303C0C SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 3

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR3.

SFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG3

Bits	Name	Description
15:0	T3AMU	SW : RW MSB address mask value Tenure counter 3 address mask

0x01303C10 SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG 0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 0 that were longer than the specified threshold for tenure counter 0

SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG0

Bits	Name	Description
15:0	T0ATCL	SW : R LSB count value

0x01303C14 SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 0 that were longer than the specified threshold for tenure counter 0

SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG0

Bits	Name	Description
15:0	T0ATCU	SW : R MSB count value

0x01303C18 SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG 1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 1 that were longer than the specified threshold for tenure counter 1

SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG1

Bits	Name	Description
15:0	T1ATCL	SW : R LSB count value

0x01303C1C SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 1 that were longer than the specified threshold for tenure counter 1

SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG1

Bits	Name	Description
15:0	T1ATCU	SW : R MSB count value

0x01303C20 SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 2 that were longer than the specified threshold for tenure counter 2

SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG2

Bits	Name	Description
15:0	T2ATCL	SW : R LSB count value

0x01303C24 SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 2 that were longer than the specified threshold for tenure counter 2

SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG2

Bits	Name	Description
15:0	T2ATCU	SW : R MSB count value

0x01303C28 SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG 3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 3 that were longer than the specified threshold for tenure counter 3

SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG3

Bits	Name	Description
15:0	T3ATCL	SW : R LSB count value

0x01303C2C SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 3 that were longer than the specified threshold for tenure counter 3

SFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG3

Bits	Name	Description
15:0	T3ATCU	SW : R MSB count value

0x01303C30 SFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 0 are measured.

SFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG0

Bits	Name	Description
12:0	T0TV	SW : RW Tenure counter 0 threshold value

0x01303C34 SFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 1 are measured.

SFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG1

Bits	Name	Description
12:0	T1TV	SW : RW Tenure counter 1 threshold value

0x01303C38 SFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 2 are measured.

SFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG2

Bits	Name	Description
12:0	T2TV	SW : RW Tenure counter 2 threshold value

0x01303C3C SFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 3 are measured.

SFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG3

Bits	Name	Description
12:0	T3TV	SW : RW Tenure counter 3 threshold value

0x01303C40 SFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 0

SFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG0

Bits	Name	Description
15:0	T0MM	SW : RW MID Mask value

0x01303C44 SFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 1

SFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG1

Bits	Name	Description
15:0	T1MM	SW : RW MID Mask value

0x01303C48 SFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 2

SFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG2

Bits	Name	Description
15:0	T2MM	SW : RW MID Mask value

0x01303C4C SFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 3

SFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG3

Bits	Name	Description
15:0	T3MM	SW : RW MID Mask value

0x01303C50 SFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure0 register.

SFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG0

Bits	Name	Description
15:0	TLC0	SW : R LSB count value Incremented every time a tenure under observation completes in tenure counter 0

0x01303C54 SFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure0 register.

SFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG0

Bits	Name	Description
15:0	TUC0	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 0

0x01303C58 SFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure1 register.

SFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG1

Bits	Name	Description

0x01303C5C SFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure1 register.

SFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG1

Bits	Name	Description
15:0	TUC1	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 1

0x01303C60 SFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure2 register.

SFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG2

Bits	Name	Description
15:0	TLC2	SW : R LSB count value Incremented every time a tenure under observation completes in tenure counter 2

0x01303C64 SFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure2 register.

SFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG2

Bits	Name	Description
15:0	TUC2	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 2

0x01303C68 SFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure3 register.

SFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG3

Bits	Name	Description
15:0	TLC3	SW : R LSB count value Incremented every time a tenure under observation completes in tenure counter 3

0x01303C6C SFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure3 register.

SFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG3

Bits	Name	Description
15:0	TUC3	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 3

0x01303C70 SFAB_FABRIC_MONITOR_TENURE_PICK_PORTS_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the main port and other port selection for the 4 event counters.

SFAB_FABRIC_MONITOR_TENURE_PICK_PORTS_REG

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3	T3PP	SW : RW Tenure counter 3 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T3MP or T3SW
2	T2PP	SW : RW Tenure counter 2 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T2MP or T2SW

SFAB_FABRIC_MONITOR_TENURE_PICK_PORTS_REG (cont.)

Bits	Name	Description
1	T1PP	SW : RW Tenure counter 1 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T1MP or T1SW
0	T0PP	SW : RW Tenure counter 0 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T0MP or T0SW

0x01303C80 SFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 0

SFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG0

Bits	Name	Description
15:0	LTOTU0	SW : RW LSB total union value of tenure, in tenure counter 0

0x01303C84 SFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 0.

SFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG0

Bits	Name	Description
15:0	UTOTU0	SW : RW MSB total union value of tenure, in tenure counter 0

0x01303C88 SFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 1

SFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG1

Bits	Name	Description
15:0	LTOTU1	SW : RW LSB total union value of tenure, in tenure counter 1

0x01303C8C SFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 1.

SFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG1

Bits	Name	Description
15:0	UTOTU1	SW : RW MSB total union value of tenure, in tenure counter 1

0x01303C90 SFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 2

SFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG2

Bits	Name	Description
15:0	LTOTU2	SW : RW LSB total union value of tenure, in tenure counter 2

0x01303C94 SFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 2.

SFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG2

Bits	Name	Description
15:0	UTOTU2	SW : RW MSB total union value of tenure, in tenure counter 2

0x01303C98 SFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 3

SFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG3

Bits	Name	Description
15:0	LTOTU3	SW : RW LSB total union value of tenure, in tenure counter 3

0x01303C9C SFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 3.

SFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG3

Bits	Name	Description
15:0	UTOTU3	SW : RW MSB total union value of tenure, in tenure counter 3

0x01303CA0 SFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures measured in tenure counter 0, that were pipelined.

SFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG0

Bits	Name	Description

0x01303CA4 SFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures measured in tenure counter 0, that were pipelined.

SFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG0

Bits	Name	Description
15:0	TUCP0	SW : R MSB count value TUCP0,TLCP0 value incremented every time a pipelined tenure completes in tenure counter 0

0x01303CA8 SFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures measured in tenure counter 1, that were pipelined.

Bits	Name	Description
15:0	TMCP2	SW : R This is the maximum number of tenures pipelined at the same time in tenure counter 2

0x01303CCC SFAB_FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the max number of tenures pipelined at any point during the monitoring window for tenure counter 3

SFAB_FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG3

Bits	Name	Description
15:0	TMCP3	SW : R This is the maximum number of tenures pipelined at the same time in tenure counter 3

0x01303CD0 SFAB_FABRIC_MONITOR_INFLIGHT_TENURE_CORRECTION_MODE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the facility to correlate a particular event counter to a tenure counter. When the tenure results of a counter are reset during a monitoring window (to account for errors due to starting the monitor in the middle of traffic), the event counters too get reset if the correlation between them is enabled.

NOTE PCORR bit (bit 0) should not be set for APQ8064.

SFAB_FABRIC_MONITOR_INFLIGHT_TENURE_CORRECTION_MODE_REG

Bits	Name	Description
15:9	RESERVED_15_9	Reserved Bits
8	EC7COR	SW : RW 0x1: Link Event Counter 7 to Tenure Counter 3 0x0: Event Counter 7 is independent

SFAB_FABRIC_MONITOR_INFLIGHT_TENURE_CORRECTION_MODE_REG (cont.)

Bits	Name	Description
7	EC6COR	SW : RW 0x1: Link Event Counter 6 to Tenure Counter 2 0x0: Event Counter 6 is independent
6	EC5COR	SW : RW 0x1: Link Event Counter 5 to Tenure Counter 1 0x0: Event Counter 5 is independent
5	EC4COR	SW : RW 0x1: Link Event Counter 4 to Tenure Counter 0 0x0: Event Counter 4 is independent
4	EC3COR	SW : RW 0x1: Link Event Counter 3 to Tenure Counter 3 0x0: Event Counter 3 is independent
3	EC2COR	SW : RW 0x1: Link Event Counter 2 to Tenure Counter 2 0x0: Event Counter 2 is independent
2	EC1COR	SW : RW 0x1: Link Event Counter 1 to Tenure Counter 1 0x0: Event Counter 1 is independent
1	EC0COR	SW : RW 0x1: Link Event Counter 0 to Tenure Counter 0 0x0: Event Counter 0 is independent
0	PCORR	SW : RW This is the enable for tenure correction mode This bit SHOULD NOT be set for APQ8064 and newer configs.

0x01303CE0 SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 0 that correspond to out-of-order transactions.

SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG0

Bits	Name	Description
15:0	TOLC0	SW : R LSB count value Incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 0

0x01303CE4 SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG0

Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 1 that correspond to out-of-order transactions

SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG1

Bits	Name	Description
15:0	TOUC1	SW : R MSB count value TOUC,TOLC value incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 1

0x01303CF0 SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 2 that correspond to out-of-order transactions.

SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG2

Bits	Name	Description
15:0	TOLC2	SW : R LSB count value Incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 2

0x01303CF4 SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 2 that correspond to out-of-order transactions

SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG2

Bits	Name	Description
15:0	TOUC2	SW : R MSB count value TOUC,TOLC value incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 2

0x01303CF8 SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 3 that correspond to out-of-order transactions.

SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG3

Bits	Name	Description
15:0	TOLC3	SW : R LSB count value Incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 3

0x01303CFC SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 3 that correspond to out-of-order transactions

SFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG3

Bits	Name	Description

0x01303D00 SFAB_FABRIC_MONITOR_RTR_STATUS_REG

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains 4 status bits (one for each performance monitor tenure counter). Each bit indicates whether the monitoring results pertaining to the associated tenure counter have been reset (to account for errors due to starting the monitor in the middle of traffic) or not.

SFAB_FABRIC_MONITOR_RTR_STATUS_REG

Bits	Name	Description
15:4	RESERVED15_4	Reserved
3	TC3_RESET	SW: R When set, this bit indicates that tenure counter 3 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic
2	TC2_RESET	SW: R When set, this bit indicates that tenure counter 2 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic
1	TC1_RESET	SW: R When set, this bit indicates that tenure counter 1 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic
0	TC0_RESET	SW: R When set, this bit indicates that tenure counter 0 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic

0x01303D04 SFAB_FABRIC_MONITOR_IDLE_INTERNAL_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 0 to Master 15). A value of 1 indicates that the internally generated idle status is to be used to determine when to reset the performance monitor tenure counter results (resetting the tenure counter results is needed to compensate for errors due to enabling the tenure counters in the middle of traffic). A value of 0 will indicate that the primary idle input is to be used instead.

NOTE These settings will have an effect only in case of AXI master ports.

SFAB_FABRIC_MONITOR_IDLE_INTERNAL_LOWER_REG

Bits	Name	Description
15	M15_PII	SW : RW 0x1: The internally generated idle status for Master 15 will be used by the performance monitor 0x0: Primary input I_AXI_M15_IDLE is used by the performance monitor

SFAB_FABRIC_MONITOR_IDLE_INTERNAL_LOWER_REG (cont.)

Bits	Name	Description
14	M14_PII	SW : RW 0x1: The internally generated idle status for Master 14 will be used by the performance monitor 0x0: Primary input I_AXI_M14_IDLE is used by the performance monitor
13	M13_PII	SW : RW 0x1: The internally generated idle status for Master 13 will be used by the performance monitor 0x0: Primary input I_AXI_M13_IDLE is used by the performance monitor
12	M12_PII	SW : RW 0x1: The internally generated idle status for Master 12 will be used by the performance monitor 0x0: Primary input I_AXI_M12_IDLE is used by the performance monitor
11	M11_PII	SW : RW 0x1: The internally generated idle status for Master 11 will be used by the performance monitor 0x0: Primary input I_AXI_M11_IDLE is used by the performance monitor
10	M10_PII	SW : RW 0x1: The internally generated idle status for Master 10 will be used by the performance monitor 0x0: Primary input I_AXI_M10_IDLE is used by the performance monitor

0x01303D0C SFAB_FABRIC_MONITOR_RTR_MASK_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains 1 bit for each of the tenure counters that controls the RTR assertion and clearing of the monitoring results pertaining to the associated tenure counter to account for errors due to starting the monitor in the middle of traffic. A value of 1 indicates that RTR will not be asserted.

SFAB_FABRIC_MONITOR_RTR_MASK_REG

Bits	Name	Description
31:4	RESERVED_31_4	Reserved
3	RTR_MASK_3	SW : RW 0x1: No RTR will be asserted for Tenure Counter 3 0x0: The design is allowed to assert RTR for Tenure Counter 3
2	RTR_MASK_2	SW : RW 0x1: No RTR will be asserted for Tenure Counter 2 0x0: The design is allowed to assert RTR for Tenure Counter 2
1	RTR_MASK_1	SW : RW 0x1: No RTR will be asserted for Tenure Counter 1 0x0: The design is allowed to assert RTR for Tenure Counter 1
0	RTR_MASK_0	SW : RW 0x1: No RTR will be asserted for Tenure Counter 0 0x0: The design is allowed to assert RTR for Tenure Counter 0

0x01303D10 SFAB_FABRIC_MASTER_SELECT_HYST_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 0 to Master 15). A value of 1 indicates that the hysteresis timer value is used to keep the master segmented clock on. A value of 0 indicates that the hysteresis timer will not be used in the master segmented clock on.

SFAB_FABRIC_MASTER_SELECT_HYST_LOWER_REG

Bits	Name	Description
15	M15_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.

SFAB_FABRIC_MASTER_SELECT_HYST_LOWER_REG (cont.)

Bits	Name	Description
14	M14_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
13	M13_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
12	M12_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.
11	M11_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.

0x01303D18 SFAB_FABRIC_MASTER_USE_CG_DISABLE_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 0 to Master 15). A value of 1 indicates that the FMCHR bit 15 can be used to always keep the master segmented clock on, hence disabling HW dynamic clock gating. A value of 0 indicates that the FMCHR bit cannot be used to disable HW dynamic clock gating.

SFAB_FABRIC_MASTER_USE_CG_DISABLE_LOWER_REG

Bits	Name	Description
15	M15_USE_CG_DISABLE	SW : RW 0x1: FMCHR bit can be used to disable HW dynamic clock gating for master 15 0x0: FMCHR bit cannot be used to disable HW dynamic clock gating

0x01303D20 SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter0.

SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG0

Bits	Name	Description
15:0	RTENL0	SW : RW Contains the LSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked bytenure counter 0

0x01303D24 SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter0.

SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG0

Bits	Name	Description
15:0	RTENU0	SW : RW Contains the MSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 0

0x01303D28 SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter1.

SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG1

Bits	Name	Description
15:0	RTENL1	SW : RW Contains the LSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 1

0x01303D2C SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter1.

SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG1

Bits	Name	Description
15:0	RTENU1	SW : RW Contains the MSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 1

0x01303D30 SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter2.

SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG2

Bits	Name	Description
15:0	RTENL2	SW : RW Contains the LSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 2

0x01303D34 SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter2.

SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG2

Bits	Name	Description
15:0	RTENU2	SW : RW Contains the MSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 2

0x01303D38 SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter3.

SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG3

Bits	Name	Description
15:0	RTENL3	SW : RW Contains the LSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 3

0x01303D3C SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter3.

SFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG3

Bits	Name	Description
15:0	RTENU3	SW : RW Contains the MSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 3

8.3 System Fabric M2MVT Registers (0x01300000 SFAB_BASE)

This section contains the System Fabric M2MVT registers.

8.3.1 M2VMT registers map with generic permutations

See Table 8-2.

Table 8-2 System Fabric M2VMT Registers Table

Register	Address / Range	Description	Type	Default
M2VMT_M2VRv [4:0]	x000 to x7FC	Defines VMID value associated with the M2VMT index:		
Where v = NUM_M2VMT_ENTRIES from the design generic	R/W	x		
Reserved	x800 to xFF0	Reserved	X	X
M2VMT_REV	xFF4	M2VMT Revision Register	RO	'10000000'b
M2VMT_IDR [8:0]	xFF8	ID Register	RO	NUM_M2VMT_ENTRIES
Reserved	xFFC	Reserved	X	x

REMOVE_M2VMT_RPU = '0' &
REMOVE_M2VMT_SYND_REG_IF_RPU_IS_PRESENT='0'

The normal default use model uses M2VMT_RPU='0' and REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT= '0'. In this default configuration, local RPU and associated syndrome registers and interrupt support registers are available.

0x01306000+ 0x4*v SFAB_M2VMT_M2VMRv_2, v=[0..15]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where v= NUM_M2VMT_ENTRIES from the design generics

SFAB_M2VMT_M2VMRv_2

Bits	Name	Description
31:5	RESERVED	v= NUM_M2VMT_ENTRIES from the design generic/parameter.
4:0	VMID	SW : RW Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9-bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRv address associations.

0x01306FF4 SFAB_M2VMT_REV_2

Type: Read
Clock: FABRIC_CLOCK
Reset State: '10000000'b

Reports the revision information for the M2VMT core and wrapper.

SFAB_M2VMT_REV_2

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	SW : R Major variant field
3:0	MINOR	SW : R Minor variant field.

0x01306FF8 SFAB_M2VMT_IDR_2

Type: Read
Clock: FABRIC_CLOCK
Reset State: M2VMTSIZE

Reports the size of the M2VMT table. It is a read-only register.

SFAB_M2VMT_IDR_2

Bits	Name	Description
31:9	RESERVED	M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.

SFAB_M2VMT_IDR_2 (cont.)

Bits	Name	Description
8:0	M2VMTSIZE	SW : R M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping.

0x01307000+0x4*v SFAB_M2VMT_M2VMRv_3, v=[0..15]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where v= NUM_M2VMT_ENTRIES from the design generics

SFAB_M2VMT_M2VMRv_3

Bits	Name	Description
31:5	RESERVED	v= NUM_M2VMT_ENTRIES from the design generic/parameter.
4:0	VMID	SW : RW Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRv address associations.

0x01307FF4 SFAB_M2VMT_REV_3

Type: Read
Clock: FABRIC_CLOCK
Reset State: '10000000'b

Reports the revision information for the M2VMT core and wrapper.

SFAB_M2VMT_REV_3

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	SW : R Major variant field
3:0	MINOR	SW : R Minor variant field.

Clock: FABRIC_CLOCK
Reset State: M2VMTSIZE

Reports the size of the M2VMT table. It is a read-only register.

SFAB_M2VMT_IDR_3

Bits	Name	Description
31:9	RESERVED	M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.
8:0	M2VMTSIZE	SW : R M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping.

0x01308000+0x4*v SFAB_M2VMT_M2VMRv_4, v=[0..0]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where v= NUM_M2VMT_ENTRIES from the design generics.

SFAB_M2VMT_M2VMRv_4

Bits	Name	Description
31:5	RESERVED	v= NUM_M2VMT_ENTRIES from the design generic/parameter.
4:0	VMID	SW : RW Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRv address associations.

0x01308FF4 SFAB_M2VMT_REV_4

Type: Read
Clock: FABRIC_CLOCK
Reset State: '10000000'b

Reports the revision information for the M2VMT core and wrapper.

SFAB_M2VMT_REV_4

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	SW : R Major variant field
3:0	MINOR	SW : R Minor variant field.

0x01308FF8 SFAB_M2VMT_IDR_4

Type: Read
Clock: FABRIC_CLOCK
Reset State: M2VMTSIZE

Reports the size of the M2VMT table. It is a read-only register.

SFAB_M2VMT_IDR_4

Bits	Name	Description
31:9	RESERVED	M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.

SFAB_M2VMT_IDR_4 (cont.)

Bits	Name	Description
8:0	M2VMTSIZE	SW : R M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping.

0x01309000+0x4*v SFAB_M2VMT_M2VMRv_5, v=[0..1]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where v= NUM_M2VMT_ENTRIES from the design generics

SFAB_M2VMT_M2VMRv_5

Bits	Name	Description
31:5	RESERVED	v= NUM_M2VMT_ENTRIES from the design generic/parameter.
4:0	VMID	SW : RW Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRv address associations.

0x01309FF4 SFAB_M2VMT_REV_5

Type: Read
Clock: FABRIC_CLOCK
Reset State: '10000000'b

Reports the revision information for the M2VMT core and wrapper.

SFAB_M2VMT_REV_5

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	SW : R Major variant field
3:0	MINOR	SW : R Minor variant field.

0x01309FF8 SFAB_M2VMT_IDR_5

Type: Read
Clock: FABRIC_CLOCK
Reset State: M2VMTSIZE

Reports the size of the M2VMT table. It is a read-only register.

SFAB_M2VMT_IDR_5

Bits	Name	Description
31:9	RESERVED	M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.
8:0	M2VMTSIZE	SW : R M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. 8.4 Application Fabric Registers (0x01400000 AFAB_BASE)

This section contains the Application Fabric registers.

0x01400000 AFAB_FABRIC_ID_REVISION_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x2C40

This register contains the upper 16-bits of the core ID and revision number and contains the Major/Minor Revision information as well as the site ID where the core was developed.

AFAB_FABRIC_ID_REVISION_REG0

Bits	Name	Description
15:13	MAJ	SW : R Major Revision 0x1: Initial Release
12:10	MIN	SW : R Minor Revision 0x3: APQ8064
9:6	SITE	SW : R Site ID 0x1: RTP
5:0	RESERVED_BITS_5_0	

0x01400004 AFAB_FABRIC_ID_REVISION_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0001

This register contains the lower 16-bits of the core ID and revision number and contains the Core ID number.

AFAB_FABRIC_ID_REVISION_REG1

Bits	Name	Description
15:8	RESERVED_BITS_3_2	
7:0	ID	SW : R Core ID 0x1: FABRIC

0x01400008 AFAB_FABRIC_CONFIGURATION_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0002

This register defines the operating frequency, power down mode for the performance monitor, as well as the decode error and performance monitor cycle counter interrupts. It also has the control bit to globally disable redirection in Fabric.

The ISYND bits contain the interrupt syndrome. If more than one interrupt type occurs, more than one bit will be set. For example, if a decode error occurs and the performance monitor cycle-counter expires, the ISYND field will contain the value 3'b101. Performance monitor interrupts are only generated when the interrupt enable (PMIE) bit is set for the interrupt type.

If multiple decode errors occur, only the first error is recorded. If multiple decode errors occur at the same clock cycle, only a single error is considered, with Master 0 having the highest priority and Master 5 the lowest priority.

The determination of the time an error is recorded in the Fabric Error Status Register (FESR) is based on the following criteria:

For Reads: When Mn_RLAST is asserted.

For Writes: When Mn_BRESP is asserted.

Therefore, if two different masters make requests with invalid addresses to the FABRIC, the master which receives the RLAST or BRESP first for the invalid transaction, is recorded in the FESR. See FABRIC_ERROR_STATUS_REG_1 for information that is captured when a decode error occurs. The address of the request which caused a decode error is captured in the FABRIC_ERROR_UPPER_ADDR_REG and the FABRIC_ERROR_LOWER_ADDR_REG. If they happen simultaneously, the master priority is used to resolve which error is recorded in a fixed priority scheme. Master 0 has highest priority and Master 31 has the lowest priority.

NOTE If the master does not have RREADY or BREADY asserted by default (i.e., it is not able to receive all responses for outstanding requests and may throttle the FABRIC), the FABRIC_Interrupt generation may precede the return of the last read data beat or the write response.

To clear the interrupt, the ISYND bits are required to be written to 3'b000.

The performance monitor event/tenure overflow condition is indicated when the ISYND value is 010. An event overflow occurs when the event counter has reached its maximum value. A tenure overflow condition occurs:

When the tenure counter has reached its maximum value

OR

More than 16 tenures are outstanding, since the performance monitor implements only 16 counters for tenure tracking. Note that if the tenure overflows, values read from the performance monitors

for min/max/total/last tenure will no longer be valid as values recorded after the overflow will be incorrect.

0x01401000+0x0100*n+4*m AFAB_FABRIC_m_WEIGHTING_REG_n, m=[0..5], n=[0..4]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

The values programmed into this register determine the Tier 2 weight for each master under the Tier Based Arbitration Scheme.

NOTE This register is required for each master and each slave segment supported by the FABRIC .

AFAB_FABRIC_m_WEIGHTING_REG_n

Bits	Name	Description
15:8	RESERVED_BITS_15_8	
7:0	M_M_W	SW : RW Master 'm' Weight

0x01402000+0x0100*n+4*m AFAB_FABRIC_m_QOS_REG_n, m=[0..3], n=[0..4]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

The values programmed into this register determine the Tier 1 weight for each master under the Tier Based Arbitration Scheme. Only 4 master ports can be configured as Tier 1. The QMC bits are used to configure a master port as Tier 1.

NOTE If more than one of these QOS Control registers are set to the same master port, unpredictable behavior will occur.

Set-up procedure:

1. Set the QOS enable bit.
2. Set the arbitration mode to Scheduled Access Time in the FABRIC arbitration configuration register FACR (See FABRIC_ARBITRATION_CONTROL_REG_n, n=[0..4]).
3. Configure the master port that needs to be set to Tier1.
4. Set the appropriate number of tokens/weight.
5. Set the MLT value (default is zero clock cycles).

NOTE Four of these registers are required for each slave segment supported by the FABRIC .

0x01403300+4*n AFAB_FABRIC_MASTER_INTERFACE_REG_n, n=[0..5]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0084

This register controls the following master port attributes:

- whether the master request priority signals are used by the internal arbiter
- the redirection of cacheable coherent requests
- write gathering on AXI
- write packing on AHB

This register also controls a particular master's halt interface and for AHB master interfaces, it enables write packing functionality for posted writes.

When the MHR bit is set, the FABRIC_MnHALTREQ signal is asserted. The MHA and MHI fields capture the state of the FABRIC_MnHALTACK and FABRIC_MnIDLE signals at every clock cycle.

NOTE A register is implemented for each master interface supported by the FABRIC

AFAB_FABRIC_MASTER_INTERFACE_REG_n

Bits	Name	Description
15	RESERVED_BIT_15	
14	OWGM	SW : RW Enable optimized write gathering mode. SW should disable for AXI Ports
13	DBW	SW : RW Disable Bufferable writes. Treats Bufferable writes as Non Bufferable writes (AHB only)
12	PRIEN	SW : RW Enable Request Priority Lets the slave way arbiter consider the master request priority AREQPRIORITY[1:0] signal that is driven with each transaction
11	RCOSH	SW : RW Redirect Cacheable-outer-sharable Governs whether or not cacheable accesses that are outer-sharable are redirected to the Scorpion-MP L2 slave port
10	RCISH	SW : RW Redirect Cacheable-inner-sharable Governs whether or not cacheable accesses that are inner-sharable are redirected to the Scorpion-MP L2 slave port
9	RCNSH	SW : RW Redirect Cacheable-non-sharable Governs whether or not cacheable accesses that are non-sharable are redirected to the Scorpion-MP L2 slave port
8	CRE	SW : RW Enable redirection of cachable coherent requests

AFAB_FABRIC_MASTER_INTERFACE_REG_n (cont.)

Bits	Name	Description
7	WGE	SW : RW Write Gathering Enable (AXI only)
6	WPE	SW : RW Write Packing Enable (AHB Only) When enabled, the master port will pack indeterminate INCR burst writes, if disabled, the master port will break indeterminate INCR burst writes into SINGLES. 0x1: Enable 0x0: Disable
5:4	IIIW	SW : RW Bufferable Indeterminate INCR WR packing (AHB only): 0x0: break into INCR4 0x1: break into INCR8 0x3: break into INCR16
3	MID	SW : RW Master Interface Disable. SW diable of Master interface.
2	MI	SW : R Master Idle. Indicates that the Master does not have any pending bus transactions. For AHB busses, this bit is set internally by the FABRIC AHB Master port. For AXI masters, this value is driven by the master that is connected to the port.
1	MHA	SW : R Master halt acknowledge. Only valid for AXI masters. This bit is 0 on AHB master ports.
0	MHR	SW : RW Master halt request. Only valid for AXI masters. Writing this bit has no effect for AHB masters.

0x01403514 AFAB_FABRIC_ERROR_UPPER_ADDR_REG

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address of the request which generated a decode error. The value of the register is valid only when the FABRIC_Interrupt signal is asserted and ISYND in the FCR is set to one (See FABRIC_CONFIGURATION_REG).

AFAB_FABRIC_ERROR_UPPER_ADDR_REG

Bits	Name	Description
15:0	EUA	SW : R Bits [31:16] of the address which generated a decode error

0x01403518 AFAB_FABRIC_ERROR_LOWER_ADDR_REG

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address of the request which generated a decode error. The value of the register is valid only when the FABRIC_Interrupt signal is asserted and ISYND in the FCR is set to one (See FABRIC_CONFIGURATION_REG).

AFAB_FABRIC_ERROR_LOWER_ADDR_REG

Bits	Name	Description
15:0	ELR	SW : R Bits [15:0] of the address which generated a decode error

0x0140351C AFAB_FABRIC_MISR_SIGNATURE_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the MISR signature. This register's contents are valid only when the TMODE and TEN fields in the FABRIC_TEST_INTERFACE_REG are set to 000000 and 1 respectively. The value that is stored in these registers is selected based on the channel selection and the slave way that is configured in the FABRIC_TEST_INTERFACE_REG.

AFAB_FABRIC_MISR_SIGNATURE_REG0

Bits	Name	Description
15:0	SIG0	SW : R Bits [15:0] of 64-bit MISR signature

0x01403520 AFAB_FABRIC_MISR_SIGNATURE_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the MISR signature. This register's contents are valid only when the TMODE and TEN fields in the FABRIC_TEST_INTERFACE_REG are set to 000000 and 1 respectively. The value that is stored in these registers is selected based on the channel selection and the slave way that is configured in the FABRIC_TEST_INTERFACE_REG

0x01403600+4*n AFAB_FABRIC_MASTER_CLOCK_HALT_REG_n, n=[0..5]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register is used to enable the low power mode clock halt & change functionality within the FABRIC master ports. To enable the clock halting functionality, the clock halt enable bit (CHTEN) needs to be set. The hysteresis timer value is a 10-bit timer (running on FCLK) value that is set using the CHTMR bits.

NOTE The register bits related to clock mode changing that exist in other fabrics are disabled in this fabric, in order to increase performance. These bits are marked as reserved and should not be modified by software.

NOTE A register is implemented for each master interface supported by the FABRIC .

AFAB_FABRIC_MASTER_CLOCK_HALT_REG_n

Bits	Name	Description
15	CHTEN	SW : RW Clock halt enable. Enables clock halt functionality for this port.

0x014038F8 AFAB_FABRIC_MONITOR_ENABLE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the trigger selection and enabling of event and cycle counters.

NOTE When PTRIG is set to use any of the external trigger signals, the external triggers incur a 2 cycle delay from the positive edge assertion of the signal to when the actual counters are enabled in the performance monitor. This allows synchronization of the external signals into the FABRIC clock domain.

0x01403924 AFAB_FABRIC_MONITOR_SELECTION_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the MID selection for event counter 3.

AFAB_FABRIC_MONITOR_SELECTION_UPPER_REG3

Bits	Name	Description
15:0	E3MID	SW : RW Event counter 3 MID selection (If MID filtering enabled)

0x01403928 AFAB_FABRIC_MONITOR_SELECTION_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the event and port selection and filtering criteria for event counter 4.

AFAB_FABRIC_MONITOR_SELECTION_LOWER_REG4

Bits	Name	Description
15:13	E4ES	SW : RW Event counter 4event selection 0x0: Read burst 4 (Master/slave) 0x1: Write burst 4 (Master/slave) 0x2: Address transfer count 4 (Master/slave) 0x3: Read transfer count 4 (Master/slave) 0x4: Write transfer count 4 (Master/slave) 0x5: Write (bufferable burst 4AHB Master only) 0x3: b110 ’ 3:b111: Reserved
12	SEL_SPDM_OUT0	SW : RW 0x0: Send total tenure overflow info (for tenure counter 0 to SPDM) 0x1: Send individual counter overflow info (for tenure counter 0 to SPDM)
11	E4MIDFEN	SW : RW Event counter 4 MID Filtering enable 0x0: Disabled 0x1: Enabled
10	E4INDFEN	SW : RW Event counter 4 Instruction/Data Filtering enable 0x0: Disabled 0x1: Enabled
9	E4IND	SW : RW Event counter 4 Instruction/Data selection 0x0: Data 0x1: Instruction

AFAB_FABRIC_MONITOR_SELECTION_LOWER_REG4 (cont.)

Bits	Name	Description
8:4	E4MPS	SW : RW Event counter 4 Master port selection 0x0: Selects Master 0 0x1: Selects Master 1 0x2: Selects Master 2 0x3: Selects Master 3 0x4: Selects Master 4 0x5: Selects Master 5 0x6: Selects Master 6 0x7: Selects Master 7 0x8: Selects Master 8 0x9: Selects Master 9 0xA: Selects Master 10 0xB: Selects Master 11 0xC: Selects Master 12 0xD: Selects Master 13 0xE: Selects Master 14 0xF: Selects Master 15 0x10: Selects Master 16 0x11: Selects Master 17 0x12: Selects Master 18 0x13: Selects Master 19 0x14: Selects Master 20 0x15: Selects Master 21 0x16: Selects Master 22 0x17: Selects Master 23 0x18: Selects Master 24 0x19: Selects Master 25 0x1A: Selects Master 26 0x1B: Selects Master 27 0x1C: Selects Master 28 0x1D: Selects Master 29 0x1E: Selects Master 30 0x1F: Selects Master 31

0x01403950 AFAB_FABRIC_MONITOR_CYCLE_COUNT_UPPER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the performance monitor cycle counter.

AFAB_FABRIC_MONITOR_CYCLE_COUNT_UPPER_REG

Bits	Name	Description
15:0	UCC	SW : RW MSB cycle count value The cycle count value is decremented once per FABRIC clock. The counter stops decrementing once the CC value equals 32:h0.

0x01403954 AFAB_FABRIC_MONITOR_CYCLE_COUNT_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the performance monitor cycle counter. If SW requires that the values when read do not change, when it reads this register, the value for all 32 bits of the cycle counter is stored. This allows for SW to read the lower reg and have the value match the exact cycle in which the upper reg was read.

AFAB_FABRIC_MONITOR_CYCLE_COUNT_LOWER_REG

Bits	Name	Description
15:0	LCC	SW : RW LSB cycle count value The cycle count value is decremented once per FABRIC clock. The counter stops decrementing once the CC value equals 32:h0.

0x01403958 AFAB_FABRIC_MONITOR_EVENT_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 0. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_LOWER_REG0

Bits	Name	Description
15:0	ECLT0	SW : RW Total events (lower 16-bit value)

0x0140395C AFAB_FABRIC_MONITOR_EVENT_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 0. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_UPPER_REG0

Bits	Name	Description
15:0	ECUT0	SW : RW Total events (upper 16-bit value)

0x01403960 AFAB_FABRIC_MONITOR_EVENT_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 1. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_LOWER_REG1

Bits	Name	Description
15:0	ECLT1	SW : RW Total events (lower 16-bit value)

0x01403964 AFAB_FABRIC_MONITOR_EVENT_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 1. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_UPPER_REG1

Bits	Name	Description
15:0	ECUT1	SW : RW Total events (upper 16-bit value)

0x01403968 AFAB_FABRIC_MONITOR_EVENT_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 2. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_LOWER_REG2

Bits	Name	Description
15:0	ECLT2	SW : RW Total events (lower 16-bit value)

0x0140396C AFAB_FABRIC_MONITOR_EVENT_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 2. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_UPPER_REG2

Bits	Name	Description
15:0	ECUT2	SW : RW Total events (upper 16-bit value)

0x01403970 AFAB_FABRIC_MONITOR_EVENT_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 3. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_LOWER_REG3

Bits	Name	Description
15:0	ECLT3	SW : RW Total events (lower 16-bit value)

0x01403974 AFAB_FABRIC_MONITOR_EVENT_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 3. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_UPPER_REG3

Bits	Name	Description
15:0	ECUT3	SW : RW Total events (upper 16-bit value)

0x01403978 AFAB_FABRIC_MONITOR_EVENT_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 4. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_LOWER_REG4

Bits	Name	Description
15:0	ECLT4	SW : RW Total events (lower 16-bit value)

0x0140397C AFAB_FABRIC_MONITOR_EVENT_UPPER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 4. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_UPPER_REG4

Bits	Name	Description
15:0	ECUT4	SW : RW Total events (upper 16-bit value)

0x01403980 AFAB_FABRIC_MONITOR_EVENT_LOWER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 5. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_LOWER_REG5

Bits	Name	Description
15:0	ECLT5	SW : RW Total events (lower 16-bit value)

0x01403984 AFAB_FABRIC_MONITOR_EVENT_UPPER_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 5. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_UPPER_REG5

Bits	Name	Description
15:0	ECUT5	SW : RW Total events (upper 16-bit value)

0x01403988 AFAB_FABRIC_MONITOR_EVENT_LOWER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 6. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_LOWER_REG6

Bits	Name	Description
15:0	ECLT6	SW : RW Total events (lower 16-bit value)

0x0140398C AFAB_FABRIC_MONITOR_EVENT_UPPER_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 6. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_UPPER_REG6

Bits	Name	Description
15:0	ECUT6	SW : RW Total events (upper 16-bit value)

0x01403990 AFAB_FABRIC_MONITOR_EVENT_LOWER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (lower 16-bits) for event counter 7. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_LOWER_REG7

Bits	Name	Description
15:0	ECLT7	SW : RW Total events (lower 16-bit value)

0x01403994 AFAB_FABRIC_MONITOR_EVENT_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of events (upper 16-bits) for event counter 7. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_UPPER_REG7

Bits	Name	Description
15:0	ECUT7	SW : RW Total events (upper 16-bit value)

0x014039A4 AFAB_FABRIC_TRIGGER_CONFIGURATION_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register configures the interface in which the trigger comparison is done on the address channel. TAMS: Selects one of the 32 interfaces from which the address channel transfer qualifiers are used to enable trigger matching.

AFAB_FABRIC_TRIGGER_CONFIGURATION_REG

Bits	Name	Description
15:7	RESERVED_BITS15_6	
6	TRGEN	SW : RW Trigger enable 1'b0 -disabled 0x1: enabled

AFAB_FABRIC_TRIGGER_CONFIGURATION_REG (cont.)

Bits	Name	Description
5:0	TAMS	SW : RW Trigger based on address channel on M/S Port #: 0x0: Master Port 0 0x1: Master Port 1 0x2: Master Port 2 0x3: Master Port 3 0x4: Master Port 4 0x5: Master Port 5 0x6: Master Port 6 0x7: Master Port 7 0x8: Master Port 8 0x9: Master Port 9 0xA: Master Port 10 0xB: Master Port 11 0xC: Master Port 12 0xD: Master Port 13 0xE: Master Port 14 0xF: Master Port 15 0x10: Master Port 16 0x11: Master Port 17 0x12: Master Port 18 0x13: Master Port 19 0x14: Master Port 20 0x15: Master Port 21 0x16: Master Port 22 0x17: Master Port 23 0x18: Master Port 24 0x19: Master Port 25 0x1A: Master Port 26 0x1B: Master Port 27 0x1C: Master Port 28 0x1D: Master Port 29 0x1E: Master Port 30 0x1F: Master Port 31 0x20: Slave Port 0 0x21: Slave Port 1 0x22: Slave Port 2 0x23: Slave Port 3 0x24: Slave Port 4 0x25: Slave Port 5 0x26: Slave Port 6 0x27: Slave Port 7 0x28: Slave Port 8 0x29: Slave Port 9 0x2A: Slave Port 10 0x2B: Slave Port 11 0x2C: Slave Port 12

AFAB_FABRIC_TRIGGER_CONFIGURATION_REG (cont.)

0x014039AC AFAB_FABRIC_TRIGGER_REG_0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the upper address which is used as comparison for the trigger feature of the on-chip trace or performance monitor function. TUADDR[15:0] will be compared against Address[31:16].

AFAB_FABRIC_TRIGGER_REG_0

Bits	Name	Description
15:0	TUADDR	SW : RW Address bits[31:16]

0x014039B0 AFAB_FABRIC_TRIGGER_REG_1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the lower address which is used as comparison for the trigger feature of the performance monitor function. TLADDR[15:0] will be compared against Address[15:0].

AFAB_FABRIC_TRIGGER_REG_1

Bits	Name	Description
15:0	TLADDR	SW : RW Address bits[15:0]

0x014039B4 AFAB_FABRIC_TRIGGER_REG_2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the lower address which is used as comparison for the trigger feature of the performance monitor function.

AFAB_FABRIC_TRIGGER_REG_2

Bits	Name	Description
15:0	AMID	SW : RW AMID / HMID

0x014039B8 AFAB_FABRIC_TRIGGER_REG_3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the address channel transfer qualifiers which are used as comparison for the trigger feature of the performance monitor function.

AFAB_FABRIC_TRIGGER_REG_3

Bits	Name	Description
15:12	RESERVED_BITS15_12	
11	AOOOWR	SW : RW Out-of-order write
10	AOOORD	SW : RW Out-of-order read
9:3	ATID	SW : RW Address TID (If ATID is less than 7 bits, the upper bits must be set to 0)
2	AFULL	SW : RW Full Transfer
1	RESERVED_BIT1	
0	APROTNS	SW : RW Protection level

0x014039BC AFAB_FABRIC_TRIGGER_REG_4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register defines the address channel transfer qualifiers which are used as comparison for the trigger feature of the performance monitor function.

AFAB_FABRIC_TRIGGER_REG_4

Bits	Name	Description
15:12	ATYPE	SW : RW Memory type attributes
11:10	ALOCK	SW : RW Lock type
9	RESERVED_BITS9	
8	ABURST	SW : RW Burst type
7:5	ASIZE	Burst size
4:1	ALEN	Burst length
0	AWRITE	Burst direction

0x014039C0 AFAB_FABRIC_TRIGGER_MASK_REG_0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR0.

AFAB_FABRIC_TRIGGER_MASK_REG_0

Bits	Name	Description
15:0	FTTR0_MASK	SW : RW Bit mask field for FTTR0 Enable: 1 Disable: 0

0x014039C4 AFAB_FABRIC_TRIGGER_MASK_REG_1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR1.

AFAB_FABRIC_TRIGGER_MASK_REG_1

Bits	Name	Description
15:0	FTTR1_MASK	SW : RW Bit mask field for FTTR1 Enable: 1 Disable: 0

0x014039C8 AFAB_FABRIC_TRIGGER_MASK_REG_2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR2.

AFAB_FABRIC_TRIGGER_MASK_REG_2

Bits	Name	Description
15:0	FTTR2_MASK	SW : RW Bit mask field for FTTR2 Enable: 1 Disable: 0

0x014039CC AFAB_FABRIC_TRIGGER_MASK_REG_3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR3.

AFAB_FABRIC_TRIGGER_MASK_REG_3

Bits	Name	Description
15:0	FTTR3_MASK	SW : RW Bit mask field for FTTR3 Enable: 1 Disable: 0

0x014039D0 AFAB_FABRIC_TRIGGER_MASK_REG_4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the mask field for FTTR4.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FTTR4.

AFAB_FABRIC_TRIGGER_MASK_REG_4

Bits	Name	Description
15:0	FTTR4_MASK	SW : RW Bit mask field for FTTR4 Enable: 1 Disable: 0

0x014039D4 AFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter0.

AFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG0

Bits	Name	Description
15:0	E0AL	SW : RW LSB address value Event counter 0 address selection (if address range filtering enabled)

0x014039D8 AFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter0.

AFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG0

Bits	Name	Description
15:0	E0AU	SW : RW MSB address value Event counter 0 address selection (if address range filtering enabled)

0x014039DC AFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter1.

AFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG1

Bits	Name	Description
15:0	E1AL	SW : RW LSB address value Event counter 1address selection (if address range filtering enabled)

0x014039E0 AFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter1.

AFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG1

Bits	Name	Description
15:0	E1AU	SW : RW MSB address value Event counter 1address selection (if address range filtering enabled)

0x014039E4 AFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter2.

AFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG2

Bits	Name	Description
15:0	E2AL	SW : RW LSB address value Event counter 2 address selection (if address range filtering enabled)

0x014039E8 AFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter2.

AFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG2

Bits	Name	Description
15:0	E2AU	SW : RW MSB address value Event counter 2 address selection (if address range filtering enabled)

0x014039EC AFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter3.

AFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG3

Bits	Name	Description
15:0	E3AL	SW : RW LSB address value Event counter 3 address selection (if address range filtering enabled)

0x014039F0 AFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for event counter3.

AFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG3

Bits	Name	Description
15:0	E3AU	SW : RW MSB address value Event counter 3 address selection (if address range filtering enabled)

0x014039F4 AFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address filter value for event counter4.

AFAB_FABRIC_MONITOR_ADDRESS_LOWER_REG4

Bits	Name	Description
15:0	E4AL	SW : RW LSB address value Event counter 4 address selection (if address range filtering enabled)

0x014039F8 AFAB_FABRIC_MONITOR_ADDRESS_UPPER_REG4

15:0	E3MM	SW : RW MID Mask value for event counter 3

0x01403A80 AFAB_FABRIC_MONITOR_MID_MASK_REG4

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 4.

AFAB_FABRIC_MONITOR_MID_MASK_REG4

Bits	Name	Description
15:0	E4MM	SW : RW MID Mask value for event counter 4

0x01403A84 AFAB_FABRIC_MONITOR_MID_MASK_REG5

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 15.

AFAB_FABRIC_MONITOR_MID_MASK_REG5

Bits	Name	Description
15:0	E5MM	SW : RW MID Mask value for event counter 5

0x01403A88 AFAB_FABRIC_MONITOR_MID_MASK_REG6

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 6.

AFAB_FABRIC_MONITOR_MID_MASK_REG6

Bits	Name	Description
15:0	E6MM	SW : RW MID Mask value for event counter 6

0x01403A8C AFAB_FABRIC_MONITOR_MID_MASK_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for event counter 7.

AFAB_FABRIC_MONITOR_MID_MASK_REG7

Bits	Name	Description
15:0	E7MM	SW : RW MID Mask value for event counter 7

0x01403AA0 AFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (lower 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_BEATS_LOWER_REG0

Bits	Name	Description
15:0	EBTL0	SW : RW Total # beats (lower 16-bit value)

0x01403AA4 AFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (mid 16-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events. Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_BEATS_MID_REG0

Bits	Name	Description
15:0	EBTM0	SW : RW Total # beats (middle 16-bit value)

0x01403AA8 AFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of beats (upper 4-bits) associated with events for event counter 0. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_BEATS_UPPER_REG0

Bits	Name	Description
15:0	EBYL7	SW : RW Total bytes (lower 16-bit value)

0x01403B58 AFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (mid 16-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_BYTES_MID_REG7

Bits	Name	Description
15:0	EBYM7	SW : RW Total bytes (middle 16-bit value)

0x01403B5C AFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG7

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the total number of bytes (upper 11-bits) associated with events for event counter 7. This value is valid only for Address Transfer Count event, Read Burst event and Write Burst events.

Note that although the register is writable, SW should not write this field. The field is made writable only for HW debug/verification.

AFAB_FABRIC_MONITOR_EVENT_BYTES_UPPER_REG7

Bits	Name	Description
15:11	RESERVED_15_11	Reserved
10:0	EBYU7	SW : RW Total bytes (upper 11-bit value)

0x01403B60 AFAB_FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the tenure selection, port selection and filtering criteria for the performance monitor tenure counter 0.

AFAB_FABRIC_MONITOR_TENURE_SELECTION_LOWER_REG0

Bits	Name	Description

Bits	Name	Description
15:0	T3MID	SW : RW Tenure counter 3 MID selection (If MID filtering enabled)

0x01403B80 AFAB_FABRIC_MONITOR_MIN_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR0 and measured in tenure counter 0.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

AFAB_FABRIC_MONITOR_MIN_REG0

Bits	Name	Description
15:0	MIN0	SW : R Minimum value of tenure, in tenure counter 0

0x01403B84 AFAB_FABRIC_MONITOR_MIN_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR1 and measured in tenure counter 1.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

AFAB_FABRIC_MONITOR_MIN_REG1

Bits	Name	Description
15:0	MIN1	SW : R Minimum value of tenure, in tenure counter 1

0x01403B88 AFAB_FABRIC_MONITOR_MIN_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR2 and measured in tenure counter 2.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

AFAB_FABRIC_MONITOR_MIN_REG2

Bits	Name	Description
15:0	MIN2	SW : R Minimum value of tenure, in tenure counter 2

0x01403B8C AFAB_FABRIC_MONITOR_MIN_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x01FF

This register contains the minimum value of the tenure that is selected using FPTSLR3 and measured in tenure counter 3.

NOTE The reset value for this register is set to 0x01FF, equivalent to 8191 clock cycles (which is the maximum tenure value that can be captured by the performance monitor). The value is used as an initial comparison against the captured tenure. If the value of this register remains at 0x01FF after the performance monitor has been set-up and tenure measurements have been completed, it indicates that no tenures have occurred.

The tenure values cannot be relied on to be accurate if an overflow condition occurs.

Bits	Name	Description
15:0	T1AL	SW : RW LSB address value Tenure counter 1 address mask

0x01403BDC AFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 1.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG1

Bits	Name	Description
15:0	T1AU	SW : RW MSB address value Tenure counter 1 address mask

0x01403BE0 AFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 2.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG2

Bits	Name	Description
15:0	T2AL	SW : RW LSB address value Tenure counter 2 address mask

0x01403BE4 AFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 2.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG2

Bits	Name	Description
15:0	T2AU	SW : RW MSB address value Tenure counter 2 address mask

0x01403BE8 AFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 3.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_LOWER_REG3

Bits	Name	Description
15:0	T3AL	SW : RW LSB address value Tenure counter 3 address mask

0x01403BEC AFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address filter value for tenure counter 3.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_UPPER_REG3

Bits	Name	Description
15:0	T3AU	SW : RW MSB address value Tenure counter 3 address mask

0x01403BF0 AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR0.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG0

Bits	Name	Description
15:0	T0AML	SW : RW LSB address value Tenure counter 0 address mask

0x01403BF4 AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 0.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR0.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG0

Bits	Name	Description
15:0	T0AMU	SW : RW MSB address mask value Tenure counter 0 address mask

0x01403BF8 AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR1.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG1

Bits	Name	Description
15:0	T1AML	SW : RW LSB address value Tenure counter 1 address mask

0x01403BFC AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 1.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR1.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG1

Bits	Name	Description
15:0	T1AMU	SW : RW MSB address mask value Tenure counter 1 address mask

0x01403C00 AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR2.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG2

Bits	Name	Description
15:0	T2AML	SW : RW LSB address value Tenure counter 2 address mask

0x01403C04 AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 2.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR2.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG2

Bits	Name	Description
15:0	T2AMU	SW : RW MSB address mask value Tenure counter 2 address mask

0x01403C08 AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the address mask value for tenure counter 3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTALR3.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_LOWER_REG3

Bits	Name	Description
15:0	T3AML	SW : RW LSB address value Tenure counter 3 address mask

0x01403C0C AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the address mask value for tenure counter 3.

Setting a mask bit to 1'b1 indicates that the selected field is not matched against the corresponding bit in FPTAUR3.

AFAB_FABRIC_MONITOR_TENURE_ADDRESS_MASK_UPPER_REG3

Bits	Name	Description
15:0	T3AMU	SW : RW MSB address mask value Tenure counter 3 address mask

0x01403C10 AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG 0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 0 that were longer than the specified threshold for tenure counter 0.

AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG0

Bits	Name	Description
15:0	T0ATCL	SW : R LSB count value

0x01403C14 AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 0 that were longer than the specified threshold for tenure counter 0.

AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG0

Bits	Name	Description
15:0	T0ATCU	SW : R MSB count value

0x01403C18 AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG 1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 1 that were longer than the specified threshold for tenure counter 1.

AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG1

Bits	Name	Description
15:0	T1ATCL	SW : R LSB count value

0x01403C1C AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 1 that were longer than the specified threshold for tenure counter 1.

AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG1

Bits	Name	Description
15:0	T1ATCU	SW : R MSB count value

0x01403C20 AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 2 that were longer than the specified threshold for tenure counter 2.

AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG2

Bits	Name	Description
15:0	T2ATCL	SW : R LSB count value

0x01403C24 AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 2 that were longer than the specified threshold for tenure counter 2.

AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG2

Bits	Name	Description
15:0	T2ATCU	SW : R MSB count value

0x01403C28 AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG 3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the count of tenures measures in tenure counter 3 that were longer than the specified threshold for tenure counter 3.

AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_LOWER_REG3

Bits	Name	Description
15:0	T3ATCL	SW : R LSB count value

0x01403C2C AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the count of tenures measured in tenure counter 3 that were longer than the specified threshold for tenure counter 3.

AFAB_FABRIC_MONITOR_TENURE_ABOVE_THRESHOLD_COUNT_UPPER_REG3

Bits	Name	Description
15:0	T3ATCU	SW : R MSB count value

0x01403C30 AFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 0 are measured.

AFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG0

Bits	Name	Description
12:0	T0TV	SW : RW Tenure counter 0 threshold value

0x01403C34 AFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 1 are measured.

AFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG1

Bits	Name	Description
12:0	T1TV	SW : RW Tenure counter 1 threshold value

0x01403C38 AFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 2 are measured.

AFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG2

Bits	Name	Description
12:0	T2TV	SW : RW Tenure counter 2 threshold value

0x01403C3C AFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains the threshold against which all tenure values in tenure counter 3 are measured.

AFAB_FABRIC_MONITOR_TENURE_THRESHOLD_VALUE_REG3

Bits	Name	Description
12:0	T3TV	SW : RW Tenure counter 3 threshold value

0x01403C40 AFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 0.

AFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG0

Bits	Name	Description
15:0	T0MM	SW : RW MID Mask value

0x01403C44 AFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 1.

AFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG1

Bits	Name	Description
15:0	T1MM	SW : RW MID Mask value

0x01403C48 AFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 2.

AFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG2

Bits	Name	Description
15:0	T2MM	SW : RW MID Mask value

0x01403C4C AFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains MID mask value for tenure counter 3.

AFAB_FABRIC_MONITOR_TENURE_MID_MASK_REG3

Bits	Name	Description
15:0	T3MM	SW : RW MID Mask value

0x01403C50 AFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure0 register.

AFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG0

Bits	Name	Description
15:0	TLC0	SW : R LSB count value Incremented every time a tenure under observation completes in tenure counter 0

0x01403C54 AFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure0 register.

AFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG0

Bits	Name	Description
15:0	TUC0	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 0

0x01403C58 AFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure1 register.

AFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG1

Bits	Name	Description

0x01403C5C AFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure1 register.

AFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG1

Bits	Name	Description
15:0	TUC1	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 1

0x01403C60 AFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure2 register.

AFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG2

Bits	Name	Description
15:0	TLC2	SW : R LSB count value Incremented every time a tenure under observation completes in tenure counter 2

0x01403C64 AFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure2 register.

AFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG2

Bits	Name	Description
15:0	TUC2	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 2

0x01403C68 AFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenure updations to total_tenure3 register.

AFAB_FABRIC_MONITOR_TENURE_COUNT_LOWER_REG3

Bits	Name	Description
15:0	TLC3	SW : R LSB count value Incremented every time a tenure under observation completes in tenure counter 3

0x01403C6C AFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenure updations to total_tenure3 register.

AFAB_FABRIC_MONITOR_TENURE_COUNT_UPPER_REG3

Bits	Name	Description
15:0	TUC3	SW : R MSB count value TUC,TLC value incremented every time a tenure under observation completes in tenure counter 3

0x01403C70 AFAB_FABRIC_MONITOR_TENURE_PICK_PORTS_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the main port and other port selection for the 4 event counters.

AFAB_FABRIC_MONITOR_TENURE_PICK_PORTS_REG

Bits	Name	Description
15:4	RESERVED_15_4	Reserved
3	T3PP	SW : RW Tenure counter 3 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T3MP or T3SW
2	T2PP	SW : RW Tenure counter 2 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T2MP or T2SW

AFAB_FABRIC_MONITOR_TENURE_PICK_PORTS_REG (cont.)

Bits	Name	Description
1	T1PP	SW : RW Tenure counter 1 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T1MP or T1SW
0	T0PP	SW : RW Tenure counter 0 port combination selection 0x0: Filtering based on other port disabled 0x1: Filtering based on other port selected by T0MP or T0SW

0x01403C80 AFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 0.

AFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG0

Bits	Name	Description
15:0	LTOTU0	SW : RW LSB total union value of tenure, in tenure counter 0

0x01403C84 AFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG0

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 0.

AFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG0

Bits	Name	Description
15:0	UTOTU0	SW : RW MSB total union value of tenure, in tenure counter 0

0x01403C88 AFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 1.

AFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG1

Bits	Name	Description
15:0	LTOTU1	SW : RW LSB total union value of tenure, in tenure counter 1

0x01403C8C AFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG1

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 1.

AFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG1

Bits	Name	Description
15:0	UTOTU1	SW : RW MSB total union value of tenure, in tenure counter 1

0x01403C90 AFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 2.

AFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG2

Bits	Name	Description
15:0	LTOTU2	SW : RW LSB total union value of tenure, in tenure counter 2

0x01403C94 AFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG2

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 2.

AFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG2

Bits	Name	Description
15:0	UTOTU2	SW : RW MSB total union value of tenure, in tenure counter 2

0x01403C98 AFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total tenure (considering pipelining) in tenure counter 3.

AFAB_FABRIC_MONITOR_TENURE_UNION_LOWER_REG3

Bits	Name	Description
15:0	LTOTU3	SW : RW LSB total union value of tenure, in tenure counter 3

0x01403C9C AFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total tenure (considering pipelining) in tenure counter 3.

AFAB_FABRIC_MONITOR_TENURE_UNION_UPPER_REG3

Bits	Name	Description
15:0	UTOTU3	SW : RW MSB total union value of tenure, in tenure counter 3

0x01403CA0 AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures measured in tenure counter 0, that were pipelined.

AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG0

Bits	Name	Description

0x01403CA4 AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures measured in tenure counter 0, that were pipelined.

AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG0

Bits	Name	Description
15:0	TUCP0	SW : R MSB count value TUCP0,TLCP0 value incremented every time a pipelined tenure completes in tenure counter 0

0x01403CA8 AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures measured in tenure counter 1, that were pipelined.

AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG1

Bits	Name	Description

0x01403CAC AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures measured in tenure counter 1, that were pipelined.

AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG1

Bits	Name	Description
15:0	TUCP1	SW : R MSB count value TUCP1,TLCP1 value incremented every time a pipelined tenure completes in tenure counter 1

0x01403CB0 AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures measured in tenure counter 2, that were pipelined.

AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG2

Bits	Name	Description

0x01403CB4 AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures measured in tenure counter 2, that were pipelined.

AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_UPPER_REG2

Bits	Name	Description
15:0	TUCP2	SW : R MSB count value TUCP1,TLCP1 value incremented every time a pipelined tenure completes in tenure counter 2

0x01403CB8 AFAB_FABRIC_MONITOR_TENURE_COUNT_PIPELINED_LOWER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

AFAB_FABRIC_MONITOR_TENURE_MAX_COUNT_PIPELINED_REG3

Bits	Name	Description
15:0	TMCP3	SW : R This is the maximum number of tenures pipelined at the same time in tenure counter 3

0x01403CD0 AFAB_FABRIC_MONITOR_INFLIGHT_TENURE_CORRECTION_MODE_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register controls the facility to correlate a particular event counter to a tenure counter. When the tenure results of a counter are reset during a monitoring window (to account for errors due to starting the monitor in the middle of traffic), the event counters too get reset if the correlation between them is enabled.

NOTE PCORR bit (bit 0) should not be set for APQ8064.

AFAB_FABRIC_MONITOR_INFLIGHT_TENURE_CORRECTION_MODE_REG

Bits	Name	Description
15:9	RESERVED_15_9	Reserved Bits
8	EC7COR	SW : RW 0x1: Link Event Counter 7 to Tenure Counter 3 0x0: Event Counter 7 is independent

AFAB_FABRIC_MONITOR_INFLIGHT_TENURE_CORRECTION_MODE_REG (cont.)

Bits	Name	Description
7	EC6COR	SW : RW 0x1: Link Event Counter 6 to Tenure Counter 2 0x0: Event Counter 6 is independent
6	EC5COR	SW : RW 0x1: Link Event Counter 5 to Tenure Counter 1 0x0: Event Counter 5 is independent
5	EC4COR	SW : RW 0x1: Link Event Counter 4 to Tenure Counter 0 0x0: Event Counter 4 is independent
4	EC3COR	SW : RW 0x1: Link Event Counter 3 to Tenure Counter 3 0x0: Event Counter 3 is independent
3	EC2COR	SW : RW 0x1: Link Event Counter 2 to Tenure Counter 2 0x0: Event Counter 2 is independent
2	EC1COR	SW : RW 0x1: Link Event Counter 1 to Tenure Counter 1 0x0: Event Counter 1 is independent
1	EC0COR	SW : RW 0x1: Link Event Counter 0 to Tenure Counter 0 0x0: Event Counter 0 is independent
0	PCORR	SW : RW This is the enable for tenure correction mode This bit SHOULD NOT be set for APQ8064.

0x01403CE0 AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 0 that correspond to out-of-order transactions.

AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG0

Bits	Name	Description
15:0	TOLC0	SW : R LSB count value Incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 0

0x01403CE4 AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 0 that correspond to out-of-order transactions.

AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG0

Bits	Name	Description
15:0	TOUC0	SW : R MSB count value TOUC,TOLC value incremented every time a tenure (of an out-of-order transaction) under observation completes in tenure counter 0

0x01403CE8 AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 1 that correspond to out-of-order transactions.

AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG1

Bits	Name	Description
15:0	TOLC1	SW : R LSB count value Incremented every time a tenure (of an out-of-order transaction) under observation completes in tenure counter 1

0x01403CEC AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 1 that correspond to out-of-order transactions.

AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG1

Bits	Name	Description
15:0	TOUC1	SW : R MSB count value TOUC,TOLC value incremented every time a tenure (of an out-of-order transaction) under observation completes in tenure counter 1

0x01403CF0 AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 2 that correspond to out-of-order transactions.

AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG2

Bits	Name	Description
15:0	TOLC2	SW : R LSB count value Incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 2

0x01403CF4 AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG2

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 2 that correspond to out-of-order transactions.

15:0	TOUC2	SW : R MSB count value TOUC,TOLC value incremented every time a tenure (of an out of order transaction) under observation completes in tenure counter 2

0x01403CF8 AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the total count of tenures counted by tenure counter 3 that correspond to out-of-order transactions.

AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_LOWER_REG3

Bits	Name	Description
15:0	TOLC3	SW : R LSB count value Incremented every time a tenure (of an out-of-order transaction) under observation completes in tenure counter 3

0x01403CFC AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG3

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16 of the total count of tenures counted by tenure counter 3 that correspond to out-of-order transactions

AFAB_FABRIC_MONITOR_TENURE_COUNT_OOO_UPPER_REG3

Bits	Name	Description
15:0	TOUC3	SW : R MSB count value TOUC,TOLC value incremented every time a tenure (of an out-of-order transaction) under observation completes in tenure counter 3

0x01403D00 AFAB_FABRIC_MONITOR_RTR_STATUS_REG

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains 4 status bits (one for each performance monitor tenure counter). Each bit indicates whether the monitoring results pertaining to the associated tenure counter have been reset (to account for errors due to starting the monitor in the middle of traffic) or not.

AFAB_FABRIC_MONITOR_RTR_STATUS_REG

Bits	Name	Description
15:4	RESERVED15_4	Reserved
3	TC3_RESET	SW: R When set, this bit indicates that tenure counter 3 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic
2	TC2_RESET	SW: R When set, this bit indicates that tenure counter 2 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic
1	TC1_RESET	SW: R When set, this bit indicates that tenure counter 1 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic
0	TC0_RESET	SW: R When set, this bit indicates that tenure counter 0 results have been reset by the design during the monitoring window, to account for errors due to starting the monitor in the middle of traffic

0x01403D04 AFAB_FABRIC_MONITOR_IDLE_INTERNAL_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 0 to Master 15). A value of 1 indicates that the internally generated idle status is to be used to determine when to reset the performance monitor tenure counter results (resetting the tenure counter results is needed to compensate for errors due to enabling the tenure counters in the middle of traffic). A value of 0 will indicate that the primary idle input is to be used instead.

NOTE These settings will have an effect only in case of AXI master ports.

AFAB_FABRIC_MONITOR_IDLE_INTERNAL_LOWER_REG

Bits	Name	Description
15	M15_PII	SW : RW 0x1: The internally generated idle status for Master 15 will be used by the performance monitor 0x0: Primary input I_AXI_M15_IDLE is used by the performance monitor

AFAB_FABRIC_MONITOR_IDLE_INTERNAL_LOWER_REG (cont.)

Bits	Name	Description
14	M14_PII	SW : RW 0x1: The internally generated idle status for Master 14 will be used by the performance monitor 0x0: Primary input I_AXI_M14_IDLE is used by the performance monitor
13	M13_PII	SW : RW 0x1: The internally generated idle status for Master 13 will be used by the performance monitor 0x0: Primary input I_AXI_M13_IDLE is used by the performance monitor

0x01403D0C AFAB_FABRIC_MONITOR_RTR_MASK_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains 1 bit for each of the tenure counters that controls the RTR assertion and clearing of the monitoring results pertaining to the associated tenure counter to account for errors due to starting the monitor in the middle of traffic. A value of 1 indicates that RTR will not be asserted.

AFAB_FABRIC_MONITOR_RTR_MASK_REG

Bits	Name	Description
31:4	RESERVED_31_4	Reserved
3	RTR_MASK_3	SW : RW 0x1: No RTR will be asserted for Tenure Counter 3 0x0: The design is allowed to assert RTR for Tenure Counter 3
2	RTR_MASK_2	SW : RW 0x1: No RTR will be asserted for Tenure Counter 2 0x0: The design is allowed to assert RTR for Tenure Counter 2
1	RTR_MASK_1	SW : RW 0x1: No RTR will be asserted for Tenure Counter 1 0x0: The design is allowed to assert RTR for Tenure Counter 1
0	RTR_MASK_0	SW : RW 0x1: No RTR will be asserted for Tenure Counter 0 0x0: The design is allowed to assert RTR for Tenure Counter 0

0x01403D10 AFAB_FABRIC_MASTER_SELECT_HYST_LOWER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 0 to Master 15). A value of 1 indicates that the hysteresis timer value is used to keep the master segmented clock on. A value of 0 indicates that the hysteresis timer will not be used in the master segmented clock on.

AFAB_FABRIC_MASTER_SELECT_HYST_LOWER_REG

Bits	Name	Description
15	M15_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.

AFAB_FABRIC_MASTER_SELECT_HYST_LOWER_REG (cont.)

Bits	Name	Description
14	M14_SEL_HYST	SW : RW 0x1: Hysteresis timer is used to keep segmented FCLK on for this master 0x0: Hysteresis timer is not used for this master.

0x01403D1C AFAB_FABRIC_MASTER_USE_CG_DISABLE_UPPER_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0xFFFF

This register contains 1 bit for each of the masters (Master 16 to Master 31). A value of 1 indicates that the FMCHR bit 15 can be used to always keep the master segmented clock on, hence disabling HW dynamic clock gating. A value of 0 indicates that the FMCHR bit cannot be used to disable HW dynamic clock gating.

0x01403D38 AFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 15:0 of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter3.

AFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_LOWER_REG3

Bits	Name	Description
15:0	RTENL3	SW : RW Contains the LSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 3

0x01403D3C AFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG3

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

This register contains bits 31:16of the number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter3.

AFAB_FABRIC_MONITOR_CYCLECOUNT_TENURES_ABV16_UPPER_REG3

Bits	Name	Description
15:0	RTENU3	SW : RW Contains the MSB of number of cycles for which there were more than 16 outstanding tenures for the port tracked by tenure counter 3

8.5 Application Fabric M2VMT Registers (0x01400000 AFAB_BASE)

This section contains the Application Fabric M2VMT registers.

8.5.1 M2VMT registers map with generic permutations

REMOVE_M2VMT_RPU = '0' &
REMOVE_M2VMT_SYND_REG_IF_RPU_IS_PRESENT='0'

The normal default use model uses M2VMT_RPU='0' and REMOVE_M2VMT_SYND_REG_IF_RPU_PRESENT= '0'. In this default configuration, local RPU and associated syndrome registers and interrupt support registers are available.

See Table 1-3 Bases in Address Order

Table 8-3 Application Fabric M2VMT Registers Table

Register	Address / Range	Description	Type	Default
M2VMT_M2VRv [4:0]	x000 to x7FC	Defines VMID value associated with the M2VMT index:		
Where v = NUM_M2VMT_ENTRIES from the design generic	R/W	x		
Reserved	x800 to xFF0	Reserved	X	X
M2VMT_REV	xFF4	M2VMT Revision Register	RO	'10000000'b
M2VMT_IDR [8:0]	xFF8	ID Register	RO	NUM_M2VMT_ENTRIES
Reserved	xFFC	Reserved	X	x

8.5.2 M2VMT VMID mapping registers

0x01404000+ 0x4*v AFAB_M2VMT_M2VMRv_0, v=[0..1]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where v= NUM_M2VMT_ENTRIES from the design generics

AFAB_M2VMT_M2VMRv_0

Bits	Name	Description
31:5	RESERVED	v= NUM_M2VMT_ENTRIES from the design generic/parameter.
4:0	VMID	SW : RW Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRv address associations.

0x01404FF4 AFAB_M2VMT_REV_0

Type: Read
Clock: FABRIC_CLOCK
Reset State: '10000000'b

Reports the revision information for the M2VMT core and wrapper.

AFAB_M2VMT_REV_0

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	SW : R Major variant field
3:0	MINOR	SW : R Minor variant field.

0x01404FF8 AFAB_M2VMT_IDR_0

Type: Read
Clock: FABRIC_CLOCK
Reset State: M2VMTSIZE

Reports the size of the M2VMT table. It is a read-only register.

AFAB_M2VMT_IDR_0

Bits	Name	Description
31:9	RESERVED	M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.

AFAB_M2VMT_IDR_0 (cont.)

Bits	Name	Description
8:0	M2VMTSIZE	SW : R M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping.

0x01405000+0x4*v AFAB_M2VMT_M2VMRv_1, v=[0..1]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Undefined

M2VMT_M2VMRn registers are used to map from the input client port M2VCBMT index to a context bank and VMID.

Where v= NUM_M2VMT_ENTRIES from the design generics

AFAB_M2VMT_M2VMRv_1

Bits	Name	Description
31:5	RESERVED	v= NUM_M2VMT_ENTRIES from the design generic/parameter.
4:0	VMID	SW : RW Virtual machine ID Defines VMID value associated with the M2VMT index. Maximum of 512 entries (9 bit M2VMT index). Initialization software must be aware of specific bit-level assignment of the signal that makes up the M2VMT index in order to make the proper master to M2VMT_M2VRv address associations.

0x01405FF4 AFAB_M2VMT_REV_1

Type: Read
Clock: FABRIC_CLOCK
Reset State: '10000000'b

Reports the revision information for the M2VMT core and wrapper.

AFAB_M2VMT_REV_1

Bits	Name	Description
31:8	RESERVED	
7:4	MAJOR	SW : R Major variant field
3:0	MINOR	SW : R Minor variant field.

0x01405FF8 AFAB_M2VMT_IDR_1

Type: Read
Clock: FABRIC_CLOCK
Reset State: M2VMTSIZE

Reports the size of the M2VMT table. It is a read-only register.

AFAB_M2VMT_IDR_1

Bits	Name	Description
31:9	RESERVED	M2VMTSIZE=NUM_M2VMT_ENTRIES from the design generic/parameter.
8:0	M2VMTSIZE	SW : R M2VMTSIZE[8:0] Indicates actual number of M2VMT entries. Minimum of 1 and maximum of 512 entries is the valid range. This value is the same as the bit width of the M2VMT index input (maximum value is 9). [8:0]=M2VMTSIZE=NUM_M2VMT_ENTRIES Allows for up to a 7-bit MID field, plus NS-prot. 1 bit of the MID field must be used by the System MMU itself for hardware page table walk. Must also take into account any use of R/W or other fields used to select mapping.

8.6 Smart Peripheral Subsystem Fabric Registers (0x01500000 DAY_CFG_BASE)

This section contains the Smart Peripheral Subsystem Fabric registers.

8.6.1 Smart Peripheral Subsystem Configuration Registers

0x01500000 DAY_CFG_FABRIC_ID_REVISION_REG0

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x2840

This register contains the upper 16-bits of the core ID and revision number and contains the Major/Minor Revision information, as well as the site ID where the core was developed.

DAY_CFG_FABRIC_ID_REVISION_REG0

Bits	Name	Description
15:13	MAJ	SW : R Major Revision 0x1: Initial Release
12:10	MIN	SW : R Minor Revision 0x0: Voyager 0x1: Phantom 0x2: Blackbird Rev2.0
9:6	SITE	SW : R Site ID 0x1: RTP
5:0	RESERVED_BITS_5_0	

0x01500004 DAY_CFG_FABRIC_ID_REVISION_REG1

Type: Read
Clock: FABRIC_CLOCK
Reset State: 0x0001

This register contains the lower 16-bits of the core ID and revision number and contains the Core ID number.

DAY_CFG_FABRIC_ID_REVISION_REG1

Bits	Name	Description
15:8	RESERVED_BITS_3_2	

DAY_CFG_FABRIC_ID_REVISION_REG1 (cont.)

Bits	Name	Description
7:0	ID	SW : R Core ID 0x1: FABRIC

0x01500008 DAY_CFG_FABRIC_CONFIGURATION_REG

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0002

This register defines the operating frequency, power down mode for the performance monitor, as well as the decode error and performance monitor cycle counter interrupts.

The ISYND bits contain the interrupt syndrome. If more than one interrupt type occurs, more than one bit will be set. For example, if a decode error occurs and the performance monitor cycle-counter expires, the ISYND field will contain the value 3'b101. Performance monitor interrupts are only generated when the interrupt enable (PMIE) bit is set for the interrupt type.

If multiple decode errors occur, only the first error is recorded. If multiple decode errors occur at the same clock cycle, only a single error is considered, with Master 0 having the highest priority and Master 2 the lowest priority.

The determination of the time an error is recorded in the Fabric Error Status Register (FESR) is based on the following criteria:

For Reads: When Mn_RLAST is asserted.

For Writes: When Mn_BRESP is asserted.

Therefore, if two different masters make requests with invalid addresses to the FABRIC, the master which receives the RLAST or BRESP first for the invalid transaction, is recorded in the FESR. See FABRIC_ERROR_STATUS_REG_1 for information that is captured when a decode error occurs. The address of the request which caused a decode error is captured in the FABRIC_ERROR_UPPER_ADDR_REG and the FABRIC_ERROR_LOWER_ADDR_REG. If they happen simultaneously, the master priority is used to resolve which error is recorded in a fixed priority scheme. Master 0 has highest priority and Master 31 has the lowest priority.

NOTE If the master does not have RREADY or BREADY asserted by default (i.e., it is not able to receive all responses for outstanding requests and may throttle the FABRIC), the FABRIC_Interrupt generation may precede the return of the last read data beat or the write response.

To clear the interrupt, the ISYND bits are required to be written to 3'b000.

The performance monitor event/tenure overflow condition is indicated when the ISYND value is 010. An event overflow occurs when the event counter has reached its maximum value. A tenure overflow condition occurs:

When the tenure counter has reached its maximum value

OR

More than 16 tenures are outstanding, since the performance monitor implements only 16 counters for tenure tracking. Note that if the tenure overflows, values read from the performance monitors for min/max/total/last tenure will no longer be valid as values recorded after the overflow will be incorrect.

DAY_CFG_FABRIC_CONFIGURATION_REG

Bits	Name	Description
15:7	RESERVED_BITS_15_7	Reserved Bits
6:4	ISYND	SW : RW Interrupt syndrome* 0x0: No/Clear (interrupt) 0x1: Cycle counter expired (Perfmon) 0x2: Event/tenure overflow (Perfmon) 0x4: Decode error detected 0x5: MPU Error 0x6: Timeout Error (SPB)
3:2	RESERVED_BITS_3_2	
1	PPDM	SW : RW Performance monitor power down/disable mode 0x0: Monitor Enabled 0x1: Monitor Disabled (Gates clocks to performance monitor registers)
0	PMIE	SW : RW Perfmon interrupt enable

0x01500100+4*n DAY_CFG_FABRIC_SEGMENT_UADDR_0_REG_n, n=[0..3]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Based on parameters passed

This register defines the upper and lower address ranges for a particular slave segment (n).If this slave segment (n) is a link then this register defines the first address range for the slave link.

NOTE A segmentation address register is required for each slave segment supported by the FABRIC.The reset values for each of these registers is set by top-level input ports which are strapped to a value determined from a configuration file

The address decode range is based on the value of the SEG_ADDR_DECODE_SHIFT & NUM_ADDR_DECODE_BITS parameters:

A request is generated to the slave segment if the address falls within the following range:

SLA[(NUM_ADDR_DEC_BITS-1):0]

<= ADDR[MSB-(SEG_ADDR_DECODE_SHIFT):MSB-((NUM_ADDR_DEC_BITS-1)+SEG_ADDR_DECODE_SHIFT)]

<= SUA[(NUM_ADDR_DEC_BITS-1):0]

and the slave segment enable (SSE) bit is set and the slave is present (Sn_NOTPRESENT = 0).

DAY_CFG_FABRIC_SEGMENT_UADDR_0_REG_n

Bits	Name	Description
15:10	RESERVED_15_10	
9:0	SUA	SW : RW Segment 'n' upper address (based on parameter- up to 10-bits)

0x01500200+4*n DAY_CFG_FABRIC_SEGMENT_LADDR_0_REG_n, n=[0..3]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Based on parameters passed

This register defines the upper and lower address ranges for a particular slave segment (n). If this slave segment (n) is a link then this register defines the first address range for the slave link.

NOTE A segmentation address register is required for each slave segment supported by the FABRIC.The reset values for each of these registers is set by top-level input ports which are strapped to a value determined from a configuration file

The address decode range is based on the value of the SEG_ADDR_DECODE_SHIFT & NUM_ADDR_DECODE_BITS parameters:

A request is generated to the slave segment if the address falls within the following range:

SLA[(NUM_ADDR_DEC_BITS-1):0]

<= ADDR[MSB-(SEG_ADDR_DECODE_SHIFT):MSB-((NUM_ADDR_DEC_BITS-1)+SEG_ADDR_DECODE_SHIFT)]

<= SUA[(NUM_ADDR_DEC_BITS-1):0]

and the slave segment enable (SSE) bit is set and the slave is present (Sn_NOTPRESENT = 0).

DAY_CFG_FABRIC_SEGMENT_LADDR_0_REG_n

Bits	Name	Description
15	SSE	SW : RW Slave segment n enable

DAY_CFG_FABRIC_SEGMENT_LADDR_0_REG_n (cont.)

Bits	Name	Description
15:10	RESERVED_15_10	
9:0	SUA	SW : RW Segment 'n' upper address (based on parameter- up to 10-bits)

0x01500400+4*n DAY_CFG_FABRIC_SEGMENT_LADDR_1_REG_n, n=[0..3]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: Based on parameters passed

This register defines the lower address range for a particular slave link segment (n). A link segment can have up to two separate address ranges. This register defines the second address range for the slave link.

NOTE A segmentation link address register is required for each slave link segment supported by the FABRIC.The reset values for each of these registers is set by top-level input ports which are strapped to a value determined from a configuration file

The address decode range is based on the value of the SEG_ADDR_DECODE_SHIFT & NUM_ADDR_DECODE_BITS parameters:

A request is generated to the slave segment if the address falls within the following range:

SLA[(NUM_ADDR_DEC_BITS-1):0]

<= ADDR[MSB-(SEG_ADDR_DECODE_SHIFT):MSB-((NUM_ADDR_DEC_BITS-1)+SEG_ADDR_DECODE_SHIFT)]

<= SUA[(NUM_ADDR_DEC_BITS-1):0]

and the slave segment enable (SSE) bit is set and the slave is present (Sn_NOTPRESENT = 0).

DAY_CFG_FABRIC_SEGMENT_LADDR_1_REG_n

Bits	Name	Description
15:10	RESERVED_15_10	
9:0	SLA	SW : RW Segment n lower address (based on parameter- up to 10-bits)

0x01501000+0x0100*n+4*m DAY_CFG_FABRIC_m_WEIGHTING_REG_n, m=[0..2], n=[0..3]

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

The values programmed into this register determine the Tier 2 weight for each master under the Tier Based Arbitration Scheme.

NOTE This register is required for each master and each slave segment supported by the FABRIC .

DAY_CFG_FABRIC_m_WEIGHTING_REG_n

Bits	Name	Description
15:8	RESERVED_BITS_15_8	
7:0	M_M_W	SW : RW Master 'm' Weight

0x01502000+ 0x0100*n+4* m **DAY_CFG_FABRIC_m_QOS_REG_n, m=[0..3], n=[0..3]**

Type: Read/Write
Clock: FABRIC_CLOCK
Reset State: 0x0000

The values programmed into this register determine the Tier 1 weight for each master under the Tier Based Arbitration Scheme. Only 4 master ports can be configured as Tier 1. The QMC bits are used to configure a master port as Tier 1.
